July 20, 2009

British Columbia Utilities Commission
Sixth Floor, 900 Howe Street
Vancouver, B.C.
V6Z 2N3

Attention: Ms. Erica M. Hamilton, Commission Secretary

Dear Ms. Hamilton:

Re: Terasen Gas Inc. ("TGI", the "Company"), Terasen Gas (Vancouver Island) Inc. ("TGVI") and Terasen Gas (Whistler) Inc. ("TGW")
Collectively the "Terasen Utilities"
Return on Equity and Capital Structure Application (the "Application")

Response to the British Columbia Utilities Commission ("BCUC" or the "Commission") Information Request ("IR") No. 1

On May 15, 2009, the Terasen Utilities filed the Application as referenced above. In accordance with Commission Order No. G-70-09 setting out the Regulatory Timetable for the Application, the Terasen Utilities respectfully submit the attached response to BCUC IR No. 1.

If there are any questions regarding the attached, please contact the undersigned.

Sincerely,

TERASEN GAS INC.
TERASEN GAS (VANCOUVER ISLAND) INC. and
TERASEN GAS (WHISTLER) INC.

Original signed by:

Scott A. Thomson
Vice President, Regulatory Affairs & CFO

cc (email only): Registered Parties

1.0 Reference: Exhibit B-1, Cover Letter pp. 3, 43 Use of an ROE AAM

Page 3 of the Cover Letter states that the Commission must review its formulaic approach to determining the ROE allowed in the rates of the utilities it regulates and that such a review is sought by this Application.

At page 43 of the Cover Letter, Terasen Utilities request as follows:

"Terasen requests that the Commission acknowledge changed circumstances by allowing TGI a common equity component of 40% in its capital structure effective January 1, 2010, and the Terasen Utilities request that a return on equity of 11% be established effective July 1, 2009 for TGI, and as the Benchmark ROE for the other Terasen Utilities. This level of return as the ROE for TGI and as the Benchmark ROE will apply until an application to the Commission at a future date for a change. The Terasen Utilities will pursue development of an appropriate ROE adjustment mechanism with the goal of presenting a proposal to the Commission in time to be considered in setting final rates for 2011, if possible."

1.1 Please confirm that in seeking to review the BCUC formulaic approach to determine the allowed ROE in the rates of the utilities it regulates, Terasen Utilities are applying for a variance of the existing ROE AAM as it is applied to TGI, TGVI and TGW and not the formula as applied to other investor-owned utilities regulated by the BCUC. If not, please explain precisely what Terasen Utilities are asking the Commission to review.

Response:

That is correct. The Terasen Utilities are applying to set aside the existing ROE AAM and establish a new Benchmark ROE for TGI which will also act as the reference ROE upon which the utility specific risk premium of TGVI and TGW will be added to determine each of their allowed ROE settings. The current formula fails to provide the Terasen Utilities with a fair return. Other investor owned utilities regulated by the BCUC may wish to request that their ROEs be set with reference to the new Benchmark ROE for the Terasen Utilities and if so might reasonably be expected to make their views known to the Commission through intervention in this proceeding or through separate applications. As a practical matter, the returns of BC Hydro and BCTC are both set off the allowed ROE for TGI so they would automatically see their returns adjusted based on the decision of the Commission in this Application, leaving only Pacific Northern Gas and FortisBC.

By providing the fair return requested in this Application, the BCUC can help to reduce the financial risks of the major utilities operating in the province of British Columbia and provide a solid foundation for Terasen Utilities to meet the challenges that will be faced going forward.

1.2 What is the extent of Terasen Utilities' knowledge of the processes before the NEB, AUC, OEB and Gaz Metro's application to Régie for a change in cost of capital methodology? Please provide the latest update on these processes along with an indication of when tribunal decisions may be rendered.

Response:

The generic cost of capital in proceeding before the AUC is in the argument and reply argument stage. A decision may reasonably be expected in the fourth quarter of this year.

On June 18, 2009, the OEB issued a letter in which it stated that there was not a sufficient basis to vary the 2009 cost of capital parameter values for 2009 rates for the electricity distributors in a timely manner. The letter also stated that the Board was satisfied that further examination of its policy regarding the cost of capital was warranted to ensure that, on a going forward basis, changing economic and financial conditions are accommodated if required. The Board is thus proceeding with a review of its cost of capital policy. An issues list is to be developed, interested stakeholders have been invited to file written comments and a technical conference is scheduled for the week of September 21, 2009. TGI is unable to provide an estimate of the date by which any decision might be issued by the OEB.

The NEB issued a letter on July 3, 2009 stating that it had decided to initiate a review of its RH-2-94 multi-pipeline cost of capital decision and was seeking comments on the continuing applicability of the RH-2-94 Decision. Comments are due on September 18, 2009. TGI is unable to provide an estimate of the date by which any decision might be issued by the NEB.

Gaz Metro filed its testimony on cost of capital with the Régie de l'Énergie on May 4, 2009 as part of its filing for rates to be effective October 1, 2009. Information requests from the Régie and intervenors to Gaz Metro were filed on June 11, 2009. Based on past experience, a decision is likely by early in the fourth quarter of 2009.

1.3 Please confirm that the requests for relief are a result of the "changed circumstances" perceived by Terasen Utilities and articulated in the Application. Should the "changed circumstances" return to circumstances of prior years or if long term bond yields move to an upward trend, is it the understanding of Terasen that the current ROE AAM would continue to apply?

Response:

The "changed circumstances" articulated in the Application relate both to changes in risk and to recent events in the financial and credit markets that increased the awareness, and provided more evidence, that the current AAM does not produce results that are appropriate. This information request relates to the latter change in circumstances, which are discussed further below.

The recent financial and credit market crisis has only made it more apparent what has been a problem for Canadian regulated utilities for a long time, i.e. that the returns established by the current British Columbia ROE AAM and those that produce similar results, such as the NEB formula, fail to meet the Fair Return Standard. The direct answer to the question posed in the second sentence of this information request is "no".

As noted in the Application, the Terasen Utilities seek to establish a new Benchmark ROE based on the evidence filed in this proceeding. If a new formula can be developed to make subsequent adjustments to allowed returns in the future that continues to ensure the Fair Return Standard can be met, then the Terasen Utilities would be supportive of its introduction and have indicated they will work towards that goal.

It is time to establish an appropriate and fair return. The mechanics of a robust formula that can operate successfully in all market conditions is a matter for a future regulatory proceeding and will be in part dependent on the outcome of this proceeding.

2.0 Reference: Exhibit B-1, Cover Letter pp. 3, 4 Reasons for a Review

The Commission's decision respecting Terasen's last Application issued on March 2, 2006 stated that should the AAM result in a ROE for the benchmark low-risk utility of less than 8 percent or greater than 12 percent the Commission will canvass the views of the parties on whether the AAM should be reviewed. One of the reasons Terasen Utilities filed the Application on May 15, 2009 is based on the forecast 30 year GCB yields on which the annual benchmark ROE is set.

2.1 Does TGI still consider itself a "benchmark low-risk utility" for the purposes of setting allowed ROEs?

Response:

TGI has been designated "a benchmark low-risk utility" by the Commission. In reference to ROE of the benchmark low risk utility in the March 2006 Decision (line two of the question) is a reference to allowed ROE for TGI.

By Regulation the crown owned utilities (BC Hydro and BC Transmission Corporation) have their ROE set with reference to the most comparable investor owned utility, which by virtue of size and geography has defaulted to TGI. TGI accepts that it is has been, and will be, the benchmark utility in respect of being the "benchmark" or "standard" used to set the ROE of other utilities in B.C., but does not consider itself to be "a benchmark low-risk utility" now, if it ever was.

Any utility could act as the benchmark and TGI due to its size has been selected as the benchmark by the BCUC in the past. Clearly BC Hydro is a lower risk utility than TGI by virtue of its government ownership, cost structure and regulation.

2.2 Terasen utilities have put forward testimony from Mr. Carmichael, opinion of Ms. McShane, and evidence of Dr. Vander Weide. Is it the intention of Terasen Utilities to include all three experts for cross-examination?

Response:

Yes.

2.3 Please comment on the time allocated to each of the three witnesses to compile evidence for this Application and the estimated total expenses on this Application.

Response:

Mr. Carmichael was asked to provide an overview of financial markets and conditions and to analyze and provide comment on the appropriateness of the current formula based determination of a fair rate of return on equity for Terasen. Ms. McShane and Dr. Vander Weide were each engaged to provide evidence and form an opinion of a fair return for TGI based on a number of different approaches in order to ensure a comprehensive evidentiary record for the Commission.

Each of the witnesses prepared their testimony between January and May of this year and will be involved in preparing responses to Information Requests on their evidence, preparation for and attendance at the oral hearing to sit for cross-examination, and final submissions.

In addition to the three expert witnesses there will be external legal support and witness preparation and training costs. Based on actual time incurred for preparation of evidence and the first round of information requests plus estimates for a second round of information requests which are assumed to be limited given the body of evidence filed and the scope of the original round of IRs, and time for the review of intervenor evidence preparation of IRs thereon, the estimated total third party expenses for this Application (excluding any costs for participant funding and excluding any costs assessed by the BCUC for hearing room time, etc.) are on the order of $675,000.

Final costs will be dependent on the length of the hearing, the extent of subsequent information requests and the intervenor evidence.

3.0 Reference: General

3.1 Please provide information in tabular format on Terasen Gas Inc. for each year since 1999: the number of customers, net incremental customers, customer growth percentage, annual throughput and peak day throughput (GJ), throughput change percentage, rate base, and revenues with and without cost of gas.

Response:

The following table illustrates the annual net customer additions, year-ending customers, customer growth rate, annual normalized throughput, annual normalized throughput growth rate, peak day demand, peak day demand growth, peak day sendout, peak day sendout growth rate, normalized actual revenues (both with and without the cost of gas), and also the normalized actual rate base.

The peak day demand figures represent the peak day demand that is filed in the current and also historical Annual Contracting Plans, whereas the peak day sendout figures represent the maximum daily sendout that was experienced in each calendar year.

	1999	2000	2001	2002	2003
Net Customer Additions	11,768	5,686	4,835	7,360	6,306

Normalized Actual Rate Base ($000's)[2]	2,305,591	2,408,116	2,442,352	2,426,180	2,474,447

Notes:

1. Includes all customer classes - residential, commercial, firm sales & industrial, also includes TGVI volumes
2. Includes Squamish as part of TGI from 2007 onwards
3. Includes 3,124 additional customers due to Squamish amalgamation
4. Growth rate calculation excludes the Squamish amalgamation

3.2 Please provide the detailed long-term debt continuity schedule for TGI, updated for the recent issuances.

Response:

The following shows the long-term debt continuity schedule of TGI from 2004 to 2009 projected.

Tearsen Gas Inc.
Long Term Debt Continuity
For the Years Ended December 31
($000's)

	2004	2005	2006	2007	2008	2009 Projected
Total Opening Long Term Debt (Financial Statements)	$ 1,768.6	$ 1,909.1	$ 1,501.6	$ 1,500.1	$ 1,490.7	$ 1,551.7
Redemptions	-	(395.0)	(120.0)	(250.0)	(188.0)	(59.9)

Series 24	6.55%	February 24, 2039	-	-	-	-	-	85.2
LILO Obligation								
Kelowna			30.0	30.8	31.7	29.8	28.7	27.7
Nelson			5.0	5.2	5.0	4.7	4.6	4.4
Vernon			16.0	15.5	15.0	14.1	13.7	13.2
Prince George				39.4	38.3	36.0	34.9	33.8
Creston				-	3.6	3.4	3.3	3.2
Fort Nelson Allocation			- 2.5	- 2.6	- 2.7	- 2.8	- 2.9	- 3.0
Total average long-term debt included in rate base			**$ 1,315.4**	**$ 1,444.7**	**$ 1,432.9**	**$ 1,470.1**	**$ 1,373.8**	**$1,476.5**

3.3 Please provide a summary of TGI's allowed ROE and actual ROE for each year since rate regulation for BC Gas commenced. Also, for each year when a PBR mechanism was in effect, please include a record of all incentives earned, and the impact of these incentives in terms of the percentage of actual ROE earned.

Response:

Please refer to the table which follows for a summary of TGI's allowed ROE and actual ROE from 1992 to 2008, inclusive of the record of incentives earned and the impact of these incentives on the percentage of actual ROE earned.

3.4 Please provide the dollar impact and delivery rate change for the proposed increase in equity thickness from 35.01 percent to 40 percent and ROE from 8.47 percent to 11.00 percent for TGI.

Response:

The dollar impact of the proposed increase in equity thickness from 35.01 percent to 40 percent and ROE from 8.47 percent to 11.00 percent is approximately $44.9 million of revenue requirement for TGI. This translates to an approximate delivery rate impact of 8.5% and results in an approximate increase to the annual bill of a TGI lower mainland Residential customer of $38 per year or approximately 3.6%.

3.5 Please provide the dollar impact to TGI of an absolute 1% increase in the equity thickness of the company.

Response:

The dollar impact of an absolute 1% increase in equity thickness is an increase of approximately $2.4 million in the revenue requirement for TGI.

3.6 Please provide the dollar impact to TGI and TGVI of a 25 basis points increase to the ROE of each company.

Response:

The dollar impact of a 25 basis points increase to the ROE is an approximate increase of $3.1 million to the revenue requirement of TGI and an approximate increase of $0.8 million to the revenue requirement of TGVI. The revenue requirement increase for TGVI may not necessarily translate to a customer rate impact because of the soft cap mechanism.

4.0 Reference: Exhibit B-1, Cover Letter, p. 2 TGVI Special Direction

4.1 Please confirm which Special Direction is being referenced. Please provide a copy of the provisions of the Special Direction.

Response:

On page 2 of the Cover Letter, the Special Direction being referred to is Order-in-Council No. 1510 Vancouver Island Natural Gas Pipeline Special Direction, dated December 13, 1995. The Special Direction is included as Attachment 4.1.

5.0 Reference: Exhibit B-1, Cover Letter p. 5 NEB Decision on TQM

Page 5 of the Cover Letter states that in the RH-1-2008 Decision, the NEB discarded the ROE determination from the RH-2-94 formula, and effectively increased the allowed ROE for TQM, at the previously approved capital structure, by almost 300 basis points over what the RH-2-94 formula produced for 2007 and 2008.

5.1 Please file a copy of the NEB Decision on TQM RH-1-2008.

Response:

The NEB Decision on TQM RH-1-2008 is provided in Attachment 5.1.

5.2 Please confirm that the 2009 Return on Common Equity for certain Group 1 pipeline companies at 8.57 percent based on the Multi-Pipeline Cost of Capital Decision RH-2-94 is still in effect.

Response:

Confirmed. The NEB, as indicated in response to BCUC No. 1.2.1, has released a decision, a copy of which is included in Attachment 5.2, stating that it intends to initiate a review of the formula later this year.

5.2.1 Please also provide the allowed ROEs and equity ratios for the years 2007 and 2008 for those pipeline companies regulated by the NEB.

Response:

The multi-pipeline formula ROEs for 2007 and 2008 were 8.46% and 8.71% respectively. The multi-pipeline formula ROE was adopted as part of settlements which covered 2007 and 2008 for TransCanada (equity ratio of 40%), TCPL-BC System (equity ratio of 36%), Foothills (equity ratio of 36%), and Westcoast Mainline (equity ratio of 36%). The 2007 and 2008 allowed ROEs and capital structures for Group 1 Gas Pipelines regulated by the NEB but not governed by the formula (also the result of settlements) are Alliance Pipeline (ROE of 11.3% on 30% equity for both years) and Maritimes and Northeast Pipeline (ROEs of 12% and 11.66% for 2007 and 2008 on equity ratios of 29.3% and 31.18% respectively).

5.3 Page 29 of the NEB Decision says that the Board has decided to rely on a market-based ATWACC methodology to interpret the information that can be extracted from different samples comparable to TQM and from the financial market as a whole.

5.3.1 Please provide a calculation of the market based ATWACC that would apply to TGI based on the methodology employed by the NEB and considering market circumstances as at April 1, 2009 and July 1, 2009. Show calculations and explain the differences in the results.

Response:

The specifics of the methodology which the NEB utilized to arrive at the 6.4% ATWACC allowed for 2007 and 2008 are not detailed enough to be able to replicate their approach using more recent data. For example, it is not clear what weight the NEB gave to the various proxy samples of companies (and thus what or whose market value capital structure is implied by the 6.4% ATWACC). Nor is it possible to discern what values were used for betas and market risk premiums. Further, it is not possible to infer what changes the NEB might have made in the relevant CAPM inputs if the analysis had been done in 2009, particularly in light of the interceding events in the capital markets.

Section VI, G of Ms. McShane's testimony developed market-based ATWACCs for proxy samples using multiple market-based methodologies for the cost of equity. The average ATWACC was 7.4%. She then translated the average ATWACC into a ROE for TGI at the requested book value common equity ratio of 40% and a current debt cost of 6.625%. The indicated ROE at 40% equity was approximately 11.0%. The ATWACC and resulting ROE at 40% equity would not be materially different had the cost of equity tests been applied on April 1, 2009. Time constraints do not permit the cost of equity tests to be updated for the most recent data available.

5.3.2 What ROE would be implied assuming TGI's current deemed capital structure of 35.01 percent equity and current embedded cost of debt?

Response:

The NEB, in its application of the ATWACC methodology, relied on the premise that the cost of capital is flat across all capital structures. While this is unlikely to be the case from 0% debt to 100% debt, that conclusion is not unreasonable across the range of capital structures relied on for the purpose of the calculation requested. Under this assumption, using TGI's embedded cost of debt of 6.64% and a book value common equity ratio of 35.01%, Ms. McShane's ATWACC of 7.4% translates into an ROE of 12.3%.

5.4 Please provide a comparison of the Business Risks of TGI and TQM. Does TGI agree with the views of some witnesses in the TQM proceeding that LDCs are generally of lower risk than pipelines? Please explain your answer.

Response:

As TGI has not done an in-depth independent analysis of the business risks of TQM, it was guided by the NEB's conclusions in this regard. TGI notes that the NEB considered business risks in the following categories: (1) Supply; (2) Market; (3) Competitive; (4) Operating; and (5) Regulatory. With respect to regulatory risks, under the current regulatory framework, TQM's forecast revenue requirement is rolled into the TCPL Mainline revenue requirement by contract and it receives 99% of its approved revenue requirement in 12 monthly payments from TCPL. The NEB noted that year-to-year earnings fluctuations are low, and that its past deferral account coverage was similar to its current deferral account coverage. It was not convinced that TQM's business risks had increased due to the NEB's regulatory policy toward more competition between pipelines. In comparison, TGI's revenues are, under the current regulatory framework, subject to greater fluctuation than TQM's. With respect to the longer-term, TGI has no basis to conclude that there is a significant difference in the likelihood that the NEB or the BCUC regulatory frameworks will change, altering the ability of the companies to recover their invested capital over the longer term.

The NEB concluded that TQM's market risk (which it defined as the business risk that arises from the overall size of the market and the ability of the pipeline to capture market share) had increased since RH-2-94. The NEB defined competitive risk as the risk resulting from competition for customers at both the supply and market ends of the pipeline system. The NEB included in competitive risk the competition in Québec markets against alternative energy sources and the ability of TQM to capture markets in New England. The NEB concluded that both competitive risk and market risk had increased due to the high industrial load and the declining competitive position of natural gas in Québec, competitive alternatives for delivering natural gas into the Northeast U.S. and higher supply risk. As TGI documents in its Application, its market and competitive risks have also increased significantly over the time horizon at issue in the TQM decision.

As regards supply risk, the NEB defined supply risk as the physical availability of competitively priced natural gas volumes that could affect TQM's income-earning capability. The Board concluded that TQM's supply risk had increased since RH-2-94 due to declining conventional supplies from the Western Canadian Sedimentary Basin, the dependence in part on economic unconventional supplies (whose development is uncertain) to maintain flows on the TCPL Mainline, and the higher absolute prices of natural gas. As defined by the NEB, TGI's supply risks have also increased, since, as indicated in response to BCUC No. 1, 40.1, conventional supplies of natural gas are declining and its competitiveness in the longer-term will be dependent on its ability to economically source unconventional supplies to serve its customers.

Operating risk is defined as the risk to the income-earning capability that arises from technical and operational factors. There was little evidence on the operating risk in the TQM decision and the Board concluded that there was insufficient evidence to conclude that the operating risk had changed. TGI does not view that the differences in operating risk as between TQM and TGI are material.

On balance, taking account of both short-term and long-term risks, TGI does views its business risks as being no lower than those of TQM given TGI's market and competitive risks. TGI has not analyzed gas pipelines versus LDCs in the broad sense that is implied in the question, but based on its assessment of TQM versus TGI, would disagree with a conclusion that TQM faces higher business risks than either TGI or the typical Canadian gas LDC.

5.5 Does TGI believe the market based ATWACC methodology employed by the NEB is an appropriate regulatory methodology for TGI? Would TGI be prepared to assume the risks inherent in using a market based cost of debt and a market based capital structure?

Response:

First, TGI would like to confirm that it is not proposing that the BCUC adopt an ATWACC methodology. Its discussion of the NEB decision and its results in the Application were intended to highlight the significant differential between the effective ROEs that were adopted for TQM for 2007 and 2008 and the corresponding NEB multi-pipeline ROEs for the same years. TGI has not fully analyzed the ATWACC methodology as applied by the NEB to determine whether it would be appropriate for the Company. Nevertheless, if the BCUC were to determine that an

ATWACC methodology were appropriate, TGI does not believe that it should be at risk for the difference between the embedded cost of debt that it has incurred under the existing methodology for setting cost of capital and the current cost of debt.

TGI understands that under the ATWACC approach, an ROE at a market-weighted capital structure converts to an ROE at a book value weighted capital structure. As such, TGI believes it could be appropriate to utilize a market based capital structure/ROE in order to establish an allowed ROE on the deemed equity component for rate base/rate making purposes, using embedded debt costs to avoid windfall gains or losses to customers or ratepayers. However, as noted, TGI has not investigated this approach in depth.

5.6 On page 81 of the TQM Decision the NEB states:

"The difference between market cost of debt and embedded cost of debt in this case is small and therefore does not require consideration of a grandfathering or transition phase for TQM for 2007 and 2008."

5.6.1 Does TGI view the market based ATWACC to be a modification or violation of the regulatory principle of cost based rates? Please consider each of the debt cost, equity cost and capital structure.

Response:

The principle of cost based rates itself does not specify how those costs are to be measured. In an original cost jurisdiction, such as British Columbia, all of the capital related costs included in the revenue requirement, with the exception of the cost of equity, are, in principle, historic average costs. The market-derived cost of equity, in contrast, is a marginal cost concept. If the cost of equity is estimated using market-derived tests only (i.e. CAPM and DCF), which are by definition estimated by reference to market values, the market value capital structures represent the financial risk component of that cost. TGI does not believe that it is a violation of cost based rates to recognize that the financial risk inherent in the book value capital structure to which the ROE is applied may be higher or lower than the financial risk inherent in the market value capital structures of the comparable companies used to estimate the cost of equity. The higher or lower financial risk of the book value capital structure relative to the market value capital structures of the proxies used to estimate the cost of equity would require an adjustment to that cost. The recognition of this relationship in the allowed ROE is fully consistent with a marginal cost approach to estimating the cost of equity and does not require a departure from using an original cost rate base, a book value capital structure or the recovery of the embedded cost of debt.

5.6.2 What would TGI do if its embedded cost of debt significantly exceeded the market cost of debt? Please show the impact that an embedded cost of debt 3 percent higher than the market cost of debt would have on ROE at the current 35 per cent equity in the capital structure.

Response:

As noted in response to BCUC 1.5.5, TGI is not requesting an ATWACC approach. Further, as noted in that response, even if the BCUC were to adopt an ATWACC approach, TGI does not believe that it should be at risk for the difference between the embedded cost of debt that it has incurred under the existing methodology and the current cost of debt. If ATWACC were adopted and TGI were allowed to recover its embedded cost of debt, the ATWACC estimate of 7.4% used in response to BCUC 5.3.1 would need to be adjusted for the difference between the embedded debt cost (9.625%) and the current debt cost (6.625% in Ms. McShane's ATWACC estimates). The ROE at 35.01% would be 12.3%, identical to the ROE that would result if the current and embedded debt cost were both 6.625%.

The alternative would be to recalculate the ATWACC using the market value capital structures of the proxy samples (47%/53% debt/equity) in conjunction with the embedded cost of debt (9.625% for the purpose of this question) and the market cost of equity (9.75%). In this case, the ATWACC would increase from 7.4% estimated in response to BCUC 5.3.1 to 8.4% and the ROE at 35.01% would be 11.2%.

6.0 Reference: Exhibit B-1, Cover Letter, p. 7 Worsening Market Conditions

6.1 The Application states that: "No pipelines are being built under formula based allowed returns in Canada." Is this statement true in light of the recently completed Terasen Whistler pipeline? Is it not true that TGVI operate under a formula based allowed return on equity?

Response:

It is true that TGVI's ROE is established with reference to the BCUC's ROE AAM. The statement refers to large scale oil and gas transmission pipelines, primarily those regulated by the NEB. For example, the Alliance Pipeline and Maritimes & Northeast are the most recent major greenfield natural gas transmission pipelines that have been constructed. In both cases, the projects were justified and approved based on negotiated rates between the pipeline company and the shippers that allowed for higher ROE's than would have resulted from the NEB ROE formula. The Whistler pipeline is an approximately 50km 8" intermediate pressure pipeline extension of TGVI's existing transmission system. It is a relatively small addition to the existing system rather than what would be considered a major new pipeline investment.

7.0 Reference: Exhibit B-1, Cover Letter, p. 7 Credit Spreads and Calculation Basis

Terasen Utilities state that the unusually wide and volatile credit spreads (i.e., yields on corporate bonds in excess of the GCB yield) observed in the market during the few months prior to the Application date support the need to reconsider use of the ROE AAM formula, including abandoning the formula.

7.1 Is it the case that the current ROE AAM implicitly assumes a stable credit spread between the GCB yield (which is taken as having essentially zero credit risk) and the yield on corporate bonds of TGI's higher credit risk level?

Response:

The current AAM assumes a stable equity risk premium between the GCB yield and the allowed ROE. By extension, assuming a stable equity risk premium would imply that the corporate credit spread is stable.

7.2 Has the credit spread defined in the preceding paragraph in fact been stable over the past year, or was this spread abnormally wide during the period of time commonly referred to as the credit crisis, when GCB yields fell – due to a flight to quality – while yields on higher risk bonds actually rose as the perceived risks of liquidity and potential default increased?

Response:

Credit spreads have been relatively unstable for over two years. Commencing in 2007, corporate credit spreads started to increase, as well as become more volatile, in part due to the concerns around asset back commercial paper and sub-prime mortgages. Spreads continued to widen through the early part of 2008, with the failure of Bear Sterns and other financial institutions. Commencing in September 2008 with the failure of AIG, Lehman Brothers, Merrill Lynch and others, events which were catalysts for what was commonly referred to as the credit crisis, corporate spreads increased dramatically. This increase in spreads has continued into 2009.

7.3 Has this credit spread been falling back toward historical norms over the past six months (i.e., January to June 2009)?

Response:

Over the past six months, corporate credit spreads have narrowed from those witnessed from November 2008 to January 2009. However, current corporate spreads remain higher than those observed in recent years.

7.3.1 What is the outlook for credit spreads for the second half of 2009 and into 2010?

Response:

The Companies expect corporate credit spreads will remain at elevated levels with higher average volatility over the next number of months. The expectation is based in part on continued concerns over a prolonged economic recession, as well common market perceptions that the global financial system and flow of capital will be less robust or as free as in periods past. This stems from several factors, including tighter monitoring, control and oversight of lending practices. Furthermore, it is unknown whether corporate spreads will narrow to levels experienced in years preceding the onset of the credit crisis given investors may now place greater emphasis on liquidity and default risks than ever before.

7.4 Rather than abandon the AAM formula, would it be appropriate to instead make a special temporary adjustment or over-ride to the ROE formula rate to account for an unusual credit-crisis spread-widening that existed during the past several months but which is now fading away?

Response:

No. A temporary over-ride to address the widening of the credit spreads assumes that during normal times the AAM formulated a Return on Equity that satisfied the Fair Return Standard. The Terasen Utilities has indicated this is not the case and a temporary adjustment to the AAM formula does not address the overall need to meet the Fair Return Standard. Terasen Utilities seek to establish a new Benchmark ROE to ensure the Fair Return Standard is met.

7.5 Are there features or attributes of bonds issued by the federal government, such as flight to quality factors associated with their essentially zero credit risk, that render GCBs a sometimes problematic base against which to compare corporate bond yields of TGI's risk class?

Response:

Yes. Reliance on GCB yields are problematic as a base against which to compare corporate bond yields' reliance on GCB yields in the AAM it is also problematic in the calculation of an ROE that meets the Fair Return Standard. The reason stems from the fact that risks of the federal government and a corporate utility such as Terasen are perceived differently by investors, and that factors that change the GCB Yield will not necessarily reflect the changes in the equity return of a corporate utility. In economic recessions, for example, market participants will shift into GCBs driving down yields (commonly referred to as a flight to quality). Conversely, corporate debt is perceived by investors to be more risky as evidenced by them demanding a premium in the form of wider corporate spreads. Higher risk premiums on debt translate into even higher perceived risk to holders of common equity. To receive a Fair Return, Common Equity holders will require the Terasen Utilities produce a higher ROE for the same level of risk; however, this is completely contrary to the AAM, which will produce a lower ROE during this time.

Terasen Utilities supports the following statement by the NEB in its TQM Decision page 17, paragraph 2:

> *"The RH-2-94 Formula relies on a single variable, which is the long Canada bond yield. In the Board's view, changes that could potentially affect TQM's cost of capital may not be captured by the long Canada bond yield, and hence, may not be accounted for by the results of the RH-2-94 Formula."*

7.6 Would it be appropriate to use some measure of corporate bond yields, rather than the GCB yield, as the base of an ROE formula in an attempt to find a credit spread between the base yield (i.e., some index of corporate bond yields) and the yield on corporate bonds of TGI's credit risk level that is more stable over time and thus captures potential issues related to the volatility of the credit spread between government and corporate bond yields?

Response:

The Terasen Utilities in this Application believe that the current benchmark ROE is inadequate, and the AAM that sets the benchmark ROE is flawed. Any discussion on a new ROE formula mechanism is premature until the Benchmark ROE is re-established at an appropriate level. To the extent the starting point ROE is not set at an appropriate level, an improved formula that more correctly tracks changes in ROE would still not deliver an adequate return if the starting point is incorrect.

With regard to alternative formulas, the Company considered a formula that adjusted the ROE based on the year over year changes in long term corporate utility bonds of a similar credit risk to TGI. In the context of the Canadian capital markets, as noted in page 32 of the Application, it is not apparent to TGI that such a corporate bond utility index actually exists. A proxy may involve some form of general corporate bond index, however, to the extent there are faulty assumptions as to the relationship between the utility ROE and the general corporate bond index, the formula over time may lead to inadequate results similar to the existing AAM.

As stated in its Application, TGI will continue to work towards developing an alternative formula. In the interim, TGI considers its proposal to maintain the benchmark ROE as established in this proceeding to be preferable to the establishment of an alternative formula which may turn out to be unworkable either due to incorrect assumptions regarding the relationship between the ROE and the adjustment variable(s) or due to lack of publicly available data for implementation.

8.0 Reference: Exhibit B-1, Cover Letter p. 13 Effective Returns Comparisons

8.1 Please add three columns to the table on page 13 to show the credit agencies Moody's, S&P and DBRS most recent ratings of the utilities listed in Canada.

Response:

The following includes the long-term debt ratings for the Canadian utilities and pipeline companies disclosed on page 13 of the Application:

	Credit Rating Agency		
	Moody's	**S&P**	**DBRS**
Newfoundland Power	Baa1	NR	A
Maritime Electric	NR	A	NR
TGVI	A3	NR	BBB(High)
FortisBC	Baa2	NR	BBB(High)
Gaz Metro	NR	A	A
TCPL	A3	A-	A
Atco Gas	NR	NR	NR
FortisAlberta	Baa1	A-	A(low)
Westcoast Energy	NR	BBB+	A(low)
Union Gas	NR	BBB+	A
Enbridge Gas	NR	A-	A
TGI	A3	A	A

9.0 Reference: Exhibit B-1, Cover Letter p. 13 Higher Leverage

"This higher leverage (more debt, less equity) makes TGI even less attractive to equity investors. Because higher leverage increases financial risk, it can impact the company's credit ratings, degrade financial ratios and debt covenant tests and impact its ability to attract capital on reasonable terms and in sufficient quantities under all market conditions."

9.1 Please provide information, including rates and amounts, on the last three TGI equity issues.

Response:

Terasen Gas does not issue public equity but rather obtained its equity from its shareholder, Terasen Inc. The following is a listing of the past three equity issuances at Terasen Gas Inc.

Year	Gross Proceeds	Number of Shares
2000	$ 120,000,000.00	11,179,390
1998	$ 64,890,000.00	3,000,000
1995	$ 25,061,234.69	2,231,633

9.2 Please provide information, including rates and amounts, on the last three Fortis Inc. equity issues.

Response:

The requested information is provided in the following table.

Preference share dividend rate	Date of Issue	# of shares	Price per share	Gross proceeds
N/A	Dec-08	11,700,000	$ 25.65	$ 300,105,000
5.25%	May-08	8,000,000	$ 25.00	$ 200,000,000
N/A	May-07	44,275,000	$ 26.00	$ 1,151,150,000

External Reports on Disparity Between US and Canadian ROEs

Terasen Utilities describe some of the conclusions of studies, namely: Concentric and NERA, undertaken to examine the disparity between Canadian and U.S. ROEs and the underlying business and operating risks differences.

At page 35 on the Concentric Report, a group of eight US gas companies is listed as "comparable companies."

10.1 To the best of TGI's knowledge, how many of these eight gas companies in the US are carrying out one or more of the following social policy instruments: (i) active payment assistance programs for low income customers, (ii) senior citizens discount programs, (iii) arrangements for customers to programs administered by local and federal governments, (iv) incorporate special tariff for low income customers, (v) regulations regarding disconnection in cold weather and to military personnel and forgiveness of non-payment (vi) special assistance for social service agencies, schools or religious institutions; (vii) utility's partnership with The Salvation Army, with employees and own corporate giving programs.

Response:

More than 12.5% of Americans live in extreme poverty, according to the US Census Bureau News[1]. As utility customers, they are faced with financial difficulties in paying their monthly energy bills, and this presents a challenge for utilities to collect revenue. That is why approximately 80% of US utilities offer low-income customers assistance in some form.[2]

Many of the eight utilities reviewed below, assist in the coordination of the Low Income Home Energy Assistance Program referred to as LIHEAP. This program is offered by the US Department of Health and Human Services; directing assistance payments to utility companies on behalf of individuals that are having difficulty in paying their utility bills. The US Department of Energy also offers assistance in weatherizing homes.

Most of the eight utilities also participate in the Energy Share Program; an emergency fund established through customer donations that provides direct assistance to qualified people facing unexpected financial difficulties, such as the loss of a job or a medical emergency. Energy Share donations are completely managed and distributed by The Salvation Army. In addition, utilities generally offer a deferred payment plan that allows customers to pay their bill over an extended period if they can demonstrate a hardship and have outstanding bills.

Southwest Gas Corporation

Southwest serves three states, including Arizona, California and Nevada. Each state has separate rules and regulations regarding income assistance programs.

In Arizona, Southwest's primary assistance programs include the Low Income Ratepayer Assistance Program. This program provides a 20% discount on the first 150 therms used each month during November through April. The number of household members, as well as the total household gross annual income determines program eligibility. Ratepayers eligible for assistance are charged on a special tariff. Southwest Gas Corporation in cooperation with the Arizona Energy Office offer the *LIEC (Low Income Energy Conservation) Program*. This program offers free energy audits, education in conservation and weatherization materials, which will increase energy efficiency and safety in low-income homes.

Arizona Utilities are advised not to terminate residential service when the customer has an inability to pay and where weather will be especially dangerous to health (usually 32° F or below for winter and triple digits for summer) as determined by the Commission. There are also rules prohibiting disconnection of service for certain medical reasons.

In California, Southwest offers several different programs for customers in financial difficulty. The Alternate Rates for Energy (CARE) Program provides a discount on monthly gas bills to income-qualified customers at their primary residence. CARE eligibility is determined by the total gross household income and number of people living in the residence. The program is funded through a rate surcharge paid by all other utility customers.

The California Additional Baseline Program is only available to California customers of Southwest Gas Corporation who are full-time residents of the household. Upon completion of an application and verification by a licensed physician, surgeon, or osteopath, an additional monthly medical allowance of 25 therms will be provided for hemiplegic / paraplegic / quadriplegic persons, multiple sclerosis / scleroderma patients and persons who are being treated for a life threatening illness and have a compromised immune system.

California utilities are prohibited from shutting off service during winter to residential customers who make regular payments of at least 50 percent of their bills. The utilities may require such customers to comply with a levelized payment plan to avoid shut-off, or otherwise must provide such customers with 9-month repayment plans starting at the end of the winter. Disconnects are not permissible if deemed detrimental to the health or safety of any household member.

In Nevada, customers can take advantage of LIHEAP or the Energy Share Program. Disconnections are not permissible when the temperature is 15° F or below and 105° F or above. Disconnection is delayed for 30 days, with one renewal, if the customer has a medical emergency. Qualifying customers must pay bill in instalments within the next 90 days. Elderly and handicapped customers must have 48 hours notice prior to disconnection.

Atlanta Gas Light

AGL facilitates a variety of programs that are offered by non-profit organizations and state and local agencies to assist qualified individuals with their natural gas bills. The LIHEAP program in the AGL service territory appears to be administered by the regulated division of SCANA Energy, a natural gas marketer. AGL also supports a variety of energy efficiency conservation programs that are oriented to low income individuals, and the company has a Senior Citizens Discount Program. Senior citizens who are 65 years of age or older and have a total annual combined household income of $14,355 or less are eligible for up to a $14 monthly discount on their Atlanta Gas Light Company base charge. Natural gas service must also be in the customer's name to be eligible.

Atlanta Gas Light and the Georgia Public Service Commission also assist those in need through the Home and Heartwarming Project, which is a joint effort with the Georgia Environmental Facilities Authority and Resource Service Ministries. This new program, in which Atlanta Gas Light will invest $1 million over the next 12 months, provides weatherization services and natural gas equipment repair or replacement for qualified senior and low-income households that receive natural gas from the AGL system.

In Georgia, utilities may not disconnect customers between November 15 and March 15 when the forecasted low temperature for a 24-hour period beginning at 8:00 A.M. on the date of the proposed disconnection is below 32 degrees. No disconnect can be completed if illness would be aggravated. Residential service will not be disconnected if at 8 A.M. on the scheduled disconnection day, a National Weather Service Heat Advisory or Excessive Heat Warning is in effect for the county of the scheduled disconnection.

Northern Illinois Gas Company (NICOR Gas)

Besides participating in LIHEAP and the Salvation Army's Energy Share Program, NICOR also facilitates the Illinois Home Weatherization Assistance Program (IHWAP) that provides weatherization services to low income homes. The company also offers a package of benefits to assist activated guard and reservists who reside in their service territory. Customers may not be disconnected when the temperature is lower than 32 degrees Fahrenheit. NICOR must offer payment plan of 10% down payment and equalized billing over the next 4 to 12 months.

CenterPoint Energy Resources

CenterPoint's Minnesota based utility operation facilitates the federally funded Low Income Home Energy Assistance Program, the Salvation Army's Energy Share program and crisis assistance offered by counties.

The company's Gas Affordability Program builds off the LIHEAP program to help low-income customers in Minnesota pay their natural gas bills. To qualify for the program, customers must have already received a LIHEAP grant for the current heating season. If accepted into the program, customers can receive credits on their monthly natural gas bill.

The Gas Affordability Program offers the following benefits:

1. A monthly GAP Affordability Credit for current natural gas charges. A customer's monthly natural gas charges will be estimated for the remaining months of the program year and then averaged to provide a fixed monthly bill amount for current charges. CenterPoint Energy will credit the account for current gas charges that are greater than 6 percent of a customer's annual household income. The flat amount for current natural gas charges will not exceed 6 percent of a customer's annual household income.

2. CenterPoint offers a matching GAP instalment credit for any past due natural gas charges on a customer's account prior to enrolment in the Gas Affordability Program. CenterPoint Energy will apply LIHEAP grants to the past due balance. If there is a past due balance remaining, CenterPoint Energy will create a GAP Instalment Plan for the remaining amount to be paid over 12 to 24 months. Each month a customer pays the GAP Instalment amount, CenterPoint Energy will match it with an equal amount in credit. This matching credit will be applied after CenterPoint Energy receives the customer's GAP payment. If customers participating in the program make their monthly instalment payments, they will be paying for only one-half of the pre-program past-due balance.

Minnesota law provides that a public utility must not disconnect the utility service of a residential customer if a household member is in active military duty provided that the customer enters into an agreement with the utility to make payments toward his or her utility bill.

There is a disconnect ban if health of a household member would be adversely affected. A medical certificate from a doctor is required.

CenterPoint cannot disconnect utility service to a household where a member of the household has been called into active duty if:

1. the household income is below state median or the household is receiving energy assistance and enters into a payment agreement where the customer pays 10% of monthly income toward the bill and remains "reasonably" current; or

2. the household income is above state median income and enters into a payment agreement "establishing a reasonable payment schedule that considers the financial resources of the household and the residential customer remains reasonably current w/ payments under the payment schedule."

The State of Minnesota set up the Cold Weather Rule to help customers who cannot pay their gas bill in full. It does not completely stop winter disconnections but provides customers extra protection from October 15 through April 15.

Public Service Electric Gas

PSEG participates and promotes the federally administered LIHEAP program, but also provides access to variety of other services.

NJ Lifeline is a $225 yearly credit for a customer's electric or gas bill. Applicants must be 65 years old, or a disabled adult at least 18 years old who is receiving Social Security Disability benefits. Annual income must be under $24,432 for a single person or $29,956 for a married couple.

NJ SHARES helps people going through short-term financial problems. To be eligible, customers must not be eligible for the Low Income Home Energy Program and the applicant's gross monthly income must not exceed 400 percent of the Federal Poverty Level. Once approved, qualifying customers can get up to $700 for their gas bill(s) and up to $300 to pay electric bill(s).

New Jersey electric and gas utilities have also joined together to develop and sponsor New Jersey Comfort Partners - a special partnership program to help customers save energy and money by making homes more energy-efficient.

From November 15 - March 15, PSEG cannot disconnect customers receiving LIHEAP, other financial assistance or households unable to pay overdue amounts because of unemployment, medical expenses, or recent death of spouse. Customers eligible for PSEG's Winter Termination Protection Program are placed on a budget plan and cannot be disconnected as long as they make good faith payments. During the heating season, New Jersey utilities may not ask for a security deposit. As well, disconnection is delayed 60 days with certification of medical emergency, and it may be renewed every 60 days as necessary. Commission approval is required for disconnection to medical emergency customers.

Puget Sound Energy, Inc.

Puget Sound Energy's HELP Program provides additional bill-payment assistance beyond the federal LIHEAP program to qualified PSE customers. Eligible customers can receive up to $750 per year in credits to lower their electricity or natural gas bills. Depending on the county in which customer lives, the maximum household income for eligibility ranges between 125 percent and 150 percent of the federal poverty guidelines. HELP assistance is offered year-round to eligible customers.

Between November 15 and March 15, disconnection is prohibited if the customer agrees and adheres to a monthly payment during the winter period. Protection is also in place for hardship customers who qualify or apply for energy assistance.

Disconnection is delayed for 30 days if a medical emergency exists. Customers need written certification from a doctor; can recertify twice within 120 days, and must pay 10% of their delinquent balance and agree to pay the balance within 120 days. Puget Sound may not require payment of more than seven percent of the customer's monthly income. In addition, the customer must pay one-twelfth of any billings from the date application is made through March 15th. If the customer does not pay the past-due bill by the following October 15th, the customer will not be eligible for protection from disconnection until the past-due bill is paid.

Wisconsin Gas LLC (WE Energy)

Wisconsin Gas operates as WE Energy in both Wisconsin and Michigan.

In Wisconsin, the Wisconsin Home Energy Assistance Program (WHEAP) administers the federally funded Low Income Home Energy Assistance Program (LIHEAP) and Public Benefits Energy Assistance Program. LIHEAP and its related services help over 100,000 Wisconsin households annually. In addition to regular heating and electric assistance, specialized services include:

- emergency fuel assistance,
- counselling for energy conservation and energy budgets,
- pro-active co payment plans,
- targeted outreach services,
- emergency furnace repair and replacement.

Wisconsin's Public Benefits program, which encompasses energy conservation, renewable energy development and low-income services, was created in 1999. Public Benefits Funds are managed by the Wisconsin Department of Administration (DOA).

In Michigan, the Home Heating Credit (HHC) is designed to assist low-income families with the cost of heating their homes. The HHC is federally funded through LIHEAP, U.S. Department of Health and Human Services. Under provisions set forth in the State Income Tax Act, the Department of Human Services (DHS) administers Michigan's Energy Assistance programs, and the Michigan Department of Treasury processes the Home Heating Credit claim and issues payments.

WE Energy supports the Service members Civil Relief Act (SCRA). The Act was established to provide relief from potential hardships for families of persons called to active duty. The Act helps families avoid service interruptions and adverse credit reporting.

10.2 Please describe the assistance programs administered by Canadian regulated companies such as Terasen Utilities, Union Gas and Enbridge. Please provide the amount contributed, the number of customer accounts that have benefited, and the operational costs earmarked for these programs. In Terasen's view, is it not true that U.S. utilities have to implement social policy tools of their respective state and federal governments and are more at risk than their Canadian counterparts in revenue recovery?

Response:

Terasen Gas does not agree with the position that U.S. utilities having to implement social policy tools are more at risk than their Canadian counterparts in revenue recovery. In Terasen's view, U.S. utilities participating in income assistance programs face lower risk than their Canadian counterparts that do not have similar programs. Income assistance programs lower the overall bad debt that a utility experiences by shifting payment responsibility to the programs and reducing the number of customers who cannot afford to pay their bills. Canadian utilities, including Terasen Gas, that do not participate in income assistance programs transfer their budgeted bad debt responsibility to their rates. However bad debt above budgeted levels is borne by shareholders. Canadian utilities without access to similar social assistance programs therefore face more risk than comparable US utilities.

Comparing US and Canadian Income Assistance Programs

The majority of US utilities offer some type of assistance to customers who have problems paying their bills. Many of these programs are explored in question 10.1. A number of Canadian utilities in different jurisdictions partner with social agencies to support low-income assistance programs[3]. However, to Terasen Gas' knowledge there is no Canadian province that has a federal, local government or utility-funded program targeting low-income consumers. In March 2009 the Ontario Energy Board recommended implementation of a low income energy assistance program. A summary of the process is discussed below.

Low-income Assistance in Ontario under Review

In July of 2008, the Ontario Energy Board (OEB) initiated a consultation to examine issues associated with low-income energy consumers in relation to their use of natural gas and electricity. The purpose of the consultation was to assist the Board in gaining a better understanding of those issues and in considering the need for, and nature of, measures that could address the challenges facing low-income energy consumers in Ontario.

---

[3] For a representative sample of programs offered in Canadian provinces and territories, please refer to the Attachment 10.2.

In March 2009, the OEB in its Report of the Board for Low-Income Energy Assistance Program reported that it is important that there be a comprehensive and province-wide approach to assisting low-income energy consumers.

The Board's policies for implementation of a "Low-Income Energy Assistance Program", or "LEAP" has three components: (1) temporary financial assistance for low-income energy consumers in need; (2) the benefit of access to more flexible customer service rules on matters such as bill payment and disconnection notice periods; and (3) targeted conservation and demand management programs. With respect to the financial assistance component, LEAP builds on the "Winter Warmth" programs in which a number of distributors already successfully participate.

The Board has formed two working groups, the Financial Assistance Working group and the Conservation Working group, to complete the work necessary to implement LEAP. A short-term framework for 2010 was expected before the end of July 2009 and program plans are anticipated for 2010.

Figure 2: Low-income Assistance Programs

Income Assistance Programs	Terasen Utilities	Union Gas	Enbridge Gas
Active payment assistance for low income customers			
Senior citizens discount programs			•
Arrangements for customers to programs administered by local and federal governments			
Incorporate special tariff for low income customers			
Regulations regarding disconnection in cold weather			
Regulations regarding disconnection of military personnel and forgiveness of non-payment			
Special assistance for social service agencies, schools or religious institutions (Emergency Energy Fund)		•	•
Partnership with the United Way		•	•
Partnership with employees			
Utility corporate giving program			•

None of the three Canadian utilities reviewed appeared to be subject to specific regulation related to cold weather disconnections. This likely reflects the extensive climate differences that exist in each company's service territory. Terasen Gas' internal policy regarding disconnections reflects the company's commitment to customer safety.

Enbridge

Enbridge has two energy efficiency Programs targeted specifically to low income customers.

Through the Home Weatherization Retrofit program Enbridge provides income-eligible participants in the Greater Toronto Area with free home energy assessment and weatherization upgrades at no cost to improve the energy efficiency of their home. Program participants can save between 15 to 75% on their monthly gas bills. Green$aver will conduct a thorough energy assessment and use the assessment to identify cost-effective energy efficient recommendations to implement, including draft-proofing and insulation. Green$aver will also be responsible for implementing the measures in each home with their experienced retrofit crews. Approximately 300 qualifying low-income Enbridge Gas customer households will benefit from this pilot program.

The "Enhanced Thermostat, Aerator, Pipe wrap, Showerhead Program," referred to as "TAPS" offers qualifying low-income families and individuals free energy saving tools. Recipients are provided the products to install equipment themselves.

In addition to energy efficiency programs the company also offers a targeted program for seniors. The Golden Age Service program for residential customers 65 years or older includes a variety of options including, the option to pay monthly gas bill after receiving pension cheque, the removal of late fees, waiving of security deposits and special payment arrangements should senior citizens fall behind in payments.

Enbridge Gas Distribution established the Winter Warmth program in 2004 as a joint venture with the United Way and its network of community agencies. The program helps low-income families and individuals who are living at or below the poverty line, and who are experiencing difficulty paying their natural gas heating bills. In 2006, Enbridge also partnered with five other utilities to ensure that all eligible households were taken care of through the winter season. During the 2006/2007 winter season, Enbridge was able to assist over 700 households with their natural gas heating bill. Since its inception, Engridge has assisted close to 4,000 households with their heating bills.

- In the 2008 - 2009 winter season, Enbridge contributed approximately $523,000 to the Winter Warmth program. Over 1,400 customers benefited and the average grant per applicant was $355. Each year since 2004, Enbridge allocates $300,000 to the Winter Warmth Program[4].
    - Enbridge donated an additional $300,000 to the Winter Warmth Fund following "The Garland Settlement", a 1994 class action claim[5] against Enbridge. A

---

[4] Manny Sousa, Manager Community Relations, Public and Government Affairs, Enbridge Gas Distribution, July 14 2009

[5] In 1994, Enbridge, was served with a class action claim seeking, among other things, a declaration that the OEB approved 5% late payment fee paid by Enbridge's customers since 1981 is interest that exceeds the amount permitted by the Criminal Code of Canada, and that by collecting the late payment fee, Enbridge had been unjustly enriched and those who paid the fee should be entitled to restitution. In

settlement of the suit included in part $5 million to be paid in equal instalments to the Winter Warmth Fund.

- In the 2007 – 2008 heating season Enbridge contributed $300,000 plus $354,000 from the Garland Settlement to Winter Warmth. A total of 700 applicants without the Garland Settlement top up and 1,124 with the top up benefited. The average grant per participant was $ 353. [6]

Operational costs for the Winter Warmth program are kept low as the infrastructure to deal with energy assistance is already in place and is shared with other programs like the Emergency Energy Fund and Share the Warmth programs.

Information was not available regarding Enbridge's contribution to other low-income assistance programs.

Union Gas
Union Gas has developed a free energy efficiency and conservation program, "Helping Homes Conserve", targeted at low-income homeowners and low-income tenants who pay for their energy bills directly and are Union Gas customers. Low-income participants benefit from free installation of an Energy Saving Kits (which contain up to 2 low-flow showerheads, two faucet aerators, and pipe insulation) and the free installation of a programmable thermostat. Customers must have a natural gas water heater to qualify for the ESK installation, and a natural gas furnace to qualify for the programmable thermostat installation.

Union Gas also partners with local United Way agencies to deliver the Winter Warmth Program. Winter Warmth is designed for low-income families and individuals living at/or below the poverty line who have exhausted all other sources of financial support. Approved households receive a one time grant. Upon successful acceptance to the program, the funds are credited to the heating bill.

- In the 2007 – 2008 heating season Union Gas contributed $217,340 to the Winter Warmth program. There were 623 applicants in the Union Gas Service area and the average grant paid was approximately $366. Funds to the program are allocated according to the level of need in each community and usage of the funds depends on the different communities. [7]

December2006 the court approved settlement of the claim commenced against Enbridge for $22 million. Annual Report 2008

Terasen Gas

Terasen Gas does not currently have any programs that specifically target low-income customers. The utility is in the process of developing energy efficiency and conservation programs for low income customers.

Risk Assessment

Social programs in the US aimed at assisting low-income families meet their energy needs puts US utilities at less risk then their Canadian counterparts in revenue recovery.

Concentric's research[8] indicates that the majority of U.S. gas and electric utilities have an explicit funding mechanism, such as a customer surcharge or a separate tariff rider, for the low income energy assistance programs which they offer. A few utilities have been allowed to embed the cost of low income programs within their existing rates for electric and natural gas service. The funding mechanisms are based on customer usage (i.e. a specified amount per therm for natural gas customers and per kilowatt hour for electric customers) and those which are a flat monthly surcharge regardless of customer. The vast majority of U.S. utilities apply the tariff rider or monthly surcharge to residential customers only. However, there are notable exceptions, such as Maryland, where low income programs are funded primarily by commercial and industrial customers.

Canadian utility programs are generally designed to provide emergency assistance (i.e., shutoff protection) and energy efficiency, rather than direct rate assistance. The emergency assistance programs are funded through voluntary contributions to social welfare agencies such as the United Way, while the energy efficiency programs are funded through government grants and utility contributions.

The Terasen Gas position is that low-income assistance programs reduce the likelihood of bad debt and therefore reduce the risk to the utility. Research analysis of the US experience by the Low-Income Energy Network in Ontario found that there are costs offsets due to low-income programs. Specifically, the US experience indicates that "…bad debt decreases because payment responsibility for portion of bill is transferred to higher income households and because low-income customers with more affordable bills pay better."[9]

10.3 Please compare the regulatory deferral accounts, gas cost deferrals, weather and sales stability accounts, interest rate, and tax true ups of TGI with each of the eight comparable utilities.

Response:

Please see the following table that compares the deferral account of TGI and the eight comparable utilities.

Deferral Account Comparison to Concentric Sample of US Utilities					
Utility	**Regulatory Deferral Accounts**	**Gas Cost Deferral Accounts**	**Weather & Sales Stability Deferral Accounts**	**Interest Rate Deferral Accounts**	**Tax Related Deferral Accounts**
Terasen Gas Inc.	Demand Side Management and NGV Conversion Grants, Pension & Insurance expense, OPEB funding	CCRA, MCRA & Revelstoke Propane; capture the difference between cost and revenue collected by rate. Designed to mitigate rate volatility for customers	RSAM- designed to mitigate rate volatility for customers and act as a decoupling mechanism for TGI. SCP Mitigation revenues- reduce the risk of over or under forecasting SCP revenues	Deferred interest account	Property tax; (Taxes accounted for on a taxes payable method) Income tax true ups as they relate to changes in tax law and rates
Atlanta Gas Light Co.	Rider for Pipeline Replacement Costs (Georgia); rider for Environmental remediation liabilities (Georgia)	No; do not purchase gas	Straight fixed variable rate (Georgia); Decoupling (Virginia); Weather Normalization (New Jersey and Tennessee)		
CenterPoint Energy Resources	Environmental expense tracker (MN); storm restoration deferral; deferral for pension and OPEBs	Pass through gas costs	Weather normalization or weather mitigation mechanisms in AR, LA, OK, and parts of Texas		
Michigan Consolidated Gas Co.	Uncollectibles true-up; deferral for pension expenses and OPEBs,environmental remediation costs 2/	Pass through gas costs			
Northern Illinois Gas Co.	Deferrals for OPEBs; rate case expense; pension expense; environmental costs	Pass through gas costs	80% Straight Fixed Variable Rate		
Public Service Electric Gas	Deferrals for Environmental remediation; pension and OPEBs; social benefits charges; New Jersey Clean Energy; stranded and restructuring costs;	Pass through gas costs	Decoupling		
Puget Sound Energy, Inc.		Purchased Gas Adjustment			Income and property tax true ups 1/
Southwest Gas Corp.	pension expense	Purchased Gas Adjustment	Decoupling (CA); declining block structure (NV)	Interest Balancing Account (Nevada)	
Wisconsin Gas LLC	deferrals for pension and OPEBs; electric transmission expense; bad debt expense;environmental costs	Pass through gas costs			

From Company 10Ks

All US Companies collect income taxes on a normalized basis

1/ Puget is primarily an electric utility and its deferral amounts largely specific to its electric operations
2/ Parent is DTE Energy, primarily electric and its deferral accounts largely related to its electric operations

The TGI Revenue Requirements for 2010 and 2011 do not have any significant change to deferral accounts that would alter the risk profile of TGI.

11.0 Reference: Exhibit B-1, Cover Letter p. 19 30 Year GCB Yields

The Cover Letter states that the ROE allowed by the formula is to some extent "luck of the draw," being highly dependent on the month used for the forecast of the GCB yield.

11.1 Please comment if this observation had been made when the first AAM formula was introduced in 1994 and during its subsequent adjustment hearings in 1999 and 2006.

Response:

TGI is unaware whether this observation was made explicitly in prior proceedings. The formula was originally based on five days of observations in October of the spot spread between 10 year and 30 year GCB yields which was subsequently adjusted to include the entire month of October each year. As illustrated in the charts on page 20 and 23 of the Application, the volatility of the movement in the forecast GCB 30 year yield has been on a steady downward trend since 2000 and up until the end of 2005 reflected relatively modest changes from month to month each year with a few more notable changes in the winter of 2000 and the summer of 2003. However, since the beginning of 2007 the movements in the long bond forecast have been quite volatile. This would have led to significantly different allowed ROEs had a different month been selected for establishing the rate for the following year.

11.2 Is it only with the passage of time that the allowed ROE formula has become "luck of the draw"?

Response:

See response to CEC IR 1.11.1 above. The observation has more significance during periods of greater volatility in movements of the forecast long GCB yield. Between November 2008 when the official yield for 2009 and January 2009 when it became effective, the implied AAM based ROE would have changed by approximately 60 basis points. Similarly, between the official setting of the 2006 ROE based on the November 2005 consensus forecast following the last BCUC amendment to the AAM and the summer of 2006, the implied ROE would have increased approximately 50 basis points.

TGI believes that investors return requirements on utility investments do not fluctuate dramatically from month to month or even year to year and certainly not to the extent implied by the BCUC AAM in recent years.

12.0 Reference: Exhibit B-1, Cover Letter p. 24 TGI's Changing Business Risk

The Cover Letter describes some components of the business risks and states that the risk factors determine whether the utility will be able to recover its investments in rate base over time and affect its ability to achieve its allowed return.

12.1 Please provide the allowed and achieved ROEs for TGI, TGVI and TGW between 1994 and 2008.

Response:

Please refer to the following tables for a summary of allowed and achieved ROEs for TGI from 1992 to 2008, and for TGVI and TGW from 1996 to 2008.

12.2 For those years where the achieved ROEs fall short of the allowed, please provide explanations.

Response:

When an achieved ROE is reported below the allowed ROE for a particular year, the major cause for this deficiency is due to forecasting variances including, but not exclusive to: rate base, cost of service and volumes (excluding weather for TGI due to the RSAM mechanism) .

With respect to TGI, the shareholder is at risk for this shortfall. TGI's achieved ROE was reported below the allowed ROE for the years 1992, 1994, 1998, and 2004.

For TGVI, the achieved ROE was below the allowed ROE for years 1997 and 2000. For the years 1996 to 2002 the Vancouver Island Pipeline Agreement ("VINGPA") provided an ROE component of 3.625% over the Government of Canada long-term bond rate. From 2003 onward, the ROE is set by the BCUC. The VINGPA also provides for a reduction in the achieved ROE of $1.867 million for the years 1996 to 2011. Variances from the approved result from O&M cost variances that company is at risk for.

For TGW, the achieved ROE was below the approved ROE for the years 1998, 2000, 2001, 2003, and 2004. In the years prior to 2005, TGW did not have approval for a deferral account (similar to TGVI) to capture differences between the actual and approved ROE. However, BCUC Order No. G-14-04, Page 5, Item 7 approved an ROE variance deferral account beginning in 2005.

13.0 Reference: Exhibit B-1, Cover Letter p. 24 Changing Business Risk

"Under the current ROE formula mechanism, TGI is discouraged from investing capital in the utility facilities beyond that which is required to meet the Company's basic obligation to serve existing customers in its service areas, much less to respond to the changing consumer demands and government policy directives. However, unless TGI participates in meeting business and government policy challenges it will see its traditional business and share of the energy delivery market erode and with it, its ability to recover its existing investments over time."

13.1 Please confirm that TGI, in its Energy Efficiency and Conservation Application (May 28, 2008), proposed to extend its amortization period of capitalized DSM costs from 3 years to 20 years. TGI also proposed that costs that were expensed were to be capitalized into the deferral account.

Response:

The Terasen Utilities believe that the Company's basic obligation to serve existing customers in its service areas include undertaking Energy Efficiency and Conservation ("EEC") (or Demand Side Measures) activities on behalf of its customers. The reasons for this are:

- EEC activities are in the best interests of customers as they help customers reduce and manage their energy bills and therefore improve their carbon footprint; and
- Recent changes to the Utilities Commission Act (the "UCA"), (See Section 44.1 of the UCA) require utilities to pursue energy conservation and efficiency activities and programs.

The Terasen Utilities believe that assisting customers to help them manage their energy consumption by providing them with information and programs fulfill the obligations that TGI has under the UCA.

In the TGI-TGVI 2008 Energy Efficiency and Conservation Programs Application submitted to the BCUC on May 28, 2008, TGI-TGVI proposed to treat the incremental EEC expenditures above amounts already approved as part of TGI PBR Extended Settlement and TGVI RR Extended Settlement as capital, by way of a regulatory asset deferral account. It was proposed that these incremental EEC expenditures be charged to a regulatory asset deferral account on a tax-adjusted basis, the balance of which was to be amortized over twenty years, with amortization commencing the year following that in which the expenditure was made. An amortization period of 20 years was selected to match the benefit received by customers from the EEC expenditures resulting in appliance and energy system installations with a weighted average measurable life of 22.5 years. In addition to closely matching the cost recovery to the period over which benefits will accrue to customers, the proposed amortization period was expected to smooth impacts to rates from the proposed increase in expenditure.

The Commission in its decision (Order No. G-14-06) accepted TGI-TGVI's proposal to record the approved EEC expenditure in a regulatory asset deferral account amortize the EEC expenditures over periods not to exceed 10 years, rather than the 20 years as proposed. The Commission was of the view that a ten year amortization period provided a reasonable balance, considering both the DSM objectives and customer impact.

13.2 Please confirm that TGI, in its Customer Care Enhancement Project CPCN Application, is applying for approval of a $155 million project including AFUDC that would be capitalized. Please elaborate on the current billing costs and customer care costs. Are they currently expensed or capitalized?

Response:

The Customer Care Enhancement Project CPCN Application from June 2, 2009 sets out a project implementation cost of $155 million including AFUDC. This amount is not exclusively comprised of costs that would be capitalized but rather includes both a capital and a deferred O&M component. Total project capital and AFUDC is $141 million, and deferred O&M is $14 million. The cost of service that is based on this project implementation cost and the future cost of O&M represents the optimal mix of resources that results in the lowest cost of service to customers.

The implementation of the project will result in the restructuring of the Company's outsourced customer care function so that core customer care services may be in-sourced and delivered by Terasen Gas directly using information technology and facilities assets that it owns and operates. Customer care services are currently provided through an outsourcing arrangement and include customer contact, billing and payment processing, collections, contract management, meter reading, and customer information system support and maintenance. The cost of these services is currently treated as an O&M expense and is not capitalized.

Terasen Gas does not believe that the current outsourcing arrangement is sustainable and must be fundamentally restructured in order for it to continue to serve customers, which constitutes the Company's basic obligation. Because the current outsourcing arrangement is not sustainable, the Customer Care Enhancement Project is required in order for Terasen Gas to continue to meet its basic obligation to customers. This project does not serve as a vehicle for investing capital beyond meeting this requirement.

14.0 Reference: Exhibit B-1, Cover Letter, pp. 24, 25 Risk Definitions

The cover letter uses the term "risk" in many ways without always defining exactly and precisely what is meant by the word "risk" from a financial economics perspective.

14.1 Please clarify what exactly is "at risk" for TGI. Are earnings per share at risk (assuming number of shares does or does not rise and fall to maintain a constant equity thickness)? Are costs at risk (i.e., costs that can or cannot be passed on to customers or hedged so as to remove the risk)?

Response:

In discussions of business risk for TGI, it is useful to consider short term and long term risks. In the short term the focus is generally on TGI's ability to earn a fair return on its investments from year to year. In the longer term the risk relates to whether or not the utility will be able to recover the cost of its investments over their useful lives and earn a fair return on such investment over the long run. Earnings per share for a privately held utility are not a particularly significant measure as this metric is typically referenced when looking the performance over time for publicly traded entities[10].

Costs, both operating and capital related must be recovered in the short and long term. The fact that a regulator allows costs to be recovered in rates does not in and of itself eliminate the business risk though a disallowance of costs in the regulatory context crystallizes a loss. Ultimately customers must be willing to buy and pay for the service. If rates are not competitive either on a cost per unit energy basis or the product/service falls out of favour and customers leave the system, then costs, even though allowed in rates, can become unrecoverable in the long run.

TGI employs multiple strategies to manage competitive risk including the use of hedging, rate design and cost containment.

14.1.1 To what specific risk factors is TGI exposed on a net, on a total, and per-share basis, after accounting for the ability to hedge, pass on some costs to customers and adjust the equity base?

---

[10] Return on invested equity is the more meaningful measure since the equity component of the capital structure is typically managed through dividend policy or through injection of additional equity which may be subscribed for at share values that differ from the average value per share of the outstanding common shares pre-subscription. EPS is a better measure for public companies because it accounts for and reflects the dilution of new equity issuance.

Response:

In the near term, TGI is exposed to credit/collection risk on virtually its entire revenue stream for sales and transportation customers. Events of default on the part of any customer who owes the company money for service other than those who have posted security expose the company to risk of loss. Similarly third party damage claims receivable are subject to collection risk as well.

TGI is/or has been exposed to capital cost disallowances for construction projects and is always exposed to prudency reviews. In some cases the Commission has imposed cost caps on the approval of CPCNs.

Commodity cost volatility/risk is managed through the annual Price Risk Management Plan and Annual Contracting Plan which are both approved by the BCUC. Not withstanding the hedging program and forward fixed price contracts entered into by the Company as well as the credit review measures taken by the Company, TGI is exposed to counterparty default risk. In the event such defaults occur and even though the costs associated would reasonably be expected to be allowed for recovery in rates, should the cost burden result in rates that were not competitive then there is a risk that these costs would not be fully recoverable from customers.

Once rates are set, the majority of O&M costs are at the Company's risk. Unfunded debt for both principle variances and related interest costs are at the Company's risk.

14.2 Please clearly define which risks being faced by TGI are "operational risks" (i.e., risks from competition, changing customer tastes, recessions, political factors, law suits, environmental forces, etc.) that arise from the operation of the business, vs. "credit risks" (i.e., risks of default or changing credit ratings, etc.), vs. "market risks" (i.e., risks from fluctuations in the market price of gas or other commodities, fluctuations in exchange rate or market interest rates or the general stock market, liquidity, etc.) as these risk terms are commonly defined in the risk management profession.

Response:

All of the risks to which TGI refers on pages 24 and 25 of the Application and which are discussed in further detail in Tab 1 are business risks or operating risks. Business risk is the risk that a utility will not be able to earn its cost of capital or recover the invested capital. Business risk comprises the fundamental characteristics of the business (i.e. demand, supply, competition and operating factors) that together determine the probability that future returns to investors will fall short of their expected and required returns. TGI also faces credit/financial risks and the systematic market risks referred to in the question as market risks.

14.3 Is volatility always the same as risk, or can these concepts be different? And if these concepts are different how are they different?

Response:

Volatility or variability in returns is one aspect of risk. However, the probability that, in the long-run, investors will not fully recover the capital which they have committed to the enterprise is not necessarily reflected in the volatility of returns, be they stock market returns or accounting returns. For example, a utility might be protected by contracts or have a regulatory framework which mitigates its short-term risks but still face long-run capital recovery risks which are not captured in the year to year variability in returns, and which is not captured in measures of market volatility such as beta.

14.4 If TGI grows faster but its value also becomes more volatile, has TGI's risk increased or decreased or is the effect uncertain? Conversely, if TGI grows more slowly but with less volatility, has TGI's risk increased or decreased or is the effect uncertain? Why?

Response:

The effect is uncertain as the impact on risk will depend on various factors, including the point of departure and the rate of change. In principle, both rapid and slow (or declining growth) can result in higher risk. Rapid growth can result in higher risk during the period of growth due to higher costs and increased customer forecasting risk, potential lag in cost recovery or disallowance of costs incurred to facilitate growth. Slow growth, particularly where there is a decline in customer usage, or declining growth can result in higher longer-term risk because rates become less competitive with alternative energy sources which in turn can further reduce consumption.

14.5 If one stock price is more volatile than another stock price, is the more volatile stock necessarily more risky for the investor?

Response:

No. If some of the risk associated with the volatility of return on an investment in Stock A can be reduced by including Stock A in a well-diversified portfolio, then the observation that Stock A has greater volatility than Stock B does not necessarily indicate that Stock A is more risky than

Stock B. However, the average investor associates risk with the concept of uncertainty about an expected outcome. For such an investor, the observation that the return on Stock A is more volatile than the return on Stock B is strongly supportive of the conclusion that Stock A is more risky than Stock B.

14.5.1 If the value of an index of utility company stocks is more volatile than the value of a broad market index such as the S&P500, does that necessarily mean that utilities are more risky than the market in general? Or, is there a more appropriate way to measure the relevant "risk", for example undiversifiable systematic risk (as captured by the CAPM beta), rather than total risk?

Response:

(a) If some of the risk of investing in utilities can be reduced by including utilities in a diversified portfolio, then the observation that utility common stocks are more volatile than a broad market index does not necessarily imply that utilities are more risky than the market. However, for the average investor, the observation that returns on utility stocks are more volatile than returns on a broad market index supports the conclusion that utility stocks are more risky than is implied by the AAM ROE formula.

(b) According to the Capital Asset Pricing Model ("CAPM"), the risk of investing in a utility stock is best measured by calculating the utility stock's beta rather than by calculating its volatility or standard deviation. However, there are at least three problems with using utility betas, as traditionally estimated using five years of weekly or monthly returns, as a measure of the risk of investing in utility stocks. First, the traditionally calculated betas depend on the correlation, or co-variation, between the returns on the utility stocks and the returns on the market index. Because utility investors invest for the long run, they do not consider the correlation, or lack thereof, between short-run utility returns and short-run returns on the market index as a measure of risk. Utility investors are more concerned about the correlation between the long-run returns on utility stocks and long-run returns on the market index. However, the correlation between the long-run returns is difficult to measure because of the lack of a reasonable sample of long-run returns.

Second, beta is only a measure of risk in the context of the CAPM. If the CAPM fails to predict the relationship between risk and return in the Canadian marketplace, beta is an unreliable indicator of risk. Dr. Vander Weide's testimony provides strong evidence that the CAPM fails to predict the relationship between risk and return in the Canadian marketplace, and, therefore, that the utility beta is not a reasonable measure of risk.[11]

Third, if beta is a reasonable measure of risk, then using the traditional estimate of beta in the CAPM should produce a reasonable estimate of a utility's cost of equity. However, traditionally-estimated betas for Canadian utilities using the last five years of data are in the range 0.25 to 0.30. Multiplying a beta of 0.30 by either a 5 percent or 6 percent risk premium on the Canadian market index yields a utility risk premium of 1.5 percent to 1.8 percent. Adding this utility risk premium to a forecasted yield on long Canada bonds of 3.69 percent produces a cost of equity in the range 5.19 percent to 5.49 percent. Since this result is absurdly low in comparison to current yields on utility bonds, it is reasonable to conclude either that: (1) betas as traditionally measured do not correctly measure the risk of utility stocks; or (2) the CAPM does not apply to the Canadian marketplace.

For these reasons, Dr. Vander Weide measures risk by volatility rather than beta.

[11] The evidence that the CAPM fails to predict the relationship between risk and return in the Canadian marketplace can be described as follows. The CAPM predicts that a company's beta should equal the risk premium on the company's stock divided by the risk premium on the market portfolio:

Beta = *(Risk Premium on Utility Stock) ÷ (Risk Premium on Market Portfolio)*

Dr. Vander Weide's data indicate that either from 1956 to the present or from 1983 to the present the risk premium on utility stocks exceeds the risk premium on the Canadian market index. This evidence is inconsistent with the widely-held belief that utility stocks are less risky than the market index. Thus, Dr. Vander Weide concludes from this evidence that the CAPM does not adequately explain the relationship between risk and return in the Canadian marketplace.

15.0 Reference: Exhibit B-1, Cover Letter pp. 32, 33 Alternative Approaches to AAM

"Furthermore, any continued reliance on a GCB-based formula would require explicit recognition of the shortcomings of the current formula and explicit recognition of the inadequate ROEs that have resulted from the formula; a major re-calibration would be required. Moreover, it would be difficult to address abnormal market conditions that affect long-term government bond yields with this approach."

15.1 The 2009 federal budget and the new federal debt management strategy 2009-2010 which includes the bond program for 2009-2010 revealed that it will increase issuance in all current benchmark maturities. In Terasen Utilities' view, would the 2009 federal budget and the prospect of the federal government posting the biggest deficit in Canadian history of more than $50 billion change the government bond yields? Please explain your answer.

Response:

The bond market and economists recognize that many factors determine the level of Government of Canada interest rates. A single large deficit is unlikely to determine the level of GOC interest rates on an on-going basis. In particular, the recent budget included major stimulus for the economy which either reduced current revenue (for example, lowering tax rates and such programs as the home renovation tax credit) or increased capital spending (i.e. the infrastructure program) which results in a larger deficit in the 2009-2010 fiscal year but is also expected to increase economic activity in the short run and improve the efficiency of the nation's infrastructure in the long run. Each of these developments will contribute to increases in national economic activity and revenue and potential budgetary surpluses in the longer term that will be used to retire the debt arising out of current initiatives. The Government of Canada has established a strong reputation with domestic and international lenders in paying down outstanding debt out of budgetary surpluses in the past. The debt markets reaction to these proposals has been a non-event as short term GOC rates have declined significantly since the date of the budget (January 27, 2009) and longer term rates (30 year benchmark bonds) have remained at about the same level of approximately 3.8%. The capital markets have not reacted in any material way to the prospect of a large budgetary deficit in 2009 and an expected series of declining deficits out to 2014-2015.

16.0 Reference: Exhibit B-1, Cover Letter, pp. 32, 33 Formula Adjustment Factor

It appears that lowering the formula adjustment factor from .75 to .50 is helpful to TGI when interest rates are falling since a smaller adjustment factor keeps the allowed return from falling as fast as market rates. Conversely, a larger adjustment factor seems more advantageous to TGI when interest rates are rising since TGI's return would be adjusted upwards more quickly with a larger adjustment factor.

16.1 Does TGI perceive a problem with the adjustment factor per se, or is the perceived problem with the level of the allowed ROE that has been arrived at today through historical application of the AAM over the past several years when interest rates were falling?

Response:

Overall, TGI believes the return produced by the current AAM has failed to produce a fair return and that is why TGI is seeking to have the AAM set aside and new Benchmark return established for the Terasen Utilities. This is a result of a number of factors including the absolute level of, and reliance on, one external observable factor being the forecast Long GCB yield; the adjustment factor itself which appears based on the evidence presented by Dr. Vander Weide to be lower smaller than 75% adjustment factor assumed in the current AAM, and implicit equity risk premium build into the formula.

16.2 If the level was re-set to some level considered appropriate by TGI, would a .75 or .50 adjustment factor then be optimal going forward?

Response:

If the Commission recalibrates the Benchmark ROE to an appropriate level it is possible that a formula could be established that would adjust the annual allowed return thereafter for a period of time subject to periodic reviews to ensure the returns continue to be fair and reasonable. Clearly the existing AAM has failed over time to deal with all the factors that affect the appropriate return on equity. A formula AAM is at best a proxy for establishing a return between more detailed examinations by the Commission. The Company attempted to develop alternative formula based approaches but was unable to find additional transparent variables such as a publicly available Canadian utility bond index on which to base such a formula.

Based on the evidence of Dr. Vanderweide and with hindsight, an adjustment factor of 0.50 would have been more appropriate than 0.75 that is used in the current AAM, but simply imposing a lower adjustment factor on the current level of returns would not produce a fair result.

16.3 Assuming that the AAM is still in place, if interest rate moves in an upward trend in future, should a .75 or a .50 adjustment be used?

Response:

As discussed in the Application, the current level of return produced by the formula does not meet the fair return standard. If the current AAM were to be recalibrated to an appropriate starting level, then based on the evidence presented a .50 adjustment factor would appear to be more reasonable than a .75 adjustment factor. However, at current levels of return and forecast Long GCB yields, changing the adjustment factor from .75 to .50 would be punitive to the Terasen Utilities.

17.0 Reference: Exhibit B-1, Cover Letter, pp. 33 & 42 AAM

TGI states that it "is not prepared to propose or commit to an automatic adjustment mechanism at this time." The conclusions on pages 42 and 43 point to the alleged problems with the AAM based on recent widening spreads between long GCB yields and corporate bond yields and the sliding scale which does not match US return data. Terasen Utilities will pursue development of a new AAM in time for implementation in 2011.

17.1 If one adjusted the existing AAM for the changes in GCB versus TGI debt spreads between 2005 and July 2010, what would the impact have been in each year since 2005? What then would be the impact on the sliding scale comparison with US data?

Response:

TGI interprets the request as asking what the ROE in each year from 2006 to 2010 would have been if:

(a) The benchmark ROE and long Canada bond yield had still been the 9.145% and 5.25% specified in the BCUC's March 2006 decision;

(b) The ROE for each year would have been determined by taking 75% of the change in forecast long-term Canada bond yields plus 100% of the change in TGI debt spreads.

The table below shows the results:

	Long Canada Bond Yield	**TGI Spread** [2/]	**ROE as per current AAM**	**ROE with AAM plus change in Spread**
Benchmark	5.25%	130.00		
2006	4.79%	124.75	8.80	8.75
2007	4.22%	130.00	8.37	8.02
2008	4.55%	142.25	8.62	8.39
2009	4.25%	310.00	8.47	9.92
2010 [1/]	4.14%	183.00	8.31	8.84

1/ July 2009 10-year Government of Canada bond yield Consensus Forecast for October 2009 and July 2010 of 3.65% plus June 2009 spread of 0.49% between the 10- and 30-year Government of Canada bond yields.

2/ Indicated spread in basis points for new 30 year TGI issue provided by RBC Capital Markets for each week in November of the preceding year, except for benchmark, which is the average March 2006 spread, and 2010, which is the average indicated spread during June 2009.

Since (1) the point of departure was a benchmark ROE of 9.145% (at a long Canada bond yield of 5.25%) when the allowed ROEs in the U.S. were approximately 10.5%; and (2) there is still a sliding scale factor on the long-term government bond which reduces the ROE by 75% of the change in spread, the average allowed ROE over the period would still be significantly lower than the returns of U.S. utilities. Only in 2009, due to the increase in credit spread, would the allowed ROE have approached 10%.

17.2 If the TGI ROE and Capital Structure are adjusted for the new risks faced by TGI, what does this imply for the setting of ROEs for other utilities in BC, including the sister companies of TGVI, TGW, and FortisBC?

Response:

Of the new risks discussed in detail in Tab 1 of the Application, those relating to Aboriginal Rights Effects on BC Utilities are experienced to some degree by all utilities operating in the province. Those related to BC government policies and climate action related initiatives are also experienced by TGVI, TGW and PNG as natural gas distribution businesses, though Terasen cannot speak for PNG.

The Terasen Utilities believe that the new risks faced by TGI are equally applicable to TGVI and TGW as they go to the competitiveness of natural gas and these are natural gas utilities. As such it is reasonable to continue to set the returns of the sister companies with reference to the new Benchmark ROE being sought in this Application for TGI. Fortis BC is also impacted by government energy policies and Aboriginal rights effects on BC Utilities though they are not impacted in the same way as the Terasen Utilities by the climate action initiatives.

17.2.1 The spreads of those companies are set based on a low risk utility but TGI argues that its risk profile has changed. On what basis could one assume that the spreads of those other companies are unchanged? For example, the risks of TGVI may have fallen with the new BC Hydro RIB rates and the elimination of its own debt deferral account.

Response:

As discussed in the response to 17.2 above and Section 5.2 of the Application, the new risks experienced by TGI are also felt by TGVI and TGW. The BC Hydro RIB rates are postage stamp rates that apply equally in each of the Terasen Utilities service areas and TGVI and TGW rates continue to be substantially higher than those of TGI. In the case of TGW, the Commission opined on the appropriate utility specific risk premium in April 2009 and TGW is not seeking reconsideration of that determination. For TGVI the current rate setting mechanism in place sets rates for certain customer classes with reference to electricity rates and they have moved in lock step with changes to electricity rates so the competitiveness level is essentially unchanged from where it was before the RIB rates were introduced. While the Revenue Deficiency Deferral Account is expected to be reduced to zero in 2009, TGVI does not recover its full cost of service without ongoing Royalty subsidization of its cost of gas for sales customers. The Royalty subsidy will be removed by the end of 2011 at which time there will be substantial upward pressure on rates which would be expected to exceed those of the BC Hydro RIB rates.

18.0 Reference: Exhibit B-1, Cover Letter, p. 34 Equity Thickness and Credit Rating

The Application states that a capital structure with 40 percent common equity ratio in addition to an ROE of 11 percent will appropriately address the requirements that meet the Fair Return Standard.

18.1 Based on the information in your Response to Question No. 8.1 above, what is the minimum level of equity thickness that is expected to be required to maintain an "A" credit rating, recognizing the overall risk of TGI as assessed by the ratings agencies? Is it 40 percent or some lower number?

Response:

TGI is not aware of, nor has it attempted to estimate, the minimum equity ratio or combination of ROE and equity thickness that would be required to maintain an A rating. The minimum equity ratio required to maintain an A rating is not a precise number as it depends on various factors, including the debt rating agency's views of the components of business risk, the regulatory climate and the financial risk arising from its ROE and equity thickness. As noted by Moody's, TGI's credit metrics are weaker than its peers and are at a level that is consistent with credit ratings below the A category. Terasen has maintained its rating in part due to qualitative factors, such as the past business environment and regulatory support. The continued weakening of TGI's credit metrics, recent increases in business risk factors or a perception of increased regulatory risk may lead to a downgrade below the A category. TGI believes an ROE of 11% and equity thickness of 40%, while not guaranteeing an A rating, would enhance the likelihood of maintaining an A rating and make a downgrade more remote.

Further, TGI's Application for a combination of capital structure and ROE in this proceeding represents an overall return which is intended to achieve the three criteria of the fair return, maintenance of financial integrity, ability to attract capital on reasonable terms and conditions, and an opportunity to earn a return on investment commensurate with that of comparable risk enterprises. Although an A credit rating is an important consideration, particularly from the debt holder's perspective, establishing either the minimum equity ratio or minimum ROE necessary to maintain A credit ratings does not address the question of the level of the return (capital structure and ROE) which fairly compensates equity holders.

As the BCUC recognized in its March 2006 cost of capital decision,

> *"As for the JIESC's lowest cost argument, the Commission Panel shares the view of the NEB, which recognized that "lowest possible" was not the appropriate test when it stated, at page 25 of its RH-2-94 Decision on generic cost of capital:*
>
> *'Contrary to what some parties advocated during the hearing, the Board is of the view that it is not appropriate to over-leverage a pipeline in order to identify the minimum acceptable deemed common equity ratio possible.'"*

18.2 If the answer to the preceding question depends on the ROE (i.e., the credit rating depends on a combination of ROE and equity thickness) then please provide a table showing combinations of ROE and equity thickness that are believed to be the minimums and maximums required to maintain an "A" credit rating.

Response:

As noted in the response to BCUC IR 1.18.1, TGI is unable to respond to the question as posed, as the debt rating agencies do not apply ratings on a purely quantitative basis, as qualitative factors are also considered. Moreover, as discussed in response to BCUC 1.18.1, the minimum combination of ROE and common equity ratio for an A rating does not address the question of what is a fair return for equity holders. Similarly, the maximum combination of ROE and common equity ratio for an A rating does not address that question either.

From a quantitative perspective, Moody's has noted that TGI's credit metrics, in particular the capital structure and interest coverage, are below that required for an A rating. Continued weakening in credit metrics, increased business risk or a less supportive regulatory environment, while maintaining the current low ROE and equity ratio, could see TGI incur a downgrade. Therefore, TGI believes an ROE of 11% and equity ratio of 40% is appropriate to maintain an A rating and address the requirements of a Fair Return Standard.

BUSINESS RISK

19.0 Reference: Exhibit B-1, Tab 1 p. 1 Business Risk - Throughput Level for a Mature Utility

19.1 The Application states that if throughput levels decline for whatever reason, TGI business risk increases. Furthermore, TGI describes that its throughput is influenced by the competitiveness of natural gas to alternative energy sources and also TGI’s ability to attract customers and retain its customer base.

19.1.1 In TGI’s view, which type of utility has more stable throughput levels: a mature, maturing, or a new, developing utility? Please explain your answer.

Response:

An indicator of how TGI business risk has increased relates to the decline in annual normalized throughput levels being transported across the TGI system. TGI capital investments have been made to serve customers over the long term. With declining throughput the costs of these investments must be recovered over a smaller volume, which increases costs to the remaining customers of TGI. Historically, a utilities throughput level would be one indicator of the utility stage of development.

A mature or maturing utility would be expected to have in general more stable throughput levels. A mature utility tends to have a relatively established, diversified, and mature customer base with high customer penetration levels achieved in its service territory. A lower percentage of customer additions to the existing customer base and thus lower customer growth rate indicate that the throughput levels stabilize over time for mature utilities. However, due to changing factors such as a focus on energy efficiency and conservation, even a mature utility may not have stable throughput levels. Technological change, energy efficiency and conservation programs will put downward pressure on use per account over time. Although new customer attachments will serve to offset load lost due to the proceeding factors to varying degrees, low customer additions make it challenging to offset the total reduction caused by reduced consumption from existing customers.

On the other hand, a new or developing utility would be characterized by lack of established customer base and customer growth rate, lower customer penetration rates, and therefore significant variability in use per customer rates and throughput levels due to the growing stage of the business. Customer attachment levels could be greater than the rate of growth in the economy, and customer appliances are more efficient on average for a maturing utility than that of a mature utility.

19.1.2 Does TGI consider itself a mature utility? Please describe in general the historical and expected growth of throughput, rate base and customer base of TGI.

Response:

Yes, TGI does consider itself a mature utility. Over the past ten years, TGI has seen overall throughput decline by approximately 1.2% annually (12% in total, from 1999 to 2008), while at the same time normalized rate base has increased by approximately 8% annually (53.3% from 1999 to 2008). TGI's customer base has grown by an average of approximately 1.1% per year (10% from 1999 through 2008) over the past ten years, and as a maturing utility, customer additions are fluctuating with the housing market.

This is consistent with the characteristics discussed in BCUC IR 1.19.1.1 that are associated with a mature or maturing utility.

19.1.3 Has TGI included changes in housing mix and changes in the conservation culture as a business risk component? If yes, please comment if the Commission should re-evaluate the business risk of TGVI and TGW relative to that of TGI.

Response:

Yes, TGI has included changes in housing mix and also changes in the conservation culture as a business risk component. Both of those factors influence the demand for natural gas, both are prevalent throughout the province, and therefore those factors add to the risk of all the Terasen Utilities. The business risk of TGVI and TGW relative to that of TGI is still appropriate, and do not require re-evaluation at this time.

19.1.4 In TGI's view, is it acceptable that a "developing" distribution company receive higher allowed ROE merely because of its given 'developing' status? I.e., Enbridge Gas New Brunswick (x-ref: Appendix 3, CEA Report, p.21 Note G).

Response:

In TGI's view the granting of a higher ROE for a developing utility is acceptable since the awarding of a fair return is in part one that provides the utility in question an opportunity to earn a return consistent with those available to similar enterprises with comparable risks. A new or developing utility with a small customer base and large initial investment (and related high investment per customer) would face additional challenges and risks including that of failing to achieve customer attachment levels that allow it to become financially viable in the long run. TGVI's predecessor companies for instance had to be restructured with government support and gas cost subsidies through royalty revenues and interest free Federal and Provincial loans when the restructuring was conducted in 1995. It can take decades for a utility to fully mature and changing circumstances along the way can accelerate or delay that maturation process.

In TGVI's case, it was originally envisioned that gas fired electric generating facilities constructed in addition to the demand of the pulp mills on island would provide a stable underpinning for the growth and development of the natural gas distribution business in TGVI's service territory. Only one co-gen facility was ever constructed and the Vancouver Island Gas Joint Venture group of pulp mills' demand has decreased down to less than 25% of the contract demand levels at the start of the decade. This has delayed the development of TGVI into a strong viable LDC in the absence of continued government support and continues to warrant a higher return than the benchmark.

20.0 Reference: Exhibit B-1, Tab 1, p. 1 Business Risk on Declining Throughput

The Application states: "All else equal, if throughput levels decline for whatever reason, TGI business risk increases."

20.1 Please confirm if there is a deferral account for changes in TGI throughput by customer group. Please provide details.

Response:

There is no deferral account for variations between forecast and actual thoughput for the industrial customer groups of TGI. There is a deferral account for variations between forecast and actual volumes due to use rate variations for Residential and Commercial customer classes, but there is no deferral account for changes in volumes resulting from variations in the forecasted number of customers.

The Revenue Stabilization Adjustment Mechanism ("RSAM"), originally approved by Commission Order No. G-59-94, is a mechanism that stabilizes the Company's delivery margin revenue from the Residential and Commercial customer classes (Rate Schedules 1, 1U, 1X, 2, 2U, 2X, 3, 3U, 3X and 23). The RSAM enables the Company to record delivery margin revenue for these customer classes based on the forecast use per customer for each rate class that was used in establishing rates. If weather or other factors result in the customer use varying from forecast, an entry is made to the RSAM account that adjusts revenue collected from customer rates from actual use to what customers would have paid based on forecast use. If actual use is less than forecast, the RSAM deferral account is charged for the variance in use times the delivery rate and the RSAM revenue is credited. Conversely, if actual use is greater than forecast, the RSAM deferral account is credited and the RSAM revenue is decreased. RSAM account balances are recovered from or returned to customers through Delivery Rate Rider 5 over a three year period. Under the RSAM, if actual thoughput is lower than forecast for residential and commercial customers, due to use rate variances, the result will be, all else equal, an increase to those customers rates over the following three years thereby reducing the competitiveness of natural gas to alternatives.

The RSAM does not reduce risks associated with longer-term reductions in consumption, which longer-term risks are a significant aspect of the Company's business risk.

20.2 Please comment on how the earnings would differ from approved revenue requirement if the revenue collected and/or costs deferred satisfy the revenue requirement.

Response:

Where revenues realized or costs incurred differ from the approved amounts, and there is no associated deferral mechanism, earnings would also differ from the approved amount. The amount that earnings would vary by would depend on whether the item was taxable or not, and whether there was a sharing mechanism in place.

The pre-amble to this series of questions relates to TGI's assertion that declining throughput levels lead to increased business risk because the Terasen Utilities revenue requirements are primarily collected based on volumetric rates and as throughput levels drop, volumetric rates must increase leading to declining competitiveness and affordability for our customers.

As long as revenues collected satisfy the revenue requirement, the earnings forecast in the revenue requirement should be achieved for that period. When the revenue requirement is satisfied by costs being deferred for future recovery, there is uncertainty that they will be fully recoverable in the future. This can be the case even when the Commission grants an order that they will be allowed in the setting of future rates if such rates are not affordable leading to further reductions in demand, and is the case when expenditures are capitalized.

The existence of deferral accounts for core sales customers provides short-term protection for changes in use per customer for rate classes 1, 1U, 1X, 2, 2U, 2X, 3, 3U, 3X and 23. The Company remains at risk for actual number of customers in these rate classes as well as all other customer classes leading to earnings variances in short term and competitive challenges in the longer term.

20.3 All else equal, if throughput levels increase for whatever reason, how would the earnings differ from the approved revenue requirement? Please explain. Does this depend on whether the change in throughput was included in ratemaking?

Response:

The level of business risk that TGI experiences as it relates to throughput is symmetrical; that is, in absolute dollars an increase in throughput within a customer class has the same impact as a decrease in throughput within the same customer class.

If throughput levels increase for the Residential and Commercial customer classes, and the increase is due to an increase in the use rate from the approved amount, earnings would not differ from that approved in the revenue requirement, since differences in the use rate would be captured in the RSAM deferral account, and returned to customers over the following three year period. Likewise, If throughput levels decrease for the Residential and Commercial customer classes, and the decrease is due to an decrease in the use rate from the approved amount, earnings would not differ from that approved in the revenue requirement, since differences in the use rate would be captured in the RSAM deferral account, and returned to customers over the following three year period. If throughput levels increase or decrease for other reasons, then earnings would be higher or lower than approved as described in the next two paragraphs.

If throughput levels increase for Residential and Commercial customers for reasons other than an increase in the use rate, of if throughput levels increase for any other customer class than Residential or Commercial:

- Under the 2003 to 2009 PBR, earnings would be higher than approved by one-half of the volume difference multiplied by the after-tax delivery rate.
- Under the proposed 2010 and 2011 Revenue Requirement Application, earnings would be higher than approved by the volume difference multiplied by the after-tax delivery rate.

If throughput levels decrease for Residential and Commercial customers for reasons other than an decrease in the use rate, of if throughput levels decrease for any other customer class than Residential or Commercial:

- Under the 2003 to 2009 PBR, earnings would be lower than approved by one-half of the volume difference multiplied by the after-tax delivery rate.
- Under the proposed 2010 and 2011 Revenue Requirement Application, earnings would be lower than approved by the volume difference multiplied by the after-tax delivery rate.

21.0 Reference: Exhibit B-1, Tab 1, pp. 1 and 34 Natural Gas vs. Electricity

TGI states that, "All else equal, if throughput levels decline for whatever reason, TGI business risk increases."

21.1 Is this statement true for the circumstances of TGI where the utility has a strong margin against other fuel options? i.e., the BC Hydro Tier 2 RIB rate, RSAM deferral account, no cost of gas risk through a deferral account, and that TGI earns its return based on rate base and rate base additions.

Response:

Yes. The statement is true when "All else equal, if throughput levels decline for whatever reason, TGI business risk increases." Where TGI has a competitive price advantage against other fuel options, declines in throughput will lead to higher unit costs and reduced competitive margin against those fuels. It is also true for each of the examples sited which will be discussed below.

In the case of the Tier 2 RIB rate, the only TGI customer rate classes that compete against this rate are residential 1, 1B, and 1U. Declining throughput will lead to lower revenue forecast which will force the company to increase delivery rates for all customers including these rate classes. Therefore the statement is true in this case.

The RSAM deferral account does not affect the rate competitiveness of TGI when throughput declines, it provides an opportunity in the short-term to recover margin related to use per customer variances in future rates. If the variances are due to declining throughput, it has the effect of putting further upward pressure on future rates leading to declining competitiveness – thus the statement remains true for this example sited in the question.

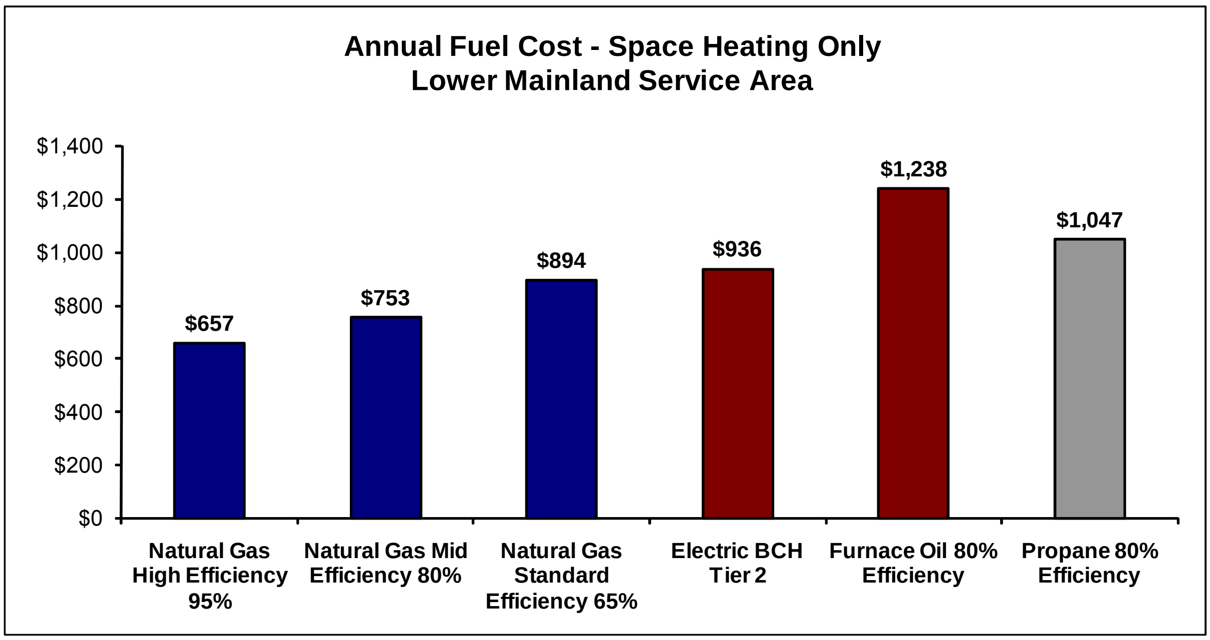
In the case of the gas cost deferral account, the deferral mechanism captures variances of gas costs for sales customers from that forecast and either refunds them or collects them in the following 12 months from the sales customers. The gas cost deferral account has no bearing on delivery rates so does not mitigate the impacts of declining throughput on delivery rates.

Finally, as indicated in the question, TGI's revenue requirement is set to recover its costs of service including a provision for an allowed return on its rate base. TGI collects its revenue requirement through a combination of monthly variable charges and volumetric delivery, midstream and gas cost charges. When throughput volumes decline, revenue variances not subject to deferral treatment result in lower revenues and earnings. Revenues subject to deferral mechanisms are built into future revenue requirements and the declining throughput built into future volume forecasts leading to increased delivery rates and declining competitiveness.

Therefore in all cases, declining throughput levels, all else being equal, lead to increased business risk.

21.2 Please provide a residential cost of heat comparison for natural gas, BC Hydro Tier 2 RIB rate, propane and home heating oil as at July 1, 2009. Please make explicit the assumptions used in the comparison.

Response:



Assumptions:
Terasen Gas rate includes the basic charge.
Typical space heating consumption of 58 GJs, based on a Mid Efficiency Furnace (80%)
Electric amount does not include basic charge since a household already pays the basic electric charge for non-heating uses.
Furnace Oil and Propane prices are based on the MJ Ervin and Associates Weekly Pump Price Survey - Canada dated July 7, 2009
Natural gas, furnace oil and propane rates are inclusive the applicable Carbon Tax effective July 1, 2009
Conversions:
1 GJ = 39.4 Litres of Propane
1 GJ = 25.8 Litres of Furnace Oil
1 GJ = 277.78 Kilowatt Hours

21.3 Please provide TGI's peak day supply forecasts for the last 10 years and a forecast for 2009 and 2010.

Response:

The following table illustrates the peak day demand forecasts over the past ten years, and also a forecast for 2009 and 2010.

	1999	**2000**	**2001**	**2002**	**2003**	**2004**
Peak Day Demand (TJ)	1,291	1,305	1,305	1,245	1,256	1,256

	2005	**2006**	**2007**	**2008**	**2009**	**2010**
Peak Day Demand (TJ)	1,256	1,278	1,275	1,279	1,274	1,282

Peak day demand has remained relatively stable over the period 1999 through 2008, and is expected to remain so over the next two years. Significant reductions were seen in 2002, likely in response to efficiency improvements that occurred while commodity prices increased significantly (and became more volatile) during the California energy crisis. Since 2002, peak day demand has shown only moderate growth (0.4% annually, on average), reflective of an increasing residential customer base (relative to the commercial and industrial customer base). Therefore, despite declining annual throughput, the stable (or moderately increasing) peak day demand will lead to a need for capacity that in large remains unused, thereby increasing risk associated with the company's ability to recover costs associated with maintaining that capacity.

21.4 Please provide TGI's capital expenditures for the last 10 years and forecasts for 2009 and 2010, broken out between base capital and CPCNs.

Response:

Below is a summary of TGI's capital expenditures for the last 10 years and forecasts for 2009 and 2010.

TGI Capital Expenditures ($ millions)

	1999 Actual	2000 Actual	2001 Actual	2002 Actual	2003 Actual	2004 Actual	2005 Actual	2006 Actual	2007 Actual	2008 Actual	2009 Projection	2010 Proposed

22.0 Reference: Exhibit B-1, Tab 1 p. 2 Competitiveness

TGI states that "Natural gas no longer enjoys a substantial operating cost advantage over electricity." However the Figures on pages 21 through 23 seem to indicate that natural gas is enjoying its largest margin in 10 years against BC Hydro Tier 2 rate.

22.1 Please reconcile the statement with the Figures.

Response:

Before responding directly to the question some background and clarification is needed. Figure 3.1.1 is a comparison of the total natural gas consumed by an average residential customer (95 GJ), not just the energy used in space heating applications. With the recent establishment of the BC Hydro RIB structure the actual operating cost difference between a natural gas home and an electricity home with the same applications has been complicated. To determine this operating cost difference one would need to look at the specific use pattern of the dwelling related to its total natural gas consumption and superimpose this on their existing electricity use to determine the appropriate electrical rate to use in the comparison. Terasen Gas would agree that in most cases for single family homes the BC Hydro RIB Step 2 rate is a reasonable comparison for space heating applications. The RIB Step 2 rate, however, is not necessarily a good comparison for the space heating requirements of a townhouse, condo or apartment. Much of the space heating energy consumption from these types of dwellings may come from the RIB Step 1 rate. Given this backdrop Terasen Gas addresses the question.

As stated in the Business Risk section of the Application (Tab 1, page 18), the annual operating cost of advantage of natural gas compared to electricity in B.C. from 1998 to 2008, has declined from 63% to 18%. This operating cost decline has had an impact on Terasen Gas' competitive position relative to electricity. An operating cost advantage is needed for natural gas to pay for the difference in capital costs to provide space heating capability in a natural gas home versus an electrical heated home.

With the establishment of the BC Hydro RIB rate in October 1, 2008 and the recent decline in the actual and forecasted natural gas commodity prices, the short term competitive position of natural gas has improved.

However, this current operating cost advantage (as outlined in Figures 3.1.1 comparing the Terasen Gas April/2009 rates against the BC Hydro Step 2 rate) may decline with an expected increase in natural gas commodity prices from the current natural gas prices that are used in setting Terasen Gas commodity rates for April/2009 ($5.966 Cdn/GJ). Natural gas prices are forecast to rise from current levels as outlined in the table below.

AECO (Cdn$/GJ) Historical and Forward (Forecast) Month Prices

	Year	Averages	
Actual	2004	$	6.44
	2005	$	8.04
	2006	$	6.62
	2007	$	6.26
	2008	$	7.70
	2009	$	4.16
Forecast	2010	$	5.80
as of July 1, 2009	2011	$	6.76
	2012	$	7.08
	2013	$	7.27

Note: 2009 prices includes actuals for Jan-June ($4.40 Cdn/GJ) and forecasted prices for July-Dec ($3.91 Cdn/GJ)

The reason for the expected increase in natural gas prices is related to the future recovery of the US and Canadian economies, which has the potential to change the current supply/demand picture for natural gas. Also, effective July 1, 2009 the B.C. carbon tax increases from its current levels of $.50 Cdn/GJ to $.75 Cdn/GJ and this tax will continue to increase through 2012 to $1.50 Cdn/GJ.

There are other factors beyond operating costs (as displayed in Figure 3.1.1) that have an impact on the competitive position of natural gas as compared to electricity over the long term. These include: differences in upfront capital costs for a natural gas space heated home versus an electrical heated home and changing customer perceptions towards natural gas. These factors are discussed below.

On page 30-31 of the Business Risks section (Tab 1 of the Application), Terasen Gas outlines why an operating cost advantage is need for a home heated with natural gas compared to one heated by electricity. It is clear from Figure 3.1.1 that since January 1, 2001 through January 2009, natural gas has not experienced the operating cost advantage it needs to make natural gas the economical choice for customer to meet their space heating requirements. Further, Figure 3.1.1 is calculated on total energy use in the home not just the operating cost advantage related to space heating. This conclusion is further supported by the BC Hydro CPR 2007, that states:

> *"No fuel switching measures were achievable. In other words, the measure payback period either exceeds the life of the measure or the measure never pays back the original investment."*[12]

[12] BC Hydro Conservation Potential Review 2007, Fuel Switching: Residential Sector, November 20, 2007, Page 112, Achievable Potential is defined: The portion of savings identified in the Economic Potential that could realistically be achieved within the study period through government and utility-led interventions and programs given institutional, economic and market barriers.

Finally, the GHG reduction targets, the Carbon Tax, the frequent public discussion of the role of GHGs in climate change and potential future increases and volatility in natural gas prices have changed customers' perception towards natural gas in B.C. This is supported by statements made by customer groups such as BCOAPOs which state:

> *"BCOAPO recognizes that Terasen's current rate compares favorably against BC Hydro's trailing residential rate. Right now, customers choosing natural gas for space and water heating are seeing a definite financial benefit as compared to their electricity-using counterparts. However, given the volatile natural gas prices, this could change at any time and customers would again find themselves in a situation where natural gas is no longer even the most economic choice*."[13]

---

23.0 Reference: Exhibit B-1, Tab 1, p. 2 Business Risk

23.1 Please provide any cost increases to the Terasen Utilities as a result of the aboriginal rights effects on operational and regulatory complexities. Have any related costs been disallowed in a revenue requirement application?

Response:

The Terasen Utilities have been experiencing growth in dialogue with First Nations regarding all aspects of the company's operations, and expect that there will continue to be an increase in efforts associated with this activity. First Nations have increased their requests for negotiated agreements regarding access to existing rights of way. First Nations are also seeking consultation agreements with Terasen to assess impacts on rights and interest with a desire to develop acceptable mitigation and accommodation measures. A recent development has been the Terasen Utilities' development of ongoing Aboriginal participation strategies in co-operation with Aboriginal organizations.

During the PBR period Terasen Gas has not had any costs relating to First Nations disallowed.

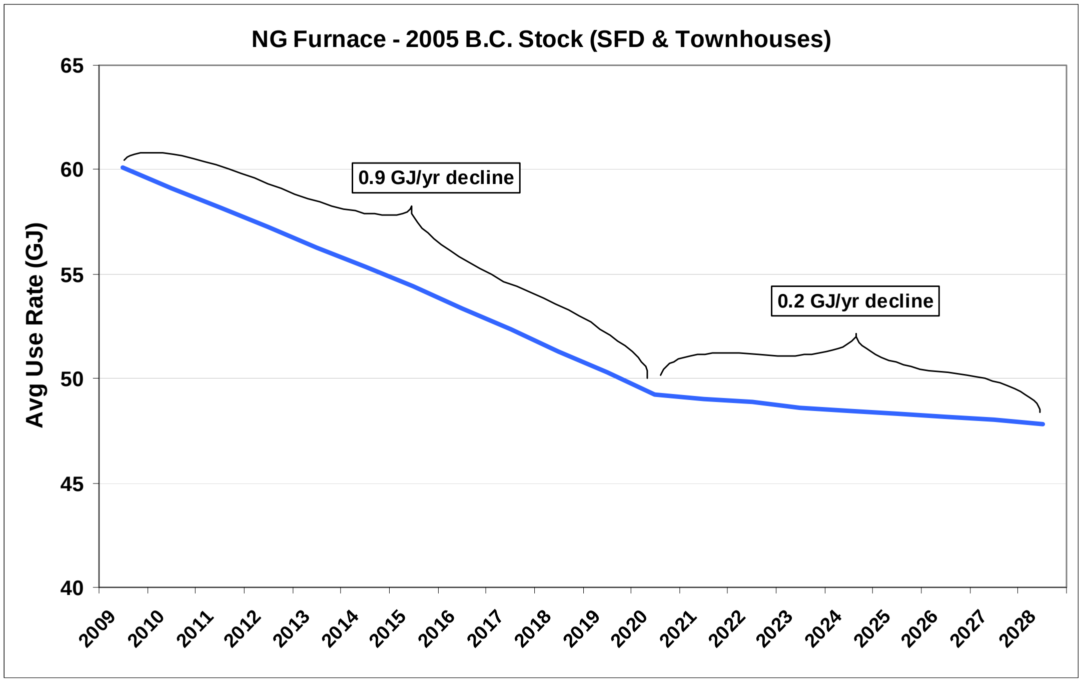
23.2 Do Terasen Utilities agree that a multi family dwelling development (i.e., high-rise) that have replaced single family dwellings in a re-zoned lot could result in higher throughput simply because of an increased number in dwellings?

Response:

TGI does agree that a multi-family development that replaces single family dwellings in a re-zoned lot ***could*** result in higher throughput simply because of an increased number of dwellings.

However, given that TGI's capture rate is much lower for multi-family dwellings, as single family dwellings are replaced by multi-family dwellings, the throughput levels do not necessarily increase. And that is because a portion of those multi-family dwellings do not end up becoming Terasen Gas customers.

More generally, there are many factors that are contributing to the overall decline in residential throughput, including not only the shift towards more multi-family dwellings in the housing mix, but also the continued efforts of our existing customers to improve efficiencies, and the increasing availability of alternative energies. These are a result of increased awareness around energy usage, technological improvements, changes to standards regulating furnace efficiencies, and also the public perception around natural gas being influenced by climate change policy. And these factors together have contributed to the approximate 12% decline (see TGI's response to BCUC IR#1 Q3.1) in total throughput since 1999, and more importantly are expected to continue influencing throughput downward over the foreseeable future. As the declining residential throughput is primarily attributed to retrofit activity, the following graph illustrates not only the estimated impact of retrofit activity, but also illustrates this factor is a long-term issue.



23.2.1 Assume a city block of 20 single family dwellings have been replaced by two 15-story high-rises with four units per floor. Please provide calculation of the volume of natural gas consumption by the new multi-family dwellings and compare it to the total volume of natural gas consumption by the single family dwellings that they replace.

Response:

To better illustrate the impact of multi-family dwellings replacing single family dwellings, TGI is assuming there are ten city blocks with each having twenty single family dwellings on them. Those ten city blocks are then assumed to be re-zoned and the single family dwellings replaced by two fifteen-storey high-rises with four units per floor on each block. The assumptions regarding annual average use per customer are stated in response to BCUC IR 1.23.2.1.1.

The following provides an estimate of the annual consumption for those ten city blocks, first with the single family dwellings on them, and then with the high-rises on them. For simplicity, TGI is assuming a capture rate for multi-family dwellings of 20%.

1) Ten city blocks with twenty single family dwellings on each block:

   Average annual consumption per single family dwelling = 94 GJ

   Total estimated throughput = 10 city blocks X 20 dwellings/block X 94 GJ/year

   = 10 X 20 X 94

   = 18,800 GJ per year

2) Ten city blocks with two fifteen-story high-rises on each block, with four units per floor:

   Average annual consumption per unit in this high-rise = 59 GJ

   Total estimated throughput = 20% capture rate X 10 city blocks X 2 high-rises/city block X 15 storeys/high-rise X 4 units/floor X 59 GJ/year

   = .20 X 10 X 2 X 15 X 4 X 59

   = 14,160 GJ

Therefore, the impact of multi-family dwellings replacing single family dwellings under the above circumstances would be a 25% decline (or 4,640 GJ per year) in total annual throughput.

23.2.1.1 Please make explicit your assumptions on use per account by dwelling type.

Response:

TGI is assuming that the average annual consumption (under normal weather conditions) for a single family dwelling is 94 GJ per year, which includes all natural gas end uses within that dwelling. The estimated annual average consumption for an average unit within a high-rise (vertical subdivision) is 24 GJ per year, and includes all natural gas end uses other than make up air (MUA) and domestic hot water (DHW). Those assumptions are derived from preliminary figures obtained from the 2008 Residential End Use Study (2008 REUS). Since both MUA and DHW, for high-rises, are typically provided to each unit through a single meter (which would be classified as a commercial customer), average consumption for these uses were outside the scope of the 2008 REUS. TGI assumes the average annual consumption per unit for MUA and DWH is 35 GJ per year. This assumption is based on informal discussions with industry experts.

Therefore, TGI assumes the average annual consumption for a single family to be 94 GJ per year, and for each unit within a high-rise to be 59 GJ per year. As TGI's response to BCUC IR#1 Q23.2 indicates, as the shift towards more multi-family dwellings in the housing mix continues, the result is downward pressure on average residential use per customer.

23.2.1.2 Does TGI agree with the increased number of dwelling units assumptions provided in this IR?

Response:

Although TGI agrees that the increased number of dwelling units assumptions appear reasonable, as per TGI's response to BCUC IR#1 Q23.2.1, the ongoing shift towards more multi-family dwellings in the housing mix will place downward pressure on throughput levels, not increase it.

24.0 Reference: Exhibit B-1, Tab 1 p. 4 Conservation and Efficiency Policies

The Application states that many of the 2007 Energy Plan policies will have the ultimate effect of reducing throughput on the TGI system.

24.1 Please provide, in tabular format, the throughput, total and by customer group, for TGI from 1994 to the present, as well as the forecasts for the next five years.

Response:

The following table illustrates the total throughput in PJs for residential, commercial, firm sales, and industrial and transportation customers, with actual results from 1994 through 2008, and then a projection for 2009 and forecast for 2010 through 2014.

(in PJs)

	1994	**1995**	**1996**	**1997**	**1998**
Residential	70.9	73.9	74.1	75.7	76.7
Commercial	49.3	51.1	50.6	51.1	47.9
Firm Sales	3.9	4.6	4.9	5.9	7.2
Industrial & Transportation	121.5	131.9	95.6	105.3	117.2
Total	**245.6**	**261.5**	**225.2**	**238.0**	**249.0**

	1999	**2000**	**2001**	**2002**	**2003**
Residential	77.8	75.4	68.4	72.6	72.6
Commercial	51.5	47.3	43.9	44.3	45.3
Firm Sales	9.6	10.9	8.9	6.9	6.1
Industrial & Transportation	98.6	110.1	125.2	96.4	94.8
Total	**237.5**	**243.7**	**246.4**	**220.2**	**218.8**

	2004	**2005**	**2006**	**2007**	**2008**
Residential	72.0	69.3	70.0	70.6	68.8
Commercial	45.2	43.9	44.1	45.5	45.9
Firm Sales	5.3	4.7	4.1	3.8	3.5
Industrial & Transportation	97.5	94.8	90.9	95.0	91.3
Total	**220.0**	**212.7**	**209.1**	**214.9**	**209.5**

	2009	**2010**	**2011**	**2012**	**2013**	**2014**
Residential	71.0	67.8	67.2	66.9	66.6	66.2
Commercial	47.5	47.3	47.9	48.6	49.3	49.9
Firm Sales	3.4	3.4	3.3	3.3	3.3	3.3
Industrial & Transportation	83.2	82.4	82.5	82.8	83.0	83.4
Total	**205.2**	**200.9**	**201.0**	**201.6**	**202.2**	**202.8**

Notes:
1. The residential sector includes TGI Rate 1 customers
2. The commercial sector includes TGI Rate 2, 3, and 23 customers
3. The firm sales sector includes TGI Rate 4, 5, and 6 customers
4. The industrial & transportation sector includes TGI Rate 7, 22, 25, 27 and also Centra and Burrard Thermal customers

As can be seen from the above table, total throughput remained relatively stable over the period 1994 through 2001, at which time a significant step change occurred (~10% decline) as a result of the increased volatility in commodity prices (during the California energy crisis). The next few years (until 2004) again remained relatively stable, but in 2005 another step change occurred as commodity prices once again increased (as a result of Hurricane Katrina). The declines seen since then, through 2008, have occurred for a number of reasons, including an increased focus on energy conservation by existing customers, a decline in the competitiveness of natural gas, and the fact that new customer attachments are not offsetting the declining energy demand from existing customers. Overall, Terasen has experienced declining volumes since 1999, and as the factors causing this decline are expected to continue impacting demand over the longer-term, there is increasing risk associated with our company's ability to recover its investment over the long term.

The projection for 2009 and forecast for 2010 & 2011 is from the recently filed 2009 TGI Revenue Requirement Application, and are based upon an analysis of the recent historical normalized actual results, trends in the market that are influencing the demand for natural gas (as discussed above), and also the economic outlook for BC. The longer-term forecast figures, for 2012 through 2014, are based upon the assumption that residential use per customer rates continue to decline, commercial use per customer rates remain stable, and industrial volumes also remain stable. Although today these assumptions are reasonable, there is increased uncertainty surrounding commercial and industrial volumes over the longer-term, as the impact of the BC Energy Plan (and programs/policies developed as a result of it) have not yet been seen. Therefore, it would be reasonable to assume there is down-side risk associated with the commercial and industrial volumes over the longer-term.

24.2 Please repeat the above for TGVI and TGW.

Response:

The following table illustrates the annual normalized throughput in TJs for residential, commercial and transportation customers of TGVI over the period 1997 through 2008, a projection for 2009 and forecast for 2010 through 2014. Normalized volumes from 1994-1996 are not available at this time.

(in TJs)

	1997	1998	1999	2000	2001	2002
Residential	3,016	3,383	3,669	3,854	3,748	3,872
Commercial	6,374	6,559	6,953	6,956	6,951	7,117
Transportation	16,511	14,685	16,384	16,404	16,289	22,399
Total	**25,901**	**24,627**	**37,856**	**38,412**	**38,777**	**39,545**

	2003	2004	2005	2006	2007	2008
Residential	4,034	4,020	4,259	4,602	4,575	4,696
Commercial	7,310	7,237	7,412	7,341	7,491	7,345
Transportation	21,169	21,536	22,146	16,334	23,302	22,342
Total	**32,513**	**32,793**	**33,817**	**28,277**	**35,368**	**34,383**

	2009	2010	2011	2012	2013	2014
Residential	4,859	4,892	5,015	5,143	5,274	5,408
Commercial	7,405	7,349	7,418	7,511	7,605	7,700
Transportation	22,946	22,309	22,017	22,336	22,350	22,365
Total	**35,210**	**34,550**	**34,450**	**34,990**	**35,229**	**35,473**

Notes:

1. Residential includes RGS customers
2. Commercial includes SC1, SC2, LC1, LC2, LC3, AGS, HLF, and ILF customers
3. Transportation includes ICP, JV, and also TG Squamish customers

As can be seen from the above table, annual throughput has grown significantly on TGVI's system over the period 1997 through 2008 (a 33% increase, or 2.6% annually). Looking at the individual customer segments, residential throughput has grown 4.1% per year, commercial throughput has grown by 1.3% per year, and transportation throughput has grown by 2.8% per year. This is consistent with TGVI being an immature utility. And given this, coupled with there being fewer opportunities for efficiency improvements, it is not surprising that the forecast of throughput for TGVI is for growth over the foreseeable future.

The following table illustrates the annual normalized throughput in TJs for residential and commercial customers of TGW over the period 1997 through 2008, a projection for 2009 and forecast for 2010 through 2014. Normalized volumes from 1994-1996 are not available at this time.

(in TJs)

	1997	1998	1999	2000	2001	2002
Residential	94.3	107.5	126.0	141.6	145.4	156.3
Commercial	389.3	441.2	480.7	549.8	541.8	534.6
Total	**483.6**	**548.7**	**606.7**	**691.4**	**687.2**	**690.9**

	2003	2004	2005	2006	2007	2008
Residential	177.8	168.0	189.3	175.3	198.5	189.6
Commercial	546.9	556.2	579.7	558.4	543.6	519.8
Total	**724.7**	**724.2**	**769.0**	**733.7**	**742.1**	**709.4**

	2009	2010	2011	2012	2013	2014
Residential	206.5	200.8	203.5	205.4	207.4	209.9
Commercial	510.7	524.4	526.3	529.6	532.2	535.5
Total	**717.2**	**725.2**	**729.9**	**735.0**	**739.6**	**745.4**

Notes:

1. Residential includes SCS1/2 Residential customers
2. Commercial includes SCS1/1 Commercial, LC1, LC2, and LC3 customers

Annual throughput for TGW, as illustrated above, has also grown significantly over the period 1997 through 2008 (a 47% increase, or 3.5% annually). This growth has been driven by the residential customer segment, where throughput has more than doubled over this period, averaging 6.6% growth per year. The commercial segment has also grown significantly (2.7% per year), but not quite at the rate the residential customer segment has experienced. The growth in throughput for TGW is also consistent with that for an immature utility, with the declines from 2006 through 2007 attributed to the large commercial customer segment, where energy management systems have been installed in more recent years, causing significant reductions in volumes. Other than that, growth has been fairly steady for the remaining customer classes.

24.3 Please describe to what extent the future increase/decrease is caused by the effects of the provincial government's Energy Plan.

