APPENDIX 5A 12

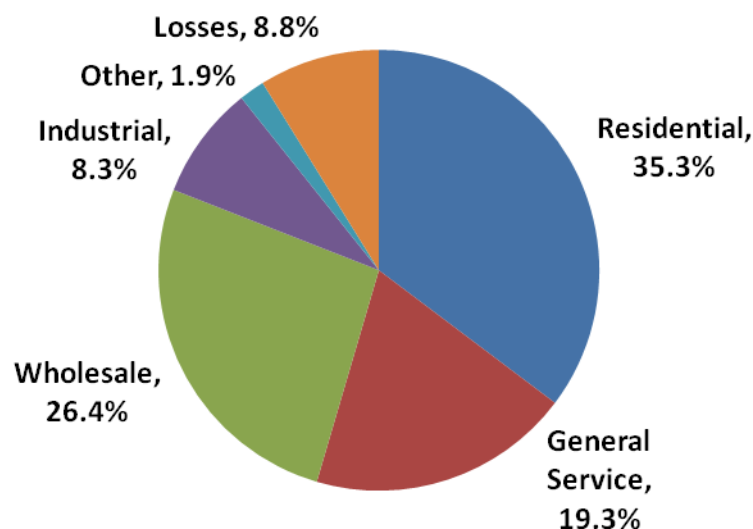

1 **5.0 Overview**

2 **2010 Forecast**

3 Gross system energy load is a mix of residential, wholesale, general service, industrial,
4 street lighting and irrigation loads that include system losses and company use. The
5 residential, general service and wholesale loads represent the largest portion of the
6 2010 forecast gross system load at 81 percent. The industrial load percentage of gross
7 load has dropped from its historical 10 percent to around 8 percent for 2010 mainly due
8 to the depression in the forestry industry. For 2010 gross system losses are forecast at
9 8.84 percent, using a two year average actual system loss calculation as agreed in the
10 2009 NSA approved by Commission Order G-193-08. Gross system load is forecast to
11 be 3,482 GWh in 2010, a 2.8 percent increase over the current 2009 normalized
12 forecast of 3,387 GWh. The comparatively large load increase forecast for 2010 is
13 related mainly to increases in industrial sales to Zellstoff Celgar and other industrial
14 companies, as outlined in Sections 5.1 and 5.2.3 below. FortisBC's 2010 distribution of
15 forecast gross energy load is shown in the chart below.

16

Figure 5.0: 2010 Gross System Energy Forecast

17 The 2010 load forecast includes end-use considerations and customer supplied
18 forecasts. Load forecasts are based on weather normalized historic loads for the
19 Residential and Wholesale classes, and historic actuals for the remainder of the

1 classes, as outlined in the Temperature Normalization Section 5.4. Reductions in
 2 energy consumption due to the DSM programs are forecast at 30 GWh.

3 The 2009 load forecast is based on 2009 normalized actuals to July 31, 2009. 2009
 4 loads will be updated on or before November 2, 2009 to reflect normalized actuals to
 5 September 30, 2009.

6 The 2010 winter peak forecast is at 697 megawatts ("MW"); slightly below the original
 7 2009 forecast of 701 MW. The 2010 forecast summer peak is identical to the 2009
 8 peak of 560 MW.

9 The total number of customer accounts in 2010 is projected to be 112,911 or a 1.5
 10 percent increase over the current 2009 forecast. The current 2009 forecast increase of
 11 1.3 percent over 2008 is lower than the prior five year average annual growth of 2.3
 12 percent. Customer growth is moving towards the 20 year average of 1.4 percent, which
 13 is directly attributable to declining population growth projections.