Response:

The provincial government's Energy Plan has set targets for conservation and energy efficiency which are aimed at reducing the overall energy demand "at work" for residential and commercial buildings, and also to reduce average energy demand per home. The Energy Plan also states the government will work closely with BC Hydro and other utilities to research, develop, and implement best practices in conservation and energy efficiency, and also to increase public awareness. Changes to building codes and also revised standards regarding minimum efficiency levels for new appliances are an indication the government is focussed on having standards in place that will impact overall energy demand. However, given the provincial government's Energy Plan does not include specific targets for natural gas, it s very difficult to develop estimates regarding the extent to which increases/decreases in the demand for natural gas can be attributed to the effects of the Energy Plan. It is, however, reasonable to assume that the Energy Plan will influence not only consumption behaviours, but also the type of appliances available for use (with respect to efficiency levels), and ultimately contribute towards the declining throughput levels being experienced by TGI. The potential efficiency gains are further seen in the figure below, which illustrates the difference between an older, low-efficient home and a new, high-efficient home.

Older Low Efficient Home in Vancouver

- One storey building with basement
- 2,500 square foot older home
- Below average insulation in ceiling and walls
- Single pane windows (USI 6.7 - Single)
- Average temperature 19 degrees Celsius
- Air tightness: 6.0 ACH (tested at 50 Pascals)
- Standard efficient furnace, AFUE of 71%

Space Heating Energy = 137.6 GJ/yr

New High Efficient Home in Vancouver

- One storey building with basement
- 2,500 square foot new home (code compliant)
- Above average insulation in ceiling and walls
- Energy Star windows (USI 2.0)
- Average temperature 21 degrees Celsius
- Air tightness: 5.4 ACH (tested at 50 Pascals)
- High efficiency condensing furnace, AFUE of 90%

Space Heating Energy = 50.7 GJ/yr

Source: Modelled through Natural Resources Canada's HOT 2000 software

The newer, high-efficient home reflects changes to building codes and also furnace regulations. When compared to the older, low-efficient home, it can be seen that there is a significant potential in terms of efficiency gains.

24.4 Reference: Exhibit B-1, Tab 1, pp. 4, 5 Recovery of Investment

"Over the long term, a decrease in throughput volume leads to high unit delivery costs for customers, which makes natural gas less competitive, which in turn hinders TGI's ability to recover its investments."

24.4.1 Please provide examples, if any, of where a TGI revenue requirement process has disallowed recovery of investment due to decreases in throughput volume.

<u>Response:</u>

The premise of the quotation from the Application is that declining throughput leads to rate increases. Declining use per customer was the single most significant factor putting upward pressure on customer delivery rates during the 2004-2009 PBR settlement period. Terasen is not aware of disallowances of investment due to decreases in throughput volume as part of a revenue requirement process.

25.0 Reference: Exhibit B-1, Tab 1 pp. 5, 10 GHG Reduction Targets

It is expected that the operating emissions of TGI and TGVI and the emissions of their customers from natural gas consumption make up approximately 17 per cent of BC total emissions for 2006 (page 5).

As natural gas is a fossil fuel, and given the aggressive provincial GHG reduction targets, the BC Carbon Tax translates into an increase in the business risk profile for TGI (page 10).

25.1 Do Terasen Utilities believe that the government policies and strategies to reduce GHG (i.e., Greenhouse Gas Reduction Targets Act, Carbon Tax Act, Western Climate Initiative, etc.) are unique to natural gas utilities in B.C.? Please explain your answer.

Response:

Yes.

BC's aggressive GHG reduction targets and being the first jurisdiction in North America with a carbon tax tied directly to the consumption of fossil fuels, has resulted in changing customer perception towards natural gas consumption in B.C. This reality is further enhanced by B.C. vast supply of renewable "clean" electricity. These facts place natural gas utilities operating in B.C. at greater risk than other natural gas utilities across North America. Electricity generation in most other jurisdictions in North America includes much higher percentages of gas and coal fired generation than in BC. In those jurisdictions direct use of natural gas in space and water heating applications provides an opportunity of displacing fossil fuel fired electricity generation and thereby reducing GHG emissions. Even natural gas fired generation displacing coal fired generation provides a large GHG reduction benefit. Natural gas is seen as part of the solution in these jurisdictions.

As an example on how these GHG policies have changed the thinking of how energy should be used in B.C., Terasen Gas points to the change in BC Hydro's position regarding using natural gas in such applications as space and water heating. This position change is outlined on pages 8 and 9 of the Business Risks section of the Application.

Further in the recent BC Hydro 2008 LTAP, the following statement is made:

"MS. VAN RUYVEN: A: So if you have a house heated by gas, all of those incentives in the LiveSmart program were meant to get in high-efficiency gas furnaces. So make the envelope of the building that you are in the most efficient it can be, regardless of fuel choice. So that's number one. And then to the conversations we've had with government, overwhelmingly these things that they're trying to do are reducing greenhouse gases in British Columbia. So you can see switching from diesel to cleaner gas is a positive thing, whether it's the transportation sector or the utility sector. So you can see as you read through these that I think an overwhelming desire is to reach that

legislated 32 percent reduction in greenhouse gases. And in the discussions that I've been in with government and with Terasen, they've been very clear that they do not want to put forward a policy that actually sees B.C. Hydro incenting increases in greenhouses gases in British Columbia. That goes against the legislated greenhouse gas reduction that they are very much trying to put lots of programs in place to get at.

MR. GHIKAS: Q: Ms. Van Ruyven, the expressed policy that we have is in the Energy Plan, and I believe that B.C. Hydro has made it clear that that be ignored at everyone's peril. Is that fair to say?

MS. VAN RUYVEN: A: Well, I was just stating a legislated requirement for greenhouse gas reductions in British Columbia, and I believe in the conversations I have had with government is they support programs that get at actual reductions of greenhouse gases in British Columbia.

MR. GHIKAS: Q: Okay. We're going to come to that in a moment, but from what I understand you saying is that the greenhouse gas reduction targets for provincial GHGs trump all other policy.

MS. VAN RUYVEN: A: That's what I'm saying. They trump, they trump a –"[14].

It is clear from these statements that government policy and strategies are having an impact on how energy should be used and consumed in B.C. given these GHG reduction targets.

In most jurisdictions across North America, the direct use of natural gas consumption is recognized as a way of helping to reduce GHG emissions. As an example, two Pacific Northwest Utilities (Avista Corp. and Puget Sound Energy) have energy efficient programs in place that promote the direct use of natural gas for such applications as space and water heating. This is a better solution from a GHG reduction point of view and cost impact to the electrical customers than using electricity to serve these direct use applications. Please refer to Attachment 25.1 for details on the Avista and Puget program. These programs highlight that energy use and solutions to reduce GHG can be different from jurisdiction to jurisdiction.

Given BC's ability to produce renewable electricity and given the strong mandate by the B.C. provincial government on reducing GHG emission, some customer groups and competitors believe that B.C.-produced clean electricity should be used at a greater rate in applications that historically have been filled by natural gas, namely in such applications as space and water

[14] BC Hydro LTAP 2008, Transcript Volume 3, February 13, 2009 page 281-283

heating. These realities make the GHG reduction path forward unique in B.C. and increase the business risks of the B.C. natural gas utilities, including TGI.

25.2 Do utilities in other jurisdictions in Canada and the US face similar new regulation with respect to reducing GHG emissions? Do some of these utilities face additional costs and/or reduced earnings from cap-and-trade programs for example, electricity generation facilities in U.S. jurisdictions having to use 'offsets'?

Response:

Yes, it is expected in the coming years that utilities across Canada and US will face new regulations with respect to reducing GHG emissions. These regulations will have an impact on these utilities by mandating reduction targets or setting performance standards in producing and delivering energy to consumers. This will result in increased cost for the utilities to comply with these new regulations over time. However, what is unclear at the present time is what form these new regulations will take. Currently, there is overlap in proposals or policies already in place at both the federal and state/provincial government levels across both the US and Canada around setting GHG reduction policies. It is unclear how these policies will work together or if one common system for reducing GHG emissions across North America will be put in place. What is clear, is B.C. has already taking steps through such mechanism as the carbon tax that do impact the competitive position of business within B.C. versus other jurisdiction across North America. Purchasing offsets is just another mechanism to conform to the future regulation, which will represent a cost to the utility in providing service to customers.

An important difference in B.C. as compared to other parts of North America is the presence of major hydro-electric production and the very small amount of fossil fuel fired electric production in B.C. As discussed elsewhere, this distinguishes the competitive position of the Terasen Utilities from gas distribution utilities in most other parts of North America.

25.3 In Terasen Utilities' opinion, would financial implications be more significant among LDCs and electric utilities in the U.S. due to their emission levels, carbon intensity, carbon costs relative to earnings? Why or why not?

Response:

Terasen Utilities are uncertain of the impact carbon costs will have on electric utilities in the US and for that matter utilities as a whole, given the uncertainty around what the GHG regulations will entail across different jurisdictions. However, in jurisdictions that have high GHG intensity in their electricity generation electrical utilities may be as much or more affected than gas utilities by climate change and GHG emission reduction regulations. The competitive position of natural gas utilities in such jurisdictions will be improved as the policies and regulations are implemented. This is not the case in BC since electricity generation in the province has low GHG intensity.

The only thing that is known for sure is that there will be compliance costs related to GHG regulation in the future. The costs each utility will pay will be determined by the regulation that the company must comply with and the source of energy that the utility is producing or moving to customers. For example, currently in B.C. the carbon tax applies to all fossil fuel consumption within B.C. However, the imported power that is consumed by residents of B.C. is presently exempt from this carbon tax; even though, this electricity has more than likely been produced from a fossil fuel. This is an example, of how different regulation across jurisdictions and energy sources can favour one energy form versus another.

26.0 Reference: Exhibit B-1, Tab 1 p. 10 Business Risk

The Application states that the provincial carbon tax increases the business risks of TGI. By 2012, natural gas consumers in BC will be paying $1.50/GJ in carbon tax. The carbon tax beyond 2012 is unknown at the present time.

26.1 What would be the increases (in absolute amount and in percentage terms) in the natural gas bill for a typical customer (residential, commercial, industrial) as a result of carbon tax in 2011 and 2013?

Response:

Please refer to Attachment 26.1 for the increases in total annual bill and percentage burner-tip for typical Lower Mainland residential (Rate Schedule 1), commercial (Rate Schedule 3), and industrial (Rate Schedule 5) customers as a result of the carbon tax in 2011 and 2013.

The schedule reflects the currently enacted increases which will become effective each July 1 through 2012. While there has been no additional announced change beyond 2012 the schedule reflects the impact of the carbon tax of $30/tonne at July 1, 2012 for the full year in 2013.

26.2 What are TGI's expected demand elasticity's with respect to price or cross elasticity's with respect to alternative fuels for the various customer groups as a result of the increase in carbon tax?

Response:

TGI estimates demand elasticity with respect to price, but does not estimate the cross elasticity's with respect to alternative fuels. Historically, electricity rates have remained quite stable, and therefore calculating cross-price elasticity's would not result in meaningful results. TGI will continue to monitor this, and when it is deemed that cross price elasticity's are meaningful, they will be estimated. The cross-price elasticity with respect to alternative fuels other than electricity are also difficult to estimate, as consumption information is not readily available.

The demand elasticity with respect to price for residential customers is estimated to be approximately 21%, and for commercial customers is estimated to be approximately 17%. Given that, the increase in carbon tax is estimated to cause at most an approximate 0.5% reduction in demand for residential customers, and at most an approximate 0.4% reduction in demand for commercial customers each year until the carbon tax reaches $1.50 in 2012.

The demand elasticity with respect to price is estimated using historical consumption data that includes variability that is caused by a number of factors, including retrofit activity, changes in the housing mix, changes to building codes & standards, and also non-recurring events such as the California Energy crisis and Hurricane Katrina. These factors all introduce a certain amount of "noise" in the demand data, which diminish the strength of the relationship between strictly price and demand. It is for that reason that TGI assumes the demand elasticity with respect to price should be used to estimate the maximum change that will likely occur due to price fluctuations. Furthermore, when prices decline, TGI does not believe the demand elasticity with respect to price is valid at all, due to the fact that in most cases, actions that result in declining consumption levels are permanent (i.e. retrofitting appliances).

27.0 Reference: Exhibit B-1, Tab 1, p. 11 Carbon Tax

27.1 Are there plans for TGI to recover the cost of implementing the carbon tax? Have any costs incurred related to the carbon tax been disallowed for recovery?

Response:

Since the B.C. Carbon Tax was introduced starting July 1, of 2008, it has created increased costs pressures on the Company's that ultimately gets reflected in delivery rates to customers. Also, the tax increases the direct costs to consumer who use natural gas in their homes and businesses.

The costs to customers related to this tax come in two forms:

1) Direct taxation tied to customer consumption of natural gas

The Terasen Utilities collect the carbon tax on behalf of the provincial government and remit these taxes to government. These taxes are directly tied to the customer's amount of natural gas consumed. This places the Terasen Utilities at a competitive disadvantage with BC Hydro, whose imported electricity to serve domestic load is not taxed under the BC Carbon Tax Act.

2) Terasen Utilities own use emissions

On May 15, 2008, TGI filed a Carbon Tax and Provincial Tax Rate Treatment Application in response to the release the Carbon Tax Act. In addition to the cost of service impact incurred as a result of the consumption of fossil fuels for the operation of TGI's business, the Application also identified one time estimated software upgrade, tax consulting and legal fee costs of $0.3 million associated with the implementation of the Carbon Tax Act. As a result, the Company requested and received Commission approval through Order No. G-88-08 for deferral account treatment of these costs as an exogenous item, subject to a review of actual expenditures.

On a go forward basis, as part of the 2010-2011 Revenue Requirement Applications filed on June 15, 2009, TGI included cost of service impacts of the Carbon Tax on fuel used in vehicles, compressors and line heaters. It is within this Application that the Company plans to recover the cost of implementing the carbon tax on Company-use fuel for approximately $410 thousand for 2010 and $530 thousand for 2011, embedded in O&M, cost of gas, and capital.

28.0 Reference: Exhibit B-1, Tab 1, p. 13 Climate Action Recommendations

"All of the above recommendations have the intent of reducing fossil fuel use within homes and businesses, which by their nature threaten the Terasen franchise and increase business risk for TGI."

28.1 The quote references items which may occur in the future. Please provide an estimate of dollar impacts to the TGI revenue requirement for items which have already occurred.

Response:

TGI has increased marketing and related costs to meet the customer's changing energy needs as a consequence of the BC Energy Plan 2007. TGI has not specifically incurred cost to deal with recommendations from the Climate Action Team, given that these measures build on policy items that promote efficient use of energy. TGI anticipates that it may need increased funding to support the Climate Action Team recommendations if and when these recommendations become accepted by government.

While the current revenue requirement which is in place through 2009 is set by the TGI PBR agreement, this increase in O&M costs will result in fewer O&M cost savings being shared by the customer and shareholder. As noted in the TGI Revenue Requirement Application 2010-2011, "In more recent years, sales, account management and business development staff have been added to the Customer Solutions and Services group, and additional staff have been added to the Customer Care and Services group. The additions of these staff were to address and meet changing customer expectations".

Since 2007, the increases that can be attributed to changing customer needs in reaction to the 2007 BC Energy Policy items that impact O&M are projected to be $2.9 million.

Further, TGI and TGVI have applied and received approval for EEC expenditures for 2008-2010 to help promote the efficient use of energy by customers, a key cornerstone of government policy. The table below shows the breakdown of the amounts approved for the period.

	2008		2009		2010
	O & M	Deferral	O & M	Deferral (Forecast)	Deferral
TGI ('000s) Programs as per EEC	$ 1,740	$ 744	$ 1,624	$ 7,258	23,075
TGVI ('000s) Programs as per EEC	$ 452	$ -	$ 497	$ 1,379	$ 4,726

As part of the EEC approval, all dollar amounts are to be capitalized and amortized over a 10 year period. The resultant revenue requirement impacts of this financial treatment is to reduce O&M going forward and increase capital and associated return on rate base.

29.0 Reference: Exhibit B-1, Tab 1, pp. 14 to 15 Aboriginal Rights Effects on BC Utilities

29.1 Please provide any information regarding operational and regulatory complexity as well as risk of litigation currently faced by the Terasen Utilities with respect to aboriginal rights. Please provide any legal or regulatory liabilities faced by Terasen Utilities in recent years with respect to aboriginal liabilities.

Response:

The Companies provide service to customers on First Nations lands and maintains gas transmission and distribution facilities on lands that are subject to land claims by various First Nations. A treaty negotiation process involving various First Nations and the government of British Columbia is underway, but the basis upon which settlements might be reached in the Companies' service areas is not clear. Furthermore, not all First Nations are participating in the process. To date, the policy of the government of British Columbia has been to endeavour to structure settlements without prejudicing existing rights held by third parties such as the Companies. However, there can be no certainty that the settlement process will not adversely affect the business of the Companies.

The Terasen Utilities manages any issues around Aboriginal rights by working with the band and the band's guidelines concerning land rights and use. Operationally, the Companies have front line contact points to address band concerns with regular communication and are proactively building and maintaining relationships with Aboriginal groups.

The Terasen Utilities are not currently subject to any litigation related to First Nations issues as significant effort is committed to successfully negotiating agreements. However, claims have been made with the suggestion that litigation might ensue on large projects currently underway or recently completed, and also with respect to facilities that have been in service for many years. In addition, the BC government has proposed new legislation which would recognize the existence of First Nations, with their own laws, governments and territories and title to land. It is not clear what effect this new legislation would have on the Companies, but it does create additional uncertainty and is likely to increase risk relating to land tenure and project execution.

In terms of regulatory liabilities, recent decisions of the BC Court of Appeal require an expanded role for the BCUC that suggests a more involved regulatory process may be required relating to First Nations consultation in applications before the BCUC, which will likely increase the cost and complexity of future regulatory applications.

29.2 Please specifically identify and show the changes from 2005 to present the aboriginal rights effects on investor-owned BC utilities. Were aboriginal rights effects on TGI an issue in the previous ROE Application (June 30, 2005)?

Response:

Aboriginal law is an evolving and complex discipline and requires diligent attention.

Although risks involving claims relating to aboriginal rights existed in 2005, those risks have significantly heightened over the last five years. There have been a number of significant changes to the law relating to Aboriginal rights and title since 2005 including those matters discussed in BCUC IR 29.1 above, as well as the 2007 BC Supreme Court case regarding the Tsilhqot'in Nation which have heightened the expectations of First Nations with respect to the extent of aboriginal title lands in BC, and which continue to refine the duty of consultation. The uncertainly in the law and potential risk associated with Aboriginal rights and title are reflected in the fact that the Companies have committed additional resources to both keep abreast of the current state of the law and to ensure that the Companies continue to conduct business in a manner that respects the social, economic and cultural interests and expectations of Aboriginal groups.

Aboriginal rights effects on the Companies were neither expressly mentioned in the previous ROE Application nor in the subsequent BCUC decision. However, the Companies' increased concern and attention to Aboriginal rights issues, and their potential effect on land tenure and project execution, is reflected in the current ROE Application as well as other recent applications before the BCUC.

30.0 Reference: Exhibit B-1, Tab 1 p. 24 Natural Gas Vs. Other Energy Source

TGI states that "Natural gas commodity pricing for consumers in BC is market based; in contrast a large percentage of the costs making up electricity rates are the low embedded costs of BC Hydro's Heritage generation facilities."

30.1 For residential sales, is it not the true that the relevant comparator is the BC Hydro Tier 2 which is a rate that resembles the cost of new generation?

Response:

The BC Hydro RIB Step 2 rate is a relevant comparator in many cases for residential sales but other factors such as the dwelling type and the additional upfront capital costs of piping, ducting and natural gas space and water heating equipment relative to comparable electrical equipment are also important considerations in the overall picture. Smaller dwellings such as townhouses and apartments use less energy for space and water heating requirements and are less likely to have space and water heating energy use coming from above the Step 2 consumption threshold. Also, the trends toward improved energy efficiency and smaller dwellings, as well as government policy and legislation promoting energy efficiency, suggest that over time a decreasing portion of the energy consumption for space and water heating will come from consumption over the Step 2 threshold, under the RIB rate structure as currently constituted.

In the case of new construction, and also in the case of end-of-life equipment replacement, capital cost differences between the gas-fired equipment and electricity based systems take on a larger prominence. In many cases it is the builders and developers that make the decision on the heating systems to install and base their decision on simple economic comparisons and their expectation of whether their selling price will recover the incremental costs of installing gas. More recently there has been an increase in the public perception that electricity should be adopted for space and water heating because it is environmentally preferable. Elements such as these suggest that while the RIB rate structure is on the surface directionally beneficial to the competitiveness of natural gas there are other factors to consider which the Companies submit mean that the premise in the question cannot be unequivocally supported.

31.0 Reference: Exhibit B-1, Tab 1 pp. 18, 27 Natural Gas vs. Other Energy Sources

The Application states that the price advantage relative to electricity has gradually declined as natural gas rates increased with rising commodity costs, while electricity rates remained relatively constant. It also states the magnitude of future electricity rate increases is uncertain as BC Hydro balances electricity self-sustainability and other government objectives going forward.

31.1 In a recent proceeding before the Commission, the BC Hydro 2008 Long Term Acquisition Plan (2008 LTAP), BC Hydro put forward evidence related to its long term rate increase forecast in real terms in that proceeding's Exhibit B-3 BCUC IR 1.7.1 Attachment 1.

Response:

Confirmed.

31.2 Please attach a copy of the 2008 LTAP Exhibit B-3 BCUC IR 1.7.1 Attachment 1 in your response.

Response:

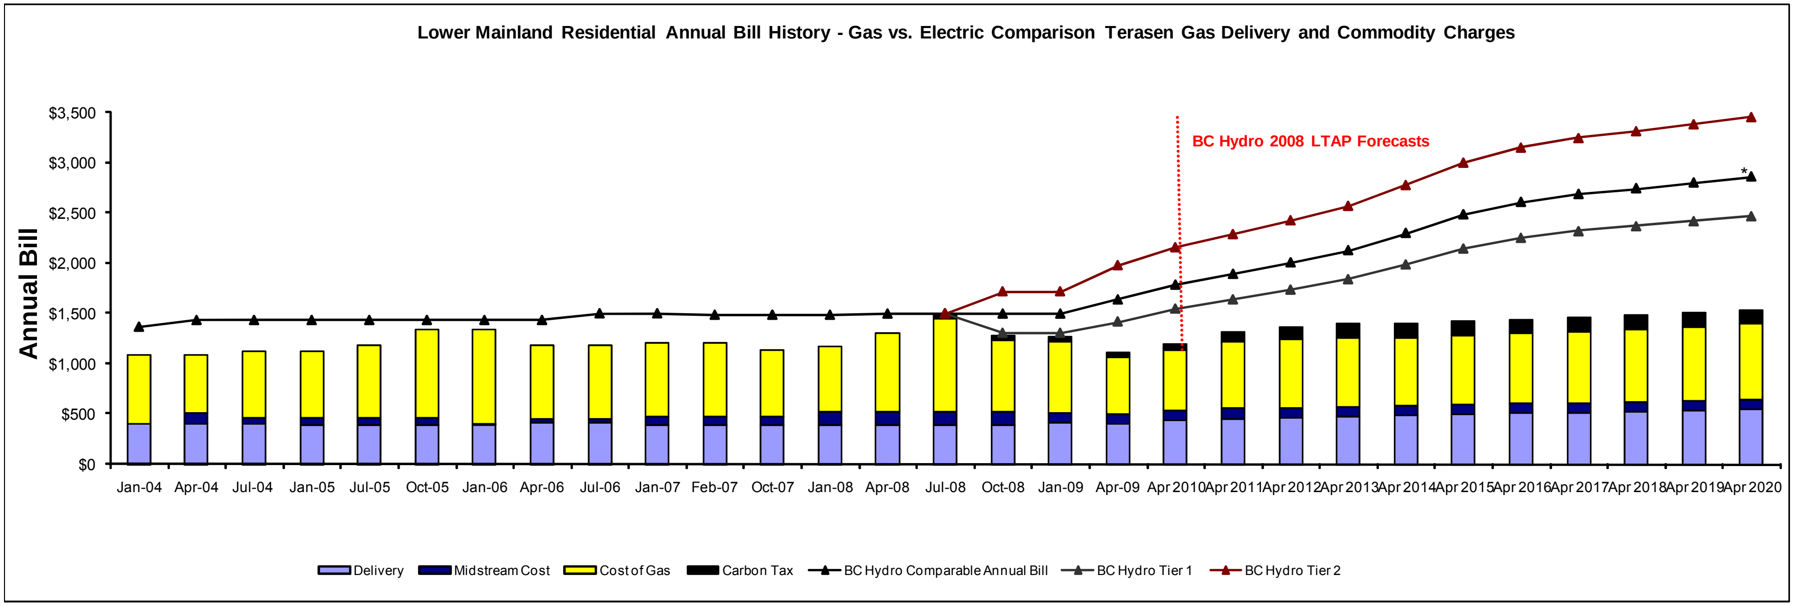
Please refer to Attachment 31.2.

31.3 BC Hydro, in Exhibit B-3 BCUC IR 1.7.1 Attachment 1 on page 7 of 9, forecasts: "For the following eight years the forecast of annual rate increases in real terms are estimated to be as follows: for F2011, 7 per cent; for F2012 through F2014, 4 per cent; for F2015 and F2016, 6 per cent; for F2017, 3 per cent; and for F2018, 1 per cent. Nominal rate increases for each year would be around 2 per cent higher, based on the forecast of inflation. As noted previously, for the F2019 to F2028 period, rates are assumed to rise at the rate of inflation (B.C. Consumer Price Index (CPI)), forecast at 2.1 per cent per year."

31.3.1 Given the electric price information from the 2008 LTAP and the gas price forecast in Figure 3.3 (Tab 1, page 28 of the Application), please provide an amended Figure 3.1.1 for the years 2004 to 2020. State the assumptions and also provide a working spreadsheet of the model.

<u>Response:</u>

See Attachment 31.3.1 for the working spreadsheet model. Amended Figure 3.1.1 follows:



Assumes:

Natural gas use of 95 GJ

Efficiency of gas equipment is 90% relative to 100% for electricity

BC Hydro amount does not include basic charge since a household already pays the basic electric charge for non-heating use

TGI Basic Charge per month and Delivery Charge per GJ for 2010 and 2011 are as per the TGI 2010 and 2011 Revenue Requirement Application and increased by 2% for years 2012 to 2020, (Rate Riders 3, 4, and 5 are held constant at 2011 applied for rates).

TGI Cost of Gas per GJ Charge is based on AECO monthly forward prices averaged for year, as at May 11. 2009

TGI Midstream Charge per GJ is held constant at rates effective January 1, 2009

Calculated BC Hydro rate based on the F2009-2010 RRA approved increase of 8.74% (inclusive of the applicable 1% rate rider)

31.4 Please discuss if one should expect the margin between residential gas rates and future Tier 2 BC Hydro residential rates to increase over the next number of years.

Response:

While the graph in the response to BCUC IR1.31.3.1 above shows that the margin between residential gas rates and future BC Hydro RIB Step 2 rates may increase over time there are many uncertainties that are not captured in this simplified depiction of the future. These uncertainties and other issues are discussed below:

- As discussed in BCUC IR 1.31.1 above the RIB Step 2 rate is not the relevant comparator to residential natural gas rates in all cases. Smaller and more energy-efficient dwellings may get much or all of their space and water heating energy requirements from electricity consumption below the Step 2 consumption threshold.

- Natural gas operating costs for space heating need to be a significantly below the comparable electricity costs in order to recover the extra upfront capital costs for natural gas space heating equipment relative to electricity. The cost of electricity needs to exceed the cost of natural gas by an amount in the order of $10/GJ (Exhibit B-1, Tab 1, Page 31, Figure 3.4).

- Carbon taxes and other disincentives against natural gas & fossil fuel consumption are likely to increase over time (beyond the $1.50 per GJ for 2012 and after included in the chart above). In addition public perceptions about using natural gas may continue to become increasingly negative.

- Residential gas rates are more subject to commodity market volatility within the annual cycle while electric rates are likely to change once per year as revenue requirements and rate changes.

- Natural gas commodity price forecasts will change over time. Economic conditions, natural gas supply / demand balance and other factors will change over time and expectations about the differentials between gas and electricity rates will change accordingly.

- The provincial government has made policy commitments in support of low electricity rates. There are several references in the 2007 BC Energy Plan in support maintaining low electricity rates, such as, for example, on p.15 where continued support for electricity trading is discussed as a means "to keep electricity rates low for all British Columbians." UCA Section 43 (1.1) from the 2008 amendments to the Utilities Commission Act now requires BC Hydro to file a report with the Commission annually comparing BC Hydro's rates to electricity rates in other jurisdictions including an assessment of whether BC Hydro's rates are competitive with those in the other jurisdictions. There is obvious conflict between the sustained high electricity rate increases forecast in the LTAP and the province's commitment to low electricity rates. Over the longer term the province's commitment to low electricity rates is likely to be a factor which will moderate the rate increases that BC Hydro will ultimately be allowed to implement.

- The 2008 amendments to the Utilities Commission Act also overturned the elements of the Commission's Decision on BC Hydro's 2007 Rate Design Application pertaining to rate rebalancing between the rate classes which, if not overturned, would have increased residential rates by more than 10% over three years. While the government's reasons for overturning portions of the 2007 RDA Decision are not known the impact of the legislation change was to reduce rate impacts for residential electricity consumers.

32.0 Reference: Exhibit B-1, Tab 1 p. 20 Business Risk

The Application states that changed public perception would lead people to increasingly turn to other alternatives to meet their space and water heating requirements over time. The Application mentions new energy alternatives such as air source heat pumps and ground source heat pumps being introduced as alternatives.

32.1 Does TGI expect that the new focus on energy conservation and efficiency and investments in energy alternatives could lead to lower demand for gas and therefore decrease in price pressure on the market-based natural gas commodity prices? Why or why not?

Response:

At this point, Terasen Gas believes that the current forward prices as presented in the natural gas marketplace reflect all currently available information relevant to natural gas supply and demand for future periods. This includes information related to increased focus by governments and customers on energy conservation and efficiency and investments in energy alternatives which, all else being equal, likely reduces demand for natural gas in the future. However, to the degree that this energy conservation and demand reduction offsets the multitude of other factors that influence natural gas prices, future prices may or may not decrease. The natural gas environment in which Terasen Gas operates is an inter-connected North American marketplace in which supply and demand are impacted by many variables. While short term factors pressuring prices downward include ample natural gas storage levels, economic downturn and mild weather conditions, longer term factors resulting in higher price levels include lower forecast natural gas production levels, rising demand from economic recovery, long run production costs and natural gas prices relative to other competing fuels (such as fuel oil or electricity). The amount of potential demand reduction created by energy conservation relative to these other supply and demand factors will determine whether or not it influences natural gas prices downward in the future and remains to be seen. It is not unreasonable to assume, all else being equal, that energy conservation leading to reduced demand and lower prices will incent producers to scale back on their drilling efforts in order to cut costs. This, in turn, would eventually lead to less available supply which, all else being equal, would result in upward pressure on future prices in order to incent producers to resume drilling activity.

33.0 Reference: Exhibit B-1, Tab 1, p. 28, Figure 3.3 Forecast Business Risks

33.1 Given the cost advantage for natural gas shown in Figure 3.3 - AECO Prices vs. Electric Equivalent Commodity Component Current Prices as of May 11, 2009, has today's forecast of the business risk decreased for the next five years?

Response:

Figure 3.3 indicates that based on the May 11, 2009 forecast gas commodity prices (forward curve), natural gas has a cost advantage against electricity on an operating cost basis over the next five years. However, it does not follow that Terasen Gas' forecast of business risk has decreased for that period. There are a number of factors and uncertainties that must be taken into consideration:

- Historical AECO prices are reflective of actual market conditions and specific events that impacted market prices. The forward curve is reflective of the market's current perception of supply and demand and cannot be predictive of market specific events that can impact near term prices. Where prices ultimately settle and become historical prices market factors can be significantly different due to the multitude of short term supply and demand variables that can influence price in the current or near term market. For example, only twelve months ago, the forward price curve for natural gas today for the same period was significantly higher than it is today. In other words, there still remains a great deal of volatility and uncertainty around future natural gas price movements, impacting the Terasen Gas cost of gas and therefore future rates (See also the Response to CEC IR 1.33.1).
- The comparison in prices are based on the assumption of 90% efficiency for natural gas relative to 100% for electricity for heating requirements, representative of high-efficiency equipment used by new customers. However it is absent any consideration of the required recovery of the up front capital cost difference and higher maintenance costs between a natural gas heated home and a home heated by electricity, as outlined in Section 3.4 of the Application, which places natural gas at a disadvantage when it comes to attracting new customers. In addition, the average efficiency of existing customers is estimated to be approximately 75% relative to electricity, which means the competitive advantage to retaining existing customers is greatly reduced.
- The comparison makes assumptions about future rate increases to BC Hydro's rates (see following response to BCUC IR 1.33.2). However, although there is general expectation that there will be upward pressure on BC Hydro rates in future years, there still remains considerable uncertain on the timing, degree of change and the impact of on Step 1 versus Step 2 rates.

The introduction of the carbon tax effective July 1, 2008 in the amount of approximately \$0.50/GJ and increasing each year by about \$0.25/GJ until 2012 when it reaches \$1.50/GJ represents a significant price disadvantage for natural gas relative to electricity which did not exist in the past. There also remains uncertainty regarding future increases to carbon taxes.

33.2 Please provide the source and forecast assumptions for the Step 1 and Step 2 Electric Equivalent Forecast.

Response:

Figure 3.3 includes a number of assumptions in the derivation of the forecast for the Step 1 and Step 2 commodity component electric equivalent prices. The base electricity rates for the forecast were derived from the BC Hydro Residential Inclining Block ("RIB") Rate Zone 1 equal to \$0.0597/kWh for Step 1 and \$0.0835/kWh (\$0.0827/kWh plus 1% deferral account rate rider) for Step 2 effective April 1, 2009 per the BC Hydro F2009/2010 Revenue Requirements Application decision. For each subsequent April, these electricity rates were increased by an inflation factor of 2% per year. In the future, it is expected that the Step 2 rate will be adjusted from period to period to reflect new information regarding the cost of new electricity supply. However, in its decision regarding the BC Hydro RIB Application, the Commission did not determine how those adjustments would be implemented and in fact in the Reasons for Decision stated that "the allocation of future revenue requirement increases between the Step 1 and the Step 2 rates will be reviewed on case by case basis each time BC Hydro makes an application to change its estimate of the cost of new supply". Nevertheless, it is generally accepted that BC Hydro's cost of new supply will be higher than the current rates however, given the uncertainty on how increases will be implemented, Terasen Gas has assumed average inflation to the electricity rates of 2% per year.

Next, these electricity rates were converted to dollar per GJ equivalents by multiplying them by a conversion factor of 277.78. Then, the prices were adjusted by a factor of 90% based on the assumption that the efficiency of new gas equipment is assumed to be 90% relative to 100% for electricity.

Following this, the Terasen Gas current fixed basic and delivery charge amounting to \$4.29/GJ and the Terasen Gas current Midstream rate of \$1.015/GJ were deducted. Given the uncertainty around future changes to these rates, it was assumed that these rates were constant over the forecast period. While it is recognized that these rates and charges may change over time, the changes are not expected to be material with respect to the electric equivalent values forecast in the figure.

Finally, the carbon tax, applicable to natural gas and not electricity, was deducted, increasing by approximately $0.25/GJ each July until 2012 and held constant at $1.50/GJ thereafter.

The result of these calculations is the forecast commodity component of the electric equivalent Step 1 and Step 2 prices which is then compared to the AECO natural gas forward price curve in Figure 3.3 to assess Terasen Gas' future competitiveness relative to electricity rates on a variable basis. The detailed calculations and formulas for this figure are discussed in the response to the following BCUC IR 1.33.3.

It should be mentioned, as outlined in Section 3.4 of the ROE and Capital Structure Application, that, as Figure 3.3 indicates, while TGI has a competitive advantage against electricity on an variable cost basis over the next five years using the current forward curve (as of May 11, 2009), TGI requires a significant operating cost advantage to overcome the upfront capital cost differential for a natural gas versus an electrically heated home.

33.3 Please provide Figure 3.3 in a working Excel spreadsheet.

Response:

Attachment 33.3 contains the working Excel spreadsheet used to derive Figure 3.3. Please note that this spreadsheet has been updated for some incorrect information relating to the Terasen Gas Midstream rates used in the calculation of the Electric Equivalent for the period April 2004 to September 2008. Figure 3.3 in the ROE and Capital Structure Application included forecast Midstream rates for some of this period as opposed to actual Midstream rates, which are now included in the spreadsheet. An adjustment for an electricity rate change effective July 2006 excluded in the ROE and Capital Structure Application has also been made and is now included in the spreadsheet. These changes are not material with respect to historical information in Figure 3.3 and do not change the forecast electric equivalent prices or their position relative to AECO forward prices.

The assumptions and basis for the calculations in the spreadsheet are discussed in the previous response to BCUC IR 1.33.2.

34.0 Reference: Exhibit B-1, Tab 1 p. 30 Business Risk - Volatility

34.1 Figure 3.3.2 has two views for each gas year: (i) a "with no market volatility" that reflects only the forward curve pricing and (ii) a "with upward market volatility" that adds a volatility adjustment factor of approximately 30 percent to the floating volumes based on historical and current market conditions. In TGI's view, which is the more likely scenario in Figure 3.3.2? Please explain your answer.

Response:

At this point in time, Terasen Gas does not know which of the two gas cost scenarios, one with no market volatility or the other with upward market volatility as presented in Figure 3.3.2, is more likely given the volatile nature of the natural gas marketplace and difficulty in predicting future natural gas price movements. Terasen Gas does not believe it should be expected to predict future gas prices or decide which scenario is more likely to occur but rather should take appropriate measures to protect customers from potential market price volatility that could occur in the future.

The best information Terasen Gas has related to future natural gas prices is the recent forward price curve as presented in the marketplace. Terasen Gas recognizes that this forward curve may change over time and so has also presented the scenario of future gas costs with upward market volatility in an attempt to illustrate potential upward price movements that may reasonably be expected to occur in the future. While there is also the potential for future downward price movements, Terasen Gas has displayed the upward market volatility scenario in order to illustrate the impacts of upward price movements on Terasen Gas' competitive position, on a variable cost basis, relative to electricity rates. In addition, there is an absolute limit to how far prices can fall due to downward price movements over the long term and current prices are below the cost of finding and development as discussed in the Application so the potential for increases is greater than the potential for decreases.

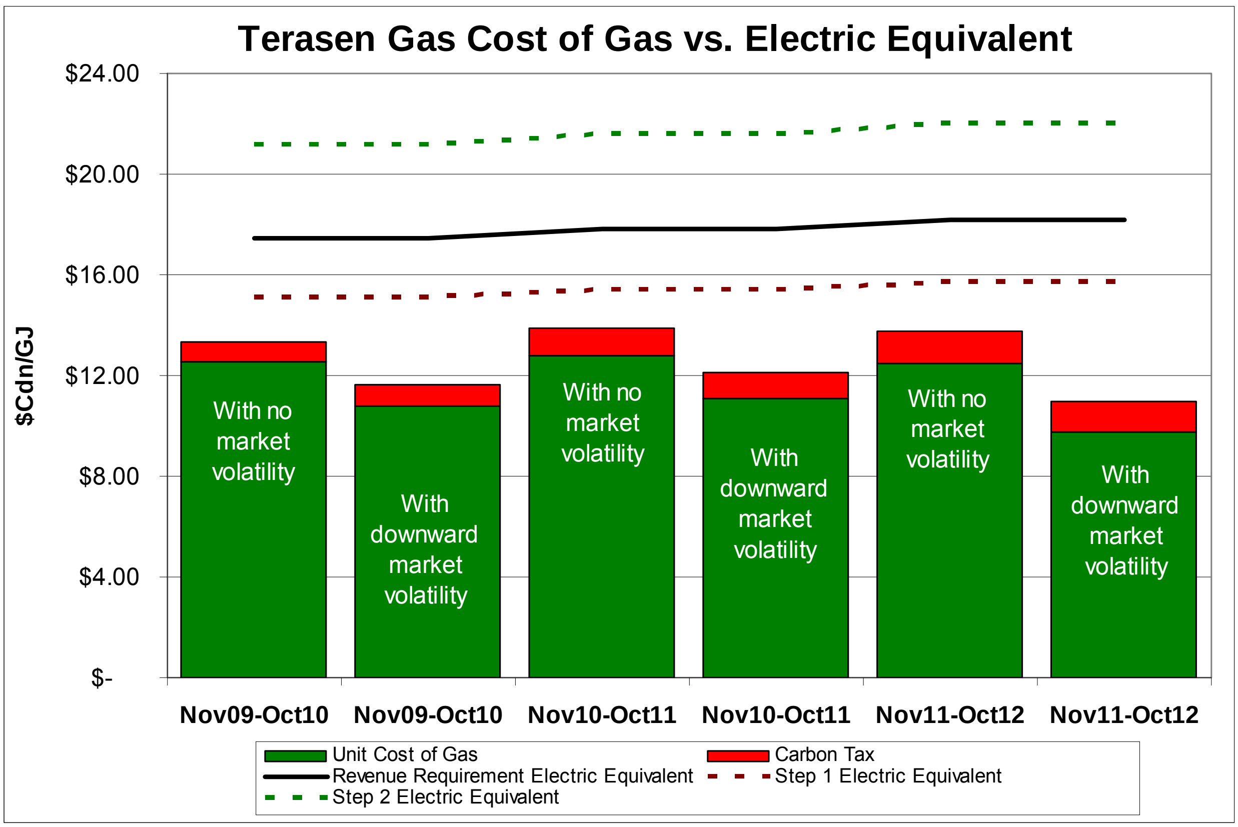
As the Application outlines in Section 3.4 regarding Business Risks, Terasen Gas requires a significant operating cost advantage to overcome the upfront capital cost differential for a natural gas versus an electrically heated home, regardless of any upward or downward market price volatility that occurs in the future.

34.1.1 Is there a third view where there is a downward pressure on gas commodity price? If not, why not?

Response:

The volatility in the natural gas marketplace could affect prices both upwardly and downwardly in the future. Figure 3.3.2 on page 30 of Tab 1 shows the Terasen Gas forecast cost of gas, with and without upward market volatility, compared to the forecast electric equivalent. This was presented to illustrate the point that upward market volatility can have a significant impact on the unit cost of gas, as has been witnessed in the past, and therefore, adversely affect Terasen Gas' competitiveness with electricity rates. Future prices could also move downwards and so Terasen Gas is presenting in the figure below a forecast cost of gas under a scenario with downward price volatility.

Terasen Gas Forecast Cost of Gas vs. Electric Equivalent



However, while one might conclude that Terasen Gas has a significant cost advantage relative to the forecast electric equivalents under this downward market volatility scenario, Terasen Gas still requires a significant variable cost advantage to overcome the upfront capital cost differential for a natural gas versus an electrically heated home as discussed in Section 3.4 of the ROE and Capital Structure Application. While Terasen Gas recognizes that future prices may move up or down, it is concerned with competing with electricity rates under either scenario, from a total cost perspective, in order to attract new customers and continue future growth. However, the potential for future upward market price pressure, which always exists in such a volatile energy marketplace, is of particular concern to Terasen Gas as outlined in Section 3.4 of the Application.

35.0 Reference: Exhibit B-1, Tab 1 p. 31 Business Risk – Alternative Energy

35.1 Please show the breakdown of the costs in Figure 3.4. For example, how is the cost of a new furnace and ducting/installations at $7,000 after calculating rebate? Why do new furnaces only last 18 years? Please provide the bases for assumptions.

Response:

Figure 3.4 is intended to illustrate cost differences between a electric baseboard and natural gas forced air system home. The actual operating cost difference that is needed to pay back the difference in the capital cost will be determined by the actual energy use in the home, the actual prices paid for the appliances, the costs to installations these appliances, and how the customer pays for the appliances.

Habart & Associates Consulting Inc. estimates the cost of ducting at between $2 and $3 per sq ft of house space, and $1,700[15] for a 90% AFUE furnace; the costs Terasen Gas provided in Figure 3.4 is based on a 2,500 sq ft house. The table below represents only the capital cost for purchasing and installing a natural gas forced air system.

Habart & Associates estimates the cost to install electric baseboards in a 2,500 sq ft home for the contractor to be about $2,500.

Capital cost for High Efficient Furnace (90% AFUE)	$1,700.00[1]
Ducting and installation ($2 X 2500 sq ft)	$5,000.00
Furnace installation	$300.00
Total	$7,000.00

The comparison is cost to the customer (in this case, the builder) and does not account for any grants or rebates that the developer may receive. Due to the varying availability of grants or manufacture rebates a rebate has not been used in the example. A further reason that a rebate was not included in this calculation is that rebate programs can come and go over time

The 18-year service life is supported by research conducted by the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. (ASHRAE) Terasen has consistently

---

[15] Price provided by Habart & Associates is congruent with contractor pricing, in the February 2009 Refrigerative Supply catalogue. This is the price the builder or developer would pay from the wholesaler for a new home. In a retrofit application, the home owner would pay the contractor a retail price of about $3,200.

used a 18 years service life in other fillings to the BCUC and any life cycle cost analysis we conduct.

35.2 Is TGI informed by market research studies with respect to decision-making over the choice of electric baseboards and natural gas forced air heated homes? Do customers prefer natural gas forced air furnace to electric baseboards? Please provide the conclusions of those studies used by TGI.

<u>Response:</u>

Primary Market Research at Terasen can be broadly divided into four streams:

- customer satisfaction;
- program evaluation;
- consumer behaviour and attitudes; and
- ad hoc.

Each study is designed to meet the needs of various internal and external stakeholders, including the BCUC. They provide information necessary to meet regulatory reporting requirements; to undertake enhancements to customer service; improve program effectiveness, and assist management in the decision making process.

There are five customer satisfaction surveys undertaken each year. Three of the studies: Small Commercial, Large Commercial, and Builders and Developers are conducted annually. A fourth, Residential, is fielded three times a year, while the fifth, the Customer Satisfaction Tracking Study ("CSTS") is continually fielded throughout the year. Scores from the first four studies are used to develop the Customer Satisfaction Index Score which is reported to the BCUC. The CSTS is a transactional based study, the results from which are used both as a teaching tool for field staff and to monitor customer satisfaction with Operations performance in three areas: Emergency Response, Meter Exchange, and New Service Installations.

Other studies that are undertaken on a regular basis include the Gas Safety Awareness (every three years), the Residential End Use Study (4-5 years) and the Corporate Image Study (two years). Ad hoc studies are conducted to meet specific needs such as in the support of project or program development activities. An example would be studies related to the Terasen Customer Care Enhancement Project that was filed as a CPCN Application in June 2009. Ad Tracking studies are conducted during large scale, long-term advertising campaigns to gauge their effectiveness and to assist with the development of marketing and communications materials in support of the campaign.

Part of the 2007 Ad Tracking Study explored commitment to home heating systems and perceptions of different home heating fuel types among BC residents (customers and non-customers). These specific questions were developed in mid-April 2007 and asked between April 25 and November 4. Conversion Model™ segmentation was used to understand the residential home heating market. Conversion Model is a way of understanding customer commitment and customer acquisition. This was used to provide Terasen Gas with greater understanding of the usage and predispositions toward various forms of home heating systems, whether they are fueled by gas or alternative types of energy.

In particular, the Conversion Model analysis for the Ad Tracking Study was designed to answer the following questions:

- Which are the strongest heating systems in the residential market?
- Which heating systems are threats to Natural Gas usage?
- Which home heating systems are opportunities for market share gains?
- Which heating systems should Terasen Gas target with marketing campaigns?
- What attributes or messaging should be used by Terasen Gas to influence homeowners to desire gas-based home heating systems?

The report concluded that commitment to forced-air heating using a gas furnace was greater than commitment to electric baseboard heaters among users of these heating technologies. This was consistent across all three regions (Lower Mainland, Interior and Vancouver Island). However it should be noted that approximately half the forced-air/gas furnace users were not committed to the technology and even among those committed to the technology the majority were not entrenched in their commitment. Furthermore the report concluded that greater than one-in-three were unhappy with their current heating system and were seeking to replace it with an alternative. The study also found that commitment levels to current heating technologies were lower than other utility global norms.

The study also assessed the attraction of each of these heating systems to non-users. In all three regions, electric baseboard heaters had substantially lower attraction than forced-air gas furnaces. However the study did not consider the importance of heating systems when consumers purchase homes and as such we cannot provide an assessment of the relative importance of heating system type against other factors such as cost, location, living space etc. And while one of the study's objectives was to isolate what attributes or messaging should be used by Terasen Gas to influence homeowners to desire gas-based home heating systems further research will be required to see if any increased desire on the part of the customers translated into a greater willingness of builders to provide natural gas heating.

The annual Terasen Gas Builder and Developer Study does not address the issue of motivation for installing natural gas in new homes. Furthermore, builders who do not install natural gas are not included in the study. Therefore we have no way of assessing whether or not consumer demand drives heating technology choice. Given the relatively low levels of commitment to heating systems identified in the study it would be reasonable to conclude that heating system type is not top-of-mind when a home is being purchased. As a consequence, it is likely that builders and developers are influenced more by the cost of each heating technology type rather than consumer demand for a particular heating fuel or technology. This conclusion is supported by TGI low capture rate in multi-family dwellings.

36.0 Reference: Exhibit B-1, Tab 1 p. 33 Business Risk

36.1 The Application states that code changes have resulted in approximately a doubling of costs. Please detail the code changes that have doubled the cost of gas hot water tanks? Show the average actual retail prices over the past several years for various models.

Response:

In the Application on page 33 of the Business Risk (Tab 1), there was a misstatement. The doubling of costs related to water heaters is caused by increases in installation costs due to code changes for new construction, "not for safety related changes".

Installation costs for gas water heaters have doubled due to minimum furnace efficiency requirement that took effect on January 1, 2008[16]. Due to the type of vent required for high efficient gas furnaces, the hot water tank is no longer able to share the same vent as the furnace. As a result, the costs to install a gas water heater include the costs for a separate vent, framing, roof penetration, and indirectly, lost of sellable floor space. Material costs for a 4" B Vent are about $300 to $400, labour cost associated to the installation, framing, and roof penetration are about $600.The location of the mechanical room is dictated by where the vent for the water heater can be installed.

After the new replacement regulations for gas furnaces come into effect December 31, 2009,[17] the cost to the homeowner to vent an existing gas hot water heater will be considerable. Once the existing furnace is replaced with a furnace with CPVC venting the existing "B Vent" will need to be replaced with a smaller 'B Vent'. Material costs for a 4" B Vent are about $300 to $400, the labor cost for the installation is difficult to estimate for existing homes and could be in the range of $200 to $500.

As the doubling of cost of gas water heaters was misstated, it is not necessary to show the average actual retail prices over the past several years for various models. However, the average cost for a 40-gallon gas hot water tank is about $500³ and a 60-gallon tank is about $750.00[18].

---

[16] A new mandatory minimum furnace efficiency requirement that took effect on January 1, 2008 for new residential, commercial and institutional construction under the provincial *Energy Efficiency Act* and the Energy Efficiency Standards Regulations. The minimum efficiency for natural gas forced air furnaces must achieve an Annual Fuel Utilization Efficiency (AFUE) equal to or greater then 90%.

[17] A new mandatory minimum furnace efficiency requirement will take effect on December 31, 2009 for replacement application in pre-existing residential dwellings also under the provincial *Energy Efficiency Act* and the Energy Efficiency Standards Regulations. The minimum efficiency for natural gas forced air furnaces must achieve an Annual Fuel Utilization Efficiency (AFUE) equal to or greater then 90%.

[18] Prices from the Home Depot and do not include installation.

36.2 Do the new tanks have any operational advantages or longer expected life?

Response:

For residential gas water heaters there have been no changes to operating efficiencies since the EF was set at .67 -.0005V in September 2004 i.e. a 40 gallon tank would be .65 (40 – (.0005 X 40).

Installation "best practices" can reduce standby losses, by installing thermal traps and insulating accessible piping. The life expectancy has not change in the past few years, however regular maintenance can extend the service life and help maintain its operating efficiency.

37.0 Reference: Exhibit B-1, Tab 1 p. 33 Business Risk

37.1 Please explain why TGI is only able to capture 18% of multiple unit construction? With the large margin between gas and Tier 2 RIB rates, does TGI anticipate improving its performance in the future?

Response:

There are a number of factors that influence TGI's capture rate of multi-family dwellings, including the installation costs, physical space requirements, operational costs, and of course the demand associated with the particular energy source.

The low capture rates experienced by TGI in the multi-family dwelling sector are a reflection of the behaviour exhibited by builders/developers, who in most cases choose to install electrical space heating equipment over natural gas. There are a number of factors that are influencing their decision, with the most significant being the higher capital and installation costs associated with natural gas space heating (as compared to electrical baseboards). Further, multi-family units are smaller than single family detached homes, and as such natural gas space heating in multi-family dwellings can be a more difficult installation. Lastly, in many cases it does not make sense for a developer to install gas heating appliances in individual suites as the heating equipment takes up valuable square footage that can be used for another purpose.

Developers tend to install equipment that they believe meets customer desires and provides the greatest margin, or return on developers investment. Though the Tier 2 RIB rate is in effect, we do not believe, and have not seen evidence that, the price spread between the Tier 2 Rate and gas rates is enough to translate into increased demand from end use customers to limit the use of electricity for heating applications. Secondly, due to the smaller size of multi-family dwellings compared to single family detached buildings, there is less electricity used to heat a multi-family unit and therefore, a smaller portion of the customer's electricity bill would be priced at the Tier 2 RIB rate.

Lastly, Developers are currently being encouraged by local policy to build projects that achieve some level of "green" certification, through rating systems such as LEED and Built Green. This results in additional construction costs to earn credits within the rating system to achieve the certification. These rating systems allow certification to be achieved with electric baseboard heating. The developers then choose this lowest capital cost heating alternative to offset some of the additional related construction costs. The unintended consequences are more encouragement to install electric baseboard heating.

Due to these factors, a developer is currently still incented to install the lowest cost heating application (electricity), as the margin on an electrically heated home is higher than that of a gas heated home. TGI is certainly working towards improving its capture rates in this customer segment, and continues to maintain ongoing communications with the builder/developer community, promoting the use of natural gas and increasing awareness with regards to natural gas being part of the long-term solution to climate change. Since 2004, we have increased and refocused our sales staff to focus on the multifamily and vertical subdivision sector. Our sales staff have been focused on meeting with, and putting on workshops for builders, developers, architects and engineers to educate and influence the choice of heating applications. We have changed our main extension test and added an option to "pipe to the suite", both having been approved by the BCUC, to help ensure that gas remains a competitive option for both developers and end use customers.

However, absent formal policies in British Columbia which identify the right fuel for the right application at the right time and that specifically encourage end use gas applications, it is reasonable to assume that British Columbian's will continue to view natural gas as a fossil fuel that is contributing to the global climate change issues. It is also reasonable to assume the significant difference in installation costs between natural gas space heating and electrical baseboard heating will continue. Given this, it is reasonable to assume that even with the high level of marketing efforts we continue to provide, and also the margin between gas and Tier 2 RIB rates, only marginal increases to capture rates for multi-family dwellings will occur.

38.0 Reference: Exhibit B-1, Tab 1, p. 37 Current government policies and initiatives

"Gas use should be encouraged, as the right fuel for the application, but current government policies and initiatives provide consumers with a contrary message."

The 2007 BC Energy Plan on page 21 states: "It is important for British Columbians to understand the appropriate uses of different forms of energy and utilize the right fuel, for the right activity at the right time. There is the potential to promote energy efficiency and alternative energy supplemented by natural gas."

38.1 Does the 2007 BC Energy Plan acknowledge that natural gas plays a role in the energy mix used in British Columbia?

Response:

The Terasen Utilities agree that the referenced quote from the 2007 BC Energy Plan acknowledges a role for natural gas in the energy mix in British Columbia. Other policy action items in the 2007 BC Energy Plan are clearly supportive of growth and development of the natural gas resource base in the province. The Terasen Utilities have been active in drawing attention to these aspects of the 2007 BC Energy Plan in various Commission proceedings such as the BC Hydro 2007 Rate Design Application and the BC Hydro 2008 LTAP proceeding.

Subsequent to the issuance of the 2007 BC Energy Plan, however, the provincial government has issued various pieces of legislation such as the Greenhouse Gas Reduction Targets Act (Bill 44 - 2007), the Greenhouse Gas Reduction (Cap and Trade) Act (Bill 18 - 2008), the Carbon Tax Act (Bill 37 - 2008) and others which have placed considerable uncertainty on what the province's view is of using natural gas in the province. Although the Terasen Utilities have advocated for the view that natural gas should be put to its highest and best use in high efficiency space and water heating, both within the province and elsewhere, various other participants in the public discussion of energy issues in BC expect a future in which the role of natural gas is reduced relative to today.

39.0 Reference: 2008 Annual Report Business Risk

39.1 Please provide a copy of the most recent Terasen Inc. Annual Report with the covering letter from Mr. Jesperson, President and CEO.

Response:

Please see Attachment 39.1.

39.2 The Annual Report speaks in glowing terms to the continuing strong financial and investment results and the stability, growth and excellence for the future. Why is this document so different in its tone and expectations to Tab 1 of the Application?

Response:

The Terasen Utilities see no difference or conflict in what appears in the annual report and this Application. They are in effect two sides to the same coin.

The letter demonstrates factually the Companies' ability to show a steady progression in improved results, including financials, through effective resource allocation and business risk management under incentive regulation, prudent investment of growth capital, and overall cost containment.

Stability, past and present, largely rests on the continuation of a progressive regulatory environment which keeps management focused on things over which they have the greatest ability to influence and avoids penalizing investors for management operating in a fashion which is in the best public interest. The effective combination of incentives, deferral arrangements such as the Revenue Stabilization Adjustment Mechanism (RSAM), EEC programs, etc. provide for aligning the interests of the Company and its customers as well as the importance management places on maintaining positive stakeholder communications/relations, etc.

Looking forward, confidence is based upon maintaining strong business processes and the culture of operational excellence we have evolved related to maintaining a strong safety focus, customer satisfaction levels, prudent financial/cost management and operating in an environmentally responsible fashion. Terasen will strive to maintain the strength and depth of the management team who, assuming the Company will be allowed an opportunity to earn a fair return in the future, are committed to pursuing value added growth opportunities such as the LNG project at Mt. Hayes, the Whistler pipeline extension, alternative and district energy systems, etc.

Importantly, and as included in the referenced disclosure documents and other sources of public information, Terasen believes that the Canadian regulatory environment including BC, is on the threshold of remedying the growing gap between current allowed returns and those required to meet the legal fair return standard. Canadian regulators are taking notice of the growing body of evidence that the current formula based returns are too low and out of step with comparable utilities in other jurisdictions. A case in point is the recent TQM decision which increased the effective ROE by almost 300 basis points and which recognized that US utilities which have consistently been granted higher returns and more robust capital structures by their regulators were reasonable comparators for Canadian utilities. Numerous studies and papers in recent years have commented on the inadequacy of Canadian formula based regulated rates of return including studies commissioned by the OEB and CGA.

In its 2006 decision the BCUC gave credence to the comparable earnings approach to estimating a fair return but gave little or no weight to the results. Additional data to support this approach is presented by the expert witnesses in this proceeding. So while the Company has established a solid track record of financial performance and growth and is optimistic about its prospects for the future, it is in large measure dependent on being granted both a fair and reasonable return and an appropriate capital structure to foster the investment climate needed to meet customers' evolving requirements in the future and assist in dealing with the challenges relating to climate change and energy and environmental policies both Provincial and Federal. With the expiry of PBR and related incentive earnings, even greater importance is placed on the Commission ensuring that investors are afforded a fair return using comparables as a key determinant. This Application places the evidence before the Commission that will allow it to establish such a return for the Terasen Utilities and help us to ensure that the energy needs of the province are met in the years to come.

40.0 Reference: Exhibit B-1, Tab 1 Business Risk

40.1 In TGI's view, which of the following is the biggest component of business risk currently faced by TGI: supply risk, market risk, regulatory risk, competitiveness, operating risk? Please quantify and rank in order of significance.

Response:

In TGI's view, and given the definition of business risk in the Application being the ability to of the utility to earn a fair return on its investment and recover that investment over time, the risks in order of significance are:

1. Regulatory risk
2. Market risk
3. Competitive risk
4. Operating risk
5. Supply risk

It is not possible to quantify such risks precisely other than in gross terms but generally the ranking of the significance of each factor is influenced in part by how well TGI can control or mitigate such risks.

In the case of regulatory risk, the Commission acts pursuant to its powers under the Utilities Commission Act, but within that framework has significant discretion in the exercise of those powers. Cost of service items may be approved or denied that impact the Terasen Utilities ability to recover the investments required to serve their customers. The Commission establishes the level of return that is allowed to be included in rates. If that return is not sufficient to achieve a fair return then which the Company asserts is currently the case under the AAM, then this goes to one of the fundamental tenants of the definition of business risk. As a rule the Commission avoids retroactive rate making so the Company will never be in a position to recoup the foregone return on its investment due to the current gap between the approved ROE and a fair return on equity.

Market risk and competitive risk are inter-related and it is difficult assess which one is of greater significance than the other. The Company understands market risk to be factors that impact demand for natural gas and other energy forms. These will include economic conditions and activity, customer attitudes and perceptions, government policies that impact energy use and conservation, tax policies, business conditions and restrictions on operations including Aboriginal Rights, etc. These can lead to impacts on demand/throughput even when actual rates are competitive with other energy forms.

Competitive risk is generally seen as related to the price competitiveness of natural gas against other energy forms, however as noted above, changing customer preferences and influences can shift demand away from natural gas even when it enjoys an apparent operating cost advantage as is currently the case due to recent softening in gas commodity prices. On a life cycle basis, as discussed in Tab 1 of the Application at page 31, natural gas must achieve an operating cost advantage of more than $10 per Gj in order to offset the higher capital cost of natural gas equipment versus electric heating which is not the case even with the current lower commodity costs and the market forward pricing of natural gas is increasing. These factors affect new customer attachment decisions and equipment replacement decisions at the end of their useful lives or on an accelerated basis in response to energy efficiency and conservation programs of Terasen or BC Hydro.

Operating risk is generally within the control of TGI and can be managed through effective use of risk management policies and controls and through insurance. The Company has a strong track record and long history of providing safe reliable gas delivery service to its customer base and delivering major construction projects on time and within budget. The inherent nature of natural gas requires that adequate safety precautions and procedures be established and maintained to control such risks and TGI has put these in place for all its operations. That said there are factors beyond the reasonable control of the Company such as damages by third parties and natural events that can have a detrimental impact on the system. The Company carries what it considers to be adequate levels of insurance coverage for such reasonably foreseeable events short of total destruction of the system.

Supply risk can be defined as being able to source and obtain adequate supplies of natural gas to meet forecast peak demand of customers throughout the year. For near term supply risk, the Company prepares an annual Price Risk Management Plan and an Annual Contracting Plan, both of which are approved by the BCUC each year and individual supply contracts are filed with the Commission. The Company manages its supply portfolio and transportation and storage resources to ensure it can meet its requirements. The Company is dependent on the WEI transmission system in BC for the bulk of its natural gas supplies and a sustained outage on that system could impair its ability to continuing to serve all the customers on the TGI, TGVI and TGW systems. Short of connecting addition supply resources out of Alberta there are limits to what additional risk mitigation can be achieved in this area. Over the longer term, security of supply is a risk that can only be managed contractually. The Terasen Utilities do not own any gas producing resources and the Western Canada Sedimentary Basis is experiencing production declines. New sources of supply from shale deposits are being developed in Northern BC and there is the prospect of offshore gas being developed some time in the future though that is indeterminate at this time. There is also the potential for sourcing LNG supply into BC at some point in the future though no projects are currently at a stage of development sufficient to proceed.

40.2 TGI has not included an analysis of Supply risk, Operating risk and Regulatory risk in Business Risk Tab 1. Although some of these topics are commented on by the external expert witnesses hired by TGI, they should be addressed by the Company. Please provide an assessment of all business risks faced by TGI and the mitigation measures approved by the BCUC.

Response:

Regulatory Risk

As discussed by the external witnesses, the Terasen Utilities face regulatory risk in terms of the allowed ROE being established by the AAM, which yields results that are below the Fair Return Standard. In addition, the equity component of the capital structure of TGI as allowed by the Commission for rate-setting purposes is lower than appropriate. Both of these issues are addressed in this Application.

The BCUC has, in some of its proceedings, adopted capital cost caps or limitations, which can inappropriately transfer to the utility risks that are beyond its effective control.

The BCUC allows only taxes payable to be recovered in rates, which defers the recovery of taxes from customers to future periods, when competitive pressures or other business pressures may preclude or diminish the recovery of those taxes. This is in contract to US jurisdiction that allow deferred or normalized taxes to be recovered in current rates.

The regulatory process in B.C. has been affected by special directions to the BCUC and by legislation. Residential customers of BC Hydro have been sheltered from rate increases by legislation, which affects the competitive position of the Terasen Utilities in those markets. As discussed in the Application, the Provincial government has enacted GHG and other climate related legislation, and has amended the Utilities Commission Act to further its objectives.

In areas other than ROE and capital structure the regulatory environment in B.C. for the Terasen Utilities has generally been positive, but directions to the Commission that require the regulatory regime to assist in accomplishing the government's GHG and climate control objective could present serious challenges to the Terasen Utilities in future.

Supply Risk

To deal with Supply Risk, Terasen Gas has a long stand practise of preparing an annual Price Risk Management Plan ("PRMP") and an Annual Contracting Plan ("ACP") both of which are approved by the BCUC each year and individual supply contracts and hedging transactions are filed with the Commission. While the focus of the PRMP is on cost stability in a volatile natural gas marketplace, the ACP forms the physical gas supply resources to move gas from trading hubs to the Terasen Gas transmission system. These resources include: supply portfolio (commodity), transportation and storage resources to ensure firm delivery to customers.

The physical delivery of supply resources to the Terasen Gas system is dependent on the natural gas infrastructure that is in place in the Pacific Northwest and Alberta. The Company is heavily dependent on the WEI transmission system in BC for the bulk of its natural gas supplies and a sustained outage on that system could impair its ability to continuing to serve all the customers on the TGI, TGVI and TGW systems. The largest supply of gas into the Terasen Utilities' system comes from the Westcoast system. In addition to its Aitken Creek storage movements on Westcoast's T-North and T-South system, the Company purchases the majority of its gas supply from Station 2 and flows it down on Westcoast's T-South for consumption in the market areas. Aside from supply from Aitken Creek storage, a vast majority of the supply at Station 2 (over 80%) originates from three large processing plants on the Westcoast system. The reliability of Westcoast's processing plants and delivery systems are of utmost importance to Terasen Gas and its customers. Disruptions on Westcoast, in particular, during cold weather can have significant gas supply consequences for the Company given the magnitude of reliance that is placed on this system. While the Terasen Utilities has developed a diversified resource portfolio comprised of market-area Huntingdon supply, market area storage contracts, SCP-delivered AECO and Kingsgate supply and on-system LNG, a high reliance on the Westcoast system will continue to be a reality creating supply risk, unless other significant infrastructure is developed that allows Terasen Gas to move significant supplies to its service areas (Terasen is not aware of plans for any such infrastructure development).

Over the longer term, security of supply is a risk that can only be managed contractually. These contractual arrangements more than likely involve making a commitment to gas supply over a long term to fund the development of infrastructure for the region. The Terasen Utilities do not own any gas producing resources and the Western Canada Sedimentary Basis is experiencing production declines. New sources of supply from shale deposits are being developed in Northern BC and there is the prospect of offshore gas being developed some time in the future though that is indeterminate at this time. There is also the potential for sourcing some LNG supply into BC in the future though no projects are currently at a stage of development sufficient to proceed.

As the Pacific Northwest continues to grow, which increases the demand for energy for the region as whole, all utilities (both electric and natural gas) are continually reviewing the need for new infrastructure projects that help meet these requirements. Terasen Gas has played an active role in recent years from a planning perspective through such organizations such as the Northwest Gas Association. Terasen Gas has also been proactive in making commitments to infrastructure in the region, such as securing long term contracts that resulted in a expansion Jackson Prairie storage. Closer to home, TGI has made a commitment to the Mount Haynes LNG project located on Vancouver Island. These commitments help TGI manage the energy needs of our customers, while also diversifying supply resources.

Terasen Gas will continue to mitigate supply risk in the short term through the development of its Annual Contracting Plan, providing diversity within the commodity, transportation and storage resources portfolio as well as in the longer term by continuing to monitor, and participate in, regional infrastructure developments and opportunities that benefit core customers.

Operating Risk

The company is exposed to various operational risks, such as pipeline leaks; accidental damage to, or fatigue cracks in mains and service lines; corrosion in pipes; pipeline or equipment failure; other issues that can lead to outages and/or leaks; and other accidents involving natural gas or propane which could result in significant operational disruptions and/or environmental liability.

A major natural disaster, such as an earthquake affecting the Greater Vancouver region or Vancouver Island, could severely damage Terasen Gas' or Terasen Gas Vancouver Island (TGVI) natural gas transmission and distribution systems.

Terasen Gas and TGVI natural gas transmission and distribution systems require ongoing maintenance, improvement and replacement. If the systems are not able to be maintained, service disruptions and increase costs may be experienced.

The company maintains comprehensive facility risk assessment, pipeline integrity management and damage prevention programs and pipeline security systems as preventative measures to mitigate the risk of pipeline failure or other loss of system integrity. These programs are intended to reduce both the likelihood and severity of the business interruption and/or environmental liability that could result from a pipeline failure or loss of integrity. The company also has an insurance program which provides coverage for business interruption, liability and property damage, although the coverage offered by this program is limited.

Terasen completes an annual risk assessment to identify principal risks to the organization using a Board approved Enterprise Risk Management Framework. Two Operational Risks have been identified as principal risks to the organization. Following is a brief summary of the risks identified and mitigation strategies:

1. Infrastructure Failure – Catastrophic failure of natural gas or propane infrastructure could result in significant injuries, loss of life or wide spread outages.

   Mitigation Strategies

   - Integrity Management Plan (IMP)/Hazard Mitigation Programs per Annex N of CSA Z662 (covers external interference, corrosion, natural hazards, equipment failure, manufacturing defects and operator error). Included will be regular reviews of programs, plus implementation of program metrics to ensure programs are mitigating risks as expected.
   - The TGI system includes pipe assets that are in excess of 40 years old. As these assets age, the potential for incidents increases. To mitigate this risk, the IMP includes many activities to monitor asset condition, with frequencies established based on industry and company experience. This would include the following:
     i. Natural Hazards Database
     ii. Permit Process
     iii. Vegetation management on a 5 year cycle
     iv. Pigging (in-line inspection procedures)
     v. Preventative Maintenance program
   - High risk areas like LNG plant are on a specified assessment cycle complete with their own integrity plans.
   - Environment, Health & Safety plans.
   - Assessments and audits completed on within regular cycles.
   - Transmission Operations System Review (TOSR)
   - Seismic Risk Review

2. IT System Failure – Loss of functionality of IT servers in the data centre at Surrey Operations could result in limited ability to utilize some business applications.

   Mitigation Strategies

   - Terasen has initiated the "Disaster Recovery Services Project" to assist in defining the organization's IT disaster recovery requirements and to provide recommendations on recovery strategies and level of planning necessary to support current and future needs. Business continuity and technology recovery strengthen Terasen's emergency preparedness program by ensuring critical and essential business processes are restored within pre-established recovery time objectives. It also plans for the recovery of the remaining business operations, allowing for the ultimate return to a permanent operating environment.

- Terasen has also taken the following proactive measures:

    i. Construction of the data centre room to earthquake specifications.

    ii. Non-water fire extinguisher

    iii. Back-up generator

    iv. Regular anti-virus updates

WRITTEN TESTIMONY OF MR. CARMICHAEL

41.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael p. 6

In his written testimony, Mr. Carmichael says that the formulas "incorrectly assume that utility ROEs should decline proportionately with the forecast Canada long bond yields."

41.1 In Mr. Carmichael's view, is this assumption incorrect since 1994 when the AAM was first introduced? If so, why were the formulas supported by the utilities, the rating agencies and the stakeholders? If not, please specify the particular financial and capital market circumstances where the assumptions underlying the formulas would become incorrect.

Response:

Prior to 1994, regulators in Canada considered a broad range of factors in determining an appropriate capital structure and return on common equity for a utility. These factors included the expected outlook during the utility's test year for the national economy, expected levels of corporate profitability and capital re-investment, developments in and the outlook for capital markets, changes in the utility's risk profile and estimates for the utility's cost of common equity based upon the comparable earnings test (an accounting based determination of historic and expected returns on book common equity), the discounted cash flow test (a determination of the capital market's required rate of return) and the capital asset pricing model/equity risk premium test. Regulators reviewed this information and determined an appropriate capital structure and return on common equity for the utility based on informed judgment and expected conditions during the company's test year. This process was time consuming for the regulator as well as utility management and frequently resulted in only marginal changes in the utility's capital structure and rate of return on common equity. The adoption of the automated adjustment mechanism gave rise to a more transparent, more predictable, more timely (that is, the application of the formula process reduced the likelihood of regulatory lag), significantly less time consuming approach to the setting of a return on common equity. In the first few years following its introduction, the automatic adjustment mechanism gained some support from utilities, credit rating agencies and equity analysts due to the above positive attributes of the process.

The adoption of the automatic adjustment mechanism did however defer the review of an appropriate capital structure for the utility to a generic hearing which generally has occurred every four to five years rather than annually. In addition, the adjustment mechanism presupposes that changes in the utilities risk profile or a change in the required common equity return for other reasons will be compensated for by the changes in expected long term Government of Canada bond yields. As long term Canada yields have generally declined since 1994 (the BCUC expected average 30 year bond yield to be 7.75% in 1994), many customer-based participants in the regulatory process supported the use of the formula as returns on utility common equity have declined from approximately 10.75% to a current level of 8.47%, a decline of approximately 21%. Additionally, from time-to-time, the market for corporate risk tightens driving up the required equity risk premium while, at the same time, lenders "flee" to Government of Canada bonds driving down their yields. The decline in Government of Canada yields leads to a lower return on common equity produced by the formula.

The National Energy Board identified the problem of declining government bond yields and increasing corporate spreads in it recent Decision RH-1-2008, quoted below.

Support for the automatic adjustment mechanism coming from utilities and capital market participants began to recede in 2000 and 2001as such participants became aware that returns on common equity awarded in Canadian jurisdictions using an automatic adjustment mechanism tended to be lower (and in certain instances substantially lower) than returns awarded in the United States where returns on equity were being reviewed in a traditional fashion rather than being set mechanically. This difference in the awarded rates of return on common equity in Canada and the U.S. was presented in graphical form on page 43 on Mr. Carmichael's pre-filed testimony.

In a recent review of the National Energy Board's RH-2-94 automatic adjustment mechanism outlined in decision RH-1-2008 for Trans Quebec & Maritime Pipelines, the NEB concluded

> Also, the Board is of the view that there have been significant changes since 1994 in the financial markets as well as in general economic conditions. More specifically, Canadian financial markets have experienced greater globalization, the decline in the ratio of government debt to GDP has put downward pressure on Government of Canada bond yields, and the Canada/US exchange rate has appreciated and subsequently fallen. In the Board's view, one of the most significant changes since 1994 is the increased globalization of financial markets which translates into a higher level of competition for capital. When taken together, the Board is of the view that these changes cast doubt on some of the fundamentals underlying the RH-2-94 Formula as it relates to TQM.

> The RH-2-94 Formula relies on a single variable which is the long Canada bond yield. In the Board's view, changes that could potentially affect TQM's cost of capital may not be captured by the long Canada bond yields and hence, may not be accounted for by the results of the RH-2-94 Formula. Further, the changes discussed above regarding the new business environment are examples of changes that, since 1994, may not have been captured by the RH-2-94 Formula. Over time, these omissions have the potential to grow and raise further doubt as to the applicability of the RH-2-94 Formula result for TQM for 2007 and 2008.

It is Mr. Carmichael's opinion that the National Energy Board has identified the economic and financial market circumstances under which the formulas employed by the NEB and the BCUC (which are similar) will calculate very doubtful results. The recent significant decline in Government of Canada long term yields and the expansion of corporate spreads has exacerbated the already existing doubts of capital market participants. These factors likely triggered a decision by the NEB to initiate a review of the RH-2-94 Decision at this time.

42.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael p. 6

42.1 At page 6 of Mr. Carmichael's evidence he states that utility equity bases in Canada have been consistently lower than those in the US. What independent analysis has he done on Canadian vis-à-vis US regulations as they impact gas utility sales risk, commodity cost risk, prudency disallowance risk, or interest rate risk.

Response:

As part of Mr. Carmichael's investment banking activities, he has followed the deregulation of gas and electricity markets in the United States and Canada and formulated credit rating and financing strategies for Canadian companies operating in these industries. He has been involved in creating credit rating presentations on behalf of Canadian utility clients in advance of their initial rating by Moody's, Standard & Poor's and DBRS. These rating agencies as well as large sophisticated lenders and equity investors focus on the regulatory environment in which the prospective issuer of securities operate as each group attempts to understand the differences in regulation and other business risks faced by Canadian utilities versus those in the United States.

In preparation for this evidence, Mr. Carmichael updated himself on a number of regulatory developments in the U.S. In particular, he reviewed the concept of a "margin decoupling tracker" which has been adopted for a number of gas, electric and water distribution utilities. For U.S. gas distribution companies, a number have been allowed by their regulatory commissions to adjust rates, either upward or downward, in order to recover its forecast margin (revenue less the cost of gas) independent of customer usage patterns. This mechanism was originally intended to hold the utility's financial performance harmless from deterioration due to energy conservation efforts but in some jurisdiction it has been expanded to include weather normalization adjustments. The gas utilities currently using a decoupling account include, among others, Piedmont Natural Gas (North Carolina), Northwest Natural Gas (Oregon), Public Service of North Carolina, New Jersey Natural Gas, South Jersey Gas, Baltimore Gas & Electric and Washington Gas Light (Maryland). The decoupling mechanism allows the utility to recover its projected margin independent of customer usage patterns which removes much of the utility's sales risk.

Many utilities also have approved riders which allow them to recover all prudently incurred gas costs from customers which eliminate substantially all commodity price risk for the utility.

Mr. Carmichael did not undertaken a specific review of prudency disallowance risk or interest rate risk because they appear to be similar in Canada and the U.S.

Mr. Carmichael believes that it is noteworthy that Moody's identifies Piedmont Natural Gas, Northwest Natural Gas and Public Service of North Carolina as peers of Terasen Gas in a quote on page 39 of his pre-filed evidence. It is also noteworthy that Moody's rates regulatory support in these jurisdictions as Aaa compared to Aa assigned to Terasen Gas.

42.2 At footnote 17 at page 16 of Appendix 4, a 2008 study commissioned by the Canadian Gas Association and conducted by the National Economic Research Associates, the footnote stated that capital structures are "deemed" in Canada and this contrasts with the US, where LDCs are predominantly allowed to choose their capital structure within a band of reasonableness. In Mr. Carmichael's opinion, could this have led to higher equity ratios in the US compared to Canada?

Response:

The deeming of an appropriate capital structure is one of a number of factors which has lead to the disparity between utility common equity bases in Canada and the U.S. When the process of deeming a capital structure was first accepted by regulators in Canada, it was required due to the fact that many utilities were operating regulated and non-regulated businesses within the same corporate entity and regulators were concerned that the utility operations were being forced to pay a higher cost of capital due to the potentially higher risk non regulated activities. The discussion before regulatory bodies was lengthy and often complex and ultimately required the regulator to indirectly determine an acceptable capital structure for the non-regulated operations such that the non-regulated operations were financially self sustaining and fully capable of supporting the capital structure that regulators thought to be appropriate. The process of subdividing the consolidated entity by the regulator sometime led to an allocation to the utility capital structure of all preferred shares outstanding plus a common equity base which may have been somewhat less than actually required for utility due to the perceived "riskiness" of the non-regulated operations.

Once determined and upheld by the regulator over time, the utility common equity base percentages have changed only marginally over the years, often notwithstanding the restructuring of the utilities into holding companies with pure play utilities subsidiaries and non-regulated subsidiaries, the injection of greater amounts of common equity on a consolidated basis, and the reduced availability of equity capital for the utility subsidiary.

42.3 Mr. Carmichael states that TGI is disadvantaged to compete with other highly equity capitalized US and international utilities for debt and equity funding due to globalization and greater competition. Please demonstrate this by comparing the TGI experiences in raising debt and equity with that of other Canadian, US and international utilities.

Response:

TGI is a wholly owned subsidiary of Fortis Inc., a diversified gas and electric utility holding company, and as a result does not raise common equity directly from capital markets.

Terasen Gas was able to access the Canadian long term debt market over the period 2006 to 2009 at a reasonable but escalating cost.

43.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael p. 18

In his testimony, Mr. Carmichael described the extremely modest inflationary expectations and reduction of Government of Canada investable bond product due to nine years of federal government surpluses and strong financial performance.

43.1 Does Mr. Carmichael have evidence to believe that the underlying trends that led to the 65 year low in benchmark GCB bond yields will continue? Please comment on the latest federal debt management strategy and latest estimate of the current fiscal year budget deficit and how they could reverse the financial performance of the last nine years.

Response:

Currently there is significant economic slack in the North American and global economies with unemployment and factory surplus capacity rising reflecting the global economic slowdown. Commodity prices have declined reflecting the reduction in demand. Inflation is not expected to be an area of concern for the next few years.

As discussed in the response to BCUC 1.15.1, the federal government has announced a significant deficit in 2009-2010 (approximately $50 billion) followed by a series of annual deficits until 2014-2015. This will be a departure from the government's financial performance over the past nine years as it steadily reduced its debt to GDP level by repaying previously incurred debt. Canada's debt to GDP level is now one of the lowest in the G8 group of countries and this has placed Canada in a stronger position to weather the current economic storm. Capital market participants will accept government deficit policies so long as the federal government's intention to reduce annual deficits and pay down debt remains a firm and observable commitment. Capital market participants do not like deficits; however, they do recognize the difference between cyclical deficits and structural deficits which have plagued the Government of Canada in the past.

As also noted in the response to BCUC 1.15.1, the capital markets have not reacted to the announced federal government deficit plan as long and short term interest rates have either remained approximately steady or gone down since the budget was announced.

44.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael p. 22

44.1 On page 22, Mr. Carmichael itemizes the TGI long term debt financings since September 2006, indicating the yield at issuance and the spread between long Canada yields. How do these yields and spreads to long GCB yields compare to those of other Canadian utilities of similar debt rating and to other Canadian corporate bonds of similar debt rating? Do the TGI financings indicate an inability to access the markets on competitive terms?

Response:

The following tables provide details of actual issues carried out by Terasen Gas on the dates indicated and indicative pricing for similarly rated utilities and corporate issuers on the same date.

Date of Pricing	Terasen Gas Spread (bps)	Enbridge Gas Spread (bps)	Union Gas Spread (bps)	FortisBC Spread (bps)	30 year Canada Yield (%)
9/25/2006	136	104	112	125	4.19
10/1/2007	148	140	148	160	4.52
5/12/2008	163	155	165	180	4.17
2/23/2009	285	280	295	310	3.70

(1) Terasen Gas spreads are actual, other spreads are indicative spreads provided by Scotia Capital to issuers.
(2) Terasen Gas is rated (A/A3/A) by (DBRS, Moody's and S&P), Enbridge Gas is rated (A/NR/A-), Union Gas is rated (A/NR/BBB+) and FortisBC is rated (BBB(high), Baa2, NR)

Date of Pricing	Terasen Gas Spread (bps)	BC Ferry Spread (bps)	GTAA Spread (bps)	407 Intl Spread (bps)	30 year Canada Yield (%)
9/25/2006	136	97	124	95	4.19
10/1/2007	148	115	130	115	4.52
5/12/2008	163	145	150	150	4.17
2/23/2009	285	330	335	310	3.70

(1) Terasen Gas spreads are actual other spreads are indicative spreads provided to issuers by Scotia Capital.
(2) Terasen Gas is rated (A/A3/A) by (DBRS/Moody's/S&P), BC Ferry is rated (A(low)/nr/A-), GTAA is rated (A/NR/A-) and 407 International is rated (A/NR/A).

The tables indicate that Terasen Gas has been able to access the debt market on competitive terms; however, like other corporate issuers, the spread of Terasen Gas debenture over 30 year Canada bonds has increased dramatically over the period. The table also indicates that Terasen Gas debentures must compete against infrastructure issuers such as GTAA, BC Ferry and 407 International.

45.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael pp. 30, 31

45.1 At pages 30 and 31 Mr. Carmichael speaks to investors' valuations of common shares. Given the impact of market volatility on earnings yields and dividend yields, would not investors prefer the stable earnings and high dividends of TGI?

Response:

Market volatility (that is, significant increases or decreases in the price of a common share or the market for common shares as a whole) causes similar volatility in the earnings (or dividend) yield as the earnings yield equals the earnings per common share of the company divided by the price of the common share. If the price of the common share declines by 50% the earnings yield will double (assuming that the expected earnings per share remain constant). Assuming a constant earnings stream, a decline in the price of a utility stock reflects an increase in the required rate of return which investors are using to discount the utility's expected future earnings stream. In other words, the utility's cost of common equity has been increased by investors.

With regard to dividends paid by Terasen Gas, the amount paid essentially reflects BCUC decisions regarding an appropriate equity base for the Company's regulated operations. The Company has agreed to maintain a percentage of common equity to the total capital of the Company that is at least as much as that determined by the BCUC from time to time for rate making purposes. The Company's dividend policy is intended to ensure that it maintains at least as much common equity as that deemed by the BCUC for rate making purposes. From this vantage point, it is in my view inappropriate to refer to dividend payments by the Company as being "high".

45.2 Please show the earnings yields, dividend yields and total yields of relatively pure play Canadian gas or petroleum utilities compared to the S&P/TSX during the past year by month, as well as annually for each of the last four years and, to the extent possible, for the last 30 years. Incorporate TGI data to the extent they are available and including Enbridge, Trans Canada Pipeline and any other applicable Canadian investor-owned utilities.

Response:

Please refer to Attachment 45.2.

46.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael p. 35

46.1 Mr. Carmichael identifies that the public and government funding for infrastructure projects in Canada will be massive and will compete with utility financings. Please indicate the expected impact on financing rates and the spreads between future TGI financings and those of governments and Private Public Partnerships.

Response:

The evolving form of infrastructure financing in Canada encompasses the transfer of business and financing risk from governments to private sector consortiums which construct, own, finance and operate the infrastructure facilities on behalf of government. These consortiums may consist of a developer, a contractor, a supplier of technology and/or fuel for the facility, banks to provide short term construction financing and long term debt investors to provide debt maturities of up to 30 years depending on the facilities. The sponsoring government normally provides some form of indirect credit enhancement by way of a long term "capacity agreement" or long term purchase agreement which provides the single purpose infrastructure company adequate cash flow to service the debt in most reasonable circumstances.

Alternately, an indirectly government owned but non-guaranteed infrastructure company is formed to own, operate and finance existing or new assets. Depending on the business of the company, it may be regulated or it may operate under a long term agreement (for example, a power purchase agreement) with an agent of the sponsoring government.

The credit ratings for these financings usually fall in the A category while spreads on the long term debt financing for the assets fall currently in the range of 350 to 400 basis points above the appropriate term Government of Canada bond.

As more governments adopt this form of public/private financing and infrastructure investment continues to increase in magnitude, greater competition for funds will evolve from utility-like projects with the indirect support of provincial and possibly the federal government in Canada. Governments are willing to pay a premium to have private sector consortiums absorb risks which have traditionally been backstopped by the government sponsor. This provides lenders to earn a premium return on a government supported debt obligation. As the demand for infrastructure financing grows upward pressure will be placed on the credit spreads of Terasen Gas debentures in order for these securities to compete with similar term infrastructure financing.

47.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael p. 37

47.1 Mr. Carmichael states that TGI long bond interest spreads peaked in January 2009 at approximately 390 to 400 basis points over the 30 year long term Canada bond. Is this relevant data or a short term event resulting from the world wide financial crisis? Please show the same credit spreads for each month of the last year up to and including July 2009.

Response:

Indicative long term spreads for the issuance of 30 year debentures for Terasen Gas over the past year are as follows:

Date	Indicative 30 year Credit Spread Above Benchmark Canada Bond
7/7/2008	+165
7/14/2008	+195
7/21/2008	+195
7/28/2008	+195
8/5/2008	+195
8/11/2008	+195
9/2/2008	+215
9/8/2008	+225
9/22/2008	+230
9/29/2008	+250
10/6/2008	+260
10/15/2008	+310
10/20/2008	+320
10/27/2008	+330
11/3/2008	+330
11/10/2008	+330
11/17/2008	+310
11/24/2008	+315

Source: Scotia Capital Inc.

The relevance of the comment is that the spread expansion from165 bps at the beginning of July 2008 to approximately 400 bps in January 2009 was unprecedented in its speed (6 months) and magnitude (approximately 240%). As well, lenders were demanding credit spreads for utility credits that approximated the equity risk premiums usually assigned to those same utilities to determine their cost of common equity capital under automatic adjustment formulas. Since debt capital ranks prior to common equity capital and is better protected from the business risk of the utility, it is not logical that approximately the same risk premium should satisfy both lenders and investors.

The comment is also relevant in the context of the automatic adjustment mechanism not being directionally correct. As utility credit spreads were expanding, the formula was predicting that returns on common equity should be reduced to reflect the lower yields in the Government of Canada long bond market.

48.0 Reference: Exhibit B-1, Tab 2 & Cover Letter p. 30 Written Testimony of Mr. Carmichael pp. 39, 40 Continuation of the TGVI Company Specific Risk Premium

In his written testimony, Mr. Carmichael quoted comments from Moody's in its most recent credit rating report (dated May 27, 2008).

> "TGI's financial metrics are generally weaker than those of its A3 rated global LDC peers such as Piedmont ………… and sister Company, TGVI. Moody's recognizes that TGI's relatively weaker financial metrics are largely a function of the relatively low deemed equity and allowed ROE permitted by the BCUC. In general, Canadian deemed equity ratios and allowed ROEs are low relative to those of other jurisdictions and TGI's are among the lowest in Canada. However, TGI's A3 senior unsecured rating reflects Moody's view that …. a significant degree by the supportiveness of the business and regulatory environments in which TGI operates."

48.1 Do Terasen Utilities agree with Moody's comments that TGI's financial metrics are generally weaker than TGVI's?

Response:

Terasen Utilities does agree with Moody's comments that TGI's financial metrics are weaker than TGVI.

48.1.1 If no, please explain the basis of your disagreement.

Response:

Not applicable given response to 48.1.

48.1.2 If yes, please comment on the reasonableness of TGVI's request in the Application to continue with the 70 basis points premium to the low risk utility ROE on the basis that TGVI's business risks were greater than TGI.

Response:

TGVI's 70 basis point risk premium is a function of its higher business risk relative to TGI. While both TGI and TGVI submit that business risks have increased for both entities, justifying in part the request for an appropriate benchmark ROE, both TGI and TGVI do not believe there has been a material change in the relative business risks between the two utilities, which leads to the conclusion that the 70 basis point risk premium that TGVI receives in excess of TGI is still appropriate. The fact that TGVI has stronger credit metrics is in part a function of a more appropriate equity thickness and ROE than TGI, relative to its higher business risk, and the existence of the Revenue Deficiency Deferral Account and Special Direction which allow TGVI to collect rates relative to competitive alternatives to amortize the RDDA balance.

48.2 Do Terasen Utilities agree with Moody's description of the supportiveness of the business and regulatory environments in which TGI operates?

Response:

The Terasen Utilities believe that Moody's reference to the supportive business environment is a reference primarily to the robust economic environment enjoyed by BC over the past number of years, as well as provincial government support for TGVI in the form of the royalty revenue payments, whereas the reference to the regulatory environment is primarily a reference to both the constructive relationship with the regulator and intervenors in the province that has seen the adoption of positive regulatory constructs such as PBR and certain deferral accounts. With respect to the above understanding, Terasen Utilities does agree for the most part with Moody's comments.

However, the business and regulatory environment is not static. As noted in the Application, Terasen Utilities believes the business environment has become more challenging, with the recent action by the BC government with respect to environmental legislation and the carbon tax examples of increased business risk. The continuation of a low ROE and equity thickness are factors that the Terasen Utilities believe are examples of a less supportive regulatory environment. Terasen Utilities believes that the increasing business risk and a continuation of low ROE and equity thickness may over time diminish Moody's view of the supportive operating environment facing Terasen Utilities.

48.2.1 If no, please explain if TGI agrees with its credit rating given by Moody's.

Response:

TGI believes that Moody's credit rating classification is reasonable.

48.2.2 If yes, please comment on the reasonableness of BMO Capital Markets' analyst report dated December 7, 2006 that the ROE adjustment mechanism that was in place in B.C. likely "violates the Fair Return Standard and is confiscatory" (x-ref: Tab 2 p. 38 lines 8 to 12).

Response:

The comment in the BMO report is in reference to the allowed ROE and is not an assessment of the general supportiveness of the regulatory environment. The BMO comment is reasonable in light of the low level of the ROE, which Terasen Utilities submits is not adequately addressing the Fair Return Standard.

While TGI agrees in general with the comments by Moody's regarding the supportive business and regulatory environment, as noted in the response to BCUC IR 1.48.2, this does not by extension mean that the low ROE and equity thickness is reasonable, nor does TGI believe that Moody's is implying that the low ROE and equity thickness is reasonable because of their general assertion regarding the supportive regulatory environment.

49.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael p. 40

49.1 Mr. Carmichael states that "Credit rating agencies and sophisticated lenders rank changes to regulatory environment as the single largest risk faced by a utility." Would the supportive regulatory environment afforded TGI not then be the single greatest asset for TGI? In the past, rating agencies have supported the BCUC AAM as providing regulatory certainty; therefore, could there be concern if BCUC abandoned the AAM?

Response:

Historically the regulatory environment in BC has been seen as supportive and assisted in propping up the rating that would otherwise likely be lower, certainly on the basis of the credit metrics. A supportive environment does not change the fact that the metrics are weak, nor does it justify an ROE and equity ratio much lower than peers who also have supportive environments. Secondly, the transparency and certainty provided by the current AAM may be a positive but it does not mean that the credit rating agencies believe the ROE's produced by it are appropriate or supportive.

As noted in my pre-filed testimony, Terasen Gas has achieved its credit rating based primarily on the positive view held by credit rating agencies of its supportive regulatory environment (Moody's rates Terasen Gas' regulatory support as Aa) and positive business environment in the Company's service area. These factors have, in the past, compensated for the Company's somewhat weaker financial performance (rated Ba). The views of credit rating agencies and lenders can change rapidly however given new or different circumstances. For example, in 2002, Standard & Poor's put virtually all utilities in Canada on credit watch with a negative outlook, given S&P's concern regarding the direction of regulation in Canada. Utility issuers remained on credit watch until S&P had an opportunity to talk with regulators in every major jurisdiction.

The view of lenders and investors on both the business environment and regulatory environment is not static. There is a growing consensus that the AAM is not working and the ROE's are too low. There is an expectation that regulators will take appropriate action, especially in light of the TQM decision, and announced or expected reviews of the automatic adjustment formulas by the NEB and in Alberta and Ontario. Lack of progress on ROE and the AAM may change the perception of regulatory support by lenders and investors.

Similarly the economic impact of the global recession will likely dampen the strength of the British Columbia economy and this will remove another support to the credit rating of the Company.

With both of these previously positive factors potentially becoming negatives in the eyes of rating agencies, lenders and investors, the Company's ability to attract capital on reasonable terms would become much more difficult.

Regulatory stability is appreciated by the capital markets; however, if evidence suggests that the current methodology (in this case, the automatic adjustment formula) is not working and that the financial performance of the utility is suffering, then credit rating agencies, lenders and investors are likely to applaud reasonable changes in the adjustment mechanism that improve the financial performance of the utility.

If such a change to an improved return on equity adjustment mechanism is not undertaken, Mr. Carmichael believes lenders and investors would look to other regulatory jurisdictions which have adopted more appropriate methods of determining an appropriate return or to non-regulated infrastructure projects which also offer attractive returns. Moreover, the shift away from an AAM to an approach that resulted in higher returns that meet the fair return standard would not be expected to be seen by the credit rating agencies as an increase to the utility's business risk profile. Conversely, if the BCUC and other Canadian regulators retain the AAM in the face of the TQM decision, then credit rating agencies are unlikely to maintain the view that the current regulatory environment is supportive.

50.0 Reference: Exhibit B-1, Tab 2 Written Testimony of Mr. Carmichael, p. 43
Exchange Rate Adjustments

Allowed returns (i.e., as shown in Chart 2 on p. 43) and other financial variables of Canadian and US firms are frequently compared directly to one another across countries, without adjusting for movements in the CDN: USD exchange rate.

50.1 Please state clearly what market integration implies about the direct comparability of raw returns across countries.

Response:

Market integration implies that long term real rates of return adjusted for risk should be approximately the same.

50.2 Does market integration imply that there should be comparability between real (i.e., inflation-adjusted), exchange rate-adjusted, risk-adjusted returns, and does not necessarily imply that nominal raw returns should be directly comparable across markets in different countries and different currencies?

Response:

Nominal raw returns are likely to be less accurate than real, exchange rate adjusted, risk adjusted returns; however, movement in the relationship between regulated nominal returns in Canada and the U.S. cannot be overlooked.

50.2.1 If nominal raw returns in different currencies are not in fact generally directly comparable, without any adjustments whatsoever, across even integrated markets, then what is special about the case of the Canadian and US utility returns that allows for direct comparison of raw returns across countries?

Response:

It is not the specific level of the returns in Canada or the U.S. that should be of interest, it is the assertion that nominal utility rates of return in Canada declined relative to nominal returns in the U. S. following the introduction of rate of return formulas in Canada. Prior to the formulas introduction, the authors of the study found nominal rates of return in the two countries to be approximately equal.

50.3 Please calculate the cumulative percentage change of the CDN dollar against the USD during the past decade, (a) 1998 to 2008 and (b) 2003 to 2008 (x-ref: Tab 3, Schedule 1).

Response:

The cumulative change from: (a) 1998 to 2008 was 38.24% and (b) from 2003 to 2008 was 30.56%, both calculations based data on Schedule 1.

50.3.1 Even if the raw nominal rate of return in Canada was less than the raw nominal rate of return in the USA, is it not possible that on a common-currency basis, after adjusting for the significant appreciation of the Canadian Dollar, that the return to investing in assets of similar credit risk (i.e., government bonds) was higher in Canada than the USA even if the raw return in Canada was lower?

Response:

It is possible.

50.3.2 Does this imply that even though the allowed return on Canadian utilities has been lower than the US utilities over the past decade that the returns when translated into a common currency are more similar and in fact in some cases higher for Canadian utilities?

Response:

Without identifying the common currency, the question cannot be answered.

WRITTEN EVIDENCE OF MS. MCSHANE

51.0 Reference: Exhibit B-1, Tab 3, Opinion of Ms. McShane, p. 7 Footnote

51.1 The footnote at the bottom of page 7 states that the Consensus forecast since 1997 has averaged 0.7 percent higher than actual yields. Is this a consistent forecast bias that should be adjusted for? Please explain.

Response:

There is no bias that needs adjustment. For clarification, the statement in footnote 3 refers to the forecast of 10-year Canada bond yields over the longer-term, as contrasted with the forecasts of 3-month and 12-month forward 10-year yields which have been used to estimate the long-term Canada bond yield for purposes of applying the existing automatic adjustment formula.

The point that Ms. McShane was making was that, throughout the period in question, the economic and capital market conditions which have transpired have resulted in average yields on long-term Canada bonds which are lower than what might reasonably have been expected in equilibrium. Over the longer-term, the yield on 10-year government bonds should reflect the expected long-term rate of inflation (currently expected to be approximately 2%), a real return equating to the productivity of capital (frequently estimated in the range of 2.5%-3%) and a premium for reinvestment risk. Over time, the forecast yields on 10-year government bonds for the longer-term have been in line with these building blocks.

52.0 Reference: Exhibit B-1, Tab 3, Opinion of Ms. McShane, p. 8 Figure 1 & Schedule 22

Ms. McShane opined that the allowed returns in the U.S. and Canada were comparable until automatic adjustment formulas tied to government bond yields became the norm.

52.1 Please explain what comparable means in light of movements in CDN/USD exchange rates and differences in inflation rates.

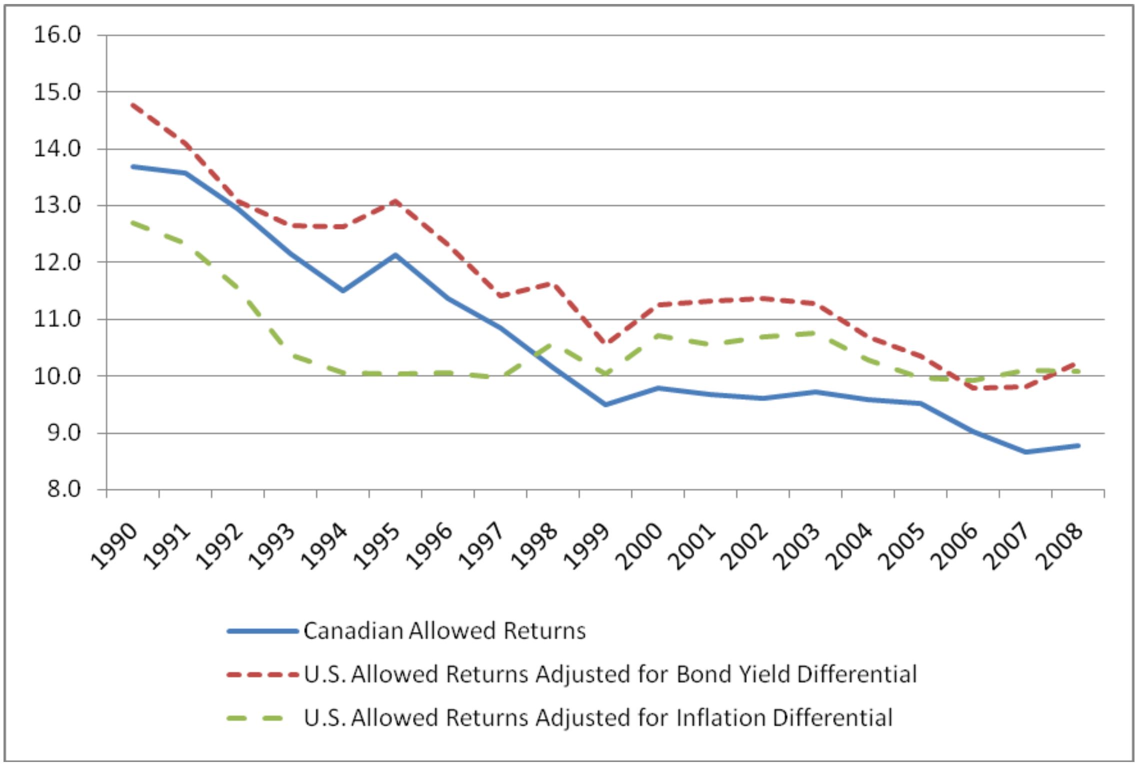
Response:

Comparable means in a similar cost of capital environment for investments of similar risk, the returns available to those investments should be comparable. Over the period since cross-over (1998-2008) on Figure 1, the difference in long-term government bond yields in Canada and the U.S. has been approximately 8 basis points. On this basis, in isolation, the average difference in ROEs should have been less than 10 basis points. The actual difference between the allowed returns in Canada and the allowed returns in the U.S. over that period was 1.4 percentage points. All other things equal, the impact of the expected exchange rate on cost of capital should be accounted for in differences in the long-run expected rate of inflation. Over the period 1998-2008, the consensus forecasts of the long-term rate of CPI inflation in the U.S. have averaged 2.4% compared to 2.0% in Canada. Thus, all other things equal, the cost of capital would be higher by 0.4% in the U.S. than in Canada. A recent study by the Bank of Canada, however, found that since government bond yields have converged in the two countries, the difference in cost of equity financing between the two countries is statistically insignificant (Lorie Zorn, *Estimating the Cost of Equity for Canadian and U.S. Firms*, Bank of Canada, Autumn 2007).

52.2 Please present Figure 1 with adjustments for (a) inflation rates; (b) exchange rates; and (c) both (a) and (b).

Response:

Please see response to BCUC 1.52.1 with respect to the relationships among inflation expectations, the exchange rate and the cost of capital. The figure below shows the allowed returns in Canada as per Figure 1 in Ms. McShane's testimony, in conjunction with (1) the allowed returns in the U.S. adjusted for the difference between the yields on U.S. and Canadian long-term government bonds during the corresponding year and (2) the allowed returns in the U.S. as adjusted for the difference in the consensus (Consensus Economics, *Consensus Forecasts*, April and October issues) long-term expected rate of inflation published in the corresponding years to which the allowed returns apply.



52.3 Is the U.S. utility statistics limited to actual awards in the particular year or do they include cases where an ROE was awarded from previous years?

Response:

The U.S. allowed returns are limited to awards made in the specific year.

53.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, p. 28 Credit Spreads

53.1 Please update Table 1 to add the most recent possible information, for example, add a column showing credit spreads as of July 2009.

Response:

The source documents required to update the table are no longer being distributed. The indicated spreads for TGI as of July 13, 2009 are 155 and 180 basis points for new 10-year and 30-year issues respectively.

53.2 Have credit spreads on corporate bonds over Government of Canada bonds generally narrowed over the past 6 months?

Response:

Yes, as indicated on line 729 of Ms. McShane's evidence. The point of the table was, as stated at lines 728-733, "this table underscores the potential magnitude of the incremental costs that are associated with being a BBB rated issuer, and the importance from both a cost and market access perspective of maintaining ratings in the A category. It bears noting that, in the case of a downgrade, the increased cost of debt would be borne by ratepayers over the full life of the issues." [emphasis added]

54.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, pp. 37, 38 Financial Statistics

54.1 On page 37 it is argued that reduced tax rates indicate a need to increase the common equity ratio to maintain EBITA. Is this rational if TGI is protected for actual tax expense?

Response:

Yes, it is rational. Ms. McShane understands that TGI and ratepayers are protected from changes in tax rates, not that it is protected on actual tax expense. Lower tax rates means less pre-tax income to cover interest expense. From a financial theory perspective, lower corporate income tax rates (when interest is deductible) also mean there is less of a cost savings benefit from debt leverage and thus, all other things equal, support lower debt ratios.

54.2 Table 5 on page 38 indicates financial statistics for TGI and others. Please indicate the requirements of TGI in its trust indentures and other binding debt related agreements, and the consequences if TGI falls below the required levels.

Response:

TGI has three primary financing agreements:

1. Trust Indenture for the Senior Unsecured Debentures

The majority of TGI's long term debt is senior unsecured debentures, issued pursuant to the Trust Indenture. The Trust Indenture includes a new issue incurrence test which restricts TGI from issuing new long term debt maturing 18 months or more from the date of issue unless TGI has annual available earnings which are greater than two times the interest on long term debt, including the new long term debt being issued. The covenant acts to restrict the amount and timing of new unsecured long term debt issued by TGI. If the test is not met, TGI would be restricted in the amount of new unsecured long term debt it could issue until the test could be met.

The test excludes the Purchase Money Mortgages, which are senior ranking obligations that are exempted.

2. Trust Indenture for the Purchase Money Mortgages

The Purchase Money Mortgages are senior, secured obligations of Terasen Gas, issued under a trust indenture. The Purchase Money Mortgages were issued in connection with the acquisition of the lower mainland gas distribution assets from BC Hydro, and those assets are pledged as security. The Purchase Money Mortgages are limited to a total issuance of $425 million, of which $275 million are currently outstanding and mature in 2015 and 2016. The PMM Trust Indenture has no financial test covenants.

3. Credit Agreement for the Operating Credit Facility

TGI maintains an unsecured revolving credit facility of $500 million through a syndicate of lenders. The agreement contains a financial covenant that TGI maintain a total debt to capital ratio of no more than 0.75 to 1.00, at each financial quarter end. If TGI fails to meet the covenant, it will be given a period of 60 days to obtain sufficient equity to cure the default. Further failure to provide sufficient equity will result in an event of default under the credit agreement which would allow the bank to demand payment of all outstanding debt balances and cancel the facility.

TGI would be required to negotiate a new facility, likely at higher rates to fund repayment of any outstanding balances. In addition, without a replacement facility, TGI would not be able to issue commercial paper, as investors require commercial paper programs to be backstopped by a credit facility. An additional effect would be the potential for providers of hedges to terminate and demand payment early, as hedge contracts provide early termination option when a counterparty defaults on credit documents.

55.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, p. 44 Risk Free Rate Analysis

55.1 The analysis uses the April Consensus forecast and yield spreads at that time. Is April an inappropriate point in time to do world and market events?

Response:

More precisely, the analysis used the April consensus as a point of departure. The April consensus in isolation produced a long term Canada bond yield forecast of 3.85% compared to the 4.25% relied upon for the application of the risk premium tests. With respect to whether April is an appropriate time due to world and market events, a utility must be in a position to raise capital and have the opportunity to earn a fair return, irrespective of the prevailing capital market conditions. Any cost of capital analysis must be done on the basis of the outlook for the capital markets available at the time, in both volatile capital markets or in markets that, in retrospect, turn out to have been overly sanguine.

55.1.1 What was the long Canada bond yield in April and July 2009? If the long Canada bond yields are expected to rise in 2010, would not the AAM sliding scale of .75 redress the impact of low risk free rate?

Response:

The long-term Canada bond yield averaged 3.7% during April 2009 and was 3.85% as of July 2, 2009. The forecast long-term Canada bond yield for mid-2010 using the June 2009 Consensus Forecast is approximately 4.25% (3.8% 10-year forecast yield plus a spread between 10-year and 30-year Canada bond yields of 0.5%). Using the existing benchmark ROE (9.145%) and long-term Canada bond yield (5.25%) and the existing AAM, the indicated low risk benchmark ROE in 2010 would be 8.4%. An ROE of 8.4% would not meet the fair return standard, and thus the AAM formula would not redress the impact of the low risk free rate.

56.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, p. 45 and Appendix B

CAPM

Ms. McShane states that there are some potential drawbacks with the CAPM. One potential drawback mentioned is a potential bias of the beta estimate. Ms. McShane's evidence deals with this by applying what in the finance profession is sometimes called a "shrinkage factor" by which the value of beta estimated from the data is manually moved toward the value "1.0". The addition of a second risk factor is also explored in line 1349 on page 54.

56.1 Would it also be possible to employ a richer industry-standard model that accounts for three risk factors, such the Fama-French Model cited in on page B-21?

Response:

It might be possible to do so if the premiums (sensitivities or "betas") for size and book/market values for different companies could be estimated and tested so that the results could be applied with a sufficient degree of confidence in their accuracy and stability.

56.2 If yes, please undertake such a Fama-French model estimation and report the regression results and the mean and standard deviation of the resulting implied return for TGI.

Response:

The application of the Fama French model is beyond the scope of Ms. McShane's testimony and would require significant time and effort with no guarantee that the results would provide robust estimates of the cost of equity.

57.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, pp. 49 - 51 Return Estimates

Table 6 reports point estimates of the mean, or average, risk premia. Table 7 reports point estimates of mean, or average, equity market returns.

57.1 Please update Table 6 to also report standard deviations of the annual risk premia and the resulting 95 percent confidence interval around the point estimate of the mean.

Response:

Updated Table 6 follows.

57.6 Please clarify, from the perspective of standard financial economics and not from the perspective of precedent ruling of regulatory tribunals, why one should prefer to use arithmetic averages rather than geometric.

Response:

Pages B-13 to B-19 contain a full explanation from the perspective of standard financial economics.

57.6.1 Does Ms McShane agree that arithmetic averages are often preferred when comparing potential returns across potential future economic "states", as when pricing an option with a binomial tree (akin to the cross-state tree example in Appendix B)? For example, starting from today and looking one year forward one might say there is an equal chance a stock's price will double in value (i.e., rise from $100 up to $200) or loses half its value (i.e., from $100 down to $50). The arithmetic average of +100 percent and -50 percent is +25 percent and thus on average we expect our wealth to grow by 25 percent, and indeed this is the average outcome (on average the price grows by [$100 - $50]/2 = $25 for an expected price of $125, which is a +25 percent growth and thus the arithmetic average is correct in this cross-state example).

Response:

Yes.

57.6.2 Does Ms. McShane agree that when using historical time-series data on returns one links returns in a sequence over time, which is a different exercise than comparing potential returns across states at a single point in time? For example, if in the first six months of the year a stock price rises by +100 percent (i.e., from $100 to $200) and then over the next six months falls by 50 percent (from $200 down to $100) the return over the year is 0 percent (since the price begins and ends at $100) which is the geometric return; the annual return is not the arithmetic average of +25 percent (which would imply an end-of-year price of $125 rather than the $100 that actually occurs). Thus, is it not the case that the geometric average is usually considered more appropriate in time-series investigations in financial economics? If Ms. McShane disagrees, please provide the rationale for the disagreement.

Response:

Ms. McShane agrees that geometric averages are used for purposes of investigating what historical performance has been.

57.6.3 At page 49 Line 1209 asserts that using geometric averages removes uncertainty from the data.

57.6.3.1 What is the meaning of the word "uncertainty" in this context?

Response:

It means the volatility of the returns during the period over which those returns are being measured. If, for example, we have two portfolios with the same beginning and ending value, the geometric average will be the same for both, irrespective of how volatile the returns of the two portfolios were over the period of measurement.

57.6.3.2 Since historical returns are observed, and are thus known for certain, is it not the case that there is no uncertainty (i.e. things unknown) whether geometric or arithmetic averages are employed?

Response:

Yes. However, there is uncertainty in future returns which must be reflected in the expected value. Please see response to BCUC 1.57.6.3.3 below.

57.6.3.3 In Ms. McShane's view, can one not more appropriately capture a notion of non-constancy (which may be what is meant by uncertainty in this context) by estimating the volatility (i.e. standard deviation) of the raw annual returns?

Response:

One can capture a notion of non-constancy by measuring the volatility of past returns, but then what is required is a translation of that non-constancy into an expected value of the return. The arithmetic average does this directly.

57.6.3.4 Please confirm that under the geometric measure this volatility is not zero and it is also not zero under the arithmetic measure; and therefore either method can be used in this specific context to capture the volatility. Is it not true that the arithmetic measure is not doing something that the geometric measure cannot also accomplish, and potentially, more accurately.

Response:

While one may be able to calculate standard deviations from the geometric series, the standard deviations themselves cannot be translated into return requirements or expectations. Given two return series with the same geometric average return and two very different geometric standard deviations, using the geometric averages for both as estimates of the expected value of the return in a cost of capital estimate understates the risk that was associated with the series with the higher standard deviation. Using the arithmetic average will capture the differential risk.

57.6.4 Please confirm that, under either the arithmetic and geometric measures, when the expanded Table 6 reports the "average", this means the average of the annual risk premia (i.e. calculate a risk premium for every year first, then take the average over time and also estimate the time-series volatility - i.e., standard deviation of the annual averages).

Response:

When calculated using arithmetic averages, the "average" risk premium is the same whether calculated by calculating each annual difference between the equity and bond returns and averaging those differences or by calculating the average equity return and the average bond return and calculating the difference between the two averages. The geometric average returns were calculated by creating a wealth index from annual return values for each data series and then the beginning and ending values of each index were used to calculate the average equity and bond returns. The geometric average risk premium was calculated as the difference between a single geometric average equity return and a single geometric average bond return. Individual years' risk premiums were not calculated. The geometric standard deviation of the risk premiums was estimated by taking the square root of the sum of the geometric variances of the annual returns for each series minus twice the covariance of the annual returns for the two series.

58.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, p. 51 Ex-Post vs. Ex-Ante Premia

In several places in the Opinion, including in lines 1273-1278, expectations of future returns and risk premia are obtained directly from past returns and equity premia without adjustment.

58.1 Does Ms. McShane agree with recent financial research results that suggest that the ex-post equity risk premium (i.e., the return investors have historically earned on risky stocks in excess of risk free bonds [where the term "risk free" in this context implies zero credit risk]) substantially over-estimates the equity risk premium investors require ex-ante (i.e., the future return they think they will receive at the time they invest), because of survivorship biases and other factors in the standard data and estimation procedures? Please explain your rationale.

<u>Response:</u>

No. The recent studies to which the question refers presumably include some which excluded consideration of the "tech wreck" in 2001/2002; none of the financial research is likely to have considered the impact of the current financial crisis on either historic results or investors' required rates of return going forward. With respect to studies which concluded that historical equity returns are not sustainable in the future because the historic values were achieved through an increase in the price/earnings ratios, please see Ms. McShane's evidence at B-16 to B-19. Several studies look at much older U.S. data, i.e., data going back to the 1800s in drawing their conclusions. The data from the 1800s are not reliable for the purpose of drawing conclusions regarding future risk premiums due to (1) dominance of a few railroads and banks in the data sets; (2) the data collected for a considerable portion of the 1800s excludes dividends; and (3) the distinctions between debt and equity that exist today were not as clear as they now are.

With respect to survivorship bias specifically, the study entitled Dimson, March and Staunton, "Risk and Return in the 20th and 21st Centuries", *Business Strategy Review*, Volume 11, Issue 2, 2000, concluded that earlier studies of historic returns suffer from survivor bias, that is, the data used to conduct analyses of the market return and market risk premiums in previous studies were (1) constructed with hindsight and excluded sectors of the market that have since disappeared, and (2) that previous studies focus on the second half of the 20th century, during which the equity market performed better relative to the first half of the century. Despite Dimson's *et al* reliance on data designed to eliminate survivor bias, the article shows a equity market risk premium in relation to bonds for the U.S. covering the period 1900 to 2000 of 7.2% (equity market return of 12.2% and a bond return of 5.0%).

Moreover, despite Dimson's *et al* concerns that previous studies focused on the second half of the century, Ms. McShane's Schedule 8 show that the most significant difference between the results for the post-World War II period compared to results which include pre-World War II data is due to the difference in bond returns between the two periods, rather than differences in equity market returns. Ms. McShane's evidence at pages B-15 to B-16 discusses the impact of the differences between the higher historic bond returns relative to expected values on the expected equity market risk premium.

A second study which dealt with survivorship, William Goetzmann and Philippe Jorion, *A Century of Global Stock Markets*: Working Paper 5901, National Bureau of Economic Research, 1997, concluded that the U.S. equity risk premium was overstated by 60 basis points, but the data employed did not take dividend income into account.

58.2 In light of this, what downward adjustments might be appropriate to the market equity premium estimates in the Opinion?

Response:

Ms. McShane does not believe that any downward adjustments to the estimated market equity risk premium are warranted.

59.0 Reference: Exhibit B-1, Tab 3, Opinion of Ms. McShane p. 52 & Tab 4 p. 23 Written Evidence of Dr. Vander Weide

At page 52 line 1284, Ms. McShane states that market risk premium result needs to be adjusted to recognize the relatively lower risk of utilities. Tab 3 Schedule 10 presents the calculations of standard deviations of monthly total market returns for each of the 10 major Sectors of the S&P/TSX Index over five-year periods ending 1997 through 2008.

At pages 23 and 24 of 87 of Mr. Vander Weide's evidence, he concludes that the Canadian utility stocks have approximately the same risk as the Canadian stock market as a whole.

59.1 Please reconcile the above two statements.

Response:

There is nothing to reconcile. The testimonies of Ms. McShane and Dr. Vander Weide provide evidence that: (1) the relative risk of Canadian utilities is higher than the "raw" betas of those utilities would imply; and (2) the relative risk of Canadian utilities is higher than the beta implied by the existing automatic adjustment formulas in Canada, including the BCUC AAM.

60.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, pp. 54-55 Multi-Factor Beta

Line 1349 reports regression results which are discussed in lines 1351-1359. Please clarify the interpretation of these results, in particular:

60.1 Please confirm that the R-squared of 43 percent means that the right hand side (i.e. independent) variables explain 43 percent of the movement in the left hand side (i.e. dependent) variable.

Response:

Confirmed.

60.2 Please describe the functional form and clarify the meaning of the regression coefficients. Do they not mean that the level of the return on the TSX Utility Index is estimated as equal to 0.185 percent plus 42 percent of the level of the return on the TSE (stock) Composite plus 53 percent of the level of the Long Bond Yield?

Response:

The regression is a time series regression for which the monthly observations of the dependent variable (utility stock returns) and the independent variables (equity market composite and long-term Canada bond) are the monthly total returns, taken from the total return indices published by the TSX in the case of the equities, and calculated for the bond as the coupon expressed on a monthly basis plus the change in price. The regression coefficients of the equity market composite and the Long-term Canada bond represent the relationship between the monthly returns for the utility index and the equity market composite and the long-term Canada bond return. As indicated in the preamble to the question, the regression means that, on average, the monthly equity return of the utility index was 42% of the return of the equity market composite plus 53% of the return on the long-term Canada bond plus 0.185%.

60.2.1 How then can this regression be used to conclude that utility shares have over 50 percent of the volatility of the Long Bond yield?

Response:

As described in response to BCUC IR 1.60.2, the regression was performed by regressing the monthly returns on the utility index against the monthly returns on the equity market and the monthly returns on the long-term Canada bond. The returns themselves include the monthly change in prices for the equity indices and the long-term bond. The monthly changes in price reflect the volatility of the variables. More precisely, the regression coefficients measure the extent to which the dependent variable co-varies with the independent variables.

61.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, p. 56 Adjusted Betas

61.1 Please identify the "Canadian Utilities" in Table 8.

Response:

Canadian Utilities refers to the company, Canadian Utilities Limited.

62.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, p. 58 DCF Based Equity Premium Test

Ms. McShane opines at page 58 that the 13 U.S. utilities are reasonable proxies for estimating the cost of equity of TGI.

62.1 Please provide details on each of the 13 utilities: (a) whether they are gas or electric, (b) are they LDCs, (c) which ones have non-regulated business, (d) which ones have risk reduction deferral accounts, sales and weather normalization features, commodity cost risk adjustment, investment prudency protection, and (e) the frequency of ROE setting and when their ROEs were last set.

<u>Response:</u>

The following table indicates for each company the type of utility, the weather and sales normalization features, whether there is commodity cost recovery, a list of the other major deferral accounts and risk mitigation mechanisms, and the date of the most recent ROE determination. Recovery of costs for all of the utilities is subject to the standard of prudency. The utilities do not have any prescribed schedule for rate reviews; except where they are subject to a rate freeze, utilities have the flexibility to apply for new rates as they deem warranted.

BENCHMARK SAMPLE OF U.S. GAS AND ELECTRIC UTILITIES

Company	Type	Type	Sales and Weather Normalization Features	Commodity Cost Recovery Assurance	Other Risk Reduction Mechanisms	Last ROE Setting
AGL Resources	Gas	LDC	Straight fixed variable rate (Georgia); Decoupling (Virginia); Weather Normalization (New Jersey and Tennessee)	Yes for all but Georgia where the company does not sell gas	Rider for Pipeline Replacement Costs (Georgia); rider for Environmental remediation liabilities (Georgia)	2005 (Georgia)
Consolidated Edison	Electric/Gas	LDC	Revenue Decoupling (electric); weather normalization (gas)	Yes (gas and electric)	True ups for OPEBS and environmental remediation expenses	2008
Dominion Resources	Electric/Gas	Vertically integrated and LDC	Straight fixed variable (Ohio)	Yes	Legislation allows for rate adjustment clauses for environmental compliance costs, FERC approved transmission rates, conservation and energy efficiency programs	1994 Virginia; 2008 Ohio
Duke Energy	Electric/Gas	Vertically integrated and LDC	Straight fixed variable rate (gas Ohio)	Yes	storm cost deferral, demand side management cost deferral, RTO cost deferral; pension expense deferral	2008
FPL	Electric	Electric Distribution		Yes	Rate Riders for generation construction costs including pre-construction costs; securitized storm recovery costs;deferral for pension expense	1990
New Jersey Resources	Gas	LDC	Decoupling	Yes	Deferrals for universal service fund; environmental remediation expenses; post retirement benefits;conservation incentive program	2008
Northwest Nat. Gas	Gas	LDC	Decoupling (Oregon)	Yes	deferral for pipeline integrity management program; pension expense deferral; environmental cost deferral	2008
NSTAR	Electric/Gas	LDC	Generic order issued for gas and electric permitting development of plans	Yes	provision for goodwill recovery;deferral for pension expense	2005
Piedmont Natural Gas	Gas	LDC	weather normalization;Customer utilization tracker (gas, NC)	Yes	deferrals for pension and retirement benefits expense, environmental remediation, demand side management; pipeline integrity expense; uncollected gas costs	2008
Scana	Electric/Gas	Vertically integrated and LDC	Weather normalization (gas, SC); Customer utilization tracker (gas, NC)	Yes	CWIP in rate base; storm damage reserve; deferrals for pension and employee benefit expense;environmental remediation expense; planned major maintenance	2007
Southern Co.	Electric	Vertically Integrated		Yes	CWIP in rate base (Georgia); storm damage reserve;deferrals for pension and employee benefit expense, plant outage costs, environmental remediation costs	2007
Vectren	Gas/Electric	LDC and Vertically Integrated	Straight fixed variable rate design (gas, Ohio); weather normalization (Indiana);	Yes	Employee benefit deferral; deferrals for demand side management expense and pipeline integrity expense	2009
WGL Holdings Inc.	Gas	LDC	decoupling (MD); declining block structure (VA)	Yes	trackers for pension and OPEB expenses	2007

Note: All companies collect income taxes on a normalized basis

63.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, p. 63 DCF Test

63.1 Ms McShane states that the DCF test is the principal model utilized in the US. Which Canadian jurisdictions have also adopted it as the principal model? In what jurisdictions have Canadian regulators rejected or minimized the DCF model? Please provide the details.

Response:

Ms. McShane is not aware of any jurisdictions that have adopted it as the principal model. The BCUC gave weight to Ms. McShane's DCF test results in its March 2006 Decision (page 55). In the last two decisions in which the Newfoundland regulator fully considered the various cost of equity tests (1998 and 2003), it determined that it would give principal weight to the equity risk premium tests. The most recent decision on ROE (December 2007) was a settlement which did not address any of the various tests. To Ms. McShane's knowledge the Nova Scotia UARB has not taken a position on the DCF test or to the other tests used to estimate the cost of equity. In the most recent completed proceeding before the Régie de l'Énergie (for Gaz Metro) on ROE (Decision dated October 2007), the DCF test does not appear to have been one of the models which was applied by the experts in that case. In its Generic Cost of Capital Decision 2004-052, the predecessor to the AUC placed no weight on the DCF results presented in that proceeding. In its most recent decision on cost of capital (for Ontario Power Generation dated October 2008), the Ontario Energy Board determined that one could not rely wholly on DCF and that the equity risk premium test is the most reliable test upon which to base its determinations. The NEB did not rely on the DCF in its March 2009 decision.

63.2 Is the use of 'analysts forecast' not a significant flaw that would affect the confidence one could place on the DCF model?

Response:

No, Ms. McShane does not view the use of analysts' forecasts as a flaw. It is true that, as with all of the other tests used to estimate the cost of equity, some of the key inputs must be inferred. In the application of the DCF test, investors' growth expectations must be inferred. The financial research supports the conclusions that analysts' forecasts are superior predictors of future growth rates than historical growth rates and, when actual earnings are properly measured, analysts' forecasts of earnings growth are unbiased. As with any test used to estimate the cost of equity, there is bound to be measurement error. It is precisely for that reason analysts and regulators need to apply multiple tests and judgment when arriving at the cost of equity and a fair return.

64.0 Reference: Exhibit B-1, Tab 2, Opinion of Ms. McShane, pp. 66, 67 Flexibility Factor

Pages 66 to 67 and Appendix E discuss the need to add an extra return component to the base ROE in order to account for a financial flexibility factor.

64.1 Is it not the case that the required market return on a share of some arbitrary company's stock should already contain the return investors require for financial flexibility and indeed for all other risk factors? If not, do you agree then that some risk that should be priced is not being priced in the market? In your view, would this have violated standard finance?

Response:

The financing flexibility adjustment includes cost factors which are not by their very nature contained in the required market return as estimated using the market-derived tests, i.e., costs of raising new equity (out of pocket financing costs and market pressure). With respect to the remainder of the 0.50% increment for financing flexibility, it is the distinction between the manner in which the returns are derived (on market values) and the manner in which they are applied (to book values) which results in the need for a financing flexibility adjustment. The application of a return estimated on the basis of market values and applied to book values implies a market value just equal to book value. In this regard, please note the conclusion drawn by the Independent Assessment Team in their review of the cost of capital for the Alberta Power Purchase Arrangements referenced at page E-2 of Ms. McShane's testimony. "This is sometimes associated with flotation costs but is more properly regarded as providing a financial cushion which is particularly applicable given the use of historic cost book values in traditional rate of return regulation in Canada." The adjustment to the market derived cost for financing flexibility rate provides a minimal increment to preserve financial integrity (i.e., market price slightly in excess of book value).

64.2 If yes, then if one estimates the ROE required for TGI using data on stock returns of other companies (that already contain compensation for a flexibility factor), then why does the calculated ROE for TGI require an additional adjustment for a flexibility factor? Why does this not result in double-counting?

Response:

Please see response to BCUC 1.64.1.

64.3 Lines 1679 to 1680 on page 67 states that "a financing flexibility allowance adequate to maintain a market/book in the range of 1.05-1.10 is approximately 50 basis point". Please provide the monthly market to book ratios of Canadian gas utilities from September 2006 to July 2009.

Response:

There are only two Canadian gas utilities which are publicly traded, Gaz Metro LP and Pacific Northern Gas. The requested monthly market to book ratios through June 2009 are presented in the table below.

	Gaz Metro LP	PNG		Gaz Metro LP	PNG
Sep06	2.20	0.81	Feb08	2.02	0.81

65.0 Reference: Exhibit B-1, Opinion of Ms. McShane, pp. 63-66 DCF Model Robustness

Appendix D details the DCF model employed to estimate the cost of equity, results from which are employed in the body of Ms. McShane's Opinion.

65.1 How robust are the estimates of "k", the cost of equity, with respect to a variety of reasonable changes in data and time periods?

Response:

Please see response to BCUC 1.65.3.1.

65.1.1 For example, one could vary the estimate of "g" and "D" by changing data windows or assumptions used to estimate "D" and "g". How sensitive is the cost of equity to the assumptions used regarding these inputs into the DCF model? Please provide the data and the results of the analysis to support your answer.

Response:

Please see response to BCUC 1.65.3.1.

65.2 The DCF model requires a price "P" to be specified. Is it true that, all else being equal, the lower the price "P", the higher the cost of equity (called "k") by construction?

Response:

By construct, *ceteris paribus*, a decline in the value of "P" would result in an increase in the estimated value of "k". Similarly, a cut in dividends or the expected growth rate, absent a change in "P", would result in a decrease in the estimated value of "k". While changes in price are immediate, changes in price do not occur in a vacuum. As economic circumstances change, whether related to a particular company or on an industry-wide or global basis, analysts, companies and investors respond by modifying their growth forecasts.

65.3 Is it not the case that the stock market was significantly below its trend at the time Ms. McShane's Opinion was written and thus that the value of "P" employed might have been lower than the value of "P" would be using other potential time periods?

Response:

Confirmed that the market composites in Canada and the U.S. are currently higher than their average during the January to March period for which the DCF costs for the utilities were estimated. However, the prices for the utility sample were less than 0.50% higher in June 2009 than they were on average during the January to March period.

65.3.1 For example, please use the average "P" over the past year, and use the value of "P" as of July 2009, and report on the sensitivity of the results regarding the estimate of "k". How robust is the estimate of "k"?

Response:

As changes to "P" do not occur in a vacuum, i.e., growth forecasts change as well as price, the DCF costs of equity presented in Schedules 16 and 17 were re-estimated using average data (price, growth forecasts and dividend) over the past year as well as for the most recent month ending June 2009. An expanded version of Table D-1 including these results is presented below. The reported standard deviation is for the estimated costs of equity for the companies in the sample. The individual point estimates are included in Attachment 65.3.1.

Based on the most recent data, the estimated "bare-bones" return on equity derived from the constant growth DCF model is virtually identical to the 11.0% estimated by Ms. McShane at the time her evidence was filed (see page D-5).

65.3.2 Please demonstrate how the above would change the results of Table D-1.

Response:

Please see response to BCUC 1.65.3.1.

65.4 Please provide standard deviations along with point estimates when reporting results from the foregoing estimations.

Response:

Please see response to BCUC 1.65.3.1.

66.0 Reference: Exhibit B-1, Opinion of Ms. McShane, pp. 67-72 Comparable Earnings Test

66.1 Do any Canadian regulators support the use of the Comparable Earnings Test? Which ones and how do they use the results?

Response:

As noted in Ms. McShane's evidence at page F-6, in arriving at its decision for TGI and TGVI in March 2006, the British Columbia Utilities Commission stated that it did not believe comparable earnings had outlived its usefulness, and that it may yet play a role in future ROE hearings. It also concluded that that there was insufficient evidence before it regarding whether or not a market/book ratio adjustment was merited and, if so, how it might be accomplished. Ms. McShane provided a full discussion on the merits of a market/book adjustment in her evidence in this proceeding and concluded that there was no reason to make such an adjustment. To Ms. McShane's knowledge, although other Canadian regulators have supported the use of the comparable earnings in the past (i.e., Alberta, Ontario), there have been no other decisions within the past 10 years which have supported the use of the comparable earnings test as applied in this proceeding. In its recent TQM decision, the NEB placed some weight on the litigated returns of U.S. utilities, which is effectively a form of comparable earnings.

66.2 For the 27 comparable companies identified on Schedule 19, please compare each of their risk profiles to TGI. Please show the derivation of the 75-100 basis point risk adjustment and the statistical validity to the adjustment.

Response:

Ms. McShane has not done a qualitative assessment of the business risks of each of the 27 companies identified on Schedule 19. To select companies of relatively similar risk to a utility, as noted on page F-1, "As a point of departure, the selection was limited to industries that are characterized by relatively stable demand characteristics, as well as consistent dividend payments and relatively low earnings and share price volatility." The risk statistics for the individual companies are found on Schedule 20. The 75 to 100 basis point reduction to the ROEs of the unregulated companies reflects as noted in footnote 28:

(1) the typical spread between the yields on long-term BBB rated industrial bonds (since the non-regulated companies have an average debt rating of BBB to BBB (high) and the corresponding yields on A rated utility bonds (equal to the typical utility rating), estimated at 75 basis points;

(2) the differential in estimated 2007-2008 betas between the sample of unregulated companies (.71) and the samples of Canadian utilities (.59) and U.S. utilities (.65). The differential betas were applied to the premium of the sample ROEs of 12.5-12.75% over the forecast of long-term Canada bonds over the longer term of 5.25%. The lower betas of the utilities indicate a downward adjustment to the unregulated companies' ROEs of slightly less than one percentage point.

The reduction is based on two separate measures, which, to Ms. McShane's knowledge, do not lend themselves to specific tests of statistical validity.

66.3 On page 70, Ms. McShane states that the full business cycle 1991-2007 provides an appropriate proxy for the next business cycle.

66.3.1 Please provide the rationale and if alternative time periods have been explored and what the results are.

Response:

The rationale is provided at pages F-2 and F-3 of Ms. McShane's testimony. In light of prevailing recessionary conditions, Ms. McShane concluded that it was appropriate to include returns during the prior recession during 1991-1992. The use of any sub-period of 1991-2007 would have resulted in higher average returns. For example, if the period 1996-2007, which includes several years of sub-trend economic growth, had been utilized the average of annual medians ROE for the sample would have been in excess of 14% compared to the 1991-2007 corresponding value of just under 13%.

66.3.2 How were the returns on equity calculated for each company?

Response:

The annual returns were calculated as the net income available to common equity before extraordinary items divided by the mid-year average common equity.

66.4 Please identify if any companies were added or removed from the list of comparable companies in the past 10 years. If so, why were changes made? Please also comment what would be the impact if no changes were made.

Response:

A comparison of the companies included in the comparable earnings sample employed in the cost of capital proceeding for TGI in 1999 and the current proceeding shows that the following companies were included in the sample in 1999 but not in the 2009 sample: Canada Bread Ltd., Cara Operations Ltd., CCL Industries, Corby (H.)Distillery, Dover Industries Ltd., DuPont Canada, Empire Company Ltd., Imperial Oil Ltd., Oshawa Group Ltd., Quebecor Inc., Shell Canada Ltd., U A P Inc., and Winpak Ltd. Companies in the 2009 sample that were not in the 1999 sample include Astral Media Inc., Canadian National Railway Co., Canadian Pacific Railway Ltd., Cogeco Inc., Finning International Inc., Jean Coutu Group, Linamar Corp., Magna International, Maple Leaf Foods Inc., Metro Inc., Newfoundland Cap Corp., Richelieu Hardware Ltd., Saputo Inc., Shaw Communications Inc., SNC-Lavalin Group Inc., Toromont Industries Ltd., Torstar Corp., Transcontinental Inc., TVA Group Inc., and Uni-Select Inc.

A sample is the outcome or result of the application of a set of screening criteria to a universe of companies; a new sample is selected each time the analysis is done. Over time, companies are acquired and disappear; as new companies are formed they are added. A priori, it is not known which companies will be included in a particular sample. Further, the criteria for selection have been changed since 1999. In 1999, the selection criteria included coefficients of variation of returns and coefficients of variation of earnings before interest and taxes which were criticized as being biased toward selecting high earnings firms. These criteria were replaced with criteria which did not depend directly on the earnings themselves: betas, debt ratings, and stock rankings.

In addition, in 1999, the initial screen was limited to companies within particular Standard Industrial Classification (SIC) codes. The industry identification system has since changed to Global Industrial Classification Standard (GICS) codes, so these are now being used, with the objective of covering similar industries. However, the mapping between SIC and GICs codes is not precise. The integrated oil companies, for example, which were included in the 1999 sample, do not fall into a GICS code currently used for selection. The average of annual medians for both the existing sample and the 1999 sample are identical at 12.8%.

66.5 In the discussion of the 81 US comparable companies on page 71, the risk adjustment is approximately 14 percent (lines 1791-1793). Why is it a percentage for US companies and a discrete number of basis points for Canadian companies (lines 1779-1781)?

Response:

The discussion at page 71 indicates that the sample average ROE of 15.5% was reduced to 14% (i.e. by 1.5 percentage points), not by 14%.

67.0 Reference: Exhibit B-1, Tab 3, Expert Testimony of Ms. McShane p. 70

"Since the universe of Canadian unregulated companies is sufficiently large to produce a representative sample of sufficient size, the focus of the comparable earnings analysis was on Canadian firms. The application of the selection criteria to the Canadian universe produced a sample of 27 companies."

On Tab 2 page 94 of the TGI June 30, 2005 ROE Application the sample by Ms. McShane resulted in a sample of 17 companies.

67.1 Please confirm if the screening criteria in the present Application is the same as in 2005. If not explain the differences and impact on the resulting screened companies.

Response:

The screening criteria are largely the same; the only substantive difference is the removal of the 2005 criterion which eliminated companies that were plus or minus one standard deviation from the sample mean return. The criterion was removed to allow for a larger sample of companies, and the criterion itself was not necessary to ensure selection of comparable companies. The following table compares the specific criteria used in 2005 and 2009. If the criterion had been applied, the sample would have contained 16 companies rather than 27.

Criteria For Removing Companies From Unregulated Company Sample

Year of Selection	GICS Codes	Equity Data Availability	Market Data Availability	Equity Level	Shares Traded	Income Trust	Dividends Paid	CBS Stock Ranking	Debt Ratings	Betas	+/- 1 Standard Deviation From Average
2005	20-30	Missing or negative equity 1993-2003	not specified	no limits	Traded fewer than 125,000 shares in 2003	yes	No dividends paid in any year 1999-2003	Higher Risk or Speculative	Non-investment grade or no rating	Above 1.0 for December 2003	yes
2009	20-30	Missing or negative equity 1997-2007	Less than 5 years of market data	equity less than $100 million	Traded fewer than 5% of outstanding shares in 2007	yes	No dividends paid in any year 2004-2008	Higher Risk or Speculative	Non-investment grade or no rating	Above 1.0 on average for December 2007 and December 2008	no

67.2 Compare the 2009 sample to the 2005 sample and identify those companies who were in 2005 and no longer in 2009, if any, and provide financial information on these companies similar to what has been filed for the 2009 sample. Explain why these companies are no longer in the 2009 sample.

Response:

Four companies were included in the 2005 sample that are not included in the 2009 sample, Algoma Central Corp., Canada Bread Co. Ltd., Empire Co. Ltd., and Quebecor World Inc. Financial data for these companies are presented in the following table. Algoma Central and Canada Bread were removed from the universe because they traded less than 5% of their outstanding shares in 2007. Empire was removed because it was rated BB(high) by DBRS. Quebecor World was removed because its average 2007 common equity was negative.

RISK MEASURES FOR 4 LOW RISK UNREGULATED CANADIAN COMPANIES NOT INCLUDED IN 2009 SAMPLE

	Debt Ratings		CBS Stock	Beta				2007 Equity Ratio	1991-2007
				2003-2007		2004-2008		Based On	Average Market
Company Name	S&P	DBRS	Rating	Raw	Adjusted	Raw	Adjusted	Total Capital	To Book Ratio
ALGOMA CENTRAL CORP			Average	0.43	0.62	1.08	1.05	96.3%	0.98

Source: Standard and Poor's Research Insight, DBRS and The Blue Book of CBS Stock Reports.

67.3 Compare the 2009 sample to the 2005 sample and identify those companies who are in the 2009 sample and were not included in 2005. Please explain why these were excluded in the 2005 sample.

Response:

The following table identifies the companies and the reason they were not included in 2005.

Companies in 2009 Sample Not in 2005 Sample	
Company	*Reason*
Andres Wines	CBS Higher Risk
Astral Media	insufficient data
Canadian National Railway	+/- one standard deviation
Canadian Pacific Railway	insufficient data
Cogeco	Beta higher than 1.0
Jean Coutu	non-investment grade

Companies in 2009 Sample Not in 2005 Sample	
Company	*Reason*
Newfoundland Capital	did not pay dividends in all years
Richlieu Hardware	insufficient data
Saputo	insufficient data
Shaw Communications	+/- one standard deviation
SNC-Lavalin	Utility assets
Toromont	+/- one standard deviation
TVA	Beta higher than 1.0
Uni-Select	insufficient data

68.0 Reference: Exhibit B-1, Tab 3, Appendix A p. A-4

At page A-4, Ms. McShane commented that in the presence of inflation, even at moderate levels, absent significant technological advances, replacement cost should exceed the original cost book value of assets. Consequently, the market value of utility shares should be expected to exceed their book value.

68.1 Given the quarterly Canada and US GDP Deflator Indexes and Consumer Price Indexes for 2008 as presented in Schedule 2, does Ms. McShane believe that the two economies could have entered a period of no-inflation or deflation?

Response:

No. In this context, in its April 2009 *Monetary Policy Report*, the Bank of Canada judged that the possibility of a sustained period of deflation was remote. The April 2009 consensus forecasts for the U.S. and Canada indicate that economists anticipate CPI inflation to average 2.3% and 2.1% respectively from 2010 to 2019. The comparative CPI rates of inflation over the 10-year period ending 2008 were 2.8% and 2.3%.

68.1.1 In Ms. McShane's view, has the likelihood that market value of utility shares to exceed their book value decreased?

Response:

No, on the basis of the premise discussed in the preamble to the question, that is, in the presence of inflation, even at moderate levels, absent significant technological advances, replacement cost should exceed the original cost book value of assets.

68.1.2 Please provide an update to the above indexes for Canada and the US for the first two quarters of 2009.

Response:

The requested second quarter data are not currently available. The following table presents data for the first quarter of 2009 for the Canadian and U.S. GDP deflator indices (U.S. Implicit Price Index) and monthly data through May for the Canadian and U.S. Consumer Prices Indices.

	Canada		**U.S.**	
	Consumer Price Index	**GDP Deflator Index**	**Consumer Price Index**	**Implicit Price Index**
Jan-09	151.1		170.3	
Feb-09	152.2		171.1	
Mar-09	152.4		171.5	
Q1 2009	**151.9**	**147.3**	**171.0**	**158.0**
Apr-09	152.3		172.0	
May-09	153.4		172.5	

69.0 Reference: Exhibit B-1, Tab 3, Opinion of Ms. McShane Charts and Schedules

69.1 Chart 1 (preceding Schedule 1) shows the performance of the S&P/TSX Composite and the S&P/TSX Utilities since 1988. Please show the TSX Utilities indices disaggregated by company. Please also create a similar chart with total returns, including stock price change plus dividends and reinvestment of dividends.

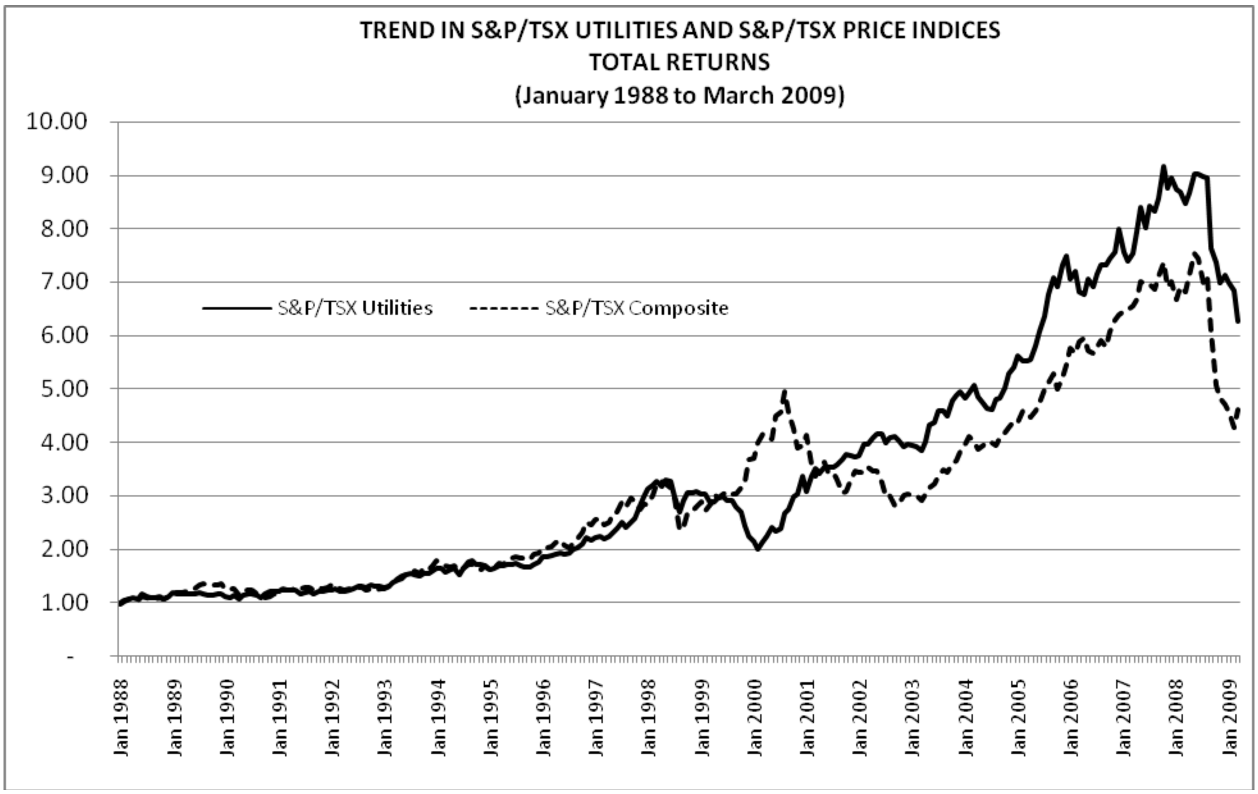
Response:

Ms. McShane has not compiled the data which would permit the disaggregation of the index by company. Note that the index has not always included the same companies. Some have disappeared due to acquisition (i.e. Terasen Inc. and Westcoast); some have been moved to other indices (i.e. Enbridge and TransCanada) and some have been added during the time frame in question (i.e. Northland Power). Ms. McShane has however calculated the total returns for the individual companies which appear on page 11, page 3 of 3 for the period in question. These returns appear in the table below.

	CANADIAN UTILITIES	EMERA INC	ENBRIDGE INC	FORTIS INC	PACIFIC NORTHERN GAS LTD	TERASEN INC	TRANSCANADA CORP
1988	6.4%		5.4%	12.5%	19.4%	19.8%	0.0%
1989	20.7%		7.2%	19.3%	10.3%	24.7%	18.2%
1990	-0.1%		13.2%	3.5%	2.2%	2.3%	4.1%
1991	9.1%		-28.0%	17.7%	28.6%	22.9%	7.4%
1992	5.8%		-4.0%	9.7%	27.9%	-8.8%	5.3%
1993	32.8%	28.9%	50.4%	24.0%	39.8%	19.5%	19.2%
1994	-0.6%	-8.7%	-5.5%	-4.5%	-3.9%	-13.8%	-10.2%
1995	15.2%	19.0%	19.4%	12.8%	8.7%	26.1%	16.5%
1996	23.8%	23.3%	32.7%	32.2%	11.3%	33.4%	33.9%
1997	39.0%	28.1%	71.1%	29.9%	39.2%	42.6%	38.7%
1998	22.6%	9.4%	11.7%	-4.9%	-4.4%	13.8%	-26.5%
1999	-15.4%	-17.0%	-15.7%	-13.6%	-32.8%	-13.1%	-40.6%
2000	36.8%	30.3%	58.5%	21.5%	-52.5%	37.1%	46.4%
2001	1.2%	-0.6%	2.7%	36.8%	20.8%	3.4%	20.9%
2002	6.6%	0.9%	1.5%	16.3%	84.9%	19.3%	20.6%
2003	17.3%	17.1%	30.5%	16.4%	15.0%	30.2%	27.1%
2004	8.2%	12.7%	15.1%	22.2%	11.9%	19.5%	11.4%
2005	50.4%	15.1%	25.5%	43.7%	-2.6%		27.6%
2006	12.3%	12.3%	14.3%	26.0%	-3.5%		14.9%

	CANADIAN UTILITIES	EMERA INC	ENBRIDGE INC	FORTIS INC	PACIFIC NORTHERN GAS LTD	TERASEN INC	TRANSCANADA CORP
2007	-0.2%	1.1%	2.7%	0.4%	8.5%		3.5%
2008	-10.0%	5.9%	2.0%	-12.0%	-23.8%		-15.0%

A chart showing the total return indices for the Utilities Index and the S&P/TSX Composite from 1988 to 2008 is provided below.



69.2 Schedule 5 shows the financial metrics of Canadian utilities. Please show the impact that a 40 percent equity ratio and a ROE of 11 percent would have on TGI's financial metrics.

Response:

The approximate impact of 40% deemed equity ratio and ROE of 11% will have on TGI's financial metrics per Schedule 5 is as follows:

	EBIT Coverage	FFO/Total Debt	FFO Coverage
TGI	2.5x	11.9%	2.8x

69.3 Schedule 10 provides the standard deviations of market returns for TSX indices. The utilities data appear extremely volatile but seems to indicate an average beta of about 0.4. Is there any statistical confidence in the utilities betas?

Response:

The table below shows the R^2s, t-statistics and standard errors for each of the utility index betas shown on Schedule 10, page 2 of 2. Over the full period for which the betas have been provided, the betas exhibit relatively low statistical significance i.e. low R^2s and low t-statistics, particularly for the betas ending 1999 through 2006.

5 Year Price Betas for S&P/TSX Utility Index				
	Beta	***R^2***	***T-Statistic***	***Standard Error***
1997	0.53	0.370	5.8394	0.0915
1998	0.55	0.465	7.0974	0.0779
1999	0.30	0.130	2.9470	0.1019
2000	0.14	0.025	1.2101	0.1153
2001	-0.03	0.001	-0.2799	0.1128
2002	-0.06	0.005	-0.5257	0.1088
2003	-0.25	0.079	-2.2381	0.1136
2004	-0.13	0.023	-1.1652	0.1141
2005	0.00	0.000	-0.0244	0.1077
2006	0.25	0.068	2.0535	0.1217
2007	0.46	0.143	3.1123	0.1487

5 Year Price Betas for S&P/TSX Utility Index				
	Beta	***R^2***	***T-Statistic***	***Standard Error***
2008	0.49	0.281	4.7636	0.1024

69.4 Schedule 11 shows the S&P/TSX composite sector compound returns and betas. Throughout the various time periods, the Pipelines and Utilities compound returns are near the top of the sub-indices. Why would this be the case when their betas are lower than the other sub-indices?

<u>Response:</u>

There are two possible inter-related reasons: (1) Betas and actual returns do not reflect the relationship that would be expected *a priori* and (2) If riskier stocks always earned higher returns, they would not necessarily be viewed as risky.

WRITTEN EVIDENCE OF DR. VANDER WEIDE

70.0 Reference: Exhibit B-1, Tab 4 Written Evidence of Dr. Vander Weide, pp. 9-10
Risk and Volatility

70.1 Lines 14-16 on p. 9 refer to "comparable risk". Exactly and specifically, what risks are comparable and worthy of consideration?

Response:

The phrase on page 9, lines 14 – 16, of Dr. Vander Weide's written evidence is a paraphrase of the fair return standard enunciated by the three Supreme Court cases cited on page 7, lines 22 – 25. These cases do not define "exactly and specifically" the risks that should be considered in assessing whether a return is fair. However, from an economic perspective, it is only important that the overall risk of the comparable companies be similar to the risk of the company whose rates are being determined. Furthermore, one must recognize that are no companies that are perfectly comparable in risk to a target company. Thus, the analyst necessarily must choose a set of companies that are most comparable in overall risk to the utility whose rates are being set. For the reasons explained in his written evidence, Dr. Vander Weide believes that his two comparable groups of Canadian utilities and his two comparable groups of U.S. utilities are sufficiently comparable in overall risk to provide valuable information regarding the fair return for TGI.

70.2 Lines 15-19 on page 10 as well as other places in the Evidence including page 24 lines 7-9 consider the volatility of returns.

70.2.1 Is volatility of return the same as risk?

Response:

In theory, volatility is not exactly the same as risk. As noted in response to BCUC IR 1.14.5 and BCUC IR 1. 14.5.1, however, the average investor considers risk to be uncertainty regarding the expected outcome. Thus, to the average investor, volatility is a reasonable measure of risk.

70.2.2 Please explain why the volatility of returns on utility stocks being higher than the volatility of the general stock market must necessarily imply that utility stocks are riskier than the market in general?

Response:

Please see response to BCUC IR 1.14.5.1 (a) and (b).

70.2.3 Under generally accepted finance theory, are stock holders compensated for: total volatility or just systematic risk that cannot be diversified (which is what is implied by standard finance theory and the CAPM, for example)? Please explain your response in detail.

Response:

Under the Capital Asset Pricing Model, stock holders are compensated only for systematic risk that cannot be diversified. However, the CAPM is a single-period model that does not necessarily describe how returns are generated in the marketplace in the long run. As discussed in response to BCUC IR 1.14.5.1 (b), systematic risk is difficult to measure for long-run investors like investors in utility stocks.

70.2.4 If systematic risk is what investors are compensated for, then why is total volatility a useful statistic to employ in its raw form? Please explain your answer.

Response:

Volatility is a useful statistic because it is consistent with the reasonable notion that risk is defined as the uncertainty about an expected value. Furthermore, volatility may be more indicative of the risk of long-run investments such as utility stocks than systematic risk as measured by beta. As discussed in response to BCUC IR 1.14.5.1 (b), systematic risk as measured by beta reflects the correlation between the short-run (weekly or monthly) returns on utility stocks and short-run returns on the market index. Since utility investors are long-term investors, the correlation between weekly and monthly returns on utility stocks and weekly and monthly returns on the market index is a poor indicator of systematic risk in the long run.

71.0 Reference: Exhibit B-1, Tab 4 Written Evidence of Dr. Vander Weide, p. 11
Utilities Stock Index

71.1 At lines 11 to 18 on page 11, the companies included in the S&P/TSX utilities stock index appear to be mostly electric Income Trusts. Why are these companies' returns comparable to TGI?

Response:

As explained on pages 27 – 28 of Dr. Vander Weide's written evidence, the companies in the S&P/TSX utilities stock index are not perfectly comparable to TGI. TGI is a regulated natural gas distribution utility, and there are few regulated natural gas distribution utilities that have publicly-traded stock. Recognizing the difficulties in identifying publicly-traded companies with exactly the same risks as TGI, Dr. Vander Weide examined cost of equity evidence from two groups of publicly-traded Canadian utilities, the BMO CM market basket of utilities, and the S&P/TSX utilities index, and two groups of publicly-traded U. S. utilities. The primary advantage of using the S&P/TSX utilities stock index is that there are more companies in the S&P/TSX index than in the BMO CM basket of utility stocks and return data for this index is available for a long period of time. The primary advantage of the BMO CM basket of Canadian utilities is that it only includes companies that receive a significant portion of their revenues from traditional utility operations. The primary advantages of his U.S. utilities groups are that: (1) they include a significantly larger sample of companies with traditional utility operations than Canadian groups; (2) the business risk of U.S. utilities is comparable to the business risk of TGI; (3) reasonable estimates of expected growth rates are available for U.S. utilities, whereas the same data are not available for the Canadian utilities; and (4) historical data for the U.S. utilities are available for a much greater length of time than for the Canadian utilities.

72.0 Reference: Exhibit B-1, Tab 4, Written Evidence of Dr. Vander Weide, p. 13
Calculating Returns

Line 13 calculates the annual return as: rt = (Wt/Wt-1) -1, where the time t signifies a year. In other words, the formula employed by Dr. Vander Weide steps over temporary price fluctuations that may occur within the year and compares wealth at the beginning and end of the year to calculate an annual return, as is commonly done in standard accepted finance practice.

72.1 In keeping with the spirit of how the calculation above was accomplished, how should one then calculate the return to holding stock over a longer span of time, for example a decade?

Response:

The answer depends on whether one is attempting to: (1) measure the compound return that was actually achieved during a past time period; or (2) predict the expected value of wealth at the end of a future time period. If one is simply attempting to measure the compound return that was actually achieved during a past time, then one should use the geometric mean return calculated from the formula:

$$G_m = \prod_t (1 + r_t)^{1/n} .$$

However, if one is attempting to predict the expected value of wealth at the end of a future time period, then one should use the arithmetic mean return calculated from the formula:

$$AM = \sum_t r_t / n .$$

Since the results of Dr. Vander Weide's studies are used to estimate an investor's required rate of return on future investments, the arithmetic mean return is the most appropriate return for his studies. Therefore, Dr. Vander Weide calculates the arithmetic mean return rather than the geometric mean return on his historical data sets.

Further explanation of why the arithmetic mean is required to predict the future value of wealth at the end of a future time period is contained in *Ibbotson SBBI® 2009® Valuation Yearbook Market Results for Stocks, Bonds, Bills, and Inflation 1926 – 2008*, pages 59 – 60.

72.1.1 Does Dr. Vander Weide agree with the approach where one takes wealth at the beginning of the decade and compare it to wealth at the end of the decade? In other words, apply the same formula above, rt = (Wt/Wt-1) -1, except with the span of time being 10 years instead of one year? If not, why not.

Response:

Dr. Vander Weide agrees that the approach is reasonable if one is attempting to measure the compound return that was actually received at the end of a 10-year period. Dr. Vander Weide does not agree that this is a reasonable approach to estimate the required return on a future investment. Please also see response to BCUC IR 1.72.1.

72.1.1.1 What then would be the formula average return for each year within the decade? Would it be based on the 10th root of the gross 10-year return? Is this the geometric average?

Response:

If one is attempting to measure the compound return that was actually achieved for each one-year period within a decade, then one could measure the return using the formula, $r_t = (W_t \div W_{t-1}) - 1$, where t signifies a year; or by taking the 10^{th} root of the return over a 10-year historical period. Either formula would yield the geometric average of the experienced return in the particular period. However, as noted in response to BCUC IR 1.72.1, the geometric average return would not be an appropriate estimate of the required rate of return on future investments.

72.1.2 What would happen if, instead, one estimated total return over the decade by simply summing up the 10 individual-year returns to obtain a 10-year total return estimate?

Response:

If one estimates the total return over a decade by simply summing up the ten individual annual returns, the result would be an estimate of the simple, or non-compounded, return over the ten-year period.

72.1.2.1 Will this calculation result in a total return estimate that overestimates or underestimates the return actually earned by the investor?

Response:

A calculation that estimates return by summing up the ten annual returns earned over a ten-year period will underestimate the return that was actually achieved during that past ten-year period because it does not include the effect of compounding. Please also see response to BCUC IR 1.72.1.

72.1.2.2 If we divided this total return estimate by 10 to produce an estimate of average annual return over the decade, will this average estimate therefore overestimate or underestimate the return actually earned by the investor? Is this the arithmetic average? Please explain your answer.

Response:

(a) The arithmetic mean return calculated by summing up ten annual returns over a ten-year period and then dividing this sum by ten will be larger than the geometric mean return actually earned over the ten-year period.

(b) The sum of the ten annual returns divided by ten is the arithmetic average return. Please also see response to BCUC IR 1.72.1.

72.1.3 What does the foregoing imply about the appropriateness of using geometric vs. arithmetic averages in a general finance sense when estimating average returns from a time-series of price data?

Response:

The foregoing implies that the geometric mean measures the returns actually achieved in a past period but that the arithmetic mean is the best estimate of the return investors require in the future, that is to say, the arithmetic mean return is the appropriate return for estimating the cost of equity. Please also see response to BCUC IR 1.72.1.

72.1.4 In Dr. Vander Weide’s opinion, what does the foregoing imply about using arithmetic, rather than geometric, methods when calculating time-series averages (i.e. average returns and risk premia over a span of time) in this Application?

Response:

Dr. Vander Weide’s purpose in this proceeding is to estimate the investor’s required rate of return. For this purpose, the arithmetic mean return should be used to calculate time-series averages. Please also see responses to BCUC IR 1.72 and its sub-parts.

73.0 Reference: Exhibit B-1, Written Evidence of Dr. Vander Weide, p. 14, Ex-Post vs. Ex-Ante Premia

In lines 4-6, expectations of future returns and risk premia are obtained directly from past returns and equity premia without adjustment.

73.1 Does Dr. Vander Weide agree with suggestions from recent financial research that the ex-post equity risk premium (i.e. the return investors have historically earned on risky stocks in excess of risk free bonds [where the term "risk free" in this context implies zero credit risk]) substantially over-estimates the equity risk premium investors require ex-ante (i.e. the future return they think they will receive at the time they invest), because of survivorship biases and other factors in the standard data and estimation procedures? Please explain your answer.

Response:

No. In general, Dr. Vander Weide disagrees with the methods used to reach the conclusion that ex post equity risk premiums "substantially" over-estimate "the equity risk premium investors require ex-ante."

73.2 In light of this over-estimation, what downward adjustments might be appropriate to the market equity premium estimates?

Response:

Dr. Vander Weide disagrees with the hypothesis of the question. In particular, he disagrees that "downward adjustments" are appropriate.

74.0 Reference: Exhibit B-1, Tab 4 Written Evidence of Dr. Vander Weide p. 16
Business Risk

Dr. Vander Weide stated that the business risk of electric and natural gas utilities is similar in the U.S. and Canada. Three factors were cited, namely: technology to deliver, the economics of transmission and distribution, and the regulatory structures and principles.

74.1 Does Dr. Vander Weide have any evidence regarding the similarity of technologies of natural gas facilities? If possible, please provide a comparison of the O&M expense per customer and Net Gas Plant in Service per customer between TGI and U.S. natural gas utilities that have allowed ROEs of 10.3 to 10.5 percent.

Response:

Dr. Vander Weide's statement at page 16 was meant to be a general statement that is consistent with his many years of experience in studying natural gas utilities. He has not conducted a specific study of the O&M expense per customer and Net Plant in Service per customer for TGI and the U.S. natural gas utilities. Such a study would be both time consuming and costly, and it is unlikely that such a study would produce relevant information for the purpose of determining TGI's fair rate of return on equity. However, given the collaboration of Canadian and U. S. gas utilities and their adoption of common practices, Dr. Vander Weide believes that, on average, Canadian and U. S. utilities use similar technologies; and thus that the business risk factors noted above will converge over time.

74.2 Does Dr. Vander Weide have any evidence regarding the lifeline rates for residential customers of natural gas utilities in the U.S. vis-à-vis TGI? Does Dr. Vander Weide have any evidence on the benchmark SQIs of natural gas utilities in the U.S. vis-à-vis TGI?

Response:

(a) Dr. Vander Weide has not conducted a study of the lifeline rates for residential customers of natural gas utilities in the U.S. compared to rates of TGI (Dr. Vander Weide understands that TGI does not have lifeline rates). Such a study would be impractical because each natural gas utility's lifeline rates would need to be studied separately in each regulated jurisdiction. Dr. Vander Weide's group of natural gas utilities were selected to be representative of the overall risk of investing in TGI. Since lifeline rates would have a relatively small impact on each utility's overall risk, such a study would not provide relevant information for determining TGI's fair rate of return in this proceeding.

In addition, to the extent lifeline rates reduce the risk of uncollected receivables, this risk is relatively small, because uncollected receivables are generally treated as an expense for the purpose of ratemaking.

(b) No, Dr. Vander Weide does not have evidence comparing TGI's SQIs to natural gas utilities in the US. As he understands from discussions with the Company, the benchmark Terasen SQIs were introduced as part of a performance-based rate settlement in 2004 in order to ensure that service quality was not sacrificed in the pursuit of operating efficiencies and cost savings. As such, they are an internal comparison of measures specific to TGI's past performance.

There would be no basis on which to make comparisons with other utilities on inwardly-focused measures.

74.3 Please provide general comments on the prevalence of deferral accounts for throughput variances, gas costs, interest expense variances, flow through adjustments of exogenous factors; and risk of disallowance in the U.S. natural gas utilities. Please compare the U.S. experience with the terms under the TGI's current Performance Based Review Plan.

Response:

Most U. S. gas utilities have automatic rate adjustment mechanisms for purchased gas costs and weather normalization. Many U. S. gas utilities have decoupling mechanisms that seek to stabilize revenues by "decoupling" gas rates from gas volumes. Decoupling occurs either through a rate design that allows recovery of fixed costs from fixed monthly charges, or through a revenue normalization adjustment mechanism that increases rates or refunds rates to customers for the difference between actual revenues and authorized revenues. Please see chart in Attachment 74.3.

As noted on pages 19 – 20 of Terasen's 2008 Annual Report, there are three regulatory mechanisms in place for Terasen to reduce the impact of unanticipated changes in forecast costs and revenues. The first two relate to the recovery of gas costs (Gas Cost Reconciliation Account and Midstream Cost Reconciliation Account), and the third seeks to stabilize revenues from residential and commercial customers (Revenue Stabilization Adjustment Mechanism). In addition, Terasen has an interest rate deferral account to absorb interest rate fluctuations.

75.0 Reference: Exhibit B-1, Tab 4 Written Evidence of Dr. Vander Weide p. 16
Allowed ROEs

75.1 Dr. Vander Weide states that the average allowed rates of return on equity for U.S. utilities is 10.4 percent. Please show how this average figure is derived. Are the ROEs from recent rate cases subsequent to 2008? Please provide the dates as to when the ROEs were set.

Response:

The average allowed rates of return on equity for U. S. electric and gas utilities during the past two years, 2006 through 2008, are shown on Schedule 3, pages 44 – 46, of Dr. Vander Weide's written evidence. The tables display the date a company's ROE was established (that is, the date of the commission order), the name of the utility whose ROE is being set, the state where the ROE is being set, and the ROE established. The 10.4 percent average return is simply the average of all the returns shown in the schedule. Dr. Vander Weide shows the most recent two years of data that were available at the time he prepared his written evidence.

75.2 At lines 26 to 30, Dr. Vander Weide states that deferral accounts generally reduce the gap between a utility's actual and allowed returns, they do not necessarily reduce the gap between a utility's actual and required returns. Please validate the above statement. Please provide, for each US utility that has been used to compare to TGI, its risk deferral mechanisms and compare these mechanisms to those afforded TGI by the BCUC.

Response:

(a) The statement is validated by Dr. Vander Weide's written evidence, including his six tests of whether the current AAM ROE Formula produces a fair return for TGI.

(b) With regard to U.S. gas utilities, please see response to BCUC IR 1.74.3. With regard to U.S. electric utilities, Dr. Vander Weide is aware from his experience in regulatory proceedings that most U. S. electric utilities have automatic fuel cost adjustment mechanisms and pass-through accounts for uncontrollable items such as demand management programs, costs of environmental protection, franchise fees, revenue taxes, and storm-related surcharges. In addition, most U. S. electric utilities have annual resource planning reviews with the utility commission in which the commission approves the utility's long-term capital expenditure plans. Once plans are approved, the utility's capital expenditures are assumed to be prudent unless proven to be otherwise.

75.3 At the bottom of page 16 it is stated that Canadian utilities face greater regulatory risk than US utilities because of the ROE formulas. Please reconcile this statement with the greater regulatory certainty that utility analysts have reported in the past.

<u>Response:</u>

Utility analysts use the phrase "regulatory certainty" to indicate that Canadian utilities have a reasonable likelihood, in the short run, to earn their *allowed* rates of return. Regulatory risk generally refers to the likelihood that Canadian utilities will earn less than their *required* rate of return. Dr. Vander Weide's written evidence demonstrates that Canadian formula allowed returns are significantly less than Canadian utilities' required return. Thus, Canadian utilities face greater regulatory risk than U. S. utilities because of the Canadian ROE formulas, even though Canadian utilities have a reasonable likelihood of earning their allowed returns in the short run.

76.0 Reference: Exhibit B-1, Tab 4 Evidence of Dr. Vander Weide p. 19

76.1 Please explain the reason for choosing 20-year U.S. Treasury bonds as opposed to 30 year bonds.

Response:

Dr. Vander Weide chose 20-year U.S. Treasury bonds because data on the yield on U.S. Treasury bonds is available from Ibbotson Associates for the last 80 years, whereas Dr. Vander Weide is not aware of a data source for yields on 30-year Treasury bonds that go back continuously over such a long period of time. In addition, because both 20-year and 30-year U.S. Treasury bonds are long-term obligations of the federal government, there is generally little difference in the yields on these bonds. Dr. Vander also notes that his ex ante risk premium studies, described beginning at page 17, extend back over approximately the last ten years; the 30-year U.S. Treasury bond was not offered over the years 2002 to 2006.

77.0 Reference: Exhibit B-1, Tab 4 Evidence of Dr. Vander Weide p. 23 Tables 2 and 3

Tables 2 and 3 indicate that Canadian utilities have higher standard deviations and much higher returns than the S&P/TSX Canadian market.

77.1 Does this make sense given the low betas calculated by other witnesses and the expectation that returns should be less than the market?

Response:

Dr. Vander Weide agrees that the evidence in Table 2 and Table 3 is inconsistent with the low betas for Canadian utilities that are sometimes calculated by other witnesses. However, as noted in response to interrogatory BCUC IR 1.14.5, Dr. Vander Weide believes that the problem lies not with the data presented in Table 2 and Table 3, but, rather, with the low estimated betas for Canadian utilities. The traditionally-calculated betas of other witnesses depend on the correlation, or co-variation, between the short-run returns on the utility stocks and the short-run returns on the market index. Because utility investors invest for the long run, they do not consider the correlation, or lack thereof, between short-run utility returns and short-run returns on the market index as a measure of risk. Utility investors are more concerned about the correlation between the long-run returns on utility stocks and long-run returns on the market index. However, the correlation between the long-run returns is difficult to measure because of the lack of a reasonable sample of long-run returns. Also see full response to BCUC IR 1.14.5.

77.2 Does it indicate that the BMO Capital Markets Utilities Stock is not representative? Would it indicate that returns awarded by regulators have been too high for the betas of Canadian utility stocks?

Response:

(a) No. The BMO Capital Markets utilities stock data set only includes Canadian companies that receive a significant portion of their revenues from traditional utility operations.

(b) No. As discussed in Dr. Vander Weide's written evidence, the data in Table 2 and Table 3 indicate that the risk of Canadian utility stocks compared to the risk of the Canadian stock market as a whole is greater than is implied by the AAM ROE formula. This evidence also indicates that the AAM ROE formula produces returns that are lower than the returns required by investors in Canadian utility stocks.

77.3 Please explain what work the author did to verify the reasonableness of his statistical regressions to expected results and the findings of other analysts. Please confirm that total returns were used including dividend reinvestment.

<u>Response:</u>

Statistical regressions are not required to estimate the standard deviations shown in Table 2 and Table 3. Dr. Vander Weide confirms that total returns were used, including both dividends and capital gains.

78.0 Reference: Exhibit B-1, Tab 4, Written Opinion of Dr. Vander Weide, p. 31 Econometrics

In lines 4-6, and in Exhibit 13, a regression model is proposed relating the risk premium (variable RPcomp) to the interest rate (I_B).

78.1 Are any econometric problems (especially biases in results) created by the fact that the variable I_B effectively appears on the left hand side of the regression as well as the right side, given that RPcomp is defined as the equity return, DCFcomp, minus I_B?

Response:

No. Because there is sufficient independent variation in the DCF results, there are no econometric problems created by the appearance of the variable I_B on the left side and right side of the regression equation.

78.2 Please provide results from unit root test on the variable I_B.

Response:

The unit root test is used to discover whether a variable such as I_B is serially correlated. As explained in Exhibit 13, Appendix 4, in conducting his regressions, Dr. Vander Weide examined the residuals from his initial regression analysis to determine whether the residuals were serially correlated (non-zero serial correlation indicates that the residual in one time period tends to be correlated with the residuals in previous time periods). Dr. Vander Weide found from his initial examination that the residuals from his first regression analysis were serially correlated. He therefore made adjustments to his data to adjust for serial correlation in the residuals. The common procedure for dealing with serial correlation in the residuals is to estimate the regression coefficients in two steps. First, a multiple regression analysis is used to estimate the serial correlation coefficient, *r*. Second, the estimated serial correlation coefficient is used to transform the original variables into new variables whose serial correlation is approximately zero. The regression coefficients are then re-estimated using the transformed variables as inputs in the regression equation. Because Dr. Vander Weide's regression analysis includes only the transformed variables as inputs in the regression equation, the regression results are not distorted by serial correlation in the variables or residuals.

In addition, in preparing this response, Dr. Vander Weide determined that there are typographical errors in Exhibit 13, Appendix 3, which should be replaced with the revised Appendix 3 provided in Attachment 78.2 to correct typographical errors in the reported statistics; the data as filed relate to a study from an earlier time period. Please note that there is no change to Dr. Vander Weide's study results or conclusions as reported in the body of his written evidence.

78.2.1 Is I_B a stationary variable? If not, why not use the first difference of I_B in the regression to avoid potentially spurious results?

Response:

The initial values for I_B are non-stationary. However, as discussed in response to BCUC IR 1.78.2, Dr. Vander Weide transformed the variables on both the left and right sides of the equation in order to remove the serial correlation. The transformation is described by the following equation:

$$y_t' = y_t - r y_{t-1}$$

$$x_t' = x_t - r x_{t-1}$$

where y_t' and x_t' are the transformed variables, and r is an estimate of the serial correlation coefficient.

For a complete explanation of this procedure, see chapters on treating serial correlation in standard texts on econometric methods.

78.3 Are DCFcomp and I_B cointegrated? If yes, is the model in any way misspecified, or at least suboptimally specified, as written and estimated? If no, please explain.

Response:

No. The transformed values of DCF_{comp} and I_B are not cointegrated because, as explained in response to BCUC IR 1.78.2 and BCUC IR 1.78.3, they are not serially correlated. As noted, Dr. Vander Weide used only transformed values that are not serially correlated in his regression analysis.

78.4 If any of the foregoing are in fact econometric problems, then what happens to the regression results and conclusions if these issues are addressed? Please report the results. Does that change any of the conclusions regarding the appropriate ROE for TGI?

Response:

Since none of the foregoing are econometric problems, no change in Dr. Vander Weide's conclusions is required.

78.5 Please confirm that the average stock return presented in Table 4 includes dividends and reinvestments.

Response:

Confirm.

79.0 Reference: Exhibit B-1, Tab 4, Written Opinion of Dr. Vander Weide, p. 33 DCF Robustness

Concerning robustness and confidence in the DCF results,

79.1 How robust are the estimates of "k", the cost of equity, with respect to a variety of reasonable changes in data and time periods?

Response:

In his written evidence, Dr. Vander Weide presents the best data available at the time of his analysis to estimate prices, growth rates, and dividends in his DCF analysis. In his opinion, there is no reason to change the values used in his analysis.

79.1.1 For example, vary the estimate of "g" and "D" by changing data windows or assumptions used to estimate "D" and "g" and report results – how sensitive is the cost of equity to the assumptions used regarding these inputs into the DCF model?

Response:

Dr. Vander Weide used the most recent four quarterly dividends to estimate the "d" component in his DCF analysis, and the most recent I/B/E/S estimate of EPS growth to estimate the "g" component in his DCF analysis. Dr. Vander Weide does not believe it would be appropriate to use historical dividends from prior years or growth estimates from prior years in his DCF analysis because such estimates would be inconsistent with his use of recent prices. Further, the cost of equity is forward looking, and it is appropriate to use the most recent data at the time of the analysis.

79.2 The DCF model requires a price "P" to be specified. Is it true that, all else being equal, the lower the price "P" the higher the cost of equity (called "k") by construction? If no, please explain.

Response:

Although it is strictly true, all else being equal, that the lower the price, the higher the cost of equity, all else is rarely equal. Specifically, the price generally rises or falls because of changes in expected dividends or growth rates.

79.3 Is it not the case that the stock market was significantly below its trend at the time Dr. Vander Weide's Evidence was written and thus that the value of "P" employed might have been lower than the value of "P" would be using other potential time periods?

Response:

As discussed above, Dr. Vander Weide uses the most recent prices available at the time of his analysis along with contemporaneous dividends and growth rates in his DCF analysis. It would make no economic sense whatsoever to adjust the price term in the DCF model to reflect a belief that a price is "significantly below its trend" without also adjusting the dividends and growth rates in the DCF model; however, it makes no sense for an analyst to speculate on a "trend" in prices, dividends, and growth rates, when actual market information is available that already reflects all the information available to investors, including any "trends." Thus, Dr. Vander Weide uses the most recent data at the time of his analysis.

79.3.1 For example, please use the average "P" over the past year, and use the value of "P" as of July 2009, and note the sensitivity of the results regarding the estimate of "k". How robust is the estimate of "k"? Please report on the sensitivities of the results.

Response:

See response to BCUC IR 1.79.3.

79.4 Please provide standard deviations along with point estimates when reporting results from the foregoing estimations. For example, on pp. 60 and 61, at the bottom of each table, please report the standard deviations of the estimates in addition to the mean.

Response:

Please see response to BCUC IR 1.79.3. The standard deviation of the DCF results in Exhibit 8, page 60, is 1.75 percent, and for the DCF results in Exhibit 9, page 61, 1.71 percent.

80.0 Reference: Exhibit B-1, Tab 4, Written Opinion of Dr. Vander Weide, pp. 33, 34 DCF

In applying the DCF Model, the comparable utilities analysis is done after culling the companies to eliminate those that have deteriorating conditions.

80.1 Does this not result in a residual group of companies that are the best possible performers? Do these conditions precedent to running a DCF model not indicate major limitations in the usefulness of the DCF model?

Response:

No. Dr. Vander Weide's written evidence at page 33 lists the five criteria he uses to select comparable companies: all the utilities in Value Line's electric and natural gas industry groups that: (1) paid dividends during every quarter and did not decrease dividends during any quarter of the past two years; (2) have at least three analysts included in the I/B/E/S mean growth forecast; (3) are not in the process of being acquired; (4) have a Value Line Safety Rank of 1, 2, or 3; and (5) have investment grade S&P bond ratings. Dr. Vander Weide did not "cull" the companies "to eliminate those that have deteriorating conditions." Rather, he eliminated companies that were either not comparable in risk to TGI or whose data are not reliable inputs for a DCF analysis. A further discussion of why Dr. Vander Weide uses his selection criteria is contained in Dr. Vander Weide's written evidence, response to Questions 101 – 103, page 33 – 34.

(a) No. The residual group of companies is the set of companies that are most comparable to TGI.

(b) No. Dr. Vander Weide's selection criteria do not indicate any "major limitations" in the usefulness of the DCF model. Rather, as discussed above, these selection criteria are designed to select companies that are comparable in risk to TGI. Thus, to be consistent with the fair return standard, Dr. Vander Weide applies the DCF model only to a comparable group of utilities, because the fair return standard requires that the allowed return for TGI be equal to the returns investors expect to earn on other investments of comparable risk.

81.0 Reference: Exhibit B-1, Tab 4, Written Opinion of Dr. Vander Weide, pp. 35, 36
Comparable Risk Utilities

Dr. Vander Weide opines that the business risk of TGI is approximately equal to the average business risk of U.S. electric and natural gas utilities.

81.1 Please provide the analyses carried out to confirm this statement

Response:

Dr. Vander Weide's opinion is based on his knowledge, from more than 30 years of experience in utility regulation, that both TGI and U. S. electric and gas utilities: (1) sell energy services under regulated rates; (2) face similar competitive forces; (3) are regulated under similar cost of service mechanisms; and (4) must make large investments in long-lived energy facilities whose costs are largely sunk once they are made. Please also see response to BCUC IR 1.74.3 and BCUC IR 1.75.2.

81.2 If the awarded ROE and equity thickness for TGI is dramatically lower than U.S. utilities that are competing for capital in a global market, would one have expected TGI to face greater difficulty in raising debt? Would one have expected TGI's total returns to significantly lag the S&P/TSX Composite? Has this happened?

Response:

Dr. Vander Weide has not studied TGI's difficulty in raising debt because his testimony is concerned with TGI's fair rate of return on equity. Dr. Vander Weide has also not studied TGI's total returns in the marketplace because TGI has not been publicly-traded in recent years.

82.0 Reference: Exhibit B-1, Tab 4, Written Opinion of Dr. Vander Weide, pp. 31, 35 Estimates

Concerning estimates in Tables 4 and 5 of Dr. Vander Weide’s Evidence:

82.1 Please specify the time periods employed in the estimations.

Response:

With regard to the data shown in Table 4, the time periods employed are the periods from 1956 – 2008 and 1983 – 2008, as shown in the table heading columns. With respect to the summary of Dr. Vander Weide’s cost of equity study results shown in Table 5, as described in his written evidence concerning each cost of equity study: ex post studies employ the annual experienced risk premium data from 1956 – 2008 and 1983 – 2008 and the recent forecast long-term Canada bond yield (see Table 4 and Questions and Answers 92 - 93, pages 30 - 31 of Dr. Vander Weide’s written evidence); ex ante studies employ monthly data beginning June 1998 through February 1999 (see Questions and Answers 96 – 98, pages 32 – 33 and Exhibit 5, Exhibit 6, and Exhibit 13, Appendix 3 of Dr. Vander Weide’s written evidence); discounted cash flow studies employ data beginning December 2008 through February 2009 (see Question and Answer 104, page 34, and Exhibit 8 and Exhibit 9).

82.2 Please provide standard deviations along with point estimates.

Response:

The standard deviation of returns for the BMO/CM utilities stock data set and the S&P/TSX Utilities are reported in Table 1, page 23, of Dr. Vander Weide’s written evidence and are reproduced below. With regard to the DCF results shown in Exhibit 8 and Exhibit 9, the standard deviation of the estimates is provided in response to BCUC IR 1.79.4 above.

TABLE 1
STANDARD DEVIATION OF ANNUAL RETURNS
BMO CM UTILITIES STOCK DATA SET,
S&P/TSX UTILITIES, AND TSX MARKET INDEX

Period	BMO CM Utilities Stock Data Set	S&P/TSX Utilities Index	TSX Canadian Market
1983 – 2008	17.29	18.64	16.67
1956 – 2008		15.76	16.72

82.3 Please report results obtained using geometric averages, along with arithmetic averages.

Response:

For the reasons stated in response to BCUC IR 1.72.1, Dr. Vander Weide does not believe that geometric averages should be used to estimate the forward-looking required return. Nonetheless, the geometric average returns are shown below.

TABLE 2 REVISED IN RESPONSE TO BCUC IR 1.82.3
GEOMETRIC AVERAGE RISK PREMIUM RESULTS

Comparable Group	Period of Study	GEOMETRIC Average Stock Return	GEOMETRIC Average Bond Yield	GEOMETRIC AVERAGE Risk Premium
S&P/TSX Utilities	1956 – 2008	10.73	7.51	3.23
BMO CM Utilities Stock Data Set	1983 – 2008	13.06	7.63	5.43

With regard to the data reported in Table 5, the summary of results of each of Dr. Vander Weide's cost of equity studies, it is not possible to provide a geometric average. These data represent the most recent results, not the results of a long time series of data. Since a geometric average is appropriate for only a long series of historical data, to attempt to calculate a geometric average of the cost of equity results displayed in Table 5 would not make sense.

83.0 Reference: Exhibit B-1, Tab 4, Written Opinion of Dr. Vander Weide, p.39 Exhibit 1

83.1 Please add a column to the table in Exhibit 1 to show the TSX composite total return and the risk premium.

Response:

Please refer to Attachment 83.1.

OTHER FILINGS AND DOCUMENTS

Please file these documents/reports requested in this section electronically in PDF searchable format on CD. Please note that hard copies are not required.

84.0 Reference: Annual Reports and Other Filings

84.1 Please file the Fortis Inc. Short Form Prospectus dated March 7, 2007.

Response:

Please refer to Attachment 84.1.

84.1.1 Please provide details of the Fortis Inc. acquisition of Terasen Inc. What is the difference between a bought deal and a best efforts basis? How was investor interest in the Fortis Inc. subscription receipts?

Response:

As per Fortis news release dated February 26, 2007:

On February 26, 2007, Fortis Inc. entered into an agreement to acquire Terasen from a wholly owned subsidiary of Kinder Morgan, Inc. (NYSE:KMI), a U.S. energy transportation, storage and distribution company based in Houston, Texas, for a purchase price of $3.7 billion, including the assumption of approximately $2.3 billion of debt. Terasen (formerly BC Gas) is a holding company headquartered in Vancouver, British Columbia operating two principal lines of business: natural gas distribution and petroleum transportation. The acquisition does not include the petroleum transportation assets of Kinder Morgan Canada (formerly Terasen Pipelines), which are comprised primarily of refined and crude oil pipelines.

The natural gas distribution business of Terasen, referred to as Terasen Gas, is the third largest gas distribution utility in Canada. Terasen Gas serves approximately 900,000 customers or 95% of natural gas customers in British Columbia. The Company owns and operates 44,100 kilometres of gas distribution pipelines and 4,300 kilometres of gas transmission pipelines. Its service territory includes the populous lower mainland, Vancouver Island, and the southern interior of the province. As of December 31, 2006, Terasen Gas had an aggregate of approximately $3.8 billion of assets, an aggregate rate base approaching $3.0 billion and approximately 1,200 employees.

What is the difference between a bought deal and a best efforts basis?

Bought Deal:

The entire issue of new securities is bought from the issuing company by the underwriters and resold to its clients. The underwriter risks its own money in a bought deal, and in the event that the price has to be lowered to sell out the issue, the underwriter absorbs the loss.

Best Efforts:

The underwriter agrees to use his or her best efforts to sell a new issue of securities, but does not guarantee to the issuing company that any or all of the issue will be sold. The underwriter acts as an agent for the issuer in distributing the issue to his clients.

How was investor interest in the Fortis Inc. subscription receipts?

Fortis entered into an agreement, on February 26, 2007, with the Underwriters under which they agreed to purchase from Fortis and sell to the public 38,500,000 Subscription Receipts at $26.00 each for gross proceeds to the Corporation of $1,001,000,000. On March 15, 2007 the Underwriters exercised their over-allotment option and purchased an additional 5,775,000 Subscription Receipts at a purchase price of $26.00 each for gross proceeds from the over-allotment option to the Corporation of $150,150,000.

Fortis was informed by the underwriters for the subscription receipt deal that investor interest in the bought deal was strong with the initial issue amount being fully sold out over a couple of days.

84.2 Please provide a copy of the 2008 Fortis Inc. Annual Report.

Response:

Please refer to Attachment 84.2.

84.3 Please provide a copy of the 2008 Terasen Inc. Annual Report "Delivering BC's energy future".

Response:

Please refer to the response to BCUC IR 1.39.1, Attachment 39.1.

84.4 Please provide a copy of the financial statements of Terasen Gas Inc. for each year from 2004 to 2008.

Response:

Provided under Attachment 84.4 are the 2004 to 2008 annual audited financial statements for Terasen Gas Inc.

84.5 Please provide a copy of the Terasen Gas Customer Advisory Council Meeting May 27, 2009 materials.

Response:

Please refer to Attachment 84.5.

84.6 Please file the TGI April 24, 2008 Short Form Base Shelf Prospectus. Also file the TGI Pricing Supplement No. 2 dated February 19, 2009 and the Terasen Gas Inc. Earnings Coverage Ratio as at March 31, 2009 and December 31, 2008 which are all in conjunction with the base shelf prospectus dated April 24, 2008.

Response:

Please refer to Attachment 84.6.

84.7 Please file the TGI 2008 Management's Discussion and Analysis dated February 6, 2009.

Response:

Please refer to Attachment 84.7.

84.8 Please file the TGI Annual Information Form for the year ended December 31, 2008 dated February 18, 2009.

Response:

Please refer to Attachment 84.8.

85.0 Reference: Purchases of Terasen Gas Inc.

85.1 What was the premium above market price and the Price to Book ratio paid by Kinder Morgan for Terasen Inc.?

Response:

Kinder Morgan ("KMI") acquired Terasen on November 30, 2005 for a pro-rated value of $35.91 per Terasen share based on KMI's share price and C$/US$ exchange rates as of July 29, representing a premium of approximately 20% over the 20 day average closing price and a premium of 14% to the prior day's close at the time the acquisition was announced on August 1, 2005. At the time of the acquisition, the reported BV/share was $13.57. The total Price to Book Value per share of the transaction was 2.6 times.

85.2 What were the book value, transaction price, and resulting Price to Book ratio paid by Fortis Inc. for Terasen Inc.? Explain the difference between Terasen Inc. as acquired by Kinder Morgan and sold by Kinder Morgan (i.e. pipeline operations).

Response:

Fortis Inc. acquired Terasen Inc., which consisted primarily of the gas utilities TGI, TGVI and TGW, while Kinder Morgan retained the pipeline business, which was comprised mainly of Trans Mountain Pipeline, Express Pipeline and Corridor Pipeline. Prior to the transaction, Kinder Morgan had disposed of the Terasen's water utility and utility services businesses.

The total book values of assets acquired by Fortis Inc. were approximately $3.25 billion. The price paid for the assets was $4.15 billion, reflecting a goodwill premium of $900 million and a Price to Book Value per share of 1.28 times.

86.0 Reference: Credit Rating Agency Reports

86.1 Please provide all presentations and documentation made to bond rating agencies since 2004 in regards to TGI.

Response:

Copies of presentations prepared for rating agencies are attached. Presentations made to credit rating agencies contain confidential financial information that has not been made public. The confidential information has been removed from the presentations. No credit rating agency presentation was prepared in 2007. See the Attachment 86.1.

86.2 Please provide all credit rating agency reports (i.e. DBRS, S&P and Moody's) since 2004 in regards to TGI.

Response:

Please refer to Attachment 86.2.

86.3 Please file the latest Terasen Inc. credit rating report from each agency.

Response:

Please refer to Attachment 86.3.

86.4 Please file the latest Fortis Inc. credit rating report from each agency. If the report is an update file the previous substantive report.

Response:

Please refer to Attachment 86.4.

86.5 Tab 3 – Expert Testimony of Kathleen C. McShane in Financial – Schedule 3 shows the Moody’s Bond Rating for Terasen Gas (Vancouver Island) Senior Unsecured as A3 which is the same rating as Terasen Gas for Senior Unsecured debt.

86.5.1 Please file the latest TGVI Moody’s credit rating agency report.

Response:

Please see attachment 86.5.1.

Note that DBRS also provides a private rating on TGVI which is currently BBB (high).

86.5.2 The Application on page 9 requests that TGVI’s specific risk premium of 70 basis points that was established for TGVI in the 2006 Decision continue, and be applied to the new Benchmark ROE that is to be made effective July 1, 2009. If the proposed new Benchmark ROE was approved as filed, directionally how would the higher ROE affect the TGVI credit rating and the ability to attract capital? Please explain.

Response:

Directionally, the higher benchmark ROE would improve the TGVI credit rating metrics which may lead to an increase in ratings. However, the ROE level is one factor affecting the overall credit rating, therefore, it is not possible to determine with certainty the affect on the ratings from an increase in the benchmark ROE. An increase in the ROE to a satisfactory level to address the Fair Return Standard would make the likelihood of a rating downgrade less likely. To the extent that credit metrics are improved, all else equal, an investor in comparing investment opportunities may view the improved credit metrics of TGVI as beneficial, which would improve TGVI’s ability to compete for capital. In addition, when a shareholder is considering competing discretionary investment opportunities, preference would be given first to the investment with the higher return, therefore, an improved ROE will increase the likelihood of attracting capital.

86.6 Tab 3 – Expert Testimony of Kathleen C. McShane in Financial – Schedule 15 provides a reference to the Standard and Poor's, Issuer Ranking: U.S. Natural Gas Distributors and Integrated Gas Companies: Strongest to Weakest (March 10, 2009).

86.6.1 Please provide the Standard & Poor's "Issuer Ranking: Canadian Gas and Electric Utility Companies, Strongest to Weakest". Please file similar reports from the other credit ratings agencies, if available.

Response:

The requested report is provided in Attachment 86.6.1. Ms. McShane is not aware of any similar reports from the other credit rating agencies.

86.7 Since 2004 please provide details of any credit rating agency ratings change or change to ratings outlook for TGI, Enbridge Gas Distribution, and Union Gas Limited.

Response:

In the table below are details of credit rating agency changes and ratings outlook changes since 2004 for TGI, Enbridge Gas Distribution and Union Gas Limited. (Ratings Source: RBC Capital Markets for Enbridge Gas Distribution and Union Gas Limited).

	Agent	Rating	Outlook	Rating Period
Enbridge Gas	S&P	A-	stable	2003-Present
	DBRS	A		2003-Present
	Moody's	Not rated	n/a	n/a
Union Gas Limited	S&P	BBB+	negative	Past - Jan 2004
	S&P	BBB	stable	Feb - Nov 2004
	S&P	BBB	positive	Dec 2004 - Jan 2005
	S&P	BBB	stable	Feb - Apr 2005
	S&P	BBB	negative	May - Aug 2005
	S&P	BBB	stable	Sep 2005 - Apr 2006
	S&P	BBB	positive	May 2006
	S&P	BBB	developing	Jun -Aug 2006
	S&P	BBB	positive	Sep - Dec 2006
	S&P	BBB+	stable	Jan 2007 - Present
	DBRS	A	stable	2000 - Present
	Moody's	Not rated	n/a	n/a
TGI	S&P	BBB	Negative	2003 - Jan 2007
	S&P	BBB	Postive	Jan - May 2007
	S&P	A	Stable	Jun 2007 - Present
	Moody's	A2	Stable	2004 - July 2005
	Moody's	A2	Negative	Aug - Nov 2005
	Moody's	A3	Stable	Dec 2005 - Present
	DBRS	A	Stable	2004 - Present

.

87.0 Reference: Analyst Reports

87.1 Please provide all presentations and documentation made to financial analysts since 2005 in regard to TGI and TGVI.

Response:

The only presentations made to financial analysts are those made to credit rating agencies, as provided in the response to BCUC IR 1.86.1. As TGI and TGVI do not have publicly traded common shares, neither company is followed by equity analysts, therefore, there has been no presentations made to equity analysts in regard to either TGI or TGVI.

87.2 Please provide all financial analyst reports since 2005 in regard to Terasen Inc. and TGI.

Response:

With regards to Terasen Inc., we have included the equity analyst reports from 2005 that were filed as part of the 2005 ROE and Capital Structure Application. Terasen Inc. was acquired by Kinder Morgan Inc. in November 2005. Since then there have been no equity analyst reports issued on Terasen Inc. As TGI does not have common shares that are publicly traded, there are no equity analysts' reports that we are aware of.

With respect to Terasen Inc. and Terasen Gas Inc. included in Attachment 87.2 are the corporate debt research reports since 2005 published by Bank of Montreal and Bank of Nova Scotia research analysts.

87.3 Please file all financial analyst reports on Fortis Inc. since 2006.

Response:

Please refer to Attachment 87.3.

88.0 Reference: Deferral Accounts and Risk Management Plan

88.1 Please list all approved TGI deferral accounts with a short description and approval order. Also note if other Canadian utilities would typically have similar accounts. If available, identify which utilities have the same deferral account.

Response:

For a list of all approved TGI deferral accounts with balances as of December 31, 2008, see Attachment 88.1.

A review of the published financial statement notes of other Canadian utilities (Enbridge Gas, Union Gas, ATCO Ltd., Gaz Metro, Pacific Northern Gas (PNG), Fortis subsidiaries) shows that other Canadian utilities would typically have similar accounts, where similar circumstances exist. In particular:

- Commodity/Purchase Cost Deferral Accounts (similar to MCRA and CCRA) for Enbridge, Union Gas, Atco, Gaz Metro, PNG, Newfoundland Power, Maritime Electric
- Revenue or Weather Stabilization Accounts (similar to RSAM) for Enbridge, Atco, Gaz Metro, PNG, Newfoundland Power
- Demand Side Management or Energy Efficiency for Enbridge, Gaz Metro, Fortis BC
- Deferred costs of applications for Enbridge, Atco, PNG
- Earnings Sharing for Enbridge, Gaz Metro, Fortis BC
- Mitigation Revenues (similar to SCP Mitigation) for Union Gas and Atco

Many utilities also appear to have a deferral account for changes in tax rates. There may be additional deferral accounts for these companies for uncontrollable items that are not deemed to be material enough for financial statement disclosure. In addition, each utility has deferral accounts related to their own specific projects and circumstances.

88.1.1 Please describe the TGI Price Risk Management Plan? Explain the resulting benefits of implementing the plan.

Response:

Terasen Gas strives to provide safe, reliable and cost-effective service to energy customers within its service areas. The Price Risk Management Plan (the "PRMP") is one of the tools that Terasen Gas uses to support this goal. The primary objectives of the Price Risk Management Plan are to improve the likelihood that natural gas remains competitive with electricity over the term of the Plan, moderate the volatility of market gas prices and their effect on rates for customers, and reduce the risk of regional price disconnects (i.e. wherein Sumas pricing separates significantly from Station #2 or AECO hub pricing in periods of high demand). Terasen Gas believes these objectives have served customers well, providing value through rates significantly less volatile than prices in the natural gas marketplace at a reasonable cost that is competitive, at least on a variable cost basis, with electricity rates.

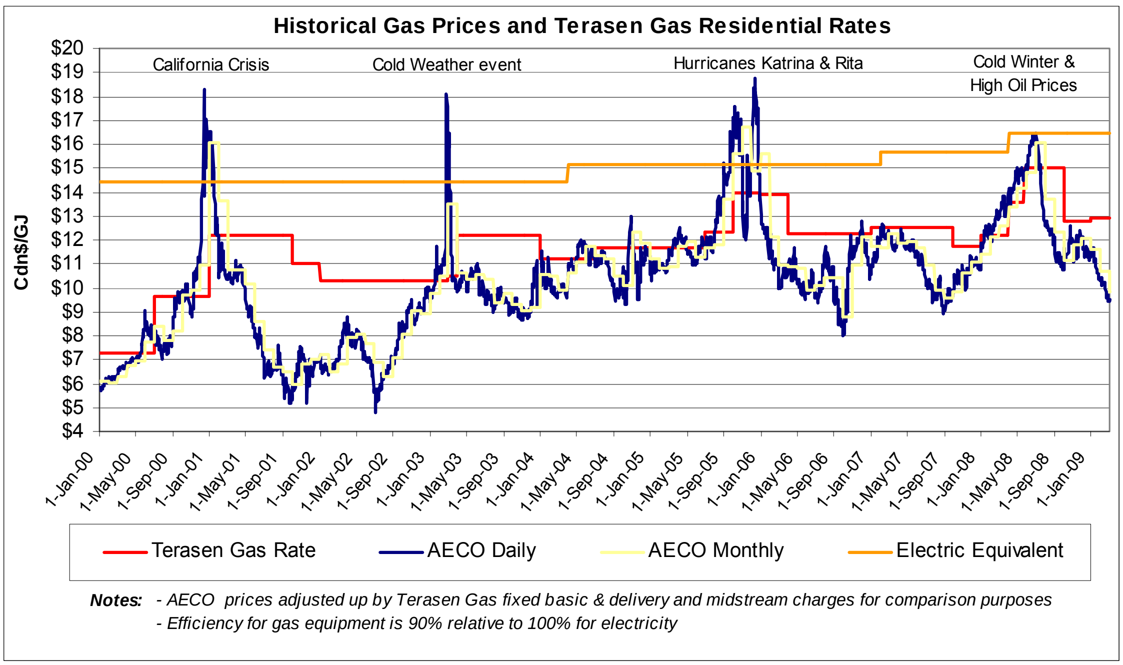
It is important to note that customer perceptions of the competitiveness of Terasen Gas rates relative to electricity rates are critical in maintaining competitive rates. To the degree that the hedging program can dampen the effects of market price volatility on rates Terasen Gas will improve the probability of successfully maintaining customer growth and reducing customer migration to electricity as a heating source. Customers' reaction and concern to the volatile natural gas prices can be demonstrated by BCOAPO's recent statement in its final argument in the BC Hydro 2008 LTAP proceeding, which states:

> *"BCOAPO recognizes that Terasen's current rate compares favourably against BC Hydro's trailing residential rate. Right now, customers choosing natural gas for space and water heating are seeing a definite financial benefit as compared to their electricity-using counterparts. However, given the volatile natural gas prices, this could change at any time and customers would again find themselves in a situation where natural gas is no longer even the most economic choice*."

BCOAPO and other customers' perceptions of future natural gas prices may have been altered recently with the oil pricing scenario that unfolded in 2008. On July 3, 2008 the NYMEX oil futures contract for August 2008 deliveries hit an all time high of $145 US/barrel. This type of pricing event can shape customers perception of what the long term price for oil or natural gas may be and thus impact their investments and behaviour towards energy choice and highlights the necessity of an effective hedging program.

In February 2005, Terasen Gas engaged a research company to survey customers regarding their tolerance for volatility and the survey results confirmed that while customers will tolerate some volatility (annual bill increase of up to 17% in a year) it is certainly less than the volatility that has occurred in the recent past in the natural gas market. Terasen Gas' market-based rate offering provides customers with a choice amongst the longer-term fixed-rate offerings of marketers in the unbundled environment, while still protecting those customers that remain under this rate from the full impact of market price volatility and price spikes. The following graph illustrates the volatility reduction provided by the Terasen Gas rate (for residential customers) as well as the electric equivalent. The electric equivalent presented in the graph is the historical residential electric equivalent until October 2008 after which time a blended electric equivalent is shown (which is calculated by inflating 2008 rates by the approved increases to the revenue requirement in the Commission decision on the BC Hydro F2009/2010 Revenue Requirements Application).

Historical Gas Prices vs. TGI Natural Gas and Electric Rates



As an example, during 2008 Terasen Gas' residential rates increased by a total of 22%, above the tolerable rate increase of 17% indicated in the customer survey. Residential commodity rate increases occurring in 2008 became effective April 1, 2008 and July 1, 2008, with each commodity rate change representing an 11% increase in residential rates. Without the use of hedges the rate increases requested in 2008 would have totalled approximately 36% (based on the cost of gas twelve-month outlook without hedges in place). The AECO forward price curve, looking 12 months out, increased by about 50% during the same period. In October 2008, Terasen Gas' commodity rate reverted back close to the level prior to the price run-up during the middle of 2008, with a reduction in the residential rate by about 15%. So while the Terasen Gas rate does not follow market prices all the way down following price spikes, it also does not follow prices all the way up either, saving customers from rate shock and the 'rollercoaster' ride of market price volatility and improving the probability of remaining competitive with electricity rates.

Should prices for any of the hedging terms fall significantly to predefined price levels, Terasen Gas immediately hedges a preset amount with fixed price swaps in order to take advantage of a potentially short-term low-priced situation. This strategy is referred to as 'accelerated hedging'. The goal of this strategy is to increase the proportion of hedging executed at lower prices and decrease the proportion of hedging at higher prices, given that the maximum amounts of winter and summer hedging remain fixed. Consideration is also given to the fact that price dips may not be short-term in nature and so a balanced approach has been taken.

Terasen Gas hedges over a 36 months period, layer in hedges according to the predefined implementation schedule, and continue with a balanced mix of fixed price swaps and options. By extending the hedging period out to 36 months, Terasen Gas can reduce volatility and potentially capture prices below the forecasted electric equivalent, improving the ability to remain competitive with electricity over the longer term.

It is important to note that while the Price Risk Management Plan reduces the effects of market price volatility on customer rates, it does not remove all of the volatility and thus it still remains a market based rate. Terasen Gas feels this approach is important in order to present the appropriate price signals to customers in the interests of energy conservation and customer market awareness. Furthermore, as detailed in the Terasen Gas ROE and Capital Structure Application, while the Price Risk Management Plan may improve the probability of natural gas being competitive with electricity rates on a variable cost basis, significantly higher capital costs for natural gas heating compared to electric space heating present a challenge for Terasen Gas in attracting new customers to offset the declining use rates of existing customers.

88.1.2 Please describe the Company Use Gas Hedging for 2010-2011? Explain the resulting benefits of having this program.

<u>Response:</u>

Company use gas is primarily required to deliver natural gas to customers in a safe and efficient manner and includes line heater fuel, compressor fuel and liquid natural gas (LNG) plant fuel associated with moving natural gas to customers as well as gas used in Terasen Gas facilities and offices. The costs related to company use gas are covered through O&M expenditures and are subject to volumetric fluctuations based on weather, customer load requirements and pipeline operating conditions, and price fluctuations based on the variability in natural gas market prices. In order to reduce the fuel cost uncertainly related to commodity pricing and protect against future potential cost increases arising from natural gas price volatility in the future, Terasen Gas has executed hedge arrangements to fix the commodity price related to the forecast of company use gas for the period January 1, 2010 to December 31, 2011. Given that current market natural gas prices are depressed relative to recent historical averages, Terasen

Gas believes this to be a favourable time to hedge the pricing related to company use gas costs. Terasen Gas requested Commission approval to hedge company use gas in its letter dated May 29, 2009 and obtained Commission acceptance for hedging company use gas for 2010 and 2011 on June 11, 2009 per Letter No. L-44-09.

The forecast volumes related to company use gas are summarized in the table below and are the same for each of 2010 and 2011. The forecasts are based on historical actual usage.

Forecast Company Use Gas Volumes (GJ)

	Compressor	Line Heater	LNG	Facilities	Total	Per Day
January	26,150	16,912	1,100	5,000	49,162	1,586
February	19,100	35,452	700	4,600	59,852	2,138
March	9,000	27,246	100	5,000	41,346	1,334
April	2,000	20,015	750	2,500	25,265	842
May	500	13,666	750	2,500	17,416	562
June	200	5,951	50	1,500	7,701	257
July	200	5,577	50	1,000	6,827	220
August	200	3,275	50	1,000	4,525	146
September	500	1,736	50	1,000	3,286	110
October	3,000	4,735	750	1,000	9,485	306
November	12,100	8,432	100	2,500	23,132	771
December	32,400	12,005	1,100	4,500	50,005	1,613
Total	**105,350**	**155,000**	**5,550**	**32,100**	**298,000**	**816**

The hedge price of the Sumas fixed price swap Terasen Gas has subsequently implemented for the company use gas forecast volumes is \$6.44 US/MMBtu. This compares favourably to the historical five year average price of \$6.90 US/MMBtu and the historical five year high price of \$8.02 US/MMBtu. While the actual index prices for 2010 and 2011 could ultimately settle lower than the hedge price achieved, Terasen Gas believes that, given the volatility in the natural gas marketplace and potential for prices to move up in the future, this is a prudent approach in managing O&M costs on behalf of customers.

88.1.3 What are the commodity cost deferral accounts used by TGI? Explain the resulting benefits of having these deferral accounts.

Response:

Since April 2004, with the implementation of the Essential Services Model and the Commercial Commodity Unbundling Program the Gas Cost Reconciliation Account ("GCRA") was divided into a Commodity Cost Reconciliation Account ("CCRA") and a Midstream Cost Reconciliation Account ("MCRA"). These two new gas cost related deferral accounts are used to accumulate the difference between the costs incurred by Terasen Gas to purchase the gas commodity and midstream services and the revenue collected by Terasen Gas through the gas cost recovery component of rates. CCRA is designated to capture and account for costs and recoveries associated with the baseload supply through gas commodity rates whereas MCRA is associated with the midstream resources required to balance the daily load and meet design day. The MCRA costs are made up of seasonal commodity purchases, transport costs and storage costs.

CCRA rates are reviewed on a quarterly basis, and typically reset when the commodity recovery-to-cost ratio, on a 12-month prospective basis, falls outside the 0.95 to 1.05 threshold. Generally, when commodity rates are reset, the new rate is designed to recover, or refund, over the next 12 months any existing CCRA account balance, along with any under or over recovery of commodity costs forecast to occur over the next 12-month period.

Midstream rates are reviewed on a quarterly basis and, under normal circumstances, midstream rates are adjusted on an annual basis with a January 1 effective date. Generally, when midstream rates are reset for the upcoming calendar year, the new rate is designed to recover, or refund, over the next 12 months any existing MCRA account balance, along with any under or over recovery of midstream costs forecast to occur over the next 12-month period.

The Terasen Gas Utilities customers, along with customers of other Canadian and US utilities, benefit from these deferral accounts given that they potentially smooth out the volatility in commodity rate changes and volume related variances.

88.2 In a table for total 2009 revenue requirements including cost of gas, please itemize the components (i.e. cost of gas, O&M, taxes, interest, earnings, etc.) by amount and percentage of total. For each of the items indicate how much is covered by a deferral account. Also include tabulation subtotals for revenues with and without deferral account protection.

Response:

	Revenue Requirement		Revenue Requirement Covered by Deferred Charges			Revenue Requirement Not Covered by Deferred Charges	
Revenue Requirement Item	**$000's**	**% of Total**	**% Covered by Deferred Charges**	**($000's)**	**% of Total Revenue Requirement**	**($000's)**	**% of Total Revenue Requirement**
Cost of Gas	$ 1,187,999	70.3%	100.0%	$ 1,187,999	70.3%	$ -	0.0%
Operation & Maintenance Expenses	174,942	10.4%	4.9%	8,570	0.5%	166,372	9.8%
Property and Sundry Taxes	47,593	2.8%	100.0%	47,593	2.8%	-	0.0%
Depreciation and Amortization	89,685	5.3%	0.0%	-	0.0%	89,685	5.3%
Other Operating Revenue	(23,444)	-1.4%	4.3%	(1,000)	-0.1%	(22,444)	-1.3%
Income Taxes *	26,331	1.6%	0.0%	-	0.0%	26,331	1.6%
Interest	110,953	6.6%	94.4%	104,691	6.2%	6,262	0.4%
Equity Earned Return	75,360	4.5%	0.0%	-	0.0%	75,360	4.5%
Total Revenue Requirement	**1,689,419**	**100.0%**		**1,347,853**	**79.8%**	**341,566**	**20.2%**
Total Delivery Margin Revenue Requirement	**501,420**	**100.0%**		**159,854**	**31.9%**	**341,566**	**68.1%**

* Since deferral accounts are maintained on a net-of-tax basis, to the extent any amounts were charged to or credited to deferral accounts, there would be an offsetting income tax impact

88.2.1 For those costs/revenues not covered by a deferral account, please provide for the last five fiscal years the forecast and actual.

Response:

Please refer to Attachment 88.2.1.

89.0 Reference: Exhibit B-1, Tab 1, p. 3, par. 2, line 8 Business risk – government policy

89.1 Please provide a copy of the document referenced by footnote 2. The web link does not appear to work.

Response:

Please see Attachment 89.1.

Attachment 4.1

PROVINCE OF BRITISH COLUMBIA

ORDER OF THE LIEUTENANT GOVERNOR IN COUNCIL

Order in Council No. 1510 *, Approved and Ordered* DEC. 13.1995

I hereby certify that the following is a true copy of a Minute of the Honourable the Executive Council of the Province of British Columbia approved by His Honour the Lieutenant-Governor.

Order-inCouncil Custodian

Lieutenant Governor

Executive Council Chambers, Victoria

On the recommendation of the undersigned, the Lieutenant Governor, by and with the advice and consent of the Executive Council, orders that the attached Vancouver Island Natural Gas Pipeline Special Direction is issued to the British Columbia Utilities Commission.

Anne Edwards
Minister of Energy, Mines and Petroleum Resources

M Harcourt
Presiding Member of the Executive Council

(This part is for administrative purposes only and is not part of the Order.)

Authority under which Order is made:

Act and section:- Vancouver Island Natural Gas Pipeline Act, s. 7 (4)

Other (specify):-

December 8, 1995

1970/95/11/aaa

SPECIAL DIRECTION
TO THE
BRITISH COLUMBIA UTILITIES COMMISSION

PART 1
PRELIMINARY & GENERAL MATTERS

1.1 Definitions

"**Annual CPI**" means the percentage increase in the CPI over the most recent twelve month period for which information is available at any particular time when New Customer rates are approved pursuant to Section 2.7;

"**Annual Revenue Deficiency**" and "**Revenue Deficiency Deferral Account**" shall have the meanings given to these terms in Section 2.10;

"**BCUC**" means the British Columbia Utilities Commission;

"**Canada Repayable Contribution**" and "**British Columbia Repayable Contribution**" shall each have the meanings given to these terms in an agreement entered into among Her Majesty the Queen in Right of Canada, the Province, and PCEC substantially in the form of the Pacific Coast Energy Pipeline Agreement attached as Schedule 3 to the Vancouver Island Natural Gas Pipeline Agreement Approval Order.

"**CPI**" means the monthly consumer price index for Victoria, British Columbia for all items, as published by Statistics Canada;

"**Centra**" means, at the effective date of this Special Direction, collectively, Centra Gas British Columbia Inc., Centra Gas Vancouver Island Inc. and Centra Gas Victoria Inc., and thereafter means such other company or companies that may from time to time own and operate all or any part of the Centra Distribution System;

"Centra Distribution System" means the gas distribution systems of Centra that were connected to the Pipeline as of the effective date of this Special Direction, together with any extensions thereof;

"Class "A" Instruments" means cumulative redeemable preferred shares issued by Centra, having attached the right to receive dividends at an annual rate determined by Centra, based on the issue price of such shares, not exceeding 58% of the Current 5 Year Canada Rate at the date of iseuance, plus 275 basis points and having such other terms (including provision for a dividend reset date) as are set out in the form of Class "A" Instrument attached as Schedule "A" to this Special Direction, or as may be otherwise determined by Centra and approved by the BCUC;

"Class "B" Instruments" means promissory notes or other debt instruments issued by Centra bearing interest at an annual rate determined by Centra, not exceeding the Current 5 Year Canada Rate at the date of issuance, plus 275 basis points and having such other terms (including provision for an interest reset date) as are set out in the form of Class "B" Instrument attached as Schedule "B" to this Special Direction, or as may be otherwise determined by Centra and approved by the BCUC;

"Current 5 Year Canada Rate" means, on any particular date, the most recent monthly rate published by the Bank of Canada as the benchmark yield on 5 year Government of Canada Bonds, as set out in column B14069 of the most recent release of the Bank of Canada Review;

"Interruptible Incentive Payments" means those payments to be made by the Province to PCEC in accordance with Sections 2.06, 2.07, and 2.08 of the Vancouver Island Natural Gas Pipeline Agreement;

"Joint Venture" means those corporations or other entities which, from time to time, own and operate the seven pulp mills that were being served by the Pipeline at the effective date of this Special Direction (the "**Mills**"), and which are operating as a joint venture for the purpose of obtaining gas transportation service from PCEC for the Mills;

"**Long Canada Rate**" means for any particular year, the Government of Canada long term bond reference rate used by the BCUC to determine return on equity for public utilities for that year and, in the event that such a reference rate does not exist for any particular year, then Long Canada Rate shall mean the rate implied by an independent consensus forecast of Government of Canada long term bond yields for that year that is approved by the BCUC;

"**PCEC**" means Pacific Coast Energy Corporation, or such other company that may from time to time own and operate the Pipeline;

"**Pipeline**" means the Vancouver Island natural gas pipeline, as described in the Energy Project Certificate issued to PCEC;

"**Province**" means Her Majesty the Queen in Right of the Province of British Columbia;

"**Rate Stabilization Facility**" means the financial facility continued in respect of Squamish Gas under the Rate Stabilization Facility Continuation Agreement;

"**Rate Stabilization Facility Continuation Agreement**" means an agreement between the Province and PCEC substantially in the form of the agreement attached as Schedule 2 to the Vancouver Island Natural Gas Pipeline Agreement Approval Order;

"**Royalty Revenue Payments**" means those payments to be made by the Province to Centra in accordance with Sections 2.03 and 2.04 of the Vancouver Island Natural Gas Pipeline Agreement and, in the event that the Pipeline and the Centra Distribution System are owned and operated by a single legal entity, "Royalty Revenue Payments" shall also include the Interruptible Incentive Payments;

"**Single Entity**" means a single legal entity which owns and operates both the Centra Distribution System and the Pipeline;

"**Squamish Gas**" means, at the effective date of this Special Direction, Squamish Gas Co. Ltd., and thereafter means such other company or companies that may, from time to time, own and operate the Squamish Gas Distribution System;

"**Squamish Gas Distribution System**" means the gas distribution system of Squamish Gas that was in existence as of the effective date of this Special Direction, together with any extensions thereof;

"**Squamish Gas Transportation Service Agreement**" means that Agreement between PCEC and Squamish Gas dated April 1, 1990;

"**Squamish Rate Stabilization Agreement**" means that Agreement between the Province and Squamish Gas dated July 9, 1992;

"**Utilities**" means, collectively, PCEC, Centra, and Squamish Gas, and "**Utility**" means any one of them;

"**Vancouver Island Natural Gas Pipeline Agreement**" means an agreement among the Province, Westcoast Energy Inc., PCEC and Centra substantially in the form of the agreement attached as Schedule 1 to the Vancouver Island Natural Gas Pipeline Agreement Approval Order.

1.2 Schedules

The following Schedules are a part of this Special Direction:

Schedule "A" - FORM OF CLASS "A" INSTRUMENT

Schedule "B" - FORM OF CLASS "B" INSTRUMENT

Schedule "C" - INITIAL NEW CUSTOMER RATE SCHEDULE

Schedule "D" - DESIGNATED ROYALTY ADJUSTED COST OF GAS

Schedule "E" - EXAMPLES OF CALCULATION OF REVENUE DEFICIENCY DEFERRAL ACCOUNT BALANCE

Schedule "F" - JOINT VENTURE TRANSPORTATION SERVICE AGREEMENT

Schedule "G" - CENTRA TRANSPORTATION SERVICE AGREEMENT

Schedule "H" - PACIFIC COAST ENERGY CORPORATION GENERAL TERMS AND CONDITIONS

1.3 Effective Date, Special Direction No. 5 and Duration

This Special Direction shall become effective and supersede and replace Special Direction No. 5 (established pursuant to Order in Council No. 990, July 11, 1991) when the Secretary of the BCUC receives a written notice from each of the parties to the Vancouver Island Natural Gas Pipeline Agreement confirming that such Agreement has been executed and delivered. This Special Direction shall cease to have any application after the latest of:

(a) the time when the balance of the Revenue Deficiency Deferral Account has been reduced to zero; and

(b) the date of the expiration or earlier termination of the Joint Venture Transportation Service Agreement appended as Schedule "F", which date shall in no event be later than January 1, 2011; and

(c) the date of the termination of the Squamish Gas Transportation Service Agreement.

1.4 General

The BCUC shall regulate the Utilities and fix the rates charged by the Utilities in accordance with the requirements of this Special Direction , and in accordance with the requirements of the Utilities Commission Act and such regulatory principles that are otherwise applicable to the Utilities from time to time that are not inconsistent with this Special Direction. In the event of any inconsistency between this Special Direction and any requirement of the Utilities Commission Act or any regulatory principles that would otherwise be applicable to the Utilities, the BCUC shall follow the provisions of this Special Direction. For greater certainty, the BCUC shall not apply any provisions of the Utilities Commission Act (including, without limitation, Sections 64, 65, 66, and 67) in any manner which has the effect, directly or indirectly, of eliminating or varying any rates that have been specified in, or determined in accordance with, this Special Direction, or eliminating or varying any other determination or matter provided for herein.

PART 2
DIRECTION RESPECTING CENTRA

2.1 General Direction With Respect to Rates

Rates, changes in rates, changes in customer classifications or other rate design matters, shall be filed with and approved by the BCUC on an annual basis or such other periodic basis as the BCUC may determine.

2.2 Pioneer and New Customers

All customers of Centra (other than customers who have entered into long term commercial gas supply contracts that have been individually approved by the BCUC) shall be categorized as either a **"Pioneer Customer"** or a **"New Customer"** based upon the criteria set out below. Such categories shall be for the purpose of fixing rates for the period from the effective date of this Special Direction to December 31, 2003, in the case of Pioneer Customers within the ACR-2 customer rate class, and for the period from the effective date of this Special Direction to December 31, 2002, in the case of all other Pioneer and New Customers.

(a) Pioneer Customer

Any customer of Centra:

(i) who applies for service as a Pioneer Customer prior to February 13, 1996, and whose application is accepted by Centra; and

(ii) to whom gas has been delivered within 60 days after a service line has been provided to that customer by Centra,

shall be a Pioneer Customer for the purpose of service to that customer at the location applied for. A customer shall cease to be classified as a Pioneer Customer:

(iii) if the customer enters into an agreement with Centra, releasing its entitlement to be classified as a Pioneer Customer; or,

(iv) if the customer enters in a gas supply contract with a party other than Centra, the other party provides gas for the customer, and Centra is subsequently required to provide the customer's gas supply.

(b) New Customer

Any customer of Centra who does not satisfy the requirements for classification as a Pioneer Customer, or any customer who has released its entitlement to be classified as a Pioneer Customer, shall be classified as a New Customer. The BCUC may require Centra to develop policies for approval by the BCUC for the purpose of determining whether there has been a change that would result in any particular customer not being entitled to service as a Pioneer Customer.

2.3 Closing of Pioneer Customer Rate Classes

The customer rate classes for Pioneer Customers shall be the SGS-1, SGS-2, ACR-1, ACR-2, LGS-1, LGS-2, and LGS-3 customer rate classes as defined in the rate schedule filed by Centra with the BCUC and in effect as of January 1, 1995. Entry into the Pioneer

Customer rate classes shall be closed in accordance with the definitions in paragraph 2.2, however, a customer within a particular Pioneer Customer rate class may move from one Pioneer Customer rate class to another, in accordance with the applicable terms and conditions of service, so long as the customer is continuing to receive service at the same location.

2.4 Rates for Pioneer Customers Within the ACR-2 Customer Rate Class 1995 - 2003

The BCUC shall fix the rates charged by Centra to Pioneer Customers within the ACR-2 rate class for the period from the effective date of this Special Direction to December 31, 2003, independently from Centra's cost of service and in accordance with the applicable provisions of the rate schedule filed by Centra with the BCUC and in effect as of January 1, 1995. In order to apply such provisions, the BCUC shall require Centra to determine the Vancouver rack price for No. 2 fuel oil for such period, and employing such methods, as may be approved by the BCUC from time to time.

2.5 Other Pioneer Customer Rates 1995 - 2001

The BCUC shall fix the rates charged by Centra to Pioneer Customers (other than those within the ACR-2 customer rate class) for the period from the effective date of this Special Direction to December 31, 2001, in accordance with the following directions.

(a) Market Monitoring and Determination of Competitive Energy Prices

The BCUC shall require Centra to monitor the competitive fuel oil markets within its service area for such period, and employing such methods, as may be approved by the BCUC from time to time, and Centra shall be required to provide the results of its market monitoring to the BCUC and, based thereon, the BCUC shall determine the market price at which fuel oil would be available to a Pioneer Customer within each applicable rate class and the price or prices so determined shall be the "Competitive Fuel Price" for the applicable period and customer class. The BCUC shall also determine the price equal to 67% of the B.C. Hydro Trailing Block Rate for residential service available to Pioneer Customers and the price or prices so determined (expressed in dollars per gigajoule equivalent) shall be the "Discounted Electricity Price" for the applicable period.

(b) SGS-1, SGS-2, ACR-1, LGS-1, LGS-2 and LGS-3 Rates

Rates for Pioneer Customers within the SGS-1, SGS-2, ACR-1, LGS-1, LGS-2 and LGS-3 rate classes shall be determined independently from Centra's cost of service and shall be equal to the lesser of:

(i) the applicable Competitive Fuel Price, less the applicable Fuel Oil Discount as set out in Table 1 below; or

(ii) the applicable Discounted Electricity Price.

Table 1

FUEL OIL DISCOUNT

Year	Discount
1995	13%
1996	12%
1997	11%
1998 - 2001	10%

2.6 Other Pioneer Customer Rates 2002

The BCUC shall fix the rates charged by Centra to Pioneer Customers (other than those within the ACR-2 customer rate class) during 2002 independently from Centra's cost of service at the lesser of the rate that would be determined under Section 2.5(b)(i) (given a Fuel

Oil Discount of zero) and the rate for New Customers set in accordance with Section 2.7.

2.7 New Customer Rates 1995 - 2002

The BCUC shall fix the rates charged by Centra to New Customers for the period from the effective date of this Special Direction to December 31, 2002, in accordance with the following directions.

(a) General Principles

Rates should, to the greatest extent reasonably possible, be consistent with the goals of simplicity, equity between the various New Customer rate classes and the optimization of revenue to Centra. Centra is to be allowed flexibility in structuring its rates and, where it is determined by the BCUC to be appropriate, rates may be structured to include demand charges and commodity charges. The foregoing general principles shall be subject to the more specific directions set out below.

(b) Initial New Customer Rate Schedule

Rates charged to New Customers for the period from the effective date of this Special Direction to December 31, 1996, shall be those rates set out in the Initial New Customer Rate Schedule that is attached as Schedule "C" to this Special Direction.

(c) Rate Ceilings

Subject only to paragraph (d) below, the rates that are approved for each year from January 1, 1997, to December 31, 2002, shall be subject to rate ceilings determined in accordance with the following directions:

(i) A rate shall not be approved if it would result in an average customer (as described by reference to volume in Table 2 below) in any particular customer rate class being charged an effective unit price that would be greater than the effective unit price (determined as set out in subparagraph (iii) below) charged to that average customer in the immediately preceding year, increased by the allowable percentage increase set out in Table 3 below.

Table 2

AVERAGE ANNUAL CUSTOMER CONSUMPTION

SGS 11	70 GJ
SGS 12	270 GJ
LGS 11	945 GJ
LGS 12	2844 GJ
LGS 13	18793 GJ

Table 3

ANNUAL ALLOWABLE PERCENTAGE POINT INCREASE

1997	8%	2000	Annual CPI + 1%
1998	6%	2001	Annual CPI + 1%
1999	Annual CPI + 1%	2002	Annual CPI + 1%

(ii) If the increase in the effective unit price for an average customer in any particular customer rate class in any particular year described above is less than the allowable increase, then the difference may be carried forward to the next year so that the allowable percentage point increase for that customer rate class in the next year is increased accordingly. To the extent that the increased allowable percentage point increase is not utilized it may be carried forward in a similar fashion to subsequent years.

(iii) For the purpose of determining the rate ceilings, effective unit prices shall be calculated by taking into account all relevant demand and commodity charges, but shall not include any increase or decrease in charges which resulted from Passthrough Costs in accordance with paragraph (d) below and shall not include the charge described in Rider A as set out in Schedule "C" or any special service rates in the nature of those approved by the BCUC as of the effective date of this Special Direction. For greater certainty, it is intended that the rate ceilings be calculated so that any decrease or increase in Centra rates resulting from a Passthrough Cost in any particular year does not increase or decrease the rate ceiling applicable to a subsequent year.

(iv) Because the limitations on rate increases are governed by the effective unit price payable by average customers for each of the various customer rate classes, the effective unit prices actually payable by some New Customers may be subject to greater increases than described in this paragraph (c).

(v) If the BCUC approves a change to Centra's customer rate classes, then any resulting changed or additional customer rate class shall be subject to the limitations on rate increases described in this paragraph (c). The BCUC shall make any determination of average customer volumes, or any other matter that is necessary in order to calculate the effective unit price for an average customer of any changed or additional customer rate class.

(d) Passthrough Costs and the New Customer Rate Balancing Account

If, in any particular year, "Passthrough Costs" (meaning only those costs described below) have either increased or decreased, then notwithstanding the limitation on rate increases set out in paragraph (c) the rates charged by Centra to New Customers may be varied in accordance with Section 67(4) of the Utilities Commission Act and the following directions.

(i) Passthrough Costs for any particular year shall be determined by the BCUC as the aggregate of the following amounts:

(A) the change in the cost of service to New Customers in a particular year as a result of a change in Federal, Provincial, or Municipal tax rates;

(B) a change in the cost of service to New Customers as a result of a material and uncontrollable change in costs associated with a program established by any governmental or regulatory authority;

(C) the change in the cost of service to New Customers as a result of a difference between the "Actual Royalty Adjusted Cost of Gas" for a particular year, and the Designated Royalty Adjusted Cost of Gas for that year as set out in Schedule "D". The "Actual Royalty Adjusted Cost of Gas" for a particular year shall be determined as follows. Firstly, the BCUC shall determine Centra's cost of gas for the year being all of the costs incurred by Centra, and approved by the BCUC, to obtain gas for customer use and system use (including line losses, unaccounted for gas, and fuel requirements), including, without limitation:

(1) the purchase price of gas;

(2) gathering, processing, transportation, and storage costs; and

(3) costs of any arbitration relating to Centra's gas supply arrangements;

but excluding:

(4) commissions and gas management fees paid in connection with the purchase of gas;

(5) any toll paid by Centra to PCEC or any other cost associated with the transportation of gas through the Pipeline; and

(6) any cost associated with the transportation of gas from the point of interconnection of the pipeline systems of Westcoast Energy Inc. and BC Gas Utility Ltd. near Huntingdon (the "**Huntingdon Point of Interconnection**"), to the point of interconnection of the pipeline systems of BC Gas Utility Ltd. and PCEC in Coquitlam.

Secondly, the cost of gas for the year shall be reduced by the total of all

Royalty Revenue Payments for that year. Thirdly, the resulting number shall be divided by the total volume of gas delivered to Centra at the Huntingdon Point of Interconnection. For greater certainty, a change to the cost of service to New Customers as a result of a variation in the cost of gas as described herein may be either a negative or a positive amount.

(ii) Passthrough Costs shall include only that portion of increased costs that can be reasonably allocated to New Customers. Any portion of an increased cost that is allocated to the cost of service to other customers of Centra, together with other costs that would be allowed by the BCUC under Section 67(4) of the Utilities Commission Act, but which do not otherwise satisfy the definition of Passthrough Costs, shall be taken into account in determining whether Centra has incurred an Annual Revenue Deficiency, but shall not affect the rate ceilings applicable to Centra's New Customers.

(iii) Passthrough Costs for a particular year shall be recorded in a "New Customer Rate Balancing Account", which is a notional account for the purpose of determining adjustments to New Customer rates. The BCUC shall determine the manner in which positive or negative balances affect rates by taking into account the following objectives. Firstly, the impact of the variable nature of gas costs on New Customer rates should be minimized. Secondly, Centra, to the extent possible, should be able to increase its rates to New Customers by such amounts as are commensurate with any positive balance within the New Customer Rate Balancing Account that may exist from time to time.

(iv) The BCUC may require Centra to reduce the rates charged to New Customers in the event that the BCUC determines that there is a significant negative balance accumulating within the New Customer Rate Balancing Account that is not likely to be offset within a reasonable period of time.

2.8 Customer Rates 2003 and After

The BCUC shall fix the rates charged by Centra to its customers for the period beginning January 1, 2003, in the case of all customers other than those within the ACR-2 customer rate class, and January 1, 2004, in the case of customers formerly within the ACR-2 customer rate class, so that Centra is able to recover its cost of service in accordance with the regulatory principles that are generally applied by the BCUC from time to time to gas distribution utilities operating within British Columbia.

2.9 Gas Supply Hedging Arrangements and Transportation and Sales Service

Centra may use gas supply hedging arrangements, the terms and conditions of which have been approved by the BCUC, in order to manage the risk associated with the Revenue Deficiency Deferral Account. Centra shall file with the BCUC, in accordance with the requirements specified by the BCUC from time to time, transportation rates that shall be generally available for Centra's large commercial customers. Such rates shall be available in accordance with such terms and conditions as are from time to time determined by Centra and approved by the BCUC. If requested by Centra, such terms and conditions shall include a requirement that any customer who is purchasing gas from Centra at the time the terms and conditions are approved or who thereafter enters into a gas purchase agreement with Centra, shall not be permitted to switch to transportation service prior to December 31, 2002.

2.10 Cost of Service and Revenue Deficiencies

Subject to Part 4 of this Special Direction, the BCUC shall determine Centra's cost of service and shall make the various associated determinations, all as described in, and in accordance with, the following directions.

(a) General Principles

For each year in the period beginning January 1, 1996, Centra shall be regulated on a forecast test year basis and shall be required to apply to the BCUC for approval of its:

(i) cost of service for each year and in conjunction therewith the BCUC shall determine the allowable capital additions to be made during such year and such other matters as the BCUC may deem appropriate for the determination of Centra's cost of service; and

(ii) projected revenue for such year inclusive of all Royalty Revenue Payments payable by the Province in respect of that year.

(b) Rate Base, Revenue Deficiency Deferral Account Balance and Cost of Service 1991 - 1995

The following amounts shall be determined in accordance with the Vancouver Island Natural Gas Pipeline Agreement and shall be set forth in notices delivered by the Province to the BCUC pursuant to Article 9 thereof:

(i) net plant in service as of December 31, 1995, determined as the aggregate of:

(A) net plant in service as of December 31, 1994, of $211,474,000, less $90,000,000; and

(B) additions to net plant in service during 1995 which shall be determined by taking gross additions made during 1995 and adjusting for disposals and depreciation in 1995;

(ii) the Annual Revenue Deficiency for 1995;

(iii) the balance of the Revenue Deficiency Deferral Account as of December 31, 1995;

(iv) Centra's cost of service for the period October 1, 1991, to December 31, 1991 and each year from January 1, 1992 to December 31, 1995; and

(v) work in progress as of December 31, 1995.

Centra's rate base as of December 31, 1995, or any time thereafter, shall be:

(vi) the amount specified in paragraph (i) above; plus

(vii) an allowance for working capital as determined and approved by the BCUC from time to time; plus

(viii) the capital cost of any additions to Centra's Distribution System made after December 31, 1995 as determined and approved by the BCUC from time to time; plus

(ix) deferred charges and other miscellaneous rate base items (which shall in no event include any amount of the Revenue Deficiency Deferral Account or any amount that would change the amount for the net plant in service as of December 31, 1995) as determined and approved by the BCUC from time to time; less

(x) accumulated depreciation and disposals for the period after December 31, 1995, as determined and approved by the BCUC from time to time.

(c) <u>Deemed Equity</u>

Subject to paragraph (e), the equity component of Centra's rate base:

(i) shall be deemed to be 35% for each year from January 1, 1996, to December 31, 2002, and for greater certainty the balance of Centra's rate base shall be deemed to be financed by debt; and

(ii) for the period after December 31, 2002, shall be such percentage of Centra's rate base that is determined to be appropriate in accordance with the regulatory principles that are generally applied by the BCUC from time to time to gas distribution utilities operating within British Columbia.

(d) <u>Return on Equity</u>

The return on the equity component of Centra's rate base shall be the Long Canada Rate plus 375 basis points for each year from January 1, 1996, to December 31, 2002, and thereafter shall be such return that is determined to be appropriate in accordance with the regulatory principles that are generally applied by the BCUC from time to time to gas distribution utilities operating within British Columbia.

(e) <u>Debt Financing of Rate Base</u>

The level of deemed equity and the return allowed thereon that are stipulated in paragraphs (c) and (d) may be varied by the BCUC for any year from January 1, 1996, to December 31, 2002, if:

(i) the actual level of debt financing of Centra (excluding Class "B" Instruments that are actually issued to finance all or any portion of the Revenue Deficiency Deferral Account balance) exceeds 65% of the rate base that the BCUC has determined for Centra; and

(ii) the BCUC determines that this level of debt financing is adversely affecting the cost of debt for the purpose of determining cost of service.

(f) <u>Determination of Revenue Deficiency Deferral Account Balance</u>

The BCUC shall determine the amount recorded in Centra's Revenue Deficiency Deferral Account, which amount shall equal, at any particular time:

(i) the total of all Annual Revenue Deficiencies incurred on or before that time; plus

(ii) the total amount of Class "A" Instruments and Class "B" Instruments that are deemed to have been issued pursuant to paragraph 2.10(h)(v)B(2) on or before that time; less

(iii) the total amount of Class "A" Instruments and Class "B" Instruments that are deemed to have been redeemed or repaid pursuant to paragraph 2.10(i) on or before that time.

"**Annual Revenue Deficiency**" for the 1995 year is the amount described in paragraph 2.10(b)(ii) and for any particular year after December 31, 1995 is the amount, if any, by which Centra's "Adjusted Cost of Service" exceeds Centra's actual revenues relating to the Centra Distribution System (including Royalty Revenue Payments) for that year.

"**Adjusted Cost of Service**" means Centra's cost of service as approved by the BCUC on a forecast test year basis, excluding any amount for the amortization of Class "A" Instruments or Class "B" Instruments pursuant to paragraph 2.10(j) and subject to adjustments for variations as described below. BCUC approved variations (which may be either an increase or a decrease) between actual and forecast costs shall be taken into account in the determination of Adjusted Cost of Service, however, the BCUC shall not:

(iv) approve a variation between Centra's actual and forecast operating and maintenance expenses unless the variation was caused by a factor over which Centra had no effective control; and

(v) make any adjustment after the end of a particular year to the Long Canada Rate used to determine return on equity for that year.

For the purpose of illustration only, examples of the determination of Annual Revenue Deficiency and Adjusted Cost of Service for the purpose of determining the balance of the Revenue Deficiency Deferral Account are attached as Schedule "E" to this Special Direction.

(g) Effect of Annual Revenue Deficiencies on Rate Base and Cost of Service

The balance of the Revenue Deficiency Deferral Account, or any amount relating to the Annual Revenue Deficiency for any particular year, shall not at any time be included within Centra's rate base. Except as specifically allowed by paragraphs 2.10(h) and 2.10(j), Centra's cost of service for the purpose of determining the rates to be charged to Centra's customers shall not include any cost of financing the Revenue Deficiency Deferral Account balance, and shall not include any amount for the amortization, reduction, or recovery of the Revenue Deficiency Deferral Account balance.

(h) <u>Deemed Financing Costs That Are To Be Included Within the Cost of Service</u>

The amount recorded in the Revenue Deficiency Deferral Account shall be deemed to be financed by Class "A" Instruments, or, in the circumstances provided below, by Class "B" Instruments. Centra's cost of service for any particular year shall include the interest and dividends, as the case may be, that are payable in respect of that year on the Class "A" Instruments and the Class "B" Instruments that are deemed to be outstanding during that year. The amount of such interest and dividends shall be determined in accordance with the following directions.

(i) Unless a determination is made under paragraph (ii), the amount recorded in the Revenue Deficiency Deferral Account shall be deemed to be financed by Class "A" Instruments.

(ii) When the BCUC approves Centra's forecast cost of service the BCUC shall determine whether it would be appropriate to deem the amount recorded in the Revenue Deficiency Deferral Account, or any particular portion thereof, to be financed by Class "B" Instruments.

(iii) A determination under paragraph (ii) may only be made if the BCUC determines that the financing by Class "B" Instruments will not have an impact on Centra's cost of service for the forecast test year and subsequent years that would, on a cumulative basis, result in an adverse impact on the Revenue Deficiency Deferral Account that would have to be recovered through rates charged to customers.

(iv) To the extent that the BCUC deems any portion of the balance of the Revenue Deficiency Deferral Account to be financed by Class "B" Instruments which has previously been deemed to be financed by Class "A" Instruments, the Class "B" Instruments shall be deemed to have been converted from Class "A" Instruments in accordance with the terms and conditions contained in the form of Class "A" Instrument attached as Schedule "A". To the extent that the BCUC deems any portion of the balance of the Revenue Deficiency Deferral Account to be financed by Class "A" Instruments which has previously been deemed to be financed by Class "B" Instruments, the Class "A" Instruments shall be deemed to have been converted from Class "B" Instruments in accordance with the terms and conditions contained in the form of Class "B" Instrument attached as Schedule "B".

(v) The instruments that are deemed to be issued to finance any particular year's Annual Revenue Deficiency shall be deemed:

(A) to be issued on June 30th of the year following the year in which the Annual Revenue Deficiency was incurred for the purpose of determining the dividend or interest rate payable pursuant to such instruments;

(B) to be issued in an aggregate amount equal to the sum of:

(1) the Annual Revenue Deficiency for the year; and

(2) an additional amount to take into account Centra's cost of financing the Annual Revenue Deficiency during the year in which it arose. This additional amount shall equal the

interest or dividends, as the case may be, payable for a 6 month period, under the instruments deemed to be issued in respect of the amount in subparagraph (1) above; and

(C) to be issued on January 1 of the year following the year in which the Annual Revenue Deficiency was incurred, for the purpose of determining when interest or dividends begin to accrue and become payable pursuant to such instruments.

(i) <u>Deemed Redemption or Repayment of Instruments for the Determination of the Balance of the Revenue Deficiency Deferral Account</u>

If Centra's actual revenues relating to the Centra Distribution System for any particular year would exceed what would otherwise be Centra's Adjusted Cost of Service for that year, the BCUC shall deem Centra to redeem Class "A" Instruments or repay Class "B" Instruments at the midpoint of that year to the extent necessary to cause Centra's Adjusted Cost of Service to equal such revenues. The instruments that are deemed to be redeemed or repaid shall be those instruments which have a dividend or interest reset date, as defined in the terms and conditions applicable to the instrument, which is closest to the date of deemed redemption or repayment.

(j) <u>Deemed Redemption or Repayment of Instruments for the Determination of Cost of Service and Setting of Rates</u>

For each year beginning January 1, 2003, the cost of service of Centra that is approved by the BCUC for the purpose of determining the rates to be charged to Centra's customers shall include an amount for the deemed redemption of Class "A" Instruments or repayment of Class "B" Instruments that the BCUC determines to be appropriate in order to amortize the balance of the Revenue Deficiency Deferral Account over the shortest period reasonably possible, having regard for Centra's competitive position relative to alternative energy sources and the desirability of reasonable rates.

2.11 Assistance for Financing Requirements

The BCUC shall not apply Paragraph 3 of BCUC Order G-16-90 (the "Order") in any way that would require Centra to obtain assistance in regard to its debt/equity financing requirements from Westcoast Energy Inc., or from any corporation that is a parent, grandparent or successor, as these terms are used in Paragraph 3 of the Order, other than what is provided for in the Vancouver Island Natural Gas Pipeline Agreement.

PART 3
DIRECTION RESPECTING PCEC

3.1 Cost of Service

Subject to Part 4 of this Special Direction, the BCUC shall determine PCEC's cost of service in accordance with the following directions:

(a) Rate Base and Cost of Service 1991 - 1995

The following amounts shall be determined in accordance with the Vancouver Island Natural Gas Pipeline Agreement and shall be set forth in notices delivered by the Province to the BCUC pursuant to Article 9 thereof:

(i) PCEC's net plant in service as of December 31, 1995, determined as the aggregate of:

(A) PCEC's net plant in service as of December 31, 1994, of $192,120,673, less $30,000,000; and

(B) PCEC's additions to net plant in service during 1995 which shall be determined by taking gross additions made during 1995 and adjusting for disposals and depreciation in 1995;

(ii) PCEC's cost of service for each year from 1991 to December 31, 1995; and

(iii) work in progress as of December 31, 1995.