14 Table 5.0 below summarizes system energy requirements and customer growth for
 15 2009 and 2010.

Table 5.0: Normalized System Energy Requirements

| | Energy Sales (GWh) | Approved 2009 | Forecast 2009 | Forecast 2010 |
|---|----------------------------------|----------------------|----------------------|----------------------|
| 1 | Net Load | 3,107 | 3,083 | 3,174 |
| 2 | Losses | 296 | 305 | 308 |
| 3 | City of Nelson Loss Adjustment | (2) | 0 | 0 |
| 4 | Gross Load | 3,401 | 3,387 | 3,482 |
| 5 | Gross Loss Percentage | 8.70 | 9.00 | 8.84 |
| | System Peak (MW) | Approved 2009 | Forecast 2009 | Forecast 2010 |
| 6 | Winter Peak | 701 | 701 | 697 |
| 7 | Summer Peak | 560 | 560 | 560 |
| | Customer Count (Year End) | Approved 2009 | Forecast 2009 | Forecast 2010 |
| 8 | Total Customers | 111,913 | 111,190 | 112,911 |
| 9 | Percentage Change | 1.8 | 1.3 | 1.5 |

1 **5.1 Economic and Demographic Outlook**

2 There are encouraging signs that the worst of the recent downturn in the business cycle
3 may be over. FortisBC sales have picked up in the past few months, and industrial
4 customers are optimistically forecasting production increases in 2009 and 2010. The
5 Conference Board of Canada is forecasting British Columbia Gross Domestic Product
6 (“GDP”) to grow by 3.4 percent in 2010¹, following a decline of 2.5 percent in 2009. The
7 2010 GDP growth forecast includes forestry industry increases of 1.3 percent;
8 construction, 10.1 percent; and service industries, 3.1 percent. All British Columbia
9 industries are expected to experience modest growth starting in 2010, resulting in
10 robust economic growth for a number of years.

11 Population growth is anticipated to rise moderately, with the Okanagan demonstrating
12 the highest growth in the FortisBC service territory. Both housing starts and population
13 growth in the FortisBC service territory are expected to slow from those seen in the
14 years prior to the recent recession. Housing starts and construction have eased from
15 historical highs due to slower economic growth, but as the economy and job market
16 continue to improve housing starts are expected to increase to meet demand. Housing
17 starts are expected to recover by 2013 before gradually declining over the long term
18 due to demographic shifts².

19 **Forestry, Lumber & Pulp Industry:**

20 The forestry and manufacturing sectors have been significantly affected by the
21 downturn in the Canadian and United States economies and the strong Canadian dollar.
22 This industry is expected to gain strength and stabilize in 2010 although longer term
23 industrial growth has been, and continues to be, forecast at close to zero percent.
24 Industrial load is the most significant downside risk to the 2010 forecast, in particular for
25 the increased activity forecast by many customers and increased sales to Zellstoff
26 Celgar for their operations. Zellstoff Celgar was successful with their bid into the BC
27 Hydro Bioenergy Call for Power. The effective start date is projected to be March 1,
28 2010, with Zellstoff Celgar’s purchases from FortisBC to increase from approximately
29 16.5 GWh in 2009 to 55 GWh in 2010.

¹ Conference Board of Canada, Provincial Outlook Summer 2009.

² CMHC Housing Market Outlook, Second Quarter 2009.

1 **Educational:**

2 There are two large educational institutions and two smaller ones in FortisBC's service
3 territory. The University of British Columbia ("UBC") Okanagan campus and Okanagan
4 College have continued to increase their energy requirements over the past several
5 years. UBC Okanagan has grown dramatically, effectively doubling its energy
6 requirements from 2008 to 2010.

7 **5.2 Forecast**

8 Customer and load forecasts are based on total service territory trends and
9 expectations. The 2010 forecast is based on population growth estimates produced by
10 BC Stats³ for the FortisBC service area and the historical relationship between FortisBC
11 customer and load growth. The 2010 forecast is augmented by survey information from
12 large industrial and wholesale customers, and discussions with FortisBC
13 representatives. BC Stats is forecasting a gradual decline in the population growth rate
14 due to natural decreases overshadowing net migration.

15 **5.2.1 Residential Class**

16 Residential demand is influenced by home characteristics, household
17 consumption patterns, and weather. Energy requirements for the Residential
18 class are determined by:

- 19 • The number of residential customers; and
- 20 • The average Use Per Customer ("UPC")

21 Determination of residential growth begins with a review of past customer growth.
22 Forecast residential customer counts are determined from the historical
23 relationship between the annual growth of the number of residential accounts
24 and population growth in the FortisBC service territory. The number of
25 residential accounts has been increasing steadily, reflecting continued population
26 growth, particularly in the Okanagan region. For 2010 continued customer
27 growth is expected, although at a slightly slower rate than in recent years due to
28 slowing population growth. The growth rate in the number of residential
29 customers reached historical highs averaging over 2 percent from 2000 to 2008.

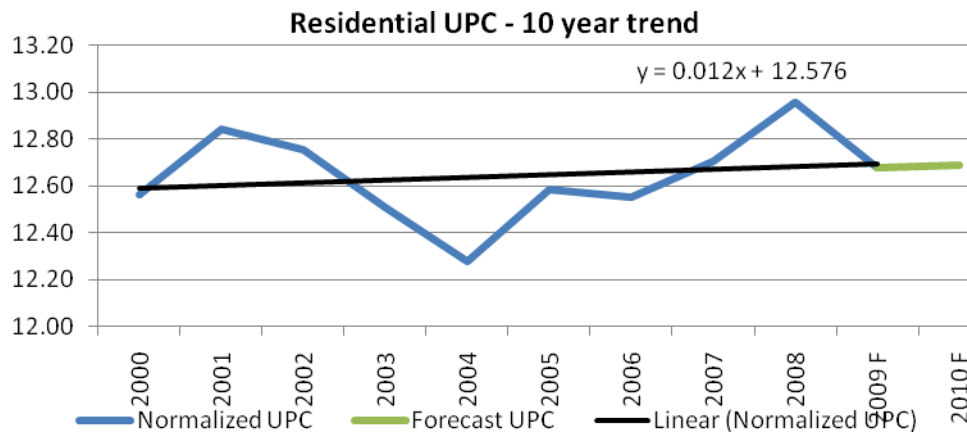

³ BC Stats P.E.O.P.L.E. report dated August 2009.

1 This is forecast to drop slightly to 1.4 percent growth for 2009 and 1.4 percent for
 2 2010.

3 Average residential usage is projected using the 10-year average annual UPC
 4 rate per customer as shown in Figure 5.2.1 below. The 2010 forecast of 12.69
 5 megawatt hours (“MWh”) per customer is based on 2009 year to date usage to
 6 July, with the remainder of 2009 as forecast, and UPC trends. While the
 7 residential UPC increased in 2007 and 2008, FortisBC and many other utilities
 8 have seen average usage drop in 2009. The possible reason for the drop in the
 9 average use per customer is more conscious behaviour due to cost
 10 considerations, prompted by the recession.

11 Projected residential load for 2010 is 1,228 GWh with the number of residential
 12 customers forecast to reach 98,264. This corresponds to a 0.7 percent after DSM
 13 growth in energy consumption over normalized 2009 and an increase of 1.4
 14 percent in forecast customers over the current 2009 forecast (see Appendix 5A).

15 **Figure 5.2.1: Residential Use per Customer**

16

17 **5.2.2 General Service Class**

18 The General Service class encompasses a broad range of commercial and small
 19 industrial customers as well as schools, hospitals, recreation centres and other
 20 public facilities. Energy consumption in this class exhibits great diversity and
 21 usage is closely tied with economic activity and population growth. Forecast
 22 customer growth is determined from the historical relationship between annual
 23 growth of the number of general service accounts and GDP.

1 There has been steady growth in the number of general service accounts, with
 2 projected accounts in 2010 to reach 11,667. This corresponds to an increase of
 3 2.8 percent in forecast customers over current 2009 forecasts (see Appendix
 4 5A). Average annual growth in the number of general service customers from
 5 2006 to 2008 was about 2.6 percent, with GDP growth in this period averaging
 6 2.3 percent. GDP forecasts for the period 2010 to 2013 average 3.5 percent
 7 annually, following decreases seen in 2007 and 2008. 2009 customer growth is
 8 forecast to be less than that seen in recent years, but with forecast increases in
 9 economic activity expected in 2010, FortisBC is expecting a return to more
 10 customary slower trends.