PCEC's rate base as of December 31, 1995, or any time thereafter, shall be:

(iv) the amount set out in paragraph (i); plus

(v) an allowance for working capital as determined and approved by the BCUC from time to time; plus

(vi) the capital cost of any additions to the Pipeline made after December 31, 1995 as determined and approved by the BCUC from time to time; plus

(vii) any amounts of the Canada Repayable Contribution or the British Columbia Repayable Contribution which have been repaid by PCEC; plus

(viii) deferred charges and other miscellaneous rate base items (which shall in no event include any amount that would change the amount for the net plant in service as of December 31, 1995) as determined and approved by the BCUC from time to time; less

(ix) accumulated depreciation and disposals for the period after December 31, 1995, as determined and approved by the BCUC from time to time.

(b) Adjustment to Cost of Service

For each year from January 1, 1996, to December 31, 2011, the return on the equity component of PCEC's rate base that would have been otherwise approved by the BCUC shall be reduced by the amount of $1,867,000. Such reduction shall not be recovered in whole or in part, directly or indirectly, through rates or tolls in any manner whatsoever.

(c) Effect of Interruptible Incentive Payments

Interruptible Incentive Payments that are payable to PCEC in respect of any particular year shall be taken into account as revenues received by PCEC in partial recovery of its cost of service for that year.

(d) Effect of Monthly Toll Revenue - Squamish Gas

During the term of the Rate Stabilization Facility Continuation Agreement, the Monthly Toll Revenues determined pursuant to that agreement shall be taken into account as the only revenues received by PCEC in recovery of its cost of service with respect to the transportation and delivery of gas pursuant to the Squamish Gas Transportation Service Agreement.

3.2 Joint Venture Transportation Service Agreement

The BCUC shall approve the transportation service agreement between PCEC and the Joint Venture, including the transportation tolls provided for therein, that is attached as Schedule "F" to this Special Direction.

3.3 Squamish Gas Transportation Service Agreement

In regulating the transportation tolls charged by PCEC to Squamish Gas for service provided pursuant to the Squamish Gas Transportation Service Agreement, the BCUC shall apply the service rate provisions of that agreement for the period contemplated by the Squamish Rate Stabilization Agreement.

3.4 Centra Transportation Service Agreement

The BCUC shall approve the transportation service agreement between PCEC and Centra, including the transportation tolls provided for therein, that is attached as Schedule "G" to this Special Direction.

3.5 General Terms and Conditions

The "General Terms and Conditions" attached as Schedule "H" to this Special Direction shall be approved by the BCUC as the general contractual terms and conditions applicable to the transportation service agreements referred to in Sections 3.2 and 3.4 and to the other transportation service agreements that PCEC may enter into from time to time after the effective date of this Special Direction.

3.6 Variations of General Terms and Conditions and Joint Venture Transportation Service Agreement

The BCUC shall not amend, change, alter, or vary the transportation service agreement referred to in Section 3.2 or the General Terms and Conditions referred to in Section 3.5, if such amendment, change, alteration, or variation would have the effect of either:

(a) varying the transportation tolls or other amounts payable to PCEC for the services provided to the Joint Venture pursuant to that transportation service agreement; or

Premier Harcourt

(b) increasing or decreasing the Contract Demand for Firm Transportation Service determined in accordance with that transportation service agreement, or the quantities of Interruptible Offset Gas which the Joint Venture is entitled to receive pursuant to that transportation service agreement.

3.7 Rates and Transportation Tolls Otherwise Applicable to the Joint Venture, Squamish Gas, and Centra

For the purpose of fixing transportation tolls to be charged by PCEC other than as directed in Sections 3.2, 3.3 and 3.4, the BCUC shall, subject to the exception set out below, apply such regulatory principles that are generally applied by the BCUC from time to time to gas utilities operating within British Columbia. In no event whatsoever shall the rates or transportation tolls that are approved for the Joint Venture or Squamish Gas pursuant to this Section 3.7 include any amount for the recovery in whole or in part, directly or indirectly, of dividends or interest as described in paragraph 2.10(h), or for the amortization, reduction, or recovery of the Revenue Deficiency Deferral Account balance.

3.8 Allocation of PCEC's Cost of Service to Service Squamish Gas

The BCUC shall, upon receipt of a written request from the Province, determine that portion of PCEC's annual cost of service for any particular year that relates to providing transportation service to Squamish Gas during that year.

PART 4

DETERMINATION OF ANNUAL REVENUE DEFICIENCY, RATE BASE, CAPITAL STRUCTURE AND RETURN ON EQUITY WHERE THE PIPELINE AND THE CENTRA DISTRIBUTION SYSTEM ARE OWNED BY A SINGLE ENTITY

4.1 Annual Revenue Deficiencies

The BCUC shall determine Annual Revenue Deficiencies and the balance of the Revenue Deficiency Deferral Account for a Single

Entity in the manner set out in Section 2.10 based upon the actual revenue and the cost of service associated with both the Centra Distribution System and the Pipeline but without taking into account any revenue or costs that relate to any other business conducted, or assets owned, by the Single Entity.

4.2 Rate Base, Capital Structure and Return on Equity

A single rate base shall be determined for the Single Entity in accordance with the directions in paragraphs 2.10(b) and 3.1(a). Subject to Sections 4.3 and 4.4, for any particular year from January 1, 1996, to December 31, 2002:

(a) the equity component of the Single Entity's rate base shall be deemed to be 35% and, for greater certainty, the balance of the Single Entity's rate base shall be deemed to be financed by debt; and

(b) the return on the equity component of the Single Entity's rate base shall be the Long Canada Rate plus 362.5 basis points.

Subject to Section 4.3, after December 31, 2002, the capital structure and return on equity for the Single Entity shall be determined in accordance with the regulatory principles that are generally applied by the BCUC from time to time to gas transportation and distribution utilities operating within British Columbia.

4.3 Adjustment to Return on Equity

The reduction to the return on the equity component of PCEC's rate base that is described in paragraph 3.1(b) shall continue to be made to the return on the equity component of the rate base of the Single Entity.

4.4 Debt Financing of Rate Base

The level of deemed equity and the return allowed thereon that are stipulated in Section 4.2 may be varied by the BCUC for any year from January 1, 1996, to December 31, 2002, if:

(a) the actual level of debt financing of the Single Entity (excluding Class "B" Instruments that are actually issued to finance all or any portion of the Revenue Deficiency Deferral Account balance) exceeds 65% of the rate base that the BCUC has determined for the Single Entity; and

(b) the BCUC determines that this level of debt financing is adversely affecting the cost of debt for the purpose of determining cost of service.

4.5 Separate Records

The BCUC shall require that the Single Entity keep separate records relating to the Pipeline and the Centra Distribution System sufficient at all times to differentiate, where appropriate, between all activities related to the construction and operation of the Pipeline and the Centra Distribution System.

PART 5
DIRECTION RESPECTING SQUAMISH GAS

5.1 Customer Rates

The BCUC shall fix the rates charged by Squamish Gas to its customers in accordance with the Squamish Rate Stabilization Agreement during the period for which that agreement remains in effect and, thereafter, in accordance with the regulatory principles that are generally applied by the BCUC from time to time to gas distribution utilities operating within British Columbia. In this regard, the BCUC shall have regard, during the period when the Squamish Rate Stabilization Agreement remains in effect, to the provisions in the "Binding Agreement", as that term is defined in the Squamish Rate Stabilization Agreement, notwithstanding any amendment or termination of the Binding Agreement subsequent to July 9, 1992.

5.2 Regulation and Other Determinations Pursuant to the Squamish Rate Stabilization Agreement

The BCUC shall regulate Squamish Gas, determine the cost of service of Squamish Gas, and make the various determinations required in order to implement the Squamish Rate Stabilization Agreement, all in accordance with the Squamish Rate Stabilization Agreement during the period for which that agreement is in effect.

Glossary of Terms

Basis point (bps)	One-hundredth of a percentage point, used in reference to interest rates or rates of return on equity
Beta	A measure of the systematic risk of a security, which estimates the extent to which a stock's price fluctuates more or less than average when the market fluctuates
Bond rating	A quality rating assigned by credit rating agencies as an indication of creditworthiness
Book value	The amount at which an item appears in the books of account and financial statements
Business risk	The risk attributed to the nature of a particular business activity (as distinct from financial risk); For pipelines, it typically includes supply, market, regulatory, competitive, and operating risks
Capital asset pricing model (CAPM)	A method used to estimate the cost of equity capital by comparing the return and risk characteristics of an individual company's shares with the market average
Capital attraction requirement	The aspect of the Fair Return Standard that requires that the return of a regulated utility permit incremental capital to be attracted to the enterprise on reasonable terms and conditions
Capital structure	The way in which a business is financed; generally expressed as a percentage breakdown of the types of capital employed
Coalbed methane	An unconventional form of natural gas that is trapped within the matrix of coal seams
Comparable investment requirement	The aspect of the Fair Return Standard that requires that the return of a regulated utility be comparable to the return available from the application of the invested capital to other enterprises of like risk
Competitive risk	The business risk that results from competition for customers at both the supply and market ends of a pipeline system
Conventional gas	Natural gas that is found in the reservoir and produced through a wellbore with known technology and where the drive for production is provided by expansion of the gas or by pressure from an underlying aquifer

Cost of service	The total cost of providing service, including operating and maintenance expenses, depreciation, amortization, taxes, and return on rate base
Dawn Hub	An interchange, located in southern Ontario, where multiple pipelines interconnect and form a market centre
Deemed capital structure	A notional capital structure used for rate-making purposes that may differ from a company's actual capital structure
Depreciation	A non-cash expense charged against earnings to write off the cost of an asset during its estimated useful life
Discounted Cash Flow (DCF)	A method used for estimating the cost of common equity based on the expected dividend yield of the company's shares and the expected future dividend growth rate
Economic resources	That portion of the technical resources that can be developed economically under anticipated economic conditions
Embedded cost of debt	The weighted-average historical cost of long-term debt outstanding
Empirical CAPM (ECAPM)	A method used to estimate the cost of equity capital by comparing the return and risk characteristics of an individual company's shares with the market average. This method relies on a security market line that attempts to match more closely the results of empirical tests on the CAPM (higher intercept and smaller slope)
Fair Return Standard	A standard that must be examined when setting the return allowed to a regulated company; it is comprised of the comparable investment, financial integrity and capital attraction requirements
Financial integrity requirement	The aspect of the Fair Return Standard that requires that the return of a regulated utility enable the financial integrity of the regulated enterprise to be maintained
Financial risk	The risk inherent in a company's capital structure; financial risk increases as the proportion of debt increases
Flow-through tax methodology	A method of estimating income taxes payable for a period based on taxable income as opposed to accounting income
GH-1-97	NEB Proceeding on the TQM PNGTS Extension (Reasons for Decision dated April 1998)
Investment risk	The total of a company's business risk and financial risk

Market risk	The business risk that stems from the overall size of the market and the market share that a pipeline is able to capture
Market risk premium	Equity risk premium for the market as a whole (where the premium is the difference between the expected equity market return as a whole and a risk-free rate)
Operating risk	Risk to the income-earning capability that arises from technical and operational factors
Rate base	Amount of investment on which a return is authorized to be earned; it typically includes plant in service plus an allowance for working capital
Regulatory risk	Risk to the income-earning capability of the assets that arises due to the method of regulation of the company
Revenue requirement	Total cost of providing service, including operating and maintenance expenses, depreciation, amortization, taxes, and return on rate base
Return on rate base (return)	The return that a regulated company is authorized to earn on its approved rate base
RH-2-2004	NEB Proceedings on TransCanada's 2004 Mainline Tolls and Tariff Application (Phase I Reasons for Decision dated September 2004; Phase II Reasons for Decision dated April 2005)
RH-2-94	NEB Multi-Pipeline Cost of Capital Proceeding (Reasons for Decision dated March 1995)
RH-2-94 Formula	Formula used to determine the rate of return on common equity for certain NEB-regulated pipelines, established in the RH-2-94 Proceeding, as amended to eliminate rounding
RH-4-2001	NEB Proceeding on TransCanada's 2001-2002 Mainline Fair Return Application concerning cost of capital for the Mainline (Reasons for Decision dated June 2002)
Shale gas	A form of unconventional gas where the gas molecules are mainly trapped on the organic material in a host rock of fine-grained shale
Supply risk	Risk that the physical availability of economical natural gas volumes could affect a pipeline's income-earning capability

Tariff	The terms and conditions under which the services of a pipeline are offered or provided, including the tolls, the rules and regulations, and the practices relating to specific services
Technical resources	Natural gas resources estimated by having regard for the geological prospects in an area or basin and anticipated technology. They are the sum of cumulative production (portions already produced), reserves (portions discovered, but not produced) and future resources (portions still undiscovered), with all given as marketable volumes. Marketable volumes for the future resources are determined by applying the recovery factors and surface losses applicable to pools discovered in the past
Test Year	A forward looking 12-month period used for rate-making purposes
Tight gas	A form of non-conventional natural gas that is held in the pore space of a rock that has a lower permeability or ability to flow than usual for that type of rock
Ultimate potential	A term used to refer to an estimate of the marketable resources that will be developed in an area by the time that exploratory and development activity has ceased, having regard for the geological prospects of an area, known technology and economics. It includes cumulative production, remaining reserves, and future additions to reserves through extension and revision to existing pools and the discovery of new pools
Unconventional gas	Natural gas that is contained in a non-traditional reservoir rock that requires significant additional stimulus to allow gas flow; it may be that the gas is held by the matrix material such as coal, ice, or shale; or where the reservoir has an unusually low amount of porosity and permeability
Utilization rate	A rate determined by dividing system throughput by pipeline design capacity, expressed as a percentage

Chapter 1

Introduction

1.1 Background

Trans Québec & Maritimes Pipeline (TQM) operates natural gas transportation facilities as *mandatary*[1] of TQM Pipeline and Company, Limited Partnership, of which Gaz Métro Limited Partnership (Gaz Métro) and TransCanada PipeLines Limited (TransCanada) are the general partners.

The TQM facilities are located in the Province of Quebec and extend from a point of interconnection with the TransCanada Mainline system at Saint-Lazare to a point near Quebec City in the Municipality of Lévis on the south shore of the St. Lawrence River, and from Terrebonne, north of Montréal, to East Hereford on the border of the Province of Quebec with the state of New Hampshire, where it interconnects with the Portland Natural Gas Transmission System (PNGTS). See Figure 1-1 for a map of the system.

Prior to 1995, the National Energy Board (Board or NEB) generally approved pipeline tolls on an annual cost of service methodology for a forward test year basis. A pipeline company's cost of capital would typically be examined as part of a cost of service tolls application.

In the fall of 1994, the Board held the Multi-Pipeline Cost of Capital Proceeding (RH-2-94). In the RH-2-94 Decision[2] the Board approved a rate of return on common equity (ROE) for a low-risk, high-grade benchmark pipeline, based primarily on the equity risk premium test. The ROE for the benchmark pipeline was set at 12.25 per cent for the 1995 Test Year. The Board also adopted a formula for adjusting the ROE on an annual basis (RH-2-94 Formula).

The RHW-1-94 Decision[3] on the TQM Toll Application for 1995 and the RH-2-94 Decision, established TQM's final tolls for 1995. Similarly, the RHW-1-96 Decision[4] on the TQM Toll Application for 1996 and the RH-2-94 Decision resulted in TQM's final tolls for 1996.

In RHW-1-97, [5] the Board approved the "1997 and Multi-Year Tolls Agreement" as submitted by TQM and directed that the provisions of the Multi-Year Tolls Agreement be used to determine TQM's net revenue requirement and resulting tolls for 1997. TQM's Multi-Year Tolls

---

1 Roughly equivalent to "power of attorney". The person who grants the mandate is called the mandatar, and the person who accepts the mandate is called the mandatary. A mandate is a contract by which one person designates another person to represent him or her, in other words act on his or her behalf, in legal dealings with a third party. See http://www.justice.gouv.qc.ca/english/publications/generale/procurat-a.htm#definitions

2 National Energy Board, RH-2-94 Reasons for Decision, TransCanada PipeLines Limited et. al. Cost of Capital, March 1995 [hereinafter RH-2-94].

3 National Energy Board, RHW-1-94 Reasons for Decision, Trans Québec & Maritimes Pipeline Inc., Tolls, April 1995.

4 National Energy Board, RHW-1-96 Reasons for Decision, Trans Québec & Maritimes Pipeline Inc., Tolls, May 1996.

5 National Energy Board, RHW-1-97 Reasons for Decision, Trans Québec & Maritimes Pipeline Inc. 1997 Tolls and Multi-Year Tolls Agreement, April 1997.

Agreement covered a five-year period, from 1 January 1997 to 31 December 2001. In 2001, the Board approved a five-year extension (to 31 December 2006) of TQM's Multi-Year Tolls Agreement. Under these settlements, the ROE was governed by the RH-2-94 Formula.

In 2007, TQM operated under interim tolls which were established at the 2006 toll level. Effective 1 January 2008, TQM is operating under revised interim tolls, which were established based on the terms of a Partial Settlement for the years 2007 to 2009 and approved by the Board by Order TGI-04-2007 dated 20 December 2007.

By letter dated 19 November 2007, TQM submitted an application requesting approval of a three-year Partial Settlement that represented an agreement with interested parties on all revenue requirement matters for the period of 1 January 2007 to 31 December 2009, with the exception of the cost of capital. The Partial Settlement Application formed part of a three step filing process that TQM established for determining tolls on its system. The steps were:

- Partial Settlement Application that did not include the cost of capital;
- 2008 Interim Toll Application; and
- Application for Cost of Capital for 2007 and 2008.

TQM indicated that it would apply for final 2007 and 2008 tolls following the disposition of the Partial Settlement and the two-year Cost of Capital Application. The Board approved the Partial Settlement Application on 4 September 2008. The Cost of Capital for 2009 is to be resolved by negotiation between TQM and parties or, failing that, will be litigated before the Board.

1.2 The Application

On 17 December 2007, TQM applied to the NEB for approval of the Cost of Capital that would be utilized by TQM in the calculation of final tolls to be charged by TQM for or in respect of transportation services provided to customers between 1 January 2007 and 31 December 2008. Pursuant to subsection 21(1) of the *National Energy Board Act* (Act), TQM applied for a review and variance of:

- the RH-2-94 Decision;
- NEB Order TG/TO-1-95 dated March 16, 1995;[6]
- NEB approval dated 23 November 2006 of a ROE of 8.46 per cent for the year 2007; and
- NEB approval dated 29 November 2007 of a ROE of 8.71 per cent for the year 2008.

Effectively, the review and variance application was to allow for the determination of an overall fair return on capital for TQM for the years 2007 and 2008.

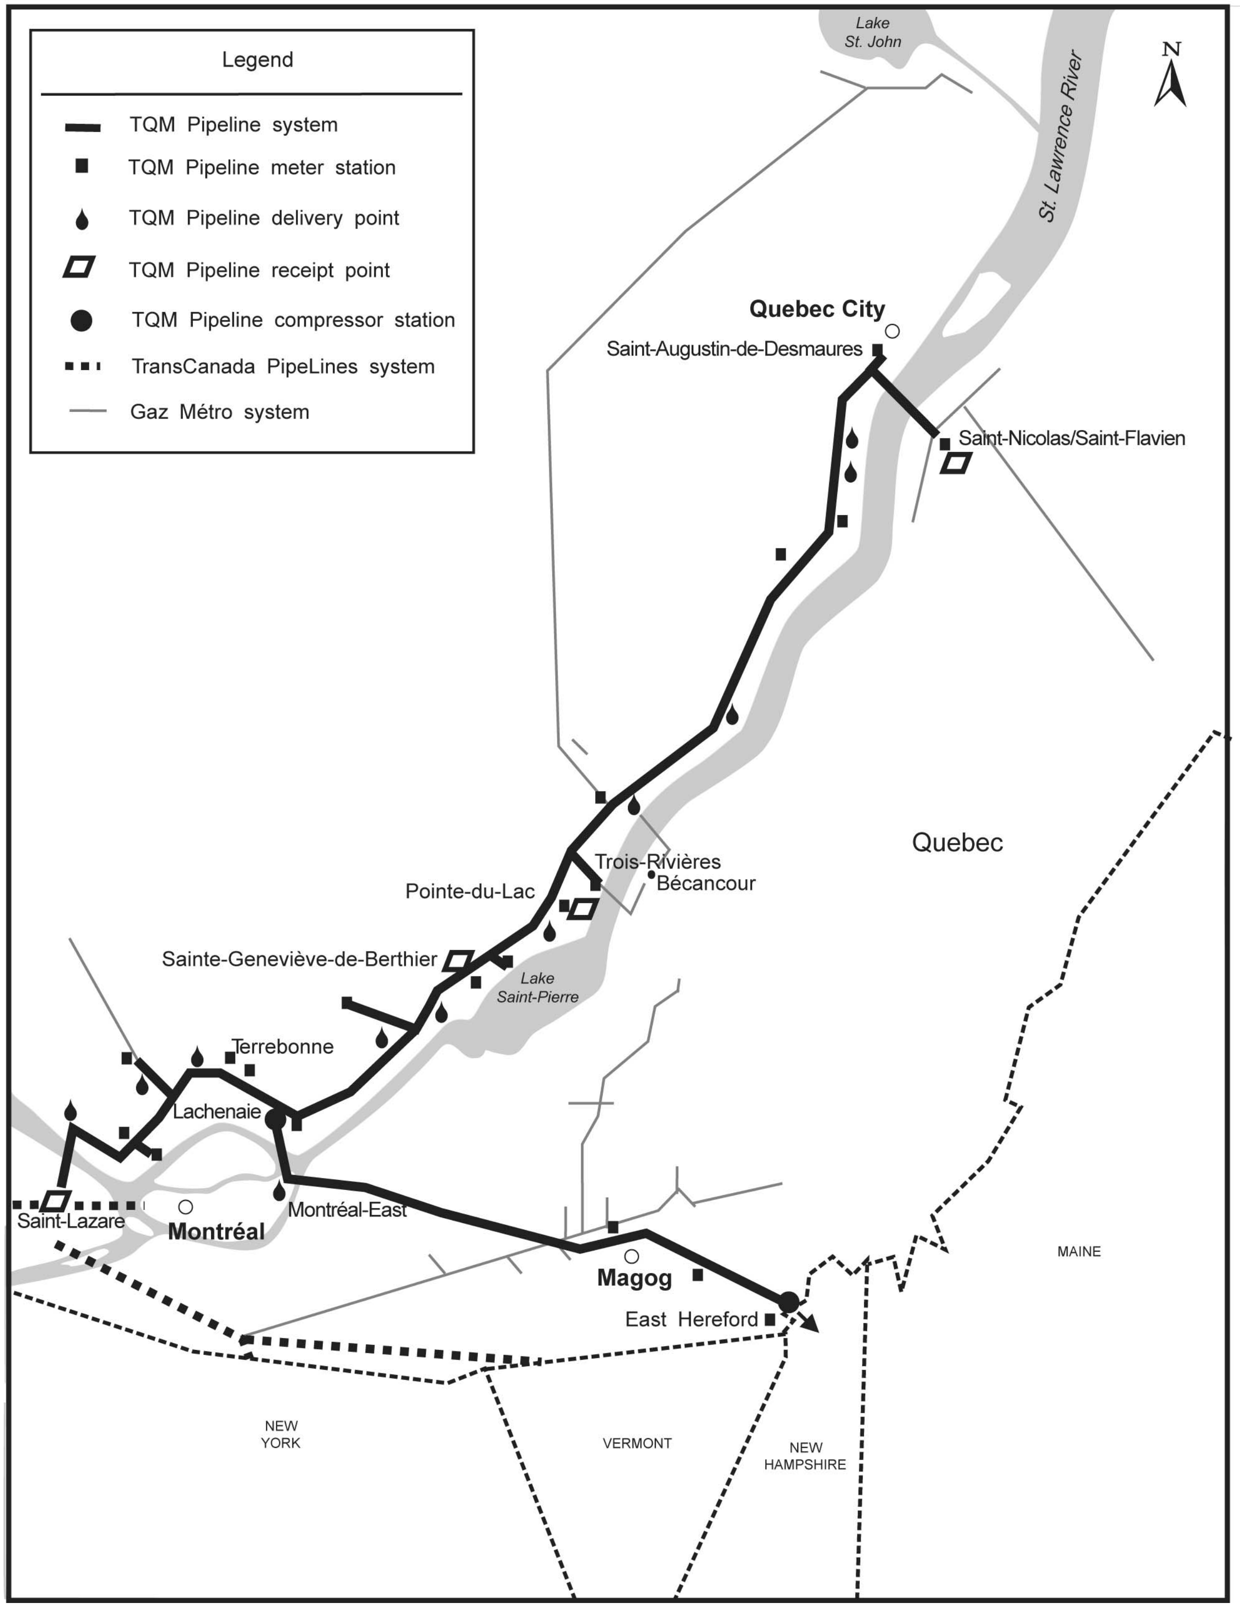
Pursuant to Part IV of the Act, TQM also applied for an order approving an overall fair return on capital for the years 2007 and 2008 resulting from the application of a rate of return of 11.0 per cent to a deemed equity component of 40 per cent of the TQM capital structure, together with the

6 From RH-2-94 Decision, *supra*, footnote 2, p. 35.

actual cost of debt of TQM. TQM stated that the requested overall return is equivalent to an After-Tax Weighted-Average Cost of Capital (ATWACC) of about 6.7 per cent (adjusted for the difference between the market cost of debt and the actual cost of TQM debt).

The Board issued Hearing Order RH-1-2008 on 22 January 2008 and scheduled an oral public hearing to begin on 23 September 2008 in Montréal, Quebec. The hearing commenced on 23 September 2008 and adjourned on 8 October 2008 in Montréal. The hearing reconvened in Calgary on 20 October 2008 and was completed on 22 October 2008. The hearing lasted 15 days.

Figure 1-1
TQM System Map



Chapter 2

Fair Return Standard

In the course of the hearing parties presented their views on the Fair Return Standard and the case law regarding it.[7] These cases, which underpin the Board's reasoning regarding the Fair Return Standard, and the Board's views on them, were discussed in the Board's RH-2-2004, Phase II Decision.[8] No party indicated that the reasoning in that Decision needed to be re-examined; indeed, TQM indicated that the determination of the return on equity of TQM for 2007 and 2008 should be guided by the principles that, in its view, were articulated in the RH-2-2004, Phase II Decision.

According to TQM, the following four principles are found in that Decision.

- The overall return on capital must meet the comparable investment, financial integrity and capital attraction requirements of the Fair Return Standard.
- Each element that goes into the determination of the overall return must be found by the Board to be reasonable. The Board then uses its judgment to ensure that a resulting return is a fair return in accordance with the legal requirements.
- Under the traditional methodology the fair total equity return is established by application of the rate of return on equity to the deemed equity component of the pipeline capital structure that reflects the business risk of a pipeline.
- The fair return is a cost to be determined without regard to the impact on tolls to be paid by customers.

The Canadian Association of Petroleum Producers (CAPP) in final argument submitted that when determining the fair return, there is a balance to be struck. It referred to the Board's RH-4-2001 TransCanada Decision which stated that a fair or reasonable rate of return should, in addition to meeting the comparable investment, financial integrity and capital attraction requirements, "achieve fairness both from the viewpoint of the customers and from the viewpoint of present and prospective investors".[9] In support of this submission, CAPP argued that the Federal Court of Appeal in *TransCanada v. NEB* looked at the 2001 Decision and the review of that decision[10] and stated that both decisions were correct.

---

7 *Northwestern Utilities Limited v. City of Edmonton*, [1929] S.C.R. 186; *TransCanada PipeLines Limited v. National Energy Board et al.* [2004] F.C.A. 149 [hereinafter TransCanada v. NEB]; *Bluefield Waterworks & Improvement Co. v. Public Service Commission of West Virginia et. al.* 262 U.S. 679 (1923) [hereinafter *Bluefield*]; *Federal Power Commission v. Hope Natural Gas* 320 U.S. 591 (1944) [hereinafter Hope].

8 National Energy Board, RH-2-2004, Phase II Reasons for Decision, TransCanada PipeLines Limited Cost of Capital, April 2005.

9 National Energy Board, RH-4-2001Reasons for Decision, TransCanada PipeLines Limited Cost of Capital, June 2002, at p. 11.

10 National Energy Board, RH-R-1-2002 Reasons for Decision, TransCanada PipeLines Limited Review of RH-4-2001 Cost of Capital Decision, February 2003.

CAPP argued that the U.S. cases cited by TQM and discussed by the Board in previous decisions also make it clear that there is a balance to be struck when a tribunal is exercising its judgment to determine the fair return. CAPP referred to the *Hope* decision, as cited in the Board's RH-2-2004, Phase II Decision, for the proposition that there is a "balancing of the investor and consumer interests."[11] Further, CAPP submitted that the *Bluefield* decision states that the utility is entitled to charge rates that are compensatory "but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures."[12]

Views of the Board

The Board has considered the arguments put forward by TQM and CAPP and continues to believe that the legal framework for determining a fair return is as set out in Chapter 2 of the RH-2-2004, Phase II Decision. The Board notes that these views were based on the Federal Court of Appeal Decision in *TransCanada v. NEB*.

When using the cost of service approach to determine tolls, the cost of capital is determined using the Board's sound judgment. Often the largest and therefore most important portion of cost of capital is the overall return on equity. While customers and consumers have an interest in ensuring that the cost of equity is not overstated, in the Board's view, this is factored in by having intervenors test and challenge the position the company has put forward. It does not mean that in determining the cost of capital that investor and consumer interests are balanced. In the Board's view, the Federal Court of Appeal was clear that the overall return on equity must be determined solely on the basis of a company's cost of equity capital, and that the impact of any resulting toll increase is an irrelevant consideration in that determination.[13]

Therefore, the Board reaffirms the Fair Return Standard as articulated on page 17 of the RH-2-2004, Phase II Decision. The Fair Return Standard requires that a fair or reasonable overall return on capital should:

- be comparable to the return available from the application of the invested capital to other enterprises of like risk (comparable investment requirement);
- enable the financial integrity of the regulated enterprise to be maintained (financial integrity requirement); and

---

11 *Hope*, *supra,* footnote 7, at p. 603.

12 *Bluefield*, *supra,* footnote 7, at pp. 692-693.

13 While it is true that TransCanada's appeal in the *TransCanada v. NEB* case was denied, this is only because, after examining the facts, the Court found that the Board did not improperly consider the impact on consumers of increasing tolls when determining the cost of capital. (See paragraphs 37 and 42.)

- permit incremental capital to be attracted to the enterprise on reasonable terms and conditions (capital attraction requirement).[14]

---

14 In previous decisions the Board used the word "standard" for each of the elements of the Fair Return Standard. The Board has changed the description to "requirement" to clarify that there are three requirements which should be met under the Fair Return Standard.

Chapter 3

Application for Review and Variance of RH-2-94

3.1 The Board's Review Procedure

Section 21 of the Act provides:

> (1) Subject to subsection (2), the Board may review, vary or rescind any decision or order made by it or rehear any application before deciding it.

The *National Energy Board Rules of Practice and Procedure, 1995* set out the requirements for a review application in section 44:

> (2) An application for review or rehearing shall contain...
>
> (b) the grounds that the Applicant considers sufficient, in the case of an application for review, to raise a doubt as to the correctness of the decision or order ... including
>
> (ii) changed circumstances or new facts that have arisen since the close of the original proceeding…

There is no automatic right of review of a Board decision. A decision to review is discretionary.

Normally, a review entails a two-step process: first, it must be determined whether a doubt has been raised as to the correctness of the impugned decision or order, and then, if that test has been met, the review is considered on its merits. These stages are commonly referred to as phases I and II and are analogous to seeking leave to appeal from a court, and subsequently having the appeal heard. In this case, the Board did not explicitly delineate the two phases of the review process, but considered both phases when deliberating on the evidence in this hearing.

This is the first time that the RH-2-94 Formula has been reviewed since *TransCanada v. NEB*. In that case, the Court confirmed that the Board's review procedure is the proper process for considering the RH-2-94 Formula and that as a result the burden of proving that the RH-2-94 Formula no longer applies rests with the Applicant which, in this case, is TQM.

As Justice Rothstein set out:

> In its 1995 decision, the Board stated that its automatic adjustment formula was to reflect a simplified procedure to determine annual adjustments to pipeline rates of return on common equity. It was therefore to continue indefinitely. When an affected party wishes to change the process, it has the onus to demonstrate that its

> proposal is preferable to the one which is the subject of a binding Board order. That is not an improper onus.[15]

It is with Justice Rothstein's words in mind that the Board considers TQM's request for a review of the RH-2-94 Decision as it applies to TQM for 2007 and 2008.

3.2 Context

3.2.1 Use of the RH-2-94 Formula

The Board held the RH-2-94 proceeding to put in place a means of improving the efficacy of the toll setting process for the year 1995 and beyond. In March 1995, the RH-2-94 Decision set the rate of return on common equity (ROE) for a benchmark pipeline at 12.25 per cent for 1995. In this context, a benchmark pipeline referred to a hypothetical utility whose overall investment risks are characteristic of a low-risk, high-grade regulated pipeline. The Board used this benchmark pipeline as the standard for determining the allowed ROE for the pipelines subject to the RH-2-94 proceeding. Under this methodology, company-specific business risk was to be accounted for in the equity component of the deemed capital structure of NEB-regulated pipelines. The Board approved a 30 per cent equity thickness for all gas pipelines subject to the RH-2-94 Decision, except for Westcoast Energy Inc. (Westcoast).

In addition, the RH-2-94 Decision established a mechanism to adjust the allowed ROE annually (RH-2-94 Formula). The RH-2-94 Formula directly links the ROE to a forecast of a long-term Government of Canada bond yield and adjusts the ROE for 75 per cent of the change in the forecasted yield. The forecast of a long-term Government of Canada bond yield is determined by averaging the 3-month-out and 12-month-out forecasts of 10-year Government of Canada bonds as published by *Consensus Forecasts* in November of each year. To this average is added the average spread between 10-year and 30-year Government of Canada bond yields as published daily in *The Financial Post* throughout the month of October of that year.

The Board did not find it necessary to specify a bond yield range outside of which the RH-2-94 Formula would not operate. Also, the Board did not set a time limit on the life of the RH-2-94 Formula. The Board indicated that its objective was to conduct detailed examinations of the pipelines' cost of capital only when significant changes had occurred in financial markets, business circumstances, or in general economic conditions. Furthermore, the Board was prepared to consider a reassessment of capital structures, likely on a pipeline-by-pipeline basis, in the event of a significant change in business risk, in corporate structure or in corporate financial fundamentals.

TQM was subject to the RH-2-94 Decision from 1995 until the end of 2006 and operated under a Multi-Year Tolls Agreement reached between TQM and interested parties between 1997 and 2006. As a result, the last time TQM's cost of capital and business risk were assessed by the Board was during the RH-2-94 proceeding.

---

15 *Supra*, footnote 7, at paragraph 56.

3.2.2 Changes in Business Circumstances, Financial Markets and General Economic Conditions

Submissions of TQM

TQM submitted that new facts and changed circumstances since the RH-2-94 proceeding raise a doubt as to the correctness of the RH-2-94 Decision as it relates to TQM for 2007 and 2008. As well, TQM stated that all changes affecting the cost of capital, other than those taken into account by the mechanical relationship between the RH-2-94 Formula and the Government of Canada bond yields, have not been accounted for by the RH-2-94 Formula.

Changes in Business Circumstances

TQM was of the view that the market environment in which gas pipelines in North America operate has changed significantly since 1994 reflecting greater uncertainty in the supply of gas, greater uncertainty in the extent and timing of growth in demand and greater competition among pipelines for customers seeking transportation service. According to TQM, there has been no quantitative link between the amount that the deemed equity thickness has been increased by the Board, or in settlements relying on the RH-2-94 Formula, and the increase in the total return required by investors to compensate them for bearing that increased risk.

Changes in Financial Markets

Major events such as increased geopolitical instability, extensive corporate corruption and collapse of the technology, media and telecom sectors were cited by TQM as having impacted financial markets and having raised the risk premium for equities since 1994. Also, the ratio of Canadian government debt to Gross Domestic Product (GDP) saw a decline, which put a material downward pressure on bond yields. Furthermore, the world's capital markets, including Canadian financial markets, have become increasingly integrated resulting in capital easily flowing from one market to another in pursuit of the best investment opportunities and competitive returns. TQM submitted that this integration has lead to increased competition for capital for Canadian companies, including TQM.

Changes in Canada's General Economic Conditions

TQM expressed the view that Canada has undergone significant changes in general economic conditions since 1994. These changes were most evident in the rise and fall in interest rates, a drop in Government of Canada bond yields, and an appreciation and subsequent fall in the Canadian/US dollar exchange rate. Commodity markets (crude oil, natural gas and base metals) also showed material increases in prices and volatility.

Based on the above-mentioned changes in business circumstances, financial markets and general economic conditions, TQM was of the view that a review of the RH-2-94 Formula as it applies to TQM for 2007 and 2008 was warranted.

Submissions of Intervenors

Changes in Business Circumstances

Dr. Booth, an expert witness for CAPP and the Industrial Gas Users Association (IGUA), stated that at the time of the RH-2-94 Decision, the Board used the same 30 per cent common equity ratio for all the major natural gas pipelines. As a result, Dr. Booth was of the view that, while it might seem obvious that the TransCanada Mainline was the benchmark, in substance all major natural gas pipelines were. In Dr. Booth's opinion, the two major developments since 1994 have been the increased supply of natural gas outside of the Western Canada Sedimentary Basin (WCSB) and the increase in intra-Alberta demand. Both have resulted in lower throughput on the TransCanada Mainline. According to Dr. Booth, neither of these factors affect TQM to the same degree as the WCSB export pipelines. Dr. Booth was of the view that the development of the Dawn Hub provides TQM with much more flexibility than any of the WCSB export pipelines. Dr. Booth argued that a case could be made that TQM is the new low risk benchmark pipeline.

Changes in Financial Markets and Canada's General Economic Conditions

In comparing the capital market conditions between 1994, 2001 and 2008, Dr. Booth assessed the variables contained in the following table.

Table 3-1
Capital Market Conditions: 1994, 2001 and 2008

	1994	2001	2008
Long-term Canada bond yield forecast			
Consensus Forecast	8.35%	5.95%	4.61%
Dr. Booth (and Dr. Berkowitz*)	8.25%	6.00%	4.75%
Real Canada yield	4.62%	3.60%	1.65%
Market risk premium	3.5% - 4.0%	4.50%	5.00%
Beta estimates	0.45 – 0.55	0.42 – 0.60	0.45 – 0.55
Equity risk premium for pipeline	250 bps	250 bps	300 bps

* Dr. Berkowitz testified in the RH-2-94 and RH-4-2001 proceedings.

According to Dr. Booth, when comparing the three periods, the major changes occurred between 1994 and 2001. In 2001, Dr. Booth pointed out that after having carefully considered all of the evidence relating to rate of return on common equity, the Board maintained the RH-2-94 Formula since it continued to yield returns appropriate for the TransCanada Mainline. Furthermore, Dr. Booth was of the view that the change in financial market conditions is less since 2001 than what occurred between 1994 and 2001. Therefore, Dr. Booth saw no substantial change in market conditions that would warrant a change in the RH-2-94 Formula and supported its continued use.

3.3 Suggested Approaches

3.3.1 After-Tax Weighted-Average Cost of Capital

Submissions of TQM

TQM approached the analysis of the fair return in two different ways. The first way was the utilization of the ATWACC approach to cost of capital estimation. The second way was the traditional methodology that reflects business risk in the equity component of the capital structure and a separate estimate of the rate of return on equity. TQM stated that ATWACC and the traditional methodology, when properly applied, yield similar results in terms of overall return on capital. TQM submitted that the ATWACC approach is the one used by corporations in the analysis of investment opportunities.

According to TQM, the base criteria to compare investment opportunities for the company are the calculations of net present value (NPV) and internal rate of return (IRR). In this context, the ATWACC is the discount rate used to determine the NPV of an investment and the IRR is the calculated return over the life of an investment. If the NPV is positive, the investment opportunity adds value and if the IRR is above the ATWACC (which can be considered the hurdle rate), the investment opportunity will have a positive NPV and therefore will add value.

The ATWACC approach can be considered from two different perspectives. The first one is an "authorized ATWACC" where the capital structure and ROE used in the analysis are the ones authorized by a regulator. The second perspective is a "market-based ATWACC" where the capital structure, cost of equity and cost of debt are all based on market values or market costs.

It was the opinion of one of TQM's expert witnesses, Dr. Kolbe, that ATWACC is the most fundamental measure of the rate of return required for a given level of business risk. ATWACC was used as the starting point for his analyses. Dr. Kolbe submitted that a stock's risk depends in part on the amount of debt a company has in its capital structure since the presence of debt magnifies the risk equity holders bear. As a result, the extra risk for equity created by debt's magnification is known as financial risk. Therefore, Dr. Kolbe was of the view that when estimating the cost of equity from sample companies, differences in the level of financial risk between the sample companies and a particular regulated company must be considered and controlled for.

TQM stated that it is not advisable to assume an appropriate capital structure for a specific company when comparing returns on equity because a capital structure is specific to each company and an external observer cannot judge whether this structure is appropriate or not. As a result, TQM argued that the best way to compare investment returns of different businesses is the ATWACC approach which focuses on the total return on capital and adjusts for financial risk.

Submissions of Intervenors

Dr. Booth referred to the ATWACC approach as leverage adjustments and was of the view that this approach was an erroneous and irrelevant way of looking at the problem of different levels of risk between TQM and sample companies when determining a fair return. Dr. Booth submitted that the ATWACC approach is not needed by any financial theory. He expressed the view that the reliance on an ATWACC approach, or leverage adjustments, to determine the return on capital for TQM for 2007 and 2008 was not necessary because the actions of regulators have equalized the risks between large classes of different types of utilities. In the event where there would be a difference in risk to the common shareholders between TQM and the sample firms, Dr. Booth argued that it would be possible to make an adjustment directly to the allowed return on equity without using an ATWACC approach. CAPP argued that an ATWACC approach does not avoid capital structure decisions since this approach requires the estimation of capital structure of sample companies.

Dr. Safir, a CAPP expert witness, submitted that the ATWACC approach is not as transparent as the traditional approach when determining a fair return, and that transparency was a valuable tool for a regulator. Dr. Booth argued that this lack of transparency created estimates for TQM for 2007 and 2008 that are beyond the range of reasonableness when compared to what other regulators have awarded to other Canadian utilities.

The Ministry of Energy of the Province of Ontario (Ontario) argued that there is no need to adopt ATWACC and that TQM's proposal in that regard should be dismissed. Ontario added that there are issues with ATWACC such as sample sizes, betas and relative risk of the Canadian sample, as well as the fact that ATWACC has not been adopted by other North American regulatory bodies.

3.3.2 RH-2-94 Formula and Similar Approaches

Submissions of TQM

According to TQM, the Board should grant the variance from the RH-2-94 Decision for the purpose of determining TQM's cost of capital for 2007 and 2008.

In addition to the changes in business circumstances, financial markets and general economic conditions discussed in Section 3.2 that were cited by TQM as reasons to review the RH-2-94 Decision, TQM submitted the results of Dr. Vander Weide's four tests regarding the validity of the RH-2-94 Formula. Dr. Vander Weide concluded the following.

- The RH-2-94 Formula currently understates the required equity risk premium in Canadian utility stocks by at least 200 basis points.
- The cost of equity for utilities declines by less than 50 basis points when interest rates decline by 100 basis points, rather than the 75 basis point decline as stipulated by the RH-2-94 Formula.
- The volatility and the realized return of Canadian utility stock indices have exceeded that of the market as a whole, implying that the RH-2-94 Formula understates the current cost of equity of Canadian utilities.
- The current forward-looking required equity risk premium on U.S. utility stocks is 150 basis points more than the 4.12 per cent offered by the RH-2-94 Formula.

Mr. Engen, one of TQM's expert witnesses, stated that sell-side analysts and credit rating agencies have displayed concern over the low ROEs produced by the RH-2-94 Formula but, on the other hand, analysts have supported the transparency of a formula such as the RH-2-94 Formula since this approach provides clarity and the resulting returns can be fully anticipated.

TQM also submitted that, absent strategic or franchise considerations, no pipeline company is investing new capital in new long-term projects at the returns currently allowed by the RH-2-94 Formula. As a result, embedded capital of existing Canadian pipelines receives significantly discounted returns relative to that of newly built projects. It was noted by TQM that negotiated settlements are consistently hundreds of basis points over the RH-2-94 Formula ROE.

Furthermore, TQM was of the view that financial risk (leverage) is important to consider and that comparing returns on equity without considering the financial risk affecting these returns is not sufficient. TQM suggested that the ATWACC approach, by determining the proper total return on the investment irrespective of financing, explicitly provides control for financial risk, as opposed to the RH-2-94 Formula or an approach by component relying on a stand alone cost of equity estimate. Finally, TQM noted that there is no empirical way to determine an equity thickness based on the business risk of a company.

Submissions of Intervenors

The Canadian Gas Association (CGA) expressed the view that the total returns based on the RH-2-94 Formula are no longer comparable to those returns enjoyed by investments of similar risk to Canadian utilities and do not meet the Fair Return Standard. The CGA submitted that annual adjustment factors, if any, should track not just factors such as interest rates, but also the returns enjoyed by other investments of similar risk. It was argued by the CGA that embedded capital trapped in an existing system should not earn inferior returns to discretionary capital committed to new services or expansions.

Spectra Energy Transmission (Spectra)[16] and Union Gas Ltd. (Union) argued that the current return on equity from the RH-2-94 Formula fails to meet the Fair Return Standard in terms of a total return which would be needed to be truly comparable to other investments available of similar risk. According to Union and Spectra, the cost of capital is determined by the interplay of many dynamic factors which are simply beyond the capacity of a single financial model to predict and which the RH-2-94 Formula cannot capture by itself.

In CAPP's view, the application to review the RH-2-94 Formula should be dismissed. CAPP supported the continued use of the RH-2-94 Formula and was of the view that the current allowed ROE is in fact generous. In addition, according to CAPP, the RH-2-94 Formula was and continues to be successful in reducing the amount of repetitive testimony in regulatory proceedings. CAPP submitted that the predictability, the stability and the understanding of the RH-2-94 Formula were all valued attributes of this approach. Dr. Booth presented the view that the Board cannot manage capital market risk for the pipelines under its jurisdiction and the Board has correctly used basic principles of finance to offset the business risk of these pipelines by allowing changes in their financial risk. By equalizing overall risk (combined business risk,

16 Carrying on business of Westcoast Energy Inc. (Westcoast).

financial risk and investment risk), the Board can then allow the same return on equity for different types of utilities relying on the RH-2-94 Formula.

CAPP stated that even if the RH-2-94 Formula operates mechanically, there is nothing mechanical in the way the RH-2-94 Formula was adopted in 1995 and reviewed in 2001 and 2004. To support this, it noted that since 1994, substantial investments have been made and continue to be made by pipelines and utilities subject to returns set by various formulae in different jurisdictions. Notwithstanding warnings of applicant witnesses in hearings, CAPP was of the view that debt and equity have flowed, and are continuing to flow, to investments subject to formula returns. Furthermore, CAPP argued that if the problem were so great and had gone on for so many years, then there would be clear and objectively observable market evidence of a problem of capital attraction and capital retention. CAPP stated that it saw no such evidence.

The view was expressed by Dr. Booth that the RH-2-94 Formula has generally resulted in a downward movement of the fair ROE as lower long Canada bond yields have caused a reduction in the risk premium in the long Canada bond yield with a corresponding increase in the market risk premium. As a result, Dr. Booth submitted that the 75 per cent adjustment mechanism to the RH-2-94 Formula has been remarkably accurate. He therefore judged the RH-2-94 Formula to be successful and recommended that it continue to be used with some minor downward adjustment in the level of ROE.

Dr. Booth submitted that he has consistently recommended that business risk be assessed in annual tolls hearings, where other firm specific information is heard and the appropriate capital structure or premium to the generic ROE is set. The generic ROE formulae, such as the RH-2-94 Formula, can then be assessed relatively infrequently based on changes in capital market conditions.

Regarding Dr. Vander Weide's results on the validity of the RH-2-94 Formula, CAPP argued that they do not form a sound basis for a determination of the cost of capital since evidence from low risk companies was ignored, adjusted betas were used in the estimates, and some of those discounted cash flow (DCF) estimates relied on analysts' growth forecasts which are known to be biased. CAPP also argued against the reliance on U.S. firms since they are more risky than TQM.

CAPP submitted that, if the RH-2-94 Formula were open to review, it would recommend a 7.75 per cent ROE for TQM for 2007 and 2008 and that the RH-2-94 Formula be rebased accordingly, based on Dr. Booth's ROE recommendation.

IGUA argued that the Board should not depart from the RH-2-94 Formula since it remains appropriate and has stood the test of time. According to IGUA, the RH-2-94 Formula generates results at the high end of the range of possible appropriate ROEs relative to the very nominal risks TQM bears.

Ontario argued that the RH-2-94 Formula should be retained since it is transparent, provides clarity and remains valid.

Views of the Board

Review and Variance of the RH-2-94 Decision

In considering an application for review and variance pursuant to subsection 21(1) of the Act, the Board takes into account the facts that could potentially raise a doubt as to the correctness of the original decision. Typically, the Board will look at changed circumstances or new facts that have arisen since the close of the original proceeding, or facts that were not placed in evidence in the original proceeding and that were then not discoverable by reasonable diligence. Furthermore, the Board stated in the RH-2-94 Decision that its objective in initiating the RH-2-94 proceeding was to conduct detailed examinations of a pipeline's cost of capital only when significant changes had occurred in financial markets, business circumstances, or in general economic conditions.[17] The Board also stated that it would be prepared to consider a reassessment of capital structures in the event of a significant change in business risk, in corporate structure or in corporate financial fundamentals.[18] The Board did not set a limit on the life of the RH-2-94 Formula and did not expect to reassess the rate of return on common equity in a formal hearing for at least three years from the time of the RH-2-94 Decision.

With regard to the variance application, the Board notes that TQM has been subject to the RH-2-94 Decision and the associated adjustment mechanism for 12 consecutive years (1995 to 2006, inclusive). The Board notes that the RH-4-2001 proceeding was the last time when the RH-2-94 Formula was challenged. The RH-4-2001 proceeding was specific to TransCanada, just as the RH-1-2008 proceeding is specific to TQM. As a result, the Board finds that it should assess the changes since 1994 instead of 2001 in this proceeding. In the Board's view, the 14-year period since 1994 is a significant time period in the context of financial regulation.

Also, the Board is of the view that there have been significant changes since 1994 in the financial markets as well as in general economic conditions. More specifically, Canadian financial markets have experienced greater globalization, the decline in the ratio of government debt to GDP has put downward pressure on Government of Canada bond yields, and the Canada/US exchange rate has appreciated and subsequently fallen. In the Board's view, one of the most significant changes since 1994 is the increased globalization of financial markets which translates into a higher level of competition for capital. When taken together, the Board is of the view that these changes cast doubt on some of the fundamentals underlying the RH-2-94 Formula as it relates to TQM.

---

17 RH-2-94 Reasons for Decision, *supra*, footnote 2, at p. 2.

18 RH-2-94 Reasons for Decision, *supra*, footnote 2 at p. 32.

As explained in the RH-2-94 Decision, the initial return on equity determination was meant to be applied to a benchmark pipeline which was assumed to be a hypothetical utility whose overall investment risks are characteristic of a low-risk, high-grade regulated pipeline. The Board notes that the equity thickness of the benchmark pipeline was not explicitly specified in the RH-2-94 Decision. The Board approved a 30 per cent equity thickness for all gas pipelines subject to the Decision, except for Westcoast, which has been interpreted by some as implicitly assigning an equity thickness of 30 per cent for the benchmark pipeline. However, the role of the benchmark pipeline, its changing risk level and its specific equity thickness have not been considered explicitly, and that leaves a doubt as to the exact level of financial risk inherent in the return on equity as determined by the RH-2-94 Formula for the benchmark pipeline.

The RH-2-94 Formula relies on a single variable which is the long Canada bond yield. In the Board's view, changes that could potentially affect TQM's cost of capital may not be captured by the long Canada bond yields and hence, may not be accounted for by the results of the RH-2-94 Formula. Further, the changes discussed above regarding the new business environment are examples of changes that, since 1994, may not have been captured by the RH-2-94 Formula. Over time, these omissions have the potential to grow and raise further doubt as to the applicability of the RH-2-94 Formula result for TQM for 2007 and 2008.

The Board notes that there were two distinct aspects of the RH-2-94 Decision, namely the adjustment mechanism which applied to all pipelines subject to the Decision and the determination of the capital structure on a pipeline-by-pipeline basis. On the one hand, the Board views the adjustment mechanism as fully transparent and predictable. The Board notes that this adjustment mechanism has received for some time the praises of the investment community citing that this approach provides clarity, transparency and its results can be fully anticipated. On the other hand, the capital structure decisions made on a pipeline-by-pipeline basis are less transparent. The Board's original objective was to adjust the capital structure, hence adjust financial risk, to offset changes in business risk experienced by any given pipeline subject to the RH-2-94 Decision. The Board is of the view that while estimating the equity ratio based on business risk, separately from the determination of the return on equity, can be useful in a regulatory context, it does not reflect the way that much of the business world approaches capital structure and capital budgeting decisions.

Based on the above reasons, the Board has decided to grant the variance from the RH-2-94 Decision to TQM for 2007 and 2008 as it relates to its cost of capital.

Approach Used to Determine TQM's Return on Capital for 2007 and 2008

Beyond the RH-2-94 Formula, two other approaches have been presented to determine TQM's cost of capital for 2007 and 2008. TQM and its expert witnesses presented the ATWACC approach – an aggregate approach to the estimation of cost of capital. CAPP and its expert witness presented a stand-alone cost of equity estimate – an approach by component to the estimation of cost of capital.

The Board is of the view that the ATWACC approach is more aligned with the way capital budgeting decision making takes place in the business world as compared to an approach by component that would include a stand-alone cost of equity estimate. When comparing investment opportunities, TransCanada and Gaz Métro, both owners of TQM, submitted that they rely on an ATWACC to determine a hurdle rate and to make capital budgeting decisions. In the Board's view, the use of an ATWACC approach alleviates the need to attempt to estimate a deemed capital structure based on business risk in the initial step of the process as is required in the context of the RH-2-94 Decision. The Board also notes that the ATWACC approach enables the comparisons of returns on an equal footing between companies of comparable risk since the ATWACC approach neutralizes financial risk differences when comparing investment opportunities. The Board is of the view that this approach facilitates the comparisons of returns by removing the impact of financial risk. Consequently, the ATWACC approach better utilizes financial market information.

Figure 3-1 illustrates how an aggregate approach, such as the ATWACC approach, may be used by the Board to determine TQM's total cost of capital for 2007 and 2008. This approach requires a business risk analysis that would be used to assess how the risks of TQM have evolved since they were last considered by the Board. The business risk analysis would also be relied upon to select firms of comparable risks based on the traditional five factors (supply, market, competitive, regulatory and operational risks). Once comparable firms are selected, information can be extracted from those firms, including cost of equity, capital structure and cost of debt to derive an aggregate cost of capital. At each step of this process, judgment is necessary to select the inputs that would ultimately inform the determination of the cost of capital for TQM for 2007 and 2008.

CAPP has presented an approach by component which relies on a stand-alone cost of equity estimate. CAPP has also suggested an equity thickness, based on its assessment of TQM's business risk, to which the ROE estimate would be applied.

Figure 3-2 illustrates an approach by component to the determination of a total cost of capital as endorsed in the RH-2-94 Decision. This approach requires two parallel decisions: an ROE determination and a capital structure determination. The ROE determination requires the selection of firms of comparable risks to TQM from which an ROE estimate could be derived. Parallel to this decision, a business risk assessment of TQM is made to determine a capital structure which would reflect its level of business risk. Once these determinations have been made separately, they are combined to derive the total equity return to which the embedded cost of debt is added, to produce the total return on capital.

The difficulty arises as to which of these two approaches is judged as the better tool to link the components impacting the determination of fair return. This, in the Board's opinion, is a matter of informed judgment. Having carefully considered both approaches, the Board finds that the ATWACC approach enables better comparisons of return on capital for companies of similar risk. This offers the potential to avoid separating two elements that are inevitably linked: capital structure and return on equity. Further, it is the Board's view that relying on an approach, such as ATWACC, that mirrors the business decision-making process contributes to its validity as an appropriate method for estimating the cost of capital. Accordingly, the Board will use the ATWACC approach to inform its judgment to determine TQM's cost of capital for 2007 and 2008.

In choosing to rely on an ATWAAC approach, transparency was an important factor considered by the Board in its decision. A single ATWACC number that incorporates the total return on capital on a comparable basis amongst companies assists the Board in making meaningful comparisons. This contrasts with simply looking at the return on equity which provides only a partial understanding of the total return on capital. Further, a capital structure is specific to each company and it is difficult for an external party to assess its appropriateness. The greater ease of comparison of using the ATWACC approach, in the Board's view, is less prone to error and enhances clarity.

The Board notes that an ATWACC approach can be implemented in various ways. The specific ATWACC methodology upon which the Board will rely in this proceeding will be described in Chapter 4 of these Reasons.

All of the evidence submitted by parties in this proceeding will be considered using an ATWACC approach to determine an appropriate aggregate return. The Board's determination on fair return will be made in Chapter 7 of these Reasons.

Figure 3-1
An Aggregate Approach to the Fair Return Standard using the ATWACC Approach

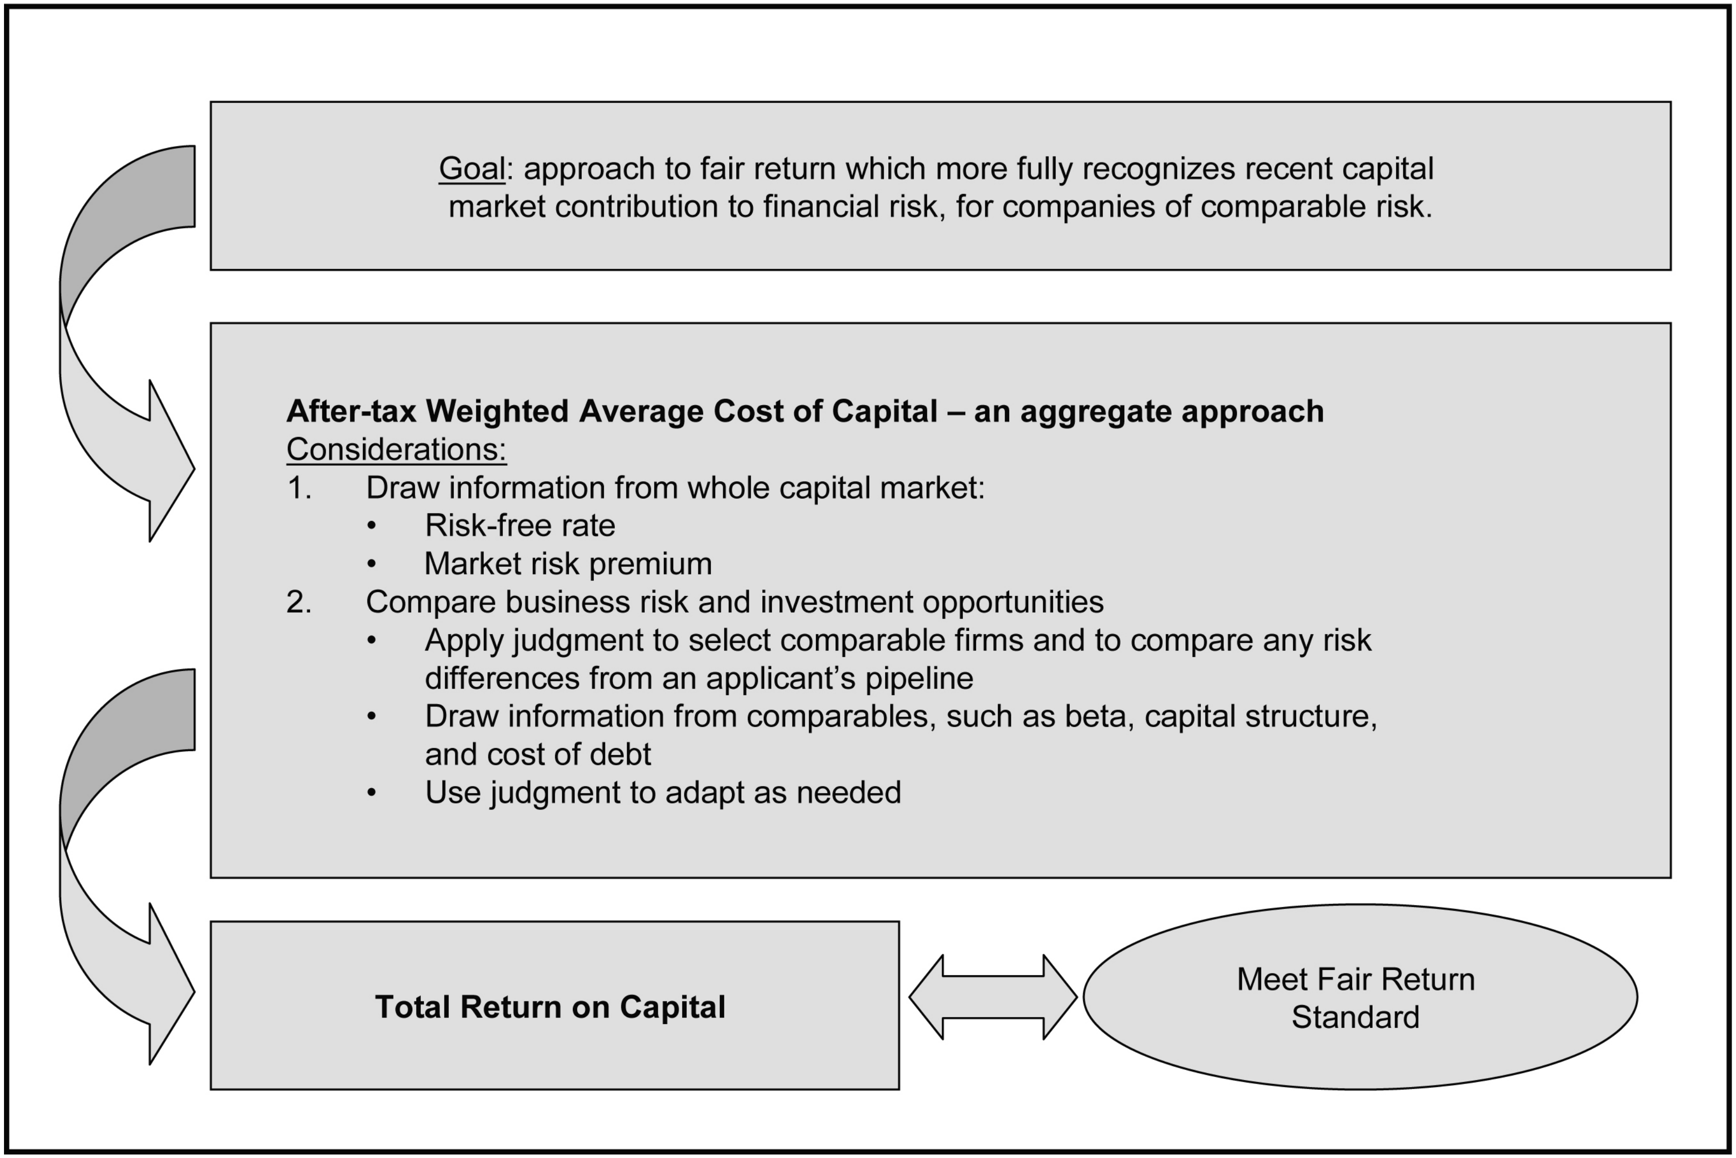


Figure 3-2

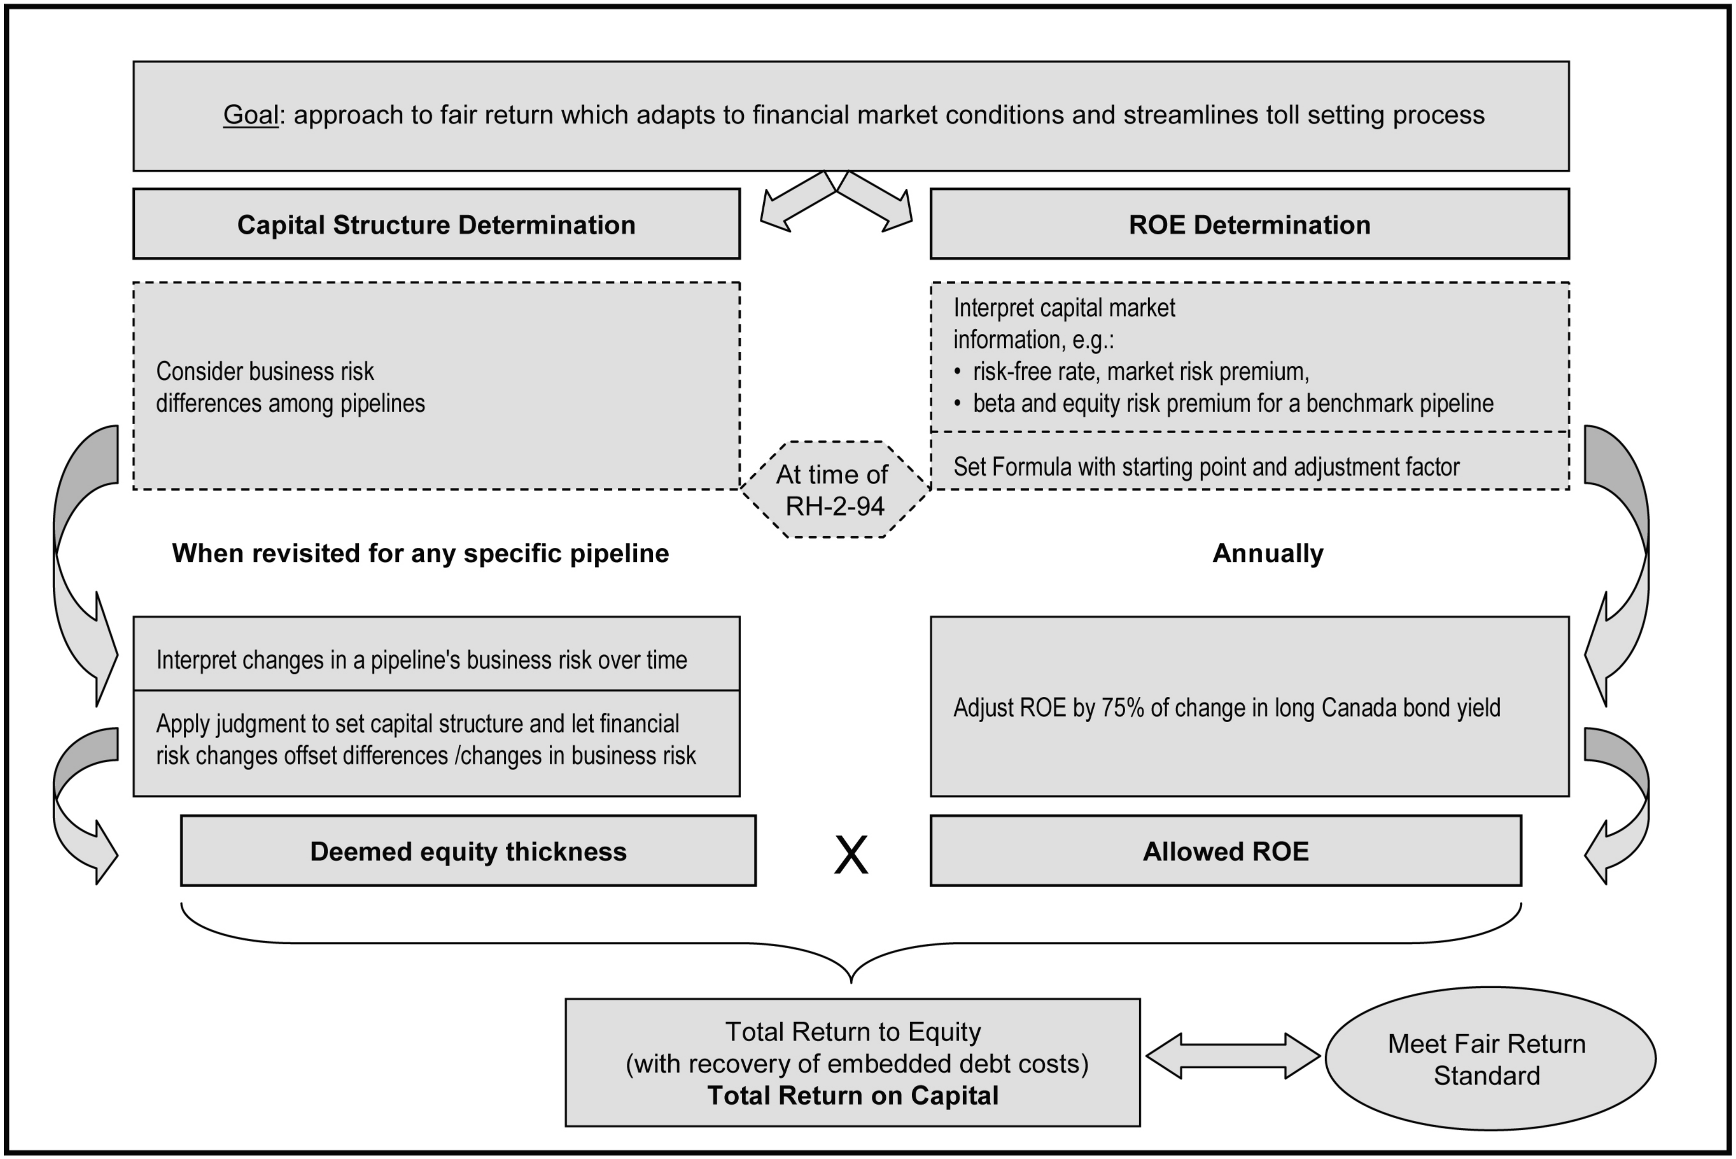
An Approach by Component to the Fair Return Standard using the RH-2-94 Formula



Chapter 4

Implementation of the ATWACC Methodology

In a regulatory context, the ATWACC approach relies on the comparison of total costs of capital of sample companies considered to be of similar risk to the regulated entity, which in this case is TQM. A specific ATWACC methodology is required to compute the ATWACC of each company in the sample and may involve many analytical steps. The resulting ATWACCs may be averaged to derive the total cost of capital of the sample. The resulting total cost of capital can then be applied to TQM with judgment on various adjustments to reflect differences in risk.

The ATWACC approach relies on the following equation to estimate the total cost of capital of a firm:

$$ATWACC^{19} = (r_e * w_e) + (CoD * w_d * (1\text{-}tx))$$

Where	$r_{e:}$	cost of equity
	CoD:	cost of debt
	w_e:	equity thickness in the capital structure
	w_d:	debt thickness in the capital structure
	tx:	corporate income tax rate[20]

In this chapter, the Board addresses each component of this equation and determines how it intends to use these parameters which, when combined together in an ATWACC methodology, will inform its judgment about TQM's cost of capital for 2007 and 2008.

4.1 Cost of Equity Methods

Submissions of TQM

Dr. Vilbert presented cost of equity estimates based on the capital asset pricing model (CAPM), the empirical capital asset pricing model (ECAPM) and the discounted cash flow model (DCF).

CAPM, as used by Dr. Vilbert, is represented by the following equation:

$$r_e = r_f + \beta * (MRP)$$

Where	r_f:	risk-free rate
	β:	beta factor
	MRP:	market risk premium

19 A potential and small contribution from preferred shares has been ignored for simplicity in this description, although it was addressed by the expert evidence submitted by Dr. Vilbert.

20 This is mathematically equivalent to pre-tax WACC of (CoD * w_d) + (r_e * w_e) + (allowance for income taxes payable on the equity portion).

Dr. Vilbert contended that CAPM has not generally performed well as an empirical model, but that its shortcomings are directly addressed by ECAPM. Specifically, Dr. Vilbert submitted that ECAPM recognizes the consistent empirical observation that CAPM underestimates (overestimates) the cost of capital for low (high) beta stocks. The alpha parameter (α) in ECAPM would adjust for this fact. When using the long-term risk-free rate, as is the case in his analysis, Dr. Vilbert suggested that α values of 1 and 2 per cent are appropriate. These α values are at the low end of the spectrum suggested by research on this topic because the use of a long-term risk-free rate incorporates some of the desired effect of using ECAPM.

Dr. Vilbert relied on the following ECAPM:

$$r_e = r_f + \alpha + \beta * (MRP - \alpha)$$

Where	r_f:	risk-free rate
	α:	alpha factor
	β:	beta factor
	MRP:	market risk premium

According to Dr. Vilbert, ECAPM estimates deserve the most weight because ECAPM adjusts for empirical shortcomings related to CAPM.

Dr. Kolbe indicated that shareholders of companies regulated on a book-value rate base receive compensation for inflation through an inflation premium in the rate of return rather than through appreciation of asset value as would the shareholders of non-regulated companies. Dr. Kolbe submitted that bondholders get inflation compensation in the same way, through an inflation premium in the interest rate. This similarity between bondholders and shareholders of companies regulated on a book-value rate base makes regulated company returns especially sensitive to fluctuations in the bond market.

TQM submitted that the measured betas of utilities regulated on a book-value rate base are underestimated since CAPM relies on a proxy for the market portfolio which consists entirely of common stocks. Dr. Kolbe recommended the use of adjusted betas to estimate the cost of equity for utilities regulated on a book-value rate base to correct for this estimation problem and commented that this is a directional adjustment only. Dr. Kolbe further stated that using adjusted betas is probably not enough, but it is an approach widely used. Dr. Vander Weide explained that the use of adjusted betas and ECAPM have the same type of effect as they compensate somewhat for the empirical observation that traditional CAPM tends to underestimate the cost of equity for companies with betas less than one.

The DCF model was relied upon by Dr. Vilbert as a check for his CAPM and ECAPM results. The DCF model was used by TQM's expert witnesses with company specific data and analysts' growth forecasts. Dr. Vander Weide contended that using composite data in the DCF model, as it was done by Dr. Booth, makes it impossible to match stock prices with the cash flows that are being valued at that price and that the data set might include companies for which the DCF model does not apply. To be consistent with the forward-looking nature of the DCF model, Dr. Vander Weide submitted that Dr. Booth should have estimated expected future growth using forecasted growth rates rather than the reported values for the last year since analysts' forecasts of future growth are superior to historically oriented growth measures in predicting a firm's stock price.

Dr. Kolbe mentioned that multi-factor models, as used by Dr. Booth, are notoriously unstable and none of these models have garnered support in the financial community. Also, Dr. Kolbe expressed the opinion that a two-factor model understates the relative risk of U.S. electric utilities and Canadian rate-regulated companies against the broader market used by CAPM theory if the betas are left unadjusted.

Submissions of Intervenors

Dr. Booth relied on CAPM, using the same type of equation as Dr. Vilbert but with different parameter values, to derive a cost of equity recommendation for TQM for 2007 and 2008.

According to Dr. Booth, utility stocks have exposure to the bond market which creates sensitivity to interest rates, a sensitivity that is not captured by CAPM. Dr. Booth submitted that a two-factor model partly adjusts for the known estimation problems of CAPM by directly incorporating the risk of the long Canada bond through an interest rate risk premium. The two-factor model of Dr. Booth relied on the following equation:

$$r_e = r_f + (\gamma * IRP) + (\beta * MRP)$$

Where	r_f:	risk-free rate based on Treasury Bills
	γ:	gamma factor
	IRP:	interest rate risk premium (premium over Treasury Bills)
	β:	beta factor
	MRP:	market risk premium (premium over Treasury Bills)

The gammas, as presented by Dr. Booth, were more stable than the equivalent beta estimates. Dr. Booth judged the returns of utility stocks to have about half the exposure to the equity market as the average stock and half the exposure to the bond market as the long Canada bond.

The DCF model was also used by Dr. Booth as a check for his CAPM results and his DCF model was based on composite data and historical growth rates. The opinion of Dr. Booth was that any DCF estimates produced by using unadjusted analyst growth forecasts are seriously in error since it is generally accepted that analysts' earnings forecasts are biased high.

Dr. Booth submitted that Dr. Vilbert's ECAPM estimates are biased high since they rely on a 1 per cent add-on to the risk-free rate which is only valid if the short-term Treasury Bill yield is used as the risk-free rate, whereas Dr. Vilbert used the long Canada bond yield.

According to Dr. Booth, there is no indication that the utilities' betas are reverting to 1.0 as suggested by Dr. Kolbe. Consequently, Dr. Booth's view was that it is illogical to weight them with 1.0 as an "adjusted beta", as suggested by Dr. Kolbe, since there is no expectation that their risk is increasing to that of an average firm in the market.

4.2 Cost of Debt

In computing ATWACC of the sample companies, Dr. Vilbert used an estimate of the market cost of debt for each sample company. The estimation was based on the current yield on an index of utility bonds corresponding to each sample company's debt rating. No party disputed the use of these values.

4.3 Capital Structure

Submissions of TQM

The capital structure used when estimating the ATWACC of sample companies should, as submitted by Dr. Kolbe, reflect the level of risk in the cost of equity estimate. He stated that risk level depends on the sample company’s market-value capital structure, not its book-value capital structure since beta and the resulting cost of equity depend on the market value of the firm’s leverage.

It was Dr. Kolbe’s opinion that market values directly determine the amount of financial risk equity investors actually bear. If a firm is partly financed by debt, as the total market value of the firm fluctuates, the market value of equity will fluctuate more than the market value of the firm. This leverage illustrates financial risk.

Dr. Kolbe stated that the use of market-value weights to calculate the ATWACC for rate-regulated companies would not be circular or lock in an excessive return. Furthermore, the use of market-value weights to calculate ATWACC would not imply an abandonment of regulation based on book value. Dr. Kolbe’s view was that it is absolutely standard in rate regulation, even in North America, to apply a market-derived rate of return to a book-value rate base.

TQM argued that the U99099 Decision from the Alberta Energy and Utilities Board (EUB) (as it was then) accepted the ATWACC concept but applied it using book-value capital structure since it interpreted the specific terms of its enabling statute as requiring that the return on capital be on the book value of the rate base, and not the market value. TQM noted that the *National Energy Board Act* does not dictate the methodology to determine just and reasonable tolls.

When calculating CAPM and ECAPM estimates, Dr. Vilbert estimated each company’s average market value of equity over the most recent five-year period in order to match the estimated betas to the degree of financial risk present during the period of estimation. Dr. Vilbert contended that this matching was optimal.

Submissions of Intervenors

Dr. Booth noted that the NEB’s mandate is to set just and reasonable tolls and it should not be concerned with maximizing or enhancing shareholder value. If the Board wants to rely on ATWACC to estimate TQM’s cost of capital, it should rely on the book-value weights of the sample companies since these weights should be approximately equal to the market-value weights in the long run. CAPP argued that the EUB in the U99099 Decision said it would be derelict in its responsibility to use market-value weights in cost of service regulation, a position which according to CAPP should be adopted by the NEB. An ATWACC methodology based on market weights is fundamentally incompatible with the Canadian cost of service model of pipeline regulation.

According to Dr. Booth, the financial risk stems from the imposition of fixed interest charges since the firm has to pay these interest charges prior to distributing equity returns. This risk does not change as the market value of the firm changes; it only changes when book values change. As a result, financial risk only depends on the book value of a firm's capital structure. CAPP argued that using market weights would be unsustainable if market values were to fall. If this were to happen, CAPP submitted that utilities would revert to the age-old utility concern for a return sufficient to maintain financial integrity and the ability to attract capital under all market conditions. Furthermore, CAPP was of the view that relying on market value would promote circularity because investor expectations, as reflected in market values, would be confirmed. This, in turn, would lead to even higher market values, which would translate into still higher returns in the next regulatory proceeding. Ultimately, this would delay the adjustment to a fair and reasonable value for the allowed ROE.

4.4 Corporate Income Tax Rate

Dr. Vilbert used TQM's estimated marginal income tax rate of 31.9 per cent when calculating the after-tax cost of debt for the comparable companies.[21] No parties disputed the use of this value.

Views of the Board

In Chapter 3, the Board stated that it will use an ATWACC approach when determining TQM's cost of capital for 2007 and 2008. As is evident from the diverging views on the different ATWACC parameters discussed above, an ATWACC approach can be implemented in various ways. In the Board's view, these various ways could each represent a different ATWACC methodology. The Board will explain below its views on the various aspects of the ATWACC methodology for its determination of TQM's cost of capital.

Cost of Equity Methods

The Board is of the view that CAPM is widely accepted as a cost of equity model. This model has been relied upon by the Board in previous proceedings and was not contested in this proceeding as a method to estimate the cost of equity. In the Board's view, CAPM captures the risk equity holders have to bear when holding a common stock.

The Board notes Dr. Vilbert's position that ECAPM results deserve the most weight because this method adjusts for the empirical shortcomings of

21 TQM submitted that the income tax rates of its two partners average 32.185% for 2008. This differs by 0.285 per cent from the estimate used by Dr. Vilbert.

CAPM. In the Board's view, the fact that the long-term risk-free rate is used in CAPM already corrects for the empirical findings of this model, albeit possibly not perfectly. In order to rely on ECAPM to correct for this potential imperfection, the Board would need to be persuaded that the residual empirical shortcomings of CAPM, after using the long-term risk-free rate, are significant. The Board is of the view that the evidence presented in this proceeding did not enable the Board to make such a finding. As a result, the Board will not rely on ECAPM when using the ATWACC methodology.

The Board notes that both Dr. Vilbert and Dr. Booth have relied on the DCF model as a check on their results which are based on the methods discussed above. In the Board's view, even if the DCF model is intuitive and theoretically sound, challenges remain in its applicability since historical growth rates might not reflect the future and analyst expectations might be different than the aggregate expectations of all financial market participants. As a result of these challenges, the Board will not rely on the DCF model and will be informed by CAPM when estimating the cost of equity of sample companies using the ATWACC methodology.

In the Board's view, the cost of equity for utilities regulated on a book-value rate base is influenced by equity market fluctuations as well as bond market fluctuations. The Board finds that a model that successfully combines the two aspects would be useful to adequately consider the specific behaviour of a utility stock. The Board is of the view that a two-factor model offers a more intuitive approach to address the issue of interest rate sensitivity, but such a model is not sufficiently tested to be relied on in this proceeding. On the other hand, the Board was not persuaded that adjusted betas would adequately address the issue of interest rate sensitivity since that approach is an *ad hoc* rather than a systematic adjustment of an appropriate magnitude. The Board does not believe that TQM has demonstrated that utility betas ultimately revert to one, an assumption on which adjusted betas rely. When determining TQM's return, the Board will allow for interest rate sensitivity in the cost of equity estimates since, in the Board's view, the reliability of the estimates is improved with the recognition of the interest rate sensitivity of utility stocks.

Cost of Debt

The Board notes that the market cost of debt was assumed to be equal to the current yield on an index of utility bonds corresponding to each sample company's debt rating. In the Board's view, this assumption is reasonable given the considerable effort required to calculate the actual market cost of debt of each individual sample company. Accordingly, the Board accepts the estimated market cost of debt in the estimated ATWACC of sample companies.

Capital Structure

In the Board's view, one of the benefits of relying on an ATWACC approach is that it allows the Board to compare returns from different investment opportunities irrespective of financing decisions. This is consistent with the way decisions are usually made in the business world. ATWACC enables the comparison of returns while controlling for financial risk. As a result, the weights of the capital components used in calculating ATWACC should reflect the financial risk each of those components bear in a company's capital structure.

The Board notes that there have been two interpretations of financial risk presented in this proceeding:

- financial risk can be the variability of equity value resulting from the variability of the market price of a firm; or
- financial risk can be the variability of income to equity holders arising from the firm's fixed financing costs.

In the RH-4-2001 Decision, the Board expressed the view that financial risk is the risk inherent in a company's capital structure.[22] The Board was also of the view that financial risk increases as the proportion of debt increases in relation to shareholders' equity because debt interest and repayment obligations must be met irrespective of the overall profitability of the business. This definition is closer to the second interpretation of financial risk described above.

As explained in the *Cost of Equity Methods* Section in the Views of the Board above, the Board finds that the present value of the expected cash flows of a firm is an intuitive approach to estimate its current market value. However, the Board notes that markets have shown that the true model determining stock prices is more complex than the intuition implied by the present value of the expected cash flows. On balance, the Board is of the view that even though the present value of expected cash flows cannot determine the value of all firms in all circumstances, it is nonetheless a widely accepted principle in financial theory. This conclusion implies that the variability of future income, as expressed in the second interpretation of financial risk above, can be a reasonable representation of the market price of an asset. As a result, the Board concludes that the two interpretations of financial risk are consistent and the Board need not change its definition of financial risk which it expressed in RH-4-2001.

When drawing ATWACC information from sample companies, the Board is of the view that market-value weights should be used to emulate the

22 RH-4-2001 Reasons for Decision, *supra,* footnote 9, at p. 34.

actual financial risk which each capital component bears. In the Board's view, market values reflect the level of financial risk that equity holders bear for the sample companies. These market values, and ultimately the financial risk, are determined by aggregate expectations of all financial market participants. Furthermore, although the Board is conscious that trends in market valuation are not mitigated by using five-year averages, nonetheless, the Board finds that the reliance on a five-year average market-value capital structure mitigates the risk that a short-term anomaly in the share price of a sample company could unduly impact cost of capital estimations. In choosing to use market-value weights in determining the ATWACC of comparable companies, the Board is not concerned about the circularity that this could create since, in the Board's view, a firm's cost of capital, whether the firm is regulated or not, is determined by investors' expectations as observed in the financial markets.

The Market-Based ATWACC Methodology

In the Board's view, no methodology is a perfect means to implement an ATWACC approach; each methodology has benefits and shortcomings.

Based on the findings of this chapter, the Board has decided to rely on a market-based ATWACC methodology to interpret the information that can be extracted from different samples comparable to TQM and from the financial markets as a whole. The additional insights provided by the market-based ATWACC methodology concerning the workings of the financial market and their resulting impact on financial risk to equity holders significantly influenced the Board's determinations in this proceeding. CAPM will inform the Board's views on the market cost of equity. Further, this cost of equity and the after-tax market cost of debt, when combined with market-value capital structure, will produce the aggregate cost of capital for sample companies.

Chapter 5

Business Risk

The reliance on the ATWACC approach and the market-based ATWACC methodology requires a business risk assessment for two purposes. It is needed in order to identify firms with comparable risk, and to assess changes to TQM's risks since 1994. In these Reasons for Decision, the discussion of business risk has been divided into an assessment of supply risk, market risk, regulatory risk, competitive risk and operating risk. The various forms of risk are in some cases inextricably linked, and the boundaries between them are subjective. To avoid duplication, each concept is presented under only one form of risk, although the Board may have considered it under various forms.

5.1 Short-term vs. Long-term Risk

The concept of short-term versus long-term risk can assist in the presentation and analysis of business risks.

Submissions of TQM

To distinguish between the nature of various business risks, TQM characterized short-term risks as affecting year-to-year earnings of a pipeline or utility, and long-term risks as taking place over a period of time and causing permanent changes in the economic vulnerability of the regulated entity. TQM emphasized that these terms are not meant to distinguish between the time horizons, as long-term risks can still be realized in the short or medium time horizon and short-term risks can continue to be borne out in the longer time horizon. Dr. Carpenter, on behalf of TQM, suggested that Dr. Booth's characterization of short and long-term risks, outlined below, was consistent with TQM's.

TQM agreed with the view of its expert witness, Dr. Carpenter, that long-term risks should be given more weight when conducting comparative business risk analysis. Dr. Carpenter submitted that what distinguishes pipelines from other investments is their long-term sunk investment nature, and that short-term variability in the earnings of an equity investment is only a small part of the business risk picture. TQM also submitted that regulation can play a role in reducing short-term risk of earnings volatility but cannot ensure the long-term return on and of capital.

As an equity investor in a pipeline, TransCanada stated that its primary concern is the long-run return it expects to earn relative to the long-run risks it must bear. TransCanada suggested that this is quite a different perspective from bond holders who view differences in short-term earnings variability as a material difference. It emphasized that credit rating agencies are specifically concerned with the risks to bond holders. TransCanada acknowledged that a business with a higher risk from a debt holder's perspective would need to be compensated in the form of a higher return to avoid deterioration of credit quality.

Submissions of Intervenors

Like TQM, Dr. Booth distinguished between short-term and long-term business risks. Although he did not define these terms, he described several short-term risks caused by revenue and cost uncertainty, and submitted that the main long-term risks are bypass risk and capital recovery risk, with the latter driven mainly by the underlying supply and demand of the commodity. In Dr. Booth's submission, regulators have a variety of tools available to protect utilities from risks, and the history of regulation in Canada is that utilities are, in fact, protected specifically through the use of deferral accounts and rebalancing involved with the forward test year methodology. Dr. Booth provided the example of Pacific Northern Gas (PNG) to demonstrate the extent to which Canadian regulators protect utilities. In Dr. Booth's submission, PNG faces the most severe problems of any Canadian utility. Despite the British Columbia Utilities Commission's efforts to address PNG's situation, Dr. Booth suggested that a death spiral remains possible. He submitted that ultimately, there are limits to what a regulator can do, for example, if demand disappears.

In the opinion of Dr. Booth, investors do not always place a greater weight on either short or long-term risks; rather it is case specific. He also contended that the discounting process in security valuation reduces the amount of capital at risk in the future, which implies that if the risk is very far off, then it can effectively be ignored.

Dr. Booth expressed the view that equity and bond holders have very similar perspectives on long-term risk, although he suggested that bond holders take a more diligent long-term perspective. With respect to short-term risks, he suggested that bond investors generally look at cash flows and are more focused on fundamentals. He submitted that equity markets are influenced less by institutional investors, and that while equity markets are intrinsically long-term oriented, they react very violently to short-term swings in earnings. This is because they readjust their expectations about the future which is generally very difficult to predict. However, for utilities, Dr. Booth indicated that this is less true since low earnings caused by a factor such as weather shouldn't change expectations of the future.

Dr. Safir contended that Dr. Carpenter's distinction between short and long-term time horizons is inappropriate, since ultimately, risk realization over the long-term is just a culmination of yearly comparisons of actual and allowed returns.

5.2 Supply Risk

Supply risk is the risk that the physical availability of competitively priced natural gas volumes could affect TQM's income-earning capability.

Submissions of TQM

TQM indicated that its long-term business risk has increased, in part, due to an increase in its supply risk. As evidence, TQM indicated that WCSB supplies have declined since 2001 and that the projection is for a sustained production decline of conventional natural gas. Volatility in gas prices renders development of unconventional gas uncertain, further contributing to increased supply risk.

In TQM's view, the underlying natural gas market environment in North America has changed since 1994. In 1994, the WCSB was described as a prolific, low-cost supply basin with no significant supply risk. In this proceeding, the evidence of Dr. Carpenter indicated that the North American gas market now reflects greater supply and market uncertainty and that tighter supply/demand balances have led to substantially increased prices and price volatility.

In support of its position on gas supply, TQM submitted a Throughput Study prepared by TransCanada. This included an assessment of natural gas available to TQM via the TransCanada Mainline, which delivers gas produced in the WCSB. The study took into consideration both conventional and unconventional WCSB gas supply, potential Northern gas supply, the level of western Canada demand for natural gas, and possible imports of liquefied natural gas (LNG). The study investigated three cases: Base, Low and High to address the uncertainty with respect to gas supply.

TransCanada concluded that the WCSB is maturing and that production from conventional sources has already peaked. It submitted that this basin maturation and production decline is evident from the following factors:

- total productivity is declining;
- production decline rates for individual wells continue to increase;
- initial well productivity continues to decrease;
- the Reserves Life Index has remained constant while annual gas well connection rates have increased significantly from 2,700 in 1990 to 15,900 in 2007; and,
- finding and development costs continue to increase, making it difficult for industry to grow production.

All of these factors are contrary to the expectations of 1994, the time period with which this application must be compared.

For unconventional resources of CBM and tight gas, TransCanada submitted that most of the gas from those two sources was not considered to be economically viable, with current technology, within the forecast period. As for shale gas development, TransCanada's view was that while there is a possibility for such development, it is too early to estimate volumes. Shale gas in western Canada was projected by TransCanada to commence production in 2008 and to increase by a small amount to 2012.

Mackenzie gas flowing into Alberta was accounted for in TransCanada's projection, with a start date of 2014/15. No Alaska gas flowing into Alberta was accounted for in TransCanada's projection as that too was considered to be speculative at the time of filing.

During the proceeding, TransCanada acknowledged the possibility of gas resources being developed in Quebec, either from conventional or unconventional sources, and that its 2008 supply forecast would show a small volume of gas from Quebec sources due to recent developments in the province. However, TransCanada considered the volumes to be speculative and noted that there was no certainty that any Quebec volumes would even be connected to TQM, since they could connect directly to Gaz Métro.

The flow rates for supply from the various regions are provided in Table 5-1, while estimates of ultimate potential for the regions and gas types are shown in Table 5-2.

TQM/TransCanada provided evidence on its ability to access other gas supplies including gas delivered to TQM from Dawn in Ontario, LNG from Quebec facilities or imported gas from the New England region via PNGTS.

Dawn has access to gas from the Rockies, Mid-Continent, WCSB and Gulf Coast regions. However, gas from those sources, delivered through Dawn, would not be as cost effective as past WCSB supplies.

As to the possibility of LNG from Quebec, there is uncertainty as to whether facilities will be constructed, notwithstanding the fact that the Board approved a new receipt point at the proposed Gros Cacouna LNG terminal. The Rabaska project intended for LNG imports may or may not materialize. TransCanada stated that there is a risk that it will not be built, or if built, whether supply would be delivered on a regular basis. In its Throughput Study, TransCanada assumed, in its Base Case, that one LNG import facility in Quebec would start operations in 2012. In the

High Case, LNG capacity would be twice that of the Base Case, while the Low Case would have no LNG coming into Quebec.

For gas imports from the New England region to materialize, PNGTS would need to be physically reversed. Any imported volumes would depend on volumes of LNG imports into facilities in that region, or into facilities in Atlantic Canada, such as Canaport LNG Terminal (Canaport), which would be importing LNG for the purpose of supplying the New England region.

TransCanada concluded that the possibility of any sources of supply, other than from the WCSB, flowing on TQM is uncertain.

Submissions of Intervenors

No intervenors provided evidence contrary to the WCSB conventional and unconventional supply evidence provided by the Applicant. This includes the estimates of ultimate potential, the changed supply outlook, and the increasing costs for new supplies. With respect to WCSB gas supply, CAPP noted the rapid development of shale gas resources in northeast B.C. as proof that the basin has additional potential for new gas supplies that where not fully recognized by TransCanada. CAPP argued that TransCanada did everything possible to cast a negative view on shale gas in this hearing. Local Quebec shale gas and conventional gas should also be recognized as a potential supply source, although volumes are likely to be low.

CAPP focused on the role of Dawn in diversifying TQM's supply, the role of LNG imports into the region, PNGTS reversibility and the recent proposals to connect Alaska gas to the TransCanada Mainline in its argument over supply. CAPP questioned TQM on the amount of supply that it is currently getting from Dawn. Dawn, itself, can access conventional and unconventional gas from the WCSB, Rockies, Mid-Continent and Gulf Coast, including LNG supplies delivered into the Gulf Coast or Mexico. Reversal of flows on the PNGTS would allow TQM to access gas from U.S. supply basins and to access LNG delivered into the U.S. Northeast or into Atlantic Canada. CAPP, IGUA and Ontario all suggested that this diversification of supply has, in fact, decreased the overall supply risk for TQM.

On the issue of underlying changes to the North American gas market, Dr. Safir, on behalf of CAPP, disputed TQM's view that prices are more volatile and uncertain and specifically took issue with the appropriate measure of volatility. Dr. Safir stated that the best statistical measure of volatility is the coefficient of variation rather than the standard deviation method used by TQM.

TQM's Reply

TQM stated that access to non-WCSB supplies at Dawn provides some supply flexibility to TQM (as compared to the Mainline markets upstream of Dawn), but that comes at the cost of putting at risk the future application of the integrated Mainline concept for TQM's toll design and cost recovery. Increases in tolls to the TransCanada Mainline would impact tolls to shippers with delivery points off the TQM system as well. Declining throughput on the Mainline, resulting from the declining supplies from the WCSB, would result in increasing tolls on the Mainline. In addition, sourcing gas at Dawn could displace some of the long-haul throughput on the Mainline. This would increase tolls and hence, the delivered price of gas in Quebec, making gas less competitive in the markets served off the TQM system, including the PNGTS Extension. TQM noted that the TransCanada Mainline toll to the Eastern Zone has increased from 90 cents per GJ in May 1995 to $1.40 per GJ. TransCanada's view remained that the majority of gas sourced at Dawn would continue to be WCSB sourced gas. In addition, TQM argued that long-haul shippers on the Mainline would be dissatisfied in sharing the costs of the TQM system if suppliers to TQM are only using the Mainline downstream of Dawn and are only paying short haul tolls.

In response to Dr. Safir's concerns about the calculation of price volatility, Dr. Carpenter indicated that standard deviation is a measure of absolute price volatility which makes it more relevant than using the coefficient of variation which measures relative variation. Dr. Carpenter reasoned that it is absolute price risk that concerns customers.[23] He further asserted that utility hedging programs have grown during this decade and that this would be evidence that absolute price volatility is the relevant measure for end-use customers.

5.3 Market Risk

Market risk has two aspects: the business risk that results from the overall size of the market and the risk which results from the pipeline's ability to capture market share. The issue of market share, including the ability of natural gas delivered by TQM to compete in the Quebec market against alternative fuels and the ability of TQM, via its PNGTS extension,[24] to capture market share in the New England market will be discussed in Section 5.4, Competitive Risk.

Submissions of TQM

The position of TQM was that expected natural gas consumption growth in Quebec has failed to materialize, and in particular, losses in industrial loads since 1994 have resulted in significant uncertainty around the future use of TQM's assets to serve gas customers in Quebec.

TQM serves the Quebec market via Gaz Métro's local distribution system. Gaz Métro delivers 97 per cent of the gas volumes consumed in Quebec. TQM's evidence with respect to the Quebec market was based on Gaz Métro's historical usage and forecasts. Dr. Carpenter, on behalf of TQM, presented the historic, normalized natural gas usage per customer for several rate classes in Gaz Métro's market area, which showed a declining trend of utilization since 1994.

TQM has a relatively large resource-based industrial load which tends to be more variable and unpredictable than the residential and commercial sectors. TQM's evidence, based on Gaz Métro's historical usage, showed a decline in industrial customers and gas consumption since 1994. Electric power generation is a relatively new sector in Quebec, increasing the potential demand for natural gas. The Bécancour power generation station began operation in September

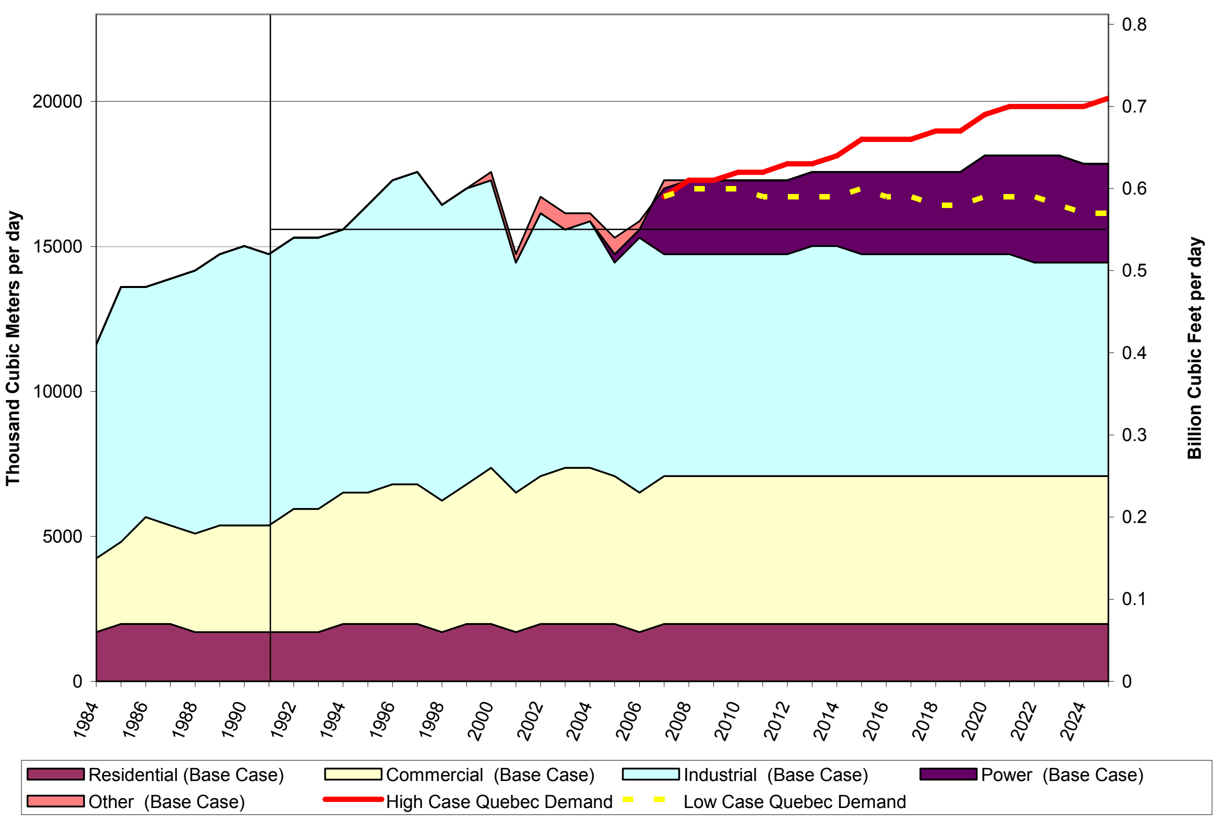
23 As an example, he asserts that a $1.50/Dth increase to an underlying $8/Dth price (yielding a cost of roughly 20 per cent) should not be considered less risky than a $.70/Dth increase to an underlying $2.20/Dth price (yielding a cost of roughly 30 per cent).

24 In 1997, the Board approved the construction and operation of additional natural gas transmission facilities to extend the TQM system from Lachenaie to East Hereford, near the Canada-United States border. This extension connected the TQM system to the PNGTS to serve markets in the U.S. Northeast. National Energy Board, GH-1-97 Reasons for Decision, Trans Québec & Maritimes Pipeline Inc. PNGTS Extension Facilities, April 1998.

2006 and was expected to make up for reduced demand in other industrial sectors since 1994. However, the Bécancour power generation plant suspended operation in 2008, making its future usage uncertain.

The Throughput Study offered three cases for Quebec gas demand. The Base Case showed 0.4 per cent annual average growth in Quebec demand, with relatively flat industrial demand at the lower end of its historical range. The High Case showed a one per cent annual average growth rate, and the Low Case showed a 0.2 per cent annual average decline rate. TransCanada did not forecast Quebec demand, by sector, for the High and Low Cases. Instead, overall Quebec demand was adjusted in the High and Low Cases to simulate a range of outcomes that TransCanada judged to be reasonable. Figure 5-1, below, shows TransCanada's forecast and historical natural gas use, by sector, in Quebec. Actual deliveries via TQM are a portion, albeit a considerable one, of the total Quebec demand.

Figure 5-1
Quebec Natural Gas Demand by Sector



Source: TQM Application

Submissions of Intervenors

In CAPP's opinion, there has been no change in TQM's market risk since 1994, and its position was supported by the evidence of Dr. Safir, Dr. Booth and IGUA. Dr. Safir stated that the demand for gas in Quebec has remained relatively stable since 1989 and TQM has actually been able to increase its deliveries and capacity utilization over the intervening years. Dr. Booth and Dr. Safir stated that they expected demand would not be significantly different in the future.

CAPP added that the risk from the large industrial load has not increased since 1994 and that the lack of market diversification and the volatile, resource-based large industrial load was previously identified as a risk by TQM in 1994. There has been little historical, and no forecast change in Quebec demand mix among the residential, commercial and industrial sectors. On behalf of CAPP and IGUA, Mr. Trahan stated that he believed that the Bécancour electric power generation plant would return to production in 2010.

CAPP maintained that if the 2025 throughput, as forecast in the Base Case at 12.75 10^6 m^3/d (0.45 Bcf/d), were reduced to remove power generation entirely and further reduced for any remaining PNGTS export flow, the throughput is comparable to the 1994 throughput at around 8.5 $10^6 m^3/d$ (0.30 Bcf/d) compared to 8.22 $10^6 m^3/d$ (0.29 Bcf/d) in 1994.

Industry restructuring since 1994 has helped Quebec industrials compete and to be better positioned to do so in the future, explained IGUA. It further suggested that prospects for industrial load growth are favourable but provided no supporting economic forecast. IGUA also noted that the Gaz Métro forecast was for higher industrial growth in the near term than the TransCanada forecast, at 4.17 per cent per year between 2008 and 2011.

TQM's Reply

TQM was of the opinion that although TQM's overall usage has not declined (distributed volumes have remained flat over the last 14 years), the evidence also shows that both Gaz Métro and TQM had to considerably increase investments in their systems to maintain the same level of throughput. TQM's capital investments have included the tunnel from Québec City to the south shore of the St. Lawrence River in 1995/96, the 2006 Lachenaie compressor station expansion in Quebec and the addition of Montréal East as a delivery point along the TQM PNGTS extension. Gaz Métro has increased investments in its system by 45 per cent to maintain and grow its market

TQM also noted that IGUA was unable to provide data in support of its position that industrial demand in Quebec will increase because plant closures and rationalizations have been completed and as a result demand could only go up.

TQM said that the Quebec Régie de l'énergie (Régie) found that since 1999, the risk to the Quebec gas market had increased. The Régie cited higher, more volatile gas prices, the impact of these prices on competition with other sources of energy, and concern over the loss of industrial volumes.

5.4 Competitive Risk

Competitive risk refers to the business risk resulting from competition for customers at both the supply and market ends of the pipeline system. It directly affects business risk by providing customers with alternatives to ship or purchase natural gas. In these Reasons for Decision, the issue of market share, which includes the ability of natural gas delivered by TQM to compete in the Quebec market against alternative fuels, and the issue of the ability of TQM, via its PNGTS extension, to capture market share in the New England market are discussed as part of competitive risk.

5.4.1 Alternative Fuels

Submissions of TQM

TQM submitted that over the long-term it will lose markets to competing fuels and to competing pipelines. TQM stated that the decline in natural gas usage in the Quebec market has been driven by a decline in the competitiveness of natural gas relative to electricity and fuel oil. It now has substantially greater risk that is unique to TQM. Industrials have decreased the size of operations in response to both macroeconomic conditions and fuel costs.

The declining competitiveness of natural gas in the Quebec market is in part driven by absolute price as well as by the stability of the price of electricity relative to the volatility in the natural gas price.

Gaz Métro estimated that approximately 90 per cent of its interruptible customers have the ability to switch to an alternate source of energy and the vast majority of these customers would switch to fuel oil, if it were economic to do so. At the end of 2007, Gaz Métro had 206 interruptible customers corresponding to annual consumption of 943.32 10^6m^3 (33.3 Bcf).

TQM stated that electricity has historically been priced lower than natural gas in the Quebec market. Furthermore, TQM submitted that electricity prices receive an effective subsidy as a result of provincial policy. The lack of competitiveness of natural gas is likely to continue, argued TQM, as Quebec residential electricity rates are forecast to remain stable and predictable with an approximate annual increase of two per cent, which is less than the current rate of inflation.

Submissions of Intervenors

Dr. Safir stated that there was no real indication that the relative attractiveness of natural gas will fall in the future. The projection of the relative price of natural gas to residual fuel oil, used in the Throughput Study is lower than historical levels over the past 12 years. Over the past few years, the relative price of electricity for residential consumers has increased. Furthermore, Dr. Safir stated that the historical disadvantage of natural gas compared to electricity is already factored into equity thickness awarded to TQM in RH-2-94.

In IGUA's opinion, the Throughput Study did not sufficiently factor in the migration to natural gas of some of the volumes that were lost to #6 Fuel Oil since early 2000. The past competitive disadvantage of natural gas to #6 Fuel Oil has been significantly reversed recently. In addition, the program from the Agence de l'efficacité énergétique will reduce barriers to more Quebec industrials choosing natural gas. During the hearing, IGUA said the Quebec Energy Strategy and the financial incentive from the Green Fund will encourage industrial customers to switch from oil products to natural gas. Mr. Trahan submitted that, while these programs will improve the competitive position of natural gas, natural gas is still at a disadvantage in Quebec to electricity but that gap would narrow because of those policies. Furthermore, IGUA argued since these programs and incentives did not exist in 1994, this aspect of TQM's market risk has actually declined. The Green Fund program is voluntary and the offer of subscribing to the program started in June 2008, and therefore, it was not possible to yet determine the level of participation.

IGUA explained that many industrials have separate thermal and electrical needs that are not interchangeable and that switching between natural gas and electricity is not possible. For some industrials, natural gas may be required for very specific applications that do not allow the use of alternative fuels. Electricity is not a direct competitor for industrial heating load needs. IGUA discussed how the magnitude of the costs to convert a plant from one fuel to another means that such investment decisions are not undertaken lightly; they are made based on a long-term analysis, not on any short-term volatility risk. Once a fuel decision is made and the capital invested at a particular location, the likelihood of reconfiguring a plant to a different fuel is unlikely. Furthermore, the Quebec government will limit the amount by which individual customers may convert energy sources to electricity service for existing operations. The new ceiling for an individual company will be set at 50 MW, down from the previous 175 MW.

The IGUA and CAPP witnesses discussed how, beyond 2008, the price of electricity in Quebec will rise as a consequence of the heritage supply now being capped, and the stated intent within Quebec of moving electricity consumers towards true cost pricing as a method of encouraging energy conservation. This will reduce the favoured pricing of electricity relative to natural gas in the future.

Ontario stated that a transformation is occurring within the Quebec electricity sector which will reduce the historic risk that natural gas faces when competing against electricity. Ontario also submitted that the overall level of risk TQM faces from electricity within the Quebec residential, commercial and industrial sectors has declined. Furthermore, the Quebec government's programs to reduce the reliance of industry on heavy fuel oil, and Gaz Métro's environmental initiatives, improve prospects for natural gas consumption and reduce TQM's risk.

TQM's Reply

Although recent environmental programs and policies instituted by the Quebec government favour cleaner energies such as natural gas, and may promote fuel switching from fuel oil to natural gas in the near term, it was TQM's view that such programs, over the medium to long-term, would encourage an overall switch from carbon-based fuels to electricity. Furthermore, it stated that hydroelectricity surpluses are expected to remain in Quebec, which is confirmed by the closure of the Bécancour power generation plant. TQM noted that gas consumers' annual contributions to the Green Fund were approximately $40 million, while electricity consumers were not required to make any contribution. Those contributions from gas consumers alone have caused an increase of two per cent in Gaz Métro's rates for 2008.

5.4.2 Market Competition and Export Risk for PNGTS

Treatment of PNGTS

Submissions of Intervenors

CAPP noted that neither TQM, nor TransCanada for its Mainline, requested a change in their capital structure when TQM applied to build the PNGTS extension. CAPP and Dr. Safir asserted that this makes TQM's argument that the PNGTS extension increased its risks unpersuasive, and implies that the real question is only whether the risks related to the PNGTS extension have materially increased since the application to construct the facilities was made.

TQM's Reply

Recent environmental programs and policies instituted by the Quebec government favour cleaner energies such as natural gas, and may promote fuel switching from fuel oil to natural gas in the near term. It was TQM's view that such programs, over the medium to long-term would encourage an overall switch from carbon-based fuels to electricity. TQM noted that at the time of the application for the PNGTS extension, it had not been very long since the release of the RH-2-94 Decision, and argued that the RH-2-94 Formula returns were considered more reasonable at that time than they are today. Dr. Carpenter argued that following Dr. Safir's logic would imply that regulators would never consider changed circumstances in evaluating a company's allowed return.

Market Competition and Export Risk for PNGTS

Submissions of TQM

TQM argued that the business risk associated with TQM's PNGTS extension is a function of the competition for export demand in the New England market that did not exist for TQM in 1994. This competition will increase following the completion of the Canaport in New Brunswick, and the completion of other LNG facilities, like Gateway LNG, and pipeline expansions into New England, which will likely take market share away from WCSB gas, delivered via the PNGTS extension.

Dr. Carpenter explained that TQM invested $317 million in the PNGTS extension which now represents 53 per cent of its undepreciated rate base. He further stated that increased competition for transportation volumes through TQM's East Hereford extension increased the risk that costs and return associated with those assets will not be recovered over life of the assets. The Throughput Study forecast declining throughputs, in all cases, on TQM to East Hereford as a result of Canaport imports that were expected to begin in late 2008. The range of uncertainty in these forecasts is demonstrated by the High and Low Case results that depend heavily on whether and when Quebec LNG imports might be connected to and flowing on TQM.

Submissions of Intervenors

CAPP expressed the view that rather than increasing TQM's business risk, the PNGTS extension has provided more and better markets for TQM. Dr. Safir stated that by expanding markets, TQM's risk is either the same as or lower than it was in 1994. Ontario shared this view. Dr. Safir argued that PNGTS was not operationally linked to TQM in 1994, and at that time, there were already risks that throughput levels on TQM could fall. TQM achieved growth beyond what was expected in 1994 and if throughput were to fall back to levels originally anticipated, TQM should not claim that it is in a more adverse position than when its original equity ratio was decided. CAPP argued that the PNGTS extension was presented as a "market opportunity" in 1997, and is now being presented as a "risk".

CAPP also noted that competition from Canaport via the Maritimes and Northeast Pipeline is not new; the risk in 1997 was the expected increase in production from offshore Sable Island. Presently, LNG deliveries at Canaport replace the production expected from Sable Offshore, and there is uncertainty with respect to Canaport volumes achieving levels expected by TransCanada in the Throughput Study. Cross-examination of TQM witnesses by CAPP, revealed the uncertainty in LNG imports to the U.S. Northeast, as existing new LNG facilities have not been utilized to date in 2008. Furthermore, the TQM witnesses discussed the price disparity between low North American gas prices and high LNG prices elsewhere in the Atlantic Basin and Japan.

The number of proposed projects presently coming into service or proposed to serve the U.S. Northeast also did not appear to CAPP to represent an increase in risk to PNGTS. CAPP believed that the availability of Canadian supply for export is the cause of the risk, not competition from other pipes. The High Flow Case of the Throughput Study showed less impact on PNGTS. TransCanada analysed all North American gas flows for its Throughput Study; competition from other projects was not identified as a risk factor in the Northeast market, only LNG deliveries from Canaport.

Finally, CAPP argued that PNGTS was built on 20-year contracts which give high incentive for shippers to use those contracts, and TransCanada, itself, continues to tell the market that PNGTS is among the paths to attractive U.S. markets.

Ontario submitted that the potential volume from Canaport is very small, relative to the New England market it was designed to serve, and therefore, does not increase TQM's risk. Ontario submitted that uncertainty about long-term LNG supplies also stems from the uncertainty of long-term LNG supply contracts for the U.S. LNG terminals.

TQM's Reply

TQM submitted that the overall throughput of TQM remains at 1994 levels only because of the combined demand in the Quebec market and the export market via the PNGTS extension. Furthermore, counsel for TQM argued that Gaz Métro wrote off more than 20 per cent of its investment in the PNGTS pipeline in 2008, which points to a significant change of the circumstances in which PNGTS operates, and to increasing uncertainty with regard to the recovery of the funds initially invested in that system.

TQM explained in reply evidence and in response to information requests, that when the PNGTS extension was being considered, the study completed by TransCanada focused only on natural gas demand in the U.S. Northeast and did not address gas production from Nova Scotia offshore. TQM further explained that, its focus at that time was on finding markets for excess gas supplies from the WCSB, and a forecast of stronger demand growth in the U.S. Northeast.[25] Since that time, the forecasts for WCSB production and western Canadian demand have changed substantially, resulting in lower exports from that region, thereby deteriorating the expectations for stable throughput on the PNGTS extension.

With respect to the risk to PNGTS from LNG imports, Dr. Carpenter responded by stating that the LNG projects that will be competitors for TQM are either completed or under construction, while the projects that would supply TQM are still in the initial development stages or have been suspended.

5.5 Operating Risk

Operating risk is the risk to the income-earning capability that arises from technical and operational factors.

Submissions of TQM

The only submission by TQM on the issue of operating risk was in response to information requests regarding the reversibility of the PNGTS extension. TQM submitted that past evaluations of the reversal of the system found that it was physically capable of back-hauling volumes, and that under certain unusual or emergency conditions it would be possible to back-haul some volumes without any facility modifications. However, TQM stressed that these assessments had not been detailed to the point of examining potential restrictions, such as governmental, regulatory or physical, which might be particularly important in non-emergency type scenarios.

Submissions of Intervenors

CAPP submitted that while TQM remains a single line system, it now has compression which is a new feature compared with 1994. In this regard, CAPP noted that TQM is operated by TransCanada, an experienced operator of compression. CAPP suggested that counteracting these factors is the new operational security from the existence of the PNGTS extension and its potential reversibility. CAPP did not submit a view on whether there has been a net change in TQM's operating risks.

5.6 Regulatory Risk

Regulatory risk is the risk to the income-earning capability of the assets that arises due to the method of regulation of the company.

25 When TQM applied for leave to build the PNGTS extension in 1997, it was expected that this investment would address the lack of market diversification for TQM and the forecasts expected an average annual growth rate of 2.7 per cent in Quebec natural gas demand and 1.0 to 1.7 per cent for the New England market. (See GH-1-97 Reasons for Decision, *supra*, footnote 24, at p.5.)

Treatment as part of the integrated TransCanada Mainline

Submissions of TQM

Since it began operating, the TQM system has been treated as a part of the integrated TransCanada Mainline. The contract underpinning this arrangement, whereby TransCanada holds virtually all of TQM's capacity, commenced in 1982. TQM submitted that this contract has been amended several times since, with the current principal expiration date in 2013, having been agreed to as an extension in 1998 due to the construction of the PNGTS extension. In addition to the principal volumes under contract until 2013, some are also under contract until 2017 and 2018. Individual shippers, rather than contracting directly with TQM, contract with TransCanada for deliveries to points off the TQM system. At present, over 99 per cent of TQM's revenue requirement is recovered from TransCanada in the form of 12 monthly payments, and TransCanada includes these payments in its revenue requirement as a Transmission by Others cost.

Dr. Carpenter presented evidence indicating that the contracts held by shippers on the TransCanada integrated Mainline with delivery points off the TQM system had a weighted average remaining contract duration of 3.2 years as of 15 November 2007. He noted the 2013 expiry of the principal volumes in the contract underpinning the integrated Mainline, and contended that the divergence between the 3.2 years duration and the 2013 expiry introduces uncertainty for the future of the integrated Mainline concept. Dr. Carpenter also submitted that the circumstances at the time when TQM's tolls were first set as part of the integrated Mainline, notably regulated gas commodity prices and the federal government's desire to promote the development of a gas market in Quebec, were much different than today. Another important difference in Dr. Carpenter's view is that unlike in 1994, WCSB supply is no longer growing, nor is there insufficient pipeline capacity out of the basin.

If decontracting were to occur for deliveries either to East Hereford or the domestic Quebec market, TQM argued that TransCanada could face pressure to change the toll design of the Mainline and to remove some or all of the capacity it currently holds on the TQM system from the integrated Mainline. Both Dr. Carpenter and TQM noted that there have been challenges to the integrated Mainline concept. TQM suggested that a variety of future changed circumstances could give rise to additional challenges to the integrated Mainline concept, such as, if volumes decline on the TQM system, if tolls rise on the TransCanada Mainline, or if TQM deliveries are increasingly sourced at Dawn.

If TQM were to be treated on a standalone basis rather than as part of the integrated Mainline, TQM submitted that this would result in higher tolls for deliveries off of TQM, thereby harming the competiveness of the TQM system. TQM submitted a range of potential toll impacts based on varying assumptions.

Submissions of Intervenors

In the submission of Dr. Booth, because of the contract TransCanada holds for TQM's capacity, TQM is protected from revenue fluctuations due to variances in throughput as well as from shipper-credit problems. CAPP cited the RH-2-94 Reasons for Decision in stating that the arrangement "dilutes TQM's high unit cost and provides the Company with a high degree of assurance that its costs will be recovered."[26] CAPP argued that the NEB has been clear and consistent in its treatment of TQM as part of the integrated Mainline, and that the Board recently reaffirmed this treatment in the RH-1-2007 Reasons for Decision, which CAPP argued should quieten the debate. CAPP was of the view that the risk of the NEB disallowing this arrangement remains low and has not increased.[27] CAPP also alluded to the potential that in the future, TQM could have high volumes relative to the Mainline, for example as a result of Quebec LNG, such that TQM would benefit from ending the current integrated Mainline concept.

By virtue of TQM's contract with TransCanada, IGUA argued that TQM has been insulated from the impacts Gaz Métro experienced from industrial load losses, and continues to benefit from full assurance of cost recovery. IGUA also argued that this arrangement, which is not at risk of changing, is the biggest reason why TQM's overall risks have changed little since 1994, and until the arrangement changes it remains the overriding consideration for business risk, particularly for 2007-2008.

Ontario argued that it is inconsistent for TQM to suggest that TQM's financial health should be examined on a standalone basis, without influence of its parents, while also suggesting that the Board should consider the contracts held on TransCanada to TQM delivery points rather than only the contracts held on TQM itself. Ontario encouraged the Board to only look at the latter.

Competition between pipelines

Submissions of TQM

In TQM's submission, the 1998 approval of the Alliance Pipeline Ltd. (Alliance) pipeline[28] marked a significant change in Canadian regulatory policy, towards greater competition between pipelines. TQM argued that this increased its risks because of the impact on its access to WCSB gas supplies, the impact on Mainline tolls and hence Quebec delivered gas price, and because it increased the chance that it may face greater competition from other pipelines in the future.

Submissions of Intervenors

Ontario argued that TQM's reliance on the WCSB has ended, because its gas is being increasingly sourced at Dawn. With regard to the approval of Alliance, Ontario argued that it had no impact on TQM's risks.

Other aspects of year-to-year revenue and income risk

Submissions of TQM

TQM submitted that its 2007-2009 Partial Settlement has all the same deferral accounts as its previous settlements, and that these will cover only approximately 20 per cent of its cost of

26 RH-2-94 Reasons for Decision, *supra,* footnote 2, at p. 26.

27 National Energy Board, RH-1-2007 Reasons for Decision, TransCanada PipeLines Limited Gros Cacouna Receipt Point Application, July, 2007.

28 National Energy Board, GH-3-97 Reasons for Decision, Alliance Pipeline Ltd. on behalf of the Alliance Pipeline Limited Partnership Facilities and Tolls, November 1998.

service. TQM noted that it is at risk for in-year variations in depreciation and return, its term loan financial charges, and its fixed cost envelope. With respect to its term loan financial charges, TQM submitted that it had been lucky in the past to have benefitted from the risk, since it is based on the difference between the actual prime interest rates and those forecast by major banks.

With respect to assessing a pipeline's risks based on a comparison of actual and allowed earnings, TQM submitted that such a comparison is not appropriate since it reflects past rather than future circumstances and puts too much emphasis on short-term risks. TQM contended that historical comparisons of actual versus achieved earnings are of limited use in assessing a pipeline's forward-looking business risk, emphasizing that the predictive capability of such information would be dependant on the future earnings drivers being the same as past drivers. With regard to the circumstances which impact its business risk, TQM submitted that it had demonstrated that the future is not similar to the past. In noting that actual ROEs use accounting data, Dr. Carpenter suggested that that they often reflect extraordinary one-time events. TQM argued that accounting data returns are not the relevant measure of returns in assessing TQM's cost of capital; rather, a relevant measure would be TQM's achieved market returns on its unknown market value of equity.

Submissions of Intervenors

CAPP noted that TQM's actual ROE has exceeded its allowed ROE in every year since 1994, and Drs. Safir and Booth and IGUA noted the same going back further, to 1990.

In Dr. Safir's submission, equity investors in regulated companies are informed by variations in actual earnings relative to allowed earnings because they provide information about the level of regulatory risk and hence, possible changes in the valuation of the company. A history of earning allowed returns with little variation is, in his opinion, a strong indication of the effectiveness of regulation and low regulatory risk.

Going back to 1994, Dr. Safir suggested that there has not been any substantive change in the regulatory risk facing TQM, and in his view, TQM's regulatory-sanctioned revenue protections shield it from potential effects of competition. Dr. Safir submitted that by virtue of its recovering nearly all its revenues from TransCanada, TQM is provided with a high degree of assurance of cost recovery and is shielded from throughput fluctuations. According to Dr. Safir, the best evidence of TQM's effective revenue protections is its historical financial performance, and he submitted that between 1990 and 2007, TQM's actual ROE, minus its allowed ROE, was positive at a highly statistically significant level. Dr. Booth also contended that TQM earning above its allowed ROE in every year shows that TQM's risks are not material.

Views of the Board

Short-term vs. Long-term Risk

The Board accepts that it is useful to distinguish between the nature of risks in a manner as TQM and Dr. Booth have done, even if such distinctions may not be precise.

On the question of the appropriate weights for short versus long-term risks, the Board is of the view that because of the more limited ability of regulators to respond to the realization of long-term risks, there is a sense, in this aspect, that they are more important than short-term risks. Long-term risks are more structural. Therefore, they denote more fundamental factors and trends in the evolution of the overall risk landscape of a company, while short-term risks tend to be either more cyclical or individual events. However, the Board notes that generally, the relative importance of short versus long-term risks would depend on the relative probability, size and timing of the potential impacts arising from the specific risks being realized. The Board is of the view that, in practice, a plausible set of circumstances could result in either short or long-term risks weighing more heavily in the risk profile of a specific pipeline. Therefore, the Board finds that it must consider both long-term and short-term risks and weigh them based on the circumstances applicable to the pipeline.

Supply Risk

The Board is of the view that reasonable reliance can be placed on the range of conventional supply estimates as presented by TransCanada and that significant increases in WCSB conventional supply are unlikely. As a result, the Board finds that over the longer term, maintaining flows on the Mainline will depend, in part, on the development of unconventional or Northern supply. That dependence is greater today than was anticipated in 1994.

Unconventional supply, including CBM and shale gas, is more uncertain given their early stages of development. Although unconventional supply is expected to at least partially offset future declines in conventional production from the WCSB, the extent to which it will and when this may occur remains uncertain.

Similarly, gas from the Mackenzie Delta and Alaska may act to offset future declines in WCSB conventional production. Although TransCanada has included Mackenzie Delta gas in its Throughput Study, it is not clear when, or if, this gas will flow, and, if it does, the extent to which it would flow on the Mainline. It also remains unclear as to when, or if, Alaskan gas will flow and, if it does, the extent to which it would flow on the Mainline.

The Board notes that the import of LNG into Quebec is a possibility; indeed it has already approved a receipt point on TQM for the proposed Gros Cacouna regasification facility. Another proposal for a regasification facility, the Rabaska project near Quebec City, already has some approvals in place. The Board agrees with the Applicant that future LNG supply is uncertain, due to the need to confirm supply, finance construction, seek regulatory approvals and construct pipelines to connect the proposed facilities to the TQM system.

On the issue of access to other gas supplies, the Board recognizes that TQM does have access to Dawn, which provides a mitigating factor for physical supply to TQM. TQM acknowledges that about 20 per cent of its gas supply comes from purchases from Dawn. Today, the supply of gas at Dawn is primarily sourced from western Canada. There was discussion by TQM witnesses regarding growing production areas that could supply Dawn. However, these witnesses explained that growing Dawn supplies will impact tolls on the Mainline for long- haul shippers of gas from the WCSB. Ultimately, the Board agrees with the view that, in these circumstances, the higher tolls would be passed on to the markets that are served off of the TQM system, further impacting the competitiveness of gas in the markets that TQM is serving.

In addition, the Board notes that while PNGTS is capable of flow reversal, which would deliver gas into TQM, there are issues involved. For this to occur there would have to be a fundamental change in market and price conditions. The Quebec market would require higher prices than the New England market, and that higher price would likely create an increased market and competitive risk. The Board places little weight on the concept that a potential reversal of PNGTS represents a reduced business risk for TQM.

The Board notes the significant change in the supply picture for the WCSB between 1994 and present day. In 1994, the WCSB was seen as a growing source of low cost natural gas and likely to remain so for some time into the future. Therefore, at that time, it was not considered that Canadian pipelines faced significant supply risks. However, in 2008, conventional production from the WCSB has passed its peak and unconventional supplies remain uncertain. At the time of the hearing, gas prices were significantly higher than in 1994, while the costs to develop new supply had also increased. As a result, industry is challenged to develop new economic supplies of conventional gas resources. Both CBM and unconventional gas in the WCSB remain speculative. For Northern gas, development remains uncertain. For LNG, development of facilities and expected levels of imports into Canada remain unclear at this time.

The Board views the economic supply as a crucial change that has occurred for the TQM system and the Quebec market.[29] Absolute gas price levels are higher, and declining conventional supplies from the

29 The RH-2-2004 Phase II Reasons for Decision, *supra,* footnote 8, at p.27, defines supply risk as the physical availability of natural gas. Also note that the NEB estimates and the CGPC estimates of Canadian resources consist of volumes of marketable gas assumed to be economic under existing and expected future conditions. TransCanada relied upon the CPGC estimates for Canada, which it calls economic.

WCSB have made this source of supply more uncertain than in 1994. Therefore, the Board concludes that the supply risk for TQM is higher than it was in 1994.

Market Risk

The Board notes that Quebec natural gas demand is relatively unchanged since 1994. TQM has a relatively large industrial load which has tended to be more variable and unpredictable than the residential and commercial sectors, as was the case in 1994. Further, the introduction of the Bécancour power generation plant has not made up for the losses in other industrial sectors; its future usage is uncertain. The Board is not persuaded by CAPP's argument that TQM's risk from the large industrial load has not increased since 1994.

IGUA did not provide quantitative support for its view that industrial customers will be better able to compete in the future. Although Gaz Métro, itself, had a more favourable short-term forecast of industrial growth than TQM, the Board finds that this evidence is not determinative of the long-term market risks facing TQM.

In light of the uncertainty of the Quebec industrial and electric power generation sectors demand for natural gas, the Board finds that the TQM pipeline is exposed to increased market risk compared to its position in 1994.

Alternative Fuels

Discussion of the distribution of electricity blocks to industrials and the nature of industrial fuel switching capabilities, provided by IGUA, was useful in enhancing an understanding of the landscape of energy demand in the province of Quebec. In particular the interaction between natural gas and electricity was most useful. The discussion of the Quebec Energy Strategy was also very helpful in understanding government policy impacts on energy demand in the province. It appears the program is too new to assess the actual impact on industrial gas demand.

The Board notes the declining competitiveness of natural gas in the Quebec market. This is, in part, driven by absolute price as well as by the stability of the price of electricity relative to the volatility in the natural gas price. Furthermore, on the residential side, the Board is of the view that this lack of competitiveness is likely to continue. Quebec residential electricity rates are forecast to remain stable and predictable with an approximate annual increase of two per cent.

The Board accepts TQM's arguments that the high industrial load as compared to total system load and the declining competitive position of natural gas compared to alternative fuels are significant risks to the TQM system and these risks have increased since 1994. This was reflected in TQM’s and Gaz Métro’s customer data which showed a decline of about 50 per cent in interruptible customer consumption.

PNGTS

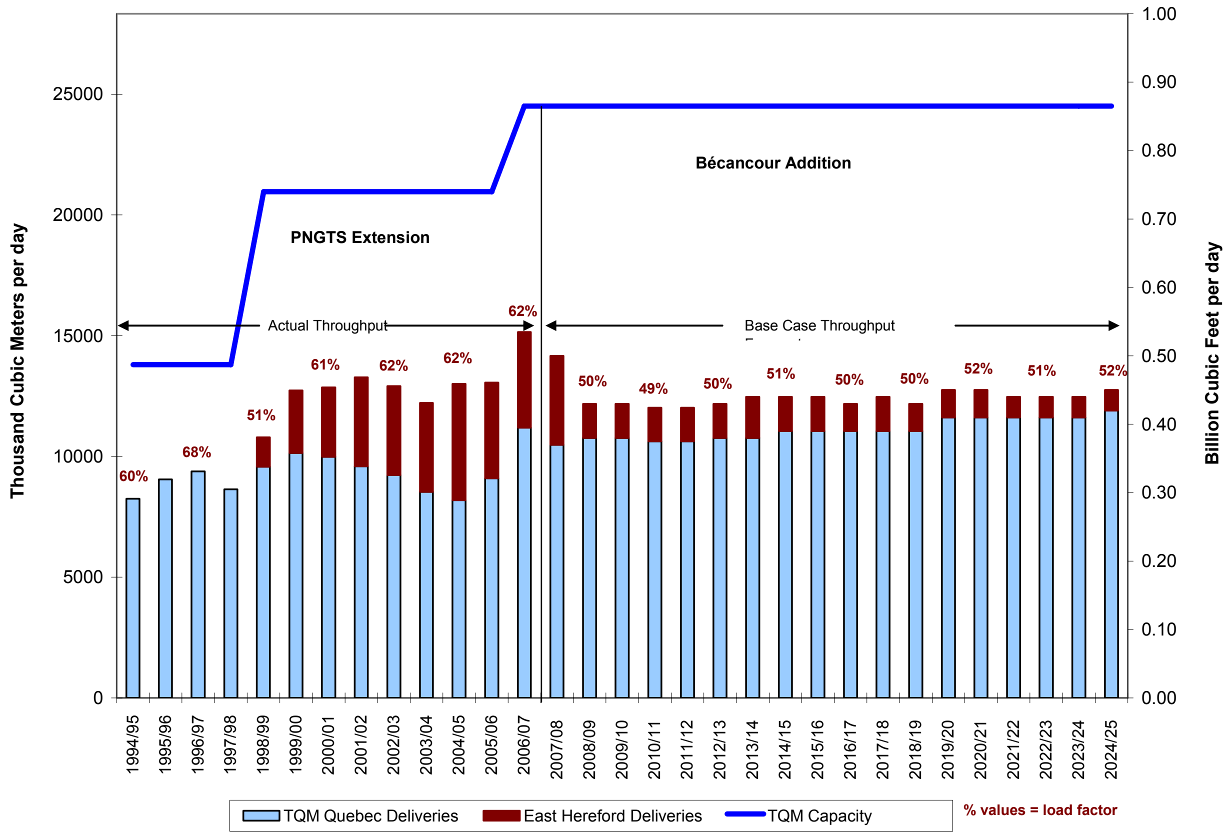
The Board is not persuaded that TQM, by not asking for an increase in its allowed return in 1997, accepted that the market circumstances related to the PNGTS extension did not increase the business risk of the TQM system as a whole. In the Board’s view, a pipeline company should not have to come forward with an application every time that it perceives a change in its risk. Rather a pipeline company can exercise discretion in deciding when to come forward to the Board, knowing that it has no recourse to be retroactively compensated for past changes in risk.

In assessing changes to TQM's business risk, the Board is using TQM's risk at the time of the RH-2-94 proceeding as the point of comparison, which was the last time that the Board fully evaluated it. Consequently, the risk of the PNGTS extension, whether higher or lower than the rest of the TQM system, is treated as a new consideration.

The Board notes that in constructing the PNGTS extension, TQM made a significant investment. The Board is of the view that as time has unfolded, the supply and market situation related to the extension has changed and the risks have increased.

The total gas volume delivered on TQM has grown from 8.22 $10^6m^3/d$ (0.29 Bcf/d) in 1993/94 to 15.01 $10^6m^3/d$ (0.53 Bcf/d) in 2006/07, but the Board does not view TQM’s market to be the same as it was in 1994. A significant portion of the gas deliveries are volumes exported through the PNGTS extension (see Figure 5-2). Capacity of the TQM pipeline system has grown from 13.88 $10^6m^3/d$ (0.49 Bcf/d) in 1993/94 to 24.56 $10^6m^3/d$ (0.867 Bcf/d) in 2006/07, leading to a utilization rate that has increased from 60 per cent to 62 per cent over the same time period (see Figure 5-2). However, it is not expected that TQM will maintain this level of utilization into the future due to competition in the U.S. Northeast.

Figure 5-2
TQM Base Case Domestic and Export Volumes



Source: TQM Application

The Board finds that the Canaport and other U.S. Northeast LNG facilities represent increased competitive risk to PNGTS. The future of LNG imports into the U.S. Northeast has an element of uncertainty due to global competition. However, significant infrastructure related to LNG imports, including an expansion of the M&NE pipeline to deliver gas from Canaport into the U.S. Northeast, is in place or under construction and these facilities represent a competitive alternative to PNGTS in delivering gas into the U.S. Northeast.

Throughput

The Board also finds that the Throughput Study generally supports the case that business risk has increased. The Board is not persuaded by CAPP's view that the appropriate conclusion to be drawn from the study is that risk has not increased because the forecast throughput remains unchanged from 1994. The Board's view is that significant capital costs have been incurred by the Applicant to facilitate the projected throughput and that when this is taken into account the Throughput Study tends to support an increased risk.

Operating Risk

The Board is of the view that there was insufficient evidence provided to conclude that there has been a change in the operating risk faced by TQM.

Regulatory Risk

The Board finds that TQM continues to benefit from its treatment as part of the integrated Mainline. In the Board's view, the risks related to TQM's costs continuing to be recovered principally through their inclusion as "Transportation by Others" on the TransCanada Mainline are the same as in 1994.

The Board is not persuaded by TQM's argument that its business risks have increased because of what TQM characterized as a change in regulatory policy toward more competition between pipelines. The Board is of the same view as expressed in the RH-4-2001 Reasons for Decision when it first examined the Mainline's risks following approval of the Alliance project. At page 27 of the RH-4-2001 Decision, the Board stated that:

> [T]here is nothing to suggest that the Board will alter its approach of considering significant changes to the regulatory framework only on the basis of a comprehensive, balanced and prospective examination of all relevant factors. Although the regulatory regime has permitted increased competition, there has been no indication that it has increased the possibility that prudently incurred costs will not be recovered.

The Board notes TQM's record of earning slightly above its allowed ROE in every year since 1990. The Board finds this history informative but not determinative for evaluating TQM's future risk of experiencing year-to-year earnings fluctuations. It is informative given that TQM indicated that its past deferral coverage was similar to its current coverage, and because TQM continues to be treated as part of the integrated Mainline. Conversely, TQM, for example, may not continue to benefit from its term loan financial charges risk. Overall, the Board finds that TQM's risks related to year-to-year earnings fluctuations are low, and have not appreciably changed.

Conclusion

The Board concludes that TQM's overall business risk has increased relative to 1994, as a result of increased market, supply and competitive risks.

Chapter 6

Interpreting the Return Information from Selected Samples

The selection of companies comparable to TQM is required to draw information that will ultimately be used to determine TQM's cost of capital. The return information, which is drawn from the comparable companies, can be categorized into two groups. The returns of the first group can be referred to as *regulatory* returns, meaning that they are returns allowed or earned on the book value of a regulated asset. This is distinct from the second group, whose returns can be characterized as *financial market* returns, since the return evidence in this group relates to how the stock price of a particular company fluctuates in response to company-specific events as well as events that affect the market as a whole. Investors' expectations are generally recognized to be the main driver of these fluctuations.

The evidence which falls into the first group is detailed in Section 6.2. It includes submissions on the regulatory returns of Canadian pipelines, and some other utilities, as determined by either litigation or negotiation. It also includes TQM experts' submissions on the regulatory returns of U.S. pipelines and local distribution companies (LDCs). Section 6.3 then describes the financial market return submissions related to three samples submitted by TQM experts, and to Dr. Booth's judgements regarding regulated utilities in Canada. The three samples submitted by TQM experts were comprised of Canadian utilities, U.S. Gas LDCs, and U.S. Master Limited Partnerships (MLPs) that own and operate natural gas pipelines (MLP pipelines).

Before addressing these two groups, Section 6.1 presents the submissions which address the relevance of comparisons with U.S. returns. This is a central question to determining the weight to be placed on U.S. returns, which are contained in both groups. Section 6.4 provides the views of the Board on all matters in this chapter.

6.1 Relevance of Comparisons with U.S. Returns

TQM's application relied in large part on U.S. comparisons. This resulted from TQM's submissions regarding both the globalization of capital markets and the similarities between the U.S. and Canadian pipeline and LDC industries. These two topics are addressed in Sections 6.1.1 and 6.1.2, respectively. The reliance on U.S. comparison is also based on TQM's views that Canadian returns suffer from circularity problems and that the companies in Dr. Vilbert's Canadian utilities sample are not pure plays in the natural gas pipeline industry, as will be discussed in Sections 6.2.1 and 6.3.1, respectively.

6.1.1 Integration of Canadian and U.S. Capital Markets

Submissions of TQM

Mr. Murphy, one of TQM's expert witnesses, argued that financial market deregulation supported the free flow of investment capital between countries, capital markets and investment opportunities with the result that comparable financial assets are increasingly priced similarly in different countries. The determination of a fair return is no longer a Canadian market issue; it is becoming a North American and global issue. As a result, Canadian companies like TQM now compete with companies and projects throughout the world for capital.

TQM indicated that the increased integration of capital markets is evidenced by: significant purchase of foreign equities by Canadian investors, including pension funds; the changes in federal tax policies such as the elimination of the foreign property rule in 2005 and the elimination of the withholding tax for cross-border interest payments with the U.S.; and the significant Canadian securities issues outside of Canada with a particular focus on the U.S. TQM also submitted that the increase in cross-border merger and acquisition activities and the increased correlation of global market returns were other evidence of the globalization of financial markets.

In Dr. Vilbert's view, the return available to investors in Canadian utilities must increasingly be comparable to the returns available to investors in comparable risk entities in capital markets worldwide. Accordingly, TQM argued that the Board needs to acknowledge globalization and rely on evidence from the U.S. to determine TQM's cost of capital.

Submissions of Intervenors

According to Spectra and Union, recent market developments made clear the close linkage amongst North American and global markets, and Canada is no exception.

In terms of market integration, Dr. Booth submitted that currencies are freely convertible, investment restrictions have been removed and there has been an increase in the coverage of international stocks among investment advisors. These changes have been mirrored in Canada's international investment position.

According to Dr. Booth, there has been increasing international investment both in and out of Canada since 1990 but the trend since 1990 has been for the U.S. to lose its share of outward Canadian investment. For inward investment, the U.S. remains by far the dominant investor in Canadian stocks and foreign direct investment. Dr. Booth gave evidence that Canadian investors have diversified away significantly from their reliance on the U.S. that was typical in 1990, such that if an external yardstick is relevant today, it is no longer the U.S.

Dr. Booth expressed the view that Canadian markets will always be partially segmented from world markets in general and the U.S. market in particular. The result is a so-called "home bias" where residents of all countries have a disproportionate amount of their wealth invested in their domestic market and look to foreign securities to fill holes in their portfolios. In this context, Canadians are not likely to buy utility or pipeline stocks in foreign markets because the Canadian market has several first tier stocks of these types. Dr. Booth offered the opinion that there is almost no impact of international diversification trends for the utility and pipeline sector's fair ROE except for the tendency for the overall market risk premium to decline.

IGUA argued that the Canadian and U.S. economies and fiscal policies are not the same. In IGUA's submission, the differences have been recently evidenced by the Canadian economy and banking system being less vulnerable in the current credit crisis, as compared with the U.S.

6.1.2 Canadian and U.S. Regulatory Environment

An important question for all comparisons with U.S. pipeline and LDC investments is the extent to which the regulatory environment impacts risk differently in the two countries.

Submissions of TQM

Dr. Carpenter and Mr. Murphy both submitted that U.S. and Canadian transmission pipeline regulation is characterized more by its similarities than differences, and that overall the business risks for pipelines are similar in the two jurisdictions.

In Dr. Carpenter's opinion, the differences between Canadian and U.S. pipeline business risks due to regulation are generally short-term in nature, whereas regulation in the two jurisdictions has fundamentally the same design with regard to factors impacting what he argued were the more important long-term risks. With respect to the latter, Dr. Carpenter contended that unlike the rest of the world, the Canadian and U.S. regimes establish tolls based on the same historical cost rate base and cost of service approach, including a fair return. As additional evidence of similarities, Dr. Carpenter referred to both jurisdictions' use of the contract carrier model, and suggested that both U.S. and Canadian regulators have been actively promoting increased competition between pipelines which increases long-term risk on both sides of the border. Dr. Carpenter also submitted that the typical Canadian regulatory flow-through approach to income taxes results in greater long-term capital recovery risks since the taxes collected as a pipeline ages are typically higher, compared to the normalized approach employed in the U.S.

With respect to short-term risks facing pipelines, Dr. Carpenter indicated that unlike in the U.S. where deferral accounts are typically not used and where toll cases are relatively infrequent, pipelines in Canada generally benefit from annual determinations of their cost of service and have deferral accounts to adjust between forecast and actual revenues and costs in between rate cases. As a result, in his view U.S. pipelines can have more variable year-to-year returns. Dr. Carpenter also contended that there were aspects of U.S. regulation which cause lower short-term risks. He suggested that U.S. pipelines have greater flexibility in charging discounted and negotiated rates which in turn allow them to better respond to increased competition or risk of bypass. Overall, Dr. Carpenter concluded that considering these factors together, in general, U.S. pipelines have greater short-term risks than their Canadian counterparts covered by the RH-2-94 Formula.

Dr. Carpenter also submitted that although the Federal Energy Regulatory Commission (FERC) has accepted settlements in which pipelines shared some costs related to capacity non-renewal, discounting to meet competition, and one-time costs resulting from transition to competition, this is not the FERC's policy. He argued that such settlements are relatively few in number and that ultimately the FERC still allows for the recovery of such costs as they fall in the realm of prudently incurred costs. He submitted that the FERC has explicitly stated that it addresses risk-sharing proposals on a case-by-case basis.

Regarding Dr. Carpenter's evidence comparing the risk exposure of Canadian and U.S. pipelines, Mr. Murphy indicated that it was consistent with his experience as an investment banker. Mr. Murphy observed that pipeline investors view the business risks in Canada and the U.S. as similar. In his view, the regulatory systems are similar, although he too noted many of the same differences submitted by Dr. Carpenter. He also contended that the NEB and FERC have similar policy objectives related to gas pipelines, that capacity charges are common in both countries such that even in the U.S. throughput has limited impact on revenues, and that construction cost incentives are common in both countries and their impact may be counter-cyclical. Additionally, in Mr. Murphy's opinion, TQM specifically, and Canadian pipelines generally, compete directly with U.S. pipelines for load, in what is appropriately characterized as a North American energy market. Mr. Murphy also highlighted his view that on both sides of the border, pipeline investments share the same fundamental long-term, inflexible and capital intensive nature, and are similarly subject to gas supply and competition risks.

Overall, Mr. Murphy was of the opinion that U.S. pipelines may bear higher short-term risks, but that any difference is small given that the duration and amount of additional risk is not significant. He argued that ultimately U.S. pipelines still have the right to return to the FERC with a rate filing if they are not earning their allowed ROE.

Specifically with respect to LDCs, Dr. Carpenter and Mr. Murphy submitted that overall, they tend to be lower risk than transmission pipelines. This is mainly because LDCs are not exposed to as much competition, due to their franchised territories and their mainly residential and commercial customer base which is not at risk of bypass. According to Dr. Carpenter, the FERC found in its 2006 Kern River decision that LDCs are of lower risk than interstate pipelines, and granted a 50 bps upward adjustment to the median ROE from the LDC companies.

In Mr. Murphy's opinion, U.S. LDCs and Canadian pipelines have similar risks because U.S. LDCs recover 100 per cent of their natural gas supply costs, and because their rate designs are increasingly decoupling revenues from volumes. Mr. Murphy also contended that compared with Canadian pipelines, U.S. LDCs have lower supply risk because they source gas supply from multiple pipelines and basins, whereas transmission pipelines are very reliant on a single basin, as is TQM on the WCSB.

Submissions of Intervenors

The CGA argued that while utilities in Canada and the U.S. are not identical, neither are utilities in different provinces identical to federally regulated Canadian utilities. With regard to many of the risks alluded to by CAPP, the CGA argued that they pre-date 1994.

In Dr. Safir's view, there are significant differences between Canadian and U.S. pipeline regulation, and overall Canadian pipelines face considerably less business risk. Dr. Safir was of the opinion that while pipeline regulation in the two countries was almost identical 30 years ago, some fundamental differences have since emerged due to actions taken by regulators, particularly the FERC. Dr. Safir suggested that the FERC has increasingly promoted a more competitive market-driven natural gas pipeline market, and that a key difference today is that rate cases have become infrequent and unnecessary. He took the position that today's U.S. approach is in contrast to the Canadian practice of setting tolls to recover all prudently incurred costs, with the protection of balancing or deferral accounts, and using frequent toll adjustments to keep earnings in line with allowed levels. While U.S. rate hearings can still be requested by either the pipeline or its customers, and can be initiated by the FERC, Dr. Safir submitted that the emphasis has been on negotiated settlements.

In instances when pipeline rate hearings do occur, Dr. Safir contended that the FERC makes few provisions for deferral or balancing accounts, leaving U.S. pipelines at greater risk for annual return variations. In Dr. Safir's submission, as part of the FERC's push towards greater market signals, it has made it clear that revenue shortfalls resulting from uncontracted capacity have to be shared by the pipeline. He noted that with this has come the ability for pipelines to negotiate for shares of the upside, when revenues are increased due to higher throughput. CAPP argued that volumetric risk is simply a part of the FERC model.

In Dr. Safir's opinion, the U.S. practice of very infrequent rate hearings means that U.S. pipelines are exposed to a high probability that significant differences will emerge between allowed and achieved earnings. Additionally, he submitted that earnings variability results from the prevalence of discounted and negotiated rates in the U.S. Dr. Safir put forward an analysis comparing the difference between actual and allowed ROEs for Canadian and U.S. pipeline companies. The results, in his submission, showed a tighter distribution of actual minus allowed earnings for Canadian pipelines, exactly as one would expect if Canadian regulation results in lower business risks than the U.S. equivalent.

Dr. Safir also suggested that additional differences are perceived by the market between U.S. and Canadian pipeline risks, citing as an example the move away from the merchant gas function for pipelines in both countries. He observed that this restructuring process resulted in real losses for U.S. pipelines, unlike their Canadian counterparts.

With respect to U.S. LDCs, Dr. Safir submitted that they are subject to a range of different state regulations, none of which provide the degree of protection afforded to NEB regulated pipelines. He provided another analysis comparing actual ROEs minus allowed ROEs of Canadian pipelines, in this case, to those of U.S. LDCs. Dr. Safir was of the opinion that the lower variability of the Canadian pipelines demonstrated that U.S. LDCs would not be a very good comparator group for TQM. He also suggested that since 1994, the risks faced by U.S. LDCs have come down to some extent, because of some regulatory changes.

Regarding the FERC's view of LDC risks, Dr. Safir contended that the FERC had determined that LDCs are not appropriate comparators for U.S. pipelines. In support of this, he submitted the same FERC Kern River decision cited by Dr. Carpenter, but he reached a different conclusion on the matter.[30] Dr. Booth was of the opinion that LDCs in general, not just in the U.S., are higher risk than pipelines.

---

30 The following excerpts from the FERC decision discuss the issue in question (FERC OPINION NO. 486, issued October 19, 2006):

> 2. … The median return of our revised proxy group is 10.7 percent. In addition, because this proxy group is small and includes companies with a relatively low proportion of pipeline business and substantial distribution operations, we approve a 50 basis point adjustment above the median to 11.2 percent. This accounts for differences in risk between Kern River and the proxy group companies. [emphasis added]
>
> 171. … We will therefore permit an adjustment above the median of the range to account for differences in risk between the pipeline and proxy group companies whose LDC operations account for a greater proportion of their business than previously occurred under our traditional policy.
>
> 172. The evidence in this case is undisputed that the risk profile of LDCs is different from the risk profile of typical interstate pipelines. No party disagrees that LDCs face lower risks due to the nature of their operations. As Kern River's witness testified, LDCs enjoy a natural service monopoly, with relatively low demand elasticity, price sensitivity and throughput risks. The franchise structure of an LDC results in lower overall business risk and lower investor expectations. In contrast, gas pipelines are one level removed from the end-use markets served by LDCs and retail utilities and enjoy no such service monopoly or territorial franchise [footnote removed].

CAPP argued that the U.S. regulatory approach is anything but safe for a utility, noting some utility bankruptcies which have occurred. CAPP noted Dr. Kolbe's past articles and text books which discuss U.S. regulatory risks, particularly related to the restructuring to end the merchant gas function for pipelines and the Duquesne instance of cost disallowance in a partial nuclear plant build.[31] CAPP also argued that comments that were made by Moody's Investor Services (Moody's) about the supportive nature of Canadian regulation and the Canadian business environment demonstrate the lower regulatory risks in Canada.

Another factor which CAPP argued lowers Canadian pipeline risks is the NEB approach to pre-approving projects before investments are made. CAPP argued that the Duquesne partial nuclear build, where costs were not ultimately allowed to be recovered, demonstrates the benefit of the NEB approach, and that today, significant efforts by U.S. project proponents are dedicated in the early phases towards avoiding eventual cost disallowances similar to those experienced by Duquesne Light Co.

With regard to U.S. LDCs, CAPP questioned why TransCanada Corporation had different views in front of the FERC regarding the comparability of pipeline and LDC returns, as compared with what was submitted to the NEB by TQM with TransCanada's support. CAPP argued that there are some fundamental parameters of regulation that are not the same across regulators, arguing that for example there is no uniform approach to rate base at the state level in the U.S. According to CAPP Counsel, when looking at a number of state decisions, one sees strange tradeoffs, for example where utilities make significant concessions in order to gain regulatory acceptance of proposals. Finally, CAPP argued that there is an ongoing debate regarding decoupling mechanisms, about such issues as whether they in fact reduce risk and what exactly is or is not a decoupling mechanism.

Overall, CAPP suggested that the significant differences between the U.S. and Canadian regulatory systems imply that U.S. pipelines and LDCs are poor comparators for TQM, with Dr. Safir emphasizing any comparison would have to be on a risk adjusted basis.

In the opinion of Ontario, U.S. pipelines are not appropriate comparators for Canadian pipelines because of significant regulatory differences, and because U.S. pipelines face higher financial liability risks.

IGUA submitted that U.S. LDCs and pipelines operate within a very different regulatory framework, implying very different regulatory risks. IGUA also argued that the U.S. and Canadian economies and fiscal policies are different.

TQM's Reply

In Dr. Carpenter's submission, the effects of the four FERC Orders, which Dr. Safir argued had substantially changed U.S. natural gas pipeline regulation, were primarily to end the merchant

31 "The Duquesne instance" refers to the case where Duquesne Light Co. cancelled plans to build nuclear power plants, and then sought regulatory approval to recover the capital it had already invested. The Pennsylvania Public Utility Commission approved the amortization of the cancelled plants, but the state legislature passed a law which the effect of disallowing the recovery of those costs. The case was ultimately decided by the U.S. Supreme Court Decision in *Duquesne Light Co. v. Barasch,* 488 U.S. 299 (1989), and the costs in question were not allowed to be recovered by Duquesne Light Co.

gas function of pipelines. Dr. Carpenter noted that similar changes occurred in Canada, and additionally that all four FERC orders pre-dated 1994 which he argued meant that they would not explain any change in relative Canadian and U.S. risks since 1994. With respect to the differences in the frequency of rate hearings and use of deferral accounts cited by Dr. Safir, Dr. Carpenter put forward that they were consistent with his own evidence related to higher U.S. short-term risks.

As discussed in Section 5.6, Dr. Carpenter also argued that Dr. Safir's comparison of actual ROEs minus allowed ROEs was flawed both conceptually and at a computational level.

With regard to the losses experienced by U.S. pipelines as a result of the restructuring process to end pipelines' merchant function, and the nuclear build cost disallowances discussed, Mr. Murphy suggested that these were two of the most difficult periods in the history of the U.S. utility industry and were one-time events. He contended that such events are not reflective of how things normally unfold. TQM suggested that subsequent electricity deregulation efforts may have been evidence of regulators having learned from the gas merchant pipeline restructuring.

On the question of Moody's view of the supportive nature of Canadian regulation, TQM acknowledged that the Canadian regulatory environment is viewed as very supportive by both Standard & Poor’s (S&P) and Moody's. However, as discussed in Section 5.1, TransCanada suggested that rating agencies have a very different perspective than equity holders.

Mr. Murphy submitted that regardless of the legal question of whether or not a utility needs prior pre-approval to build a project, as with NEB regulated pipelines, in reality plenty of work is done in advance of any build such that it is a collaborative process where regulators and outside stakeholders are generally involved at an early phase. TQM emphasized that the important question is not the legal requirements, but what an investor can reasonably expect in terms of the practical risks.

With regard to TransCanada Corporation's submission to the FERC regarding the appropriate composition of a proxy group for pipelines, TransCanada submitted that the context of the FERC's inquiry was that it had been using a proxy group composed primarily of LDCs during a period of time where a growing number of MLPs were forming with concentrated interstate pipeline holdings. In that context, TransCanada suggested that TransCanada Corporation's position was that the MLPs represented a better alternative. With regard to TransCanada Corporation's expressed concern regarding the circularity of LDC returns, TransCanada stated that the concern is only of a closed system, such as a regulator looking only at its own rulings.

Regarding the question of whether rate base is treated in a consistent manner across states, Mr. Engen, on behalf of TQM, submitted the debate had been regarding whether rate base should be calculated on a fair market- or book-value basis, but that the debate had been put to bed in favour of the book-value approach.

6.2 Regulatory Return Evidence

6.2.1 Canadian Negotiated Returns

Submissions of TQM

TQM submitted that total returns derived from negotiated settlements should be used as part of a comparative analysis. TQM recommended making these comparisons on an aggregate rather than individual basis, since individual settlements contain tradeoffs that are unknown to those not involved in the negotiating process, tradeoffs which may result in returns above or below what would have otherwise been agreed to. Looking at settlements in aggregate, in TQM's submission, provides a directional indication of market expectations for acceptable returns, and avoids the risk that any one settlement might be providing returns that are reflective of very particular unknown circumstances or tradeoffs. In response to information requests and hearing questions, TQM also submitted that settlements may result in an exchange of value which may be over and above that available under traditional cost of service regulation, and that parties may agree to increased returns without a commensurate increase in risk.

TQM suggested that the Board should give greater weight to Canadian pipeline returns derived from settlements than to NEB-adjudicated returns to avoid circularity in approving returns, but cautioned that even settled returns may be below market levels because they are negotiated against the backdrop of the below-market-level RH-2-94 Formula.

On these grounds, TQM submitted evidence on the returns derived from a number of NEB-regulated pipeline settlements. Notably, all of the Canadian pipelines which TQM submitted as comparables had their returns determined in part or wholly by settlements. TQM suggested that the returns determined wholly by settlements consistently yielded returns in excess of those provided by the RH-2-94 Formula. TQM submitted that it could not describe the tradeoffs made in any of the individual settlements since it had not been party to the negotiations. However, TQM provided a comparative business risk analysis for the subject pipelines, and concluded that all of them had business risks that were similar to or lower than TQM's. To support this finding with respect to the oil pipelines in its comparator groups, TQM suggested a number of factors, explained further in Section 6.3.1.1, that should lead the Board to no longer hold the view that oil pipelines are riskier than gas pipelines, a view it articulated as recently as the RH-2-2004, Phase II Decision.[32]

Submissions of Intervenors

The CGA argued that settlements can be informative at the aggregate level, and that the Board can exercise its judgement in assessing the relative risks at that aggregate level.

In CAPP's view, the higher returns observed in negotiated settlements are a result of pipelines moving away from the traditional cost of service model and being rewarded for creating additional value or benefits for toll payers. CAPP emphasized that settlements are package deals and involve tradeoffs, and noted that the Board has recognized this in the past. A further point advanced by CAPP was that settlements are negotiated in confidence and typically expressly

32 RH-2-2004, Phase II Reasons for Decision, *supra*, footnote 8, at p. 7.

state that parties agree that a settlement is without prejudice and is not to be used as precedent. As a signatory to the settlements cited by TQM, CAPP argued that it is unfair that it had a limited ability to respond.

CAPP's position was that the Board would have to be very cautious in putting any weight on the information from settlements, and that a better approach would be to give them no weight. If the Board were to instead put weight on Canadian settlement evidence, CAPP put forward that there could be a chilling effect on future settlements.

Dr. Safir submitted that negotiated returns are determined through a different process than litigated returns. In his view, settlements do not have to reflect any of the same factors looked at by regulators, and that parties can trade off other factors against a negotiated return. He suggested that parties to settlements work cooperatively to enhance the benefits and values for all, which could influence agreed-to returns.

IGUA recommended that the Board give no weight to settlement returns. IGUA argued that it is not possible to identify the tradeoffs made in arriving at a final outcome, and noted that the Board accepts or rejects any settlement as a package. In IGUA's view, it would be inappropriate to, after the fact, isolate the return component. IGUA also warned that doing so would have a chilling effect on future settlement prospects.

Ontario argued that settlements contain unknown tradeoffs, and so the Board should not consider settlement returns.

6.2.2 Canadian Litigated Returns

Submissions of TQM

TQM argued that Canadian provincial regulators appear to follow the NEB's lead in setting returns and using ROE formulas. In TQM's view, this makes Canadian comparisons of limited relevance if not circular. TQM excluded from its comparisons a number of Canadian pipelines and utilities on the basis that their returns were set by either the NEB or provincial ROE formulas and thus suffered from circularity.

Submissions of Intervenors

CAPP submitted that the ROE formulas across Canada were not adopted in a mechanical way, and noted that there have been many hearings involved both with establishing and reviewing the formulas. According to CAPP, in each hearing there was a full and fair consideration of the evidence.

Dr. Booth noted that the NEB was not the first regulator to adopt an ROE formula. He suggested that while there is a degree of circularity in looking at returns awarded by other regulators, each regulator has heard different evidence from different experts, at various times, and ultimately reached its own conclusions. He advised that the awards of other regulators are appropriately used as a reasonableness check.

Evidence put forward by Dr. Booth compared the allowed returns for various Canadian pipelines and utilities, including from Quebec, Ontario, Alberta, and British Columbia. Dr. Booth recommended that TQM's equity ratio be increased to 32 per cent because he argued that the EUB had increased the "floor" for utility equity thickness to 32-33 per cent.

6.2.3 Litigated U.S. Returns

Submissions of TQM

Dr. Carpenter submitted a comparison between the allowed returns of TQM and those allowed to U.S. interstate pipelines and LDCs in litigated proceedings. As noted previously, in Dr. Carpenter's opinion, achieved-earnings data are fundamentally flawed because they rely on accounting data and are based on past, not future circumstances. In his comparison of allowed returns, Dr. Carpenter submitted two alternative measures of allowed returns: (i) ROE alone; and (ii) an ATWACC return that results from the allowed ROE and capital structure combined with an assumed after-tax cost of debt for all companies in all years of 3.75 per cent.

In Dr. Carpenter's view, the current gap between the allowed returns of TQM and the U.S. comparables is not justified by differences in risk, and since 1994 there has been an unjustified divergence between the allowed ROE of TQM and the U.S. comparables. TQM argued that this divergence is not justified by any changes in relative business risks.

Mr. Murphy also provided litigated allowed returns data for both U.S. interstate pipelines and LDCs. For transmission pipelines, he submitted that his sample showed that U.S. allowed ROEs and equity thickness were both higher. In the case of LDCs, Mr. Murphy divided them into two groups depending on whether their rates featured what he referred to as revenue decoupling or weather normalization, respectively. He submitted that both groups had allowed ROEs significantly above the current RH-2-94 level.

Submissions of Intervenors

The CGA also argued that since 1994 a gap has grown between U.S. and Canadian allowed returns for utilities, a gap not justified by any changes in relative business risks.

CAPP, IGUA and Ontario all took the position that the higher U.S. allowed returns are appropriate based on their higher risks. These views are discussed in Section 6.1.2, under the heading *Canadian and U.S. regulatory environment*.

With respect to Dr. Carpenter's analysis of the allowed returns of U.S. interstate pipelines, Dr. Safir suggested that there were too few data points to conclude that there has been a systematic increase in the difference between TQM's allowed returns and the average allowed to the interstate pipelines.

6.3 Financial Market Returns Evidence

The following Section is a description of the three samples submitted by Dr. Vilbert as well as Dr. Booth's submission, Section 6.3.2 addresses the potential that the computed costs of capital might be affected by unregulated business activities.

6.3.1 Description of Samples

Table 6-1 summarizes the information drawn from the samples presented in evidence that were used by TQM and CAPP to derive their respective recommendation as to what return TQM should be allowed. The table partly reflects the following techniques which the Board determined it would rely upon in Chapter 4.

- The costs of equity (Lines 1 to 5), as derived by CAPM, rely on unadjusted betas and the respective risk-free rate and market risk premium suggested by Dr. Vilbert and Dr. Booth.
- Lines 1 to 3 rely on the market-value capital structure, market cost of debt (ranging from 5.4 per cent to 5.9 per cent) and assume the presence of preferred shares, if any, in the capital structure of the sample companies.
- Line 4 uses the same parameters as Line 1 except it uses Dr. Booth's cost of equity estimate.
- Line 5 is Dr. Booth's recommendation based on his assessment of TQM's business risk and TQM's weighted average of embedded cost of debt of 6.07 per cent for 2008, at 32 per cent equity thickness.

Table 6-1
Cost of Capital Derived from Expert Witness Evidence

Source	Description	Cost of Equity (Per cent)	Equity Thickness (Per cent)	ATWACC (Per cent)
TQM Evidence (Dr. Vilbert)	1. Canadian utilities	7.4*	51	5.7*
	2. Gas LDC	9.2	60	7.0
	3. MLP Pipelines	7.4	68	6.3
CAPP's Evidence (Dr. Booth)	4. Dr. Booth recommendation under a market-based ATWACC methodology	7.75	51	5.9*
	5. Dr. Booth recommendation	7.75	32	5.3*

* As computed by the Board

Submissions of TQM

Dr. Vilbert submitted that there is no ideal sample of publicly traded pure play Canadian natural gas transmission companies available. He submitted evidence for three samples: the Canadian utilities sample, the Gas LDC sample and the MLP pipelines sample. In determining the cost of equity of the sample companies, Dr. Vilbert used a risk-free rate of 5.0 per cent, which includes a

20 basis point maturity premium. This estimate was based on the Consensus Forecast issue of August 2007. Dr. Vilbert also used a market risk premium of 5.75 per cent based on his estimate of the long-term risk-free rate and current information on the historical market risk premium.

6.3.1.1 Canadian Utilities

Submissions of TQM

Dr. Vilbert submitted that the goal of his Canadian utilities sample is to represent companies whose primary business is as a regulated utility in Canada with business risk generally similar to that of TQM. Dr. Vilbert started with the universe of Canadian companies classified as being in the utility industry or in the oil and gas storage and transportation industry in the FPinfomart database. Companies were eliminated by Dr. Vilbert that were not listed in the FP500 Sales category on FPinfomart. This step eliminated a number of smaller companies that do not trade on the Toronto Stock Exchange. Dr. Vilbert subsequently applied additional selection criteria design to narrow the sample to companies with characteristics similar to that of TQM. The final sample resulted in the following five companies: Canadian Utilities, Enbridge Inc., TransCanada Corp., Emera Inc. and Fortis Inc. Despite the selection criteria used, Dr. Vilbert noted that several of these companies have non-regulated activities and assets, and have recently been engaged in acquisition activities. As indicated by Dr. Kolbe, the Canadian utilities sample is smaller than in the RH-2-2004, Phase II proceeding and small samples have larger measurement errors. For these reasons, Dr. Vilbert was of the view that additional samples were necessary to provide a more reliable estimate of TQM's cost of capital.

One issue of particular relevance to the Canadian utilities sample is that it contains Enbridge Inc., which has significant interests in oil pipelines. TQM noted that the Board has in the past regarded oil pipelines as having higher risk than gas pipelines, but submitted that a number of changes have caused the risks faced by oil and gas pipelines to become more similar, and that TQM's business risks are now comparable to those of Enbridge Pipelines Inc. (Enbridge). TQM submitted that new oil pipelines and expansions of existing oil pipelines are increasingly being underpinned by long-term contracts while the contract lengths on gas pipelines including TQM have been declining, such that the traditional differences in risk caused by the contract versus common carriage distinction have been diminished. TQM also submitted that Enbridge and Trans Mountain Pipe Line Company Ltd. (Trans Mountain) were traditionally exposed to greater earnings variations than is the case under their current settlement-based toll methodologies. In response to the Board's statement in RH-2-2004, Phase II regarding the "operational complexities arising from the multiproduct nature" of oil pipelines,[33] TQM submitted that in its view both Enbridge and Trans Mountain have tariff protections against costs related to such complexities. Finally, TQM submitted that there has been a divergence in the supply outlook for oil and gas, such that gas pipelines now face greater supply risk than oil pipelines. Mr. Engen submitted that the financial markets distinguish between oil and gas pipelines based primarily on supply risk, and hence now view oil pipelines as being less risky overall than gas pipelines.

33 RH-2-2004, Phase II Reasons for Decision, *supra*, footnote 8, at p. 68.

Submissions of Intervenors

In Ontario's submission, the circumstances which led the Board to view oil pipelines as riskier than gas pipelines in the RH-2-2004, Phase II Reasons for Decision remain unchanged. Namely, Ontario was of the view that: despite TQM's declining contract length, gas pipelines have long-term contracts, whereas oil pipelines remain common carriers supported only by monthly nominations; oil pipelines are exposed to operational risks because of their multi-product mix, and Enbridge's history of protection against these risks does not guarantee the same going forward; and oil pipelines operate under settlements which were negotiated with different financial parameters. Therefore, Ontario submitted that oil pipelines are intrinsically higher risk than, and inappropriate comparators for, gas pipelines.

6.3.1.2 Gas LDC

Submissions of TQM

Unlike the Canadian utilities sample, Dr. Vilbert stated that all companies in the Gas LDC sample have operations concentrated in the natural gas industry. In selecting the Gas LDC sample, Dr. Vilbert started with the universe of publicly traded natural gas distribution utilities covered by *Value Line Investment Survey Plus Edition*. Vectren Corporation was added to the initial group because, as Dr. Vilbert mentioned, it is often viewed as a natural Gas LDC. Companies with unique circumstances which may bias the cost of capital estimates were eliminated and Dr. Vilbert submitted a final sample comprising the following ten companies with the fewest reliability concerns: AGL Resources Inc., Atmos Energy Corp., The Laclede Group, New Jersey Resources, Northwest Natural Gas, Piedmont Natural Gas, South Jersey Industries, Southwest Gas Corp., Vectren Corp., and WGL Holdings Inc. Dr. Vilbert also considered a sub-sample with the fewest reliability concerns. All companies from this sample were from the U.S.

Dr. Carpenter submitted an assessment of the companies in Dr. Vilbert's LDC sample. He argued that they were relatively pure play LDCs, as described further below, and concluded based on their individual characteristics that their long-term risks were lower than TQM's. He submitted that TQM had lower short-term risks, though all the sample LDCs had weather normalization mechanisms and all but one had additional rate mechanisms to partially protect them from revenue loss related to certain volumes. Overall, Dr. Carpenter argued that the long-term risk differences outweighed the short-term differences, such that TQM's overall risk was higher than the companies in Dr. Vilbert's Gas LDC sample.

6.3.1.3 MLP Pipelines

Submissions of TQM

The MLP pipelines sample was selected by Dr. Vilbert by searching Dividend Detective and the Publicly Traded Partnerships website. Dr. Vilbert retained companies owning pipelines and having investment grade bond ratings. Companies with significant mergers and acquisition activities and having experienced distribution cuts were subsequently eliminated by Dr. Vilbert. The MLP pipelines sample was comprised of the remaining six companies: Boardwalk Pipeline Partners, Kinder Morgan Energy Partners, TC Pipelines, Oneok Partners, Enbridge Energy Partners and Enterprise Products Partners; none of these strictly being oil companies. According to Dr. Vilbert, the MLP pipelines sample is the closest to a pure play natural gas pipeline sample currently available, and the universe of MLP pipeline companies is growing. Dr. Vilbert noted that MLPs in this sample operate on a national scale in the U.S. with pipelines crossing many states. Dr. Vilbert was of the view that cost of capital estimates from this sample are conservative because of the difficulty of estimating the market value of the General Partner (GP) share of the equity.

6.3.1.4 Dr. Booth's Estimate

Submissions of Intervenors

Dr. Booth did not rely on a specific sample of comparables to derive his cost of equity recommendation. Dr. Booth relied on the historical performance and behaviour of major utility holding companies and pure play utilities in Canada. Dr. Booth also relied on TSX/S&P Composite sub-indexes of Gas/Electric, Telco, Pipes and Utilities. Based on his professional judgment, a CAPM estimation and a two-factor model, Dr. Booth expressed the view that a "typical regulated utility" should be allowed an ROE of 7.75 per cent.

In estimating the cost of equity with CAPM, Dr. Booth used a risk-free rate of 4.75 per cent based on the Consensus Economics forecast and the 30-10 year spread. Dr. Booth also relied on a 5.0 per cent market risk premium based on the influence of earlier data, the recent unexpected performance of the bond market and a reduction in the risk on the bond market compared to a few years ago. Dr. Booth's cost of equity estimate includes a 50 basis point allowance for floatation costs.

6.3.2 Unregulated Activities in Market Data from Selected Samples

To the extent that the companies in the selected samples are engaged in both regulated and unregulated business activities, in addition to comparing the risks of their regulated activities with TQM's, it is also important to determine if and the extent to which their unregulated business activities could be expected to influence the estimated costs of capital.

Submissions of TQM

Dr. Carpenter submitted evidence on the degree of unregulated business activities of the companies in Dr. Vilbert's LDC sample, as well as for some of the MLPs in Dr. Vilbert's MLP pipelines sample, based on measures of both earning and asset shares. Dr. Carpenter judged the LDC sample to be a relatively "pure play" LDC sample based on two factors. First, he submitted that for 2006 the sample LDC companies each earned between 50 and 99 per cent of their net income from regulated gas distribution, transportation and storage services, and had 66 to 100 per cent of their assets committed to these regulated activities. Second, in Dr. Carpenter's opinion, his evidence showed that for the most part, the competitive transportation and storage services were insignificant parts of the companies' overall activities. Dr. Carpenter's evidence suggested that the non-regulated activities varied in nature, ranging for example, from natural gas marketing to power plant ownership.

With respect to Dr. Vilbert's MLP pipelines sample, Dr. Carpenter examined the business activities of the three MLPs that in his view were the most heavily involved in interstate natural gas transmission and storage, namely Boardwalk Pipeline Partners, LP; Oneok Partners LP; and TransCanada Pipelines, LP. Based on his evidence for up to five recent years, these MLPs earned between 59.2 and 100 per cent of their net revenues from interstate natural gas transmission and storage, while 80 to 100 per cent of their plant, property and equipment was invested in these same activities.

Dr. Vilbert attempted to control for the potential impact of unregulated activities in his cost of capital estimations by selecting sample companies with the highest levels of regulated assets. He suggested that non-regulated activities are in general expected to be somewhat higher risk than regulated activities, but argued that risk measures and estimated cost of capital may not reflect this expectation, for example because of estimation errors. He indicated that he does not know how large an adjustment, if any, should be made on the basis of sample companies' unregulated activities. Dr. Kolbe also suggested that a factor which could offset any potential bias in estimated costs of capital from the presence of unregulated business activities is that in cases where the unregulated businesses are experiencing difficulties, their measured cost of capital will tend to underestimate their true cost of capital.

In Dr. Vander Weide's submission, there are no adequate measures to delineate regulated from unregulated activities, mainly because of distortions in accounting measures and limited availability, in practice, of information which is fully segregated between regulated and unregulated activities. He also argued that unregulated activities are not necessarily higher risk than a low risk pipeline.

In response to a CAPP IR, TQM provided a Dominion Bond Rating Service (DBRS) report describing its utilities ratings methodology. In a section titled "Non-Regulated Activities", DBRS stated:

> given the higher business risk inherent in non-regulated activities, companies with larger exposures to non-regulated activities would be expected to have lower financial risk (i.e., lower balance sheet leverage and higher fixed charges coverage ratios) as a compensating factor in order to have a comparable credit rating.[34]

Similar methodology reports from the other major bond rating agencies were less explicit on this point.

Views of the Board

Integration of Canadian and U.S. Capital Markets

In the Board’s view, global financial markets have evolved significantly since 1994. Canada has witnessed increased flows of capital and implemented tax policy changes that facilitate these flows. As a result, the

34 DBRS Rating Approaches -- Rating Utilities (Electric, Pipelines & Gas Distribution) at p. 2.

Board is of the view that Canadian firms are increasingly competing for capital on a global basis. The Board notes that Canada has been diversifying its business partners such that there is currently proportionally less Canadian foreign direct investment in the United States than there was in the 1990's. Nonetheless, the evidence is also clear that the United States is the single most important recipient of Canadian investments.

A fair return on capital should, among other things, be comparable to the return available from the application of the invested capital to other enterprises of like risk and permit incremental capital to be attracted to the regulated company on reasonable terms and conditions. TQM needs to compete for capital in the global market place. The Board has to ensure that TQM is allowed a return that enables TQM to do so. Comparisons to returns in other countries would be useful, but challenging, in terms of differences in business risks and business environment. As a result, the Board is of the view that pipeline companies operating in the U.S. have the potential to act as a useful proxy for the investment opportunities available in the global market place.

Canadian and U.S. regulatory environment - Transmission Pipelines

The Board is not persuaded that the U.S. regulatory system exposes utilities to notable risks of major losses due either to unusual events or cost disallowances. The Board views the losses and disallowances experienced by U.S. regulated entities as a result of the restructuring that took place to terminate the merchant gas function of pipelines, as well as some other circumstances such as the Duquesne nuclear build, to be, to a large extent, unique events. The Board also finds that such instances are not likely to weigh significantly in investors' perceptions today, and would thus have little or no impact on cost of capital.

The Board is of the view that volumetric risk is more a feature of the U.S. regulatory model than the Canadian one. However, the Board did not find that the evidence supported the conclusion that volumetric risk impacts long-term risks of capital recovery. The Board finds that volumetric risk clearly impacts short-term risks of allowed earnings not being achieved, and sometimes for consecutive years between rate cases. The Board also finds it significant that volumetric risk has a symmetric nature, presenting pipelines with some counteracting upside opportunities.

The Board notes that Dr. Safir's evidence points to greater variability in the actual earnings minus allowed earnings of U.S. pipelines compared with Canadian ones. Dr. Carpenter submitted that this is consistent with his view that U.S. short-term risks are higher. The Board agrees with this view and finds that the short-term risks faced by U.S. pipelines are higher than those borne by TQM specifically and by their Canadian counterparts generally.

Overall, the Board finds that the risks resulting from the regulatory environment are higher for U.S. pipelines than for Canadian pipelines, and finds that this was also true in 1994. However, the Board is of the view that the risks faced by TQM and those faced by U.S. pipelines are not so different as to make them inappropriate comparators. The Board accepts that there are many similarities between the risks faced by pipelines in the two countries. This is due to the two regulatory models sharing, to a large extent, the same fundamental principles. Moreover, Canadian and U.S. pipelines operate in what the Board views as an integrated North American natural gas market, which informs the choices made by regulators in the different jurisdictions.

Canadian and U.S. regulatory environment - LDCs

The Board notes that Dr. Safir's evidence suggested that the short-term earnings variation of U.S. LDCs was higher than that of Canadian pipelines, although lower than U.S. pipelines. The Board also notes that Dr. Carpenter submitted that TQM had lower short-term risks than the companies in Dr. Vilbert's LDC sample. The Board concurs that U.S. LDCs have higher short-term risks than TQM.

On the question of Dr. Safir's and Dr. Carpenter's divergent views on what the FERC found with respect to the relative risks and comparability of U.S. interstate pipelines and LDCs, based on the Board's consideration of the FERC decision presented in evidence, most notably the excerpts provided in the footnote in Section 6.1.2, the Board accepts Dr. Carpenter's submission that the FERC accepted companies with high proportions of LDC operations in the proxy group and adjusted their returns upward by 50 bps, having judged LDCs to have lower risks than interstate pipelines. The Board is informed by the FERC's view on this matter.

The Board notes that there was no evidence showing that LDCs have higher long-term risks than transmission pipelines. However, there were views suggesting the opposite due to the nature of LDCs' market and supply risks. The Board is of the view that the evidence did not support a clear finding on the relative long-term risks of TQM versus U.S. LDCs.

The Board is satisfied that the evidence establishes that TQM and U.S. LDCs are sufficiently similar in risk so as to make comparisons meaningful. In assessing the comparability of U.S. LDC returns, the Board's view regarding the higher short-term risks of U.S. LDCs meant that, overall, the Board viewed the regulated LDC activities of this group as somewhat higher risk than TQM. The Board would have benefited from additional information on the comparability of this group with TQM.

Canadian Negotiated Returns

The Board's policy is to approve or reject settlements as a whole, recognizing that there are unknown tradeoffs made in arriving at what ultimately comes to the Board as a package deal. When the Board finds that the resulting tolls would be just and reasonable, the Board does not approve each component as just and reasonable on a standalone basis. The Board is of the view that the evidence in this proceeding has highlighted the fact that negotiated tradeoffs cannot be observed or deduced by outside parties, and that any one aspect of a settlement, including the allowed return, cannot be presumed to have been independently acceptable to parties.

The Board is not persuaded that looking at a number of settlements in aggregate alleviates this fundamental problem. The Board finds that the uncertainty related to the tradeoffs is a great barrier to the informative value of settlement returns. Therefore, the Board has placed no weight on the returns derived from Canadian negotiated settlements.

Canadian Litigated Returns

On the question of whether litigated Canadian utility returns are similar because of problems of circularity, or whether they provide a valid signal because they represent independent conclusions reached on similar questions, the Board finds that there was no evidence that conclusively supported either view. Faced with contrasting opinions on the matter, and with the option of relying on returns from other submitted comparables, the Board placed no weight on Canadian litigated returns.

Litigated U.S. Returns

As detailed more fully in other Sections, the Board has placed principal weight on the market-based return data. Nonetheless, the Board found that litigated U.S. returns were useful as a check against the results from the analyses which relied upon market returns.

Financial Market Data Results from Selected Samples

In determining what weight to assign the Canadian utilities sample, the Board considered the relevance of the factors which led it to place no weight on Canadian negotiated and litigated returns. The Board finds that financial market data results, properly derived, yield estimates of sample companies' true underlying costs of capital. This is because, in the Board's view, the underlying cost of capital is driven by investors’ expectations as expressed in financial markets, and allowed returns are only one of many factors influencing these expectations. As a result, the Board finds that market-based estimates of cost of capital largely circumvent the problems which the Board found to be associated with direct comparisons to Canadian negotiated and litigated returns.

The Board also considered whether the risks faced by companies in the Canadian utilities sample have changed, relative to TQM's, as a result of some of their business segments being governed by negotiated settlements. In the Board's view, the evidence did not establish that settlements, at an aggregate level, have caused either a systematic increase or decrease in business risks. As a result, the Board compared TQM with the companies in the Canadian utilities sample based on other underlying business risk considerations, such as supply, market and competitive risks

In considering the Canadian utilities sample's inclusion of Enbridge Inc., the Board finds TQM's submission regarding the changes that influence the relative risks of oil and gas pipelines to be persuasive in suggesting that the relative risks of oil and gas pipelines have directionally come together. However, the Board did not find that TQM established that its risks, nor those of gas pipelines generally, are today at the same level or higher than those of oil pipelines. Given the Board's view that the relative risks have become more similar over time, and the fact that Enbridge Inc. also has interests beyond oil pipelines, the Board finds it acceptable to include Enbridge Inc. in this sample.

Given these views related to the Canadian utilities sample, and because in the Board's view the sample companies operate in a similar environment (regulatory, financial and political) as TQM, the Board found the Canadian utilities sample helpful.

Dr. Booth's cost of equity estimate of a "typical regulated utility", as shown in Table 6-1, was of assistance to the Board in its interpretation of the ATWACC results. The Board recognizes some limitations in combining this cost of equity estimate with market-value capital structure since the capital structure might not perfectly match the one of a "typical regulated utility" in Canada. Nevertheless, the Board is of the view that Dr. Booth's evidence regarding a "typical regulated utility" can reasonably be representative of the utility industry in Canada, an industry of which TQM is a part. However, the Board views TQM as being part of a larger business environment than one delineated by the Canadian border.

The Board accepts that TQM can be compared to some degree with the Gas LDC sample since the operations of the sample companies are concentrated in the natural gas business and the differences in respective business environments can, in the Board's view, be reasonably understood and accounted for.

The Board found the MLP pipelines sample informative as it was presented as a sample being the closest to a pure play natural gas pipeline sample currently available. In the Board’s view, the higher short-term business risks of U.S. pipelines, which the MLP pipelines sample is subject to, can be offset to some degree by what the Applicant submitted was an underestimation of the MLP equity value due to the difficulty of estimating the market value of the GP. Since the MLP pipelines sample seems to be a promising sample for future proceedings, the Board is of the view that it would benefit from a thorough examination of the General Partner/Limited Partner relationship.

Unregulated Activities in Market Data from Selected Samples

In principle, the Board does not believe that comparables necessarily need to be all, or mostly, regulated. Rather, the important question is how comparable the risks are. If there were completely non-regulated companies with risks that were similar to a pipeline's, or if risk differences could be accounted for, the Board would be open to such comparables, because they would provide information on the perspective of participants in competitive markets with regard to risk.

The Board notes that Dr. Vilbert acknowledged that the risks of unregulated operations are generally expected to be higher than regulated operations. The evidence also showed that DBRS views the unregulated portions of utility businesses to be of higher risk and that DBRS requires that utilities offset their exposures to unregulated activities with lower financial risk, in order to achieve a comparable rating. Despite Dr. Vilbert's contention that the unregulated activities' higher risks would not necessarily mean that the estimated cost of capital would be higher, the Board is of the view that in the case of his samples, on average it would be expected to mean exactly that.

As a consequence, the Board is of the view that in the context of all the samples presented in this case, the presence of unregulated operations in the sample companies implies that the estimated costs of capital are likely capturing to some extent the higher cost of capital of the unregulated activities.

Conclusion

In light of the Board's views expressed above on the integration of U.S. and Canadian financial markets, the problems with comparisons to either Canadian negotiated or litigated returns, and the Board's view that risk differences between Canada and the U.S. can be understood and accounted for, the Board is of the view that U.S. comparisons are very informative for determining a fair return for TQM for 2007 and 2008.

The Board was informed by all of the financial market returns comparable groups presented as evidence by both parties. Consistent with the Board's decision in Chapter 4 to rely on a market-based ATWACC methodology, the Board has put principal weight on market-determined returns as opposed to regulatory returns. These market-determined returns of companies found to be of comparable risk to TQM, combined with the market-value capital structure, provide the Board with crucial information for determining TQM's cost of capital for 2007 and 2008. How this information was used to determine the fair return for TQM is explained in Chapter 7.

Chapter 7

Fair Return for TQM for 2007 and 2008

Reliance on an aggregate approach to cost of capital involves comparing total costs of capital of comparable companies, rather than comparing the costs of individual cost of capital components. This Chapter first addresses the total fair return for TQM for 2007 and 2008, and then the manner in which the return may be implemented.

7.1 Total Return

Table 7-1 summarizes the recommendations made by various parties for the cost of capital for TQM for 2007 and 2008. One implication of using an ATWACC methodology is that the returns recommended by parties may be conveniently examined on a comparable basis. Some parties (CAPP, IGUA and Ontario) made recommendations for individual components of cost of capital, while others (TQM and CGA) stated the aggregate cost of capital implications of their recommendations. For ease of comparison all are presented using ATWACC or ATWACC equivalence in Table 7-1.

Submissions of TQM

As outlined in Section 1.2 of these Reasons, TQM requested return on capital components of 11 per cent ROE on 40 per cent equity thickness, plus the embedded cost of debt on the remaining 60 per cent of the capital structure. TQM's current embedded interest rate on the 60 per cent funded debt is 6.14 per cent. A further (unfunded) 10 per cent was set at 5.69 per cent in 2007 and 5.5 per cent in 2008. TQM indicated that it started with an ATWACC of 6.65 per cent, which is based on the market value of debt. The Application included an adjustment for the difference between market and embedded costs of debt, resulting in an ATWACC of 6.9 per cent. However TQM indicated it could accept a 6.65 per cent aggregate return when using market returns for both debt and equity.

TQM submitted that the financial integrity requirement is met when the total return allows TQM to maintain its financial integrity, including acceptable bond ratings and coverage ratios, on a stand-alone basis. Acceptable bond ratings and coverage ratios impact a utility's cost of capital which is ultimately reflected in the reasonableness of the terms and conditions upon which the utility can attract capital. Currently, S&P and DBRS rate TQM at BBB+ and A (low) respectively, both investment grade ratings. TQM submitted that these ratings reflect the implicit credit support of its parents which could potentially violate the stand-alone principle. According to Mr. Murphy, if Moody's were to apply a credit rating to TQM, it would assign a Ba1 rating which is below investment grade.

Table 7-1
Summary of Returns Recommended for TQM for 2007 and 2008

(per cent, unless specified otherwise)

Party	Equity Thickness[1]	Return on Equity	Debt	Equivalent Total Return After-tax[2]
TQM	40	11	Embedded	6.9
	n/a	n/a	Embedded	6.9
	57.5 to 60	RH-2-94 Formula [4]	Embedded	6.9
TQM [3]	n/a	n/a	Market	6.65
CGA				200 to 300 basis points above current [6]
CAPP		RH-2-94 Formula [4]		5.4 to 5.5 (2007) [7]
	30 to 32		Embedded	5.5 to 5.6 (2008) [7]
		or 7.75 [5]		5.2 to 5.3 [7]
IGUA	32	RH-2-94 Formula [4]	Embedded	See CAPP above
Ontario	36	RH-2-94 Formula [4]	Embedded	5.7 (2007) [7]
				5.8 (2008) [7]

1 Book equity / (book equity plus book debt)
2 Where the after-tax return is impacted by tax rates, e.g. when computing an after-tax debt cost, a tax rate of 32 per cent is assumed.
3 The TQM recommendations had started from the analysis of Dr. Kolbe and Dr. Vilbert which derived an ATWACC range of 6½ to 6¾ per cent, before adjusting from market to embedded cost of debt, an adjustment of 0.24 percentage points.
4 The RH-2-94 Formula return on equity is 8.46 per cent (2007) and 8.71 (2008).
5 If the RH-2-94 Formula were to be re-opened, then CAPP recommended that the current value of the return on equity be 7.75 per cent.
6 The current value for TQM is 5.4 to 5.5, as computed by the Board.
7 As computed by the Board.

Submissions of Intervenors

CGA argued that, regardless of any possible change in approach, it is necessary to eliminate the 200 to 300 basis point deficit in total returns that has emerged in Canadian formula-based returns.

Spectra and Union indicated their support for the TQM position. They recommended that the Board carefully examine whether the RH-2-94 Formula continues to represent a fair return. They did not recommend a specific return for TQM for 2007 and 2008.

In CAPP's view, the ROEs determined by the RH-2-94 Formula of 8.46 per cent and 8.71 per cent provide a more than fair return for TQM for 2007 and 2008. As to equity thickness, CAPP offered a range, based on Dr. Booth's assessment, of 30 per cent if the basis of comparison were whether TQM's business risks have changed since the RH-2-94 Decision, or 32 per cent based on comparisons with Alberta transmission operators and the EUB 2003 decision on AltaLink. CAPP took no position on the cost of debt as applied for by TQM, arguing that use of embedded debt and the RH-2-94 Formula remains valid. CAPP did not dispute TQM's submission regarding debt ratings and argued that the current return allowed to TQM cannot be unfair since TQM has been able to maintain good and stable investment grade bond ratings.

According to Ontario, as a stand-alone entity, TQM continues to be capable of attracting sufficient capital. An increase in the company's equity thickness to 36 per cent and the retention of the RH-2-94 Formula would be more than sufficient to maintain TQM's ability to attract capital on favourable terms for both the short and long-term.

IGUA recommended that the Application for any increase in the equity thickness beyond 32 per cent be denied, noting that in its 2006 Annual Report, TQM stated that a 36 per cent deemed equity thickness would be appropriate, not the 40 per cent sought in the Application. IGUA contended that even the increase to 36 per cent was unnecessary, given its views on TQM's risks as outlined in Chapter 5. IGUA further noted that in its 2006 Annual Report TQM was not looking for any increase in its ROE. IGUA submitted that a request for anything more than the RH-2-94 Formula should be denied.

7.2 Total Return and Capital Structure

The total return determined to be fair could be granted in a number of different ways. The Board sought perspectives from parties on whether they had preferences regarding returns granted as a total return, or as distinct returns on equity and on debt, with a Board deemed capital structure.

Submissions of TQM

As shown in Table 7-2, TQM demonstrated that the three combinations discussed in the Application ("11 on 40", "Formula on 60" and single ATWACC) were approximately equivalent in terms of revenue requirement, and could result in only one possible toll. TQM indicated that in all cases the after tax return would need to be grossed up for taxes, by dividing the equity return by 1 minus the approximately 32 per cent tax rate, the average tax rate of the TQM owners. In the third case shown in Table 7-2, the income taxes treat the return on capital as though it were 100 per cent based on equity with no tax deductions for debt payments.

Although TQM had a preference for the 11 per cent on 40 per cent equity, it viewed the three alternatives as equivalent because the sum of returns and taxes would not change.

Table 7-2
Implications for 2008 Revenue at a 6.9 per cent ATWACC ($000)

Three Alternative Cases Presented by TQM	Return on Capital	Income Taxes: Related to Return on Capital	Income Taxes: Timing Difference and Other [1]	Sum of Return and Income Taxes
11 on 40 calculated using the traditional approach	36,644	9,459	2,109	48,212
Formula on 60 calculated using the traditional approach	34,797	11,241	2,109	48,147
6.9% ATWACC, with no ROE or capital structure specified [2]	31,254	14,833	2,109	48,196

From TQM's Notes:

1. The $2,109,000 Tax on Timing Differences and Other is not sensitive to return and is the same in all 2008 cases.
2. In the 6.9% ATWACC case, return is the 2008 rate base ($452,962,000) times 6.9%, and the income taxes related to return on capital use a gross up percentage of 47.46% times the return on capital.

Each of TQM's owners, TransCanada and Gaz Métro, indicated that they address their total debt on a consolidated basis, and target a specific rating and contended they would not have the same incentives to consider the tax benefits of debt as a non-regulated company.

TransCanada indicated that, dependent on how the total return was granted to TQM, it would possibly reconsider how it financed its investment in TQM. For example, if TQM were granted the Formula on 60 per cent equity thickness, TransCanada indicated that it would not actually carry 60 per cent equity for the TQM investment in the TransCanada capital structure as that level is not required to satisfy rating agencies. TransCanada currently has roughly 40 per cent equity thickness in its market value capital structure. Gaz Métro also indicated that, regardless of the manner in which the award was granted, it is likely to carry a corporate equity thickness of 40 per cent.

With regard to the tax benefits from optimizing TQM's financial leverage, TransCanada acknowledged that at least part of its benefit from offshore financing refers to the structure called double dip, where an entity can legally deduct interest in two jurisdictions, in this case interest paid in Canada and interest paid in the U.S. However, TransCanada indicated that TQM's position remains consistent with the regulatory standard of looking at an entity as stand-alone, and not considering TQM as an integrated part of a larger corporation. As each of their alternative proposals for a fair total return would result in the same revenue requirement, TQM indicated that there would be no wealth transfer.

Submissions of Intervenors

CAPP suggested that the capital structure decisions could produce a wealth transfer dependent on who benefits from optimizing TQM's capital structure. Regulated companies have traditionally been allowed to include in their revenue requirement an allowance for income taxes, reflecting the deemed capital structure, allowed cost of equity and actual cost of debt. As interest is tax deductible, an aggregate cost of capital can be minimized through the use of debt. Traditional regulatory approaches have explicitly assigned this reduction in aggregate cost of capital to the shippers. CAPP expressed concern that, if a total return were granted without specifying the capital structure, the revenue requirement would include provision for taxes which may not necessarily be paid, particularly as the regulated company is held within a holding company structure.

CAPP submitted that granting an aggregate cost of capital allows a holding company, as owner of the regulated utility, to use some leverage at the holding company level, rather than at the subsidiary level where it could benefit shippers. This has been referred to as double leverage. Dr. Booth indicated that this occurs in Canada, and demonstrates that full leverage is not used at the regulated business unit level. Further, a holding company with international businesses may be able to reduce income taxes by utilizing additional deductions.[35] However Dr. Booth agreed that any such leverage would not impact what is charged to toll payers, as long as the ATWACC was constant.

35 Some of such deductions involve structures referred to as double dip.

Dr. Safir suggested that granting a total return without specifying a capital structure would alter risks, and that it would be better and more efficient to see the components even if the results were the same.

For both CAPP and IGUA, separately addressing the rate of return on equity and the appropriate capital structure is convenient and useful, and should be retained.

7.3 Adjusting for the Embedded Cost of Debt

Submissions of TQM

In its application, TQM asked that its allowed return be adjusted for the difference between the market cost of debt and the actual cost of TQM debt.[36] TQM acknowledged that a pure ATWACC approach would be based on the market value of each component, and would not adjust for the embedded cost of debt. Dr. Kolbe indicated that a pure ATWACC methodology would be superior from an economic perspective to a hybrid methodology that uses the ATWACC and the embedded cost of debt. On a conceptual basis, under an ATWACC regime, TQM argued that a utility would come back to the regulator when there are changes in the cost of capital, as driven by the market cost of equity or debt.

If the Board were to award returns on market-based ATWACC including the market cost of debt, Dr. Kolbe urged the Board to think about transition issues and decide whether the difference between market and embedded debt costs reached a level of materiality needing a transition adjustment from the past approach. TQM indicated that, if required, it would accept a return that did not provide for the difference between embedded and market cost of debt. TQM indicated that if it were allowed an ATWACC with the market cost of debt it would not return to the Board for a change in cost of capital even if its debt costs changed for 2007 and 2008, since the decision in this case is being made on a retrospective basis.

Submissions of Intervenors

Dr. Booth submitted that the use of a single market-based ATWACC to grant a return would make the utility accountable for the timing of its debt issues. Providing this implicit allowance for the market cost of debt would be a significant departure from regulatory practice in Canada, and would tend to make the equity more risky, altering many aspects including volatility and betas observed in the market. He submitted that in the traditional practice, shippers bear the risk that embedded debt costs rise above market debt costs, and are compensated for bearing that risk by a lower cost of capital in the tolls. Dr. Booth considered that moving that risk to the pipeline had implications for the use of deferral accounts and other components of the regulatory bargain, and that the added risk imposed on the system would not be offset by obvious benefits.

IGUA indicated that it preferred using the actual cost of debt, rather than regularly adjusting to market rates. This view was expressed in the context of continuing to use the current methodology for determining the return on common equity. Similarly Ontario noted the Board's

---

36 TQM's current embedded interest rate on the 60 per cent funded debt is 6.14 per cent. A further (unfunded) 10 per cent is financed at the prime rate less 0.5 per cent, that is, 5.69 per cent in 2007 and 5.5 per cent in 2008. Dr. Vilbert used 5.5 per cent for the market cost of debt.

standard practice of allowing TQM to include the actual cost of debt in its revenue requirement for recovery from customers through tolls and had no objection to continuing this practice along with continued reliance on the RH-2-94 Formula.

Views of the Board

In determining the fair return for TQM for 2007 and 2008, the Board used judgment to bring the evidence together to reach an overall conclusion. The Board has not assigned quantitative values to the adjustments made for individual elements of the evidence nor has it assigned quantitative weights to the various opinions presented in this hearing. Figure 7-1 was prepared to provide an overview of the factors that the Board considered and the extent of their influence on the Board's decision.

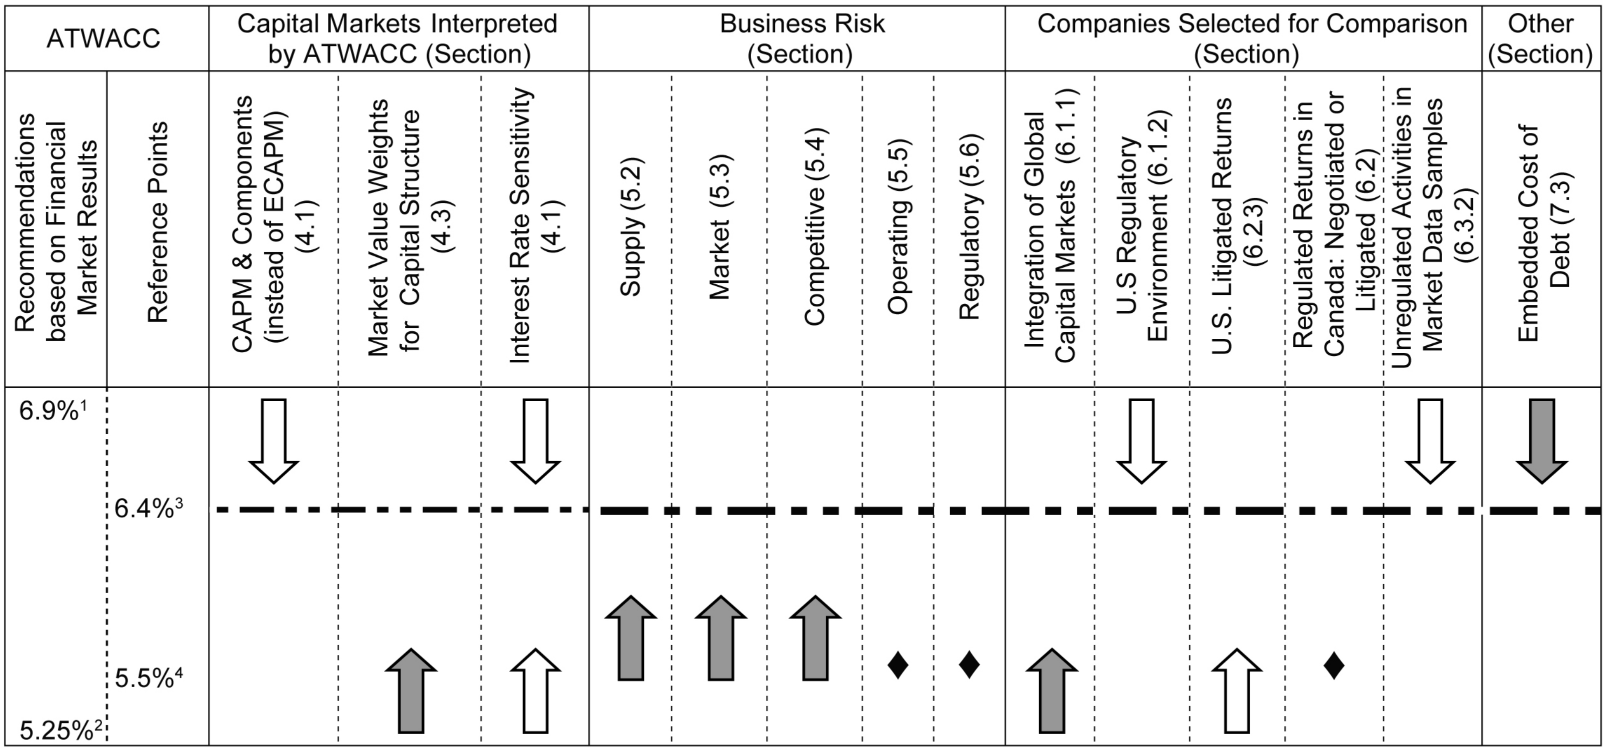
The factors included in Figure 7-1 have been discussed in greater length in earlier sections. Having decided, as described in Chapter 3, to vary from the RH-2-94 Formula, the Board considered all evidence on the estimation of cost of capital. The Board examined the evidence in ATWACC terms to reach a finding on the fair return in this particular case.

In the Board's opinion, an ATWACC methodology enables the comparisons of aggregate returns on an equal footing between companies of comparable risk by substantially neutralizing the effect of financial risk attributable to different capital structures. Consequently this methodology better utilizes financial market information. Further, it produces a single number which aligns with the manner that many businesses assess capital projects.

As explained earlier, the Board relied on CAPM for the market cost of equity. The Board considers the market value capital structure to be the appropriate way to combine the estimated market costs of equity with the market cost of debt, on an after-tax basis, to derive market-based ATWACC estimates for sample companies. The Board recognizes that there is interest rate sensitivity in regulated utility returns. However, for reasons discussed in Chapter 4, the Board did not rely explicitly or exclusively on either of the methodologies offered (adjusted betas or a two-factor model) in this proceeding.

These factors were taken into account when examining the recommendations which were based on financial market results from samples of companies. These recommendations are included in the first column of Figure 7-1. However, not all of the proposed comparable companies have risk at the level of TQM, and as discussed in Chapter 6, the Board has considered such differences in weighing the estimated costs of capital of the various samples.

Figure 7-1
Illustration of Factors and their Influence on the Board's Decision on a Total Return for TQM for 2007 and 2008



1. Each of the combinations requested by TQM match an ATWACC of 6.9 per cent, see Table 7-1.
2. The result of CAPP's recommendation of the 7.75 per cent on 30 to 32 per cent equity, if the request to vary the RH-2-94 Formula were granted, see Table 7-1.
3. The total return set by the Board.
4. The status quo, with 30 per cent equity and the (2008) RH-2-94 Formula. CAPP's recommendation of the RH-2-94 Formula on 30 to 32 per cent equity, if the request to vary the RH-2-94 Formula were denied, would be in a 5.4 to 5.6 per cent range for ATWACC. (See Table 7-1)

Legend: The size of the arrows has no implication for quantitative contribution to the Board's decision. Arrows are positioned to show movement from a starting point.

Material Influence

Limited Influence

◆ No Influence

In the Board's opinion, many factors interact in natural gas markets and provide the context for the business risk of TQM. While the Board found no change since 1994 in TQM's regulatory and operating risks, the changing dynamics of the natural gas end-use markets, pipeline competition and changing potential supply sources have combined to create greater business risk for TQM.

The Board did not take into account the stated results from negotiated settlements for Canadian pipelines, nor did it rely on the allowed returns determined in Canadian litigated proceedings. However the market returns for Canadian utilities were helpful to the Board since these returns demonstrate the market's assessment of the firms' costs of capital.

The Board found market returns of U.S. companies to be relevant to the cost of capital of Canadian firms, as U.S. market returns can be a useful proxy for investment opportunities in the increasingly integrated global capital markets. In the Board's view, Canadian and U.S. natural gas markets have many similarities. For instance, these markets operate in similar regulatory environments. However, as discussed in Chapter 6, the Board found that generally TQM faces less risk than U.S. companies which were proposed as comparables.

Fair Return Determination

Having carefully considered the evidence and assessed the factors influencing TQM's total return, the Board concludes that an ATWACC of 6.4 per cent on rate base is the fair total return for TQM for 2007 and 2008.

In the Board's view, the total return of 6.4 per cent will be in line with those of North American pipelines found to be of comparable risk. The resulting risk-reward profile of TQM will be in line with those of other comparable investments presented as evidence. The Board is therefore of the view that the aggregate return of 6.4 per cent will ensure that TQM's total return on capital meets the comparable investment requirement.

The Board is also of the view that the total return of 6.4 per cent will help TQM maintain its credit rating on a stand-alone basis. As a result, the Board believes that TQM will continue to maintain its financial integrity and its ability to attract capital on reasonable terms and conditions.

The Board finds that the total return of 6.4 per cent satisfies the Fair Return Standard, as articulated in Chapter 2 of these Reasons.

A Single Market-Based Return

The Board accepts TQM's demonstration that the alternative capital structures provided in the Application each produce the same revenue and toll results, for a constant market-based ATWACC. All parties indicated that, irrespective of the capital structure chosen, there can be only one toll for a given ATWACC number.

The Board notes that the provision for actual or embedded debt costs, and the allowance for estimated income taxes payable based on the deemed capital structure, are part of the traditional approach to toll making which considers the individual components of the cost of capital. However, the Board has decided to set an aggregate return on capital, guided by market-based principles. The Board is not specifying TQM's capital structure for 2007 and 2008. In keeping with that perspective, the Board finds that a fair treatment of embedded debt costs is to consider such costs to be accounted for in the market-based ATWACC number. In this regard, the Board subscribes to the views expressed by Dr. Kolbe to the effect that, notionally, this is the superior way from an economic perspective.[37]

The Board's decision to grant an aggregate return on capital without specifying capital structure has the result of transferring to the pipeline company the decision to determine its optimal capital structure and choose specific financial instruments without regulatory oversight. The freedom for a company to choose its optimal capital structure is consistent with the Board's philosophy of regulating pipeline companies on a goal-oriented basis. Exercise of that freedom does not, in the Board's view result in a wealth transfer, and is supported by the longstanding stand-alone principle.

The difference between market cost of debt and embedded cost of debt in this case is small and therefore does not require consideration of a grandfathering or transition phase for TQM for 2007 and 2008.[38]

In support of transparency, the Board requires that TQM report the amount of leverage that is supported by TQM in the owners' capital structures as of the end of 2008.

37 At transcript volume 9, para. 11562 Dr. Kolbe stated: "a pure ATWACC methodology would be economically superior to a hybrid methodology that gives you the ATWACC and the embedded cost of debt from an economic point of view."

38 To facilitate comparisons, the table below provides some combinations of ROE and equity thickness which, when combined with actual debt costs, are equivalent to the market-based ATWACC of 6.4 per cent set by the Board.

Equity Thickness, per cent	Return on Equity, per cent
40 (As requested by TQM)	9.7
32 (As recommended by CAPP)	11.2
50.5	8.46 (Using 2007 ROE from the RH-2-94 Formula)
49	8.71 (Using 2008 ROE from the RH-2-94 Formula)

Decision

The Board is allowing TQM to include in its revenue requirement for 2007 and 2008 a provision for after-tax weighted average cost of capital of 6.4 per cent.

TQM is directed to file for final tolls for 2007 and 2008 using this information, and to report the amount of leverage that is supported by TQM in the owners' capital structures as of the end of 2008. These filings are due by 30 April 2009.

Chapter 8

Disposition

The foregoing chapters constitute our Reasons for Decision in respect of the application considered by the Board in the RH-1-2008 proceeding.

Appendix I

Ruling 1 – 30 September 2008

Yesterday, the Board heard submissions by counsel for TQM and counsel for CAPP regarding the use that can be made, during an oral proceeding, of documents filed in response to IRs, but which remain available in a "reading room" established at the office of counsel for TQM.

Counsel for TQM stated that documents from the reading room and referred to during the hearing may be referred to in their entirety on the record during a proceeding.

Counsel for CAPP took the position that only those portions of the reading room documents put to witnesses by a cross-examiner and then expanded on by the witnesses with further related portions of the documents are considered to be accepted onto the record.

This is the Board's ruling on the matter.

The Board's traditional practice is that where a party seeks to use a document for the purpose of aiding their cross-examination, subject to relevance being established, the Board will allow the document to become an exhibit only for the excerpts that have been put to the witnesses and discussed between the examiner and the witnesses.

In this instance, TQM through its counsel has established a reading room to ensure that documents referred to in IRs, which would otherwise be filed on the record and which would be voluminous, remain accessible to all parties without creating a record that might otherwise become unwieldy. The Board finds this approach acceptable and encourages the concept of such a reading room.

The reading room documents, in the Board's view, are different from those produced by a cross-examiner as an aide to cross. The documents associated with IR responses and placed in a reading room have been made available in the information exchange as part of the evidence filed in response to IRs and are available to parties to examine ahead of the hearing. They are, in essence, the evidence of the party answering the IRs.

As such, the Board is of the view that documents or portions of documents from the reading room reproduced and presented in the hearing for the purpose of cross-examination, should be admitted in their entirety. That is, the entire document or excerpt of the document if it is lengthy (such as a text book) will be considered to be on the record, not just the passages which are brought to the witnesses' attention.

The witness to whom the document is being put may draw the Board' attention to other portions of the document either in the excerpt version produced by the cross-examiner, or if needed, by producing a longer or different version of an excerpted document.

The cross-examiner who introduced the original, shorter document will be given the opportunity to cross-examine on the other portions.

The Board recognizes that this is somewhat a change in process mid-stream of this hearing. Therefore the Board is willing to hear from parties if they have any concern regarding the documents entered to this point in time.

Appendix II

Ruling 2 – 2 October 2008

Yesterday, Mr. Yates objected to questions by Mr. Schultz on the reply evidence of TQM. The evidence cited the argument of CAPP in an EUB hearing in 1994. This argument was based on the evidence of CAPP's expert in that proceeding, Mr. Hugh Johnson.

In the Board's view, as this evidence was submitted as TQM's reply evidence, Mr. Schultz is entitled to cross-examine on it.

However, the Board notes that

- neither TQM nor CAPP are relying on Mr. Johnson's evidence for the truth of the content;
- Mr. Johnson is not here to speak to the evidence; and
- there has been a significant passage of time since that evidence was filed and the argument based on that evidence was made, which may mean that there are changes which would have affected Mr. Johnson's position.

Therefore, the Board is inclined to give little weight to this portion of the reply evidence. The Board would also point out, for guidance to counsel, that it finds helpful that cross-examination which assists it in understanding the evidence before it and the current position of parties.

The Board directs counsel to govern themselves accordingly in the way in which they cross-examine on this evidence. Mr. Schultz, if you have some limited questions on this matter, you may proceed.

Appendix III

Ruling 3 – 7 October 2008

Yesterday, Mr. Schultz objected to questions Mr. Yates posed to the CAPP policy witness regarding the adoption of the evidence presented by Dr. Booth and Dr. Safir as that of CAPP.

Mr. Schultz argued that a party presenting expert evidence is not required to accept that expert's evidence as their own although that party adopts the conclusions reached by their expert.

Mr. Yates put forward the view that if a party is not willing to accept its expert's evidence in its entirety, then that evidence should not be accepted by the Board and should therefore be struck. Otherwise, what would a party have the Board do with the expert evidence that is not accepted by the party submitting that evidence.

Expert evidence is submitted for two main reasons. First, an expert can provide information necessary for a further understanding of technical issues before the Board. Second, an expert's evidence can further aid the Board drawing inferences from the technical information presented.

When presenting expert evidence for the Board's consideration, the Board expects that CAPP would develop a degree of comfort with the methodology used by CAPP's experts to reach the conclusions which CAPP relies on. In other words, the Board would expect that CAPP, in seeking to rely on the conclusions of Drs. Booth and Safir, would hold compatible views on the opinions and methodology as those presented by the experts.

An expert is generally retained because of the complexity of the matter in question. The Board does not expect that CAPP's policy witnesses would be able to speak to the specifics of the expert's evidence nor defend the details presented in the current proceeding or in future proceedings.

Further, should a party seek to discredit CAPP's position in a future hearing by using CAPP's expert evidence from this hearing, the Board is of the view it would be incumbent upon the impugning party to produce the witness whose evidence they seek to demonstrate is contradictory.

Additionally, as noted in the Board's earlier ruling in this hearing regarding questions of an expert of CAPP in a previous proceeding, if there has been a significant passage of time since the evidence was filed, the Board understands that changes may have occurred which would have altered that expert's opinion.

The Board is of the view that an expert's evidence must be adopted by the party filing that evidence within the parameters discussed in this ruling.

Mr. Schultz, do you wish to have CAPP's policy witnesses adopt the expert evidence that they sponsored in this proceeding? Feel free to take some time to consider this matter.

Attachment 5.2

File Of-Tolls-TollsGen-COC 01
3 July 2009

To: Parties Named in the Attached Distribution List

Review of the Multi-Pipeline Cost of Capital Decision (RH-2-94)

Background

On 23 March 2009, the National Energy Board issued a letter advising that it had decided to consider whether it should initiate a review, pursuant to section 21 of the *National Energy Board Act*, of the RH-2-94 Decision. The Board solicited comments from interested persons on whether they believe that the RH-2-94 Decision should be reviewed. The Board indicated that those providing comments should include the grounds for their submission, along with their views on the process which should be used and the issues to be considered if a review is held. The Board set a deadline for comments of noon, Calgary time, Monday, 25 May 2009.

Decision and Further Process

Having considered the submissions of parties, the Board has decided to initiate a review of the RH-2-94 Decision by seeking comments on the continuing applicability of the RH-2-94 Decision. Interested persons are asked to provide comments by filing them with the Board by **noon, Calgary time, Friday, 18 September 2009.**

The Board will take into account comments already filed on this matter pursuant to its 23 March 2009 letter when making its decision. Parties need not file any further submissions unless they have supplementary comments not covered by their earlier submissions.

In providing their submissions, parties may wish to provide comments on the following possible outcomes.

- The RH-2-94 Decision remains in effect, without prejudice to parties filing company-specific applications to depart from the RH-2-94 Decision.
- The RH-2-94 Decision will not continue to be in effect and an appropriate method of and timing for transition for any pipeline still subject to the RH-2-94 Decision, and those pipelines utilizing the RH-2-94 Formula, will be implemented.

…/2

- The initiation of a generic process, which could be a formal generic hearing, or any other process developed by interested parties, to examine the manner in which, going forward, the Board should address the cost of capital.

Interested parties may suggest alternative outcomes when providing comments on whether the Board should depart from the RH-2-94 Decision. For example, parties could suggest a collaborative process led by interested stakeholders, in lieu of or in combination with the above possible outcomes, to develop a proposal for the Board's consideration and approval.

Notice and Accessibility of Correspondence

Companies in Part A of the attached Distribution List are directed to serve a copy of this letter on their shippers and interested parties, including parties to their latest tolls decision or settlement. They need not serve a copy on any person listed in Part B.

Parties are advised that copies of correspondence related to this process can be found on the Board's Regulatory Documents Repository (accessible by visiting the Board's Internet site at www.neb-one.gc.ca. Click on the "View" link under the Regulatory Documents heading). In the Repository, click on "Group 1 Gas" or "Group 1 Oil". Then click on "Multi-Client Cost of Capital (RH-2-94)"; then click on "1994-06-20 Cost of Capital (RH-2-94)"; and finally click on "2009-03-23 - Request for Comments on Review of RH-2-94 Decision". Alternatively, some recent filings may be found by clicking on "Inbox" from the Repository home page.

Yours truly,

AnneMarie Erickson

for Claudine Dutil-Berry
Secretary of the Board

ENBRIDGE

VIA EMAIL AND RESS

October 7, 2008

Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
2300 Yonge Street, 27th Floor
Toronto, Ontario
M4P 1E4

Dear Ms. Walli:

Re: Consultation on Issues Relating to Low Income Consumers
Enbridge Gas Distribution Inc.
Board File No.: EB-2008-0150

Further to Enbridge Gas Distribution Inc.'s ("Enbridge") letter of October 3, 2008 and October 6, 2008, attached is Enbridge's revised response to the Ontario Energy Board's information request regarding the Winter Warmth Program.

Sincerely,

Lesley Austin
Regulatory Coordinator

cc: Fred Cass, Aird & Berlis (via email)
David Stevens, Aird & Berlis (via email)

ENBRIDGE'S RESPONSE TO
BOARD STAFF INFORMATION REQUEST – WINTER WARTH PROGRAM

INFORMATION REQUEST

Winter Warmth Program:

1) How much each utility is spending on the Winter Warmth Program
2) Number of applicants per year
3) The average Grant per applicant
4) The amount of money needed to meet the demand
5) Is the information different in different geographic areas of your service area? If so, how?

RESPONSE

1) Enbridge is spending $300,000 per year excluding top up from the Garland Settlement. The Garland Settlement provides an amount that can vary from year-to-year based on the annual return on the settlement amount. In the 2007-2008 heating season the Garland Settlement provided an additional amount of $354,000. Of the Garland Settlement top up, $166,000 was distributed to the Winter Warmth Program and the remaining $188,000 was distributed to the United Way Community Fund.

2) The total number of applicants for the 2007-2008 heating season was 1,099 excluding top up from the Garland Settlement or 1,523 including the Garland top up. The number of applicants receiving assistance was 700 without the Garland Settlement top up and 1,124 with the top up.

3) The average grant per participant was $353 net of the 15% fee paid to the agencies that administer the Winter Warmth program.

4) It is important to note that demand can and will vary from year-to-year based on many factors such as economic conditions, energy prices, prices for other household needs such as food, clothing, and shelter costs to name a few. In the 2007-2008 heating season, of the total $654,000 available ($300,000 plus /c
$354,000 as shown in item 1 above) $466,000 was required to meet the demand. /c

5) The Winter Warmth Program is consistently delivered across the Enbridge franchise area. The demand and amounts of relief can vary depending on the number of customers and the specific need of the communities. Anticipated participation is typically based on historical take up of the program.

Witness: Debbie Boukydis

unionGas
A Spectra Energy Company

October 8, 2008

Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
2300 Yonge Street, 27th Floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Consultation on Energy Issues Relating to Low Income Consumers
Information Requests
Board File No. EB-2008-0150

In response to the information requests made by members of the Ontario Energy Board, Board Staff and participants to the consultation meeting held from September 22 to 25, 2008, Union Gas Limited provides the following.

Disconnections

Union, on average, has approximately 215,000 residential, commercial and industrial customers in arrears each month. The disconnection notice, which is printed on the monthly bill, is based on the customer's number of days in arrears and amount of arrears.

The table below shows the annual number of disconnection notices printed on customer bills, and the number of customers that received notices.

	2008 *	2007	2006
Number of Bills with Notices	389,828	477,423	373,463
Number of Customers Receiving Notices	147,042	166,659	129,244

* 2008 is year-to-date - January thru September

The table below shows the annual number of residential service disconnections and reconnections within each year.

	2008 *	2007	2006
Number of Disconnections	21,241	28,281	25,297
Number of Reconnections	10,925	19,330	15,804

* 2008 is year-to-date - January thru September

Union's billing system does not track the reasons for account disconnections.

Security Deposits

The following table shows the number of residential customers, at year end, that have security deposits in place.

	2008 *	**2007**	**2006**
Number of Residential Deposits	99,073	93,123	91,565
Average Residential Deposit Amount	$271	$277	$267
Total Residential Deposits	$26.8 million	$25.8 million	$24.5 million

* 2008 is as of September 30, 2008

Residential deposits are applied to the account after 1 year of good payment history.

The following table shows the number of security deposits applied to disconnected accounts. These numbers do not include security deposits refunded to customers in good standing or applied to cover arrears that are less than the amount of the security deposit.

- For example, if a security deposit of $500 was applied to unpaid arrears of $450, there would be a $50 credit balance on the account which is then refunded to the customer.

	2008 *	**2007**	**2006**
Number of Residential Deposits Applied to Disconnected Accounts	1,554	2,759	2,798
Total Value of Residential Deposits Applied to Disconnected Accounts	$0.4 million	$0.9 million	$1.2 million

* 2008 is year-to-date - January thru September

Winter Warmth Program

1) How much each utility is spending on the Winter Warmth Program.

- Union Gas contributed $217,340 to the Winter Warmth program for the 2007-2008 heating season.

Total Budget – 2007-2008	$217,342
Administration Fees Paid	$ 16,133
Amount Paid to Applicants	$183,977
Rollover to 2008-2009 Winter Warmth	$ 17,232

2) Number of applicants per year.

- There were 623 applicants in 2007-2008 in the Union Gas service area.

3) The average grant per applicant.

- The average grant paid to applicants accepted for funding across the Union Gas service area was approximately $366.

4) The amount of money needed to meet the demand.

- Union Gas paid out nearly $184,000 in Winter Warmth grants in the 2007-2008 program year (net of the fees paid to agencies to administer the program). Some areas used up allocations within the first month, while others had funds remaining at the end of the program. Union re-evaluates the allocations each year to respond to the level of need in each community. In instances where there are funds remaining from an allocation made to a specific community, these allocations are rolled over into the Winter Warmth program in that community for the following season.

5) Is this information different in different geographic areas of your service area? If so, how?

- Demand and grant averages vary across the municipalities in Union's service area depending on historical levels of requests and need. For example, communities with higher population density and greater economic hardship typically have greater program take-up and receive higher allocations.

Should you have any questions, please do not hesitate to contact me.

Yours truly,

[Original signed by]

Manager, Regulatory Research and Records

LOW-INCOME ENERGY NETWORK

Consultation on Energy Issues Relating to Low-Income Consumers

(EB-2008-0150)

September 22 – 25, 2008

THE ONTARIO TRILLIUM FOUNDATION
LA FONDATION TRILLIUM DE L'ONTARIO

What is the Low-Income Energy Network?

- LIEN is a network of anti-poverty, affordable housing and environmental groups.
- LIEN has over 75 member organizations, as well as individual and corporate supporters
- We seek to raise awareness of, and propose solutions to, energy poverty through:
  - outreach to community groups;
  - outreach to the public, e.g. through the media;
  - participating in OEB hearings and legislative processes;
  - working with policy-makers and local utilities to develop workable solutions to energy poverty.

LIEN Mission Statement

- The Low-Income Energy Network:
  - aims to ensure universal access to adequate energy as a basic necessity, while minimizing the impacts on health and on the local and global environment of meeting the essential energy and conservation needs of all Ontarians.
  - promotes programs and policies which tackle the problems of energy poverty and homelessness, reduce Ontario's contribution to smog and climate change, and promote a healthy economy through renewable and energy efficient technologies.

Presentation overview

1. Should the Board implement policies, programs or other measures designed to assist low income energy consumers?
2. Existing energy assistance programs
3. Low-income energy assistance programs in other jurisdictions
4. Rate measures to assist low income energy consumers.
5. Customer Service Issues (Payment Period, Disconnection, Security Deposits and Specific Service Charges) and Arrears Management Programs
6. CDM/DSM Programs for Low-Income Consumers
7. Time of Use Pricing; Sub-metering issues; energy retailers
8. Program Funding Mechanisms

Topic 1: Should the Board implement policies, programs or other measures designed to assist low income energy consumers?

- Energy poverty is a serious, systemic problem that can't be addressed with band-aid solutions
- The Board is responsible for regulating natural gas and electricity utilities
- The Board has a mandate to, and is responsible for setting just and reasonable rates
- Most low-income consumers buy "system gas" or "RPP electricity". For them, the OEB regulates 100% of the prices they pay and the bills they receive, and is in the best position to implement the needed assistance

Topic 1: Should the Board implement policies, programs or other measures designed to assist low income energy consumers?

- The Board has the relevant expertise to implement the policies, programs and other measures.
- Assistance directly from the government is more uncertain and less flexible. Certainty can be provided by the OEB and is needed for planning programs and flexibility is needed to respond to vagaries of weather and economics.
- Given that natural gas and electricity services are universal services, all customers should contribute to the assistance required by low-income consumers. There are many precedents for this.
- Low-income consumers need affordable rates. Win-win alternatives exist between customers and the utilities.

Broader context for conservation; Opportunities to end energy poverty

Environmental, social and economic…

- Ontario's goal to reduce peak electricity demand by 6,300 MW by 2025 (OPA's Integrated Power System Plan or IPSP – includes $10 Billion for conservation)
- Ontario's climate change plan (coal plant phase-out by 2014)
- Ontario's long-term affordable housing strategy
- Ontario's poverty reduction strategy, with firm targets to measure progress

Ontario's energy crisis

- Need to refurbish, rebuild, replace or conserve 25,000 MW of generating capacity by 2020 (more than 80% of Ontario's current electricity generating capacity).

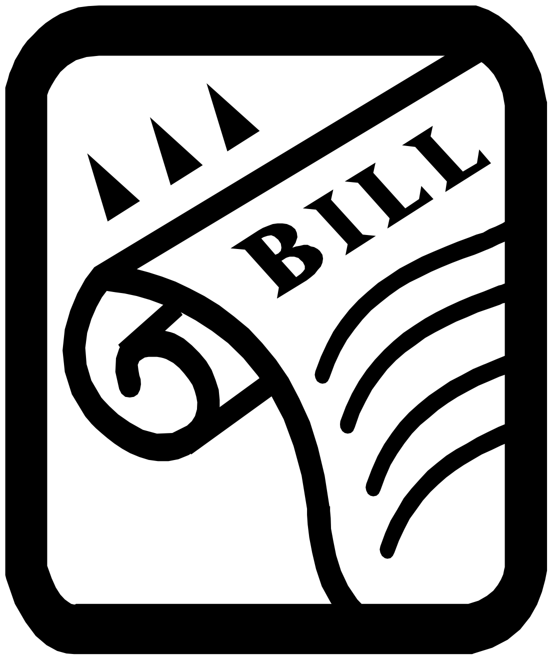
- OPA's IPSP - $60 billion infrastructure expansion and renewal over a 20-year period.

-$10 billion for conservation,
-$46 billion for new generation
-$4 billion on transmission

Rising energy prices

- Real cost-to-customer increases of OPA's 20-year IPSP expected to be 15% to 20%
- Natural gas prices and oil prices also on the rise

Rising energy prices and low-income consumers

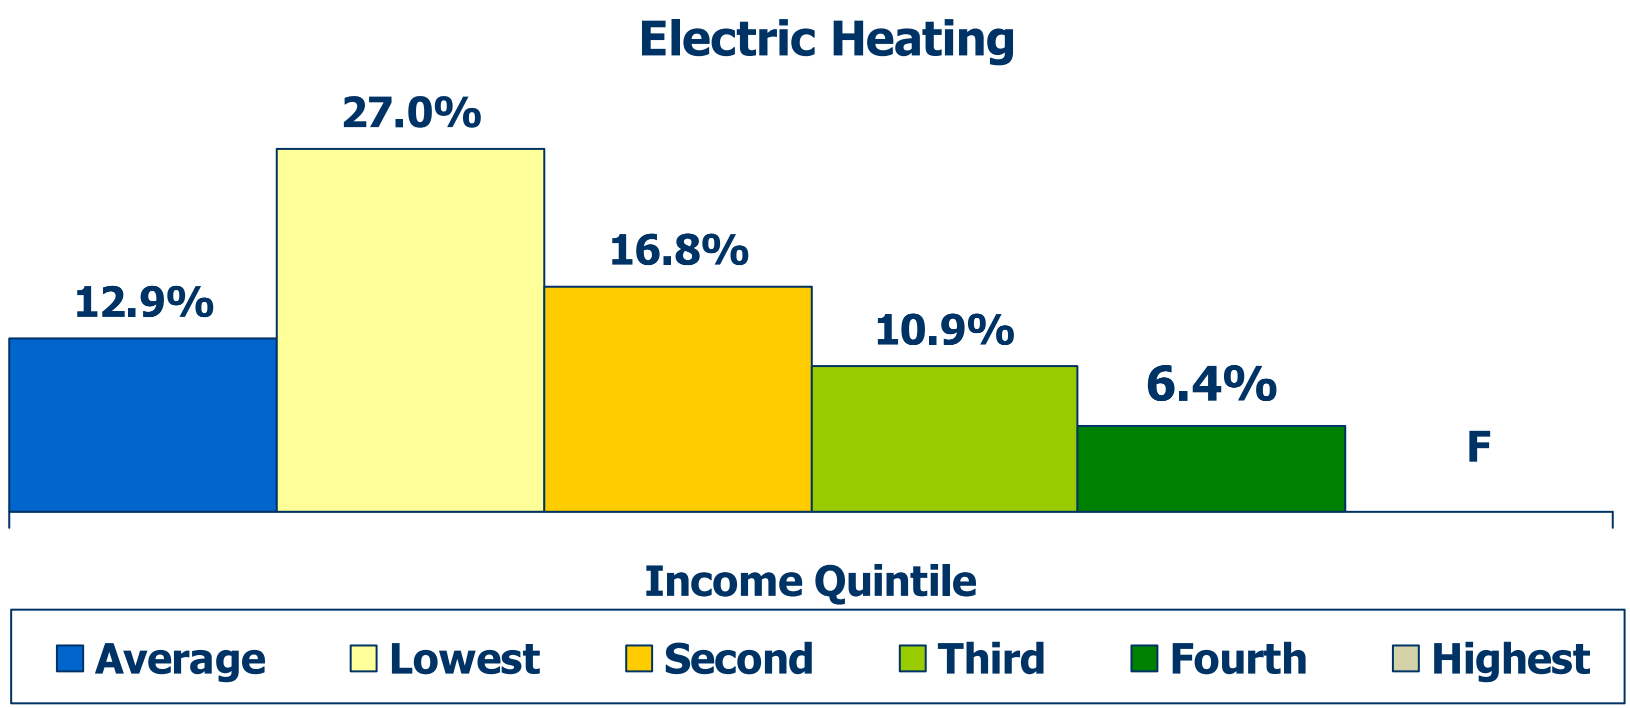


- Low-income households are particularly vulnerable to increases in shelter and utility costs - put housing in jeopardy.
- High energy costs are the second most significant reason for economic evictions in Ontario, right after unaffordable rents.
- Heating, eating or paying the rent will be choice faced by many.
- Reductions in energy use may be at the expense of health, socially acceptable standards of living.

Vulnerability to rising electricity prices

- The lowest household income quintile in Ontario has a far greater proportion of households that:
  - have electric heating as their principal heating equipment (27.0% compared to 12.9% for the average income household)
  - use electricity as principal heating fuel (30.8% compared to 16.7% for the average income household)
  - use electricity as principal heating fuel for hot water (39.3% compared to 26.4% for the average income household and 15.1% for the highest quintile).

Principal Heating Equipment



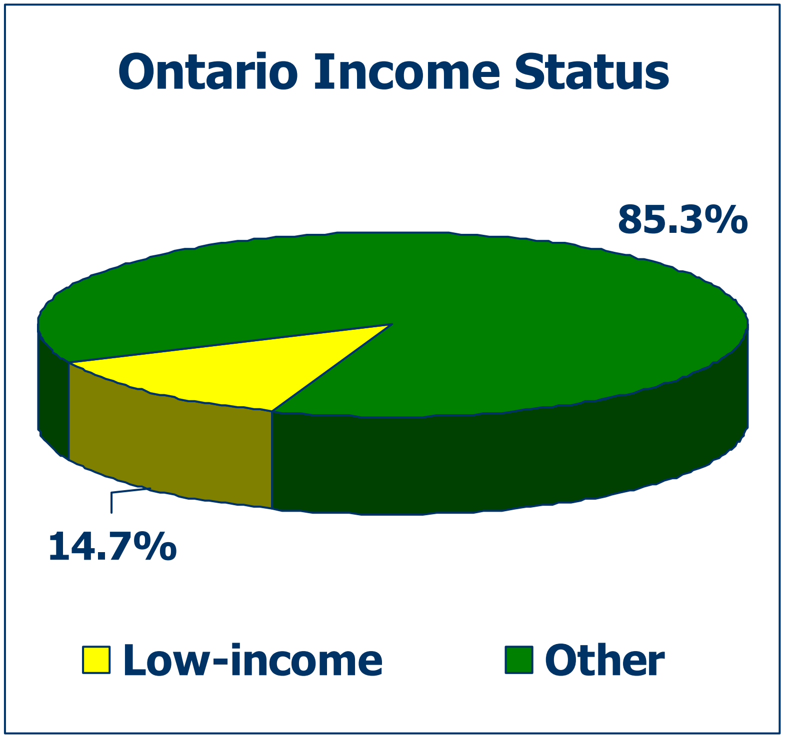
Source: Survey of Household Spending 2006, Statistics Canada

Energy use and the environment

- Electricity generating stations are big polluters.
  - 20% of greenhouse gases
  - 15% to 23% of smog-causing pollutants
  - Radioactive wastes we don't know how to deal with
  - 38% of electricity used by residential sector and apartments
- Home heating (electricity, natural gas and oil) responsible for 15% of greenhouse gas emissions in Ontario.
- Higher energy costs may spur conservation, BUT higher prices will increase the energy burden on low-income people who face barriers to accessing energy conservation/efficiency measures

Poverty

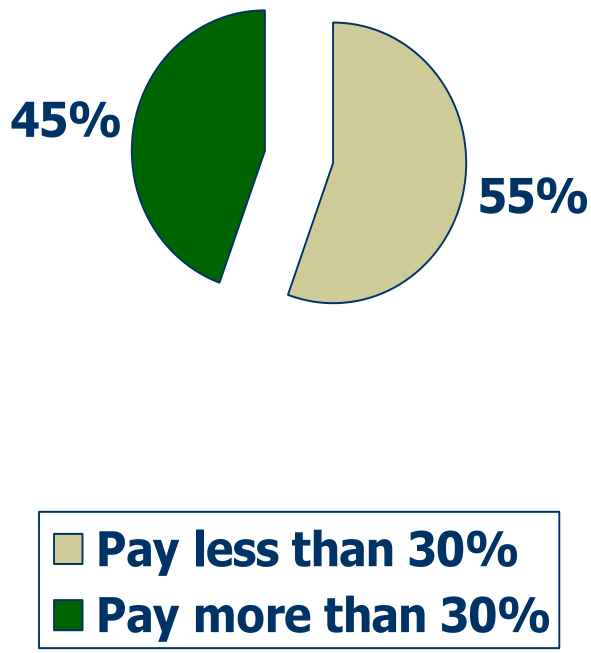
- 14.7% of Ontario's population (1,749,965 persons) are living at or below the "poverty line".
  - The majority of these persons live in tenant households, and in the private rental market



Source: Statistics Canada, 2006 Census of Population

Housing affordability and tenants

- 45% of Ontario's tenant households pay 30% or more of their household income on shelter costs (including utilities)
- 20% pay 50% and over of their household income on shelter costs - and are at risk of homelessness
- Impact of rising energy costs….



Low-income energy burden

- Low-income energy consumers face a disproportionate energy burden
- Energy burden refers to the amount of household income spent on energy
  - some experts say 6% is an affordable burden
  - U.K. fuel-poor household defined as spending more than 10%

Understanding Home Energy Burdens

Home energy burden =

Home energy bill / Household income

- Total shelter burdens affordable at 30% of income.
- Utility costs should be no more than 20% of shelter costs.
- Utility costs affordable at 6% of income

(20% x 30% = 6%).

Low-income energy burden

November 1, 2007 RPP - electricity bills for an average residential customer ranged from $92 to $140 per month.

- For a single mother with two children on social assistance, this represented 16% to 24% of her maximum shelter allowance of $595.
- For a single person working 35 hours a week at minimum wage ($8.00) this represented 8% to 12% of this worker's total monthly pre-tax income of $1213.33.

- The typical low-income family in Ontario has only a $200 "cushion" to buffer income interruptions or deal with unexpected expenditures.

Where do low-income consumers live?

759,590 LICO households (2001 Census)

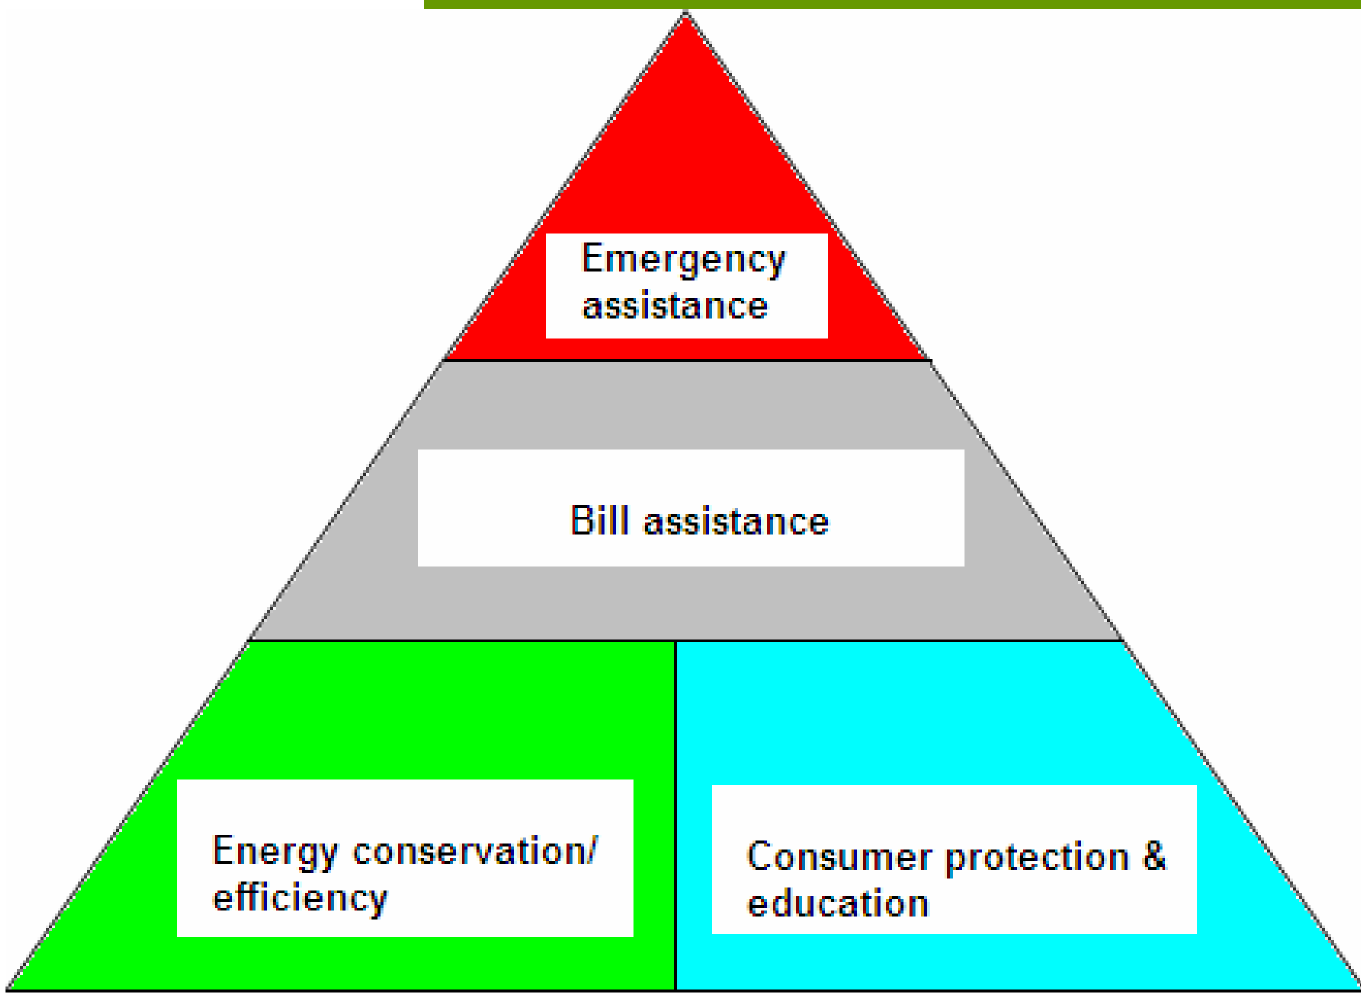
- 490,485 are tenant households (65%)
  - Live in social housing or private rental sector – most in multi-residential buildings
- 269,095 are homeowners (35%)
  - 39% are senior-led

SIMPLE SOLUTION

1. Affordable energy

2. Energy conservation

LIEN's approach to low-income energy conservation & assistance



What is needed

- A permanent low-income energy rate assistance program
- LIEN's proposal for an ***Ontario Home Energy Affordability Program*** has five major components: rate affordability, arrears management, crisis intervention, conservation and demand management, and consumer protections. It advocates that Ontario's low-income consumers should not be paying more than 6% of their total household income on energy.

Benefits of low-income energy efficiency program

- Lower energy bills for those least able to afford higher energy prices, as energy use drops by between 15% to 55%, depending on home and extent of measures
- Reduce poverty
- Reduce risk of homelessness
- Improve comfort/quality of life
- Reduce pollution, avoid building new expensive electricity generating plants

Benefits of low-income energy efficiency program

- Reduce demand for emergency assistance (public & charitable funds)
- Reduce costs to utilities associated with late payment or non-payment of bills (e.g. collection, disconnection, reconnection)
- Reduce costs to utilities associated with emergency calls
- Reduce need for public expenditures such as health, fire, building inspections, homeless shelters, and housing programs

Rising energy prices and low-income consumers

- Heating, eating or paying the rent will be a choice faced by many.

Ability to pay; just and reasonable rates

- Under the OEBA, the Board must approve or fix "just and reasonable rates"

- The Divisional Court has decided that the Board has jurisdiction to take ability to pay into account in setting rates

- The Board cannot deny this jurisdiction and refer the matter to be dealt with by Government

- The Board does not have an unfettered discretion - it must still produce just and reasonable rates

Ability to pay; just and reasonable rates

The Board must be guided by:

- ➔the public interest
- ➔ the protection of the interests of consumers with respect to prices and the reliability and quality of service

Unaffordable rates face low-income consumers with:

- ➔a choice between energy use against other essentials for normal living - a choice between "heating and eating"
- ➔disconnection of service

If rates are unaffordable, the goals of the public interest and protection of consumers are not served.