11 Sales in the General Service class are forecast to drop slightly in 2009 from 2008
 12 sales due to poor economic conditions and reductions in the average UPC.
 13 2010 sales in this class are expected to increase to 671 GWh; a 1.2 percent
 14 increase from the current 2009 forecast (see Appendix 5A). While there had
 15 been positive growth in energy consumption per general service customer for
 16 many years (as shown in Figure 5.2.2), like the Residential class, average usage
 17 has decreased in 2009.

18 **Figure 5.2.2: General Service Use per Customer**

1 **5.2.3 Industrial Class**

2 Industrial load is affected by the level of economic activity, exports, commodity
3 prices and other factors. Forestry, pulp and sundry comprise over one-third of
4 FortisBC industrial customers. Other classes of customers include large
5 educational institutions, agriculture, construction, manufacturing and mining.
6 FortisBC determines industrial load requirements through a combination of
7 surveys, discussions with companies and historical growth patterns. Many
8 FortisBC industrial customers who have reduced operations over the past two
9 years expect some recovery in 2009 and 2010. The Conference Board of
10 Canada Summer 2009 British Columbia Forestry GDP forecast calls for a 1.3
11 percent growth for 2010.

12 The total projected industrial load for 2010 is 291 GWh, an almost 26 percent
13 increase from current 2009 industrial load forecasts. The largest increase in the
14 2010 industrial load forecast stems from augmented annual sales to Zellstoff
15 Celgar of approximately 39 GWh due to their planned sale of generation to BC
16 Hydro, as outlined in Section 5.1 above.

17 **5.2.4 Wholesale Class**

18 FortisBC sells wholesale power to municipalities within its service territory that
19 own and operate their own electrical distribution system, as well as to BC Hydro
20 at Lardeau and Kingsgate. The municipal utilities are Penticton, Grand Forks,
21 Kelowna, Nelson, and Summerland. These wholesale customers have a load
22 composition that is a mix of residential, commercial, industrial, and street light
23 customers, which makes their load to a large extent sensitive to population
24 growth trends. Forecast 2010 growth is based on surveys to wholesale
25 customers, less anticipated DSM savings. Total forecast 2010 wholesale load is
26 projected at 919 GWh which corresponds to 1.7 percent growth in energy
27 consumption over the current 2009 forecast. Average growth for the period 2006
28 to 2008 was 1.8 percent.

29 In July 2008 Nelson Hydro began exporting for sale out of FortisBC's service
30 territory a portion of its generation, and on September 16, 2008, BC Hydro
31 applied to the Commission to amend Section 2.1 of its PPA with FortisBC to

1 clarify that electricity purchased by FortisBC under the PPA cannot be sold to a
2 FortisBC customer to replace electricity to be sold by that customer. The 2009
3 NSA provided that the Company would true up in 2010 Revenue Requirements
4 the difference between the 25 GWh of increased sales forecast for Nelson in
5 respect of exported power, and the actual, if the Commission approved the BC
6 Hydro application.

7 On May 6, 2009, the Commission approved the amendment to Section 2.1 of the
8 PPA, and Nelson ceased to export power. Total sales to Nelson in 2009 related
9 to exports totalled 13 GWh; a decrease of 12 GWh from forecast. The impact of
10 the true up is \$18,000 after tax and is shown in Tab 3, Table 3.5.1.

11 In June 2009 the Tolko plant within the City of Kelowna boundary began to
12 redirect fuel to its Armstrong plant, increasing its load requirements by about 2
13 GWh per month. FortisBC understands that Tolko's requirements from the City
14 of Kelowna may increase to 6 GWh per month for the remainder of 2009 and by
15 as much as 70 GWh in 2010. If confirmed, FortisBC will include this increase in
16 its Revenue Requirements Update of November 2, 2009.