Topic 2: Existing energy assistance programs

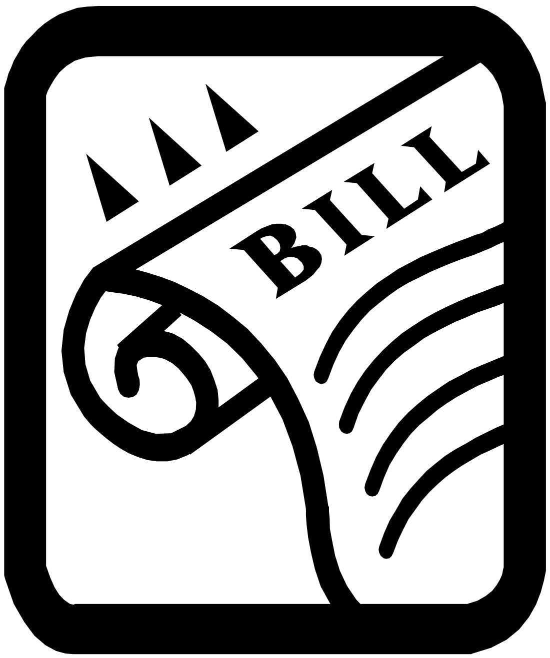
GAPS

- Patchwork of programs
- Differing eligibility criteria, application processes, and assistance levels
- Not available in all communities
- Don't provide enough money to solve the problem
- May be a grant or loan
- One-time funding only
- Funds tend to run out before the heating season is over
- Lack of awareness of existence of programs; lack of information
- Social stigma

Therefore, ill-suited to address permanent and widespread conditions of rising energy prices and income shortfalls

Topic 2: Existing energy assistance programs *continued…*

Rate assistance/emergency energy assistance



Emergency Energy Fund

- Provincial government announced "one-time" $2 million Emergency Energy Fund on March 29, 2004; renewed the fund in 2005 Ontario Budget, and annualized it; EEF doubled to $4.2 million in April 2006 (one-time)
  - *fund assists low-income households to pay energy arrears, security deposits and reconnection fees*

Topic 2: Existing energy assistance programs *continued…*

Rate assistance/emergency energy assistance

- **Shelter allowance**: Social assistance recipients who pay for heating costs directly can receive assistance for fuel costs as part of shelter allowance, up to a set maximum based on family size
- **Community Start-up and Maintenance Benefit (CSUMB)** pays for utility arrears, reconnections; maximum benefit can be accessed only once in 24-month period

Helping low-income consumers

Rate assistance/emergency energy assistance

- **Discretionary benefits** are available to assist OW/ODSP recipients with cost of utility arrears, deposits and reconnection fees

- **Share the Warmth, Winter Warmth** (Toronto Hydro & Enbridge Gas) and other charitable groups provide financial assistance to pay utility bills

Snapshot - low-income conservation programs

Enbridge Gas Distribution Inc.	$	4,558,250
Union Gas	$	4,303,000
LDCs' low-income CDM	$	4,293,120
LDCs' social housing CDM	$	4,554,216
OPA's Social Housing Program - Phase One	$	9,250,000
OPA's Energy Efficiency Assistance for Houses pilot	$	2,900,000
OPA's Canada-Ontario AHP Energy Efficiency Program	$	3,700,000
Total	$	33,558,586
OPA's Multifamily Buildings Program (6 units +)		RFP issued
OPA's Energy Efficiency Assistance for Houses program – expansion province-wide (5 units and under)		RFP issued

Utilities with Low Income and Social Housing Programs Implemented in 2005
(as reported by LDCs)

Low Income Measures

1. Aurora Hydro Connections Limited
2. Bluewater Power Distribution Corporation
3. Brantford Power Inc.
4. Centre Wellington Hydro Ltd.
5. Collus Power Corp.
6. EnWin Powerlines Ltd.
7. Guelph Hydro Electric Systems Inc.
8. Haldimand County Hydro Inc.
9. Hydro One Networks Inc.
10. Kitchener-Wilmot Hydro Inc.
11. Niagara Falls Hydro Inc.
12. Parry Sound Power Corporation
13. Peninsula West Utilities Limited
14. Port Colborne Hydro Inc.
15. St. Catharines Hydro Utility Services Inc.
16. Tillsonburg Hydro Inc.
17. Waterloo North Hydro Inc.
18. Wellington Electric Distribution Company Inc.
19. Whitby Hydro Electric Corporation

Social Housing Measures

1. Barrie Hydro Distribution Inc.
2. Enersource Hydro Mississauga Inc
3. Erie Thames Powerlines Corporation
4. Fort Frances Power Corporation
5. Hamilton Hydro Inc.
6. Hydro Ottawa Limited
7. London Hydro Inc.
8. Newmarket Hydro Limited
9. Oshawa PUC Networks Inc.
10. Powerstream Inc.
11. Toronto Hydro-Electric System Limited
12. Hydro One Networks Inc.
13. Kitchener-Wilmot Hydro Inc.

Helping low-income consumers

Energy conservation programs

- OEB encouraged LDCs to undertake low-income CDM, not mandatory
  - LIEN produced template for program for low-income homeowners and tenants who pay for utilities (electricity, gas) directly
  - Brantford Power piloted "Conserving Homes" program based on LIEN template

Helping low-income consumers

Energy conservation programs

- October 6, 2005 Minister's directive gives OPA/Conservation Bureau responsibility for low-income and social housing CDM - target of 100 MW reduction in electricity consumption and demand, or amount used by 33,000 homes
- OPA responsible for next phase of CDM programs through LDCs - $400 million over three years, beginning October 1, 2007

Helping low-income consumers

Energy conservation programs

- Social Housing Services Corporation (SHSC)
  - very motivated to reduce energy costs/consumption
  - Energy Management Program pilot and financing of retrofits
  - results from first phase audit of 5,000 units - $17.5 million needed for retrofits
- Discretionary benefits available for OW/ODSP recipients (homeowners or renters) to pay for pre-approved low-cost energy conservation measures
  - payment issued only once to benefit unit, may not exceed $50
  - for caulking, weatherstripping, insulating pipes, low-flow showerheads, CFLs, etc.

Helping low-income consumers

Energy conservation programs

- Federal government's 5-year, $500 million EnerGuide for Low-Income Households (EGLIH) program to assist 130,000 low-income households
  - some provinces (Saskatchewan, Newfoundland & Labrador) topped up EGLIH funding, piggy-backing additional energy conservation measures to achieve further energy reductions
- EGLIH <u>cancelled</u> by federal Conservative government in Spring 2006, along with EnerGuide program

Helping low-income consumers

Consumer protection

- Municipalities can pass Vital Services by-laws under Part VII of the *Tenant Protection Act*, but only a handful have
- these by-laws permit municipalities to step in to restore utility service in cases where tenants pay for the utility in their rent and the landlord has defaulted on payments
- a private member's bill has been introduced that provides for the provincial government to step in when there is no municipal vital services by-law in place

Topic 3: Low-income energy assistance programs in other jurisdictions

Low-income assistance can take many forms:

- Objectives of the program
  - Usage reduction
  - Rate Affordability

- Structure of the program
  - Rate affordability:
    - Percentage of income program (PIP)
    - Percentage of bill program (POB)
    - Discount (tiered, across-the-board)
  - Usage reduction:
    - Whole house
    - Base-load
    - Heating
    - Refrigerator replacement

Objectives of Low-Income Program

- Public health and safety
- Provide essential goods
- Efficient utility operations
- Provide least-cost service
- Prevent home energy insecurity
- Compensate for reverse subsidies

Forms of energy assistance programs in other jurisdictions: Ratepayer-funded programs

- **Fixed credit program**: New Jersey
  - Uniform statewide program
  - Gas and electric
  - Percentage of income based
  - Credits, not payments, "fixed"
  - Mandated by statute
- **Percentage of income program**: Ohio
  - Uniform statewide program
  - Made mandatory by Commission order.
  - Payments "fixed" as no greater than percentage of income.
  - Adopted under Commission inherent authority without statute.

Forms of energy assistance programs in other jurisdictions: Ratepayer-funded programs

- **Tiered discount program**: Indiana
  - Discounts vary based on income/resulting bill burden.
  - Adopted under Commission jurisdiction without statute.
  - Adopted by two natural gas utilities/not uniform statewide.
  - Participation based on LIHEAP enrollment
- **Straight discount program**: California
  - Mandated by statute.
  - Across-the-board 20% discount, not varying based on income (or bill burden)
  - Uniform statewide program (though outreach may differ by company)

Forms of energy assistance programs in other jurisdictions: Ratepayer-funded programs

- **Mixed program design**: Pennsylvania
  - Recommended: percentage of income or percentage of bill
  - If not PIP or POB, utility must show that it is at least as effective as PIP/POB
  - Adopted under Commission jurisdiction without statute.
  - Individual program designs, though within regulatory "guidelines" established by Commission.
  - Gas and electric utilities
  - Different utilities do different designs:
    - PECO: tiered rate discount
    - Multiple: Percentage of Income
    - Multiple: Percentage of Bill
    - Columbia Gas: Percentage of income (minimum average past payment).

U.S. experience: Impact on payments

- Payment are not “perfect” but are vastly improved.
- Payments measured in two ways:
  - Number of payments
  - “Payment coverage ratio” (payment / bill = coverage ratio)
- Experience shows:
  - Payments of payment-troubled customers are 10+ per year.
  - Payment coverage ratios are roughly 80 - 85% in Pennsylvania.
  - Payment coverage ratios are 90%+ in NJ.
  - As bill burdens increase, payment coverage ratios decrease.

U.S. experience: Impact on arrears

- Arrears are not eliminated, but are vastly reduced.
- Most difficult to change payment patterns of customers with historically high arrears.
- Payment patterns improve over time.
- Impact on arrears measured in three ways:
  - Number of accounts with arrears decrease.
  - Dollar levels of arrears decrease.
  - Seasonality of arrears leveled.
- Biggest impact on arrears are with those accounts having the highest arrears.

U.S. experience: Impact on collection activities

- The incidence of service terminations for nonpayment are dramatically reduced (70% or more).
- The intensity of collection contacts decrease:
  - While in past, collections may have progressed to point of a posted disconnect notice, under program, collections occur with mailed "reminder."
- Should not expect elimination (or even a reduction) in level of TOTAL collections activity.
  - By reducing collections toward low-income, utility can redirect collections toward other more productive accounts.
  - So, total collections remain the same, but are simply not attributable to low-income.

U.S. experience: Impact on revenues

- The financial impact on utility is not measured by amount of BILLINGS but rather on amount of RECEIPTS and at less cost of collection.
- **Indiana**: while program participants were BILLED 90% of what non-participants were billed, they PAID 111% of what non-participants paid.
- **Indiana**: both collection activity and low-income discounts reduced arrears. Low-income discounts reduced arrears more on a dollar-spent basis than did collection activity.
- Two conclusions: (1) low-income program can be revenue neutral (by increasing receipts even though reduced bills); and (2) low-income program can be more cost-effective in increasing receipts than the available collection alternative.

U.S. experience: Cost reductions

- There are cost offsets due to low-income program:
  - Bad debt decreases because payment responsibility for portion of bill is transferred to higher income households.
  - Bad debt decreases because low-income customers with more affordable bills pay better.
- Working capital decreases as arrears decrease.
- Customer service and collection expenses generally do NOT decrease, as customer service and collection activity simply transferred to other customers.
- Impacts on reduced expenses picked up in base rate cases.
  - Important to quantify only if there is a reconcilable rate rider to compensate utilities for program costs.

U.S. Experience: Usage Impacts

- No systematic usage increase has been found to occur as a result of a low-income affordability program.
- While no INCREASE usage occurs, programs tend to attract the highest use customers with which to begin (customers with low energy burdens choose not to participate).
- Two easy program mechanisms can be used to control usage:
  - An explicit connection between affordability program and usage reduction program, with high use participants referred to usage reduction.
  - A "fixed credit" program, which imposes cost responsibility for increased usage on customer, but allows customer to keep benefits of reduced usage.

Forms of Energy Efficiency Programs in other jurisdictions

- California – Low Income Energy Efficiency programs offered by electric and gas utilities
- Includes free weatherization, furnace repair or replacement
- Age, income, size of household and also disability form entitlement criteria

Energy efficiency – other jurisdictions, cont'd

- Connecticut – legislation requires delivery of low income residential programs
- Electrical programs delivered through community agencies; gas programs through a state Housing and Investment Fund for energy conservation loans and heating equipment upgrades

Energy efficiency – other jurisdictions, cont'd

- Illinois program since 1981
- 10 per cent of the benefits charge collected for the low-income energy assistance fund is provided for the low income weatherization assistance program
- Delivered through community agencies with priority to seniors and those with disabilities

Energy efficiency – other jurisdictions, cont'd

- Maryland - Columbia Gas Low Income Weatherization Program with Maryland Office of Weatherization
- Energy audits followed by weatherization; eligibility based on income and high gas usage

Energy Efficiency in other jurisdictions

- Massachusetts, Minnesota, Montana, New Jersey, New York and Oregon all also deliver low income energy efficiency programs

Topic 4: Rate-related measures and issues

- Not all low-income issues involve the design and implementation of a low-income "program."
- Many low-income issues involve the basic, historic process of setting cost-based rates.
- Due to the attributes of low-income customers, several issues arise with respect to basic rates and charges that relate to the imposition of undue burdens based on inattention to cost-causation.

Topic 4: Rate-related measures and issues: cost causality

- Cost causality means that the customer causing the costs should bear the costs. Conversely, if a customer does *not* cause the costs, he/she should not pay them.
- "Causation" is measured by a "but for" test: would the costs have been incurred but for the actions of the customer?
- Non-cost-based fees should be strictly scrutinized:
  - General customer service expenses should not be passed through in fees that disproportionately fall on low-income customers.
    - At the least, low-income should be exempt from such fees.
    - Disconnect/reconnect fees, collection fees, connection fees.

Topic 4: Rate-related measures and issues: basic rate structure

- Cost causality applies to the basic rate structure also, not just to fees.
- Inverted rate structure appropriate in an increasing cost environment.
- Cost-causation, however, means that:
  - appropriately sizing the first block is as important as getting the rate differential between blocks correct.
  - Seasonal rate differentials applied to the first block are rarely justified on a cost-causation basis.
  - Lost rate recovery/lost fixed cost recovery is rarely justified from the first block on a cost-causation basis.
  - Rate recovery of expensive peaking fuels/purchased power costs can rarely be justified from the first block on a cost-causation basis.

Topic 4: Rate-related measures and issues: the use of "price signals"

- Many economists argue that the rate structure should be used to send "price signals" to customers.
- The notion of "price signals" should not substitute for a rigorous analysis of the cost-causation relationship between charges and costs.
  - A non-cost-based charge cannot be justified on the basis of sending a "price signal."
- "Price signals" should be supported by data regarding:
  - The need for the price signal
  - The effectiveness of the price signal
- Consumer "price signals" are rarely effective for low-income customers.
  - Cannot control usage by "choice" without substantial investment.
  - Cannot afford to pay bills in the first instance.

Topic 4: Rate-related measures and issues: reciprocity of burdens and benefits

- The basics of cost-causation counsel that if a customer causes the cost to be incurred, that customer should pay the cost.
- There should be, however, a reciprocity in costs and benefits. The converse should be: if a customer causes a benefit to be incurred, that customer should reap that benefit.
- The reciprocal nature of the issue of "cost-causation" is frequently ignored. For example:
  - If low-income customers disproportionately contribute cash deposits, those customers should be allocated the benefit of the rate of return avoided by that customer-contributed capital.
  - If low-income customers disproportionately pay non-cost-based late fees, those customers should be allocated the revenue from those fees.
  - If low-income weatherization helps reduce bad debt and/or working capital, those avoided expenses should be captured and allocated back to additional weatherization.

Topic 4: Rate-related measures and issues: principles to be pursued

- The principle of cost-causation should be applied to miscellaneous customer service fees and charges as well as to basic rates.
- Cost-causation is measured by a “but for” test.
- Cost-causation may manifest themselves in non-price ways (e.g., size of initial consumption block).
- A rate based on “price signals” must be rigorously supported by evidence as to need and effectiveness.
- There should be reciprocity in “cost-causation.”
  - Benefits as well as burdens should be allocated back to the customers who “cause” them.

Rate affordability assistance: how does this issue of "cost-based rates" fit in?

- "Cost-based" is not a strict test. The term "costs" has many aspects to it:
  - Fully-embedded vs. marginal
  - Original cost vs. replacement cost
  - Long-run marginal cost vs. short-run marginal cost
  - Fixed costs vs. variable costs
- Cost subsidies have been used to promote social goals in the past:
  - Rural electrification promoted by rate averaging
  - Basic telephone service promoted by subsidies
  - Economic development promoted by fixed cost contribution theory
  - Carbon reduction promoted by "conservation incentive" rates.

Rate affordability assistance: how does this issue of "cost-based rates" fit in?

- Non-cost based rates approved when they are a BURDEN to low-income:
  - 1.5% per month late fees are not cost-based.
  - Deposits are not cost-based.
- Subsidy need not be cost-based if it is a PAYMENT (akin to rents).
  - Support of universal service a payment for grant of right of eminent domain.
  - Support of universal service a payment for grant of right to use public rights-of-way (e.g., streets, alleys)

Topic 5: Customer Service Issues and Arrears Management Programs

- Payment period
- Disconnection
- Security deposits
- Arrears management programs

Topic 5: Customer Service Issues and Arrears Management Programs

LIEN supports terms and conditions for utility service (e.g. consumer security deposit requirements, payment time-lines and plans, disconnection and reconnection policies, termination moratoria) that are in the best interests of low-income consumers, and:

- will not add to the service costs and penalize low-income consumers who are experiencing payment difficulties,
- will assist low-income consumers in accessing and maintaining essential utility service.

Payment options

- Low-income customers should be provided equal access to payment options meeting their needs.
- Payment periods:
  - Customers on fixed incomes may need to be able to specify the date on which they make payments (e.g., Entergy “pick-a-date” program) to ensure that payments are not due before income is received.
  - Customers using external payment centers should not be penalized for any lag in transfer and posting of payments.

Equal billing

- All distributors should offer equal billing plans to low-income consumers.
- In addition, equal billing should be available to low-income consumers who have enrolled with an electricity retailer. Community legal clinic clients have fallen into default on their electricity bills when they have switched to retailer supply because their equal billing option disappears.
- Credit history should not be a barrier to low-consumers enrolling in an equal billing plan since such plans will assist in reducing payment defaults.

Late payment fees

- Late payment charges that disproportionately and adversely affect low-income customers can be a barrier to accessing electricity service as they add to service costs and increase the risk of disconnection if low-income households are not able to make full bill payments.
  - Late payment charges cannot be justified as a "cost-based" fee.
  - Late payment charges cannot be justified as an "incentive" to pay, particularly for low-income customers.
  - Late payment charges cannot be justified as either "cost-based" or as an "incentive" for customers current on deferred payment plans.
- There should be a mandatory exemption or waiver of late payment charges for low-income consumers. A late payment fee waiver is also a component of the basic consumer protections in the LIEN proposal for a ratepayer-funded *Ontario Home Energy Affordability Program for Low-Income Households*

Disconnection

- An over-riding goal of LIEN's comprehensive strategy to address energy poverty is to pro-actively prevent service disconnections for low-income consumers who cannot afford to pay for their utility bills and other basic necessities.

- The establishment of a low-income rate affordability program will be a major step towards avoiding electricity disconnections for arrears.

Disconnection

- Crucial that LDCs' disconnection policies and procedures maximize the opportunities for low-income consumers facing service termination due to arrears to access emergency energy funds that they may be eligible to receive to prevent disconnection and/or restore service.
- This should be done in consultation and co-ordination with the relevant provincial ministries, municipal service managers, social service agencies and/or delivery agents.

Disconnection moratoria

- No service termination for low-income households in the heating and cooling seasons. OEB should protect against weather-induced death and illness.
- Other disconnection moratorium conditions should take into account age and medical conditions (households where infants and/or persons over 65 years of age reside, medically fragile)

Disconnection

- While the over-riding policy is to prevent the disconnection of service, the "threat" of disconnection can be as harmful as actual disconnection.
- Consumer protections are needed with respect to the use of disconnect notices:
  - Utilities should not threaten to disconnect in instances they do not intend to disconnect.
  - Utilities should not "over-notice" the potential of disconnections, as over-noticing leads to customers ignoring "legitimate" notices.
  - Utilities should not threaten a disconnection under circumstances where disconnection is not permitted (e.g., current on payment plan, protected by medical conditions, protected by severe weather moratorium).

Security deposits

There should be a mandatory exemption for low-income households from security deposit requirements which can adversely impact, or even exclude, these households from accessing energy.

- Other options – alternatives to cash security deposit, i.e. letter of guarantee/letter of credit
- OEB has set guidelines for collection of deposits, including payment by instalments

Arrears management programs

- LIEN's proposal for a ratepayer-funded *Ontario Home Energy Affordability Program for Low-Income Households* also includes an arrearage management program comprised of the following components:

- Arrears are to be retired over a two-year period;
- Customers are to make co-payments toward their arrears;
- Co-payments are to be set equal to an affordable percentage of income (1% per year);
- No pre-condition is established for the grant of arrearage management credits; and
- The appropriate response to non-payment is to place the program participant in the same collection process as any other residential customer.

Topic 6: CDM/DSM Programs for Low-Income Consumers

What is needed:

- Permanent, adequately-funded energy conservation programs for low-income consumers, with targets for the number of homes to be retrofitted annually.
- Such programs should be available at no cost to eligible participants and be equitably accessible province-wide.

Energy conservation and low-income consumers

Conservation is a cheap, fast, clean solution to energy crunch and climate change crisis

More efficient use of energy:

- reduces pollution major respiratory health improvements especially for youngest and oldest
- avoids cost of new generating plants
- reduces energy bills and lessens effect of rising prices
- makes housing more affordable & comfortable

BUT, it won't happen in low-income residential sector without financial investment **...**

CDM/DSM measures

- To achieve deep reductions in energy use, fuel-neutral programs should have a wide suite of measures (draftproofing, insulation, heating equipment upgrades) and be tailored to distinct low-income consumer groups: homeowners, tenants in private rental housing, and tenants in social housing.

Why is tenant involvement important?

- Deep reductions in energy use through energy efficiency will not be fully realized if there isn't a concurrent energy conservation education program to help shift tenants behaviour
- The best way to deliver an energy conservation program to low income tenants is by having low tenants design and deliver the energy conservation program

Why is tenant involvement important?

- Tenants can identify unforeseen opportunities and challenges in energy saving programs because they know their situation better than any of us.
- Tenant leaders set a good example and teach fellow tenants about saving energy – this results in real behaviour changes
- What motivates tenants to save energy will vary by situation, but we know it's not always about saving money!

Tenant-led energy saving programs exist

- Brahms Energy Savings Team (BEST) and Walpole is Reducing Energy (WiRE) were two successful tenant-led energy conservation programs run in TCHC neighbourhoods (2005, 2007).
- Low Income Tenant Energy Savers (LITES) is engaging tenants living in private high rise buildings in both Ottawa and Toronto
- The City of Toronto supports community-led conservation programs and it is being realized through Live Green Toronto

Important Program Principles

- Free for tenants to participate
- Open to everyone in the building, regardless of income/benefits.
- Tenants help design and deliver the program
- Peer education (tenants teaching tenants)
- Offers tools and materials that enable tenants to start saving energy right away (e.g. power bars, light bulbs, etc.)
- Supportive landlord who will ‘do their part’ (appliance replacement, retrofits, maintenance)

Brahms Energy Savings Team (BEST)

- 342 units and about 850 tenants (350 of whom are children)
- hired and trained six tenants from the buildings as community education and outreach workers (or Animators).
- Animators designed and delivered an energy education program that engages their fellow tenants in their primary language (English, Farsi, Somali, and Tamil) and in culturally appropriate ways.
- 75% of households participated
- 6.6% in energy reduction annually
- won 2006 Green Toronto Award for best community project

Walpole is Reducing Energy (WiRE)

- Downtown east end, 118 units
- 3 animators delivered the program
- WiRE reached 85 households
- 90% found the material easy to understand and use
- 87.5% said they learned new things
- 87.5% felt they saved money as a result of the WiRE Program
- 96.4% also said they were more comfortable

Low Income Tenant Energy Savers (LITES)

- Saving Energy: The 6-Step Guide to Tenant Action
- Regional Workshops – Toronto, Ottawa, Windsor
- 2 Tenant-led Energy Conservation Programs in private high rise buildings
  - 2 apartment buildings in Ottawa (owned by TransGlobe)
  - 2 apartment buildings in Toronto (owned by CAP REIT)

DSM for Low-Income Consumers in Ontario

- Low-income housing is also older and more in need of maintenance than the Ontario average, implying there are significant energy efficiency gains to be made
- Low-income households have fewer appliances than the average home, although these appliances and heating systems in low-income housing are older than the average, and hence less energy efficient

Access and control issues

- Much of the energy burden of low income consumers is "inelastic"
- Examples include heating, water heating, lighting, and basic appliances such as refrigeration
- Low income consumers lack control or access to capital in terms of building envelope, insulation, weatherization, efficient appliances

Characteristics of low-income dwellings

- More likely to be space heating
- More likely rented
- More likely spending relatively more on basic energy needs than higher income quintiles

Household equipment

- 27% of the lowest household income quintile have electric heating as their principal heating equipment (compared to 12.9% for the average income household)
- 62.6% of lowest income households had principal heating equipment over 10 years old (compared to 48.3% in highest income households)
- 39.3% heated hot water with electricity in lowest income quintile, compared to 15.1% in highest quintile
- The age of heating equipment also implies efficiency and cost differences in absolute terms
- Impacts of these differences on lowest income households are disproportionate

Types of low-income energy efficiency programs

- Energy audits
- Weatherization including weather stripping, caulking, attic insulation, storm windows
- Appliance replacement, particularly refrigerators
- Furnace repair or replacement
- Fuel switching (e.g. electrical space heating to natural gas, propane or oil in Vermont)

Societal benefits of low-income DSM

- Participation in energy savings and climate change
- Significant component of residential energy use
- Avoidance of energy cost mobility and improved educational outcomes for youth

Societal benefits of low-income DSM cont'd

- Reduced need for public expenditures on health, fire, housing and homeless shelters
- Reduced emergency calls to utilities
- Reduced utility costs re collection, termination, reconnection
- 17 to 300 percent "benefit adder" cited*

Topic 7: Time of Use Pricing; Sub-metering issues; energy retailers

Energy Retailers:

- Addressing issue of early termination fee for vulnerable low-income households under certain conditions

Who’s calling for Smart Meters, sub-Metering?

Ontario government

- have facilitated expansion of Smart Meter initiative to condominiums and multi-residential rental sectors to reduce electricity peak demand

Landlords

- want to transfer in-suite utility costs directly to tenants

Suppliers

- Smart sub-metering providers see business opportunity in multi-residential rental sector

Smart Meters; sub-metering

Smart meters

- Record how much, and at what time of day, electricity is used (unlike current mechanical/analog meters)

Sub-meters

- Installed behind master or bulk meters; measure electricity consumed in-suite in order to individually bill tenants. Electricity sub-meters can also be smart meters.

Smart sub-metering

- Landlord with bulk meter is the customer of the electricity LDC; smart sub-metering provider, acting on behalf of the landlord, issues bills to each tenant household in the building for in-suite consumption; collects payments and remits to landlord

How many tenants; where do they live?

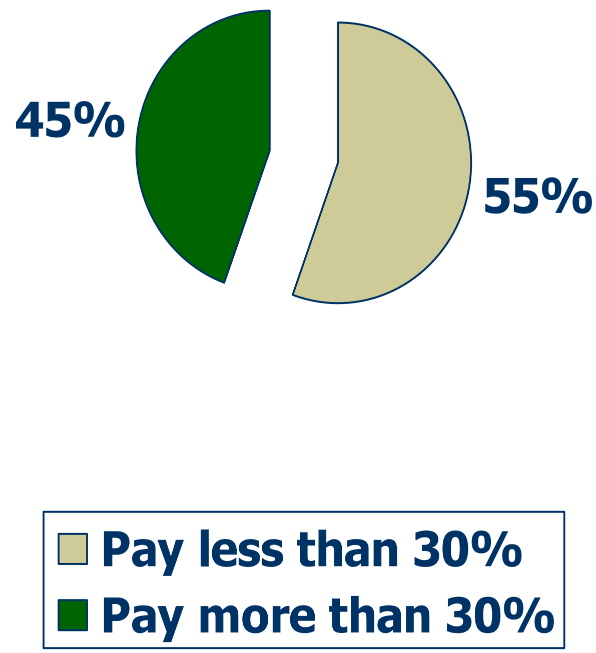
- 28.8% of all Ontario households are renters (1,312,295 tenant households)
  - 40% live in apt. buildings with five or more storeys
  - 29% live in apt. buildings with fewer than five storeys

Housing affordability and tenants

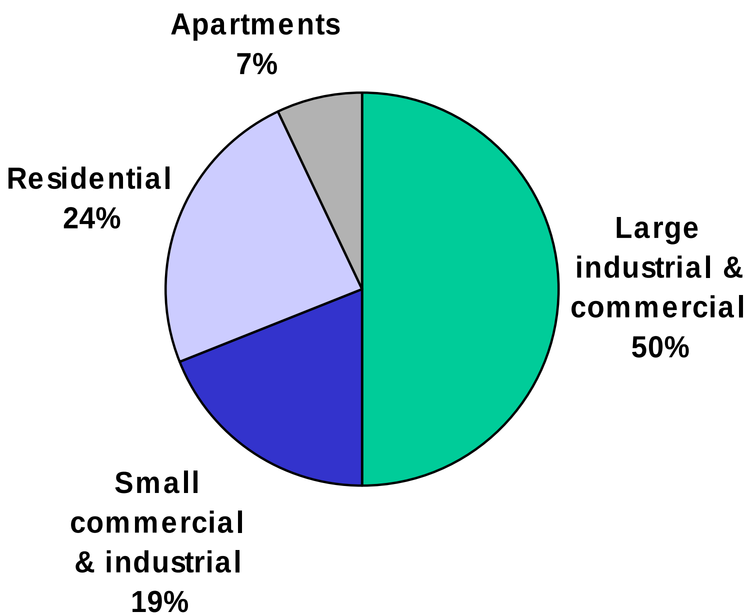
- 36% of Ontario's tenant households are living at or below the "poverty line" (2001 Census)
- The median income of Ontario's renter households is less than half of homeowner households ($33,447 vs. $74,712) – 2006 Census
- Ontario renter households represent 31% of all Ontario households, but comprise 66.4% of Ontario households in core housing need (2001 Census)

Housing affordability and tenants

- 45% of Ontario's tenant households pay 30% or more of their household income on shelter costs (including utilities)
- 20% pay 50% and over of their household income on shelter costs - and are at risk of homelessness
- Impact of smart sub-metering....



What percentage of electricity use in Ontario is from apartments?



- Our best estimate is that bulk-metered apartments, i.e. those that are candidates for sub-metering, comprise only 7% of Ontario's annual electricity consumption

Tenants and electricity use

Currently:

- most tenants in multi-residential private rental sector pay for utilities in their rent
- estimated that 85% to 90% of multi-residential buildings are bulk-metered, and most Ontario apartment buildings are not electrically heated
- most social housing tenants pay for utilities in their rent; only 18% of tenants pay electricity bills directly

Conservation does matter for tenants

- It's their home
- They pay for utilities – either in rent or directly
- They pay when landlords apply for above-guideline rent increases for "extraordinary" increases in utilities costs, or for capital expenditures for energy (or water) conservation work
- They are affected by climate change
- Their early engagement is essential for maximizing energy savings

Conservation does matter for landlords

- Utility prices are rising, increasingly volatile operating cost
- Need to maintain and environmentally retrofit their buildings to protect their assets and to ensure ongoing marketability, minimized vacancy loss
- They are affected by climate change
- Their early engagement is essential for maximizing energy savings

Who will get a Smart Meter?

- Original target was to install 4 million smart meters for all Ontario customers (residential) by 2010 at a cost of $1 billion
- Interim target of 800,000 meters in homes and small businesses by 2007
- "smart metering initiative" now means equipping each household in Ontario with a smart meter over time

Who will get a Smart Meter? cont'd

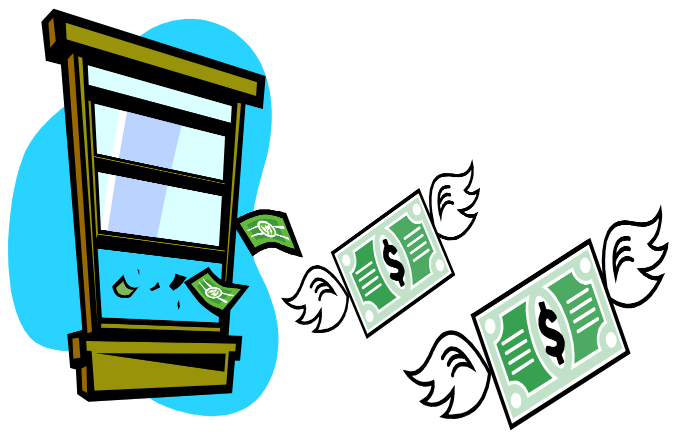
- government had been unclear on whether individual Smart Meters would be installed in each apartment and condo unit in the province
- initiative now includes condos (Bill 21, *Energy Conservation Responsibility Act, 2006)* and rental sector (Bill 109, *Residential Tenancies Act, 2006)* – *voluntary, not mandatory*
- Condo smart metering & smart sub-metering regulations in effect as of December 31, 2007; OEB has issued Smart Sub-metering Code and is licensing smart sub-metering providers

Is Smart Metering the answer, effective conservation?

- intended to encourage consumers to shift electricity use to off-peak hours
- BUT, low-income households have least capacity to shift energy use (families with children, seniors, disabled, unemployed)

If tenants pay directly for in-suite energy use, will they will use less?

- Landlord controls building envelope (windows, insulation), HVAC systems, appliances such as fridges
- Tenants control discretionary energy use in-suite
- Both impact on energy use reduction efforts



If tenants pay directly for in-suite energy use, will they will use less?

- Smart sub-metering energy savings claims vary – 10% to 40%, 15% to 25%, average of 25% to 33% - but, no expert, neutral study undertaken to date with detailed analysis of how smart sub-metering savings are being achieved
- Study should include cost-benefit analysis of sub-metering vs. energy efficiency retrofits vs. energy conservation education and examine:
  - the characteristics of the buildings and individual units where smart sub-meters are installed,
  - who is or is not achieving energy savings and why, and
  - the impact on housing and financial security of the residents

If tenants pay directly for in-suite energy use, will they will use less?

110-unit building in Toronto – smart sub-metered

- **41% of units paid more** (reduced rent + electricity bill), 12% paid same, **47% paid less**

- According to a sub-metering company, in multi-unit buildings:
  - 70% of residents use 50% of electricity (low users)
  - 20% of residents use 25% of electricity (medium users)
  - 10% of residents use 25% of electricity (high users)

Split incentive between landlords and tenants

- landlords want to minimize costs and make a profit; tenant seeks safe, comfortable, affordable home
- tenants don't have authority to invest/retrofit – or financial resources
- Smart sub-metering shifts financial incentive to provide and maintain an energy-efficient building & appliances for tenants – could undermine conservation efforts

Energy efficient fridges

- refrigerator replacement was the 2nd most recommended energy-saving measure in SHSC's Green Light initiative energy audits
- In 1990, refrigerators larger than 16.4 cu.ft. used more than 1000 kWh annually on average – cut in half by 2003

Smart sub-metering & tenants

- Part VIII, sections 137 and 138 of *Residential Tenancies Act, 2006– still to be proclaimed, regulations to be developed*
  - Landlords <u>may</u> install Smart Meters <u>without sitting tenant consent</u>; transfer electricity costs directly to tenants, outside of rent
  - Provisions for rent reductions and energy conservation obligations on landlords to be worked out in regulations

Smart sub-metering & tenants

- Currently, smart sub-metering activity taking place under section 125 of the RTA
- requires **consent** of sitting tenant before landlord can transfer the cost of electricity use to the tenant directly and decrease rent; proceeding without consent, landlord may be subject to a fine of up to $10,000 under RTA section 31(1)
- if sitting tenant does not consent, landlord may rent unit without utilities on turnover

Smart sub-metering & tenants

Lease agreement clause – consent??:

- *"The Tenant also acknowledges that where hydro is currently included in rent the Landlord, in its sole discretion, may at anytime chose to meter the Tenant's rented premises separately and transfer responsibility for payment of hydro directly to the Tenant based on the Tenant's own consumption. In such an event, the Landlord shall reduce the monthly rental in accordance with applicable Rent Control Legislation and the Tenant hereby consents to such transfer or responsibility for payment of hydro."*

- These clauses may not be legal.

Effective conservation & fairness

- Crafting of the regulations under Part VIII of the RTA will be crucial to ensuring that:
  - the energy conservation obligations on landlords will be those most effective in reducing energy consumption/costs for tenants, <u>and</u> in helping to meet province's conservation goals
  - the rent reduction after tenants take on the in-suite utility costs will be calculated fairly

Topic 8: Program Funding Mechanisms

- Ratepayer-funded
- Stability, predictability
- Equitable
- Incorporated in whole cost of system
- Burden of a very expensive system otherwise very inequitably borne by the most vulnerable

Rate Assistance: Funding through rates the most reasonable way to support low-income programs

- Legislative support is not the most appropriate way:
  - Legislative funding is uncertain (makes program planning impossible).
  - Legislative support is inflexible.
    - If prices go up, legislature cannot respond. If weather is severe, legislature cannot respond.
    - If prices go up, weather is severe, rate-based assistance automatically goes up as sales volume goes up (and vice versa).
- Legislature support involves no reciprocity. The public provides all the support, but the utilities keep all the benefits from reduced costs.

Rate Assistance: 4 different ways to collect a “system benefits charge”

- A straight per meters basis (e.g., Illinois)
- A straight volumetric basis founded on a per unit of energy (e.g., Maryland, New Jersey)
- A volumetric basis founded on a percent of revenues (e.g., Maine)
- A mixed volumetric/per meters (allocate between customer classes volumetrically but collect within customer class on a per meter basis) (e.g., Colorado).

Rate Assistance: It is appropriate for ALL customer classes to contribute

- The nearly universal rule is that all customer classes contribute (NH, ME, NJ, MD, OH, IN, MN, UT, CO, AZ, CA)
  - Only Pennsylvania allocates exclusively to residential (that decision is subject to court review).

Rate Assistance: It is appropriate for ALL customer classes to contribute

- From a policy perspective, it is appropriate to charge all customer classes:
  - Universal service is a "public good" that should be paid by all.
  - Universal service yield public benefits that benefit all customer classes (e.g., consider economic development impacts; reduced health care costs; impact of more affordable housing on employee recruitment and retention).
  - Universal service yields direct benefits to all customer classes (e.g., consider wage supplements for low-wage employers).
  - No single customer class "causes" need for universal service. Nonparticipating residential ratepayers no more cause universal service costs than do nonparticipating commercial/industrial ratepayers.

Usage Reduction: Program Funding – precedents in other jurisdictions

- Low income DSM programs offered to eligible participants free of charge
- One model: proportion of rates collected
- Another model: A Universal System Benefits Charge (e.g. Montana)
- May be supplemented by additional sources: federal or state/ provincial governments; grants and donations including in-kind

Usage Reduction: Precedents cont'd

- **Vermont**: statewide provider, Efficiency Vermont is funded by an energy efficiency charge on electric bills while the gas programs are funded by a variety of funding sources
- In **Oregon**, DSM budgets are embedded in rates, including low income programs mandated by the state.

Usage Reduction: Precedents cont'd

- **New York** provides electric efficiency program including for low-income customers under a systems benefits charge.
- **New Jersey** has a Societal Benefits Charge created by legislation which is aimed at improving energy affordability through energy efficiency measures.

Usage Reduction: Precedents cont'd

- **Montana**'s weatherization program is funded by a Univeral System Benefit Charge, also legislated by the state
- **Minnesota** allocates a percentage of state revenues for gas and electric utilities to energy conservation improvement which is required by law and includes low income programs

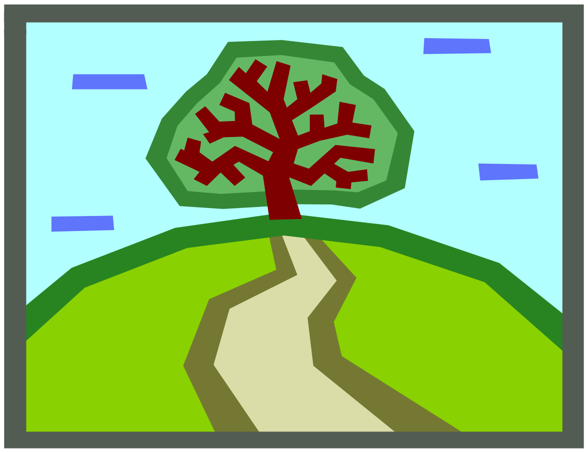
Usage Reduction: Precedents cont’d

- **Maryland**’s Electric Universal Service Program assists low income customers with their electric bills; most of the funding comes from industrial and commercial customers with the remainder from residential customers at 40 cents per month.
- **Illinois** administers a monthly systems benefit charge of .40 on residential gas and electric accounts, and higher amounts on commercial and industrial accounts for a state fund for low income energy efficiency

Usage Reduction: Precedents cont'd

- **Connecticut** administers a system benefits charge for energy efficiency on all electricity sold in the state; a portion is spent on low income energy efficiency
- **California** obtains funding for its low income energy efficiency programs, both gas and electric, from a system benefits charge on customers bills.

Going Forward



- OEB needs to initiate a generic hearing on a low-income rate affordability program
- Province-wide low-income CDM/DSM programs that provide deep reductions in energy use

ecoENERGY Retrofit for Homes	Government of Canada	Energy Efficiency	In January 2007, the federal government introduced the ecoENERGY Initiative to help Canadians use energy more efficiently, boost renewable energy supplies and develop cleaner energy technologies. ecoENERGY Retrofit for Homes provides home and property owners with grants of up to $5,000 to offset the cost of making energy-efficiency improvements. Only homes that have undergone a residential energy efficiency assessment by an energy advisor licensed by Natural Resources Canada will be eligible for grants. The ecoENERGY Retrofit grant is based on the type and number of energy improvements that have been made, and how much the efficiency of the home has been improved. The grant is based on how effective that upgrade is in saving energy, not on the cost of the upgrade. The maximum grant one can receive per home or multi-unit residential building is $5,000; whereas the total grant amount available to one individual or entity for eligible properties over the life of the program is $500,000. Residential Rehabilitation Assistance Program (RRAP) for Homeowners	Canada Mortgage and Housing Corporation	Loan forgiveness	Financial assistance to low-income homeowners for mandatory home repairs that will preserve the quality of affordable housing. The program helps people who live in substandard dwellings and cannot afford to pay for necessary repairs to their home. Homeowners may qualify for assistance if your property is eligible and if your total household income is at or below the Income Threshold set by CMHC. In general, mandatory repairs related to heating, structural, electrical, plumbing and fire safety are eligible for funding under Homeowner RRAP. Assistance is in the form of a fully forgivable loan. The loan does not have to be repaid if you agree to continue to own and live in this hous during the earning period, which could be up to five years (the loan forgiveness period). The amount you could receive is based on the cost of mandatory repairs and the area in which you live. Energy Efficiency Program for Houses (Single Family Homes) / Ministry's Low Income CDM Initiative	Ontario Power Authority	Energy Efficiency	Objectives of the program: (1) Achieve energy consumption and demand savings in low-income single family homes to support the 100 MW Low Income and Social Housing Directive; (2) Create awareness among low-income households and their support networks about the benefits of energy conservation; and (3) Establish effective channels for the delivery and implementation of Conservation Demand Management programs sensitive to the needs of the low-income community. The 100 MW Low Income and Social Housing Directive is designed to reduce overall electrical energy consumption and demand by residents of low-income and social housing by up to 100MW; also expected to result in longer-term reductions in electricity peak demand, particularly by reducing the use of inefficient appliances.	X																					X										"Housing Initiatives." OPA Initiatives. Ontario Power Authority. 13 August 2008 <http://www.powerauthority.on.ca/Page.asp?PageID=751&SiteNodeID=406> Minister of Energy, "Conservation and Demand-Side Management Initiatives (Residents of Low-Income and Social Housing)." Memorandum to Ontario Power Authority, dated October 2005.
Multi-Family Building Program	Ontario Power Authority	Energy Efficiency	Objectives of the program: (1) Reduce, by 2010, the multi-family building sector's contribution to the electricity needs of the electricity system for summe peak demand by at least 100 MW and overall energy consumption by 385 GWh/yr; (2) Reduce the energy burden imposed notably on low income residents and their housing providers and/or building owners, managers, and operators; (3) Promote sustainable, comprehensive, 'building as a system' energy management initiatives in which buildings are regarded as an integrated whole with interactions among energy efficient measures within a project that can affect the building's overall energy efficiency performance; (4) Integrate multi-family building conservation projects with other OPA initiatives. For examples, OPA demand response, distributed generation, renewable energy; (5) Raise the level of energy awareness through education; and (6) Promote the culture of conservation within the multi-family sector.	X																					X										"Housing Initiatives." OPA Initiatives. Ontario Power Authority. 13 August 2008 <http://www.powerauthority.on.ca/Page.asp?PageID=751&SiteNodeID=406>
Enbridge Home Weatherization Retrofit Program	Enbridge Gas	Energy Efficiency	The Enbridge Home Weatherization Retrofit program provides income-eligible participants in the GTA with a free home energy assessment and weatherization upgrades at no cost, to improve the energy efficiency of their home. Program participants can save between 15 to 75% on their monthly gas bills. Green$aver will conduct a thorough energy assessment and use the assessment to identify cost-effective energy efficient recommendations to implement, including draft-proofing and insulation. Green$aver will also be responsible for implementing the measures in each home with their experienced retrofit crews. Approximately 300 qualifying low-income Enbridge Gas customer households will benefit from this pilot program.	X																			X	X	X		X								"Enbridge Home Weatherization Retrofit Program." Residential Energy Affordability Program (REAP)	Conserve Nova Scotia and Dept of Community Services	Energy Efficiency	Program designed to help low-income households take control of their energy costs. Under the pilot program, Conserve Nova Scotia, funded energy efficient upgrades in 105 homes across the province. Under the current program, Conserve Nova Scotia has provided funding to upgrade an additional 200 homes. These homes are scheduled to be upgraded by fall 2008. Initial results indicate that participating homeowners save on average 30% on their energy bills. Participating homes first undergo a home energy evaluation, and then upgrades are completed to make the building more efficient (at no cost to the homeowner). There is no application for this program. All homes were selected based on pre-approved lists for housing programs from the Department of Community Services. Climate Action Credit	British Columbia	Energy Efficiency	On July 1, 2008, subject to approval by the legislature, British Columbia will begin to phase in a fully revenue-neutral carbon tax with built-in protection for lower income British Columbians. The purpose of the carbon tax is to encourage individuals and businesses to make more environmentally responsible choices, reducing their use of fossil fuels and related emissions. The tax has the advantage of providing an incentive without favouring one way to reduce emissions over another. Business and individuals can choose to avoid it by reducing usage, increasing efficiency, changing fuels, adopting new technology or any combination of these approaches. To help offset the cost of the carbon tax, lower-income British Columbians will receive an annual Climate Action Credit of $100 per adult and $30 per child; the credit will be paid quarterly along with the federal Goods and Services Tax Credit. Social Assistance	Yukon Health & Social Services	Rate Assistance	Yukon Social Assistance is a program that provides financial assistance to people who do not have enough money to live on. This program is to be used only as a last resort after all other possible sources of income have been explored. When you cannot meet your basic living expenses, and you have tried all other possible sources, then you may be eligible for Social Assistance. If you are eligible for income assistance from any other Government, Agency or Program you are required to access that source first before coming to the Yukon Government's income assistance program. A shelter allowance is provided to cover expenses. The amount varies depending on family size and what community you live in. The actual costs of utilities are also covered, up to a maximum depending on family size and time of year.											X												X										"Social Assistance." Programs & Services: Social Assistance. Yukon Health & Social Services. 13 August 2008 <http://www.hss.gov.yk.ca/programs/social_services/assistance/>
Pioneer Utility Grant	Yukon Health & Social Services	Rate Assistance	Pioneer Utility Grant is also available to seniors living in their own homes to offset the costs of utilities. Alabama	$ 17,111,350	150% Federal Poverty Level	Heating and Cooling: $70 min, $240 max	Heating: 110,340; Cooling: 40,000	4.3%	Max. benefit: $2,826	125% Federal Poverty Level	846		Neighbors Helping Neighbors Fund In 1996, Senate Bill 45 was passed in the legislature providing for a state low-income weatherization program to supplement federal funds by including a voluntary tax check-off option for state income-tax filers. Taxpayers may designate an amount of their refund as a voluntary contribution to the "Neighbors Helping Neighbors Fund". The Department of Economic and Community Affairs will administer the monies, which will help provide weatherization assistance to eligible recipients.		Alabama prohibits the disconnection of residential electric or natural gas service for nonpayment when the National Weather Service forecasts that the temperature at that location will be 32 degrees Fahrenheit or below for that calendar day.		Alabama Power Co: Customers who are verified as Supplemental Security Income (SSI) or Aid for Families with Dependent Children (AFDC) recipients will not be billed a monthly service charge of approximately $8.91. Alagasco: Customers who receive Supplemental Security Income (SSI) or Aid fo Families with Dependent Children (AFDC) will not be billed a monthly customer charge of about $8. Mobile Gas: Customers who receive Supplemental Security Income (SSI payments or Aid to Dependent Children) and who qualify, can have the customer charge of approximately $8 waived from their monthly gas bill.		Project Share: Project Share is funded by contributions from major electric and gas utilities' customers, employees, and stockholders. Alabama Power administers collections, and the Red Cross administers the rest of the program. The project operates year round and serves senior citizens, disabled persons, and those on fixed or low incomes. Cherokee Electric Cooperative - Operation Warm: Customer donations are used to assist the needy with their electrical bills. Funds are administered through the Cherokee County Crisis Center. Decatur Utilities - Operation Warm: Provides assistance to people who don't qualify for LIHEAP. Community Action bases its decision about who receives Operation Warm funds on income and necessary expenses, such as medications. The program runs from Dec. 1 through May 31, during which applicants are eligible for assistance only once. Joe Wheeler Electric - Operation Warm: Provides assistance to people who don't qualify for LIHEAP. Community Action bases its decision about who receives Operation Warm funds on income and necessary expenses, such as medications. The program runs from Dec. 1 through May 31, during which applicants are eligible for assistance only once. Hartselle Utilities - Operation Warm: Provides assistance to people who don't qualify for LIHEAP. Community Action bases its decisio
Alaska	$ 10,827,790	150% Federal Poverty Level	Heating: $170 min, $2,975 max	Heating: 8,887	12.8%	Avg. benefit: $6,000	60% State Median Income	697	Power Cost Equalization Program (PCE) PCE program provides economic assistance to customers in rural areas of Alaska where the kilowatt-hour charge for electricity can be three to five times higher than the charge in more urban areas of the state. The program seeks to equalize the power cost per kilowatt-hour statewide. For more detailed information, go to Alaska Statute 42.45.110.	Rural Residential Energy Rehab Program (Enhanced Weatherization) The state general fund provides weatherization assistance to low-income residents located between the Yukon-Kuskokwim Delta and the Northwest Arctic Borough in Alaska (nonroad-accessible communities), where winter temperatures can reach -40°F and fuel costs may consume as much as half of a family's monthly income. The program provides extensive energy-related repairs, heating and electrical improvements, and housing rehabilitation, in addition to energy conservation measures such as caulking and weather-stripping. Maximum assistance per household: $17,000; Households with income at or below 60% of the state median income are eligible; Households served (4/05-3/06): 90	General Relief Assistance (GRA) GRA provides for the basic needs of Alaskans not eligible for other state assistance programs. Examples of basic needs include shelter, and utilities. GRA can provide limited assistance for clothing, transportation, food, medical care and burial. Applicants must demonstrate and verify an unmet emergent need in the month of application.	Health: Alaska does not have a cold weather disconnect policy but does require utilities to delay for 15 days the disconnection of residential electric or natural gas service for nonpayment if the customer notifies the utility that a member of the household is seriously ill, over age 65, disabled, or dependent on a life-support system. Deferred Payments: The state requires utilities to offer deferred-payment arrangements to residential customers in danger of having their service disconnected for nonpayment. If the customer agrees and adheres to such an arrangement, the utility is prohibited from disconnecting service. Deferred-payment agreements must include the following requirements: The customer must pay one-third of the outstanding bill at the time of the agreement; The customer must pay off outstanding balance over a period not to exceed 12 months.			Golden Valley Electric Association (GVEA) - Home$ense An energy audit and energy saving measures are provided at no cost to Low-Income Weatherization Assistance Program recipients.	
Arizona	$ 8,275,252	150% Federal Poverty Level	Heating and Cooling: $25 min, $400 max	Heating and Cooling: 24,117	3.2%	Max. benefit: $2,672	150% Federal Poverty Level	627		Neighbors Helping Neighbors Energy Assistance Fund The Neighbors Helping Neighbors Energy Assistance Fund has helped to supplement LIHEAP and provide qualified low-income households with one-time crisis/emergency utility bill payments, energy conservation, and home weatherization. State tax forms include an option for taxpayers to make a voluntary contribution to the Neighbors Helping Neighbors fund. All funding for this program comes from taxpayers who decide to increase their tax payment or decrease their tax refund to make a contribution. The state treasury manages the fund and coordinates this assistance with the state LIHEAP and weatherization assistance programs. State residents with household income at or below 150% of poverty are eligible for assistance. The Neighbors Helping Neighbors fund is administered by the Department of Economic Security through local community offices.	Utility Repair, Replacement and Deposit (URRD) Established by the state legislature in 1989, the URRD program provides emergency assistance to eligible customers who need to make a utility deposit or have a heating or cooling appliance repaired or replaced. Assistance is limited to $2,000 per household, once a year.	Seasonal: Utilities are prohibited from disconnecting residential gas or electric service when the commission deems the current weather to be dangerous to health. This occurs when temperatures are at or below 32°F or at or above 95°F. Health: The state prohibits utilities from disconnecting residential service for nonpayment if a customer can establish (through a physician's documented professional opinion) that such an action would be especially dangerous to the health of the customer or other household resident, or if lifesupporting equipment in the home depends on utility service for operation. Customers in these cases may be required to enter into a deferred payment arrangement with the utility within 10 days after the termination date.		Arizona Public Service (2 programs) - [1] Energy Support Program Offers a discount up to 40% off the cost of electricity for customers who meet certain income guidelines. The income guidelines are based on 150% of the federal poverty guidelines and change every July 1st. The discount varies depending on how much electricity is used each month [2] Medical Care Equipment Program: Offers a discount up to 40% off the cost of electricity for customers who meet certain income guidelines. The income guidelines are based on 150% of the federal poverty guidelines and change every July 1st. The discount varies depending on how much electricity is used each month. Applicants must also provide a letter from a doctor showing a need of life sustaining medical equipment. Unisource Energy Services - C.A.R.E.S.: Customers whose income does not exceed 150% of the federal poverty level may be eligible for a deduction of up to $8 off their monthly electric bills and up to $15 off their natural gas bills, depending upon usage. CARES rates also apply to the Low-Income Medical Life Support Program for customers who are medically life-support dependent and w Salt River Project (2 programs) - [1] Economy Price Plan: Customers with limited	Arizona Public Service - Energy-Wise: Provides weatherization improvements or repairs to the home and energy education. Household income must be at or below 150% of the federal poverty level. Tucson Electric Power: Since 1982 the Tucson Urban League and Pima County have been assisting low-income residents in reducing energy use and lowering their utility bills by implementing year-round weatherization measures - at no cost to eligible customers. TEP conducts energy audits and provides funding for weatherization measures. Southwest Gas - Low-Income Energy Conservation Program Energy-saving measures are available to income-qualified customers, at no cost. Examples of energy-saving measures are caulking, insulation, weather-stripping, ductwork repairs and windows.	Arizona Public Service - Project S.H.A.R.E. (Service to Help Arizonans with Relief on Energy) Project S.H.A.R.E may be able to help pay energy (gas, electric, oil, wood) bills for seniors over 60, living on a fixed income and facing a financial emergency or for customers under age 60 and experiencing special hardships or for disabled with no source of income. Southwest Gas Corporation - Energy Share Energy Share is an emergency fund that provides direct assistance to qualified people with unexpected financial difficulties, such as the loss of a job or a medical emergency. All Energy Share donations are managed and distributed by The Salvation Army. Tucson Electric Power Company (2 programs) - [1] Help with Emergency Energy Relief Operation H.E.E.R.O. provides one-time payments on energy bills for low-income customers. Customer donations fund the program, which is administered by the Salvation Army. [2] Low-Income Fund for Emergencies (LIFE) Fund In 1996, Tucson Electric Power Company set aside $4.5 million in shareholder funds for the LIFE Fund. Arkansas	$ 13,056,769	125% Federal Poverty Level	Heating: $42 min, $111 avg, $259 max	Heating: 56,426; Cooling: 49,423	7.8%	Max. benefit: $2,744	125% Federal Poverty Level	579				Seasonal: Arkansas prohibits the disconnection of residential electric or natural gas service for nonpayment when the National Weather Service forecasts that the temperature at that location will be 32°F or below, or 95°F or above (in the case of disabled or older residents) for that calendar day. Health: The state requires utilities to delay for up to 30 days the disconnection of residential service for nonpayment if a customer or other permanent household resident presents a physician's certificate stating that suspension of utility service would cause a significant decline in the householder's health. Deferred Payments: Electric and natural gas utilities are required to offer a deferred-payment arrangement to residential customers in danger of disconnection for nonpayment and are prohibited from disconnecting service if a customer agrees and adheres to such an arrangement.		Entergy Arkansas: Sales tax exemption on the first 500 kWh used each month for customers with an annual household income of less than $12,000. Empire District Electric Company - Empire's Action to Support the Elderly (EASE): Provides late fee and security deposit waivers for seniors age 60 and older and disabled customers.		American Electric Power - Neighbor to Neighbor Customer and AEP donations are distributed through United Way. Arkansas Western Gas - Hearts Warming Homes: Provides heating assistance to customers in Northwest, North Central and Northeast Arkansas. The program will operate from November to April and assistance grants re based on need and not strict income guidelines. The fund is administered by The Salvation Army. CenterPoint Energy - Good Neighbor Fuel Fund Donations from Arkla Gas customers and employees are matched by Arkla. The Good Neighbor Fuel Fund is integrated and coordinated with LIHEAP by supplementing LIHEAP dollars after the program has ended when benefits are insufficient to meet the household's needs. Empire District Electric Company - Project Help Project Help extends a helping hand to needy senior citizens 55 years or older and handicapped persons. The program is administered by the Red Cross which screens applicants and provides relief where the need is greatest. Entergy - Beat The Heat During May, thousands of fans were distributed to customers living in the Entergy service area. Entergy - Project Deserve: Project Deserve is funded by customer, employee and stockholder donations and provides crisis assistan
California	$ 91,797,411	60% State Median Income	Heating: $131 min, $479 max	Heating: 123,463	6.2%	Max. benefit: $1,506	60% State Median Income	20,617		Weatherization and Energy-Efficient Rehabilitation (WEER) The California Conservation Corps, in partnership with the state's Department of Community Services and Development, provides no-cost home repair and weatherization services to low-income households through the WEER program. WEER also provides on-the-job training to low-income youths who participate in basic weatherization activities. WEER crews perform minor home repairs to bring houses up to minimum standards, and then perform standard weatherization services. Maximum benefit per household: $2,500. WEER is funded through California's petroleum violation escrow account. State residents with household incomes at or below 150% of poverty are eligible for assistance. In addition, WEER targets houses that are in disrepair and do not meet the minimum building conditions for weatherization.		Health/Deferred Payments: There is no weather-related disconnect policy in California, but the state prohibits utilities from disconnecting residential natural gas or electric service for nonpayment if the following requirements are met: A licensed physician certifies that disconnection would be life-threatening to the customer, and the customer agrees to a deferred-payment agreement; The customer is granted an extension or agrees to a deferred-payment arrangement (not to exceed 12 months) to pay the delinquent balance.		REFER TO DETAILED STATE SUMMARY Through the California Alternate Rates for Energy (CARE) program eligible customers receive a 20% discount on electric and natural gas bills. Eligibility: total household income is at or below 200% of federal poverty level. The CARE income guidelines, effective June 1, 2007, are as follows: Household size 1 or 2 = Income $29,300; Household size 3 = Income $34,400; Household size 4 = Income $41,500; Household size 5 = Income $48,600; Add $7,100 for each additional household member	REFER TO DETAILED STATE SUMMARY Low-Income Energy Efficiency (LIEE) Services include attic insulation, energy efficient refrigerators, energy efficient furnaces, weatherstripping, caulking, low-flow showerheads, water heater blankets, and door and building envelope repairs which reduce air infiltration. Eligibility: 200% of federal poverty level.	REFER TO DETAILED STATE SUMMARY
Colorado	$ 31,729,192	185% Federal Poverty Level	Heating: $201 min, $370 avg, $700 max	Heating: 93,473	11.4%	Avg. benefit: $2,800	185% Federal Poverty Level	4,082	Property Tax, Rent, and Heat Rebate Operated through the state Department of Revenue, allows tax rebates for home heating payments to residents at least 65 years old, surviving spouses at least 58 years old, or to disabled. The income limit for single households is $11,000; for married couples, $14,700. Qualified applicants can receive a rebate of up to $600 of their property tax and $192 directly or as part of their rent payments, by filing the Property Tax/ Rent/Heat Rebate Application Form 104PTC. [39-31-101 C.R.S.]			Health: Colorado does not have a temperature-based disconnect policy for residential natural gas or electric service. Instead, utilities are required to delay for up to 60 days disconnection of residential service to households where a medical professional certifies that such an action would result in a decline in the health of the customer or other permanent household resident. Deferred Payments: Colorado prohibits the disconnection of residential natural gas or electric service if the customer pays at least 1/10 of arrears and agrees to a deferred-payment arrangement not to exceed six months.			Energy $avings Partnership Program Provides no cost energy efficiency services to income-eligible customers, seniors and disabled. Services can include an energy audit, attic, wall and crawlspace insulation, air leakage reduction, appliance safety inspections, forced air efficiency assessment, high efficiency lighting surveys and other safety inspections. Energy Resource Center - ERC: The Energy Resource Center offers free home weatherization, insulation and furnace services to low-income families. Customers currently receiving LEAP, Temporary Assistance for Needy Families, Supplemental Security Income or MEDICAID assistance automatically qualify for ERC services. Colorado Springs Utilities - Home Efficiency Assistance Program (HEAP) A partnership with the Energy Resource Center, HEAP provides energy and water efficiency measures and conservation education for customers with household incomes at or below 225% of federal poverty guidelines. Measures include insulation, air sealing, energy efficient light bulbs, low flow faucets and toilets, and furnace repair or replacement. Fort Collins Utilities - REACH (Residential Energy Assistance Through Commun	Energy Outreach Colorado - Utility Assistance Program Distributes energy assistance dollars year round through 78 community-based organizations at 93 sites reaching all 64 Colorado counties. The funds provide emergency fuel bill assistance for Colorado's lo income households facing an energy crisis. Aquila - Aquila Cares Employee contributions are matched dollar for dollar, up to $10,000. $15,000 is earmarked to support local weatherization efforts including weatherstripping, caulking and other energy-saving actions. Customer donations are matched at 50 cents on the dollar, up to a combined total of $115,000. Donations are managed locally throughout the seven-state Aquila service area. Local assistance agencies determine eligibility and distribute funds. Atmos Energy - Sharing the Warmth Customer donations combine with company donations to help people pay their gas bills. All donations go directly to local people in need that meet criteria established by each individual program's guidelines. City of Fountain - Lighten the Load Bill payment limited to $150 once per year for water, electricity or wastewater. Must have disconn City of Longmont - COPE Utility bill payment assistance. Must apply for LEAP first and have a disconnect notice. City of Loveland Water and Power Department - Help a Neighbor in Distress (HAND) The HAND project helps qualified applicants av Colorado Springs Utility Company - Citizens Option to Provide Energy (COPE) Project COPE is funded by donations from citizen-own Delta Montrose Electric Association - Operation Roundup Customer donations help individuals and organizations in the community. Fort Collins Utilites - Payment Assistance Fund Customers with a shut off notice are eligible for help through the Payment Assistance Mountain Parks Electric, Inc. - Operation Roundup Customer donations fund a charitable trust. Funds are then distributed to needy in Mountain View Electric Association, Inc. - Round-Up Customer donations are distributed to needy individuals and families and to non Yampa Valley Electric - Caring Consumers Caring Consumers is funded by customers that round up electric bills to the next highest
Connecticut	$ 41,754,126	150% Federal Poverty Level; 200% Federal Poverty Level (seniors and disabled)	Heating: $400 min, $537 avg, $675 max	Heating: 86,000	10.7%	Avg. benefit: $2,826	200% Federal Poverty Level	809	Contingency Heating Assistance Program (CHAP) CHAP is for households with higher incomes, 60% of State Median Income, than would qualify for the Connecticut Energy Assistance Program. State Appropriated Fuel Assistance Program (SAFA) The State General Assembly provides an annual appropriation of state funds for energy assistance benefits to elderly and/or disabled households with incomes between 151-200% of poverty guidelines. These and additional state funds provided by the General Assembly supplement the Connecticut Energy Assistance Program (LIHEAP).			Seasonal: Between November 1 and April 15, Connecticut prohibits utilities from disconnecting natural gas or electric service to residential customers who qualify for "hardship" status by meeting any of the following criteria: Receive state or federal assistance or have incomes at or below 125% of the federal poverty guideline; Are unemployed with a household income at or below 300% of the federal poverty guideline; Are seriously ill or disabled; Will potentially be deprived of food or other life necessities if required to pay the delinquent bill. Health: Connecticut requires natural gas and electric utilities to delay for up to 15 days disconnection of service to residential customers where it has been certified by a physician that such an action would result in a decline in the health of the customer or a permanent household resident. Medical certificates may be renewed every 15 days for as long as the medical condition persists. Deferred Payments: Before disconnecting service for nonpayment, natural gas and electric utilities must offer residential customers an opportunity to enter into a deferred-payment arrangement. If the customer agrees and adheres to such an		A systems benefits charge (SBC) imposed on customers of the state's two investor-owned utilities – Connecticut Light & Power and United Illuminating – pays for some low-income programs. SBC-funded arrearage, uncollectibles, and hardship programs for both utilities amounted to about $7.2 million in 2004. All gas public service companies are required by statute to operate an arrearage forgiveness program for gas heating customers. Arrearages are forgiven if customer makes regular payments. Eligibility criteria include: arrears of $100 or more that are 60+ days overdue, income of less than 200% FPG, and have had at least $25 paid toward bill by LIHEAP (or other assistance program). Electric utilities have voluntary arrearage forgiveness as part of budget programs. Connecticut Light and Power (3 programs) - [1] NUSTART Customers can reduce or eliminate their past-due balance if they pay an agreed-upon budgeted amount on time, each month. Eligibility: arrears of $100 or more that are 60+ days overdue, income of less than 200% FPG, and have had at least $25 paid toward bill by LIHEAP (or other assistance program) [2] Matching Payment Plan Connecticut Natural Gas - Matching Payment Plan Customers who qualify for ma Southern Connecticut Company - Matching Payment Pla: Customers who qualify	The mandated system benefits charge (SBC) for energy efficiency is assessed on all electricity sold by the state's two investor-owned electric utilities. The fund is used for programs affecting all customer classes. Of this amount, Connecticut Light and Power Company and United Illuminating Company are spent about $1 million in 2004 on low-income energy efficiency, mostly though community action agencies. Connecticut Light and Power - Low-Income Weatherization Residential Assistance Program (WRAP): Free for eligible customers who use more than 2,000 kilowatt-hours of electricity a year. Households with an income of up to 200% of the federal poverty level qualify. Connecticut Natural Gas (2 programs) - [1] Energy Audit On site energy audits are performed to provide recommendations of energy conservation measures. Each audit includes a review of the dwellings energy consumption pattern, air infiltration characteristics, the number of inhabitants and other variables affecting energy consumption. There is no charge for qualified/identified hardship customers. [2] Insulation and Weatherization Professional weatherization and in United Illuminating Co. - UI HELPS For customers on a limited income, UI Helps	Operation Fuel: Operation Fuel is a private, non-profit program that provides emergency help with energy or utility bills for people who are not eligible for CEAP or SAFA. Connecticut's legislature passed a law requiring all of the state's gas and electric utilities with at least 75,000 customers to facilitate the collection of donations for Operation Fuel. In most instances, eligible families have incomes at 151 to 200% of the federal poverty level. Warm Up Fund: Community donations provide funds for fuel assistance in Westport and Weston. The Windsor Fuel Bank Additional fuel assistance is available through The Windsor Fuel Bank for CL&P and Connecticut Natural Ga customers. Donations are made to the Windsor Community Service Council and can be used to help people who do not qualify for other assistance programs.
Delaware	$ 5,542,056	200% Federal Poverty Level	Heating: $200 min, $535 max; Cooling: $200 max	Heating: 15,137; Cooling: 1,921	6.6%	Avg. benefit: $2,500	150% Federal Poverty Level	475				Seasonal: Delaware prohibits disconnection of residential electric or natural gas service from November 15 through April 15 for nonpayment if the National Weather Service forecasts the temperature to be 20°F or below on the day the customer's service is slated to be disconnected. Health: The state prohibits disconnection of service to residential customers when a medical professional certifies that such an action would result in a decline in the health of the customer or a permanent household resident.				Chesapeake Utilities - Sharing Program The Sharing Program assists elderly, disabled or fixed income households with winter heating costs. Customer donations and matching shareholder contributions are administered by Catholic Charities in Kent and New Castle counties and by the Salvation Army in Sussex county. Delmarva Power (Conectiv) - Good Neighbor Fuel Fund Conectiv matches customer contributions with a donation from shareholders. A household must first apply for LIHEAP. Funds are administered by the Salvation Army.
District of Col	$ 6,484,484	60% State Median Income	Heating and Cooling: $31 min, $1349 max	Heating: 29,500	8.2%	Max. benefit: $2,672	60% State Median Income	1,084				Seasonal: The District of Columbia Public Service Commission prohibits disconnection of residential electric or natural gas service for nonpayment when the National Weather Service forecasts that the temperature at that location will be 32°F or below for that calendar day. Health: The Commission requires that utilities delay for up to 21 days disconnection of residential service if the customer provides a physician's certificate or notice from a public health official stating that disconnection would be detrimental to the health and safety of the customer or permanent household resident. The customer is also required to enter into a deferred-payment plan. Disconnection may be delayed for an additional 21 days by renewal of the certificate or notice.		The Public Service Commission requires Potomac Electric Power Company (PEPCO), and Washington Gas to offer discount rates to low-income residential customers. PEPCO - Residential Aid Discount on first 400 kWhs of electricity used each month. This translates into a savings of up to $5 per month or $60 a year. Washington Gas Company - Residential Essential Service (RES) This program offers discount gas rates, based on household size and income level, during the winter months from November through April. There are three classifications: Class C may receive a total discount up to $142.02, Class B up to $151.03 and Class A up to $189.08.		Washington Gas Company - Washington Area Fuel Fund (WAFF) WAFF, operated by the Salvation Army, aids customers who need assistance paying their home heating bills. Funds are available January 1 through May 31. To apply for help, contact your local Salvation Army.
Florida	$ 27,075,265	150% Federal Poverty Level	Heating and Cooling: $100 min, $200 max	Heating: 33,816; Cooling: 56,513	1.7%	Max. benefit: $5,652	150% Federal Poverty Level	1,400	City Electric System, Key West of Florida - Senior Citizen's/Disabled American Veteran's Discount: To be eligible, applicants must be 62 years or older or totally or permanently disabled American Veteran. Annual income must not exceed $17,196 per household. Applications are accepted through March 31; must reapply each year.	In 1992 the Florida legislature passed the William E. Sadowski Affordable Housing Act. Funding comes from a portion of documentary stamp taxes on deeds and supports two programs that supplement the state's WAP State Housing Initiatives Partnership which funds weatherization measures; and the Low-Income Emergency Home Repair Program, which funds emergency and energy-related home repairs. Tampa Electric - Weather Care: Free home improvements available to senior citizens 60 years and older on low, fixed incomes whose homes are in need of energy-related improvements. This program is a joint service offered by Tampa Electric and The Centre for Women.		Florida does not have state-mandated disconnection policies in these areas.				Florida Power & Light Company - Care to Share Program Provides energy assistance to customers who are in a crisis situation and are unable to pay their electric bill. A household may receive assistance of up to $500 for electric service once in a 12-month period. Progress Energy - Energy Neighbor Fund Low-income families facing unexpected energy costs can receive help through the fund. All funds are distributed through local social service agencies to pay for electricity, gas, oil or wood. Tampa Electric - SHARE: Helps elderly customers who are low-income and/or medically disabled pay their energy-related bills. JEA - Neighbor To Neighbor: Emergency energy-related assistance for elderly, disabled and low-income citizens. City of Lake Worth Utilities - Share to Care: Customer donations are used to assist needy families with their bills. The fund is administered by the Salvation Army. City of Leesburg - Citizens Utility Relief Effort (C.U.R.E.) Provides assistance to utility customers who are unable to pay their bill. The fund may be used in the event of loss of employment or an unexpected illness or injury. Guidelines set the criteria for extending assis City of Tallahassee Utilities - Project Share One-time financial assistance payments for eligible customers. Project Share funds are a Clay Electric Cooperative - Project Share: The Salvation Army handles the distribution of the fund and determines eligibility. Georgia	$ 21,407,149	150% Federal Poverty Level	Heating: $220 min, $238 avg, $250 max; Cooling: $250 max	Heating: 102,100; Cooling: 40,000	3.6%	Max. benefit: $2,684	150% Federal Poverty Level	2,517				Seasonal: Between November 15 and March 15, Georgia prohibits disconnection of residential electric or natural gas service whenever the National Weather Service forecasts that the temperature at that location will be 32°F or below during a 72-hour period beginning at 8 a.m. on the date of the proposed disconnection. During the winter protection period, utilities are prohibited from disconnecting residential service if a customer agrees in writing to a deferred payment plan and adheres to the arrangement. Health: Georgia requires natural gas and electric utilities to delay for 30 days—or the duration of the illness, whichever is less—the disconnection of residential service when a medical professional certifies that such an action would result in a decline in the health of the customer or other permanent household resident.	The regulated natural gas provider program provided by SCANA Energy and partially funded by the state's universal service fund, provides natural gas service to low income households and to consumers who are unable to obtain or maintain natural gas service from another marketer. Households meeting the low income requirements established by the Georgia Department of Human Resources qualify for a reduced security deposit, special rates and a lower customer service fee. To sign up, customers need to contact the community action agency serving their county. Those not meeting low-income requirements may still qualify for service with the Regulated Provider.	Since 1989, the Public Utility Commission (PUC) has mandated that major gas and electric utilities waive their monthly service charge for customers over age 65, who own their homes, and earn less than $12,000 per year. Atlanta Gas Light Senior citizens who are 65 years of age or older and have a total annual combined household income of $12,000 or less are eligible for a $10.50 monthly discount on their base charge. To apply contact your gas marketer. Georgia Natural Gas: Customers who are 65 years of age or older with an annual combined gross income per household of $12,000 or less are eligible for a $14.00 monthly discount on their base charge. Georgia Power: The monthly base charge ($10.50 for gas and $14.00 for electric) is waived for customers who are at least 65 years old and the total household income is not more than $12,000 annually. SCANA Energy: Customers who are 65 years of age or older with an annual combined gross income per household of $12,000 or less are eligible for a $14.00 monthly discount on their AGL base charge. Carroll Electric Membership Corporation - Senior Citizen Discount Members ove		The Heating Energy Assistance Team (HEAT) The HEAT program is administered by the Georgia Department of Human Resources statewide through Community Action Agencies. Private citizens and the natural gas industry provide funding. Project SHARE: A statewide program funded by electric utility customers who donate through their monthly electric bills. The program is administered by The Salvation Army. Atmos Energy - Sharing the Warmth Customer donations combine with company donations to help people pay their gas bills. All donations go directly to local people in need that meet criteria established by each individual program's guidelines. 	Low Income Rate Assistance	Low Income Energy Efficiency	Low Income Emergency Assistance
Illinois	Effective 1998, the Supplemental Low-Income Energy Assistance Fund (SLEAF) was authorized through electric utility restructuring legislation. The law directed gas and electric utilities to assess a monthly surcharge from customers and deposit it into a state fund, which the General Assembly appropriates yearly to the state Department of Commerce and Community Affairs, the LIHEAP and weatherization grantee. Annually, about 80% of the fund, $65 million, goes for lo income bill payment assistance, and 10%, about $7.6 million, supplements the state's weatherization program. LIHEAP makes payments from the fund directly to utilities. SLEAF funds may be used only for assistance to low-income customers of the utilities that assess the surcharge.	Effective 1998, the Supplemental Low-Income Energy Assistance Fund (SLEAF) was authorized through electric utility restructuring legislation. The law directed gas and electric utilities to assess a monthly surcharge from customers and deposit it into a state fund, which the General Assembly appropriates yearly to the state Department of Commerce and Community Affairs, the LIHEAP and weatherization grantee. Annually, about 80% of the fund, $65 million, goes for lo income bill payment assistance, and 10%, about $7.6 million, supplements the state's weatherization program. LIHEAP makes payments from the fund directly to utilities. SLEAF funds may be used only for assistance to low-income customers of the utilities that assess the surcharge.	City Of Chicago - Emergency Housing Assistance Program Emergency repair grants are available to qualified low-income homeowners. This may include repair or replacement of heating units, emergency roof repairs and other energy saving conservation activities. Good Samaritan Energy Trust Fund Created by the Good Samaritan Energy Plan Act in 2003, allows Illinois residents to contribute money towards emergency heating bills of low-income households. County agencies grant funds to low-income consumers to pay overdue gas or electric bills in order to have household gas or electric utility service reconnected. The Good Samaritan reconnection agreement allows LIHEAP recipients to get their heat restored if they agree to pay $250 or 20 percent of the money they owe and enter into a payment plan for the balance. Grants go directly to eligible low-income residents of the county from which funds were donated.

Kentucky	The Department of Social Services Preventive Assistance Program initiative assists families with an energy payment of up to $300 per family if payment wou prevent removal of a child from the family or assist in reuniting the child with the family. Families must have exhausted or been denied all other means of public assistance.	Project WARM: Since 1982, Project WARM has provided free weatherization and energy conservation services to residents of Louisville and Jefferson County. Weatherization measures include sealing air leaks, adding attic insulation, and offering energy education. Free self-help classes on window cover installation and conservation measures are available during the winter. Summer Cooling: Each summer, air conditioners are loaned to people whose health is threatened by the high heat and humidity as verified by their doctors. The program was established and operates through local donations. Available in Fayette, Bourbon, Harrison, and Nicholas Counties. Air conditioners and fans are available in Louisville to households with incomes at 110% of federal poverty income guidelines or below. Households that include a member with a life-threatening medical condition are given an air conditioner and a volunteer technician to install it. Those who meet the poverty guidelines, but not the medical criteria, are given a fan. Louisville Metro Housing (Weatherization): Installs weatherization materials for lo

Maine		Central Heating Improvement Program (CHIP): Grants to low-income homeowners and renters to reduce energy costs by improving home energy efficiency; eligibility: income is within 150% of federal poverty guidelines. If your household includes seniors (age 60 and above) or small children (age two and under), you may be eligible if your income is within 170% of federal poverty guidelines. When you apply for the Low Income Heating Energy Assistance Program (LIHEAP), you are automatically considered for the CHIP Programs. Maximum CHIP grant: $2,500 (lifetime)	The General Assistance Program is provided in each town to help people in emergencies, including energy emergencies Emergency Moratorium: The Public Service Commission may declare a partial or complete moratorium on termination or disconnectio of utility service including gas and/or electric service in cases of general weather or health emergency.
Maryland	Electric Universal Service Program (EUSP): Authorized through restructuring legislation, the EUSP includes current electric bill assistance, retirement of certain old bills, and weatherization services. Its funding of $34 million per year continues but is subject to annual review and approval by the Maryland Public Service Commission (PSC) and the legislature. Eligibility: electricity customers with incomes at or below 150% FPL. Eligible customers may receive both EUSP and LIHEAP. Project Energy Assistance: A comprehensive state plan to help Maryland's working families with their energy costs. Project Energy Assistance extends the income eligibility requirements to include homes with annual income levels up to 200% of the poverty level, which is $40,000 for a family of four. Applications for the program were taken from January 15 to March 31, 2006. Universal Service Protection Program (USPP): Available to LIHEAP recipients, USPP reduces and evens out monthly utility payments by subtracting the amount of the LIHEAP benefit from a customer's yearly bill and dividing the remainder by twelve months. Those who keep on payment plans are eligible for credits from s Transitional Emergency, Medical, and Housing Assistance (TEMHA) 11 Low-inc Local energy tax dollars are given in a rebate to low-income households in two c		
Massachusetts			
Michigan	Home Heating Credit: A state tax credit that can help offset the costs of natural gas or electricity used to heat homes in the winter. The Credit is based on household income, the number of exemptions claimed and the home's actual heating costs. Special exemptions may be available to customers 65 and older and to people with disabilities.		Crisis Intervention (State Emergency Relief): As part of SER, a program that distributes financial assistance to state residents facing emergencies that threaten their health or safety, Crisis Intervention helps eligible low-income households pay for energy-related emergency services. Heating fuel or electricity payments help prevent shutoffs or restore service, while home repair payments provide the minimum necessary assistance to maintain "a decent, warm dwelling unit."

	Seasonal, Health, and Income Related Disconnection Policies	Low Income - Other
Illinois	Seasonal: Illinois prohibits disconnection of residential natural gas or electric service for nonpayment when the National Weather Service forecasts that the temperature at that location will be 32°F or below for that calendar day. The Utili Termination Bill prevent utilities from disconnecting service to any LIHEAP-eligible households for nonpayment from December 1 through March 31. Between December 1 and March 31, utilities must offer all customers who are subject to disconnection the opportunity to maintain service by making a down payment equal to 10% of the bill and paying the balance over the next 4 to 12 months. The utility must allow the customer to earn credits applicable to the overdue bill by working at a nonprofit organization or by attending school. Health: Illinois requires that natural gas and electric utilities delay disconnection of residential service for up to 30 days if a physician or other health official certifies that such an action would adversely affect the health of the customer or permanent household resident. Disconnection may be delayed for another 30 d	
Indiana	Seasonal: Indiana prohibits utilities from disconnecting residential natural gas or electric service for nonpayment from December 1 to March 15 if the customer qualifies for public assistance, whether or not the customer receives the benefit. Health: Indiana requires that natural gas and electric utilities delay residential disconnection for up to 10 days if a physician or other public health official certifies in writing that such an action would adversely affect the health of the customer or permanent household resident. Deferred Payment: Utilities are prohibited from disconnecting residential service for nonpayment if the customer can prove financial hardship or other legitimate cause of nonpayment, and if he or she fulfils the following requirements: Pays th lesser of $10 or 10% of the overdue bill and agrees to pay the balance within the next three months; Agrees to pay all undisputed future bills; Has met requirements of similar payment arrangement(s) within the last 12 months.	Legislation, since 1894, requires Indiana's 1,008 towns and townships to provide "poor relief" that can include housing, utility, food, and medical assistance. Townships are local governmental units within counties and cities, with elected boards and trustees. Property taxes fund "poor relief"; each local entity establishes spending guidelines for the funds. Universal Service Program: Beginning January 1, 2005, eligible customers of Citizens Gas and Vectren who have applied for the state's LIHEAP through local community action agencies, will automatically be enrolled in the new USP and will receive bill reductions in addition to LIHEAP. Monthly bill reductions will rang from 9% to 32% of the total bill (not including LIHEAP benefits), depending on the consumer's income level and utility provider. The pilot USP will also provide additional funding to both utilities' weatherization programs.
Iowa	Seasonal: From November through April, Iowa prohibits the disconnection of residential electric or natural gas service for nonpayment if the customer is certified eligible for LIHEAP and/ or the Weatherization Assistance Program. Iowa also prohibits the disconnection of residential electric or natural gas service for nonpayment when the National Weather Service forecasts that the temperature at that location will be 20° F or below for that calendar day. Health: The state requires utilities to delay for up to 30 days the disconnection of residential service if a physician or other public health official certifies that such an action would adversely affect the health of the customer or a permanent household resident. The delay may be extended for an additional 30 days if the physician certifies that the problem still exists at the end of the initial period. The customer is required negotiate a payment arrangement to pay the overdue balance. Deferred Payments: Utilities are required to offer deferred payment arrangements to residential customers in danger of disconnection for nonpayment, and are prohibited from disconnecting service when a customer ag	
Kansas	Seasonal/Deferred Payment: Between November 1 and March 31, Kansas prohibits regulated electric and natural gas utilities from disconnecting service to residential customers for nonpayment unless the National Weather Service forecasts temperatures of above 35°F for the 48-hour period immediately following the proposed disconnection. Customers can avoid disconnection when the temperature is above 35°F during the winter protection period (or at any othe time of the year) by paying 1/12 of the amount owed and agreeing to a deferred-payment arrangement to pay the balance within 12 months. Health: Kansas requires utilities to delay for up to 21 days disconnection of residential service if the customer notifies the utility—and the utility verifies—that such an action would adversely affect his or her health or the health of a permanent household resident. During the 21-day delay, the customer is expected to negotiate a deferred-payment arrangement to pay off the delinquent balance.	
Kentucky	Seasonal: Between November 1 and March 31, residential utility customers in Kentucky who are certified eligible for LIHEAP by the Cabinet for Human Resources, or who have incomes under 130% of poverty, are exempt from termination for 30 days beyond any termination date set by the utility. Under the winter hardship reconnection policy, which extends from November to March, electric and natural gas utilities are required to reconnect a customer's residential service if the customer obtains a certificate of need from the Cabinet for Human Resources, pays either onethird of the outstanding bill or $200 (whichever is less), and agrees to a deferred-payment arrangement. Health: Utilities are required to delay for up to 30 days disconnection of a customer's residential service whenever a physician or other public health officia certifies in writing that such an action would aggravate an existing medical or debilitating condition of the customer or any other household member. The customer is required to negotiate a deferred-payment arrangement to maintain service beyond the delay. Deferred Payment: During the winter protection dates, and at any other time of t	
Louisiana	Health: Louisiana delays for up to 63 days disconnection of residential electric or natural gas service for nonpayment if a medical professional certifies in writing that such an action would be detrimental to the customer's health or safety. The customer is required to negotiate a deferred-payment plan with the utility before the scheduled disconnection date.	
Maine	Seasonal/Low-Income: Maine prohibits utilities from disconnecting residential natural gas or electric service for nonpayment between November 15 and April 15 if the customer's account is less than three months overdue, or if the amount owed is less than $50. During these protection dates, Maine also requires regulated utilities to offer LIHEAP participants, SSI recipients, and state residents with household income at or below 185% of poverty the opportunity to pay a portion of each winter bill as it becomes due, and the remaining portion of the bill(s) in installments during the nonheating months. Health: Maine requires utilities to delay for up to 30 days disconnection of residential service for nonpayment if a physician certifies in writing that such an action would adversely affect the health of the customer or a permanent household resident. A certificate delaying disconnection can be renewed up to three times in 12 month periods. Deferred Payments: Maine prohibits utilities from disconnecting residential service for nonpayment whenever a customer pays a "reasonable" portion of the	
Maryland	Seasonal/Low-income: Customers of Maryland's Utility Service Protection Program are protected from utility disconnections year-round (see program description above). For all other residential customers, utilities cannot disconnec residential service between November 1 and March 31 unless they can prove that such an action will not endanger the health of any member of the customer's household. Health: Maryland requires natural gas and electric utilities to delay for up to 30 days disconnection of residential service if a physician certifies that such an action would adversely affect the health of the customer or other household resident. The customer is required to negotiate a deferred payment arrangement to extend service beyond the 30-day delay.	
Massachusetts	Seasonal: Between November 15 and March 15, Massachusetts prohibits disconnection of residential natural gas or electric service—if such service either provides heat or operates the heating system—for any household that is unable to pay an overdue bill because of financial hardship. In 2006 the moratorium on disconnection of residential natural gas or electric service was extended until April 30, 2006. Health/Age: Massachusetts prohibits disconnection of natural gas or electric service for nonpayment whenever a customer presents certification that the household contains either a seriously ill member or a child under 12 months old. Utility companies may not shut off services without written approval to households where all residents are 65 years of age or older. Certifications of serious illness may be renewed monthly, or quarterly in cases of chronic illness. Certifications of infancy remain in effect until the child exceeds 12 months of age.	
Michigan	Seasonal/Winter Protection Plan: The Michigan Public Service Commission requires state-regulated utilities to provide winter protection programs that help low-income and senior citizen customers avoid service disconnections and high utility bill payments from November through March. State residents with household incomes at or below 200% of poverty are eligible for this program. Residents meeting any of the following criteria are also eligible: Age 65 or older; Receiving Michigan Department of Human Services cash assistance; Receiving food stamps or Medicaid. The program requires participants to make regular payments throughout the protection period and pay the balance in installments between April and October. Health: Michigan requires utilities to delay for up to 21 days disconnection of residential service if a physician or other public health official certifies that such an action would adversely affect the health of the customer or other permanent household resident.

	Low Income Rate Assistance	Low Income Energy Efficiency
Illinois	ComEd - Rate Relief Program (3 programs) - [1] Summer Assistance Program: A one-time $30 credit for Low Income Home Energy Assistance Program participants with household incomes up to 200% of the poverty level, or $40,000 for a family of four. [2] Residential Rate Relief Program: A one-time credit of up to $240 for customers who experienced a higher-than-average rate increase of 30% or more. This program is for households with incomes up to 200% of the poverty level, or $40,000 for a family of four. [3] Residential Hardship Fund: Variable grants of up to $1,000 to offset rate increases for people with special circumstances and hardships. Customers with household incomes up to 400% of the poverty level, or $80,000 for a family of four, may be eligible, if they identify a special hardship issue such as medical expenses, military service, seniors requiring in-home care or grandparents raising minor grandchildren, or a person in the home with a disability. Verification of hardship will be required. Springfield City Water Light & Power - Senior Citizen Discount Rate A 10% disc	
Indiana	Northern Indiana Public Service Co. (NIPSCO) - Winter Warmth LIHEAP eligible customers or customers with a financial hardship can receive up to $400 that can be applied to both the payment of delinquent utility bills and natural gas deposits. Additionally, NIPSCO will limit natural gas deposit payments for LIHEAP eligible customers to $150 and $300 for other non-LIHEAP eligible customers determined to have a financial hardship.	Duke Energy - Low-Income Weatherization Program Offered through a partnership with the state of Indiana, the program is designed to provide energy saving installations and energy education at no cost to our customers who qualif for the weatherization or heating bill assistance as part of the state or federal programs. Northern Indiana Public Service Company (NIPSCO) - Home Energy Solutions Weatherization Program: Qualifying homeowners will receive a home energy assessment at no cost. Depending on the results of the assessment, your home may receive one or more of the following energy efficiency improvements at no cost: replacing an inefficient furnace or water heater with a more efficient appliance; adding insulation, air sealing, and/or installing energy-saving devices such as water-saving faucet aerators and shower heads. The program will be available through April 1, 2008, or while funds last. Vectren - Share the Warmth: Vectren matches all public donations, up to an annual total of $200,000. Funds are distributed annually to the Indiana Low Income Weatherization Assistance Program. Weatherization services vary with
Iowa		Aquila: Provides CAP agencies with funding for weatherization recruitment and installation. Weatherization improvements include floor, ceiling, and wall insulation; band joist; water heating measures (pipe wrap, water heater blankets low-flow showerheads, and faucet aerators); and air infiltration measures. MidAmerican Energy (2 programs) - [1] Funding for low-income weatherization is available to customers year-round. MidAmerican's energy efficiency department with assistance from the Iowa Department of Human Rights, administers the program and distributes funds specifically earmarked for home improvements to low-income customer homes.[2] HomeCheck: Free energy assessment for homes built before December 31, 1994 includes installation of water heater blanket, pipe insulation, low-flow faucet aerators and shower heads, waterbed mattress pad and energy-efficient light bulbs.
Kansas		
Kentucky	Louisville Gas & Electric - Home Energy Assistance: Provides a year-round fixed credit that varies by month and is based on the household's income, size and utility bills for the previous 12 months, an adjustment for monthly normal heating degree days, and any significant changes in utility pricing. The credit can be applied to arrearages. Customers with household income at or below 110% of federal poverty guidelines must have a minimum monthly household income of $100 and household utility arrearages under $700 and to participate. Kentucky Utilites - Home Energy Assistance: Eligible customers will receive a fixed amount of $294 per year in seven monthly installments of $42 that are applied to the current bill. The credit will be applied to bills during peak heating a cooling months and cannot be used to reduce arrearages. Customers must use electric heat and have household income at or below 110% of federal poverty guideline to participate.	Duke Energy: Eligible households receive a furnace/heat pump clean and tune, energy efficient light bulbs, energy saving tips and, if needed, hot water heater wrap, weather-stripping and pipe wrap. Depending on the condition of the home and its energy usage, other services may include duct sealing, wall and attic insulation and other air leakage sealing measures. Louisville Gas & Electric - WeCare: Participants receive a walk-through inspection and energy education. Many will receive HVAC and water heater system inspection, air sealing and attic insulation. Eligibility: income 125% of the federal poverty level or less, priority is given to elderly and disabled. Kentucky Utilities - WeCare: All participants receive a walk-through inspection and energy education. Many will receive HVAC and water heater system inspection, air sealing and attic insulation. Eligibility: income equal to or less than 125% of the federal poverty level, priority is given to elderly and disabled.
Louisiana	Entergy Gulf States Utilities, Inc. - Senior Discount Program Waiver of $6.00 monthly customer charge for customers who are 65 or older and have an annua income less than $10,000. Entergy New Orleans - Elderly and Handicapped Emergency Assistance Fund Entergy provides funding for the program, that is administered by the New Orleans Council on Aging and Total Community Action, to address the needs of the disadvantaged through direct energy assistance.	Entergy LA and Entergy New Orleans Caulking, hot water jackets, door strips, outlet plugs, solar screens, refrigerator replacement and general repairs.
Maine	Low-Income Assistance Program (LIAP): Maine's transmission and distribution utilities are required to create or maintain a LIAP to make electric bills more affordable for LIHEAP-eligible customers. The Maine State Housing Authority administers, implements and coordinates the statewide plan and the individual LIAPs in conjunction with its delivery of LIHEAP. The fund amounts to approximately $5.7 million yearly. Bangor Hydro Electric (2 programs) - [1] LIHEAP-eligible customers may qualify for a rate discount. Depending on income, the percentage of the discount will vary based on kWh usage.[2] Emergency Assistance Program: Limited to AFDC families, or families with children under the age of 18, who may be eligible for AFDC. One of the program's functions is to assist families in paying past due energy-related costs in order to avoid being shut-off. Central Maine Power - Electricity Lifeline Program Offers qualified low-income customers a credit on their electric bill. This credit is based on household income and estimated electricity usage and is applied to your bill for the same amount e Maine Public Service Co. - PowerPact LIHEAP-eligible customers who keep cur	Low Income Refrigerator Replacement: A collaborative effort involving Efficiency Maine, the Maine State Housing Authority and the state's Community Action Programs. The program replaces inefficient refrigerators and installs energy efficient lighting in the homes of qualified low-income consumers. Families or individuals that have incomes at or below 150% of federal poverty guidelines or incomes at or below 170% of federal poverty, if that household has an elderly member or a child under 24 months, may be eligible for the program. Community Action Programs deliver the services. Central Maine Power - Low-Income Energy Management Program Electric water heater and pipe insulation and water conservation measures.
Maryland	The largest utility, Baltimore Gas and Electric, and many smaller utilities offer deposit, reconnect fee and application fee waivers to qualifying customers. Baltimore Gas and Electric - Customer Assistance Maintenance Program (CAMP): Under the CAMP, customers who participate in the Universal Service Protection Program can qualify to earn monthly bill credits ranging from $7 to $12. The amount of credit is based upon income. Allegheny Power - Energy assistance plans Washington Gas Light Company - Residential Essential Service (RES) MEAP-eligible residents who use natural gas for home heating and who are current on their utility bills may be eligible to receive discounts on a portion of their Washington Gas bills during the winter heating season. The discount could be worth up to $135.	Allegheny Power - Energy assistance plans Columbia Gas - Low Income Weatherization Program A free program, for customers with low incomes and higher gas usage, that identifies an energy picture of a home and takes action to seal up areas of heat loss.
Massachusetts	Over a dozen gas, electric and combination IOUs offer utility rate discounts totaling nearly $40 million per year and ranging from 20% to 42% off the low-income customer bill. These discounts were negotiated during the past two decades and were required to continue under Massachusetts' restructuring legislation. Households earning less than 175% of Federal Poverty Guidelines, or receiving one of several means tested programs, including LIHEAP, Food Stamps, TANF and SSI are eligible. NSTAR - R2 Discount Rate: Discount rate for customers who receive certain government means-tested benefits or qualify for fuel assistance. KeySpan Energy Delivery (Boston, Essex and Colonial Gas Companies) You may receive a discount if you are a low-income residential customer and participate in the following public assistance programs: SSI, AFDC, Medicaid, E.A.E.D.C., Food Stamps, Refugee Resettlement, Fuel Assistance or Mass Veterans Service Benefits. KeySpan Energy Delivery - On Track On Track works with 350 low-income 1-2 family heating customers, who are receiving public assistance, to help them resolve financial difficulties. Each participant receives a financial and energy hor Massachusetts Electric: Monthly discount for customers with income at or below Nantucket Electric: Monthly discount for customers with income at or below 175	Customers of Massachusetts regulated electric and gas companies who receive the low-income discount rate may also be eligible for free energy efficiency services that may include energy audits, electric baseload measures, appliance efficiency services, attic and wall insulation, air sealing and heating system replacement. Berkshire Gas - HEARTWAP: This grant program provides low-income, fuel assistance-eligible homeowners with assistance for: Heating system repair/replacement services; Heating system cleanings; Free energy, health and safety audit; Free attic and/or side-wall insulation, air sealing, weather-stripping and other winterization energy repairs. City of Boston (2 programs) - [1] HeatWorks: The Department of Neighborhood Development has partnered with Keyspan Energy Corporation and Action for Boston Community Development, Inc. (ABCD), to create HeatWorks, a program for eligible senior homeowners who are 60 years of age and older, who are owner-occupants of a residential 1-4 family property in the City of Boston, and whose income doe not exceed 80% of median family income as determined by KeySpan Energy Delivery Free weatherization services for customers on the R3 Massachusetts Electric - Energy Efficiency and Conservation Programs Special NSTAR (2 programs) - [1] MassSAVE: Energy efficiency specialists will answer
Michigan	Arrearage forgiveness and deposit and fee waivers are provided by utilities that participate in the state's automated positive billing system and other payment plans. Under positive billing, a participating household must pay a percentage of its monthly assistance grant to its utility. Winter Protection Plan: This plan protects senior and low-income customers of Commission-regulated natural gas and electric companies, rural electric cooperatives and alternative electric suppliers from electric or natural gas service shut-off and high utility payments between December 1 and March 31. Persons qualify for the plan if they meet any of the following criteria: are age 65 or older, or receive Michigan Family Independence Agency cash assistance, or receive Food Stamps or Medicaid, or have a household income at or below 200% of poverty level. Winter Protection allows eligible low income customers to make monthly payments of at least 7% of their estimated annual bill, along with a portion of any past-due amount, December through March, and avoid shut-off during that time even if their bills are higher. Eligible senior citizens participating in Winter Protec

Ohio	$ 101,350,902	175% Federal Poverty Level	Heating: $72 min, $298 avg, $520 max; Cooling: $200 max for utility bills.	Heating: 359,802; Cooling: 36,683	13.6%	Avg. benefit: $3,250	150% Federal Poverty Level	6,207	Percentage of Income Payment Plan (PIPP): Ohio's regulated gas and electric utilities are mandated to participate in the statewide PIPP. Low-income customers who heat with natural gas pay 10% of their monthly income to their gas company and 5% to their electric company. Those with incomes at or below 150% of federal poverty guidelines (FPG) pay 3% instead of 5% to their secondary source of heat. If their utility provides both gas and electric, or if they heat with electricity, they pay 15% of income to the one utility. Eligibility: must receive primary or secondary heat source from a company regulated by the Public Utilities Commission of Ohio, total household income must be 150% FPG or below, and, if eligible, must apply for all energy assistance programs. PIPP is administered by the Ohio Department of Development's HEAP (or LIHEAP) office. Winter Reconnect Program: Allows most households that have been disconnected or are threatened with disconnection due to non-payment of a utility bill to have service restored during the winter months by paying either the total amount they owe or $175, whichever is less, plus a reconnection fee of no more Ohio Energy Credit (OEC) Program: Permanently disabled, 65-years-or-older c	The Electric Partnership Program (EPP) was provided for under Ohio's 1999 electric restructuring legislation and is funded by the electric universal service rider. Its goal is to reduce electric consumption by households that participate in the state's Percentage of Income Payment Plan (PIPP). The program is targeted to high consumption, high arrears PIPP households and is composed of two types of programs: A baseload efficiency program which audits lighting, appliances and all other uses of electricity not related to heating and installs appropriate measures; and, A weatherization program for those who heat with electricity and who have moderate to high usage. This program adds insulation, performs heating system inspections and addresses health & safety measures. The EPP began operations in March 2002 and is administered by the Ohio Office of Energy Efficiency. In addition to programs offered by electric utilities through EPP, gas utilities also provide energy efficiency programs. LIHEAP funds transferred to the Ohio Office of Energy Efficiency are matched with utility funds to allow local providers		Seasonal: From November 1 to April 15, the Ohio Winter Protection Plan requires utilities to add 10 extra days to the customary 14 days notice given to low-income residential natural gas or electric customers facing service disconnections. The plan also prohibits natural gas or electric service disconnections for utility customers with incomes at or below 150% of poverty who are enrolled in the state's Percentage of Income Payment Plan. From October 22 to April 12 , the winter reconnect rule allows residential customers who are facing natural gas or electric service disconnects - or who have already had their service disconnected—to pay a minimum of $175 and agree to a payment plan to have service maintained or restored. Health: Ohio requires utilities to delay disconnection of residential natural gas or electric service for nonpayment if such an action is certified by a medical professional to be dangerous to health. Disconnections are also prohibited if such actions would make operation of necessary medical or life-support equipment impossible or impractical. Medical certificates may be renewed twice Deferred Payments: Utilities are required to offer customers in danger of disconn Low-Income: Utilities are prohibited from disconnecting residential service at any		Dayton Power & Light (2 programs) - [1] Percentage of Income Payment Plan Credit Program: Customers who have been on the PIPP program for one year and have more than 12 months PIPP arrears may be eligible for PIPP credits. The amount of credit is based on the total 12 months arrears. This credit is applied to the outstanding balance and not to the current installmen[2] Fresh Start: An arrearage-crediting program for customers no longer on PIPP.	Columbia Gas - Warm Choice: Weatherization measures include insulation, air sealing and high-efficiency furnaces. Homeowners and renters whose income is 150% or less of federal poverty guidelines are eligible. Dominion East Ohio - Housewarming Program Provides weatherization assistance to eligible customers. Duke Energy: Income-qualified customers receive a furnace or heat pump clean and tune, energy-efficient light bulbs, energy-saving tips and if needed, a hot water heater wrap, weather stripping and pipe wrap. Depending on the condition of your home and its energy usage, other services may include duct sealing, wa and attic insulation and other air leakage sealing measures.	Columbia Gas - Heatshare: Funded by shareholder and customer donations, this fund helps low-income customers who have nowhere else to turn for energy assistance. The Salvation Army administers the fuel-funds program. Dominion East Ohio - EnergyShare Sponsored by Dominion East Ohio, the EnergyShare program is designed to help needy individuals and families pay any type of winter heating bill--natural gas, wood, oil, kerosene or electricity. Contact your local Salvation Army office to apply. Duke Energy - HeatShare: Designed to assist those in need with heating bills during the winter season. Eligibility is based upon need and doesn't necessarily follow government assistance guidelines. An individual must be subject to disconnection of service in order to qualify. Eligible customers may apply for a one-time annual assistance beginning mid-January through May or until funds are depleted. For additional information or to apply for assistance, contact the Salvation Army after the program begins in mid-January. Oklahoma	$ 15,728,845	110% Federal Poverty Level	Heating: $57 min, $220 max; Cooling: $120 max for 1 person household, $180 max for 2+ person household	Heating: 87,520; Cooling: 32,632	10.3%	Max. benefit: $2,826	60% State Median Income	1,150				Seasonal: Oklahoma prohibits disconnection of natural gas or electric service if the National Weather Service forecasts any of the following temperatures for the day of disconnection: 32°F or below during the daytime; 20°F or below during the nighttime; 103°F or above during the day. In addition, the Oklahoma Corporate Commission has the authority to order a temporary ban on all disconnections during periods of extremely severe weather, or in circumstances where disconnection would be dangerous to the life or health of the customer. Health: The state requires utilities to delay for up to 30 days disconnection of residential service if a licensed medical doctor or osteopath certifies that disconnection of service would precipitate a life-threatening condition because the customer or a permanent household member is dependent on electrically operated equipment that is needed to sustain the person's life. A medical certificate may be renewed once, for a total of 60 days. The customer is required to pay the bill in full or negotiate a deferred-payment arrangement for the balance during the period of delay. Income/Deferred Payments: The state delays disconnection of natural gas and e		Oklahoma Gas & Electric: LIHEAP customers pay the regular residential rate for the first 600 kWhs used and then receive a credit of $0.67 per kWh from November through April. Oklahoma Natural Gas: LIHEAP customers receive a reduced gas bill which averages $5.03 a month during the winter months (October through April) and $4.26 during the summer months (May through September).		America Electric Power - Light A Life: Customer and AEP donations are distributed through the Salvation Army. Canadian Valley Electric Cooperative - Operation Roundup Member donations provide funds to assist individuals and organizations with medical care, food, clothing, housing, educational assistance and other needed services that are not being met by other agencies. Indian Electric Cooperative - Operation Round Up Member donations assist organizations and individuals with a variety of worthy causes throughout the service area. Northeast Oklahoma Electric Cooperative - Operation Round-Up In 1998, Northeast Electric launched the Operation Round-Up program. Collected money is placed into a benevolence fund and overseen by the Northeast Electric Cooperative Trust Foundation, Inc. The funds that accumulate in the foundation will be distributed to individuals and organizations which prove to be worthy of the funds. Proper application for funds must be made, and the governing board of trustees (separate from the cooperative's board) will determine who will receive assistance. Oregon	$ 24,591,465	60% State Median Income	Heating: $150 min, $276 avg, $320 max	Heating: 58,000	11.1%	Avg. benefit: $3,855	60% State Median Income	2,551	Oregon Energy Assistance Program: Oregon's restructuring legislation requires its two investor-owned electric companies to collect $10 million per year, beginning in 2000, for low-income electric bill payment assistance. The funds are administered by the state LIHEAP office and must be expended in the service area of the electric company from which the funds are collected. Income eligibility for the electric assistance funds is the same as for LIHEAP, 60% of state median income. Emerald PUD (2 programs) - [1] ERAP Emerald's Rate Assistance Program assists low-income seniors (60 years or older) and disabled households with bills. Letters are sent from Lane County to those who qualify[2] AFP (Arrearage Forgiveness Program): A one-year case management program that helps with energy and money management. If a customer stays current with electric bills for one year, the arrearage they entered the program with is forgiven.	Utility restructuring legislation established a 3% Public Purpose Charge (PPC) to be collected from the state's two investor-owned electric companies. About 13% of the PPC, about $7.8 million, is earmarked for low-income weatherization, distributed through the state weatherization agency network. Collection of these funds began March 1, 2002. Low Income Weatherization Program: Oregon Housing and Community Services performs energy audits to determine appropriate services. State devotes 13% of the total collected public purpose charge to fund low-income weatherization services. Households with incomes at or below 60% of the state median income are eligible for assistance. Households served in 2005: more than 1,600		Seasonal: Oregon delays disconnection of residential natural gas or electric service for nonpayment for up to six months if a medical professional certifies that the disconnection would be dangerous to the health of the customer or other permanent household member. If the medical professional labels the householder's illness as "chronic," the utility is required to delay disconnection for up to 12 months. Customers submitting a medical certificate are required to enter into a written deferred-payment arrangement. Deferred Payments: Oregon prohibits natural gas and electric utilities from disconnecting residential service if the customer enters into a written deferred-payment plan, which at a minimum offers a choice between a level payment plan and a down payment and equal pay arrearage plan.		Avista Utilities - LIRAP: A low-income rate assistance program funded by Avista customers. Eugene Water & Electric Board (3 programs) - [1] Universal Service Plan This program provides low-income seniors and disabled customers with weatherization services and bill co-payments. At the successful end of the program, EWEB will forgive any arrearage on the customer's bill. The Human Services Commission administers the program. [2] Low-income customers may also be eligible for the Deposit Guarantor program, which provides assistance for half of a qualifying customer's account deposit (not to exceed $300). Anyone who is accepted into the Deposit Guarantor program must also participate in EWEB's Customer Care Plus. [3] Military assistance: This is a special, limited-duration program for military personnel who are called to active duty and serve overseas in Iraq, Afghanistan or in support of those military actions. Families of eligible military personnel may receive up to $300 in bill-payment assistance per 12-month period. Pennsylvania	$ 134,810,209	150% Federal Poverty Level	Heating: $100 min, $245 avg, $1200 max	Heating: 294,000	17.2%	Avg. benefit: $2,826	150% Federal Poverty Level	12,406			Customer Assistance Referral and Evaluation Program (CARES) The CARES program helps customers with special needs. CARES may help you find ways to pay your utility bill. For example, special needs are customers who are experiencing family emergencies, divorce, unemployment, or medical emergencies. The goal is to provide support and direction to help customers pay their utility bills.	Seasonal: From December 1 to April 15, Pennsylvania requires utilities to seek permission from the PUC before disconnecting residential natural gas or electric service for nonpayment. In practice, the Pennsylvania PUC does not grant permission for disconnection of service for nonpayment during the winter months. Health: Pennsylvania requires utilities to delay for up to 30 days disconnection of residential service if a medical professional certifies in writing that the customer or a permanent household resident is seriously ill or affected by a medical condition that would be aggravated by a lack of utility service. The medical certificate can be renewed two more times, the customer is required to negotiate a deferred payment arrangement during the period of delay. Deferred Payments: Utilities are required to offer residential customers in danger of service disconnection an opportunity to enter into a deferred payment agreement, and they are required to maintain service to the customer if the customer agrees to the arrangement.		Pennsylvania's major gas and electric utilities are required to provide Customer Assistance Programs (CAPs), which generally provide a percentage of bill plan or a percentage of income payment plan, wherein low-income customers' utility payments are based upon their incomes and/or utility bills. Some programs include utility arrearage forgiveness; others provide flat rate discounts or bill credits. Under electric and gas restructuring legislation all electric and gas utilities are required to offer universal service programs, to include CAPs, and to continue pre-restructuring low-income programs. Hardship Funds: Utility company hardship funds provide cash assistance to utility customers to help them pay their utility bills. Hardship funds provide assistance grants to customers who "fall through the cracks" of other financial assistance programs, or to those who still have a critical need for assistance after the other resources have been exhausted. The funds make payments directly to companies on behalf of eligible customers.	Mandated by a 1987 PUC order, the Low-Income Usage Reduction Program (LIURP) was renewed in 1992 thru 1996, and continued under universal service provisions of electric and gas utility restructuring legislation. The state's 15 major gas and electric utilities participate in LIURP with a pre-restructuring funding level of about 2/10 of 1% of each utility's total revenues. LIURP includes an education component that addresses energy savings, regular bill payment behavior and provides application assistance. Allegheny Power (3 programs) - [1] CAP Reduced monthly payment based on a percentage of the household's income. If customer is faithful to the plan, arrearages are reduced. [2] Waived late payment charges Eligibility: 150%, or below, federal poverty guidelines[3] LIURP: Emphasis on baseload electric measures; lighting; heating system, water heater, and refrigerator replacement. Columbia Gas of Penn (3 programs) - [1] CAP Affordable payment plans for customers with low incomes and long-term bill payment problems. Eligibility: 150%, or below, federal poverty guidelines[2] Warm Choice: A free weatherizati Dominion Peoples (3 programs) - [1] CAP Based on income and family size, CA Duquesne Light (3 programs) - [1] CAP: Payment reduction based on percentage	$1 Energy Fund The $1 Energy Fund, Inc. was founded in 1983 in Western Pennsylvania by a coalition of concerned community, religious, and business leaders, and has grown to become the fourth largest fuel fund in the country, both in clients served and dollars granted. The fund partners with utility companies across Pennsylvania. Each company matches every donation dollar for dollar and makes a separate donation towards administrative expenses. Philadelphia Utility Emergency Services Fund The Philadelphia Utility Emergency Services Fund is one of the largest fuel funds in the country, providing over $2 million annually in energy crisis assistance benefits in recent years. It was created by utility companies, public officials, business leaders, and community organizations in response to increased terminations of gas, electric, and water service coupled with inadequate LIHEAP benefits. Philadelphia's three major utilities (gas, electric and water) provide a dollar-for-dollar match to every dollar raised and contribute to the fund's operating costs. Philadelphia residents have thirteen sites to choose from to get help with their utility bills. Equitable Gas - Hardship Fund Supplemental payments for repair/replacement of defective heating equipment or gas lines. National Fuel Gas - Neighbor For Neighbor Heat Fund The fund is supported by customer, employee and shareholder donations that PECO - Matching Energy Assistance Fund (MEAF) MEAF is an energy assistance program that enables PECO Energy to assist low- PPL - Operation Help: Funds may be used to pay any type of home heating bill (electric, natural gas, oil or coal). Rhode Island	$ 13,628,926	60% State Median Income	Heating: $400 min, $500 avg, $650 max	Heating: 29,000	13.0%	Max. benefit: $3,200	60% State Median Income	895		Appliance Management Program (Refrigerator Replacement Program) Special services are available to low income National Grid customers to help lower energy bills with our Energy Efficiency and Conservation Programs. The goal of the program is to provide a comprehensive review of the customer's electric bill, existing appliances and electric use patterns. The program provides client education, ideas and information you can use to help make saving energy easier and more cost effective. The program targets low income households that are customers of the National Grid Company. Heating System Replacement Assist's owner occupied low and moderate income households with major repairs and/or the replacement of their boiler/furnace. This program is designed to increase the boiler/furnaces efficiency and to insure the health and safety of the household occupants. Clients must be income eligible and pre-approved by their local Community Acti Program (CAP Agency) in order to be applicable for this program.	RISEO Emergency Fuel Program This state program is separate from LIHEAP and offers emergency assistance to households that are experiencing an energy-related crisis. An application may be submitted if a household has not received heating assistance and the fuel tank is empty or near empty or if they are in danger of losing utility service.	Seasonal/Low-Income: From November 1 to March 31, Rhode Island prohibits disconnection of residential natural gas or electric service to households containing seriously ill or disabled persons, residents 65 years of age or older, unemployed persons, or persons eligible for or receiving LIHEAP. Utilities are also prohibited from disconnecting residential service to non-protected customers if the customer owes the utility $500 or less for utility service that is the primary heat source or $200 or more for service that is not the primary source of heat. Health: The state requires utilities to delay for up to 21 days disconnection of residential service for nonpayment if a licensed physician certifies that any resident of the customer's household is seriously ill. If the duration of the illness exceeds 21 days, the customer may request a review to determine if the initial delay will be extended, and, if so, for how long. Deferred Payments: The state requires utilities to offer residential payment plans to customers who are in danger of having their service disconnected for nonpayment. Protected status customers are required (at a minimum) to pay on		Rhode Island Utility Discounts As a condition of deregulation of the electric industry in Rhode Island, the state requires utilities to provide low-income rate discounts to eligible customers, and preserves all existing low-income programs that were offered by the utilities before deregulation. Narragansett Electric: Provides a discount rate for low-income households amounting to about $9 per month.	Narragansett Electric - Appliance Management Program An Energy manager from your local Community Action agency will provide an appliance analysis which indicates how much each appliance costs to operate and how much you might save. You may qualify for other items including: ENERGY STAR® refrigerators, ENERGY STAR® lighting, water saving measures and insulation and air sealing measures.	Good Neighbor Energy Fund A statewide cooperative effort between gas and electric companies and The Salvation Army. The Good Neighbor Energy Fund is available to any Rhode Islander who, because of temporary financial difficulty, cannot meet a month's energy expense and has not qualified for or received other energy assistance funds. The maximum Fund grant is $300, the total of which can be distributed to more than one utility. The Fund grant is given only one time per family per heating season and a recipient must exceed LIHEAP income guidelines. UniBank Fuel Assistance Fund Funds may be available to families who do not qualify under traditional income guidelines, to families who cannot afford the standard 100-gallon minimum delivery amount, or to those families who may have already reached their annual limit for fuel oil benefits. For more information on applying for a grant, contact the Worcester Community Action Council, Inc.
South Carolina	$ 13,589,900	150% Federal Poverty Level	Heating or Cooling: $150 min, $370 max	Heating: 18,030; Cooling: 3,984	5.3%	Max. benefit: $5,652	150% Federal Poverty Level	1,149				Seasonal/Health: Between December 1 and March 31, South Carolina requires natural gas and electric utilities to delay disconnection of residential natural gas or electric service for up to 31 days, if a medical professional certifies that disconnection of service would adversely affect the health of the customer or a permanent household member. A medical certificate can be renewed up to three times during the winter protection period. Deferred Payments: Before disconnecting residential service for nonpayment, natural gas and electric utilities are required to provide customers with an opportunity to enter into a deferred-payment arrangement. The utility is prohibited from disconnecting service whenever a customer accepts and adheres to such an arrangement.				Progress Energy - Energy Neighbor Fund The project receives support from employees, customers, churches and civic organizations. Employee and customer campaigns help raise funds for the Energy Neighbor Fund each fall, and the Progress Energy Foundation provides $250,000 in matching funds. Duke Power (3 programs) - [1] Share the Warmth A heating bill assistance program funded by Duke Power customers and Duke Energy shareholders. The Duke Energy Foundation matches individual contributions, dollar-for-dollar up to $50, for a maximum corporate contribution of $500,000 annually. The funds may be used for the payment of heating costs, regardless of energy source. [2] Cooling Assistance Program: Funded by Duke Power and the Duke Energy Foundation, an annual contribution of $250,000 is spread among the counties within their service area. A specific agency (or agencies) is selected in each county to distribute the funds and to determine the criteria for family eligibility[3] Fan-Heat Relief Program: The Duke Energy Foundation contributes $40,000 annually for the purchase of fans for senior citizens. Administered by the N.C. Department of Human Resources/Division of Aging. Piedmont Natural Gas - Share the Warmth Piedmont matches contributions from customers and employees. Funds are used to help South Carolina Electric & Gas Co. - Project Share Through contributions to Project Share, SCE&G employees and customers provid Aiken Electric Cooperative - Operation Round Up® AEC members help provide food, shelter, clothing, healthcare and other services
South Dakota	$ 12,807,748	160% Federal Poverty Level	Heating: $235 min, $865 max	Heating: 18,000	19.3%	Max. benefit: $2,744	160% Federal Poverty Level	619				Seasonal: From November 1 to March 31, South Dakota requires utilities to give an additional 30 days' notice before disconnecting service to residential customers. Health: South Dakota requires utilities to delay for up to 30 days disconnection of residential service for nonpayment if a physician or other public heath or social service official certifies in writing that such an action would adversely affect the health of the customer or another permanent resident of the household. Deferred Payment: The state requires natural gas and electric utilities to offer residential customers the opportunity to avoid disconnection of service by agreeing and adhering to a deferred-payment agreement.				MidAmerican Energy - I Care The I CARE program helps your local community action agencies provide financial assistance for heating bills and home weatherization. MidAmerican Energy contributes funds based on customer contributions and pays all administrative costs. Sioux Valley Southwestern Electric - Operation Round Up Voluntary contributions from participating cooperative customers. The Operation Round Up funds are kept in a trust fund and are dispersed as directed by the Operation Round Up board. Individuals are eligible to receive up to $2,500/year. West River Electric Association, Inc. - Operation Round Up Operation Round Up donations are placed in trust and administered by a independent Board of Directors. The funds will be available to help any charitable projects for organizations, groups, families, or individuals within the service territory of West River Electric.
Tennessee	$ 27,583,705	125% Federal Poverty Level	Heating and Cooling: $150 min, $750 max	Heating: 74,267	4.8%	Max. benefit: $2,744	125% Federal Poverty Level	2,672				Seasonal: Tennessee prohibits disconnection of residential electric or natural gas service for nonpayment when the National Weather Service forecasts the temperature at that location to be 32°F or below for that calendar day. Health: The state requires natural gas and electric utilities to delay for up to 30 days disconnection of residential service if a physician or public health or social service official certifies in writing that such an action would adversely affect the health of the customer or that of a permanent household member. During these 30 days, the utility is required to refer the customer to social service agencies fo investigation, confirmation of need, and guarantee of payment. Medical certificates may be renewed three times, each for an additional 30-day period. Deferred Payments: The state requires utilities to offer customers an opportunity to avoid disconnection by entering into a deferred-payment arrangement. Such an arrangement requires the customer to pay the current bill as due, and to pay the overdue balance in installments over six months.		Memphis Light Gas and Water - On Track A payment program designed to help customers with limited incomes to manage debt and pay off their bills over a period of time. The program focuses on education, financial management and social services. To qualify for the program customers must have a steady, but limited, income and owe more than $600 to MLGW. Participants may receive Extended Payment Plans for up to three years; minor home repairs for homeowners; and deposit credited back to the account after completion of program.	Memphis Light Gas and Water - EnergySmart Memphis A year-long energy education and home improvement initiative designed to help Memphians save money on their energy costs. Customers will receive in-depth energy conservation training and eligible customers will have weatherization improvements made to their home.	Appalachian Power - Neighbor-to-Neighbor Program The eligibility of recipients is determined and funds are distributed by the Upper East Tennessee Human Development Agency. Athens Utility Board - Warm Neighbors Program Working with Coordinated Charities of McMinn County, AUB provides a way to help those in need to maintain their service without interruption. Atmos Energy - Sharing the Warmth Customer donations combine with company donations to help people pay their gas bills. Texas	$ 45,044,208	125% Federal Poverty Level	Heating: $704 avg, $1200 max; Cooling: $739 avg, $1200 max	Heating: 7,192; Cooling: 15,082	2.7%	Max. benefit: $2,826	125% Federal Poverty Level	4,800	Lite-Up Texas: Effective July through October 2007, low-income customers in areas with retail electric choice (Houston, Dallas, and areas of South and West Texas) are eligible for a summer discount. Households currently receiving Food Stamps or Medicaid will automatically be included in the program if the information on file with the Health and Human Services Commission matches information on file with the household's Retail Electric Provider. Those with total household income of less than 125% of federal poverty guidelines may apply by calling 1-800- 241-7011. (The discount will also be available June through October of 2008 and June through September of 2009.)	The electric competition law created a System Benefit Fund part of which is used to help finance energy efficiency programs. The Texas Department of Housing and Community Affairs (TDHCA) will administer energy efficiency programs in coordination with existing weatherization programs. Utilities will develop standard-offer programs to install energy efficiency measures that may include: compact fluorescent lightbulb lease-purchase programs, refrigerator and air-conditioner lease-purchase programs, and water-flow restrictors (low-flow shower heads and faucet aerators) provided free of charge. Independent service providers will deliver these services to customers. TDHCA operates partnership programs with: Central Power & Light, El Paso Electric, Entergy, HLP / Reliant, Southwest Public Service, Southwestern Electric Power, Texas Utilities Electric, Texas-New Mexico Power and West Texas Utilities.		Seasonal: Texas prohibits utilities from disconnecting residential natural gas or electric service for nonpayment when the temperature was 32 degrees or below on the previous day and is forecasted by the National Weather Service to be 32°F or below during the next 24 hours. Utilities are also prohibited from dosconnecting service if a heat advisory has been in effect for any of the two preceding days. In these cases the utility must defer collection full payment until after the weather emergency is over and work with customers to establish a pay schedule for deferred bills. Health: Texas requires utilities to delay for up to 63 days disconnection of residential service if a licensed physician certifies that such an action would adversely affect the health of the customer or a household resident. The customer is also required to enter into a deferred-payment agreement with the utility by the stated date of disconnection. Low-Income: Texas prohibits electric utilities from disconnecting residential service for nonpayment if the utility receives notification that an energy assistance provider intends to forward payment on the client's behalf.		Austin Energy - Low-Income Discount The $6 service charge is waived for customers with persons living in the household who receive SSI, City of Austin Medical Assistance Program (MAP) or Aged, Blind and Disabled Medicaid. Eligible customers can also receive a 50% reduction on their residential City of Austin Drainage fee. Central Power & Light - Lite-Up Texas Effective July through October 2007, low-income customers are eligible for a summer discount. Households currently receiving Food Stamps or Medicaid will automatically be included in the program. Those with total household income of less than 125% of federal poverty guidelines may apply by calling 1-800- 241-7011. (The discount will also be available June through October of 2008 and June through September of 2009.) El Paso Electric - Low Income Rider Eligible customers will not be billed the Residential Service Customer Charge. Eligibility: Food Stamp recipient First Choice Power - Lite-Up Texas: Effective July through October 2007, low-income customers are eligible for a summer discount. Utah	$ 14,744,631	125% Federal Poverty Level	Heating: $50 min, $295 avg, $550 max	Heating: 31,000	10.9%	Max. benefit: $3,100	125% Federal Poverty Level	1,562				Seasonal: Between November 15 and March 15, Utah prohibits disconnection of residential utility service if the customer has a written notice from the utility statin that a deferred-payment arrangement could not be agreed upon; that the customer has applied for HEAT assistance and Red Cross utility assistance; and further, that any of the following criteria apply to the customer either in the month of application or the month before: Has a household income at or below 125% of the federal poverty guideline; Experiences a medical emergency; Becomes unemployed or experiences a 50% or greater drop in income; Winter moratorium participants must pay at least 5% of household income (10% for electric heating) toward utility costs. Health: Utah requires utilities to delay for up to 30 days disconnection of residential service for nonpayment whenever a physician certifies that such an action would adversely affect the health of the customer or that of a household member. Deferred Payments: Utilities are required to offer customers the opportunity to avoid disconnection by agreeing and adhering to a deferred-payment arrangem		Rocky Mountain Power (PacifiCorp) - Home Electric Lifeline Program (HELP) The program is funded through a surcharge on all electric customer bills, averaging about $0.12 per month, and operates in coordination with Utah's LIHEAP. Applications will be available for non-LIHEAP households at community-based organizations when LIHEAP is not operating. Participating customers will receive an $8 per month credit on their bills.	Rocky Mountain Power (PacifiCorp): Energy education, electrical usage evaluation, appliance testing, audit and the installation of cost-effective measures.	Questar Gas - REACH - Residential Energy Assistance through Community Help REACH is funded through contributions from local residents through tax-deductible donations included with their utility payments and donations from utility employees and stockholders. The American Red Cross administers the program and distributes the funds. Eligibility: low income and age 65 or older or disabled. Catholic Community Services - Crisis Funds for Salt Lake County Applications are available April to January for help once per heating season. Eligibility: must be approved for HEAT program first, based on 125 percent of poverty guidelines. Provo City Power (2 programs) - [1] HELP. Voluntary donations are sent each month to Community Action Services to distribute. [2] The city also has a program to help military families with 50 percent of the utility bill written off for up to six months. Rocky Mountain Power (PacifiCorp) - Lend a Hand An organization formed to help families and seniors in need pay their winter heating bills. Customer donations are matched dollar-for dollar by Utah Power,funds are administered by the American Red Cross.
Vermont	$ 11,746,617	Heating: 125% Federal Poverty Level; Crisis: 150% Federal Poverty Level	Heating: $50 min, $1364 avg, $1565 max	Heating: 21,022	15.9%	Max. benefit: $3,000	150% Federal Poverty Level	1,373	Emergency/General Assistance provides emergency help to meet basic needs, including fuel and utilities. Eligible are persons with little or no income and resources who are unable to work or who have employment barriers. Also persons who have experienced a crisis such as a fire, flood, death in the family or eviction may be eligible. Individuals must apply in person at PATH district offices when they have an emergency. Seasonal Fuel Assistance: Fuel Assistance can help to pay part of your home heating bills. To determine your eligibility, we will consider both your household's income and resources. You can have a monthly net income up to 125% of federal poverty levels, and you can have up to $5,000 in resources.	The Weatherization Trust Fund established in 1990, is funded by a 0.5 percent gross receipts tax on regulated utilities and all fuels except wood. The trust fund has raised about $3 million annually to supplement the Vermont Weatherization Assistance Program.	Emergency/General Assistance provides emergency help to meet basic needs, including fuel and utilities. Eligible are persons with little or no income and resources who are unable to work or who have employment barriers. Also persons who have experienced a crisis such as a fire, flood, death in the family or eviction may be eligible. Individuals must apply in person at PATH district offices when they have an emergency. Crisis Fuel Assistance helps Vermonters who experience a crisis during the winter months. Your household income can be up to 150% of the federal poverty level. However, in addition to being income eligible, you must show that you are experiencing a crisis.The income level used to determine eligibility for Crisis Fuel Assistance is higher than that of the Seasonal Fuel Assistance Program.	Seasonal: Vermont prohibits disconnection of residential natural gas or electric services for nonpayment from November 1 through March 31 if the National Weather Service forecasts temperatures to be at or below 10°F (32°F for households with members age 62 or older) for a 48-hour period beginning on the morning of the date of disconnection. Health: Vermont requires utilities to delay for up to 30 days disconnection of residential service for nonpayment if a physician certifies in writing that the customer or a household member would suffer a health hazard in the event of service disconnection. A physician's certificate may be renewed twice within a calendar year. Deferred Payments: The state requires utilities to offer residential customers the opportunity to avoid disconnection by agreeing and adhering to a deferred-payment arrangement. The state prohibits utilities from disconnecting service to customers who accept and complete such an arrangement.		Green Mountain Power - Energy Support 10% discount for customers whose annual household income is at or below 200 percent of the federal poverty level.	A unique "energy efficiency utility" called Efficiency Vermont was created by the Vermont legislature and Vermont Public Service Board to provide energy efficiency services to low-income and other customers. The Low-Income Single Family Program provides electric efficiency improvements to eligible customers of Vermont's electric utilities (except in Burlington) who are actively enrolled in the federal Weatherization Assistance Program. Measures include energy efficiency lighting, refrigerator replacement, and water heater efficiency measures. Also provides energy efficiency measures to owners, managers and developers of multi-family housing units. Green Mountain Power Offers free weatherization service to low-income households through local weatherization agencies. Qualified technicians come to your home and inspect the heating system, make any necessary repairs, insulate, and seal air leaks.	WARMTH: The WARMTH Support Program uses funds donated by concerned Vermonters to help low-income families pay their energy costs. All contributions go directly to fuel suppliers; administrative costs are funded by participating fuel dealers and utilities. WARMTH funds are available when a household has exhausted its supply of fuel or faces disconnection of utility services. Funds are only available when an individual has not been able to find sufficient help through other channels. Central Vermont Public Service - The Shareheat Fund The Fund helps less fortunate customers pay their winter energy bills. Recipients must have exhausted other fuel assistance funds before receiving help from Shareheat. Donations are distributed to community action agencies operating within the CVPS service territory, which in turn, provide the funds on a case-by-case basis to those in need.