17 **5.2.3 Irrigation and Lighting**

18 Due to differences in acreage, crop types and energy use patterns, and the
19 complexity of economic and environmental issues affecting irrigation customers,
20 growth patterns for energy sales in this class are variable. The average ten year
21 growth rate is 1.9 percent, with annual changes ranging from +23 to -18 percent.
22 For 2010, annual energy sales have been estimated at the forecast 2009 level of
23 52 GWh.

24 Lighting load varies slightly from year to year, and has grown at a low annual
25 average rate of 0.9 percent over the past 10 years. The 2010 lighting forecast
26 assumes lighting load at the 2009 forecast level of 13 GWh.

1 **5.3 System Losses**

2 System losses consist primarily of:

- 3 1. Losses in the transmission and distribution system;
- 4 2. Company use;
- 5 3. Losses due to wheeling through the BC Hydro system; and
- 6 4. Unaccounted for energy (metering inaccuracies, and theft).

7 As agreed in the 2009 NSA "System losses to be utilized in Revenue Requirements will
8 be calculated on a two-year rolling average for the remainder of the PBR term". The
9 percentage of system losses in 2010 is the average of 2007 (8.99%) and 2008 (8.70%),
10 8.84 percent.

11 **5.4 Temperature Normalization**

12 In order to forecast temperature sensitive loads it is necessary to eliminate the
13 contribution of temperature to load growth prior to performing any statistical analyses of
14 load growth. This is accomplished through temperature normalization for the
15 Residential and Wholesale temperature sensitive load classes, adjusted to correspond
16 to a reference temperature. The Residential and Wholesale classes are the only ones
17 to exhibit any significant correlation of usage to weather. The Wholesale class is
18 weather sensitive due to the high proportion of residential customers.

19 The 2010 forecast is based on 10-year average temperatures which are referred to as
20 'normal temperatures'. The temperature normalization model consists of sensitivity
21 factors that correspond to Heating Degree Days ("HDD") and Cooling Degree Days
22 ("CDD")⁴ obtained from Environment Canada historical temperature data.

23 **5.5 Peak Demand**

24 The summary of historical and forecast system peak data is shown in Table 5.0 and in
25 Appendix 5A. Peak demand is affected by economic activity, the number of customers,
26 use per customer and temperature. Peak demand forecasts are derived from historical

⁴ The concept of Heating and Cooling Degree Days involves a threshold temperature. The threshold temperature used is 18 degrees C. HDD is calculated as the difference between the threshold and a daily mean temperature for temperatures lower than the threshold, multiplied by the number of days. CDD is calculated in an analogous manner for daily mean temperatures greater than the threshold.

1 peaks and historical and forecast load growth. The 2010 forecast winter peak of 697
 2 MW is slightly lower than the 2009 forecast of 701 MW. The decrease in the 2010
 3 forecast winter peak from the prior year's forecast is due to the 10 year window
 4 calculation. On a normalized peak basis the 2008 peak was lower than the 2007 peak
 5 due to lower sales in many customer classes. The 2010 summer peak is identical to the
 6 2009 peak of 560 MW.

7 **5.6 Forecast and Actual Electric Sales Revenue**

8 Sales revenue by customer class for 2010 are based on rates effective as at September
 9 1, 2009 and includes the impact of the 4.6 percent general rate increase effective
 10 January 1, 2009 and a 2.2 percent general rate increase related to the flow-through of
 11 BC Hydro rate changes, effective September 1, 2009. The 2007 and 2008 revenues
 12 are actuals. The 2009 forecast is comprised of actual revenue values to July adjusted
 13 for unbilled amounts and forecast revenue for August through December.

Table 5.6: Actual and Forecast Revenue by Customer Class

| | | Actual | | Forecast | |
|---|-----------------|----------|---------|----------|---------|
| | | 2007 | 2008 | 2009 | 2010 |
| | | (\$000s) | | | |
| 1 | Residential | 93,146 | 102,600 | 108,803 | 108,012 |
| 2 | General Service | 49,598 | 53,820 | 56,230 | 57,814 |
| 3 | Wholesale | 43,425 | 45,614 | 49,583 | 49,212 |