Virginia				Virginia does not have state-mandated disconnection policies related to temperature, health, or income.	All participating vendors for the LIHEAP Fuel and Crisis Assistance components agree to waive charging the State Sales Tax on all fuel deliveries. Eligible households receive the amount that would be paid to the State for sales tax in the total amount of fuel delivered.
Washington		State general funds go to "Energy Matchmaker" program and are matched by local, utility and other funds. The funds were used to weatherize 1,291 low-income homes in FY 2002. Measures included attic, wall and floor insulation, weatherstripping and furnace modifications.		Seasonal/Low-Income: Between November 1 and March 31, Washington prohibits disconnection of residential natural gas and electric service for nonpayment if customers are able to fulfill the following requirements: Declare an inability to pay a bill and/or required deposit; Have household income at or below 125% of the federal poverty guideline; Apply for energy assistance and low-income weatherization assistance; Pay at least 7% of monthly income each month to utility in addition to one-twelfth of past due amounts accrued from date of application. Health: Washington requires utilities to delay for up to 60 days disconnection of residential service for nonpayment if the utility receives written or verbal notice that a medical emergency exists at the customer's residence. The utility may require the customer to submit written certification from a physician stating that disconnection would aggravate an existing medical condition of a resident of the customer's household. Deferred Payments: The state also prohibits disconnection of residential service for nonpayment if the customer agrees and adheres to a deferred payment arra	
West Virginia				Seasonal: Between December 1 and February 28, West Virginia prohibits disconnection of residential natural gas or electric service for nonpayment because such action is interpreted as being dangerous to the health and safety of the customer's household. Health: West Virginia requires utilities to delay for up to 30 days disconnection of residential service for nonpayment if a licensed physician certifies that such an action would be dangerous to the health of the customer or a household membe Certificates may be renewed every 30 days for the duration of the illness unless the physician can state that the condition is permanent. Deferred Payments: Utilities are required to offer residential customers in danger of having their service disconnected for nonpayment the opportunity to enter into a deferred-payment agreement. If the customer agrees and adheres t such an agreement, service cannot be disconnected.	
Wisconsin	A Public Benefits Fund (PBF) created in 1999 under energy reliability legislation funds low-income energy programs, along with other conservation and renewables programs. Funding for the low-income energy portion of the PBF varies each year and comes from three sources: prior utility (gas and electric) low-income expenditures (about $21 million per year), a new access fee or customer charge on all electric bills, and the current year's federal LIHEAP and weatherization allocations. Funding is split between energy assistance and energy efficiency. The new funding allows the LIHEAP program to pay a non-heating electric benefit, averaging about $92 for FY 2003, along with the regular LIHEAP heating benefit. Low-income programs formerly operated by utilities will transition to the LIHEAP grantee by January 2003. The State of Wisconsin under Wis. Stat. Chapter 49 directs General Assistance funds to households without assets or means of support to provide a minimum of life's necessities including the cost of home heating. General assistance is provided only as a last resort to eligible households. State and local sales taxes are suspended for LIHEAP eligible households for the Housing Cost Reduction Initiative Utility Payment Program: State funds are distri	Focus On Energy is a public-private partnership offering energy information and services to energy utility customers throughout Wisconsin. The Targeted Home Performance with ENERGY STAR® program assists Wisconsin residents in making energy efficiency improvements to their homes. Wisconsin residents wh receive their electricity from a participating utility, and who meet the income requirements, are eligible to participate. Depending on results from a home energy assessment, energy efficiency measures may include insulation, sealing air leaks, heating system update or energy saving devices.		Seasonal: From November 1 to April 15, Wisconsin prohibits disconnection of natural gas or electric service to households with incomes at or below 250% of poverty. Utilities are allowed to disconnect services to other residential customers during this period only if the household does not include members wi because of age, developmental or mental disabilities, illness, or infancy, would have their health or safety endangered by such an action. Health: The state requires utilities to delay for up to 21 days disconnection of residential service for nonpayment if a licensed Wisconsin physician certifies that such an action would aggravate an existing medical condition of the customer or a household member. During the delay the utility must work with the customer to make a reasonable payment arrangement. The delay may be extended to facilitate completion of such an agreement. Deferred Payments: Wisconsin requires utilities to offer residential customers the opportunity to avoid disconnection by negotiating a deferred payment arrangement. Disconnections are prohibited when customers agree and adhere	
Wyoming	Senior Tax Rebate: Provides a tax rebate in the form of a check made out to the client for up to $500 or $600 depending on program guidelines. You must be 65 years of age or older, or over age 18 and 100% disabled, and a Wyoming resident for one full year at the time of application. An applicant must be income qualified.			Seasonal: Wyoming prohibits disconnection of natural gas or electric service to residential customers for nonpayment between November 1 and April 30 if any of the following apply: The customer can establish a documented inability to pay for services, and; The customer has exhausted government assistance, or The customer is actively in the process of seeking government assistance, or The customer is able to pay for service only by installments. Health: The state requires utilities to delay for up to 22 days disconnection of residential service for nonpayment if a physician certifies that a member of the household is handicapped or seriously ill. If the physician certifies that a member of the household is on life support, the utility must allow 30 days for the customer to enter into a deferred payment arrangement. Deferred Payments: The state requires utilities to offer deferred payment arrangements to residential customers in danger of losing service because of nonpayment. Disconnections are prohibited when customers agree and adhere to such arrangements.

Pennsylvania	Yes	X			X								Waived	Reduced Monthly Bill	X	X		Arrearage Amount	X					Pennsylvania's major gas and electric utilities are required to provide Customer Assistance Programs (CAPs), which generally provide a percentage of bill plan or a percentage of income payment plan, wherein low-income customers' utility payments are based upon their incomes and/or utility bills. Some programs include utility arrearage forgiveness; others provide flat rate discounts or bill credits. Under electric and gas restructuring legislation all electric and gas utilities are required to offer universal service programs, to include CAPs, and to continue pre-restructuring low-income programs. Hardship Funds: Utility company hardship funds provide cash assistance to utility customers to help them pay their utility bills. Hardship funds provide assistance grants to customers who "fall through the cracks" of other financial assistance programs, or to those who still have a critical need for assistance after the other resources have been exhausted. The funds make payments directly to companies on behalf of eligible customers.
Rhode Island	Yes	X		X	X	X							Waived	Reduced Monthly Bill		X		Arrearage Amount	X					Narragansett Electric: Provides a discount rate for low-income households amounting to about $9 per month.

Programs	Sponsor(s)	Program Type	Program Description
Winter Fuel Payments	UK Government	Rate Assistance	A Winter Fuel Payment is an annual payment to help people aged 60 and over with the costs of keeping warm this winter. If you are aged 60 to 79 and you are entitled to receive a Winter Fuel Payment, this year you will get either £125 or £250, depending on your circumstances in the qualifying week (15 to 21 September 2008). If you are aged 80 or over and you are entitled to a Winter Fuel Payment, this year you will either £200 or £400, depending on your circumstances in the qualifying week. You do not pay tax on Winter Fuel Payments.
Cold Weather Payments	UK Government, E.ON UK and Age Concern	Rate Assistance	Cold weather payments made to vulnerable households who are on certain benefits in periods of very cold weather in their area, to help pay for extra heating costs. To get a Cold Weather Payment the average temperature must be recorded as, or expected to be, 0°C or below for seven days in a row. These include a guaranteed cold weather payment of £10 for all gas customers, whilst those aged 60 or over receive an additional payment based upon the number of days the temperature is below zero between December and February; increase the Cold Weather Payment to all Age Concern gas customers over the age of 80 from £10 to £20. All customers on our Age Concern product also receive a free early warning hypothermia thermometer and four free low energy light bulbs, and all are eligible for further reduced energy efficiency measures.
Warm Front Scheme	Department for Environment, Food and Rural Affairs (Defra)	Energy Efficiency	Warm Front Scheme established in 2000 (previously called Home Energy Efficiency Scheme) provides grants to improve heating and energy efficiency of private sector housing in England. The grant provides energy-efficiency advice, energy-efficient light bulbs, and insulation measures such as cavity wall insulation, loft insulation, hot water thermal jackets, and heating improvements. The scheme is aimed at vulnerable households in receipt of eligible benefits. Warm Front also provides a Benefit Entitlement Check to maximise income. The Warm Front Grant provides a package of insulation and heating improvements up to the value of £2,700 (or £4,000 if oil central heating is recommended).
Warm Front £300 Heating Rebate Scheme	Department for Environment, Food and Rural Affairs (Defra)	Energy Efficiency	On Monday 5 December 2005, the Chancellor made a pre-budget announcement regarding the Government's intention to offer a £300 rebate off the cost of installing a new central heating system for people aged 60 or over who own or privately rent their home. The £300 rebate, which forms part of the Warm Front Scheme, can only be used by householders who either have no heating system or one which is inoperable. The £300 rebate was made available from 11 August 2006 to all householders aged 60 or over who are not in receipt of a qualifying Warm Front benefit.
Home Heat Helpline	Energy Retail Association and Energy Suppliers	Rate Assistance	This is an initiative supported by energy suppliers, aimed at helping to reduce the number of fuel-poor households. The main purpose of the helpline is to encourage vulnerable customers to speak with their energy suppliers either directly or through third parties. The helpline is staffed by trained advisers who can carry out a preliminary assessment of callers' benefit entitlement. They are also linked to each energy supplier's priority care team.
Community Energy Efficiency Fund (CEEF)	Department for Environment, Food and Rural Affairs (Defra)	Rate Assistance	Community Energy Efficiency Fund (CEEF) has been set up to provide financial support in 2007/08 to projects in England and applicants have been invited via a competitive process to apply. The aim is to ensure 300,000 of the most vulnerable pensioner and other vulnerable households are assisted to feel warmer and more comfortable using an area based approach to provide a coordinated set of ad vice and measures to them. Community Energy Efficiency Fund (CEEF) was launched on 13th June 2007 and is administered by Defra.
Energy Best Deal Campaign	Ofgem and the Citizens Advice Bureau	Rate Assistance	The objective of the project will be to provide training sessions for a wide range of front line advice workers as part of the CAB's financial capability work. The aim of the project will be to raise awareness among low-income consumers of the savings that can be made by switching supplier and/or payment method and help to provide reassurance about the switching process.
Low Carbon Buildings Programme	Department for Environment, Food and Rural Affairs (Defra)	Energy Efficiency	Pilot project within the low carbon buildings programme (LCBP) to introduce fuel saving microgeneration to fuel poor communities.
Energy Efficiency Commitment (EEC) / Carbon Emissions Reduction Target (CERT)	Energy Suppliers	Energy Efficiency	Across Great Britain, under the EEC, electricity and gas suppliers are required to meet targets for the promotion of improvements in household energy efficiency. In both the first phase of EEC (EEC1), 2002-05, and the current phase (EEC2), 2005-08, suppliers were required to focus at least 50% of energy savings on a Priority Group of low income consumers. Households in this group are those in receipt of income or disability based benefits or tax/pension credit, similar to the eligibility criteria for the Warm Front Scheme. The consultation proposals on the third phase of EEC 2008-11, now known as the Carbon Emissions Reduction Target, were published in May 2007. Also, that energy suppliers should be required to direct at least 40% of carbon savings to a Priority Group of those in receipt of income/disability based benefits or tax/pension credit or those who are aged 70 or over.
E.ON UK - CaringEnergy Service	E.ON UK	Rate Assistance	This includes energy efficiency advice and measures, a benefits entitlement check, a priority service register as well as a range of tariff and payment options. In 2007, we helped 21,000 customers through the CaringEnergy service and within the service over 1600 customers have benefitted from a Benefits Entitlement check.
StayWarm Tariff	E.ON UK	Rate Assistance	Exclusively designed for the over-60s, StayWarm offers customers a fixed price for all their energy by monthly Direct Debit. The amount they pay is based on the number of people who live in their home and the number of bedrooms their home has. We guarantee that as long as they remain with StayWarm, the price they pay will be fixed for 12 months from when they sign up. During 2007, we continued to hold prices for medium and high-user Staywarm customers on benefits, even though their consumptions would have warranted a price increase. These customers are amongst the most vulnerable of fuel poor customers. All are over 60, many live on their own and they require discounts of several hundred pounds as a means of alleviating fuel poverty.
Warm Deal	Scottish Government	Energy Efficiency	Warm Deal offers a grant for heating for households on particular benefits of up to a maximum of £500 for a range of energy saving measures. If you are aged 60 or over and not in receipt of income-related benefits, you can get a smaller grant of up to £125. The Home Energy Efficiency (Scheme) Scotland Regulations, effective from January 2007, also extended the Warm Deal programme to households with children with disabilities and receiving the Disability Living Allowance. These homes can have free insulation measures installed up to the value of £500.
Central Heating Programme / Over 80s Central Heating Programme	Scottish Government	Rate Assistance	Central Heating Programme provides free central heating and insulation packages to the over 60s. It is available to all households in the private sector who lack central heating and where the householder or partner is aged 60 or over. The Programme was extended in May 2004 to include householders (or partners) aged 80 or over who had partial or inefficient central heating systems. The programme has been further extended from 1 January 2007 to include homeowners aged between 60 and 79 and in receipt of the guaranteed element of Pension Credit are now eligible under the scheme if their home central heating is partial or inefficient.
Home Energy Efficiency Scheme (HEES Wales) / HEES Plus	Welsh Assembly Government	Energy Efficiency	The HEES grant provides a package of heating and insulation improvements up to the value of £3,600 (Oil Central Heating up to the value of £5,000). There are two levels of the grant; HEES is for householders who are pregnant and in receipt of a MAT B1 certificate or families with children under 16; provides grants up to to the value of £2,000. HEES Plus is for householders who are 60 and over, lone parents with children under 16 and persons who are receiving certain sickness or disability related benefits; provides grants up to to the value of £3,600. Partial grant of £500 for those over 60 that do not qualify for HEES/HEES Plus. All must be in receipt of the relevant benefits or allowances. The availability of these improvements will depend on what form of heating or insulation you have in your property. The HEES grant does not cover the cost of upgrading a working heating system. Households will also receive tailored energy efficiency advice, provided by eaga plc's Home Visits team. For those householders over the age of 80 they will automatically qualify for these grants.
Warm Homes - Northern Ireland / Warm Homes Plus	Northern Ireland - Department for Social Development	Rate Assistance	The Warm Homes and the Warm Homes Plus Schemes continue to be the main programme for tackling fuel poverty in Northern Ireland, through the provision of energy efficiency measures to owner-occupied and private sector homes. The Warm Homes grant provides a package of energy efficiency and heating measures, up to the value of £850. Energy efficiency advice, tailored to each household, is provided by eaga plc's Home Visits team in accordance with the Energy Savings Trust's Code of Practice. As part of Warm Homes Plus, those over 60 and who are in receipt of one of the necessary benefits are also eligible for heating measures, as well as the insulation measures offered as part of Warm Homes (The total grant available in this instance for both insulation and heating measures is £4,300).

Utility Relief Grant Scheme	State Government	Rate Assistance	Administered and funded by the State Government, provides assistance to domestic customers who are unable to pay their utility bills due to short-term financial crisis. Financial assistance is available on electricity gas and water bills. Pensioner Concession Card, Health Care Card, Gol Card holders and low income households who are registered with their utility retailer' hardship program are eligible to apply to the Scheme. Applicants must demonstrate that an unexpected hardship has left them seriously short of money so that they cannot pay their utility bill without assistance, and risk disconnection of supply. In addition, applicants must satisfy at least one of the following criteria: (a) have experienced a significant increase in bills, for example, if caused by a faulty appliance; (b) have experienced a recent decrease in income, for example, if caused by unemployment, illness or breakdown of a household; (c) have experienced high unexpected expenses on essential items, for example, funeral costs or repairs/replacement of essential items; (d) cost of their shelter is more than 30% of the household income; or (e) cost of their ut					X		2005/06: $3.2 million	2005/06: 9,401							X	X	X								The grant provides for either the full or partial payment of an outstanding utility bill, with a maximum grant of six months worth of usage. Energy Rebate Scheme	State Government	Rate Assistance	The State provides an energy subsidy to people who are financially disadvantaged. The subsidy is intended to assist with the costs of buying energy of all types (electricity, gas, fuel oil, wood, etc.). However for administrative simplicity, the subsidy is paid through Western Power as a rebate on some electricity costs to residential customers who are holders of eligible concession cards. Holders of Centrelink Health Care Card, Seniors Health Card, Veteran Affairs Gold Cards (War Widow, Dependant, Totally and Permanently Incapacitated), and Pensioner Concession Card are entitled to reduced fees on meter testing and rebates on: Account establishment fee; and Supply charge. Where dependant children are listed on eligible Centrelink cards, customers are also entitled to a rebate on a proportion of the energy charge. Holders of Seniors Cards are entitled to reduced fees on meter testing and to rebates on: Supply Charge. This rebate is also available to eligible permanent caravan and park home residents. ENERGYWISE Home Grants	Energy Efficiency and Conservation Authority	Energy Efficiency	EECA's ENERGYWISE™ home grants programme funds improvements to insulation and other energy efficiency measures for homes throughout the country. To be eligible for funding: (1) your property must have been built prior to 1978, when insulation in New Zealand homes became mandatory; (2) you must be eligible for a community services card. The home grants programme targets households on low-incomes; (3) people with health problems such as asthma and other respiratory illnesses are in some areas given priority because of the significant health benefits insulation provides. You are not eligible for a subsidy if you are a Housing New Zealand tenant.				X					X	X								Subsidy for energy efficiency improvements			Subsidy for energy efficiency improvements	"ENERGYWISE Home Grants." Residential Projects. National Rental Property Insulation Programme	Energy Efficiency and Conservation Authority	Energy Efficiency	Currently landlords are being offered a subsidy of at least 60% on insulation and other energy efficiency measures for existing rental properties occupied by low-income tenants. There are two organisations that do this work on rental properties – Eco Insulation and EECN (Energy Efficiency Community Network). To be eligible: (1) the tenant named on the tenancy agreement must be eligible for a Community Services Card; (2) the property must have been built before 1978; (3) the property should have insufficient ceiling and/or underfloor insulation rent must not be increased within six months of receiving the subsidy. ENERGYWISE. 15 August 2008 <http://www.energywise.govt.nz/funding-available/landlords.html>
ENERGYWISE Funding	Energy Efficiency and Conservation Authority	Energy Efficiency	The funding will be available to homeowners earning less than $100,000 pa (1 or 2 earners) or $140,000 pa (3 or more earners), with houses or other dwellings built before 1 April 1978. It will also be available to private residential landlords, where they are insulating and applying other energy efficiency measures to residential properties built before 1 April 1978. This programme is looking to reach a wider population group and will include middle income households. Funding is limited to primarily cover the cost of the interest. Home grants targets Community Services Card holders and offers higher levels of funding. Partners will provide access to loan capital for customers. They can provide this directly or establish partnerships with banks or other reputable lenders. EECA will provide an interest subsidy for qualifying customers. A maximum interest subsidy of $1,400 (incl GST) will be paid in respect of any one loan/customer. If customers prefer a grant to an interest subsidy, EECA will pay partners an amount equivalent to 10% of the capital cost of core products purchased (incl. GST), up to a	$23 million for 4 years			X					X									Interest subsidy of $1,400 OR Grant maximum of $530			Interest subsidy of $1,400 OR Grant maximum of $530	"ENERGYWISE Funding for Insulation and Clean Household Heating." Clean Heat Programme	Energy Efficiency and Conservation Authority	Energy Efficiency	EECA's clean heat programme is working towards cleaner air, making homes warmer and drier, achieving better health, and efficient use of energy. Through this programme inefficient open fires and solid fuel burners are removed from New Zealand homes and replaced with clean, efficient and sufficiently sized heating appliances. The programme currently targets homes of low income householders situated in a critical air shed area. A critical air shed area is an area of high pollution where the National Environmental Standards (NES) for air quality have been exceeded at least five times in the last 12 months. This programme is funded by the Ministry for the Environment. If you are eligible for a clean heat grant you will pay no more than $500 to replace your home's inefficient heating appliance. Full assistance provides for the full cost of the conversion and complete project management including: the retrofitting of necessary insulation to meet building standards where possible; the removal or sealing up of the existing solid fuel burner or fireplace; and the provision and installation of a	$50 million over 11 years			X					X									Grant			Grant	"Clean Heat" Residential Projects. Program Eligibility & Guidelines The following incentives are available for residential energy efficiency measures. Space heating and weatherization offers apply to residential homeowners in Washington and Idaho who heat their homes primarily with Avista electricity or natural gas. Water heating offers apply to customers heating with Avista electric or natural gas. Conversion offers apply to Avista electric resistance heat customers only. Please see descriptions for complete incentive requirements. All programs are subject to change and **request for rebate must be submitted within 90 days** of job completion. Offers apply to existing homes, for new construction please refer to the residential incentives for new construction.

HIGH EFFICIENCY EQUIPMENT

Natural Gas Furnace/Boiler A $400 incentive is available for installation of a high efficiency natural gas furnace or boiler of 90% AFUE (efficiency) or greater.

Air Source Heat Pump A $400 incentive is available for installation of a high efficiency air source heat pump of 8.5 HSPF (heating efficiency) (7.7 HSPF and 13.0 SEER for manufactured homes. Please make note on form to indicate manufactured home). **HSPF verification requires an ARI Certificate.**

Ground Source Heat Pump A $1500 incentive is available for installation of a ground source heat pump of 3.5 COP or greater. This may not be combined with any other high efficiency incentives.

Variable Speed Motor A $100 incentive is available for installation of a primary heating system that incorporates a variable speed motor. This incentive may be combined with a high efficiency incentive.

Central Air Conditioner A $350 incentive is available for replacing an old but functioning central air conditioning system with a new high efficient model of 14.0 SEER or better. Central air conditioning in this case is defined as a ducted air conditioning system of 1.5 tons (18,000 BTUs) cooling or higher, conditioning at least 75% of the home. This incentive may not be combined with heat pump or variable speed motor incentives. **SEER verification requires an ARI Certificate.**

Water Heater A $50 incentive is available for installation of an electric water heater (tank type) of 0.93 EF (efficiency) or greater; a natural gas water heater (tank type) of 0.60 EF or greater for 50-gallon, 0.62 EF or greater for 40-gallon. A $200 incentive is available for an instantaneous natural gas model (tankless) of 0.82 EF or higher.

CONVERSIONS FROM ELECTRIC

Replacement of Electric Straight Resistance as Primary Heat A $1,000 incentive is available to Avista electric customers who replace electric straight resistance as their primary heat (i.e. electric forced air furnace or electric baseboard heat) with a central natural gas heating system or central heat pump. This incentive may be claimed in addition to the high-efficient incentive. A $500 incentive is available to replace Avista electric heat with a natural gas wall heater.

Electric to Natural Gas Water A $250 incentive is available to Avista electric customers who replace an electric water heater with a new natural gas water heater. This incentive may be claimed in addition to the high-efficient natural gas water heater incentive.

WEATHERIZATION

Insulation Incentives are available for the addition of new insulation that increases the R-Value by R-10 or greater (both fitted/batt type and blown-in). Insulation must be installed only where such cavities separate conditioned from unconditioned areas of the residence.

Ceiling/Attic A 25 cents per square foot incentive is available if existing insulation level is R-19 or less.

Wall and Floor A 50 cents per square foot incentive is available if existing insulation level is R-5 or less. Any insulation installed outside the cavity, such as siding applications, does not meet incentive requirements..

Windows A $3.00 incentive, per square foot of qualifying windows installed, is available to customers who heat with Avista electric or natural gas for the upgrade of windows with a u-factor of .35 or lower. The lower the u-factor, the more efficient the window. Windows must be rated by a recognized organization such as the National Fenestration Rating Council (NFRC) or Department of Energy (DOE). **Square footage, u-factor ratings, and cost must be itemized on the invoice in addition to being listed on the rebate form.**

Attach originals or legible copies of your receipts and mail to:
Residential Incentives Avista - MSC-15 P.O. Box 3727 Spokane, WA 99220-3727

WA/ID ADDITIONAL CONDITIONS

- The incentives listed are applicable to existing single and multifamily residences (up to a fourplex), including manufactured and modular homes.
- Incentives are not available for seasonal or recreational homes; they must be a primary living residence.
- Homeowners are responsible for complying with all applicable codes and regulations.
- Homeowners installing both a high efficient natural gas furnace and high efficient air source heat pump are eligible for both high efficiency incentives. Ground source heat pumps cannot be combined with any other high efficiency incentive.
- Homeowners converting from electric heat may only receive one conversion incentive (either electric to heat pump or electric to natural gas).
- Incentives shall not exceed 50% of the actual measure cost.
- Verification of efficiencies for space and water heating equipment are according to the Gas Appliance Manufacturers Associations (GAMA) Consumers' Directory of Certified Efficiency Ratings.
- Incentives are paid directly to the homeowner.
- Incentives must be submitted within 90 days of completion of energy efficiency measure.
- Avista reserves the right to inspect energy efficiency measures prior to payment and will coordinate inspection as applicable.
- Allow 6 to 8 weeks for processing and payment of incentive.

ENERGY EFFICIENCY INCENTIVE AGREEMENT

DISCLAIMERS. AVISTA HEREBY DISCLAIMS ANY AND ALL IMPLIED OR EXPRESS WARRANTIES (INCLUDING, BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) AND SHALL NOT BE RESPONSIBLE FOR ANY REPRESENTATION OR PROMISE WITH RESPECT TO THE EQUIPMENT MATERIALS OR LABOR REQUIRED FOR THE INSTALLATION OF THE EQUIPMENT ON THE PREMISES, OR THE COST OF SUCH EQUIPMENT, MATERIALS AND LABOR.

Avista is providing funding under this Agreement at the request of the Participant. Because of the variability and uniqueness of individual energy use, it is not possible to predict exact energy savings (if any) that may accrue to any particular participant. Avista, by providing funding, does not warrant that the equipment will achieve any reduction in energy costs to the Participant.

RELEASE. As part of the consideration for this Agreement, participant hereby releases and shall indemnify, hold harmless and defend Avista from any and all claims, losses, harm, costs, liabilities, damages and expenses (including attorneys' fees) of any nature whatsoever arising directly or indirectly out of or in connection with the installation of space-and/or water heating equipment, or weatherization measures at the premises or any material and labor required for such installation.

ENTIRE AGREEMENT/APPLICABILITY/ASSIGNMENT. This Agreement contains the entire agreement between the parties and shall not be modified except by a written instrument signed by the parties. Furthermore, this Agreement shall be binding upon the successors and assigns of the parties. Participants shall not assign this Agreement without the prior written consent of Avista. Avista may freely assign, without limitation, its interest herein.

ATTORNEYS' FEES. If any action is brought to enforce this Agreement, the prevailing party in such action shall be entitled, in addition to any other relief, to a ward of reasonable attorneys' fees and costs incurred in such action.

VERIFICATIONS. Avista shall have the right to verify equipment installed on the Premises. These Residential Energy Efficiency Programs are ongoing as part of Avista's continued commitment to energy efficiency. **The programs are subject to change without notice.**

The direct use of natural gas

Energy efficiency is more important than ever. With prices rising all around us, for gasoline, groceries, and so much more, using energy wisely makes good sense.

And while it's true that natural gas prices are trending upward, its many advantages — like consistent hot water, even heat, precise temperature control and more — make it a good energy choice for homeowners and businesses.

Natural gas is also used to generate electricity, and demand for that process across the country is expected to increase significantly, with the continued growth in population and businesses. This puts upward pressure on our costs to serve our customers' electric load, because when we use natural gas to generate electricity, it is less than 50% efficient. That is, when we input 100 BTUs of natural gas into a natural gas-fired generator, less than 50% of the BTUs are converted into useful energy in the form of electricity. The remaining BTUs are exhausted at the end of the process as waste heat. By comparison, when 100 BTUs of natural gas are input into in a high efficiency gas furnace in your home, 90% of the BTUs are converted into useful energy in the form of space heat.

So, despite the upward trend in natural gas prices, the best, most efficient, environmentally friendly use of natural gas is to use it directly in your homes and businesses for space heating, water heating, cooking, and drying clothes.

"While other energy technologies are under development, the direct use of natural gas remains the most efficient and environmentally responsible way to make wise use of our available energy supplies," says Avista's CEO, Scott Morris.

Conservation and energy efficiency measures can also help you manage your energy bill. To identify where to focus your energy efficiency efforts, you can analyze your usage patterns with our online energy audit at www.avistautilities.com.

Once you've determined the energy efficiency efforts that will make a difference in your home, please visit the rebate house at www.everylittlebit.com to learn about the many rebates and incentives to help you conserve energy and improve efficiency.

ENERGY $AVER

Free and easy

This won't cost you a thing.

When the sun's just a little much for you, close your drapes and blinds to keep heat out and air conditioned air in.

Cold weather will be around again, and that's when you want to let the sun in to warm you up.

every little bit

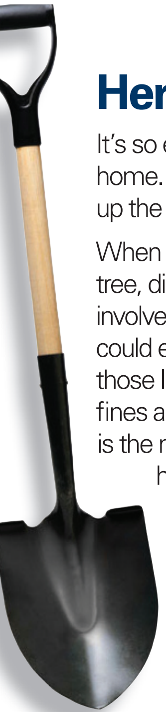
connections

SEPT. 08 connecting you with your hometown utility

Here's the dirt



It's so easy to be safe around your own home. Just put the shovel down and pick up the phone.

When you're sinking a post, planting a tree, digging a ditch, or anything else that involves getting down in the ground, you could easily hit a utility line. Damaging those lines can disrupt service, cost you in fines and repair expenses, or — and this is the most important part — cause you harm.

You can avoid all that in one simple step: Phone the national 811 "Call Before You Dig" number.

That call signals someone to locate and mark the underground lines for you within two working days — for free. And then you'll know what's under your feet and what to watch out for.

We have more information about "Call Before You Dig" and lots more safety tips on our Web site: www.avistautilities.com (key word search: your safety).

Thanks for the assist

Connections readers are one smart bunch!

A couple of months ago, we told you about our efforts to reduce mercury in the environment.

An alert reader sharpened his pencil and noticed we printed a mistake in our story. He kept us on our toes, and we really appreciate it.

Here are the accurate numbers:

Avista began recycling electronic remote transmitters (ERTs) in 1998. Each contains 1.16 grams of mercury, and over the next nine years, we recycled 12,788 ERTs, preventing 32.7 pounds of mercury from reaching the atmosphere.

What's more, Avista disposed of 1,124 cathode ray tube computer monitors — 67,435 pounds' worth — over a five-year period. And when switches in our hydro or substation facilities fail, we replace them with non-mercury switches.

Like you, we strive to do what's best for the environment, and do it right.

One answer is blowing in the wind

Renewable energy: It's on everybody's mind lately. We've been thinking about it too, and so we've acquired the rights to develop a 50-megawatt, $120 million wind farm on 3,200 acres near Reardan, Washington.

Just to put that in context, a single megawatt provides enough energy for 750 homes.

We like the potential wind power represents. We've included wind in our resource mix for several years, and this facility will contribute — on average — 15 megawatts a year. That's less than its 50-megawatt capacity since wind doesn't blow all the time.

There's more wind energy out there, and we're shooting to secure a total of 300 megawatts by 2017. And we're confident we'll get there. We've been developing renewable resources for years.

There's more information about our wind program at www.avistautilities.com (key word search: wind).

Avista cares for our community's seniors…and their caregivers

You might find Avista in some unexpected places.

We serve our community not only by heating your homes and lighting your walkways, but also by extending a helping hand to the more vulnerable members of our community — such as senior citizens.

At the same time, we realize the caregivers of these seniors could use some extra help themselves.

That's why we've teamed up with KHQ.com to form the "Care Giver Resource Center," a wealth of helpful information at your fingertips. We designed the site to answer your questions and introduce you to the many programs and services available to senior citizens in our area.

It addresses such topics as senior housing options, financial affairs, senior life travel, Alzheimer's/dementia, and more.

Simply move your mouse over the KHQ.com "Home" menu at the top left of your screen. Then click on "KHQ Senior Life." to reach the "Senior Life Community Calendar," with details about movie nights, art classes, garden tours, free seminars and other community activities.

On the same page, click the Avista logo to connect to energy-saving tips, information on eligibility for rebates and a list of the many energy assistance programs we offer.

We know that life gets busy and finding the time and resources to care for your loved ones can be a challenge. Let us help so you can enjoy your time together with peace of mind.

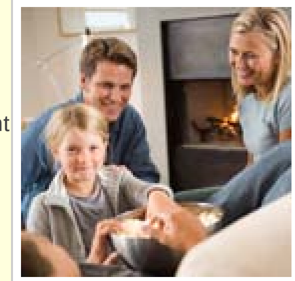
Choosing Natural Gas

How to Switch | Benefits | Heating Systems | Your Feedback

Benefits of natural gas



Choosing natural gas for your home offers valuable benefits, for your budget, the environment, and your comfort.

Energy cost savings

Historically natural gas has cost between 20 percent and 50 percent less than the equivalent amount of electricity, heating oil, or propane. Even with fluctuating energy prices natural gas remains the least expensive and most convenient way to heat homes over electricity, heating oil and propane for furnaces. With space and water heating making up about two-thirds of an average homes' energy usage in the Northwest, you'll see significant savings every month on your bill. When you choose high-efficiency natural gas equipment, the savings are even greater.

Many uses

Natural gas can be used for cooking, space heating, water heating (including on-demand, tankless water heaters), fireplaces, clothes drying, stand-by generators, barbecues, pools, spas, and deck heaters.

Better for the environment

Natural gas is a clean burning fuel – one of the cleanest energy sources available. Harmful air emissions are much less than for heating oil, wood or electricity produced from fossil fuel.

Comfort and convenience

Natural gas delivers comfort! The warm air delivered to your home is about 110 ^{o} F, much warmer than your skin temperature, so your house heats up quickly and feels warm. Heat pumps will deliver air at a temperature lower than your skin temperature and will therefore feel cooler. Natural gas water heaters heat water up twice as fast as electric models, so you receive more hot water sooner.

Reliable and safe

Natural gas is a safe and abundant fuel source. Even during power outages, natural gas cooking ranges, water heaters and fireplaces will continue to work. For safety information about natural gas service and appliances during major power outages and other emergencies, visit our Emergency Preparedness pages under Safety & Reliability on PSE.com

Increased home value

Home buyers routinely ask about natural gas availability when looking for a new home. They want comfort, convenience and lower heating bills that only natural gas can bring. By having natural gas as your home heating fuel you can increase the value of your home.

Rebates

Purchase an ENERGY STAR qualified natural gas furnace, a high efficiency natural gas water heater, or an on-demand, tankless water heater, and receive rebates of $350, $50 and $150 respectively.

Rebates & Promotions: Converting to Natural Gas

Fuel conversion rebate

- Rebate Description
- Qualifying Rebate Levels & Additional Qualifications

If you're currently heating your home with electricity from PSE, you may be eligible for **up to a $3,950 rebate** to switch your home and water heating source to reliable and affordable natural gas. Click here for more information about qualifying rebate levels and additional qualifications.

An efficient choice

Puget Sound Energy is committed to helping our customers save energy, not only to save money, but to conserve our region's natural resources. You can reduce your energy costs while helping PSE offset the need for securing additional power supplies by converting your electric heating equipment, such as your furnace and water heater, to natural gas.

Benefits of converting to natural gas

In addition to PSE's rebate, you'll also enjoy the many benefits of natural gas:

- Lower energy costs.
- Convenience. Natural gas is delivered to your home directly through underground pipes making it reliable and available to be used in many appliances throughout your home.
- Safety. Natural gas is one of the world's safest sources of energy used by more than 63 million U.S. homes and nearly 750,000 PSE customers.
- Environmental benefits. Natural gas burns cleaner than all other fossil fuels.
- Increased home value. Adding natural gas to your home will pay dividends when you decide it's time to move.

More information about fuel conversion

For more information and to learn if you qualify for the fuel conversion rebate, call a PSE Energy Advisor at 1.800.562.1482, Monday through Friday, 8 a.m. to 5 p.m.

Read more about PSE's fuel conversion rebate and download an application. (560 KB PDF)

Rebates & Promotions: Converting to Natural Gas

- Rebate Description
- Qualifying Rebate Levels & Additional Qualifications

Qualifying rebate levels and additional qualifications

If you're currently heating your home with electricity from PSE, you may be eligible for **up to a $3,950 rebate** to switch your home and water heating source to reliable and affordable natural gas.

In addition to the fuel conversion rebate, PSE offers rebates on ENERGY STAR® qualified natural gas equipment to make the switch to natural gas even more affordable. Potential rebate amounts:

PSE fuel conversion rebate tables*

Type of heating	Conversion rebate
Home and water	$1,950 - $3,950
Home only	$500 - $2,500
Water only	$950

** Rebate amount is dependent on current type of home and/or water heating, annual electricity usage and type of heating equipment installed. Rebate amount is limited to 75 percent of total equipment and installation cost.*

PSE equipment rebate levels**

Type of equipment	Equipment rebate
ENERGY STAR® qualified furnace	$350
ENERGY STAR® qualified water heater	$50
ENERGY STAR® qualified tankless water heater	$150

***Other natural gas providers may offer different equipment rebates.*

Additional Qualifications

- Conversion must be completed within an existing single-family residence of four units or less. Manufactured, modular and mobile homes are not eligible.
- Applicant must be a PSE electric customer currently using electricity as a primary source of home and/or water heating.
- Rebate is subject to the current minimum annual electric usage requirements, as determined by PSE.
- Applicant must install ENERGY STAR® qualified natural gas home and/or water heating equipment (fireplaces are not eligible).
- Applicant is ineligible for home heating rebate if a hybrid system and/or heat pump is installed in conjunction with natural gas equipment or if existing heat pump remains on the premises.
- Applicant is responsible for complying with all applicable codes and regulations.
- Applicant must have ordered natural gas service and have an invoice dated after Jan. 30, 2009.
- Rebate form must be submitted within 90 days of fuel and equipment conversion.
- Other requirements may apply.

More information about fuel conversion

For more information and to learn if you qualify for the fuel conversion rebate, call a PSE Energy Advisor at 1.800.562.1482, Monday through Friday, 8 a.m. to 5 p.m.

For more information about the benefits of choosing natural gas, visit the Choosing Natural Gas section of the PSE Web site.

TGI Total Annual Bill	**$86,324**	**$86,324**	**$86,324**	**$86,324**	**$86,324**
Carbon Tax per GJ	**$0.7449**	**$0.9949**	**$1.2449**	**$1.4949**	**$1.7449**
Annual Carbon Tax Amount	**$7,226**	**$9,651**	**$12,076**	**$14,501**	**$16,926**
Total Annual Bill Inclusive of Carbon Tax	***$93,549***	***$95,974***	***$98,399***	***$100,824***	***$103,249***
Annual Bill Increases Due to Carbon Tax					
Annual Bill Increase per Year		**$2,425**	**$2,425**	**$2,425**	**$2,425**
Annual Percentage Increase		**2.59%**	**2.53%**	**2.46%**	**2.41%**

All rates are as at July 1st of each year, inclusive of applicable rate riders, and exclusive of any applicable taxes (except the Carbon Tax).
All delivery and commodity rates are held constant at current rates as at July 2009.

Attachment 31.2

Directive 17, 2006 IEP/LTAP
Long Term Rate Increase Forecast

1. Introduction

This report is BC Hydro's compliance with directive 17 from the British Columbia Utilities Commission (BCUC) decision on BC Hydro's 2006 Integrated Electricity Plan and Long Term Acquisition Plan (2006 IEP/LTAP)[1].

The directive states:

> **"…the Commission Panel directs BC Hydro to file a report containing, among other things, a financial forecast of BC Hydro's rates in both real and nominal terms, for a minimum of ten years, but preferably 20 years. Input assumptions should be summarized in a concise, but comprehensive manner."**

The decision (as amended via an errata to the decision, in the BCUC letter of June 1, 2007) goes on to direct:

> **"The Commission Panel further directs BC Hydro to rely on the report for assumptions regarding retail prices in each of the CPR, the load forecast, and DSM evaluation methodologies. Furthermore, the report should identify and explain linkages, if any, of the impact of real electricity prices in the CPR, the load forecast and BC Hydro's DSM evaluation methodologies."**

The forecasting of BC Hydro's electricity rates over an extended period of time (10 to 20 years) requires a significant number of input assumptions with respect to a wide range of variables:

- external forecasts, such as interest rates, inflation rates, and exchange rates;

[1] *In the Matter of British Columbia Hydro and Power Authority's 2006 Integrated Electricity Plan and 2006 Long-term Acquisition Plan,* Decision, May 11, 2007, page 154.

- timing and magnitude of capital programs and projects, and demand-side management (DSM) expenditures (and energy savings);

- other revenue requirement inputs (for example, the different elements of the cost of energy, operating costs, amortization rates, trade income, deferral account transfers and recoveries).

All of these inputs need to be internally consistent. The forecasting exercise is not a trivial task and necessitates many simplifications.

In addition, any such forecast also relies on making assumptions regarding any changes in government policy and changes in legislation and regulations, including, for example, special directions regarding BC Hydro's capital structure for rate setting purposes.

Because of the above, BC Hydro is of the view that a long term rate increase forecast is highly uncertain and is subject to significant variability depending on the assumptions made. In particular, a rate increase forecast beyond a 10 year period relies on so many uncertain assumptions, and in theory could come about from many possible future scenarios, that, in BC Hydro's view, to attempt to make a specific forecast for that period is of little or no value. For that reason BC Hydro chooses to assume nominal rate increases at the rate of inflation (i.e., real rate increases of zero) for the second ten years of the twenty year forecast.

Further, the first ten years of the long term rate increase forecast presented in this report are based on a large number of assumptions and as such must be treated as indicative only, produced solely for the purpose of informing the load forecast and DSM analysis, as required by the BCUC directive. The forecast does not represent BC Hydro's view as to its future revenue requirements applications beyond F2010. Any rate increases requested in those applications will be based on BC Hydro's detailed assessment of its expected revenues and costs at the time of filing, taking into account the operating conditions and plans forecast for the relevant test period.

Section 2 of this report summarises the financial forecast overview and the input assumptions used to develop the forecast. Section 3 of this report provides the rate increase forecast in both nominal and real terms. Section 4 describes how the long term rate increase forecast relates to the 2008 DSM Plan, the 2007 Load Forecast and the 2007 Conservation Potential Review (CPR), and shows the variance from the January 2008 long term rate increase forecast.

2. Forecast Overview and Assumptions

2.1 Forecast Overview

The financial forecast uses F2008 rates, including the deferral account rate rider, as the reference rate, or starting point. The forecast has been developed using a variety of inputs including forecast revenues, operating expenses, capital expenditures, debt balances, and economic variables over a 10 year forecast period (F2009 to F2018). The forecast reflects the Base Resource Plan (BRP) shown in Appendix O to the 2008 LTAP (Exhibit B-1-1). The inputs are used to estimate the incremental revenue required to achieve an assumed return on equity each year during the 10 year period. This incremental revenue can be presented in real or nominal terms, and is an indicative estimate of across-the-board rate increases that the assumptions and inputs would give rise to.

Note that for consistency, the forecast rate increases for the first two years of the financial forecast are based on the revenue requirements included in BC Hydro's Evidentiary Update filing in its F2009/F2010 Revenue Requirements Application (F09/F10 RRA) (Exhibit B-10 in that proceeding). In addition, they take account of the change in the deferral account rate rider from year to year, using BC Hydro's proposed rate rider mechanism, as per the F09/F10 RRA.

2.2 Inputs and Assumptions

The inputs and assumptions used in the financial forecast are described below.

Economic Variables – Forecasts of economic variables provided by the B.C. Ministry of Finance for the period F2009 to F2013 are used as inputs into the financial forecast. These are also consistent with the economic variables in the forecast in the Evidentiary Update to the F09/F10 RRA. Table 1 below summarises the assumptions. For the F2014 to F2018 forecast period, the forecasts for F2013 are assumed.

Table 1 Economic Variables

Economic Variables	F2009	F2010	F2011	F2012	F2013	F2014-F2018
Inflation (BC CPI) (%)	2.1	2.1	2.1	2.1	2.1	2.1
Short Term Interest Rate (%)	4.30	4.78	5.25	5.25	5.25	5.25
Long Term Interest Rate (%)	5.04	5.59	6.33	6.70	6.70	6.70
Exchange Rate C$/U.S.$	1.01	1.05	1.07	1.07	1.07	1.07

Capital Structure – By Orders in Council No. 27 and 28 (January 17, 2008), the B.C. Government amended the definition of BC Hydro's equity included in Special Directive HC1 and Special Direction HC2. The forecast assumes the new definition of equity as set out in HC1 and HC2, and the forecast also assumes that dividend payments to the Province must not result in a greater than 80:20 debt to book equity ratio, to be consistent with Special Directive HC1.

Return on Equity – Consistent with the F09/F10 RRA, the forecast assumes a return on equity for BC Hydro of 11.78 per cent, and applies that throughout the F2009 to F2018 forecast period. The forecast assumes a deemed equity for ratemaking purposes equalling 30 per cent of the sum of BC Hydro's average debt and average equity balances for the year, to be consistent with the amended Special Direction HC2.

Load Forecast – For the F2009 to F2018 period, the forecast assumes the 2007 Load Forecast, which was provided in the 2008 LTAP, with the exception that for the F2009 to F2010 period, the forecast assumes updated load forecast volumes as presented in the F09/F10 RRA Evidentiary Update.

DSM (Energy Savings and Expenditures) – The financial forecast assumes DSM energy savings that are consistent with the DSM Option A– Mid scenario (included as part of the 2008 LTAP BRP) throughout the F2009 to F2018 forecast period.

The forecast assumes:

- DSM expenditures that are consistent with the DSM Plan costs included in the 2008 LTAP; and

- DSM expenditures will continue to be subject to regulatory deferral treatment, and are amortized over a ten-year period.

Domestic Revenue – The forecast calculates domestic sales volumes based on the 2007 Load Forecast and DSM energy savings described above. F2008 rates by customer class (including the deferral account rate rider) are applied to forecast domestic sales volumes to determine forecast total domestic revenue before rate increases, on an annual basis, for the F2009 to F2018 forecast period.

Trade Income – Trade Income is the net income of Powerex Corp., adjusted for rate-setting purposes to be no more than $200 million and no less than $0. The forecast assumes net trade income for F2009 and F2010 as per the Evidentiary Update. For F2011 to F2013, trade income is assumed to increase to $199 million by F2013. For F2014 to F2018, trade income is assumed to be $200 million annually.

Energy Costs – For F2009 and F2010, the forecast assumes the cost of energy forecast as per the Evidentiary Update. These costs, and estimated F2011 energy costs, are based on the resource operating decision process documented in the F09/F10 RRA at section 3.2 “System Optimization Overview”.

For the F2012 to F2018 forecast period, the forecast assumes cost of energy, on an annual basis, based upon the BRP shown in Appendix O of the 2008 LTAP.

Water Rental Costs – For F2009 and F2010, the forecast assumes the water rental costs as per the Evidentiary Update. For this period, as well as for the F2011 to F2018 forecast period, the forecast assumes water rental rates as of January 1, 2008 are applied to forecasted hydroelectric generating capacity and forecasted generation output on an annual basis to estimate water rentals. Additionally, the forecast assumes that water rental rates are indexed to BC Hydro's rate increases from F2009 to F2018, as per the existing indexation mechanism.

Operating Costs – For F2009 and F2010, the forecast assumes operating costs as per the Evidentiary Update. From F2011 operating costs, excluding those subject to regulatory treatment, are assumed to increase by inflation.

Taxes – Taxes include school taxes and grants in lieu of general taxes. For F2009 and F2010, the forecast assumes school taxes and grant amounts as per the Evidentiary Update. From F2011 to F2018 school taxes, generation facility grants, and general grants are assumed to increase by inflation. Revenue grants are based on one per cent of forecast domestic revenue from F2011 to F2018.

Capital Expenditures – The forecast includes estimated capital expenditures by major plant type, developed for this forecasting exercise. These are high level estimates only, and actual capital plans and projects over the ten year period will depend on many variables. For the F2009 to F2010 forecast period, the forecast assumes capital expenditure and additions as per the Evidentiary Update. Transmission capital expenditures estimates for F2009 to F2018 are consistent with the "BCTC - Transmission System Capital Plan F2009 to F2018", as submitted to the BCUC on December 21, 2007.

Amortization – The forecast assumes property, plant and equipment in service are amortized over the expected useful lives of the assets using the straight-line method. All depreciation rates used are the same as those used in the F09/F10 RRA.

Finance Charges - Finance charges represent the cost of BC Hydro's debt portfolio, and mainly comprise of interest charges on BC Hydro debt. The forecast assumes interest costs on existing debt are based on actual interest rates at the time the debt was issued. Interest costs on future debt are based on forecast debt issues at forecast interest rates. BC Hydro has used interest rate forecasts provided by the B.C. Ministry of Finance for F2009 to F2013 (see Table 1).

Deferral Accounts – The forecast assumes the ongoing treatment of the Deferral Accounts and other regulatory accounts as either previously approved by the BCUC or as proposed by BC Hydro in the F09/F10 RRA, including the deferral account rate rider mechanism.

3. Forecast Rate Increases

As noted in section 1 above, the forecast increases provided below are indicative only, rely on a large number of assumptions, and have been produced solely for the purpose of informing the load forecast and the DSM analysis.

The rate increase forecast from F2009 uses F2008 rates, including the deferral account rate rider, as the reference or starting point. For the first two years of the forecast the rate increases are based on those applied for in BC Hydro's F09/F10 RRA Evidentiary Update, and also include the changes in the rate rider. Accordingly the rate increases for F2009 and F2010 are 4 per cent and 9 per cent respectively in nominal terms (2 per cent and 6 per cent respectively, in real terms).

For the following eight years the forecast of annual rate increases in real terms are estimated to be as follows: for F2011, 7 per cent; for F2012 through F2014, 4 per cent; for F2015 and F2016, 6 per cent; for F2017, 3 per cent; and for F2018, 1 per cent. Nominal rate increases for each year would be around 2 per cent higher, based on the forecast of inflation. As noted previously, for the F2019 to F2028 period, rates are assumed to rise at the rate of inflation (B.C. Consumer Price Index (CPI)), forecast at 2.1 per cent per year.

4. Use of Forecast Output

For the purpose of determining the 2007 Load Forecast and the energy savings and lost revenue associated with the 2008 DSM Plan, BC Hydro has incorporated the effects of indicative rate increases as estimated in the long term rate increase forecast.

4.1 Demand Side Management Analysis

Given the timing of preparing the 2008 DSM plan, a January 2008 version of the long term rate increase forecast was used in the estimation of lost revenues associated with that plan. Lost revenues are an input to the Non-Participant test. The January 2008 forecast was also used in the estimation of energy savings from assumed new stepped rate structures in the 2008 DSM Plan, by informing the specific pricing levels within the modelled rate structures.

4.2 2007 Load Forecast

A January 2008 version of the long term rate increase forecast was also used as an input to the 2007 Load Forecast presented in the 2008 LTAP. The rate increase forecasts impact the after-DSM load forecast in two ways, and these impacts are determined separately. Firstly, the assumed across-the-board rate increases under current rate structures produce a demand response (given an assumed price elasticity), and reduce the before-DSM load forecast. Secondly, assumed new stepped rate structures (with prices based on the forecast rate increases), produce a demand response (given assumed price elasticity). These rate structure-induced energy savings are considered to be part of DSM savings and are subtracted to produce the after-DSM load forecast.

4.3 2007 Conservation Potential Review (CPR)

A long term rate increase forecast was not available in time for the 2007 CPR. The BCUC, in its decision concerning the 2006 IEP/LTAP at page 154, recognized that the financial forecast may not be available in time for the 2007 CPR, and also noted that the financial forecast "was not an item in the terms of reference" for the 2007 CPR. The 2007 CPR referenced the 2006 Load Forecast. In the 2006 Load Forecast rates were assumed to increase in nominal terms at the rate of inflation. This is the same assumption used in the 2007 CPR.

4.4 Current Forecast Compared to January 2008 Rate Increase Forecast

The January 2008 long term rate increase forecast was prepared and used for load forecasting and DSM analysis purposes, in the development of BC Hydro's 2008 LTAP[2]. Since that time, updates have been made to the forecast inputs and assumptions including: (1) updated capital expenditure estimates; (2) updated energy cost estimates related to an updated energy portfolio from the 2008 LTAP; (3) new deemed equity definition; (4) updated water rental rates, and; (5) inclusion of the deferral account rate rider in calculating annual rate increases.

[2] The forecast was filed as an undertaking in BC Hydro's Residential Inclining Block Rate proceeding (Undertaking No. 7, Exhibit B-28).

The difference between the current long term rate increase forecast and the January 2008 long term rate increase forecast is shown in Table 2. The variations between the two forecasts illustrate generally the sensitivity of rate increase forecasting to the inputs and assumptions, and demonstrate why such a forecast must be viewed as indicative only.

Table 2 Variance from January 2008 forecast

	F2009	F2010	F2011	F2012	F2013	F2014	F2015	F2016	F2017	F2018	F2019-F2028
Increase (decrease)	(2)%	0%	2%	(3)%	6%	6%	4%	2%	1%	2%	0%

BC Hydro, as a result of the variance between the current long term rate increase forecast and the January 2008 forecast, analysed the effect of this current forecast on the load forecast.

The analysis suggests that the current long term rate increase forecast results in additional rate structure-induced energy savings averaging approximately 600 GWh per year from F2017 through F2028 (approximately 1 per cent of the forecast load after DSM in F2017). After integration with other DSM initiatives, net incremental savings would likely be lower since some of the additional rate structure-induced savings would displace savings from DSM programs.

The analysis also suggests that the current long term rate increase forecast reduces the forecast load before DSM by an additional approximate average of 600 GWh per year from F2017 through F2028.

BC Hydro does not intend to update the 2007 Load Forecast to reflect these changes as there are other uncertainties and developments that have occurred since the forecast was produced that would also need to be reflected.

Annual report

Letter from R.L. (Randy) Jespersen, President & CEO

From the first natural gas service, to the pursuit of delivering alternative energy solutions today, Terasen and its predecessor companies have always been innovative - with a vision for British Columbia's future. With this in mind, the theme for the 2008 Terasen Inc. Annual Report is *Delivering BC's energy future*.

For Terasen, 2008 was an exceptional year. I invite you to use this report as a guide to our overall performance.

We produced balanced business results, invested more than $213 million in BC, and improved our customer satisfaction rating for the fifth year in a row.

As leaders in energy efficiency and conservation, Terasen is well positioned to help meet BC's climate action targets. In 2008, we helped customers save more than 610,000 gigajoules of natural gas, the equivalent of heating over 6,400 homes.

As an emerging leader in alternative energy solutions, Terasen led the way with one of the first biogas capture projects in the province and continues to develop geothermal projects and district energy systems - initiatives that support BC's Energy Plan. Such endeavours show our leadership in developing uses for clean, renewable energy.

Participating in the growth and well-being of the cities and towns we serve is important for us at Terasen. We work hard to demonstrate this in what we do every day - from expanding BC's energy infrastructure to the many volunteer efforts of our employees.

Committed to safety and excellence, Terasen serves more than 931,000 customers in over 125 BC communities. Going forward, we will continue to build on our successes, and create value for our customers, Fortis Inc. and BC communities, while being a great place to work.

Terasen

Delivering BC's energy future

Annual Report 2008

About Terasen

Terasen Inc., a Canadian corporation headquartered in Vancouver, British Columbia, is the parent company of the regulated Terasen Gas companies and Terasen Energy Services Inc. Together they serve more than 931,000 customers in over 125 BC communities. British Columbians trust Terasen to deliver energy safely and reliably.

A wholly owned subsidiary of Fortis Inc., Terasen, together with its subsidiaries, is one of the largest distributors of natural gas in the greater Pacific Northwest and a leading provider of alternative energy systems. It serves more than 95 per cent of BC's natural gas customers and delivers more than 20 per cent of the Province's energy needs.

In 2008, Terasen invested more than $213 million in British Columbia.

Terasen Gas safely and reliably delivers the natural gas and propane that warms people's homes, cooks their dinners, heats their water and helps run their businesses. Three companies make up the Terasen Gas group: Terasen Gas Inc., Terasen Gas (Vancouver Island) Inc. and Terasen Gas (Whistler) Inc.

Terasen Energy Services Inc. provides both regulated and non-regulated alternative energy, delivered through integrated energy systems, to multi-family developments, larger commercial buildings and resorts. This includes geothermal, solar and other renewable energy forms combined with conventional fuels such as natural gas, propane and electricity. The operations of these integrated energy systems are managed through a shared services contractual arrangement with Terasen Gas.

Solutions for today and tomorrow

Terasen maintains a strong focus on operational excellence including environmentally sound practices. As a leader in BC's energy mix, the company plays a foundational role in the economic, environmental and energy framework of the Province.

Terasen is committed to successfully meeting BC's climate action challenges. Well managed with a solid reputation among regulators, First Nations, municipalities and employees, Terasen works with customers and communities providing energy solutions to help them meet their economic and environmental goals.

By providing innovative solutions, the company is adapting to the Province's changing energy needs. Respected and trusted, Terasen's integrated approach to piped energy solutions is delivering BC's energy future.

Contents

Our performance

A year of solid results

Terasen is a healthy, growing company and a leading provider of piped energy and related infrastructure. A well-managed company with solid earnings, it is efficient, productive and innovative in meeting customers' energy needs.

Terasen lives its commitment to the environment and the communities it serves. In 2008, the company ensured the public's ongoing trust, delivered stable rates, maintained its safety record, and increased customer connections.

Adapting well to the Province's changing energy mix, Terasen is a solution provider with a vision for BC's energy future.

Terasen Gas highlights

Financial[1]	2008	2007	2006
Net earnings *In millions of dollars*	$ 118.9	$ 111.7	$ (651.1)
Gross revenues *In millions of dollars*	$1,905.2	$1,750.8	$1,739.2
Operating expenses *In millions of dollars*	$ 199.3	$ 192.0	$ 189.5
Capital programs before contributions *In millions of dollars*	$ 227.9	$ 178.2	$ 161.5
O&M per customer	$ 229.15	$ 224.27	$ 231.41
Performance[2]	**2008**	**2007**	**2006**
Overall customer satisfaction rating	79.7%	79.3%	77.7%
Emergency response time[3] *In minutes:seconds from dispatch to site*	20:42	20:36	21:30

Letter to Shareholder

When the Government of BC put forth its bold vision for the Province's environment, economy and energy framework, it essentially set new challenges for many, including Terasen.

We believe policy makers showed wisdom by recognizing that meaningful reductions in greenhouse gas emissions must come from both the industrial and consuming sectors. Given that Terasen delivers more than 20 per cent of the energy consumed in BC, an amount comparable to the total electricity consumed, we are expected to find and facilitate energy solutions to help meet the Province's climate action targets.

Uniquely positioned as a trusted, reliable service provider, we are promoting the efficient direct application of natural gas and expanding integrated energy solutions. Piped energy, whether natural gas, propane or alternative renewable energies, will be a foundation on which a sustainable energy system will be built over the long term. Interacting with BC's existing power grid, the two will be mutually supportive and deliver energy services at efficiency levels vastly higher than we see today.

By building on our core competencies and carefully executing our strategic plan, we are pursuing new, environmentally responsible opportunities.

Innovative leaders

Last year, Terasen became one of the first utilities in North America to explore the potential of biogas. Our project with a West Vancouver wastewater treatment facility will capture biogas and inject it into our existing delivery system. The pilot is the first of its kind in the Province.

With our Request for Expressions of Interest for biogas production we will pursue methane recovery opportunities from landfills, waste treatment and agriculture facilities. Such innovative partnerships reflect our leadership in capturing and developing practical uses for clean, economic, renewable energy.

We expanded our reach into commercial and multi-family housing markets, while pursuing technologies such as thermal and individual gas metering. We worked with FortisBC and BC Hydro on energy efficiency and conservation initiatives.

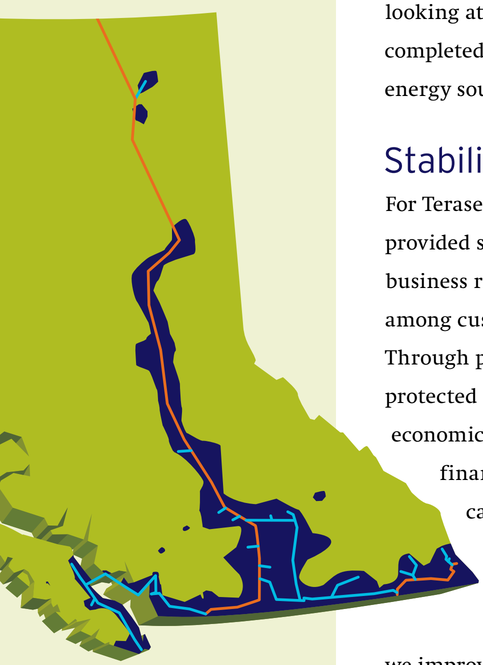
Responsible stewards

Since 1995, Terasen has continued to reduce greenhouse gas emissions from our operations. In fact, our mainland utility's average annual emissions aligned with Canada's Kyoto obligations from 2000 through the latest reporting period. We also remained vigilant in maintaining our environmental management practices, protecting the land, air and waters of BC.

Area of operations

Ever mindful of the environmental impacts business and industry produce, we introduced a compressed natural gas vehicle program for the transportation sector. We also submitted an Energy Efficiency and Conservation Application, which is before the BC Utilities Commission. It is designed to help customers conserve energy, reduce emissions and improve the affordability of natural gas service.

As BC's emerging leader in alternative energy systems, we worked on a variety of projects and signed a number of agreements in 2008. These projects reflect how we can use our resources more efficiently—by looking at energy as an integrated system. Once completed, these projects will harness renewable energy sources, and ensure clean energy delivery.



Stability and growth

For Terasen, 2008 was an exceptional year. We provided safe, reliable service, produced balanced business results, and maintained a solid reputation among customers, regulators and local governments. Through prudent financial management we protected customer interests. Despite challenging economic times and volatile capital markets, our financial performance maintained access to capital important for our operations.

Our strong commitment to operational excellence remained focused. In fact, we improved our customer satisfaction record for the fifth year in a row. We invested more than $213 million in BC, connected 18,360 new homes and businesses to our system, and held our delivery rates essentially flat for five consecutive years. We helped our customers save more than 612,500 gigajoules of natural gas, the equivalent of heating more than 6,400 homes. We also hired more than 190 new employees. As a result, Terasen is well positioned to contribute to Fortis' focused growth. We will continue to invest in the future, creating value for our customers, the communities we serve, employees and our shareholder.

Continued excellence

Going forward, we will capitalize on value-added growth opportunities, including the development and execution of sound environmental and energy regulatory policy. We will remain focused on operational excellence and continue to retain and invest in our talented employees.

Fulfilling a key element in Whistler's Sustainable Energy Plan, we will complete the Whistler pipeline and convert the community's propane system to natural gas. Our energy infrastructure will expand with the continuing construction of the Mt. Hayes natural gas storage facility on Vancouver Island.

We will also implement technology improvements, continue our focus on system integrity management, expand customer service offerings and contribute to Vancouver and Whistler's 2010 Olympic security preparedness. With our corporate performance and reliable service, we have proven ourselves a leader in serving the diverse energy needs of British Columbians.

Expectations around the economy, energy and the environment will continue to evolve. Be assured, Terasen is delivering BC's energy future.

Engaging our stakeholders

Whether as an educator, expert, partner or energy provider, Terasen engages with stakeholders in many ways. The company maintains mutually beneficial relationships with customers, local governments, our shareholder, regulators and employees.

As an educator

As a leader in BC's energy mix, Terasen has a responsibility as an educator. The company's strategic education campaigns help customers learn about energy efficiency, natural gas safety and the rates they pay.

Safety education is a primary objective for Terasen employees who, once again, volunteered to teach natural gas safety to elementary school children. Additionally, communications aimed at the public, contractors and municipalities promoted responsible excavation practices, appliance maintenance and seasonal safety.

Meanwhile, the Customer Choice campaign marked its second year in 2008 and continued to educate the public about their energy supplier options. Energy efficiency and conservation information was also made readily available through the web, radio, newspaper and print items.

As an expert

An example of Terasen's solid reputation among regulators is its work with the Oil and Gas Commission. Recognizing the company's operational experience and history of safety and system integrity, the Commission invited Terasen to participate in the development of BC's new Pipeline and Facilities Regulations.

As a partner

Terasen is committed to being an integral part of the climate change solution.

"We serve over 125 of the 133 communities that signed BC's Climate Action Charter," said David Bodnar, director, community, government and aboriginal relations, Terasen Gas. "So it makes sense for us to provide solutions to assist in their efforts to become carbon neutral."

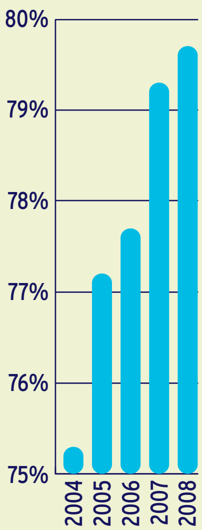
Terasen is doing just that with a range of solutions. From district energy systems and natural gas powered fleet vehicles, to biogas capture and joint energy efficiency programs—Terasen works in partnership with its stakeholders every day.

Comfort experts appear in Terasen Gas' education campaigns to promote energy efficiency, natural gas safety and Customer Choice.

As an energy provider

When it comes to satisfying customers, Terasen continues to improve on its own record. In 2008, its customer satisfaction rating was the highest in the measure's history, with 79.7 per cent indicating a high level of satisfaction. In fact, Terasen set a new customer satisfaction record in each of the last five years.

Customer satisfaction



Sustainable solutions

Kristen Mucha of Terasen Energy Services understands sustainable energy solutions. Here, she makes a site visit to Richmond's Waterstone Pier; its geothermal system provides heating and air conditioning.

Terasen Energy Services specializes in innovative alternative energy solutions with a focus on sustainability. Solutions range from geothermal systems for stand-alone buildings to complete district energy systems serving multiple buildings.

One fleet at a time

Terasen's compressed natural gas vehicle program helps businesses conserve energy, while reducing operating costs and emissions.

With technology provider FuelMaker, 100 forklifts were converted from propane to natural gas for Euro Asia Transload. The converted fleet will save 150 tonnes of carbon dioxide annually, the equivalent of removing 150 vehicles from the road. Additionally, the fleet will produce 95 per cent less carbon monoxide—a significant improvement for the employees' indoor air quality.

Initiating change for a greener future

A green blueprint

Since 1995, Terasen has reduced emissions from its operations through voluntary, efficiency-based programs.

It mitigates environmental impacts by:

- optimizing equipment
- improving operating practices
- purchasing emission offsets
- using over 100 alternative fuel fleet vehicles, including Honda's passenger vehicle, the Civic GX (fueled by compressed natural gas—the cleanest-burning hydrocarbon available)

Terasen is a leader in energy efficiency, conservation and environmental management practices. Environmental protection measures, such as the monitoring plan used for the Columbia River pipeline upgrade, are fully integrated into Terasen's business.

Living our green commitment

In 2008, Terasen applied to its regulator to expand funding for energy efficiency programs. If approved, the enhanced programs would help customers significantly reduce their natural gas use by about 1.5 million gigajoules annually. Environmental benefits would include reducing 78,500 tonnes of greenhouse gases annually, the equivalent of removing almost 16,000 vehicles from the road. Funding would be treated as a capital investment in the company's system, benefiting customers, Terasen and the environment.

Getting to zero

About 40 per cent of BC's greenhouse gases come from transportation, with commercial vehicles being the biggest emitters. Terasen's compressed natural gas vehicle program provides a clean energy alternative that significantly reduces vehicle emissions.

"I congratulate Terasen and its partners in supporting BC's Energy Plan by promoting clean, efficient natural gas vehicles as an energy alternative," said former Minister of Energy, Mines and Petroleum Resources, Richard Neufeld, at the program launch. "It is through the support of companies like yours that we will reach the Province's climate action goals."

Last year, Terasen, FortisBC, the City of Kelowna and the Clean Air Foundation launched "Cool Shops," a free energy audit program that helped about 300 businesses reduce their annual collective greenhouse gas emissions by 36 tonnes.

Renewable by design

Consumer demand for sustainable, affordable homes has increased dramatically in the past few years. Meanwhile, Terasen continues to promote renewable, alternative energies. A deal with The Beedie Group will see Terasen design, build and manage a $25 million district energy system for The Village at Fraser Mills in Coquitlam, BC.

"We sought out Terasen Energy Services—a leader in alternative energy systems—to develop and manage a district energy system that would contribute to a leading-edge, sustainable community," said Ryan Beedie, president of The Beedie Group.

Innovative capture

Terasen is leading the way with BC's first biogas capture project. With QuestAir Technologies and Metro Vancouver, the pilot project will capture biogas from the Lions Gate Wastewater Treatment Plant and deliver it through Terasen's existing distribution system. The project, which supports BC's Energy Plan, will provide enough fuel for 100 homes and reduce greenhouse gases by 500 tonnes annually.

By working with municipalities, businesses and technology partners, Terasen is initiating change for a greener future.

Managing business soundly

Through enterprise risk management, system integrity practices and the company's alignment with ISO 14001 environmental management system standards, Terasen manages its business soundly.

A simple equation

People plus technology plus processes is a simple equation for solid business results. Take, for example, Terasen's Distribution Mobile Solution. It improved scheduling, dispatching and tracking of work and resources. By improving such efficiencies, Terasen enhanced service and reduced its costs and carbon footprint.

By land and water

In 2008, Terasen applied to its regulator to replace two pipelines crossing the Fraser River that provide natural gas to five municipalities. If approved, the replacement of the 20 and 24-inch pipelines will address potential seismic activity and mitigate river erosion. The new crossings will exemplify Terasen's risk mitigation and system integrity management practices.

End of an era

The year saw Terasen complete a program to replace the remaining low-pressure piping in its natural gas distribution system. During the past three years, 95 kilometres of steel main and 7,100 steel services were replaced with polyethylene. By doing so, Terasen ensured ongoing system integrity, safety and reliability. Completed under budget and ahead of schedule, the Vancouver Low Pressure Replacement project marked the end of an era.

Terasen also completed seven pipeline projects including improvements and relocations for provincial and municipal highway projects.

A river runs over it

Running beneath the Columbia River, a new natural gas pipeline now serves Castlegar. Using state-of-the-art, horizontal drilling equipment, Terasen installed 300 metres of new pipe, replacing the old transmission pipeline once suspended above the river by aerial towers. As with all Terasen construction projects, life in and around the river was protected, including an endangered fish species, the white sturgeon.

Fuel for growth

After five years of community consultation, a $200 million project to construct a natural gas storage facility on Vancouver Island received approval from the BC Utilities Commission. The Mt. Hayes facility is a significant addition to BC's energy infrastructure.

"Mt. Hayes will help deliver a secure natural gas supply for Vancouver Island and mainland customers well into the future," said Cynthia Des Brisay, vice president, gas supply and transmission, Terasen Gas.

Sound business management and a commitment to excellence will drive Terasen's growth and continued success today and tomorrow.

About Mt. Hayes

Terasen's natural gas storage facility provides substantial community benefits including:

- about $50 million in local construction
- direct employment for about 40 construction workers
- nine full time jobs

In service by late 2011, the facility will be supplied by the company's existing system.

Once complete, it will mean:

- cost-competitive storage close to customers
- reduced dependency on remote storage
- increased flexibility to meet energy needs

A solid foundation

At the Mt. Hayes project site, more than 1,000 cubic metres of concrete forms the foundation that will support the thermos-like structure.

When complete, the storage tank will measure about 50 metres high, 60 metres in diameter, and hold 1.5 billion cubic feet of liquefied natural gas.

Growing community spirit

Kirsten Walker, a Terasen Gas employee, was one of many employees and family members who volunteered a Saturday to help plant Terasen Garden at Holland Park in Surrey.

The event was one of three regional projects that marked Terasen's inaugural Community Giving Day. Selected by employees, each project received a $30,000 corporate donation.

Caring for communities

From public consultation and innovative training, to planting an urban garden—Terasen cares.

Involving communities

In 2008, construction began at Mt. Hayes, the site of Terasen's new natural gas storage facility on Vancouver Island. An important part of BC's energy infrastructure, the project is the outcome of extensive community involvement.

"Terasen demonstrated a real desire to work with us in its development of a significant project on our traditional land. We encourage other businesses to follow their lead," stated the late Chief Peter Seymour, Chemainus First Nation.

Terasen, the Chemainus First Nation and Cowichan Tribes signed a landmark equity agreement—the first partnership of its kind. It provides them the opportunity to share a 15 per cent equity interest in the Mt. Hayes natural gas storage facility, gaining valuable business understanding and an important revenue stream for years to come.

Preparing tomorrow's workforce

Terasen led a joint utility construction "boot camp" to train and prepare First Nations youth for potential employment in the utility construction industry.

The initiative between several BC utilities and aboriginal community representatives also received recognition and partial funding from the Province and the Sto:Lo Nation.

"The program gave us the opportunity to learn in a flexible and supportive environment," said David Harris, Chemainus First Nation.

Mr. Harris is now employed with a Chemainus crew subcontracted to install power lines to the Mt. Hayes site.

Driving community giving

Equipped with smiles and determination, employees volunteered their own time in Terasen's inaugural Community Giving Day. Selected by employees, three regional projects each received a $30,000 corporate donation.

Employees planted Terasen Garden at Surrey's Holland Park. Featuring indigenous plants and beautiful landscaping, "the garden is a definite asset to the park," said Steve Whitton, Surrey Parks development coordinator.

On Vancouver Island, volunteers supported Community Living Victoria, and in Kelowna partnered with Habitat for Humanity.

Meanwhile, Warm Hearts, the charitable foundation created, funded and managed by employees, continued its heartfelt work. Since 1994, Warm Hearts has donated close to $500,000 to BC charities. In 2008, Terasen also topped up employee donations by 50 per cent through its new Community Giving Program.

Contributing to the communities where its employees live and work is another way Terasen invests in BC's future.

Where we live and work

In 2008, Terasen employees made a difference in their communities in many ways. Events they participated in included:

- Terasen's Community Giving Day in Surrey, Kelowna and Victoria
- Great Canadian Shoreline Cleanup
- Environmental Mind Grind
- Heart & Stroke Big Bike
- CANstruction Vancouver
- Dress for Success Vancouver
- Give Where You Live fundraising campaign
- Kamloops Christmas Parade
- Kelowna Festival of Trees / Adopt-a-family
- Warm Hearts Toy Drive for Transition Homes

Investing in employees

Terasen employees are known for their hard work, dedication and innovative ideas—which is why retaining, attracting and developing valued employees is an ongoing priority.

Retaining expertise

Terasen employees are part of a culture that promotes lifelong learning and advancement, while rewarding leadership, performance and results. Employees enjoy competitive benefits and a healthy work-life balance. As well, the company supports employee-directed community giving.

Attracting talent

Terasen continues to be successful in attracting high-calibre talent despite 2008's competitive labour market. In a survey, 98 per cent of new employees cited Terasen's reputation as strongly influencing their decision to join the company. Career and development opportunities were cited by 96 per cent, and attractive benefits were identified by 92 per cent.

Developing careers

Terasen is dedicated to helping employees build long-standing careers. With a comprehensive approach to learning, the company develops talent through a variety of programs including those for trade apprenticeships, engineers-in-training, co-op and intern students.

Developing leaders is also an important part of Terasen's approach to talent management. Managers participate in development opportunities such as the company's Manager-in-Training program and the Western Energy Institute's Emerging Leaders program. Additionally, Terasen's Learning Management System provides a solid foundation for employee development, succession planning and recruitment.

Every day the company works hard to make Terasen a great place to work, where employees can thrive in their careers and continue to support the company's exciting growth objectives.

A great place to work

"In 2008, we hired 193 new employees, more than a 30 per cent increase over 2007. And our voluntary attrition rate is about 4 per cent, well below our industry peers' rate of 6.9 per cent."
Jan Marston,
vice president,
human resources
and operations
governance,
Terasen Gas

Looking forward

From the first natural gas service in Vancouver and Victoria, to the pursuit of alternative energy solutions today, Terasen and its predecessor companies have always been innovative—with a vision for British Columbia's future.

Efficient and adaptive, Terasen will continue to make important advances as the Province's needs and expectations change. Working together with communities, policy makers, regulators, and those progressive in the industry, Terasen is making its mark.

Energy solutions

Committed to doing what makes sense, Terasen will help BC move towards a leaner carbon future. Uniquely positioned across the Province as a safe, trusted, reliable and efficient operator of piped energy solutions, Terasen has a strong foundation for profitable growth opportunities.

Whistler pipeline

In 2008, construction continued on the new 50-kilometre natural gas pipeline from Squamish to Whistler.

A significant contribution to BC's energy infrastructure, the pipeline is also a key element in Whistler's Sustainable Energy Plan that calls for the existing propane system to be converted to natural gas. This conversion will reduce greenhouse gas emissions by about 15 per cent and help meet Whistler's growing energy demands.

As the energy and environment world evolves, Terasen will continue to pursue integrated energy opportunities in more diverse areas to serve the energy needs of British Columbians in the decades to come.

For 2009 and beyond, Terasen's priorities include:

- **Staying focused on operational excellence**—including safety, customer satisfaction, financial performance, and environmental responsibility
- **Contributing to BC's infrastructure**—by continuing construction of the Mt. Hayes storage facility and completing the Whistler pipeline
- **Offering alternative energies and energy efficiency opportunities**—for a cleaner, greener and more affordable future
- **Growing the business**—by pursuing new applications for natural gas and solutions that integrate piped and alternative energies
- **Retaining, attracting and investing in employees**—the cornerstone of Terasen's success

Building on its core strengths and public trust, Terasen *is* delivering British Columbia's energy future.

Management's Discussion and Analysis

For the year ended December 31, 2008

February 6, 2009

This discussion should be read in conjunction with the consolidated financial statements of the Company and related notes for the years ended December 31, 2008 and 2007. In this Management's Discussion and Analysis (MD&A), we, us, our, the Company and Terasen mean Terasen Inc., its subsidiaries, joint ventures and investments in significantly influenced companies. Terasen Gas refers to Terasen Gas Inc.; TGVI refers to Terasen Gas (Vancouver Island) Inc.; TGW refers to Terasen Gas (Whistler) Inc.; TES refers to Terasen Energy Services Inc.; CWLP refers to CustomerWorks LP; Trans Mountain refers to Terasen Pipelines (Trans Mountain) Inc.; Corridor refers to Terasen Pipelines (Corridor) Inc.; Terasen Pipelines refers to Terasen Pipelines Inc.; Express refers to the Express and Platte Pipeline Systems; the Petroleum Pipeline companies refers to Trans Mountain, Corridor, Terasen Pipelines and Express; KMI refers to Knight Inc. (formerly known as Kinder Morgan, Inc.); and Fortis or the parent refers to Fortis Inc.

The financial data included in this discussion has been prepared in accordance with Canadian generally accepted accounting principles (GAAP), and all dollar amounts are in Canadian dollars unless otherwise stated.

Forward-looking statement

Certain statements contained in this Management's Discussion and Analysis contain forward-looking information within the meaning of applicable securities laws in Canada (forward-looking information). The words "anticipates," "believes," "budgets," "could," "estimates," "expects," "forecasts," "intends," "may," "might," "plans," "projects," "schedule," "should," "will," "would," and similar expressions are often intended to identify forward-looking information, although not all forward-looking information contains these identifying words.

The forward-looking information in this Management's Discussion and Analysis includes, but is not limited to, statements regarding: the Company's expectation to generate sufficient cash from operations to meet its working capital needs and to maintain its financial capacity and flexibility; the Company's expected capital expenditures for 2009, including estimated construction costs, the expectation to finance those expenditures with a combination of proceeds from shareholder advances, short and long-term borrowings and internally generated funds and the expectation that capital spending will not significantly decline in 2009; the Company's belief that changes in consumption levels and changes in the commodity cost of natural gas do not materially impact earnings as a result of regulatory deferral accounts; the Company's expectation that delivery margins will not be impacted by migration of residential customers to alternative commodity suppliers; and the Company's expectation that it will not experience difficulty in servicing its debt obligations and paying common dividends.

The forecasts and projections that make up the forward-looking information are based on assumptions, which include but are not limited to: receipt of applicable regulatory approvals and requested rate orders; no significant operational disruptions or environmental liability as a result of a catastrophic event or environmental upset; the competitiveness of natural gas pricing when compared with alternate sources of energy, continued population growth and new housing starts; the availability of natural gas supply, access to capital including no material adverse ratings actions by credit ratings agencies; interest rates; the ability to hedge certain risks including counterparties to derivative instruments failing to meet obligations; and no material change in pension expenses or funding requirements.

The forward-looking information is subject to risks, uncertainties and other factors that could cause actual results to differ materially from historical results or results anticipated by the forward-looking information. The factors that could cause results or events to differ from current expectations include, but are not limited to: regulatory approval and rate orders risk; operational disruptions and environmental risk; price competitiveness risk including the impact of carbon taxes or other environmental policies of government; changes in economic conditions including population changes and declining housing starts; risk related to the development of the TGVI franchise; natural gas supply risks; capital and credit ratings risk including material adverse ratings actions by credit ratings agencies; interest rate risk; counterparty credit risk including counterparties to derivative instruments failing to meet obligations; and pension expense and funding risk. For additional information with respect to these risk factors, reference should be made to the section entitled "Commitments, events, risks and uncertainties" in this Management's Discussion and Analysis.

All forward-looking information in this Management's Discussion and Analysis is qualified in its entirety by this cautionary statement and, except as required by law, the Company undertakes no obligation to revise or update any forward-looking information as a result of new information, future events or otherwise after the date hereof.

About Terasen

On February 26, 2007, KMI, the Company's former parent, announced it had entered into a definitive agreement with Fortis to sell Terasen and its principal natural gas transmission and distribution assets, including its subsidiaries Terasen Gas and TGVI, as well as other activities including TES. The sale did not include the petroleum transportation subsidiaries nor investments under the Kinder Morgan Canada name. The purchase price of approximately $3.7 billion included the assumption of approximately $2.4 billion of debt. The transaction closed on May 17, 2007. The Company classified its petroleum operations income and cash flow as discontinued. The Company converted any accrued interest and inter-company payables into equity and recorded this as contributed surplus.

The result of the above transactions is that Terasen's holdings are primarily natural gas transmission and distribution assets. All petroleum transportation assets, liabilities, revenues and expenses were sold after these transactions.

Natural gas transmission and distribution

Terasen's natural gas transmission and distribution operations consist primarily of Terasen Gas and TGVI in addition to several small related utility operations. Terasen Gas is the largest distributor of natural gas in British Columbia, serving approximately 834,000 residential, commercial and industrial customers in more than 100 communities. Major areas served by Terasen Gas are Greater Vancouver, the Fraser Valley and the Thompson, Okanagan, Kootenay and North Central Interior regions of the province. TGVI serves approximately 95,000 residential, commercial and industrial customers on Vancouver Island and the Sunshine Coast area and TGW serves approximately 2,500 residential and commercial customers in the Whistler region. Terasen Gas and TGVI provide transmission and distribution services to their customers, and obtain natural gas supplies on behalf of most residential and commercial customers. Gas supplies are sourced primarily from northeastern British Columbia and, through the Company's Southern Crossing Pipeline, from Alberta.

Petroleum transportation

Terasen's petroleum transportation operations were the Trans Mountain, Corridor, Express and Platte pipelines. These operations were conducted under the Kinder Morgan Canada name. Trans Mountain transported crude oil and refined products from Edmonton, Alberta to Burnaby, British Columbia and also delivered Canadian crude oil to several refineries in Washington State. Trans Mountain also owned the Westridge Marine Terminal, which is located at tidewater in the Port of Vancouver, and a jet fuel pipeline connecting to Vancouver

International Airport. Corridor owned a dual pipeline system that transported diluted bitumen and diluent between the Muskeg River mine near Fort McMurray and the Shell upgrader north of Edmonton, Alberta. Corridor commenced commercial operations in May 2003. Terasen also owned a one-third interest in the Express Pipeline and the Platte Pipeline that transported crude oil from Hardisty, Alberta to the Rocky Mountain region of the United States and on to Wood River, Illinois.

These operations were sold in 2007 and are classified as discontinued operations at December 31, 2007 as described above.

Other activities

In addition to Terasen's core businesses of natural gas transmission and distribution and petroleum transportation, Terasen owns interests in several smaller businesses including a 30 per cent interest in CWLP and TES. CWLP provides billing and customer care services to utilities, municipalities and retail energy companies. CWLP has outsourced the provision of its customer care services to an entity owned and operated by Accenture Inc. TES provides innovative, safe and reliable alternative energy solutions with a focus on sustainability.

RESULTS OF OPERATIONS

NET EARNINGS	Three months ended December 31		Twelve months ended December 31	
In millions of dollars	**2008**	2007[2]	**2008**	2007[2]
Natural gas transmission and distribution				
Terasen Gas	**$ 38.2**	$ 41.3	**$ 88.8**	$ 81.7
TGVI and TGW	**8.7**	8.2	**30.1**	30.0
	46.9	49.5	**118.9**	111.7
Discontinued operations[1]	**-**	-	**-**	(410.2)
Other activities	**(2.3)**	(8.9)	**(17.2)**	(75.3)
Net earnings	**$ 44.6**	$ 40.6	**$ 101.7**	$ (373.8)

1 During the second quarter of 2007, Terasen entered into a series of transactions with affiliated companies whereby the assets of the Petroleum Pipeline companies were sold to the affiliated companies in April and May 2007. For a description of the transactions, see DISCONTINUED OPERATIONS below.

2 Amounts have been restated to reflect the amalgamation of Terasen during the first quarter of 2007. See Note 1 of the December 31, 2008 annual financial statements for further details.

Terasen reported earnings of $44.6 million for the three months ended December 31, 2008 compared with earnings of $40.6 million in the corresponding quarter of 2007. For the twelve months ended December 31, 2008, earnings were $101.7 million compared to a loss of $373.8 million in the twelve months of 2007. The earnings have increased due to the absence of a goodwill impairment charge taken in the first quarter of 2007 and lower interest expense in 2008.

In 2008, net earnings increased by $475.5 million compared to 2007. The significant items that impacted net earnings in 2008 compared to the previous year were as follows:

CERTAIN ITEMS

In millions of dollars	
2007 write-off of goodwill related to Trans Mountain	$ 441.9
Lower earnings in 2008 due to the sale of the Petroleum Pipelines business part way through 2007	(31.7)
2008 interest savings, net of tax, on the conversion of subordinated debt to preferred shares	30.7
2007 higher interest and other expenses due to higher borrowings in corporate and transaction related expenses that were not charged to the Trans Mountain business	28.3
2007 one-time gain on the sale of land	(8.2)
Settlement of retroactive amending Québec tax legislation	7.5
Lower loss in International due to a one-time tax provision taken in 2007	7.0
	$ 475.5

Interest expense was substantially lower in 2008 due to the conversion of subordinated debt into preferred shares in 2007. The conversion results in lower net interest expense of $30.7 million in 2008 compared to 2007. The sale of the Petroleum Pipelines business in May resulted in lower earnings of $31.7 million in 2008 compared to 2007. Corporate interest and expenses were lower in 2008 due to the conversion discussed above, and lower expenses due to transaction-related expenses incurred in 2007.

SELECTED ANNUAL INFORMATION

Years ended December 31	**2008**	2007	2006
In millions of dollars			
Total revenues[1]	**$ 1,921.5**	$ 1,768.5	$ 1,783.4
Net income (loss) before discontinued operations[1]	**101.7**	36.4	(764.2)
Net income (loss)	**101.7**	(373.8)	(687.3)
Common dividends paid	**77.0**	-	-
Total assets (restated)[1]	**4,758.6**	4,425.1	7,282.2
Long-term debt[2]	**1,841.6**	1,673.7	2,121.5
Current portion of long-term debt	**$ 78.5**	$ 470.6	$ 285.9

1 Total revenues in 2007 and 2006 have been restated to reflect the reclassification of the Petroleum Pipeline companies as discontinued operations. Total assets for 2006 have been restated to reflect the reclassification of amounts between other assets and other long-term liabilities and deferred credits.

2 Excluding current portion of long-term debt.

Results by business segment

NATURAL GAS TRANSMISSION AND DISTRIBUTION

In millions of dollars	Three months ended December 31		Twelve months ended December 31	
	2008	2007	**2008**	2007
Revenues	**$ 607.4**	$ 547.9	**$ 1,905.2**	$ 1,750.8
Operating expenses				
Cost of natural gas	**417.9**	366.7	**1,267.8**	1,128.6
Operation and maintenance	**57.9**	52.2	**199.3**	192.0
Depreciation and amortization	**24.2**	23.0	**97.3**	94.1
Property and other taxes	**13.4**	13.4	**53.5**	53.1
	513.4	455.3	**1,617.9**	1,467.8
Operating income	**94.0**	92.6	**287.3**	283.0
Financing costs	**(33.6)**	(33.4)	**(131.4)**	(125.7)
Earnings before income taxes and gain on sale of land	**60.4**	59.2	**155.9**	157.3
Gain on the sale of land	**-**	8.2	**-**	8.2
Earnings before income taxes	**60.4**	67.4	**155.9**	165.6
Income tax expense	**(13.5)**	(17.9)	**(37.0)**	(53.8)
Net earnings (loss)	**$ 46.9**	$ 49.5	**$ 118.9**	$ 111.7

For the three months ending December 31, 2008, revenues from natural gas transmission and distribution increased by $59.5 million while for the twelve months ending December 31, 2008, revenues from natural gas transmission and distribution increased by $154.4 million, compared to the corresponding periods in 2007. Revenues for the quarter and year to date from natural gas transmission and distribution increased in 2008 compared to 2007 mainly as a result of cooler weather in 2008 and the effect of higher commodity cost of gas charged to customers, which are flowed through in customer rates.

Natural gas transmission and distribution net earnings increased from $111.7 million in 2007 to $118.9 million in 2008. The increase in earnings is mainly due to strong operating performance in both Terasen Gas and TGVI and the tax benefit related to the settlement with Revenu Québec and Canada Revenue Agency related to amounts owing as a result of retroactive amending Québec tax legislation. For the three months ended December 31, 2008, net earnings decreased by $2.6 million mainly due to the recognition of the gain on sale of land in 2007.

Terasen Gas

For the three months ended December 31, 2008, earnings decreased from $41.3 million in 2007 to earnings of $38.2 million in 2008. For the twelve months, earnings increased from $81.7 million in 2007 to earnings of $88.8 million in 2008. The decrease in earnings for the three months is mainly due to the recognition of the one-time gain on the sale of surplus land in the prior year offset partially by a higher allowed return on equity in 2008. The increase in earnings for the twelve months is mainly due to the settlement in 2008 of various tax matters including those with Revenu Québec and Canada Revenue Agency related to amounts owing as a result of retroactive amending Québec tax legislation plus the effect of a higher allowed return on equity in 2008.

Revenues from Terasen Gas increased by $52.3 million for the three months and $139.9 million for the twelve months ending December 31, 2008, compared to the corresponding periods in 2007.

Cost of natural gas changed on a year-over-year basis, up $47.9 million in the fourth quarter and $134.9 million for the twelve months ended December 31, 2008. Higher revenues and cost of natural gas for the three and twelve months ended December 31, 2008 reflect higher consumption in the current quarter and on a year to date basis due to cooler weather and higher commodity cost of gas charged to customers. Changes in consumption levels and changes in the commodity cost of natural gas do not materially impact earnings as a result of regulatory deferral accounts.

Terasen Gas net customer additions during 2008 were 9,256, down from 9,939 in 2007. The weakening housing and construction markets contributed to lower net customer additions in 2008 compared to 2007. In addition, the growth in multi-family housing impacted net additions as natural gas use is less prevalent in this type of dwelling. Terasen Gas industrial and transportation sales volumes decreased by 4,521.4 terajoules (TJ), mainly due to lower volumes for pulp and paper customers. Terasen Gas earns approximately the same margin regardless of whether a customer contracts for sales or transportation service.

For the three and twelve months ended December 31, 2008, operation and maintenance expenses increased by $5.2 and $6.0 million respectively, as compared with the corresponding periods of 2007. The increase in operating and maintenance expenses for the three months and twelve months is a result of higher labour costs in the current year partially offset by lower non-labour costs in the current year versus the comparative period. Non-labour costs are lower in the current year primarily due to the absence of incremental costs in 2007 associated with the Fortis transaction offset by higher bad debt and customer care costs in the current quarter and on a year-to-date basis. For the three months and twelve months ended December 31, 2008, financing costs increased by $0.3 million and $3.5 million respectively. Higher borrowing costs in the current year are due to higher borrowing rates in the current period and incrementally greater short-term borrowings versus the same period in the prior year. Income taxes for the three and twelve months of 2008 were lower than in the comparable periods of 2007 due to lower earnings, a lower effective tax rate and the net impact of the settlement of various tax matters including the retroactive amending tax legislation. During the year, the Company reached a settlement with Revenu Québec and Canada Revenue Agency related to amounts owing as a result of retroactive amending Québec tax legislation. The legislation was passed in 2006 for the purpose of challenging certain inter-provincial Canadian tax structures. As a result of the tax settlement, an earnings benefit of approximately $5.6 million was recognized.

Regulation

Terasen Gas' rates are based on estimates of several items, such as natural gas sales volumes, cost of natural gas, and interest rates. In order to manage the risks of forecast error associated with some of these estimates, a number of regulatory deferral accounts are in place.

Two mechanisms to ameliorate unanticipated changes in forecast items have been implemented specifically for Terasen Gas. The first, originally called the Gas Cost Reconciliation Account (GCRA), relates to the recovery of all gas costs through a deferral account that captures variances (overages and shortfalls) from forecasts. Balances are either refunded to or recovered from customers via a quarterly review and application to the British Columbia Utilities Commission (BCUC). Creation of the GCRA was approved by the BCUC in October 1993. Effective April 2004, the GCRA was split into two new deferral accounts called the Commodity Cost Reconciliation Account (CCRA) and the Midstream Cost Reconciliation Account (MCRA). The CCRA and MCRA were created to support customer commodity choice (unbundling) and the refund/recovery mechanism works the same as that used for the GCRA. The second mechanism seeks to stabilize revenues from residential and commercial customers through a deferral account that captures variances in the forecast versus actual customer use throughout the year. This mechanism is called the Revenue Stabilization Adjustment Mechanism (RSAM).

The RSAM and CCRA/MCRA accounts reduce Terasen Gas' earnings exposure to earnings volatility by deferring any variances between projected and actual gas consumption and gas costs, and refunding or recovering those variances in rates in subsequent periods. Variances in usage by large volume, industrial transportation and sales customers are not covered by these deferral accounts as their usage is more predictable and less likely to be significantly affected by weather.

In 2008, the net balances of the RSAM and CCRA/MCRA accounts decreased to a receivable of $22.5 million from a receivable of $72.9 million in 2007. Mark-to-market adjustments on commodity cost hedges, which are out of the money at December 31, 2008 and 2007, account for $4.5 million of the change. In order to ensure that the balances in the CCRA/MCRA account are recovered on a timely basis, Terasen Gas prepares and files quarterly calculations with the BCUC to determine whether customer rate adjustments are needed to reflect prevailing market prices for natural gas costs. These rate adjustments ignore the temporal effect of derivative valuation adjustments on the balance sheet and instead reflect the forward forecast of gas costs over the recovery period.

Short-term and long-term interest rate deferral accounts are also in place to absorb interest rate fluctuations. The interest rate deferral accounts effectively fixed the interest rate on short-term funds attributable to Terasen Gas' regulated assets at 5.00 per cent during 2008 and 4.75 per cent for 2007. The effective fixed short-term interest rate for 2009 has been set at 4.25 per cent. Any variations from this rate are deferred.

Allowed Return on Equity (ROE) and capital structure

Terasen Gas' allowed ROE is determined annually based on a formula that resets annually off a forecast of 30 Year Canada Bonds plus a 3.90 per cent risk premium when the forecast yield on 30 Year Canada Bond is 5.25 per cent. The risk premium is adjusted annually by 75 per cent of the difference between 5.25 per cent and the forecast yield on 30 Year Canada Bonds. For 2008, the application of the ROE formula set Terasen Gas' allowed ROE at 8.62 per cent, up from 8.37 per cent in 2007. The deemed equity component for Terasen Gas is 35.01 per cent, unchanged from 2007. For 2009, the allowed ROE has been set at 8.47 per cent for Terasen Gas.

2008-2009 Performance Based Rate Plan (PBR)

In July 2003, Terasen Gas received BCUC approval of a negotiated settlement for a 2004-2007 PBR. The PBR Settlement establishes a process for determining Terasen Gas' delivery charges and incentive mechanisms for improved operating efficiencies. The four-year agreement included incentives for Terasen Gas to operate more efficiently through the sharing of the benefits between Terasen Gas and its customers. The PBR Settlement includes 10 service quality measures designed to ensure Terasen Gas maintains adequate service levels. It also sets out the requirements for an annual review process that will provide a forum for discussion between Terasen Gas and interested parties regarding its current performance and future activities.

Operation and maintenance costs and base capital expenditures were subject to an incentive formula reflecting increasing costs due to customer growth and inflation, less an adjustment factor based on 50 per cent of inflation during the first two years of the PBR and 66 per cent of inflation during the last two years. Base capital expenditure amounts are a function of customer numbers and projected customer additions. The PBR Settlement provides for a 50/50 sharing mechanism of earnings above or below the allowed return on equity beginning in 2004.

In 2007, Terasen Gas applied for an extension of the 2004-2007 PBR settlement agreement. The application requested approval to extend the existing settlement term for 2008-2009. On March 23, 2007, the BCUC approved the application as filed.

Unbundling

Over the past several years, Terasen Gas, the BCUC and a number of interested parties have laid the groundwork for the introduction of natural gas commodity unbundling. On November 1, 2004, commercial customers of Terasen Gas became eligible to sign up to buy their natural gas commodity supply directly from third-party suppliers. Terasen Gas continues to provide delivery of the natural gas. Approximately 80,000 commercial customers are eligible to participate in commodity unbundling. By December 31, 2008, 19,800 customers elected to participate in this program.

During 2006, the BCUC approved offering commodity supply choice to residential customers. The BCUC agreed to open a portion of the Province's residential natural gas market to competition, allowing homeowners to sign long-term fixed price contracts for natural gas with companies other than Terasen Gas starting in May 2007. Consumers can choose to remain with Terasen Gas or sign with a marketer, in which case they began receiving gas at the marketer's rate starting in November 2007. Terasen Gas will continue to provide delivery service to unbundled customers and delivery margins are not expected to be impacted by migration of residential customers to alternative commodity suppliers. Approximately 748,000 residential customers are eligible to participate in commodity unbundling. By December 31, 2008, 115,500 customers elected to participate in this program.

Municipal leasing transactions

The Company has leasing arrangements that allow Terasen Gas to continue to operate the gas distribution assets by effectively selling the assets to the municipality and leasing them back for a 17-year period. After 17 years, Terasen Gas has an option to repurchase the assets at depreciated value. At December 31, 2008, Terasen Gas had entered into transactions involving a total value of $153 million. In addition the municipalities participating in the leasing transactions have the right each year to acquire any new asset additions within their boundaries at cost, subject to the same repurchase option at the end of the initial 17-year lease term.

Terasen Gas (Vancouver) Island

Earnings from TGVI increased from $30.0 million in 2007 to $30.1 million in 2008.

For the twelve months ending December 31, 2008, revenues from TGVI increased by $14.5 million compared to the corresponding period in 2007. Cost of natural gas changed on a year-over-year basis, up $4.3 million. Higher revenues and cost of natural gas for the twelve months ended December 31, 2008 reflect higher consumption in the year due to cooler weather on a year-over-year basis. Changes in consumption levels and changes in the commodity cost of natural gas do not materially impact earnings as a result of regulatory deferral accounts.

TGVI net customer additions during 2008 were 3,574, down slightly from 3,922 customer additions in 2007. The weakening housing and construction markets contributed to lower net customer additions in 2008 compared to 2007. In addition, the growth in multi-family housing impacted net additions as natural gas use is less prevalent in this type of dwelling. TGVI industrial and transportation sales volumes decreased by 1,215.2 TJ compared to the previous year. The decrease is primarily due to the Vancouver Island Joint Venture requiring lower volumes in 2008 compared to 2007.

For the twelve months ended December 31, 2008, operation and maintenance expenses increased by $1.3 million compared with the corresponding period of 2007. The increase in operations and maintenance expenses was mainly a result of higher inspection and maintenance costs in 2008 compared to 2007. For the three and twelve months ended December 31, 2008, depreciation and amortization increased by $1.0 million and $3.3 million respectively, compared to the corresponding periods of 2007. The increase in depreciation is due to increased capital assets spending in 2007 compared to the prior years. Financing costs for the twelve months ended December 31, 2008 were higher than the comparable period due to incrementally higher rates of interest on the debenture issued in 2008 compared to short-term borrowings in the prior year. Income taxes were higher for the twelve months ended December 31, 2007 due to higher income.

Regulation

TGVI is also regulated by the BCUC. In 1995, an agreement was entered into between TGVI, the Province of British Columbia (the Province) and the Government of Canada, which included a Special Direction that was issued to the BCUC. The agreement, which expires no sooner than December, 2011, includes the following terms:

- TGVI receives, for the benefit of its customers, an annual payment until 2011 from the Province based on the wellhead price of natural gas in BC. This payment amounted to $43.1 million in 2008, up from $35.1 million in 2007.
- The accumulated revenue deficiency resulting from overall revenues being below the cost of service prior to 2003 had been recorded in a Revenue Deficiency Deferral Account (RDDA). When Terasen acquired TGVI, the amount of the RDDA was $85 million, for which Terasen paid a price of $61 million. The accumulated RDDA recorded on Terasen's consolidated financial statements totals $3.6 million as at December 31, 2008, corresponding to a balance for TGVI regulatory purposes of $7.1 million. The balance on Terasen's consolidated financial statements is down $17.5 million from December 31, 2007. Terasen is committed to fund these revenue deficiencies by purchasing preferred shares or subordinated debt issued by TGVI. The BCUC was directed to set rates beginning in 2003 that amortize the RDDA balance over the shortest period reasonably possible, having regard for TGVI's competitive position relative to alternative energy sources and the desirability of reasonable rates. The earnings impact of the RDDA discount is discussed under "Results—Natural gas transmission and distribution."
- Any variances in the achieved ROE in a particular year from the allowed ROE (other than variances resulting from operation and maintenance costs) are deferred and recorded in the RDDA. The RDDA accumulated by TGVI is funded by the Company. Recovery of the deficiency through rates charged to customers is dependent upon regulatory approval and must be balanced against maintaining the competitiveness of TGVI's service relative to alternative energy sources. As a result, most risks associated with TGVI's annual financial results (other than operating costs) are, subject to BCUC approval, transferred to customers through the RDDA. The Company began recovery of the deficiency in 2003.

Similar to Terasen Gas, in 2007 TGVI applied for a two-year extension of its settlement agreement, which would have expired at the end of 2007. The BCUC approved the application, which grants the extension until the end of 2009. The extension provides for a continuation of the operation and maintenance cost incentive arrangements previously in place. The allowed ROE for TGVI was 9.32 per cent for 2008 compared to 9.07 per cent in 2007. The deemed equity component for TGVI is 40 per cent, unchanged from 2007. Due to a decrease in the forecast benchmark 30-year Canada Bond, TGVI's ROE for 2009 has been set at 9.17 per cent.

To ensure prompt recovery of the RDDA, the BCUC has approved a rate-setting mechanism for TGVI whereby customer rates are set at levels in excess of TGVI's cost of service, but effectively capped by the price of competitive alternative fuels (electricity or heating oil). This has resulted in significant RDDA amortization in both 2008 and 2007. However, RDDA recovery is sensitive to the relative pricing of natural gas and electricity in TGVI's service area, as well as to margin generated under TGVI's firm transportation agreements discussed below. There is no certainty that TGVI will be able to charge rates that will be sufficient to fully recover the RDDA prior to the expiry of the Provincial royalty payments at the end of 2011.

Contractual arrangements

In 2007, the BCUC approved several agreements between TGVI and BC Hydro, subject to certain conditions. The principal agreement approved was a long-term Transportation Service Agreement (TSA) under which TGVI will provide BC Hydro with both firm and interruptible transportation service. Firm service will be provided in respect of the contract demand volume prevailing from time to time under the TSA. The initial term of the TSA is from January 1, 2008 to April 12, 2022. The initial contract demand is 45 TJ per day, which BC Hydro can change to a minimum of 40 TJ per day or a maximum of 50 TJ per day by giving 12 months notice. Tolls for firm and interruptible service will be determined by the BCUC from time to time. BC Hydro may elect to terminate the TSA on or after November 1, 2015 upon giving two years notice. In addition, BC Hydro may reduce the contract demand or terminate the TSA if TGVI gives notice of its intention to construct expansion facilities of a material nature (excluding the Mt. Hayes Storage Facility) that would impact transportation tolls payable by BC Hydro. If BC Hydro elects to terminate, it may by the terms of the TSA be required to make a termination payment to TGVI that would in essence compensate TGVI for incremental revenue requirements relating to expansion facilities constructed by TGVI after January 1, 2008, but prior to BC Hydro's notice of termination.

On November 15, 2007, the BCUC granted a Certificate of Public Convenience and Necessity (CPCN) to TGVI for construction of a liquefied natural gas storage facility near Mt. Hayes on Vancouver Island and related works on TGVI's existing pipeline system, subject to certain conditions. On April 1, 2008, the BCUC provided final approval to construct and operate a natural gas storage facility at Mt. Hayes on Vancouver Island. The project has an estimated construction cost of $200 million and is expected to be in service in 2011, at which time it will be included in TGVI's rate base for regulatory purposes. In addition, TGVI entered into a foreign exchange futures contract to mitigate the foreign exchange risk associated with the US dollar portion of the Engineering, Procurement and Construction (EPC) contract.

The BCUC also approved a 35-year storage and delivery agreement between TGVI and Terasen Gas, subject to certain amendments, under which TGI will contract for at least two-thirds of the storage capacity and deliverability provided by the storage facility. TGVI may reduce the level of storage and delivery provided to TGI for the last 15 years of the agreement to reflect capacity required to serve customers on TGVI's pipeline system.

DISCONTINUED OPERATIONS

	Three months ended December 31		Twelve months ended December 31	
In millions of dollars	**2008**	2007	**2008**	2007
Net (loss) earnings from discontinued operations	**$ -**	**$ -**	**$ -**	$ (410.2)

On April 30, 2007, Terasen sold the assets of the Trans Mountain system to Kinder Morgan Energy Partners for proceeds of $549 million US. During the month of May, the remaining Petroleum Pipelines businesses within Terasen were transferred to a company affiliated with Kinder Morgan Energy Partners for fair value. In return for the assets, the Company redeemed $1,311.5 million of preferred shares. The Company has recorded an after-tax charge to equity in the amount of $531.2 million related to the sale of these businesses. Additionally, the Company recorded a goodwill impairment charge of $441.9 million during the first quarter of 2007.

OTHER ACTIVITIES

In millions of dollars	Three months ended December 31		Twelve months ended December 31	
	2008	2007	**2008**	2007
Revenues	**$ 4.9**	$ 2.7	**$ 16.3**	$ 17.7
Operating expenses:				
Cost of revenues	**-**	0.4	**0.2**	8.0
Operation and maintenance	**0.6**	2.5	**4.9**	5.8
Depreciation and amortization	**2.3**	1.4	**6.7**	5.6
Property and other taxes	**-**	-	**-**	0.2
	2.9	4.3	**11.8**	19.6
Operating income (loss)	**2.0**	(1.6)	**4.5**	(1.9)
Financing costs	**(8.6)**	(8.4)	**(36.1)**	(96.8)
Loss before income taxes	**(6.6)**	(10.0)	**(31.6)**	(98.7)
Income taxes recovery	**4.3**	1.1	**14.4**	23.4
Net loss	**$ (2.3)**	$ (8.9)	**$ (17.2)**	$ (75.3)

During the fourth quarter of 2008, revenues from other activities increased by $2.2 million while during the twelve months of 2008, revenues from other activities decreased by $1.4 million on a year-over-year basis. At the end of the first quarter of 2007, CWLP lost a major customer contract that resulted in substantially lower revenue and cost of revenue compared to prior periods. In 2008, the Company invested in FortisWest Inc. (FortisWest) preferred shares that has resulted in increased revenue from the fixed preferential cumulative cash dividend associated with this investment. Cost of revenues from other activities declined by $0.4 million for the three months and $7.8 million for the twelve months ended December 30, 2008. The cost of revenues is lower due to the loss of major contracts as discussed above. Operations and maintenance expense is lower by $1.9 million and $0.9 million for the three and twelve months ended December 31, 2008 due to a charge recognized in the prior year for the loss on the wind-up of one of the Terasen International businesses. Depreciation and amortization is higher by $0.9 million and $1.1 million for the three and twelve months ended December 31, 2008. The depreciation is a result of accelerated depreciation on the assets within CWLP. The depreciation was accelerated to recover the assets value by the end of CWLP's contract with its major customer rather than their original expected useful lives. Finance charges for the fourth quarter of 2008 were higher by $0.2 million while during the twelve months of 2008, finance charges were $60.7 million lower on a year-over-year basis. The finance charges were lower for the twelve months of 2008 due to the conversion of the subordinated debt into preferred shares in May 2007. The conversion was part of the overall transaction upon the sale of Terasen to Fortis. Income tax recovery for the twelve months ended December 31, 2008 decreased by $9.0 million mainly due to the conversion of the subordinated debt to equity during May 2007.

Commitments, events, risks and uncertainties

The Company is subject to commitments, events, risks or uncertainties that may affect the Company's future performance including revenue and income or loss. The Company's key risk factors include, but are not limited to the following:

Regulation

Through the regulatory process, the BCUC approves the return on equity that Terasen Gas and TGVI are allowed to earn, in addition to various other aspects of utility operations. In addition, the recovery of costs incurred in constructing and operating the gas utility is subject to the approval of the BCUC. Fair regulatory treatment that allows Terasen Gas and TGVI to earn a fair risk adjusted rate of return comparable to that available on alternative, similar risk investments is essential for maintaining service quality as well as ongoing capital attraction and growth. Since 1994, subject to minor modifications, the allowed ROE has been set based on a formula linked directly to forecast 30-year Canada Bond yields that have steadily declined in recent years. It is essential that the Company maintain good relationships with its various regulators and customer representatives. Terasen Gas and TGVI will be challenging the current generic ROE adjustment mechanism and increases to deemed equity thickness to more fair and appropriate levels. The Company intends to file an application with the BCUC in the second quarter of 2009.

Terasen Gas' 2004-2007 PBR settlement agreement, which has been extended through 2009, includes incentive mechanisms that provide Terasen Gas with an opportunity to earn returns in excess of the allowed return on equity determined by the BCUC. TGVI's regulatory settlement, which has been extended through 2009, includes operation and maintenance cost incentives. Upon expiry of these settlements, there is no certainty as to whether new negotiated settlements will be entered into, or what the terms of the new settlements might be.

Terasen Gas and TGVI are currently preparing rate applications with anticipated filing with the BCUC in the second quarter of 2009. BCUC approval of rates for 2010, and for future years, will be required. There can be no assurance that the rate orders issued will permit the Company to recover all costs actually incurred and to earn the expected rate of return. A failure to obtain acceptable rate orders may adversely affect the business carried on by the Company, the undertaking or timing of proposed upgrades or expansion projects, the issue and sale of securities, ratings assigned by rating agencies, and other matters which may, in turn, negatively impact the Company's results of operations or financial position.

Operations and the environment

The Company is subject to numerous laws, regulations and guidelines governing the management, transportation and disposal of hazardous substances and other waste materials and otherwise relating to the protection of the environment and health and safety. The costs arising from compliance with such laws, regulations and guidelines may be material to the Company. The process of obtaining environmental permits and approvals, including any necessary environmental assessment, can be lengthy, contentious and expensive. Potential environmental damage and costs could arise due to a variety of events and could be material if an event happened. However, there can be no assurance that such costs will be recoverable through rates and, if substantial, unrecovered costs may have a material effect on the business, results of operations, financial condition and prospects of the Company.

The Company is exposed to environmental risks that owners and operators of properties in British Columbia generally face. These risks include the responsibility of any current or previous owner or operator of a contaminated site for remediation of the site, whether or not such person actually caused the contamination. In addition, environmental and safety laws make owners, operators and persons in charge of management and control of facilities subject to prosecution or administrative action for breaches of environmental and safety laws, including the failure to obtain certificates of approval. The Company has not been notified of any such regulatory action in regard to the operation or occupation of its facilities. However, it is not possible to predict with absolute certainty the position that a regulatory authority will take regarding matters of non-compliance with environmental and safety laws. Changes in environmental, health and safety laws could also lead to significant increases in costs to the Company.

The Company is exposed to various operational risks, such as pipeline leaks; accidental damage to, or fatigue cracks in mains and service lines; corrosion in pipes; pipeline or equipment failure; other issues that can lead to outages and/or leaks; and any other accidents involving natural gas, which could result in significant operational disruptions and/or environmental liability. The Company believes it has taken all reasonable and prudent steps to minimize its exposure in the case of a catastrophic event or environmental upset. The Company conducts its operations utilizing an Environmental Management System that specifies impacts, control measures and audit protocols. The Company maintains comprehensive facility risk assessment, pipeline integrity management and damage prevention programs and pipeline security systems as preventive measures to mitigate the risk of a pipeline failure or other loss of system integrity. These programs are intended to reduce both the likelihood and severity of the business interruption and/or environmental liability that could result from a pipeline failure or loss of integrity.

A major natural disaster, such as an earthquake affecting the Greater Vancouver region or Vancouver Island, could severely damage Terasen Gas' or TGVI's natural gas transmission and distribution systems. The Company has detailed emergency preparedness plans in place to respond to natural disasters, accidents and emergencies, and regularly tests these plans in simulations involving employees and other emergency response organizations. The Company also has an insurance program which provides coverage for business interruption, liability and property damage, although the coverage offered by this program is limited. In the event of a large uninsured loss caused by a natural disaster, the Company would apply to the BCUC for recovery of these costs through higher rates. However, there is no assurance that the BCUC will approve any such application.

The actions necessary to abandon pipeline systems at the eventual end of their useful lives have not been defined and the costs of these actions may not be fully recovered in rates or tolls. Until such time as the specified requirements of abandonment and the funding mechanism for the eventual recovery of negative salvage is determined, the Company, like other Canadian pipeline systems, makes no provision for these amounts.

Terasen Gas' and TGVI's natural gas transmission and distribution systems require ongoing maintenance, improvement and replacement. Accordingly, to ensure the continued performance of the physical assets, the Company determines expenditures that must be made to maintain and replace the assets. If the systems are not able to be maintained, service disruptions and increased costs may be experienced. The inability to obtain regulatory approval to reflect in rates the expenditures which the Company believes are necessary to maintain, improve and replace their assets; the failure by the Company to properly implement or complete approved capital expenditure programs; or the occurrence of significant unforeseen equipment failures despite maintenance programs could have a material effect on the Company.

The Company continually develops capital expenditure programs and assesses current and future operating and maintenance expenses that will be incurred in the ongoing operation. Management's analysis is based on assumptions as to costs of services and equipment, regulatory requirements, revenue requirement approvals, and other matters, which involve some degree of uncertainty. If actual costs exceed regulatory-approved capital expenditures, it is uncertain as to whether such additional costs will receive regulatory approval for recovery in future customer rates. The inability to recover these additional costs could have a material effect on the financial condition and results of operations of the Company. See "Regulation" for further discussion on regulatory risk.

Competitiveness

Prior to 2000, natural gas consistently enjoyed a substantial competitive advantage when compared with alternative sources of energy in British Columbia. However, because electricity prices in British Columbia continue to be set based on the historical average cost (primarily hydro-electric dams) of production, rather than based on market forces, they have remained artificially low compared to market-priced electricity. As a result, the price of electricity for residential customers in British Columbia is now only marginally higher than for natural gas. There is no assurance that natural gas will continue to maintain a competitive price advantage in the future.

The Company employs a number of tools to reduce its exposure to natural gas price volatility. These include purchasing gas for storage and adopting hedging strategies, which include a combination of both physical and financial transactions, to reduce price volatility and ensure, to the extent possible, that natural gas commodity costs remain competitive against electric rates. Activities related to the hedging of gas prices are approved by the BCUC and gains or losses accrue entirely to customers.

If natural gas pricing becomes uncompetitive with electricity prices or the price of other forms of energy, the Company's ability to add new customers could be impaired, and existing customers could reduce their consumption of natural gas or eliminate its usage altogether as furnaces, water heaters and other appliances are replaced. This may result in higher rates and, in an extreme case, could ultimately lead to an inability to fully recover the Company's cost of service in rates charged to customers.

In 2008 the Government of British Columbia introduced changes to energy policy including greenhouse gas emission reduction targets and a consumption tax on carbon-based fuels that impact the competitiveness of natural gas versus non-carbon based energy sources or alternate energy sources. It did not, however, introduce carbon tax on imported electricity generated through the combustion of carbon-based fuels. The future impact of these changes in energy policy may have a material impact on the competitiveness of natural gas relative to other energy sources.

There can be no assurance that the current regulatory-approved flow through mechanisms in place allowing for the flow through of the cost of natural gas will continue to exist in the future. An inability of the Company to flow through the full cost of natural gas could materially affect the Company's results of operations, financial position and cash flows.

Labour relations

Approximately 75 per cent of the employees of the Company are members of labour unions that have entered into collective bargaining agreements with the Company. The provisions of such collective bargaining agreements affect the flexibility and efficiency of the business carried on by the Company. The Company considers its relationships with its labour unions to be positive but there can be no assurance that current relations will continue in future negotiations or that the terms under the present collective bargaining agreements will be renewed.

The inability to maintain, or to renew, the collective bargaining agreements on acceptable terms could result in increased labour costs or service interruptions arising from labour disputes, that are not provided for in approved rates and that could have an adverse effect on the results of operations, cash flow and net income of the Company.

Impact of changes in economic conditions

Typical of utilities, economic conditions in the Company's service territories influence energy sales. Energy sales are influenced by economic factors such as changes in employment levels, personal disposable income, energy prices and housing starts. New customer additions at the

Company are typically a result of population growth and new housing starts, which are affected by the state of the provincial economy. The Company is also affected by changes in trends in housing starts from single-family dwellings to multi-family dwellings, for which natural gas has a lower penetration rate. Housing starts in 2008 were more moderate compared to the previous number of years, and the growth of new multi-family housing starts continues to significantly outpace that of new single-family housing starts. Higher energy prices can dampen economic activity and reduce consumption by customers. Natural gas and crude oil prices are closely correlated with natural gas and crude oil exploration and production activity in certain of the Company's service territories. The level of these activities can influence energy demand.

An extended decline in economic conditions would be expected to have the effect of reducing demand for energy over time. The regulated nature of Terasen Gas and TGVI, including various mitigating measures approved by regulators, helps to reduce the impact that lower energy demand, associated with poor economic conditions, may have on the Company's earnings. However, a severe and prolonged downturn in economic conditions could materially affect the Company despite regulatory measures available for compensating for reduced demand. For instance, significantly reduced energy demand in the Company's service territories could reduce capital spending that would in turn impact rate base and earnings growth. Despite current depressed economic conditions and natural gas prices, which are expected to continue during 2009, the Company does not anticipate any significant decrease in capital spending in 2009.

Risk related to TGVI

TGVI is a franchise under development in the price-competitive service area of Vancouver Island, with a customer base and revenue that is insufficient to meet the Company's current cost of service and to recover revenue deficiencies from prior years. Recovery of accumulated revenue deficiencies from prior years puts gas at a cost disadvantage relative to electricity. To assist with competitive rates during franchise development, the Vancouver Island Natural Gas Pipeline Agreement (VINGPA) provides royalty revenues from the Government of British Columbia which currently covers approximately 20 per cent of the current cost of service. These revenues are due to expire at the end of 2011, after which time TGVI's customers will be required to absorb the full commodity cost of gas, all other costs of service and the recovery of any remaining accumulated revenue deficiencies. When VINGPA expires in 2011, the remaining $60.8 million non-interest bearing senior government debt, which is currently treated as a government contribution against rate base, will be required to be repaid. As this debt is repaid, the cost of the higher rate base will increase the cost of service and customer rates, making gas less competitive with electricity on Vancouver Island.

Natural gas supply

The Company is dependent on a limited selection of pipeline and storage providers, particularly in the Vancouver, Fraser Valley and Vancouver Island service areas where the majority of the Company's natural gas distribution customers are located. Regional market prices have been higher from time to time than prices elsewhere in North America as a result of insufficient seasonal and peak storage and pipeline capacity to serve the increasing demand for natural gas in BC and the US Pacific Northwest.

In addition, the Company is critically dependent on a single source transmission pipeline. In the event of a prolonged service disruption on the Spectra transmission system, the Company's residential customers could experience outages, thereby affecting revenues and incurring costs to safely relight customers.

Capital resources and liquidity

The Company's financial position could be adversely affected if it fails to arrange sufficient and cost-effective financing to fund, among other things, capital expenditures and the repayment of maturing debt. The ability to arrange sufficient and cost-effective financing is subject to numerous factors, including the results of operations and financial position of the Company, conditions in the capital and bank credit markets, ratings assigned by rating agencies and general economic conditions. Funds generated from operations after payment of expected expenses (including interest payments on any outstanding debt) will not be sufficient to fund the repayment of all outstanding liabilities when due as well as all anticipated capital expenditures. There can be no assurance that sufficient capital will continue to be available on acceptable terms to fund capital expenditures and to repay existing debt.

Generally, the Company is subject to financial risk associated with changes in the credit ratings assigned to them by credit rating agencies. Credit ratings impact the level of credit risk spreads on new long-term debt issues and on the Company's credit facilities. A change in the credit ratings could potentially affect access to various sources of capital and increase or decrease the Company's finance charges. Also, a significant downgrade in Terasen or Terasen Gas' credit ratings could trigger margin calls and other cash requirements under Terasen Gas' natural gas purchase and natural gas derivative contracts. The Company's corporate investment-grade credit ratings were confirmed and maintained during the year and the Company does not anticipate any material adverse rating actions by the credit rating agencies in the near term. However, the current global financial crisis has placed increased scrutiny on rating agencies and rating agency criteria that may result in changes to credit rating practices and policies.

The recent and expected continued volatility in the global financial and capital markets will likely increase the cost of and affect the timing of issuance of long-term capital by the Company in 2009. The cost of borrowing is expected to increase as new long-term debt is expected to be issued at higher rates due to an increase in credit spreads. Due to the regulated nature of Terasen Gas and TGVI, the expected higher cost of borrowing of Terasen Gas and TGVI is eligible to be recovered in future customer rates.

To help mitigate liquidity risk, Terasen Gas and TGVI have secured multi-year committed credit facilities to support short-term financing of capital expenditures and seasonal working capital requirements.

Transition to International Financial Reporting Standards

The Accounting Standards Board of the Canadian Institute of Chartered Accountants has announced that Canadian publicly accountable enterprises are required to adopt International Financial Reporting Standards (IFRS) as issued by the International Accounting Standards Board, effective January 1, 2011. IFRS will require increased financial statement disclosure as compared to Canadian GAAP, and accounting policy differences between Canadian GAAP and IFRS will need to be addressed by the Company. The Company is currently considering the impact a conversion to IFRS would have on its future financial reporting. Additional information on the Company's transition to IFRS is provided in the "Future accounting pronouncements" section of this MD&A.

Interest rates

The allowed returns on equity for Terasen Gas and TGVI are determined by formulae that result in lower allowed ROEs if forecast long-term Canada bond yields decline. Terasen Gas' and TGVI's exposure to short-term interest rates are covered by regulatory deferral accounts; however, the Company is exposed to changes in short-term interest rates through debt on non-regulated operations.

Employee future benefits

The Company maintains defined benefit pension plans and there is no certainty that the pension plan assets will be able to earn the assumed rate of returns. Market-driven changes impacting the performance of the pension plan assets may result in material variations in actual return on pension plan assets from the assumed return on the assets causing material changes in the pension expense and funding requirements. The regulated operations of the Company currently have a deferral mechanism that allows for deferral of the pension expense that is approved for recovery in rates and the actuarial pension expense. Net pension expense is impacted by, among other things, the amortization of experience and actuarial gains or losses and expected and actual return on plan assets. Market-driven changes impacting other pension assumptions, including the assumed discount rate, may also result in future contributions to pension plans that differ significantly from current estimates as well as causing material changes in pension expense. There is also measurement uncertainty associated with pension expense, future funding requirements, the accrued benefit asset, accrued benefit liability and benefit obligation due to measurement uncertainty inherent in the actuarial valuation process.

Counterparty credit risk

The Company is exposed to credit risk in the event of non-performance by counterparties to derivative instruments. The Company is also exposed to significant credit risk on physical off-system sales. Terasen deals with high credit quality institutions in accordance with established credit approval practices. Due to recent events in the financial markets including significant international government intervention in the banking systems and financial markets the Company has further limited the financial counterparties that it transacts with and reduced available credit to, or taken additional security from, the physical off-system sales counterparties it deals with. To date, the Company has not experienced any counterparty defaults and does not expect any counterparties to fail to meet their obligations; however, the credit quality of counterparties, as recent events have indicated, can change rapidly.

First Nations lands

Terasen Gas, TGVI and TGW provide service to customers on First Nations lands and maintain gas distribution facilities on lands that are subject to land claims by various First Nations. A treaty negotiation process involving various First Nations and the Government of British Columbia is underway, but the basis upon which settlements might be reached in the service areas of the Company is not clear. Furthermore, not all First Nations are participating in the process. To date, the policy of the Government of British Columbia has been to endeavour to structure settlements without prejudicing existing rights held by third parties such as the Company. However, there can be no certainty that the settlement process will not adversely affect the business of the Company.

Critical accounting estimates

The preparation of the Company's consolidated financial statements in accordance with GAAP requires management to make estimates and judgments that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenue and expenses during the reporting periods. Estimates and judgments are based on historical experience, current conditions and various other assumptions believed to be reasonable under the circumstances.

Due to changes in facts and circumstances and the inherent uncertainty involved in making estimates, actual results may differ significantly from current estimates. Estimates and judgments are reviewed periodically and, as adjustments become necessary, are reported in earnings in the period they become known. The Company's critical accounting estimates are discussed below.

Regulation

Generally, the accounting policies of the Company's regulated operations are subject to examination and approval by the respective regulatory authorities. These accounting policies may differ from those used by entities not subject to rate regulation. The timing of the recognition of certain assets, liabilities, revenues and expenses, as a result of regulation, may differ from that otherwise expected using GAAP for entities not subject to rate regulation. Regulatory assets and regulatory liabilities arise as a result of the rate-setting process at the regulated operations and have been recorded based on previous, existing or expected regulatory orders or decisions. Certain estimates are necessary since the regulatory environments in which the Company's regulated operations operate often require amounts to be recorded at estimated values until these amounts are finalized pursuant to regulatory decisions or other regulatory proceedings. The final amounts approved by the regulatory authorities for deferral as regulatory assets and regulatory liabilities and the approved recovery or settlement periods may differ from those originally expected. Any resulting adjustments to original estimates are reported in earnings in the period in which they become known. As at December 31, 2008, the Company recorded $121.2 million in current and long-term regulatory assets (December 31, 2007 - $128.2 million) and $68.8 million in current and long-term regulatory liabilities (December 31, 2007 - $31.2 million).

Capital asset amortization

Amortization, by its nature, is an estimate based primarily on the useful life of assets. Estimated useful lives are based on current facts and historical information and take into consideration the anticipated physical life of the assets. As at December 31, 2008, the Company's consolidated utility capital assets were $2.9 billion, or approximately 61 per cent of total consolidated assets, compared to consolidated utility assets of $2.8 billion, or approximately 64 per cent of total consolidated assets, as at December 31, 2007. Changes in amortization rates can have a significant impact on the Company's amortization expense.

As part of the customer rate setting process, appropriate amortization rates are approved by the respective regulatory authorities for the Company's regulated operations.

The amortization periods used and the associated rates are reviewed on an ongoing basis to ensure they continue to be appropriate. From time to time, third-party depreciation studies are performed for the regulated operations. Based on the results of these depreciation studies, the impact of any over or under amortization as a result of actual experience differing from that expected and provided for in previous amortization rates is generally reflected in future amortization rates and amortization expense, and such differences are reflected in future customer rates.

Capitalized overheads

As required by the BCUC, Terasen Gas, TGVI and TGW capitalize overhead costs that are not directly attributable to specific capital assets, but which relate to the overall capital expenditure program. These General Expenses Capitalized (GEC) are allocated over constructed capital assets and amortized over their estimated service lives. The methodology for calculating and allocating these general expenses to utility capital assets is established by the respective regulators. In 2008, GEC totaled $32.7 million (2007 - $32.6 million). Any change in the methodology of calculating and allocating general overhead costs to utility capital assets could have a significant impact on the amount recorded as operating expenses and utility capital assets.

Goodwill impairment assessments

Goodwill represents the excess, at the dates of acquisition, of the purchase price over the fair value of the net amounts assigned to individual assets acquired and liabilities assumed relating to business acquisitions. Goodwill is carried at initial cost less any write-down for impairment.

The Company is required to perform an annual impairment test and at such time any event occurs or if circumstances change that would indicate that the fair value of a reporting unit was below its carrying value. In July of each year, the Company reviews for impairment of goodwill, which is based on current information and fair market value assessments of the reporting units being reviewed. Fair market value is determined using net present value financial models and management's assumption of future profitability of the reporting units. There was no impairment provision required on $818.1 million in goodwill recorded on the Company's balance sheet as at December 31, 2008.

Employee future benefits

The Company's defined benefit pension plans and Other Post Employment Benefits (OPEB) plans are subject to judgments utilized in the actuarial determination of the expense and related obligation. The main assumptions utilized by management in determining pension expense and obligation are the discount rate for the accrued benefit obligation and the expected long-term rate of return on plan assets.

The assumed long-term rate of return on the defined benefit pension plan assets, for the purpose of estimating pension expense for 2009, is 7.25 per cent, consistent with the assumed long-term rate of return used for 2008.

The assumed discount rate, used to measure the Company's accrued pension benefit obligations on the applicable measurement date in 2008, and to determine pension expense for 2009 was 6.25 per cent, up from 5.25 per cent used in 2007. The discount rate increased as a result of the impact of increased credit risk spreads on investment grade corporate bonds due to volatility in the capital markets.

The long-term rate of return is based on the expected average return of the assets over a long period given the relative asset mix. The discount rate is determined with reference to the current market rate of interest on high-quality debt instruments with cash flows that match the time and amount of expected benefit payments.

Terasen expects consolidated pension expense for 2009 related to its defined benefit pension plans to be approximately $0.7 million lower than in 2008. The lower expense is due to the effect of the change in discount rate partially offset by lower returns on the assets in 2008.

The following table provides the sensitivities associated with a 100 basis point increase in the expected long-term rate of return on plan assets and discount rate on 2008 net benefit expense and the accrued benefit pension asset and liability recorded in the Company's consolidated financial statements, as well as the impact on the accrued pension benefit obligation.

Increase (decrease) (in millions of dollars)	Accrued benefit assets	Accrued benefit liability	Net benefit expense	Benefit obligation
1% increase in the expected rate of return	$ 2.6	$ (0.1)	$ (2.6)	$ -
1% decrease in the expected rate of return	(2.6)	0.1	2.6	-
1% increase in the discount rate	(0.8)	(0.7)	0.1	(18.5)
1% decrease in the discount rate	(2.7)	1.1	3.7	21.0

The above table reflects the changes before the effect of the regulatory deferral account that would defer most of the effect on the expense.

Other assumptions applied in measuring defined benefit pension expense and/or the accrued pension benefit obligation were the average rate of compensation increase, average remaining service life of the active employee group, and employee and retiree mortality rates.

The Company's OPEB plans are also subject to judgments utilized in the actuarial determination of the expense and related obligation. Except for the assumptions of the expected long-term rate of return on plan assets and average rate of compensation increase, the above assumptions, along with health care cost trends, were also utilized by management in determining OPEB plan expense and obligations.

As disclosed under the "Commitments, events, risks and uncertainties" section of this MD&A, Terasen Gas has regulatory-approved mechanisms to defer variations in pension expense from forecast pension expense, used to set customer rates, as a regulatory asset or a regulatory liability.

As at December 31, 2008, the Company had a consolidated accrued benefit asset of $226.3 million (December 31, 2007 - $261.2 million) and a consolidated accrued benefit liability of $351.0 million (December 31, 2007 - $360.2 million). During 2008, the Company recorded consolidated net benefit expense of $12.9 million (2007 - $16.0 million).

Asset Retirement Obligations (AROs)

In measuring the fair value of AROs, the Company is required to make reasonable estimates concerning the method of settlement and settlement dates associated with the legally obligated asset retirement costs. The Company does not currently have any identified AROs and as such no amounts have been recorded as at December 31, 2008 and 2007. The nature, amount and timing of costs associated with land and environmental remediation and/or removal of assets cannot be reasonably estimated at this time as the transmission and distribution systems are reasonably expected to operate in perpetuity due to the nature of their operation; and applicable licences, permits and laws are reasonably expected to be renewed or extended indefinitely to maintain the integrity of the related assets and to ensure the continued provision of service to customers. In the event that environmental issues are identified, or the applicable licences, permits, laws or agreements are terminated, AROs will be recorded at that time provided the costs can be reasonably estimated.

Revenue recognition

The Company recognizes revenue on an accrual basis. Recording revenue on an accrual basis requires use of estimates and assumptions. Customer bills are issued throughout the month based on meter readings that establish gas consumption by customers since the last meter reading. The unbilled revenue accrual for the period is based on estimated gas sales to customers for the period since the last meter reading at the approved rates. The development of the sales estimates requires analysis of consumption on a historical basis in relation to key inputs such as the current price of gas, population growth, economic activity, weather conditions and system losses. The estimation process for accrued unbilled gas consumption will result in adjustments to gas revenue in the periods they become known when actual results differ from the estimates. As at December 31, 2008, the amount of accrued unbilled revenue recorded in accounts receivable was approximately $246.7 million (December 31, 2007 - $173.8 million) on annual consolidated operating revenues of $1.9 billion (2007 - $1.8 billion).

Contingencies

The Company is subject to various legal proceedings and claims that arise in the ordinary course of business operations. Management believes that the amount of liability, if any, from these actions would not have a material effect on the Company's financial position or results of operations. Contingencies are described in Note 17 to the Company's annual financial statements.

QUARTERLY FINANCIAL INFORMATION

In millions of dollars	For the three months ended									
2008	Mar 31[1]		Jun 30		Sep 30		Dec 31		Total	
Revenues	$	638.6	$	394.2	$	276.4	$	612.3	$	1,921.5
Net income (loss)		52.4		5.7		(1.0)		44.6		101.7
2007[1]										
Revenues (restated)[2]	$	639.1	$	346.1	$	232.7	$	550.6	$	1,768.5
Net income (loss) before discontinued operations		27.5		(22.4)		(9.3)		40.6		36.4
Net income (loss)		(396.4)		(8.7)		(9.3)		40.6		(373.8)

1 Amounts have been restated to reflect the amalgamation of Terasen during the first quarter of 2007. See Note 1 of the December 31, 2008 annual financial statements for further details.

2 Revenues for 2007 have been restated to reflect the reclassification of the Petroleum Pipelines companies as discontinued operations.

Because of natural gas consumption patterns, the natural gas transmission and distribution operations of Terasen Gas normally generate higher earnings in the first and fourth quarters and lower earnings in the second quarter, which are partially offset by losses in the third quarter. As a result of the gas distribution segment seasonality, interim earnings statements are not indicative of earnings on an annual basis.

March 2008/2007—Earnings increased by $448.8 million due to the absence of a goodwill impairment charge of $441.9 million in the first quarter of 2007 slightly offset by the sale of the Petroleum Pipelines businesses in 2007. The March 2007 earnings include results from the Petroleum Pipelines segment while the results in 2008 do not as a result of the sale of the businesses. Additionally, earnings are higher in the current year due to the conversion of the subordinated debt into preferred shares in May 2007.

June 2008/2007—Earnings increased by $14.4 million due to the conversion of subordinated debt into preferred shares in May 2007 offset slightly by lower earnings due to the sale of the Petroleum Pipelines businesses in 2007. Additionally, more customers and an increase in the return on equity increased the earnings from the natural gas transmission and distribution operations.

September 2008/2007—Earnings increased by $8.3 million mainly due to the settlement of the retroactive amending tax legislation. As a result of the tax settlement, an earnings benefit of approximately $7.5 million was recognized. Additionally, more customers and an increase in the return on equity increased the earnings from the natural gas transmission and distribution operations.

December 2008/2007—Earnings increased by $4.0 million mainly due to higher return on equity, lower operations and maintenance expense and lower tax expense in the current period versus the prior year.

Liquidity and capital resources

Terasen expects to generate sufficient cash from operations to meet its working capital needs and to maintain its financial capacity and flexibility.

CONSOLIDATED CASH FLOW

	Three months ended December 31		Twelve months ended December 31	
In millions of dollars	**2008**	2007	**2008**	2007
Cash flow provided by (used for):				
Operating activities	**$ 79.8**	$ (5.9)	**$ 255.5**	$ 113.5
Investing activities	**(52.3)**	(39.7)	**(314.5)**	(306.2)
Financing activities	**(25.3)**	63.7	**74.2**	199.3
Net (decrease) increase in cash	**$ 2.2**	$ 18.1	**$ 15.2**	$ 6.6

Cash flow from operating activities

Cash flow from operating activities increased from $113.5 million in 2007 to $255.5 million in 2008 due to a number of factors. Net earnings from continuing operations were $65.3 million higher in 2008 as a result of the items outlined on page 18. Cash from operations refers to cash generated before the impact of working capital. Cash from operations for the three months ended December 31, 2008 was $66.1 million compared to $54.7 million in the corresponding period of 2007. Cash from operations for the twelve months ended December 31, 2008 was $201.0 million, compared to $123.0 million in the corresponding period of 2007. The increase in cash from operations for the three and twelve months ended December 31, 2008 is mainly a result of higher net earnings in the comparable periods of 2008 versus 2007.

Between December 31, 2007 and December 31, 2008, accounts receivable, inventories of gas in storage and supplies, accounts payable and accrued liabilities, excluding the mark-to-market on gas derivative, have increased while the current portion of rate stabilization accounts decreased as a result of the cooler weather and higher commodity cost of gas charged to customer. Due to the greater impact of these changes in 2008 as compared to 2007, cash flow generated from operating activities has increased.

Investing activities

Capital expenditures totaled $213.0 million in the twelve months ended December 31, 2008 compared with $174.6 million in the corresponding period in 2007. The increase in capital expenditures was primarily attributable to work on the Mt. Hayes Natural Gas Storage project on Vancouver Island and the Whistler Pipeline project.

Additionally, Terasen invested $150 million in FortisWest preferred shares.

In 2007, there was a net use of cash of $163.2 million related to the disposal of the Petroleum Pipelines businesses during the second quarter. The cash flows of the comparative periods have been restated to reflect the classification of the Petroleum Pipelines businesses as discontinued operations.

Financing activities

On February 15, 2008, TGVI issued $250.0 million of Medium-Term Note Debentures at a coupon interest rate of 6.05 per cent. The proceeds were used to repay the current operating facility.

On May 13, 2008, Terasen Gas issued $250.0 million of Medium-Term Note Debentures at a coupon interest rate of 5.80 per cent. The proceeds were used to repay current debt maturities of $188.0 million, which matured on June 2, 2008, and the remainder of the proceeds were used to pay down Terasen Gas' operating line.

On June 30, 2008, TGVI made a $6.5 million payment on its government loans, of which approximately $3.9 million was refinanced through borrowings under its $20 million non-revolving credit facility and the remaining amount funded with cash on hand.

On December 1, 2008, Terasen repaid the Series 1 Medium-Term Note Debentures using short-term borrowings from Fortis.

To finance the Company's investment in FortisWest preferred shares, Terasen borrowed an additional $150 million from its parent company.

On June 1, 2007 and July 18, 2007, Terasen reduced the capacity of its credit agreement by $270 million and $80 million respectively, to bring the operating limit to $100 million.

On June 30, 2007, TGVI made a $1.4 million payment on its government loans, of which approximately $0.8 million was refinanced through borrowings under its $20 million non-revolving credit facility and the remaining amount funded with cash on hand.

On August 24, 2007, Terasen Gas renegotiated and extended its credit facility for five years with similar terms to the original facility and common for such term credit facilities. The $500 million unsecured committed revolving credit facility is with a syndicate of banks and matures in August 2012. In 2008, under the terms of the agreement, the facility was extended to mature in August 2013.

On October 2, 2007, Terasen Gas issued $250.0 million of Medium-Term Note Debentures at a coupon interest rate of 6.00 per cent. The proceeds were used to repay the current debt maturities that matured during October 2007.

As at December 31, 2008, the Company and its subsidiaries had lines of credit in place totalling $950.0 million to finance cash requirements. The borrowings on these lines are included in short-term notes. These lines enable the respective companies to borrow directly from their bankers, issue bankers' acceptances and support commercial paper issuance. Bank lines of $552.9 million were unutilized at the end of 2008. Virtually all short-term cash needs are funded through commercial paper and bankers' acceptances in the Canadian market at rates generally below bank prime. Terasen does not have, nor does it expect to have, any defaults or arrears.

The Company declared dividends on common shares of $77.0 million during 2008. No dividends on common shares were declared in 2007.

Contractual obligations

The Company's subsidiaries and proportionately consolidated entities have entered into operating leases for certain building space and natural gas transmission and distribution assets. In addition, Terasen Gas and TGVI have entered into gas purchase contracts that represent future purchase obligations. The following table sets forth the Company's operating leases, gas purchase obligations and employee benefit plan contributions due in the years indicated:

In millions of dollars	Operating leases	Purchase obligations	Employee benefit plans	Total
2009	$ 17.4	$ 416.5	$ 10.8	$ 444.7
2010	16.1	26.9	8.5	51.5
2011	15.8	22.8	-	38.6
2012	15.3	-	-	15.3
2013	13.5	-	-	13.5
Thereafter	85.5	-	-	85.5
	$ 163.6	$ 466.2	$ 19.3	$ 649.1

Gas purchase contract commitments are based on market prices that vary with gas commodity indices. The amounts disclosed reflect index prices that were in effect at December 31, 2008. The employee benefit plan contributions have been estimated up to the date of the next actuarial valuation for each plan unless the valuation falls in the next twelve months, then the Company has provided for an estimate of the contributions. Employee benefit plan contributions beyond the date of the next actuarial valuation cannot be accurately estimated.

In prior years, TGVI received non-interest bearing, repayable loans from the Federal and Provincial governments of $50 million and $25 million respectively, in connection with the construction and operation of the Vancouver Island natural gas pipeline. As approved by the BCUC, these loans have been recorded as government grants and have reduced the amounts reported for property, plant and equipment. The government loans are repayable in any fiscal year after 2002 and prior to 2012 under certain circumstances and subject to the ability of TGVI to obtain non-government subordinated debt financing on reasonable commercial terms. In 2006, all of the repayment criteria were met when TGVI obtained additional financing through a new credit agreement. In addition, since the conditions continue to be met (an annual test) TGVI is expected to make a repayment on the loans in 2009 of approximately $8.1 million (2007 - $6.5 million). As the loans are repaid and replaced with non-governmental loans, property, plant and equipment and long-term debt will increase in accordance with the approved capital structure, as will the rate base used in determining rates. The amounts are not included in the obligations in the table above as the amounts and timing of repayments are dependent upon the approved RDDA recovery each year and the ability to replace the loans with non-government subordinated debt financing on reasonable commercial terms.

Financial position

The following table outlines the significant changes in the consolidated balance sheets as at December 31, 2008 compared to December 31, 2007, other than assets and liabilities related to the Petroleum Pipelines businesses that were sold in May 2007.

Balance sheet item	Increase (decrease) ($ millions)	Explanation
Rate stabilization accounts (including current and long-term)	(51.9)	The decrease in the net asset position is mainly due to the fair value mark-to-market for the gas derivatives being lower at December 31, 2008 versus December 31, 2007. Additionally, the company has been collecting higher amounts from customers while gas prices have declined.
Accounts receivable	44.5	The increase in accounts receivable is due to cooler weather and an increase in the commodity cost of gas charged to customers in 2008 compared to 2007.
Short-term notes	48.5	The increase is due to the reclassification of borrowings by TGVI from long-term debt to short-term notes during the year. When TGVI issued its medium-term notes, the credit facility was re-classified to short-term notes to reflect the nature of the borrowings. This is partially offset by the lower borrowings in Terasen Gas due to additional long-term debt issued in the year.
Accounts payable and accrued liabilities	69.8	The increase is mainly due to higher gas cost payable due to cooler weather in the current year compared to the prior year.
Long-term investments	150.0	The Company acquired Series C Preferred Shares of FortisWest Inc., a subsidiary of Fortis Inc., on May 1, 2008.

Working capital

Terasen's working capital requirements fluctuate seasonally based on natural gas consumption. Given the relatively low-risk regulated nature of its business, Terasen is able to maintain negative working capital balances. Terasen maintains adequate committed credit facilities to meet its working capital requirements. On an annual basis, Terasen generates sufficient cash flow to meet its working capital requirements.

Cash flow

It is expected that operating expenses and interest costs will generally be paid out of operating cash flows, with varying levels of residual cash flow available for capital expenditures and/or for dividend payments. Cash required to complete capital expenditure programs is also expected to be financed from a combination of borrowings under credit facilities, equity injections from Terasen and long-term debt issues.

The Company's ability to service its debt obligations and pay dividends on its common shares is dependent on the financial results of the Company and the related cash payments from these subsidiaries. Cash required to support capital expenditure programs is expected to be derived with borrowings from Fortis. Depending on the timing of cash payments from the subsidiaries, borrowings under the Company's credit facility or from Fortis may be required from time to time to support the servicing of debt and payment of dividends.

The Company does not expect any significant decrease in operating cash flows in 2009, in light of the expected continued downturn in the global economy and, therefore, does not anticipate any difficulty in servicing its debt obligations and paying common dividends. Also, the Company does not anticipate any difficulty in sourcing the cash required to fund the 2009 capital expenditure programs.

Dividend restrictions

As part of its approval of the acquisition of Terasen by KMI, as well as the subsequent sale from KMI to Fortis Inc, the BCUC imposed a number of conditions intended to ring-fence Terasen Gas and TGVI from Terasen. These restrictions included a prohibition on the payment of dividends unless Terasen Gas or TGVI has in place at least as much common equity as that deemed by the BCUC for rate-making purposes. As a result of this and the decision issued by the BCUC on March 2, 2006, Terasen Gas and TGVI must maintain a percentage of common equity to total capital that is at least as much as that determined by the BCUC from time to time for rate-making purposes. In 2008 and 2007, none of these restrictions constrained the distribution of subsidiary earnings not otherwise needed for reinvestment.

Credit ratings

Securities issued by Terasen and Terasen Gas are rated by DBRS Inc. (DBRS) and Moody's Investors Service Inc. (Moody's). The ratings assigned to securities issued by the Terasen group of companies are reviewed by these agencies on an ongoing basis.

The table below summarizes the ratings assigned to the Company's various securities. The DBRS rating for Terasen and Terasen Gas is as of May 20, 2008. The Moody's rating for Terasen is as of July 17, 2008 and for Terasen Gas is as of May 28, 2008.

CREDIT RATINGS

	DBRS	Moody's
Terasen Inc.		
Unsecured long-term debt:	BBB (High)	Baa2
Capital securities	BBBy	Baa3
Terasen Gas Inc.:		
Commercial paper	R-1 (Low)	-
Secured long-term debt	A	A2
Unsecured long-term debt	A	A3
Terasen Gas (Vancouver Island) Inc.:		
Unsecured long-term debt	BBB (High)	A3

During the year, Terasen discontinued its commercial paper rating with DBRS.

In 2004, after reassessing its relationship with Standard & Poor's Ratings Services, a division of the McGraw-Hill Companies (Canada) Corporation (S&P), Terasen discontinued the engagement of S&P to provide credit ratings on the debt of Terasen and Terasen Gas. Terasen believes the credit ratings issued by Moody's and DBRS will be sufficient to service the requirements of creditors and maintain the Company's access to capital. S&P continues to provide an unsolicited rating on Terasen's outstanding debt based on publicly available information. As of December 17, 2008, Terasen's unsecured long-term debt was rated BBB+ and Terasen Gas was rated A by S&P. There is a provision in Terasen's $100 million credit facility that a downgrade of Terasen's unsecured long-term debt rating below BBB (low) or Baa3 by DBRS or Moody's, respectively, would shorten the remaining term of Terasen's credit facility to ten months.

In addition, a downgrade of Terasen Gas below investment grade by any of the major credit rating agencies could trigger margin calls and other cash requirements under Terasen Gas' gas purchase and commodity derivative contracts.

Projected capital expenditures

Terasen has estimated total 2009 consolidated capital expenditures before contributions in aid of construction of $307.7 million. Major capital expenditures in 2009 include construction of the Mt. Hayes Natural Gas Storage Project ($73.7 million), the Gateway Infrastructure Project ($15.5 million), the Fraser River South Bank South Arm (SBSA) Rehabilitation Project ($25.4 million), the review of the potential replacement of the Customer Information System (CIS) ($13.9 million) and the Squamish to Whistler Pipeline Project ($16.3 million).

Mt. Hayes Natural Gas Storage Project

On April 1, 2008, the BCUC provided final approval to construct and operate a natural gas storage facility at Mt. Hayes on Vancouver Island. Once the approval was received, TGVI entered into an Engineering, Procurement and Construction (EPC) contract with a third party. In addition, TGVI entered into a foreign exchange futures contract to mitigate the foreign exchange risk associated with the US dollar portion of the EPC contract. Construction of the facility is now underway and is expected to be fully commissioned by late 2011. Overall, the project is projected to cost approximately $200.0 million to complete.

Gateway Infrastructure Project

As the result of the Provincial government's Gateway initiative, a regional infrastructure program to improve the movement of people, goods and transit throughout Greater Vancouver, Terasen Gas will be required to relocate some of its pipeline system. Total anticipated spending for the project expected to be fully recoverable is approximately $30.0 million with $15.5 million estimated for 2009.

Fraser River SBSA Rehabilitation Project

Terasen Gas filed a CPCN application in the fourth quarter of 2008 requesting approval to perform extensive rehabilitation of the current 20-inch and 24-inch underwater transmission pipeline crossings of the south arm of the Fraser River serving Vancouver and Richmond. Terasen Gas expects to receive approval for this project in early 2009 with completion anticipated to be in 2010.

Customer Information System Project

The Company is currently conducting a review of the existing customer care services arrangements with its outsourced provider to ensure the needs of customers will be met in the future. Later in 2009, the Company expects to file a CPCN application requesting approval and funding for the development of a replacement CIS system with spending in 2009 estimated to be $13.9 million.

Whistler Pipeline Project

TGVI's construction of the 50-kilometre pipeline lateral from Squamish to Whistler continues and, as at the end of December 2008, approximately 49 kilometres of the pipeline had been constructed. Originally scheduled to be completed by summer 2008, the pipeline lateral is now expected to be completed in April 2009. Upon completion of the pipeline, the Company will convert the Resort Municipality of Whistler from propane to natural gas during the spring and summer of 2009. TGW expects that the overall cost of the conversion to be up to $4 million above the costs currently approved for recovery by the BCUC due to a higher number of appliances to convert, higher labour rates and longer duration. The Company is assessing the impact of this cost overrun, as well as mitigating options with respect to managing the expected conversion cost increase.

The Company expects to finance capital expenditures in 2009 with a combination of proceeds from shareholder advances, short and long-term borrowings and internally generated funds.

Off-balance sheet arrangements

There are no material off-balance sheet arrangements.

Transactions with related parties

The Company's current parent company Fortis Inc. provided corporate management services totalling approximately $4.3 million (2007 - $5.0 million) provided by Fortis Inc. and former parent company, Kinder Morgan Inc. for the year ended December 31, 2008.

The Company was charged interest of approximately $11.6 million (2007 - $3.7 million) during the year ended December 31, 2008 by Fortis Inc. on the borrowings from the parent company including borrowings for the purchase of the FortisWest shares. The amount due to parent company is unsecured and due on demand and accrues interest at a bankers acceptance rate plus twenty five basis points.

On May 1, 2008, the Company borrowed $150.0 million from its parent company, Fortis Inc. The proceeds were used to purchase 6,000,000 Series C Preferred Shares (Shares) of FortisWest, a subsidiary of Fortis Inc. The Shares entitle the Company to a fixed preferential cumulative cash dividend at a rate of 6.75 per cent annually with dividends paid quarterly. The interest is also paid quarterly and the advance is due on demand and secured by a pledge of the Shares. For the period from May 1, 2008 to December 31, 2008 the Company paid interest of $6.5 million to Fortis Inc. on the demand loan and the Company received dividends from FortisWest of $6.7 million on the Shares.

The Company's parent, Fortis Inc., grants stock options to certain employees of the Company under its stock option plans. For the year ended December 31, 2008, the Company was charged, and recorded an expense of $0.3 million (2007 - $0.1 million) for the fair value of the stock compensation granted by Fortis Inc.

Related party transactions are recorded at the exchange amount.

Changes in accounting policies

Effective January 1, 2008, the Company adopted the following new accounting standards issued by the Canadian Institute of Chartered Accountants (CICA).

a) Section 3862, *Financial Instruments—Disclosures*, and Section 3863, *Financial Instruments—Presentation*, requires disclosures of both qualitative and quantitative information that enables users of financial statements to evaluate the nature and extent of risks from financial instruments to which the Company is exposed.
b) Section 1535, *Capital Disclosures*, requires the Company to disclose additional information about its capital and the manner in which it is managed. This additional disclosure includes quantitative and qualitative information regarding the Company's objectives, policies and processes for managing capital.
c) Section 3031, *Inventories*, requires inventories to be measured at the lower of cost or net realizable value, disallows the use of a last-in first-out inventory costing methodology, and requires that, when circumstances that previously caused inventories to be written down below cost no longer exist, the amount of the write-down is to be reversed. This standard is to be applied retrospectively. As at January 1, 2008, supplies and other inventories of $8.2 million ($7.6 million as at January 1, 2007) were reclassified to property, plant and equipment

from inventory on the balance sheet as they are held for the development, construction, maintenance and repair of other property, plant and equipment. During the year ended December 31, 2008, gas in storage inventories of $1,267.8 million (2007 - $1,128.6 million) were expensed and reported in cost of natural gas on the consolidated statement of earnings and comprehensive earnings.

Future accounting pronouncements

International Financial Reporting Standards (IFRS): In February 2008, the Accounting Standards Board (AcSB) confirmed that the use of IFRS will be required in 2011 for publicly accountable enterprises in Canada. In April 2008, the AcSB issued an IFRS Omnibus Exposure Draft proposing that publicly accountable enterprises be required to apply IFRS, in full and without modification, on January 1, 2011.

On June 27, 2008, the Canadian Securities Administrators (CSA) issued Staff Notice 52-321, Early Adoption of IFRS, which indicated that the CSA would be prepared to grant an exemption to allow Canadian financial statement issuers to adopt IFRS early on a case-by-case basis, provided that they could demonstrate that they met certain conditions. Terasen is not planning to adopt IFRS early.

The adoption date of January 1, 2011 will require the restatement, for comparative purposes, of amounts reported by the Company for its year ended December 31, 2010, and of the opening balance sheet as at January 1, 2010. The AcSB proposes that CICA Handbook Section - *Accounting Changes*, paragraph 1506.30, which would require an entity to disclose information relating to a new primary source of GAAP that has been issued but is not yet effective and that the entity has not applied, not be applied with respect to the IFRS Omnibus Exposure Draft.

Terasen is continuing to assess the financial reporting impacts of the adoption of IFRS and, at this time, the impact on future financial position and results of operations is not reasonably determinable or estimable. Terasen does anticipate a significant increase in disclosure resulting from the adoption of IFRS and is continuing to assess the level of disclosure required, as well as systems changes that may be necessary to gather and process the required information.

Terasen commenced its IFRS conversion project in 2007 and has established a formal project governance structure that includes the audit committees, senior management and a project team. Overall project governance, management and support is coordinated by Fortis. Regular reporting occurs to the Audit Committee of the Board of Directors. An external expert advisor has been engaged to assist in the IFRS conversion project.

The Terasen IFRS conversion project consists of three phases: Scoping and Diagnostics, Analysis and Development, and Implementation and Review.

Phase One: Scoping and Diagnostics, which involved project planning and staffing and identification of differences between current Canadian GAAP and IFRS, has been completed. The resulting identified areas of accounting difference of highest potential impact to the Company, based on existing IFRS, are rate-regulated accounting, property, plant and equipment, provisions and contingent liabilities, employee benefits, impairment of assets, income taxes, and initial adoption of IFRS under the provisions of IFRS 1 *First-Time Adoption of IFRS*.

Phase Two: Analysis and Development is nearing completion, and involves detailed diagnostics and evaluation of the financial impacts of various options and alternative methodologies provided for under IFRS; identification and design of operational and financial business processes; initial staff and audit committee training; analysis of IFRS 1 optional exemptions and mandatory exceptions to the general requirement for full retrospective application upon transition to IFRS; summarization of 2011 IFRS disclosure requirements; and development of required solutions to address identified issues.

It is anticipated that the adoption of IFRS will have an impact on information systems requirements. The Company is assessing the need for system upgrades or modifications to ensure an efficient conversion to IFRS. As part of Phase Two, information systems plans are being prepared for implementation in Phase Three. The extent of the impact on the Company's information systems is not reasonably determinable at this time.

Phase Three: Implementation and Review, expected to commence mid-year 2009, will involve the execution of changes to information systems and business processes; completion of formal authorization processes to approve recommended accounting policy changes; and further training programs across the Company's finance and other affected areas, as necessary. It will culminate in the collection of financial information necessary to compile IFRS-compliant financial statements and reconciliations; embedding of IFRS in business processes; and, audit committee approval of IFRS compliant financial statements.

Terasen will continue to review all proposed and continuing projects of the IASB, particularly the project on rate-regulated activities that was recently added to the IASB's technical agenda, and proposed amendments to IFRS 1 for entities with operations subject to rate regulation, and will participate in any related processes as appropriate.

Rate-regulated operations: In March 2007, the AcSB issued an Exposure Draft on rate-regulated operations that proposed: (i) the temporary exemption in Section 1100, *Generally Accepted Accounting Principles*, of the CICA Handbook providing relief to entities subject to rate regulation from the requirement to apply the Section to the recognition and measurement of assets and liabilities arising from rate regulation be removed; (ii) the explicit guidance for rate-regulated operations provided in Section 1600, *Consolidated Financial Statements*, Section 3061, *Property, Plant and Equipment*, Section 3465, *Income Taxes*, and Section 3475, *Disposal of Long-Lived Assets and Discontinued Operations*, be removed; and (iii) Accounting Guideline 19, *Disclosures by Entities Subject to Rate Regulation*, be retained as is.

The AcSB has also observed that relying on US Statement of Financial Accounting Standards No. 71, *Accounting for the Effects of Certain Types of Regulation* (FAS 71), as another source of Canadian GAAP in the absence of CICA Handbook guidance addressing the specific circumstances of entities subject to rate regulation, is consistent with Section 1100 when the qualifying criteria of FAS 71 are met.

In August 2007, the AcSB issued a Decision Summary on the Exposure Draft that supported the removal of the temporary exemption in Section 1100, *Generally Accepted Accounting Principles*, and the amendment to Section 3465, *Income Taxes*, to recognize future income tax liabilities and assets, as well as an offsetting regulatory asset or liabilities for entities subject to rate regulation. Both changes will apply prospectively for fiscal years beginning on or after January 1, 2009. It was also decided that the current guidance pertaining to property, plant and equipment, disposal of long-lived assets and discontinued operations, and consolidated financial statements be maintained and that the existing AcG-19 will not be withdrawn from the Handbook but that the guidance will be updated as a result of the other changes. The AcSB also decided that the final Background Information and Basis for Conclusions associated with its rate regulation project would not express any views of the AcSB regarding the status of US Statement of Financial Accounting Standards No. 71, *Accounting for the Effects of Certain Types of Regulation*, as an "other source of GAAP" within the Canadian GAAP hierarchy.

Effective January 1, 2009, the impact on the Company of the amendment to Section 3465, *Income Taxes*, will be the recognition of future income tax assets and liabilities and related regulatory liabilities and assets for the amount of future income taxes expected to be refunded to or recovered from customers in future gas rates. Currently, the Company uses the taxes payable method of accounting for income taxes on regulated earnings. The estimated effect on the Company's consolidated financial statements, if it had adopted amended Section 3465, *Income Taxes*, as at December 31, 2008, would have been an increase in future tax liabilities of $321.3 million, including those associated with income taxes that will become payable on future revenues as they are collected from customers when the tax timing differences reverse. There would also be a corresponding increase in regulatory assets. Terasen is continuing to assess and monitor any additional implications on its financial reporting related to accounting for rate-regulated operations.

Effective January 1, 2009, with the removal of the temporary exemption in Section 1100, the Company must now apply Section 1100 to the recognition of assets and liabilities arising from rate regulation. Certain assets and liabilities arising from rate regulation continue to have specific guidance under a primary source of Canadian GAAP that applies only to the particular circumstances described therein, including those arising under Section 1600, 3061, 3465, and 3475. All assets and liabilities arising from rate regulation do not have specific guidance under a primary source of Canadian GAAP. Therefore, Section 1100 directs the Company to adopt accounting policies that are developed through the exercise of professional judgment and the application of concepts described in Section 1000, Financial Statement Concepts. These assets and liabilities qualify for recognition as assets and liabilities under Section 1000. Therefore, there would be no effect on the Company's consolidated financial statements if it had adopted the removal of the temporary exemption in Section 1100, for the year ended December 31, 2008. Terasen is continuing to assess and monitor any additional implications on its financial reporting related to accounting for rate-regulated operations.

Effective January 1, 2009, the Company will be adopting the new CICA Handbook Section 3064, *Goodwill and Intangible Assets,* which converges Canadian GAAP for goodwill and intangible assets with IFRS. The new standard provides for more comprehensive guidance on intangible assets, in particular for internally developed intangible assets. The Company is still assessing the financial reporting impact of adopting this standard.

Financial and other instruments

FAIR VALUE ESTIMATES

	December 31, 2008		December 31, 2007	
In millions of dollars	**Carrying value**	**Estimated fair value**	Carrying value	Estimated fair value
Held in trading				
Cash and short-term investments[1]	**$ 33.0**	**$ 33.0**	$ 17.8	$ 17.8
Loans and receivables				
Accounts receivable[1,2]	**392.9**	**392.9**	348.4	348.4
Long-term receivable[1,2]	**9.1**	**9.1**	9.2	9.2
Other financial liabilities				
Short-term notes[2]	**353.5**	**353.5**	305.0	305.0
Accounts payable and accrued liabilities[2]	**455.0**	**455.0**	385.2	385.2
Due to parent company[2]	**470.3**	**470.3**	135.3	135.3
Long-term debt, including current portion[4,5,6]	**1,920.1**	**1,959.2**	2,144.3	2,356.4

1 Due to the nature and/or short-term maturity of these financial instruments, carrying value approximates fair value.

2 Carrying value approximates amortized cost.

3 The fair market value is not readily available.

4 Carrying value is measured at amortized cost using the effective interest rate method.

5 Carrying value at December 31, 2008 is net of unamortized deferred financing costs of $15.6 million (2007 - $12.3 million). On January 1, 2007, deferred financing costs were reclassified from other assets in accordance with the transitional provisions of CICA Section 3855. The majority of the Company's long-term debt relates to regulated operations which enables the Company to recover the existing financing charges through rates or tolls.

6 Fair value is calculated by discounting the future cash flow of each debt issue at the estimated yield to maturity for the same or similar issues at December 31, 2008, or by using available quoted market prices.

Fair value estimates are made at a specific point in time, based on relevant market information and information about the financial instrument. These estimates cannot be determined with precision as they are subjective in nature and involve uncertainties and matters of judgment.

Derivative instruments

The Company hedges its exposure to fluctuations in natural gas prices and foreign exchange rates through the use of derivative instruments. The table below indicates the valuation of the derivative instruments as at December 31, 2008.

ASSET (LIABILITY)

			December 31, 2008		December 31, 2007	
In millions of dollars	Number of swaps and options	Term to maturity (years)	**Carrying value**	**Fair value**	Carrying value	Fair value
Foreign exchange forward contract:						
TGVI	1	3	**$ 7.4**	**$ 7.4**	$ -	$ -
Terasen Gas and TGVI[1]:						
Natural gas commodity swaps	228	Up to 3	**$ (84.2)**	**$ (84.2)**	$ (79.4)	(79.4)
Gas purchase contract premiums	74	Less than 3	**(7.6)**	**(7.6)**	5.2	5.2

1 The natural gas derivatives fair value reflects only the value of the natural gas derivatives and not the offsetting change in value of the underlying future purchases of natural gas. These fair values reflect the estimated amounts the Company would receive or pay to terminate the contracts at the stated dates. The natural gas derivatives fair values have been determined using published market prices for natural gas commodities. The gains and losses associated with natural gas derivatives are recorded in deferral accounts, subject to regulatory approval, and passed through to customers in future rates.

Outstanding share data

February 4, 2009	
Common shares issued and outstanding	17,037,853
8.0% capital securities issued and outstanding	$125,000,000

Terasen is a direct wholly-owned subsidiary of Fortis Inc. At December 31, 2008, all of the common shares of the Company are owned by Fortis Inc.

The 8.0 per cent capital securities are exchangeable on or after April 19, 2010 for common shares of the Company at 90 per cent of the market price, subject to the right of the Company to redeem the securities for cash. A maximum of 125,000,000 common shares could be issued if this right was exercised.

Management's report

Financial reporting

Management is responsible for the accompanying consolidated financial statements. These financial statements have been prepared in conformity with Canadian generally accepted accounting principles and, where appropriate, include amounts that are based on management's best estimates and judgments.

The Board of Directors, through its Audit Committee, oversees Management's responsibilities for financial reporting and internal control. The Audit Committee meets with the internal auditors, the independent auditors and management to discuss auditing and financial matters and to review the consolidated financial statements and the independent auditors' report. The Audit Committee reports its findings to the Board for consideration in approving the consolidated financial statements for issuance to the shareholder.

Internal control over financial reporting

Management is also responsible for establishing and maintaining adequate internal control over the Company's financial reporting. The internal control system was designed to provide reasonable assurance to the Company's Management regarding the preparation and presentation of the consolidated financial statements.

Internal control systems, no matter how well designed, have inherent limitations. Therefore, even those systems determined to be effective can provide only reasonable assurance with respect to financial statement preparation and presentation. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

The Company's independent auditors, Ernst and Young LLP, conducted their audits in accordance with Canadian generally accepted auditing standards. Their report outlines the scope of their audits and gives their opinion on the consolidated financial statements.

Auditors' report

To the Shareholder of

Terasen Inc.

We have audited the consolidated balance sheets of Terasen Inc. as at December 31, 2008 and 2007 and the consolidated statements of earnings (loss) and comprehensive earnings (loss), deficit and cash flows for the years then ended. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these consolidated financial statements present fairly, in all material respects, the financial position of the Company as at December 31, 2008 and 2007 and the results of its operations and its cash flows for the years then ended in accordance with Canadian generally accepted accounting principles.

Notes to consolidated statements of financial statements

(Tabular amounts in millions of dollars, except where stated otherwise)
Years ended December 31, 2008 and 2007

Terasen Inc. (Terasen or the Company) provides energy transportation and utility asset management services. Terasen operated in two primary business segments which were separately managed to assess operational performance.

a) Natural gas transmission and distribution operations involve the transmission and distribution of natural gas and propane for residential, commercial, institutional, and industrial customers in British Columbia. The operations are conducted through Terasen Gas Inc. (Terasen Gas), serving the Lower Mainland and Interior of British Columbia; Terasen Gas (Vancouver Island) Inc. (TGVI), serving Vancouver Island and the Sunshine Coast; and Terasen Gas (Whistler) Inc. (TGW).

b) Petroleum transportation operations were carried out through Terasen Pipelines (Trans Mountain) Inc. (Trans Mountain), which owned and operated a common carrier pipeline system for crude and refined petroleum products transported from Edmonton, Alberta to Vancouver, British Columbia and Washington State; Terasen Pipelines (Corridor) Inc. (Corridor), which owned a pipeline in northern Alberta transporting diluted bitumen; and the one-third owned entities Express Pipeline LP and Express US Holdings LP (the Express System). The Express System transported crude oil from Hardisty, Alberta, through the Rocky Mountain region of the United States and on to Wood River, Illinois. These operations were sold in 2007 and are classified as discontinued operations at December 31, 2007 as described in Note 4.

c) Other activities include international consulting activities, the Company's 30 per cent interest in CustomerWorks LP (CWLP), Terasen Energy Services (TES) and corporate financing costs and administration charges.

On February 26, 2007, Knight Inc. (formerly known as Kinder Morgan, Inc.) (KMI), the Company's former parent announced that it had entered into a definitive agreement with Fortis Inc. to sell Terasen and its principal natural gas transmission and distribution assets, including its subsidiaries Terasen Gas and Terasen Gas (Vancouver Island) Inc. as well as other activities including Terasen Energy Services. The sale did not include the petroleum transportation subsidiaries nor investments under the Kinder Morgan Canada name. The purchase price of approximately $3.7 billion included the assumption of approximately $2.4 billion of debt. The transaction closed on May 17, 2007. The Company has classified its petroleum transportation operations income and cash flow as discontinued. The Company converted any accrued interest and inter-company payables into equity and recorded this as contributed surplus.

1. Amalgamation

On February 16, 2007, Terasen was amalgamated with Terasen Pipelines (Trans Mountain) Inc. and 0731297 BC Ltd. under the name "Terasen Inc." which is the Company represented in these financial statements. 0731297 BC Ltd. was the direct parent of Terasen Inc. prior to the amalgamation and acquired the shares of Terasen as part of the KMI acquisition of Terasen on November 30, 2005. It is the amalgamated corporation that is represented in the Terasen consolidated financial statements as at December 31, 2008 and for the years ended December 31, 2008 and 2007. Post-amalgamation Terasen continued to own all the assets it owned immediately prior to the amalgamation including the gas distribution business operated by Terasen Gas.

As a result of this amalgamation, the Terasen consolidated financial statements as at December 31, 2006 and for the years ended December 31, 2006 and 2005 do not reflect the same entity as, and are not directly comparable with the consolidated financial statements shown in this document as at December 31, 2007 and for the year ended December 31, 2007 that relate to the amalgamated corporation.

PURCHASE COST

	(millions)
Shares of KMI issued	$ 1,338.7
Debt issued	2,491.3
Transaction costs	18.5
	$ 3,848.5

In accordance with the purchase method of accounting, the purchase cost was allocated to the underlying assets acquired and liabilities assumed based primarily upon their estimated fair values at the date of acquisition. The estimated fair values were based on a combination of independent appraisals and internal estimates. The excess of purchase cost over the net identifiable tangible and intangible assets acquired represents goodwill. The goodwill is not deductible for tax purposes. The purchase cost and purchase price allocation are summarized in the following table:

PURCHASE PRICE ALLOCATION

	(millions)
Current assets	$ 788.5
Property, plant and equipment	4,244.1
Investment in Express	455.5
Rate stabilization—long-term	51.5
Other assets	93.2
Goodwill	2,271.6
Current liabilities	(1,581.7)
Long-term debt and debentures	(2,060.6)
Long-term liabilities	(163.1)
Future income taxes	(250.5)
	$ 3,848.5

During the fourth quarter of 2008, Terasen Gas recognized the benefit of certain tax loss carry forwards which were restricted when KMI acquired the Company in 2005. The benefit of these tax loss carry forwards were recognized within Terasen Gas. Goodwill has been adjusted by $6.0 million for the benefit of these loss carry forwards.

2. Significant accounting policies

The preparation of these consolidated financial statements in conformity with Canadian generally accepted accounting principles (GAAP) requires management to make estimates and assumptions that affect the reported amounts of assets, liabilities, revenues and expenses in the financial statements, as well as the disclosure of contingent assets and liabilities. Actual results could differ from those estimates.

In the opinion of management, these consolidated financial statements have been properly prepared within reasonable limits of materiality and reflect the following summary of significant accounting policies.

Basis of presentation

The consolidated financial statements include the accounts of the Company, its subsidiaries, and its proportionate share of the accounts of jointly-controlled entities. Investments in entities that are not subsidiaries or joint ventures, but over which the Company exercises significant influence, are accounted for using the equity method.

Certain of the prior year comparative figures have been reclassified to conform with the current year's presentation.

Changes in accounting policies

Effective January 1, 2008, the Company adopted the following new accounting standards issued by the Canadian Institute of Chartered Accountants (CICA).

a) Section 3862, *Financial Instruments—Disclosures*, and Section 3863, *Financial Instruments—Presentation*, require disclosures of both qualitative and quantitative information that enables users of financial statements to evaluate the nature and extent of risks from financial instruments to which the Company is exposed. The new disclosures are included in Note 15.

b) Section 1535, *Capital Disclosures*, requires the Company to disclose additional information about its capital and the manner in which it is managed. This additional disclosure includes quantitative and qualitative information regarding the Company's objectives, policies and processes for managing capital. The new disclosures are in Note 15.

c) Section 3031, *Inventories*, requires inventories to be measured at the lower of cost or net realizable value, disallows the use of a last-in first-out inventory costing methodology, and requires that, when circumstances which previously caused inventories to be written down below cost no longer exist, the amount of the write-down is to be reversed. This standard is to be applied retrospectively. As at January 1, 2008, supplies and other inventories of $8.2 million ($7.6 million as at January 1, 2007) were reclassified to property, plant and equipment from inventory on the balance sheet as they are held for the development, construction, maintenance and repair of other property, plant and equipment. During the year ended December 31, 2008, gas in storage inventories of $1,267.8 million (2007 - $1,128.6 million) were expensed and reported in cost of natural gas on the consolidated statement of earnings (loss) and comprehensive earnings (loss).

Financial instruments

The Company utilizes derivatives and other financial instruments to manage its exposure to changes in foreign currency exchange, interest rates and energy commodity prices.

a) Section 3855, *Financial Instruments—Recognition and Measurement*, prescribes the criteria for recognition and presentation of financial instruments on the balance sheet and the measurement of financial instruments according to prescribed classifications. This section also addresses how financial instruments are measured subsequent to initial recognition and how the gains and losses are recognized.

   The Company is required to designate its financial instruments into one of the following five categories: held for trading; available for sale; held to maturity; loans and receivables; and other financial liabilities. All financial instruments are to be initially measured at fair value.

Financial instruments classified as held for trading or available for sale are subsequently measured at fair value with any change in fair value recorded in net earnings and other comprehensive income, respectively. All other financial instruments are subsequently measured at amortized cost.

All derivative financial instruments are recorded on the balance sheet at fair value. Mark-to-market adjustments on these instruments are included in net earnings, unless the instruments are designated as part of a cash flow hedge relationship, and then the effective portion of changes in fair value are recorded in other comprehensive income. Any change in fair value relating to the ineffective portion is recorded immediately in net earnings. For the rate regulated operations, any difference between the amount recognized upon a change in the fair value of a derivative financial instrument, whether or not in a qualifying hedging relationship, and the amount recovered from customers in current rates, is subject to regulatory deferral treatment to be recovered from or refunded to customers in future rates.

In accordance with the standard's transitional provisions, the Company recognizes as separate assets and liabilities only embedded derivatives acquired or substantively modified on or after January 1, 2003.

The Company has designated its financial instruments as follows:

- Cash and short-term investments are classified as "Held for Trading" and are recorded at fair value. Due to the relatively short period to maturity of these financial instruments the carrying values approximate their fair values.
- Accounts receivable and long-term receivables are classified as "Loans and Receivables." These financial assets are recorded at values that approximate their amortized cost using the effective interest method.
- Short-term notes, accounts payable and accrued liabilities, due to parent company, long-term debt and related issue costs are classified as "Other Financial Liabilities." These financial liabilities are recorded at values that approximate their amortized cost using the effective interest method.

Deferred financing costs will be taken into earnings using the effective interest method over the life of the related debt. Prior to January 1, 2007, deferred financing costs were amortized using the straight-line method of amortization. As allowed by the standard, a one-time adjustment of $1.7 million has been made to retained earnings to reflect the difference between the straight-line method and the effective interest method of amortization prior to January 1, 2007.

The Company recognizes transaction costs associated with financial assets and liabilities, that are classified as other than held for trading, as an adjustment to the cost of those financial assets and liabilities recorded on the balance sheet. These transaction costs are amortized into earnings using the effective interest rate method over the life of the related financial instrument.

b) Section 1530, *Comprehensive Income*, requires the presentation of a statement of comprehensive income and provides guidance for the reporting and display of other comprehensive income. Comprehensive income represents the change in equity of an enterprise during a period from transactions and other events arising from non-owner sources including gains and losses arising on translation of self-sustaining foreign operations, gains and losses from changes in fair value of available for sale financial assets and changes in fair value of the effective portion of cash flow hedging instruments. The Company has not recognized any adjustments through other comprehensive income for the years ended December 31, 2008 and 2007.

c) Section 3865, *Hedges,* specifies the criteria under which hedge accounting may be applied, how hedge accounting should be performed under permitted hedging strategies and the required disclosures. The Company's cash flow hedges are for the purchase of natural gas. Given that the Company is subject to rate regulation, the ineffective portion of changes in the fair value of these hedges is deferred as an asset or liability until it is settled, offset by an asset or liability on behalf of customers. Upon settlement, the recognized gain or loss is recorded as a regulatory asset or liability and is collected from or refunded to ratepayers in subsequent periods. The Company recognized an additional liability of $1.1 million to counterparties for unrealized losses related to gas purchase hedges at January 1, 2007 and an amount recoverable from ratepayers of $1.1 million. Amounts recoverable from ratepayers are recorded in rate stabilization accounts.

The Company utilizes cash flow hedges to hedge the variability in interest payments on the underlying debt instruments. Cash flow hedges for rate-regulated businesses are recorded in Other assets with the offset to Other long-term liabilities and deferred credits while the non-regulated cash flow hedges are recorded in Other assets and Long-term debt. The adoption of this new standard on January 1, 2007 increased Other assets by $0.9 million, increased Long-term debt by $0.1 million and increased Other long-term liabilities and deferred credits by $0.8 million.

Under the Canadian standard prior to January 1, 2007, certain equity investees of the Company had designated future US dollar revenues as a hedge of the foreign currency risk associated with US dollar debt. The investees defer the exchange gains and losses on the US dollar long-term debt and recognize an adjustment to the related revenues at the time the revenue is earned. These arrangements do not qualify for hedge accounting under the new Canadian standard. Accordingly, the Company recorded a one-time adjustment of $38.6 million to the value of its investment offset by an increase of $4.8 million of future income taxes for a net adjustment to retained earnings of $33.8 million.

Foreign currency translation

The Company's former US-based petroleum transportation operations are integrated and were translated into Canadian dollars using the temporal method. Under this method, monetary assets and liabilities denominated in foreign currencies are translated at exchange rates in effect at the balance sheet date. Non-monetary assets and liabilities denominated in foreign currencies are translated at exchange rates in effect on the dates the assets were acquired or liabilities assumed. Revenues and expenses are translated at the average rates of exchange prevailing during the month the transactions occurred. Under this method, exchange gains and losses on translation are reflected in income when incurred.

Regulation

The natural gas transmission and distribution companies are subject to the regulation of the British Columbia Utilities Commission (BCUC), an independent regulatory authority. Both Terasen Gas and TGVI have multi-year agreements that expire at the end of 2009. These multi-year agreements are cost-of-service based agreements with allowed rates of return on approved rate base set by the BCUC. For 2008, the allowed ROE for Terasen Gas was 8.62 per cent (2007 - 8.37 per cent) and for TGVI was 9.32 per cent (2007 - 9.07 per cent). The allowed rates of return are based on a notional debt-equity ratio of 64.99 per cent debt and 35.01 per cent equity for Terasen Gas and 60 per cent debt and 40 per cent equity for TGVI. The entities have annual review processes for rate approvals, and the allowed rates of return are reset annually unless directed differently by the BCUC. For 2009, the allowed ROE has been set at 8.47 per cent for Terasen Gas and 9.17 per cent for TGVI.

The Trans Mountain and Express System operations were governed by contractual arrangements with shippers and were regulated in Canada by the National Energy Board and, in the United States, tariff matters are regulated by the Federal Energy Regulatory Commission. Both of these regulatory authorities are independent bodies.

Corridor's operations were governed by contractual arrangements with shippers and were subject to regulation by the Alberta Energy and Utilities Board (AEUB), an independent regulatory authority. Corridor's rates were cost-of-service based and determined using formulas embedded in agreements with shippers.

Over 95 per cent of the Company's operations are subject to rate regulation by independent regulatory agencies. These regulatory authorities exercise statutory authority over such matters as rates of return, construction and operation of facilities, accounting practices, rates and tolls, and contractual agreements with customers. Rates are bundled to include transmission and distribution services, where applicable.

In order to recognize the economic effects of regulation, the timing of recognition of certain revenues and expenses in these operations may differ from that otherwise expected under GAAP for non-regulated businesses.

Regulatory assets represent amounts that are expected to be recovered from customers in future periods through rates. Regulatory liabilities represent amounts that are expected to be refunded to customers in future periods through rates. Long-term regulatory assets are recorded in other assets whereas current regulatory assets are rate stabilization accounts which are recorded as current portion of rate stabilization accounts. Regulatory liabilities are recorded in other long-term liabilities and deferred credits.

The impacts of rate regulation on the Company's operations for the twelve months ending December 31, 2008 and 2007 and as at December 31, 2008 and 2007 are described in these Significant Accounting Policies, and in Note 6 "Property, plant and equipment," Note 7 "Rate stabilization accounts," Note 8 "Other assets," Note 10 "Other long-term liabilities and deferred credits," Note 12 "Employee benefit plans," Note 13 "Financing costs," and Note 14 "Income taxes."

Inventories

Inventories of gas in storage are valued at weighted-average cost. The cost of gas in storage is recovered from customers in future rates.

Long-term investments

Investments in entities, when the Company exercises significant influence on their activities, are accounted for under the equity method and are presented in long-term investments in the consolidated balance sheets. Long-term investments in non-quoted equity instruments where the Company does not have significant influence are carried at cost and are presented in long-term investments in the consolidated balance sheets.

When the carrying value exceeds the fair value and the decline in fair value is other than temporary, long-term investments are written-down to their fair value.

Property, plant and equipment

Property, plant and equipment are recorded at cost less accumulated depreciation and unamortized contributions in aid of construction. Cost includes all direct expenditures for system expansions, betterments and replacements, an allocation of overhead costs and an allowance for funds used during construction. When allowed by the regulators, regulated operations capitalize an allowance for equity funds used during construction at approved rates.

Depreciation of regulated assets is recorded on a straight-line basis over their useful lives. Depreciation rates for regulated assets are approved by the respective regulators, and for non-regulated assets require the use of management estimates of the useful lives of assets. Depreciation of non-regulated equipment is recorded using the declining balance method.

The cost of regulated depreciable property retired, together with removal costs less salvage, is charged to accumulated depreciation, as is any gain or loss incurred on disposal.

Impairment of long-lived assets

Long-lived assets are reviewed for impairment whenever events or changes in circumstances indicate that the carrying amount of an asset may not be recoverable. Recoverability of assets is measured by a comparison of the carrying amount of an asset to estimated undiscounted future cash flows expected to be generated by the asset. If the carrying amount of an asset exceeds its estimated future cash flows, an impairment charge is recognized by the amount by which the carrying amount of the asset exceeds the fair value of the asset. There was no impairment of long-lived assets for the years ended December 31, 2008 and 2007.

Asset retirement obligations

The Company will recognize the fair value of a future asset retirement obligation as a liability in the period in which it incurs a legal obligation associated with the retirement of tangible long-lived assets that results from the acquisition, construction, development, and/or normal use of the assets. The Company will concurrently recognize a corresponding increase in the carrying amount of the related long-lived asset that is depreciated over the remaining life of the asset. The fair value of the asset retirement obligation is to be estimated using the expected cash flow approach that reflects a range of possible outcomes discounted at a credit-adjusted risk-free interest rate. Subsequent to the initial measurement, the asset retirement obligation will be adjusted at the end of each period to reflect the passage of time and changes in the estimated future cash flows underlying the obligation.

Changes in the obligation due to the passage of time are to be recognized in income as an operating expense using the interest method. Changes in the obligation due to changes in estimated cash flows are to be recognized as an adjustment of the carrying amount of the related long-lived asset that is depreciated over the remaining life of the asset.

As the fair value of future removal and site restoration costs for the Company's natural gas transmission and distribution and petroleum transportation systems are not currently determinable, the Company has not recognized an asset retirement obligation as at December 31, 2008 and 2007. For regulated operations there is a reasonable expectation that asset retirement costs would be recoverable through future rates or tolls.

Rate stabilization accounts

TGVI maintains a BCUC approved Revenue Deficiency Deferral Account (RDDA) to accumulate unrecovered costs of providing service to customers or to drawdown such costs where earnings exceed an allowed return as set by the BCUC. The RDDA has accumulated the allowed earnings in excess of achieved earnings prior to 2003 and is to be recovered through future rates.

Terasen Gas is authorized by the BCUC to maintain rate stabilization accounts that mitigate the effect on its earnings of unpredictable and uncontrollable factors, namely volume volatility caused principally by weather and natural gas cost volatility. The Revenue Stabilization Adjustment Mechanism (RSAM) accumulates the margin impact of variations in the actual versus forecast volume use for residential and commercial customers.

The Commodity Cost Reconciliation Account (CCRA) and the Midstream Cost Reconciliation Account (MCRA) accumulate differences between actual natural gas costs and forecast natural gas costs as recovered in rates. The two accounts segregate costs that are allocable to all sales customers (MCRA) and all residential customers and certain commercial and industrial customers for whom Terasen Gas acquires gas supply (CCRA). TGVI has a Gas Cost Variance Account (GCVA) that mitigates the effect on its earnings of natural gas cost volatility. The GCVA is recoverable in rates from customers in TGVI's service areas in future periods. All rate stabilization account balances for both TGVI and Terasen Gas are amortized and recovered through rates as approved by the BCUC.

Deferred charges

The Company defers certain costs that the regulatory authorities or contractual arrangements require or permit to be recovered through future rates or tolls. Deferred charges are amortized over various periods as approved by the regulator and depending on the nature of the costs.

Deferred charges not subject to regulation relate to projects that are expected to benefit future periods and will be capitalized on completion, expensed on project abandonment, or amortized over their useful lives.

Goodwill

Goodwill represents the excess, at the dates of acquisition, of the purchase price over the fair value of the net amounts assigned to individual assets acquired and liabilities assumed relating to business acquisitions. Goodwill is carried at initial cost less any write-down for impairment. The Company is required to perform an annual impairment test and any impairment provision is charged to earnings. To assess for impairment, the fair value of each of the Company's reporting units is determined and compared to the book value of the reporting unit. If the fair value of the reporting unit is less than the book value, then a second test is performed to determine the amount of the impairment. The amount of the impairment is determined by deducting the fair value of the reporting unit's assets and liabilities from the fair value of the reporting unit, to determine the implied fair value of goodwill, and then by comparing that amount to the book value of the reporting unit's goodwill. Any excess of the book value of the goodwill over the implied fair value of the goodwill is the impairment amount. In addition to the annual impairment test, the Company also performs an impairment test if any event occurs or if circumstances change that would indicate that the fair value of a reporting unit was below its carrying value. No goodwill impairment provision has been determined for the year ended December 31, 2008.

Revenue recognition

The Company recognizes revenues when products have been delivered or services have been performed.

The natural gas transmission and distribution utilities record revenues from natural gas sales on the basis of regular meter readings and estimates of customer usage since the last meter reading date to the end of the year and are adjusted for the RSAM and other BCUC approved orders.

For the petroleum transportation operations, revenues are recorded when products are delivered and adjusted according to terms prescribed by toll settlements with the shippers and approved by the respective regulator.

Post-employment benefit plans

The Company sponsors a number of employee benefit plans. These plans include both defined benefit and defined contribution pension plans, and various other post-retirement benefit plans.

The cost of pensions and other post-retirement benefits earned by employees is actuarially determined as the employee provides service. The Company uses the projected benefit method based on years of service and management's best estimates of expected returns on plan assets, salary escalation, retirement age of employees, mortality and expected future health-care costs. The discount rate used to value liabilities is based on AA Corporate bond yields. The Company accrues the cost of defined benefit pensions and post-employment benefits as the employee provides services, except when the regulator requires costs to be expensed as paid.

The expected return on plan assets is based on management's estimate of the long-term expected rate of return on plan assets and a market-related value of plan assets. The market-related value of assets as of December 31, 2008 is calculated as the average of the market value of invested assets at December 31, 2008 and two actuarially determined extrapolated market values of invested assets at December 31, 2008. The two extrapolated market values are calculated by using the market value of invested assets at December 31, 2006 rolled forward to December 31, 2008 using 2007 and 2008 net contributions and assumed investment returns, and the market value of invested assets at December 31, 2007 rolled forward to December 31, 2008 using 2008 net contributions and assumed investment returns. These three amounts are then averaged to determine the market-related value of plan assets used in calculating net benefit expense. Additionally, the Company compares the average market-related value to the underlying market value at the end of the period. If the difference between the average market-related value and the actual market value is greater or less than 20 per cent of the actual market value, then any difference is amortized over the expected average remaining service life of the employee group covered by the plan.

Adjustments, in excess of 10 per cent of the greater of the accrued benefit obligation and plan asset fair value, that result from plan amendments, changes in assumptions and experience gains and losses, are amortized over the expected average remaining service life of the employee group covered by the plan. Experience will often deviate from the actuarial assumptions resulting in actuarial gains and losses.

Defined contribution plan costs are expensed by the Company as contributions are payable.

Income taxes

The Company's natural gas transmission and distribution-regulated operations account for and recover income tax expense in rates as prescribed by their regulator. This includes accounting for income taxes by the taxes payable method and accounting for certain deferral and rate stabilization accounts on a net of realized tax basis. Therefore, future income taxes related to temporary differences are not recorded.

The taxes payable method is followed as there is a reasonable expectation that all future income taxes will be recovered in rates when they become payable.

The Company's non-regulated operations follow the asset and liability method of accounting for income taxes. Future income tax assets and liabilities are determined based on temporary differences between the tax bases of assets and liabilities and their carrying values for accounting purposes. Future income tax assets and liabilities are measured at the tax rate that is expected to apply when the temporary differences reverse.

Variable interest entities

The Company has performed a review of the entities with whom it conducts business and has concluded that there are no entities that are required to be consolidated or variable interests that are required to be disclosed under the requirements of the Guideline.

Future accounting pronouncements

a) *International Financial Reporting Standards* (IFRS): In February 2008, the Accounting Standards Board (AcSB) confirmed that the use of IFRS will be required in 2011 for publicly accountable enterprises in Canada. In April 2008, the AcSB issued an Omnibus Exposure Draft proposing that publicly accountable enterprises be required to apply IFRS, in full and without modification, on January 1, 2011.

The adoption date of January 1, 2011 will require the restatement, for comparative purposes, of amounts reported by the Company for its year ended December 31, 2010, and of the opening balance sheet as at January 1, 2010. The AcSB proposes that CICA Handbook Section - *Accounting Changes*, paragraph 1506.30, which would require an entity to disclose information relating to a new primary source of GAAP that has been issued but is not yet effective and that the entity has not applied, not be applied with respect to Exposure Draft.

Terasen, along with Fortis, is continuing to assess the financial reporting impacts of the adoption of IFRS and, at this time, the impact on future financial position and results of operations is not reasonably determinable or estimable. Terasen does anticipate a significant increase in disclosure resulting from the adoption of IFRS and is continuing to assess the level of disclosure required as well as systems changes that may be necessary to gather and process the information.

b) *Rate-regulated operations*: In March 2007, the AcSB issued an Exposure Draft on rate-regulated operations that proposed: (i) the temporary exemption in Section 1100, *Generally Accepted Accounting Principles*, of the CICA Handbook providing relief to entities subject to rate regulation from the requirement to apply the Section to the recognition and measurement of assets and liabilities arising from rate regulation be removed; (ii) the explicit guidance for rate-regulated operations provided in Section 1600, *Consolidated Financial Statements*, Section 3061, *Property, Plant and Equipment*, Section 3465, *Income Taxes*, and Section 3475, *Disposal of Long-Lived Assets and Discontinued Operations*, be removed; and (iii) Accounting Guideline 19, *Disclosures by Entities Subject to Rate Regulation*, be retained as is. The AcSB has also observed that relying on US Statement of Financial Accounting Standards No. 71, *Accounting for the Effects of Certain Types of Regulation* (FAS 71), as another source of Canadian GAAP in the absence of CICA Handbook guidance addressing the specific circumstances of entities subject to rate regulation, is consistent with Section 1100 when the qualifying criteria of FAS 71 are met.

In August 2007, the AcSB issued a Decision Summary on the Exposure Draft that supported the removal of the temporary exemption in Section 1100, *Generally Accepted Accounting Principles*, and the amendment to Section 3465, *Income Taxes*, to recognize future income tax liabilities and assets as well as an offsetting regulatory assets or liabilities for entities subject to rate regulation. Both changes will apply prospectively for fiscal years beginning on or after January 1, 2009. It was also decided that the current guidance pertaining to property, plant and equipment and disposal of long-lived assets and discontinued operations, consolidated financial statements be maintained and that the existing AcG-19 will not be withdrawn from the Handbook but that the guidance will be updated as a result of the other changes. The AcSB also decided that the final Background Information and Basis for Conclusions associated with its rate regulation project would not express any views of the AcSB regarding the status of US Statement of Financial Accounting Standards No. 71, *Accounting for the Effects of Certain Types of Regulation*, as an "other source of GAAP" within the Canadian GAAP hierarchy.

Effective January 1, 2009, the impact on the Company of the amendment to Section 3465, *Income Taxes*, will be the recognition of future income tax assets and liabilities and related regulatory liabilities and assets for the amount of future income taxes expected to be refunded to or recovered from customers in future gas rates. Currently, the Company uses the taxes payable method of accounting for income taxes on regulated earnings. The estimated effect on the Company's consolidated financial statements, if it had adopted amended Section 3465, *Income Taxes*, as at December 31, 2008, would have been an increase in future tax liabilities of $321.3 million, including those associated with income taxes that will become payable on future revenues as they are collected from customers when the tax timing differences reverse. There would also be a corresponding increase in regulatory assets. Terasen is continuing to assess and monitor any additional implications on its financial reporting related to accounting for rate regulated operations.

Effective January 1, 2009, with the removal of the temporary exemption in Section 1100, the Company must now apply Section 1100 to the recognition of assets and liabilities arising from rate regulation. Certain assets and liabilities arising from rate regulation continue to have specific guidance under a primary source of Canadian GAAP that applies only to the particular circumstances described therein, including those arising under Section 1600, 3061, 3465, and 3475. All assets and liabilities arising from rate regulation do not have specific guidance under a primary source of Canadian GAAP. Therefore, Section 1100 directs the Company to adopt accounting policies that are developed through the exercise of professional judgment and the application of concepts described in Section 1000, *Financial Statement Concepts*. These assets and liabilities qualify for recognition as assets and liabilities under Section 1000. Therefore, there would be no effect on the Company's consolidated financial statements if it had adopted the removal of the temporary exemption in Section 1100, for the year ended December 31, 2008. Terasen is continuing to assess and monitor any additional implications on its financial reporting related to accounting for rate-regulated operations.

c) Effective January 1, 2009, the Company will be adopting the new CICA Handbook Section 3064, *Goodwill and Intangible Assets,* which converges GAAP for goodwill and intangible assets with IFRS. The new standard provides for more comprehensive guidance on intangible assets, in particular for internally developed intangible assets. The Company is still assessing the financial reporting impact of adopting this standard.

Capital expenditures	168.2	6.4	174.6

The segmented disclosures in these consolidated financial statements report the petroleum transportation operations as discontinued operations. Terasen's 30 per cent share of CWLP is included in other activities.

4. Discontinued operations and dispositions

On April 18, 2007, it was announced Kinder Morgan Energy Partners would acquire the Trans Mountain pipeline system from Terasen. Subsequently, on April 30, 2007 the assets were transferred to Kinder Morgan Energy Partners. This transaction caused the Company to consider the fair value of the Trans Mountain pipeline system, which was previously included in the Petroleum Segment, in determining whether goodwill related to these assets was impaired. Accordingly, based on the Company's consideration of the transaction value and supporting third-party information obtained regarding the fair values of the Trans Mountain pipeline system assets, a goodwill impairment charge of $441.9 million was recorded in the year and has been included in the loss on discontinued operations.

On April 30, 2007, Terasen sold the assets of the Trans Mountain system to Kinder Morgan Energy Partners for proceeds of $549 million US. During the month of May, the remaining petroleum transportation businesses within Terasen were transferred to a company affiliated with Kinder Morgan Energy Partners for fair value. In return for the assets, the Company redeemed $1,311.5 million of preferred shares (Note 11). The Company recorded an after-tax charge to equity in the amount of $531.2 million, net of current income tax expense of $101.3 million and future income tax recoveries of $172.7 million, related to the sale of these businesses. The revenue and expense items for 2007 have been classified as discontinued operations.

5. Investments in jointly-controlled entities

As at December 31, 2008 and 2007, the Company has a 30 per cent interest in CWLP for which it uses the proportionate consolidation method of accounting.

The Company's proportionate share of assets, liabilities, revenues, expenses, and cash flows related to this proportionately consolidated entity are summarized as follows:

In millions of dollars	**2008**	2007
Current assets	**$ 8.7**	$ 7.8
Long-term assets (including property, plant and equipment)	**27.5**	30.0
Current liabilities	**17.8**	20.7
Revenues	**8.9**	16.8
Expenses (including financing costs and income tax)	**7.3**	14.4
Net earnings from continuing operations	**1.6**	2.4
Cash flows from operating activities	**6.9**	(4.2)
Cash flows from investing activities	**(3.7)**	(5.3)
Cash flows from financing activities	**-**	-

6. Property, plant and equipment

2008

	Weighted average depreciation rate	**Cost**	**Accumulated depreciation**	**Net book value**
Natural gas transmission and distribution systems	**2.35%**	**$ 2,781.0**	**$ 208.3**	**$ 2,572.7**
Plant, buildings and equipment	**7.42%**	**254.9**	**51.3**	**203.6**
Land and land rights	**0.12%**	**89.3**	**0.4**	**88.9**
Assets under construction	**-**	**120.0**	**-**	**120.0**
		$ 3,245.2	**$ 260.0**	**$ 2,985.2**

2007

	Weighted average depreciation rate	Cost	Accumulated depreciation	Net book value
Natural gas transmission and distribution systems	2.33%	$ 2,660.8	$ 157.9	$ 2,502.9
Plant, buildings and equipment	8.15%	235.8	21.3	214.5
Land and land rights	0.03%	87.4	0.3	87.1
Assets under construction	-	47.8	-	47.8
		$ 3,031.8	$ 179.5	$ 2,852.3

As allowed by the regulators, during the year ended December 31, 2008, the Company capitalized an allowance for equity funds during construction at approved rates of $2.7 million (2007 - $1.4 million) and approved capitalized overhead of $32.7 million (2007 - $32.6 million), with offsetting inclusions in earnings.

7. Rate stabilization accounts

In millions of dollars	**2008**	2007
Current assets		
RDDA	**$ 3.6**	$ 14.2
RSAM	**-**	5.9
CCRA	**53.9**	34.8
MCRA	**-**	20.4
GCVA	**19.0**	3.0
	76.5	78.3
Long-term assets		
RDDA	**-**	6.9
RSAM	**-**	11.8
	-	18.7
Current liabilities		
MCRA	**(23.7)**	-
Long-term liabilities		
RSAM	**(7.7)**	-
Net rate stabilization accounts	**$ 45.1**	$ 97.0

The current portion of the rate stabilization accounts represents the amounts expected to be recovered or refunded in rates over the next year. Actual recoveries (refunds) will vary depending on actual natural gas consumption and recovery amounts approved by the BCUC. Rate stabilization accounts are presented net of tax, where applicable.

The RSAM account is anticipated to be refunded in rates over three years. Refund of the RSAM balance is dependent upon annually approved rates and actual gas consumption volumes. The MCRA and CCRA accounts are anticipated to be fully recovered or paid within the next fiscal year. The RDDA has accumulated the allowed earnings in excess of achieved earnings prior to 2003 and is to be recovered through future rates. During the years ended December 31, 2008 and 2007, the RDDA has decreased as achieved earnings have exceeded the allowed return.

In the absence of rate regulation, the costs in the rate stabilization accounts above would have been expensed as incurred which would have resulted in increased natural gas transmission and distribution revenues of $631.4 million (2007 - $568.6 million), increased cost of natural gas of $556.5 million (2007 - $554.7 million) increased income tax expense of $22.9 million (2007 - $3.5 million), decreased other comprehensive income of $17.6 million (2007 - increased $65.5 million) related to the gas derivatives, and increased net earnings of $17.4 million (2007 - $9.9 million) related to the RDDA.

8. Other assets

In millions of dollars	2008	2007
Deferred charges		
Subject to rate regulation and approval for recovery in rates:		
Income taxes recoverable on post-employment benefits	**$ 17.7**	$ 15.5
Residential unbundling costs	**6.5**	8.6
Corporate capital tax deferrals	**0.7**	2.4
Replacement transportation agreement	**0.7**	1.3
Commercial commodity unbundling costs	**-**	1.2
Other items included approved for recovery in rates	**6.1**	5.1
Subject to rate regulation but not yet approved for recovery in rates:		
Southern Crossing Pipeline PST reassessment	**7.3**	7.2
Deferred development costs for capital projects	**4.6**	4.2
Included in non-regulated entities:		
Other items included in non-regulated entities	**3.0**	2.5
	46.6	48.0
Pension assets (Note 12)	**20.1**	14.0
Investments	**-**	0.3
Long-term receivables	**9.1**	9.2
	$ 75.8	$ 71.5

Amortization of these deferred charges in rates for the year ended December 31, 2008 totalled $4.0 million (2007 - $3.5 million).

The deferral account for income taxes on post-employment benefits relates to income tax amounts on post-employment benefit expense. The BCUC allows post-employment benefits to be collected from customers through rates calculated on the accrual basis, rather than a cash paid basis, which produces timing differences for income tax purposes. Since Terasen Gas accounts for income taxes using the taxes payable basis of accounting, the tax effect of this timing difference is included in other assets, and will be reduced as cash payments for post-employment benefits exceed required accruals and amounts collected from customers in rates.

The residential and commercial commodity unbundling costs deferred are costs incurred to develop a third-party marketer alternative for residential and commercial customers to purchase natural gas from suppliers other than the Company. The BCUC has approved the recovery of these costs in rates over a three-year period.

The deferral for corporate capital tax relates to tax payments that were made to the Province related to assessments for corporate capital tax for TGVI. In November 2006, the Supreme Court of BC decided in favour of the Company in respect of some of the significant issues under appeal. Amounts will be recovered from customers in future rates.

The deferral account for the replacement transportation agreement relates to amounts that Terasen Gas is allowed to recover from customers in rates in order to cover any shortfall in revenues relative to a minimum amount approved by the BCUC on the Company's Southern Crossing Pipeline (SCP). The deferral account is being amortized and recovered in rates over a five-year period, of which one year remains at December 31, 2008.

The deferral account for the SCP PST reassessment relates to a payment made in regards to a reassessment of additional provincial sales tax on the SCP. See Note 17. In 2006, the Company made a payment of $10 million pending resolution of the appeal as a good faith payment in order to forestall an order from the Province of British Columbia (the Province) to provide full payment or security. During 2007, the assessment was reduced to $7.0 million and the overpayment was refunded to the Company. Incremental costs associated with the appeal are being deferred. Depending on the success of the appeal, the Company will either be refunded this payment from the Province or alternatively expects to recover the costs from customers in future rates.

Deferred development costs for capital projects include costs for projects under development that are expected to be added to regulated rate-base in future periods. These costs include approximately $4.6 million (2007 - $4.2 million) for capital projects that are currently in progress by the natural gas transmission and distribution operations.

Deferred charges for rate-regulated entities that have been aggregated in the table above and in the table in "Other long-term liabilities and deferred credits" in Note 10 relate to more than 56 deferral accounts, none of which exceed $1.6 million individually. All of these accounts have been approved by regulators in prior annual rate approvals or orders and are being amortized over various periods depending on the nature of the costs.

In the absence of rate regulation, the deferred charges in the above table would have been recorded in income, except for the costs related to deferred development costs for capital projects, SCP PST Reassessment, the investment balances and the pension assets. This would have resulted in increased natural gas transmission and distribution revenues of $8.4 million (2007 - $2.1 million), decreased cost of natural gas of $1.3 million (2007 - increased $0.6 million), increased operation and maintenance costs $3.1 million (2007 - $11.2 million), decreased depreciation and amortization of $4.0 million (2007 - $3.5 million), increased financing costs of $0.3 million (2007 - $1.0 million), and increased income tax expense of $4.9 million (2007 - decreased $7.3 million).

Less: long-term debt issue costs		15.6	12.3
		$ 1,841.6	$ 1,673.7

a) Terasen Inc. medium-term note debentures

The Company's Medium-Term Note Debentures are unsecured obligations but are subject to the restrictions of the Trust Indenture dated November 21, 2001.

In 2006, the Company entered into a $450 million three-year revolving credit facility. This facility replaced three bi-lateral facilities aggregating $450 million and includes terms and conditions similar to the facilities it replaced. During 2007, this facility was downsized to $100 million. The facility was unutilized at December 31, 2008 and December 31, 2007.

b) Terasen Inc. capital securities

On April 19, 2000, the Company issued $125.0 million of 8.0 per cent Capital Securities with a term to maturity of 40 years for gross proceeds of $123.7 million. The Company may elect to defer payments on these securities and settle such deferred payments in either cash or common shares, and has the option to settle principal at maturity through the issuance of common shares. The securities are exchangeable at the option of the holder on or after April 19, 2010 for common shares of the Company at 90 per cent of the market price, subject to the right of the Company to redeem the securities for cash at par as of the same date.

c) Terasen Gas Inc. purchase money mortgages

The Series A and Series B Purchase Money Mortgages are secured equally and rateably by a first fixed and specific mortgage and charge on Terasen Gas' Coastal Division assets, and are subject to the restrictions of the Trust Indenture dated December 3, 1990. The aggregate principal amount of Purchase Money Mortgages that may be issued under the Trust Indenture is limited to $425 million.

d) Terasen Gas Inc. debentures and medium-term note debentures

Terasen Gas' debentures are unsecured obligations but are subject to the restrictions of the Trust Indenture dated November 1, 1977, as amended and supplemented.

On May 13, 2008, Terasen Gas issued $250.0 million of Medium-Term Note Debentures at a coupon interest rate of 5.80 per cent. The debentures mature on May 13, 2038 and are unsecured and subject to the restrictions of the Trust Indenture. The proceeds were used to repay Terasen Gas' Series 9 Medium-Term Debentures, which matured on June 2, 2008, and the remainder of the proceeds were used to pay down Terasen Gas' operating line.

On October 2, 2007, Terasen Gas issued $250.0 million of Medium-Term Note Debentures at a coupon interest rate of 6.00 per cent. The debentures mature on October 2, 2037 and are unsecured and subject to restrictions of the Trust Indenture. The proceeds were used to repay Terasen Gas' Series 13 and Series 20 Medium-Term Debentures that matured in 2007.

On August 24, 2007, Terasen Gas renegotiated and extended its credit facility for five years with similar terms to the original facility and common for such term credit facilities. The $500 million unsecured committed revolving credit facility is with a syndicate of banks and matures in August 2012. In 2008, under the terms of the agreement, the facility was extended to mature in August 2013.

e) Terasen Gas (Vancouver Island) Inc. bank syndicate

TGVI's debentures are unsecured obligations but are subject to the restrictions of the Trust Indenture dated February 15, 2008, as amended and supplemented.

On February 15, 2008, TGVI issued $250.0 million of Senior Unsecured Debentures at a coupon interest rate of 6.05 per cent. The debentures mature on February 15, 2038. The proceeds were used to repay the current operating facility.

On January 13, 2006, TGVI entered into a five-year $350 million unsecured committed revolving credit facility with a syndicate of banks. TGVI issued bankers' acceptances under this facility to completely refinance TGVI's former term facility. The bankers' acceptances have terms not to exceed 180 days at the end of which time they are replaced by new bankers' acceptances. The facility can also be utilized to finance working capital requirements and for general corporate purposes. The terms and conditions are similar to those of the previous facility and common for such term credit facilities. Concurrently with executing this facility, TGVI entered into a $20 million seven-year unsecured committed non-revolving credit facility with one bank. This facility can only be utilized for purposes of refinancing any annual prepayments that TGVI may be required to make on non-interest bearing government contributions. The terms and conditions are primarily the same as the aforementioned TGVI facility except this facility ranks junior to repayment of TGVI's Class B subordinated debt, which is held by its parent, the Company. While the bankers' acceptances are short-term, the underlying credit facility on which the bankers' acceptances are committed is open through January 2011. Accordingly, under the $350 million credit facility, borrowings outstanding at December 31, 2007 of $269 million have been classified as long-term debt and an estimated $66.0 million as current maturities. During 2008, the Company paid down this facility with the proceeds from the Senior Unsecured Debentures. Subsequent drawings on this credit facility in 2008 have been included in short-term notes. Borrowings outstanding against the $20 million credit facility at December 31, 2008 were $8.5 million (2007 - $4.6 million) and are included in the current portion of long-term debt.

Long-term debt issue costs are amortized using the effective interest rate method as discussed in Note 2.

The Company's Series 1 and Series 3 Medium-Term Note Debentures and Capital Securities, Terasen Gas' Series B Purchase Money Mortgages, Series E Debentures, and Series 11, Series 18, Series 19, Series 21, Series 22 and Series 23 Medium-Term Note Debentures and TGVI's Series 2008 Senior Unsecured Debentures are redeemable in whole or in part at the option of the Company at a price equal to the greater of the Canada Yield Price, as defined in the applicable Trust Indenture, and the principal amount of the debt to be redeemed, plus accrued and unpaid interest to the date specified for redemption. The Canada Yield Price is calculated as an amount that provides a yield slightly above the yield on an equivalent maturity Government of Canada bond.

REQUIRED PRINCIPAL REPAYMENTS OVER THE NEXT FIVE YEARS AND THEREAFTER ARE AS FOLLOWS (IN MILLIONS):

2009	$ 78.5
2010	1.9
2011	1.9
2012	1.9
2013	1.9
Thereafter	1,849.6

10. Other long-term liabilities and deferred credits

In millions of dollars	2008	2007
Pension and other post-employment benefit liabilities (Note 12)	$ **77.1**	$ 68.6
Deferred gains on sale of natural gas transmission and distribution assets	**46.3**	50.5
Deferred acquisition payment	**43.3**	40.7
Deferred credits		
Subject to rate regulation and approved for refund in rates:		
Earnings sharing mechanism	**10.7**	12.5
Fair value of foreign exchange forward	**7.4**	-
SCP net mitigation revenue	**6.6**	4.4
SCP west to east transmission revenue	**2.5**	0.9
Deferred interest on MCRA	**1.8**	1.7
Deferred interest mechanism	**1.4**	0.1
Customer benefit from land sale	**0.5**	1.7
Large corporation tax elimination	**-**	2.1
Pension cost variance	**-**	2.3
Other items included approved for repayment in rates	**7.6**	6.5
Other deferred credits/liabilities	**6.8**	8.3
	$ **212.0**	$ 200.3

The deferred gains on sale of natural gas transmission and distribution assets occurred upon the sale and leaseback of pipeline assets to certain municipalities in 2001, 2002, 2004 and 2005. The pre-tax gains of $70.5 million on combined cash proceeds of $141.1 million are being amortized over the 17-year terms of the operating leases that commenced at the time of the sale transactions. These operating lease commitments are included in the table in Note 17.

The deferred payment resulted from the Company's acquisition of TGVI effective January 1, 2002. The deferred payment has a face value of $52.0 million but was discounted at January 1, 2002 to a present value of $28.2 million. The payment is due on December 31, 2011 or sooner if TGVI realizes revenues from transportation revenue contracts to serve power-generating plants which may be constructed in TGVI's service area. If any part of the deferred payment is paid prior to December 31, 2011, the difference between the payment and the carrying value of the debt will be treated as contingent consideration for the acquisition of TGVI and will be added to the cost of the purchase at that time.

The Earnings Sharing Mechanism is a mechanism agreed to in Terasen Gas' multi-year agreement to share, on a 50/50 basis, amounts earned by Terasen Gas on its regulated activities that exceed or are less than amounts allowed by the BCUC in the cost-of-service allowed return calculations. These amounts are shared on an after-tax basis, and are returned to customers in rates.

The fair value of foreign exchange forward is the fair value of TGVI's foreign exchange forward contract hedging the US dollar payments required under a contract for the construction of the Mt. Hayes Natural Gas Storage Facility. This account captures the change in the fair value of the foreign exchange forward contract and has been approved by the BCUC.

The SCP net mitigation revenue is revenue that is received from third parties for the use of the SCP transportation capacity that has not been utilized by the firm transportation agreement customers. This account is used to record differences between actual revenues from SCP mitigation and what has been approved in the current revenue requirement. Amounts are being amortized to income over five years.

The SCP west to east transmission revenue is revenue that is received from third parties for the use of the SCP west to east transmission system. This account is used to record differences between actual revenues received from the SCP west to east transmission system and what has been approved in the current revenue requirement. Amounts are being amortized to income over five years.

The deferred interest on MCRA is the interest calculated on the difference between the actual and forecasted average balance of the MCRA account multiplied by the composite interest rate.

Terasen Gas has a deferred interest mechanism, which has been approved by the BCUC, that requires that variances due to differences in long-term borrowings and long-term and short-term interest rates from those that have been approved in rates be returned to customers in future rates. The impact of this mechanism was to increase financing costs for the year ended December 31, 2008 by $2.4 million (2007 - nil) from what otherwise would be reported. The balance of the deferred interest account is being amortized on a straight-line basis over three years.

The customer benefit from land sale represents the customers' portion of the net of tax gain on the sale of surplus land that will be refunded to customers by the first quarter of 2009.

The large corporation tax elimination costs resulted from the federal government eliminating the tax on large corporations in 2006. The BCUC allows large corporation tax to be recovered from customers through rates. These costs were collected from customers through rates in 2006 and now are owed back to customers in future rates upon the elimination of the large corporation tax.

The pension cost variance account accumulates differences between pension expense that is approved for recovery in rates and actuarial pension expense. Amounts are recovered in rates in the following year.

Other deferred credits/liabilities include amounts resulting from the Company's acquisition of TGVI effective January 1, 2002.

Amortization of deferred credits in entities that are subject to rate regulation in rates for the year ended December 31, 2008 totalled $5.1 million (2007 - $5.4 million).

In the absence of rate regulation, the other long-term liabilities and deferred credits in the above table would have been recorded in income, aside for the pension and other post-employment benefit liabilities, deferred gains on sale of natural gas transmission and distribution assets and the deferred payment. This would have resulted in increased natural gas transmission and distribution revenues of $4.1 million (2007 - $6.2 million), decreased cost of natural gas of $0.7 million (2007 - increased $0.4 million), decreased operation and maintenance costs of $7.3 million (2007 - $2.6 million), decreased property and other taxes of nil (2007 - $1.1 million), increased depreciation and amortization of $5.1 million (2007 - $5.4 million), decreased financing costs of $2.4 million (2007 - $0.4 million) and increased income tax expense of $3.4 million (2007 - $1.9 million).

11. Share capital and contributed surplus

Authorized share capital

The Company is authorized to issue an unlimited number of common shares and an unlimited number of Class A and Class B preference shares, all without par value. The preference shares are redeemable at the option of the holder.

COMMON SHARES

Changes in the issued and outstanding common shares are as follows:

All of the common and preferred shares outstanding at December 31, 2008 and December 31, 2007 are owned by Fortis Inc.

CONTRIBUTED SURPLUS

Changes in contributed surplus are as follows:

In millions of dollars	**2008**	2007
Outstanding, beginning of period	**$ 91.0**	$ 19.2
Capital contributions made as part of the reorganization and Pipelines sale in 2007 (Note 4)	**-**	71.8
	$ 91.0	$ 91.0

12. Employee benefit plans

The Company is a sponsor of pension plans for eligible employees. The plans include registered defined benefit pension plans, supplemental unfunded arrangements, which provide pension benefits in excess of statutory limits, and defined contributory plans. The Company also provides post-employment benefits other than pensions for retired employees. The following is a summary of each type of plan:

Defined benefit plans

Retirement benefits under the defined benefit plans are based on employees' years of credited service and remuneration. Company contributions to the plan are based upon independent actuarial valuations. The most recent actuarial valuations of the defined benefit pension plans for funding purposes were at December 31, 2005 and December 31, 2007 and the date of the next required valuations are December 31, 2008 and December 31, 2010. The expected weighted average remaining service life of employees covered by the defined benefit pension plans is 10.1 years (2007 - 10.3 years).

Effective January 1, 2007 all employees became participants in a new defined benefit pension plan in which costs are split evenly between the employees and employer. All current employees were grandfathered in their respective defined contribution and defined benefit plans and those plans were closed to all new members, except for the TGVI plans which were closed to all new non-unionized members. The most recent actuarial valuation of the new defined benefit pension plan for funding purposes was May 17, 2007 and the date of the next required valuation is December 31, 2009.

Defined contribution plan

Company contributions to the plan are based upon employee age and pensionable earnings for employees of the natural gas transmission and distribution operations. Effective January 1, 2007, all new employees of the Company, except for the TGVI unionized members, became members of the new defined benefit plan described above. Company contributions to the plan are based upon employee age and pensionable earnings for employees.

Supplemental plans

Certain employees are eligible to receive supplemental benefits under both the defined benefit and defined contribution plans. The supplemental plans provide pension benefits in excess of statutory limits. The supplemental plans are unfunded and are secured by letters of credit.

Other post-employment benefits

The Company provides retired employees with other post-employment benefits that include, depending on circumstances, supplemental health, dental and life insurance coverage. Post-employment benefits are unfunded and annual expense is recorded on an accrual basis based on independent actuarial determinations, considering among other factors, health care cost escalation. The most recent actuarial valuations were completed as at December 31, 2005 and December 31, 2007 and the dates of the next required valuations are December 31, 2008 and December 31, 2010. The expected weighted average remaining service life of employees covered by these benefit plans is 9.8 years (2007 - 9.8 years).

The Company measures its accrued benefit obligations and the fair value of plan assets for accounting purposes as at December 31 each year. The financial positions of the employee-defined benefit pension plans and other benefit plans are presented in aggregate in the tables below:

In millions of dollars	Pension benefit plans		Other benefit plans	
	2008	2007	**2008**	2007
Plan assets				
Fair value, beginning of year	**$ 261.2**	$ 334.7	**$ -**	$ -
Sale of Petroleum businesses	**-**	(82.5)	**-**	-
Company contributions	**8.9**	7.8	**1.8**	1.4
Contributions by members	**5.1**	4.4	**-**	-
Actual return on plan assets	**(36.6)**	8.5	**-**	-
Benefits paid	**(11.8)**	(11.6)	**(1.7)**	(1.3)
Other	**(0.5)**	(0.1)	**(0.1)**	(0.1)
Fair value, end of year	**226.3**	261.2	**-**	-
Accrued benefit obligation				
Balance, beginning of year	**280.8**	370.0	**79.4**	89.7
Sale of Petroleum businesses	**-**	(98.1)	**-**	(11.1)
Service cost	**7.4**	7.8	**1.5**	1.6
Interest cost	**14.9**	13.7	**4.2**	4.0
Benefit payments	**(11.8)**	(11.6)	**(1.7)**	(1.3)
Contributions by members	**5.1**	4.4	**-**	-
Actuarial gain	**(16.9)**	(5.4)	**(11.9)**	(3.5)
Balance, end of year	**279.5**	280.8	**71.5**	79.4
Plan deficiency	**(53.2)**	(19.6)	**(71.5)**	(79.4)
Unamortized transitional (benefit) obligation	**(7.5)**	(9.2)	**-**	1.6
Unamortized actuarial loss	**58.8**	21.2	**15.2**	29.2
Unamortized past service costs	**3.1**	3.7	**(1.9)**	(2.1)
Accrued benefit asset (liability)	**$ 1.2**	$ (3.9)	**$ (58.2)**	$ (50.7)
Represented by:				
Pension assets	**$ 20.1**	$ 14.0	**$ -**	$ -
Accrued benefit liability	**(18.9)**	(17.9)	**(58.2)**	(50.7)
	$ 1.2	$ (3.9)	**$ (58.2)**	$ (50.7)

The net accrued benefit liability is included in other long-term liabilities and deferred credits (Note 10) and the pension asset is included in other assets (Note 8).

Included in the accrued benefit obligation and fair value of the plan assets at year-end are the following amounts in respect of plans with accrued benefit obligations in excess of fair value of assets:

In millions of dollars	Pension benefit plans		Other benefit plans	
	2008	2007	**2008**	2007
Accrued benefit obligations:				
Unfunded plans	**$ 26.8**	$ 26.9	**$ 71.5**	$ 79.4
Funded plans	**252.7**	253.9	**-**	-
	279.5	280.8	**71.5**	79.4
Fair value of plan assets	**226.3**	261.2	**-**	-
Funded status deficit	**$ (53.2)**	$ (19.6)	**$ (71.5)**	$ (79.4)

The accrued benefit obligations for certain unfunded pension benefit plans are secured by letters of credit.

The net benefit plan expense is as follows:

In millions of dollars	Pension benefit plans		Other benefit plans	
	2008	2007	**2008**	2007
Current service cost	**$ 7.4**	$ 7.8	**$ 1.5**	$ 1.6
Interest cost on projected benefit obligations	**14.9**	13.7	**4.2**	4.0
Actual loss (return) on plan assets	**36.6**	(8.5)	**-**	-
Net actuarial gains	**(16.9)**	(5.4)	**(11.9)**	(3.5)
Other	**0.5**	0.1	**0.1**	0.1
Net benefit plan (income) expense before adjustments	**42.5**	7.7	**(6.1)**	2.2
Adjustments to recognize the long-term nature of employee future benefit costs:				
Difference between actual and expected return on plan assets	**(55.4)**	(8.7)	**-**	-
Difference between actual and recognized actuarial gains (losses) in year	**17.8**	6.7	**13.9**	6.3
Difference between actual and recognized past service costs in year	**0.6**	0.6	**(0.2)**	(0.3)
Amortization of transitional (benefit) obligation	**(1.8)**	(1.8)	**1.6**	1.6
Sale of Petroleum businesses	**-**	1.4	**-**	0.6
Net benefit plan expense	**$ 3.7**	$ 5.9	**$ 9.2**	$ 10.4

Benefit plan assets

The weighted-average asset allocation by asset category of the Company's funded defined benefit pension plans is as follows:

	Pension benefit plans	
	2008	2007
Equity securities	**49%**	56%
Fixed income securities	**40%**	36%
Other assets	**11%**	8%
Total assets	**100%**	100%

The investment policy for benefit plan assets is to optimize the risk-return using a portfolio of various asset classes. The Company's primary investment objectives are to secure registered pension plans, and maximize investment returns in a cost-effective manner while not compromising the security of the respective plans. The pension plans utilize external investment managers to manage the investment policy. Assets in the plan are held in trust by independent third parties.

The pension plans do not directly hold any shares of the Company.

Significant assumptions

The discount rate assumption used in determining pension and post-retirement benefit obligations and net benefit expense reflects the market yields, as of the measurement date, on high-quality debt instruments. The expected rate of return on plan assets assumption is reviewed annually by management, in conjunction with actuaries. The assumption is based on the expected returns for the various asset classes, weighted by the portfolio allocation.

The weighted average significant actuarial assumptions used to determine the accrued benefit obligation and the benefit plan expense are as follows:

	Pension benefit plans		Other benefit plans	
	2008	2007	**2008**	2007
Accrued benefit obligation				
Discount rate at December 31, based on AA Corporate bonds	**6.25%**	5.25%	**6.25%**	5.25%
Rate of compensation increase	**3.19%**	3.77%	**-**	-
Net benefit plan expense				
Discount rate at January 1, based on AA Corporate bonds	**5.25%**	5.00%	**5.25%**	5.00%
Expected rate of return on plan assets	**7.25%**	7.25%	**-**	-

The assumed health-care cost trend rates for other post-employment benefit plans are as follows:

	2008	2007
Extended health benefits:		
Initial health-care cost trend rate	**8.0%**	8.0%
Annual rate of decline in trend rate	**1.0%**	1.0%
Ultimate health-care cost trend rate	**5.0%**	5.0%
Year that the rate reaches the ultimate trend rate	**2012**	2011
Medical Services Plan Benefits Premium trend rate	**4.0%**	4.0%

A one percentage-point change in assumed health-care cost trend rates would have the following effects:

2008	One percentage point increase	One percentage point decrease
Effect on the total of the service cost and interest cost components of the benefit plan expense	**$ 0.8**	$ (0.7)
Effect on accrued benefit obligation	**$ 9.7**	$ (8.5)

Cash flows

Total cash contributions for employee benefit plans consist of:

	Employee benefit plans	
	2008	2007
Funded plans	**$ 7.2**	$ 6.1
Beneficiaries of unfunded plans	**3.5**	3.1
Total	**$ 10.7**	$ 9.2

The contributions for 2009 are anticipated to be approximately the same as 2008 for both the defined pension benefit plans and other benefit plans (Note 17).

Impact of rate regulation

As required by the regulator, Terasen Gas is required under its approved cost of service model to defer the amounts of pension benefit expense that exceed or are less than the amounts approved by the regulator to be recovered in rates each year. During the year ended December 31, 2008, the Company has deferred pension expense of $0.4 million (2007 - less than amount approved $1.5 million) that exceeded the amount approved by the regulator to be recovered in rates in 2009.

13. Financing costs

In millions of dollars	2008	2007
Interest and expense on long-term debt	**$ 142.5**	$ 186.3
Interest on short-term debt	**27.1**	37.6
Interest capitalized	**(2.1)**	(1.4)
	$ 167.5	$ 222.5

As allowed by the regulator, during the year ended December 31, 2008, the Company capitalized interest for borrowing requirements for construction of assets that have not been included in rate base of $2.1 million (2007 - $1.4 million).

14. Income taxes

Provision for income taxes

In millions of dollars	2008	2007
Current income taxes	**$ 21.6**	$ 28.9
Future income taxes	**1.0**	1.5
Income tax expense from continuing operations	**$ 22.6**	$ 30.4

Variation in effective income tax rate

Consolidated income taxes vary from the amount that would be computed by applying the Canadian Federal and British Columbia combined statutory income tax rate of 31.0 per cent (2007 - 34.12 per cent) to earnings before income taxes as shown in the following table:

In millions of dollars	2008	2007
Earnings from continuing operations before income taxes	**$ 124.3**	$ 66.8
Combined statutory income tax rate	**31.0%**	34.12%
Combined income taxes at statutory rate	**38.5**	$ 22.8
(Decrease) increase in income taxes resulting from:	**(7.5)**	-
Québec settlement (Note 17)		
Capital cost allowance and other deductions claimed for income tax purposes over amounts recorded for accounting purposes	**(8.3)**	(7.0)
Non-deductible expenses and non-taxable income	**2.4**	5.7
Impact of reassessments related to prior years	**(2.2)**	6.4
Impact of tax rate change on Future Income Taxes balance	**0.4**	1.0
Other, net	**(0.7)**	1.5
Actual consolidated income taxes	**22.6**	$ 30.4
Effective income tax rate	**18.18%**	45.51%

Future income taxes

The net future income tax asset of the Company of $12.1 million (2007 - $13.1 million) relates primarily to the tax effect of temporary differences on non-regulated property, plant and equipment balances.

Currently, the Company uses the taxes payable method of accounting for income taxes on regulated earnings. The estimated effect on the Company's consolidated financial statements, if it had adopted amended Section 3465, *Income Taxes*, as at December 31, 2008, would have been an increase in future tax liabilities of $321.3 million, including those associated with income taxes that will become payable on future revenues as they are collected from customers when the tax timing differences reverse. There would also be a corresponding increase in regulatory assets.

15. Financial instruments

Fair value estimates

	December 31, 2008		December 31, 2007	
In millions of dollars	**Carrying value**	**Estimated fair value**	Carrying value	Estimated fair value
Held for trading				
Cash and short-term investments[1]	**$ 33.0**	**$ 33.0**	$ 17.8	$ 17.8
Loans and receivables				
Accounts receivable[1, 2]	**392.9**	**392.9**	348.4	348.4
Long-term receivables[1, 2]	**9.1**	**9.1**	9.2	9.2
Other financial liabilities				
Short-term notes[1, 2]	**353.5**	**353.5**	305.0	305.0
Accounts payable and accrued liabilities[1, 2]	**455.0**	**455.0**	385.2	385.2
Due to parent company[1, 2]	**470.3**	**470.3**	135.3	135.3
Long-term debt, including current portion[3, 4, 5]	**1,920.1**	**1,959.2**	2,144.3	2.356.4

1 Due to the nature and/or short-term maturity of these financial instruments, carrying value approximates fair value.

2 Carrying value approximates amortized cost.

3 Carrying value is measured at amortized cost using the effective interest rate method.

4 Carrying value at December 31, 2008 is net of unamortized deferred financing costs of $15.6 million (2007 - $12.3 million). On January 1, 2007, deferred financing costs were reclassified from other assets in accordance with the transitional provisions of CICA Section 3855. The majority of the Company's long-term debt relates to regulated operations which enables the Company to recover the existing financing charges through rates or tolls.

5 Fair value is calculated by discounting the future cash flow of each debt issue at the estimated yield to maturity for the same or similar issues at December 31, 2008, or by using available quoted market prices.

Fair value estimates are made at a specific point in time, based on relevant market information and information about the financial instrument. These estimates cannot be determined with precision as they are subjective in nature and involve uncertainties and matters of judgment. Interest expense associated with the Company's short-term borrowings and long-term debt is disclosed in Note 13 to these consolidated financial statements.

Derivative instruments

The Company hedges its exposure to fluctuations in natural gas prices and foreign exchange rates through the use of derivative instruments. The table below indicates the valuation of the derivative instruments as at December 31, 2008.

In millions of dollars

Asset (liability)	2008				2007	
December 31 (in millions)	**Number of swaps**	**Term to maturity (years)**	**Carrying value**	**Fair value**	Carrying value	Fair value
Foreign exchange forward						
TGVI	**1**	**3**	**$ 7.4**	**$ 7.4**	$ -	$ -
Terasen Gas and TGVI						
Natural gas commodity swaps and options	**228**	**Up to 3**	**$ (84.2)**	**$ (84.2)**	$ (79.4)	$ (79.4)
Gas purchase contract premiums	**74**	**Less than 3**	**(7.6)**	**(7.6)**	5.2	5.2

The natural gas derivatives fair value reflects only the value of the natural gas derivatives and not the offsetting change in value of the underlying future purchases of natural gas. These fair values reflect the estimated amounts the Company would receive or pay to terminate the contracts at the stated dates. The natural gas derivatives fair values have been determined using published market prices for natural gas commodities.

The derivatives entered into by Terasen Gas and TGVI relate to regulated operations and any resulting gains or losses are recorded in rate stabilization accounts, subject to regulatory approval, and passed through to customers in future rates.

Risk management

Exposure to credit risk, liquidity risk, market risk, and natural gas commodity price risk arises in the normal course of the Company's business. The Company enters into financial instruments to finance its operations in the normal course of business.

Credit risk

Credit risk is the risk that a third party to a financial instrument might fail to meet its obligations under the terms of the financial instrument. For cash and short-term investments, derivative assets, accounts receivable, and other receivables due from customers, the Company's credit risk is limited to the carrying value on the balance sheet. The Company generally has a large and diversified customer base, which minimizes the concentration of credit risk.

The Company is exposed to credit risk in the event of non performance by counterparties to derivative financial instruments, including natural gas commodity swaps and options. The Company is also exposed to credit risk on physical off-system sales. Because the Company deals with high credit quality institutions, in accordance with established credit approval practices, the Company does not expect any counterparties to fail to meet their obligations. Counterparty credit exposures are monitored by individual counterparty and by category of credit rating, and are subject to approved limits. The counterparties with which the Company has significant transactions are A-rated entities or better. The Company uses netting arrangements to reduce credit risk and net settles payments with counterparties where net settlement provisions exist.

In the case of commercial and industrial customers, credit risk is managed by checking a company's creditworthiness and financial strength both before commencing and during the business relationship. For residential customers, creditworthiness is normally ascertained before commencing commodity delivery by an appropriate mix of internal and external information to determine the payment mechanism required to reduce credit risk to an acceptable level. Certain customers will only be accepted on a prepayment basis. The Company manages its exposure to credit risk associated with all customers by monitoring an aging of receivables and by monitoring groupings of customers according to method of payment or profile.

Receivables from customers are generally considered to be fully performing until such time as the payment that is due remains outstanding past the contractual due date. The contractual due date is generally 22 days. The aging analysis of the Company's consolidated accounts receivable is as follows:

In millions of dollars	December 31, 2008
Not past due	$ 379.8
Past due 0-30 days	13.9
Past due 31-60 days	2.3
Past due 61-90 days	1.0
Past due over 91 days	3.7
Subtotal accounts receivable	400.7
Less: allowance for doubtful accounts	(7.8)
	$ 392.9

Liquidity risk

Liquidity risk is the risk that an entity will encounter difficulty in raising funds to meet commitments associated with financial instruments. The Company's financial position could be adversely affected if it or its operating subsidiaries fail to arrange sufficient and cost-effective financing to fund, among other things, capital expenditures and the repayment of maturing debt. The ability to arrange sufficient and cost-effective financing is subject to numerous factors, including the results of operations and financial position of the Company and its subsidiaries, conditions in the capital and bank credit markets, ratings assigned by rating agencies and general economic conditions.

To mitigate this risk, the Company and its subsidiaries had consolidated authorized lines of credit of $950.0 million (2007 - $950.0 million) as at December 31, 2008, of which $552.9 million (2007 - $602.0 million) was unused. The Company targets to have, on average, sufficient liquidity to allow it not to access the capital markets for a period of twelve months.

The following summary outlines the Company's credit facilities by entity.

In millions of dollars					
Credit facilities	Terasen Inc.	Terasen Gas Inc.	Terasen Gas (Vancouver Island) Inc.	**Total as at December 31, 2008**	Total as at December 31, 2007
Total credit facilities	$ 100.0	$ 500.0	$ 350.0	**$ 950.0**	$ 950.0
Credit facilities utilized					
Short-term borrowings	-	(238.5)	(115.0)	**(353.5)**	(305.0)
Letters of credit outstanding	(0.1)	(43.5)	-	**(43.6)**	(43.0)
Credit facilities available	$ 99.9	$ 218.0	$ 235.0	**$ 552.9**	$ 602.0

Furthermore, the Company and its subsidiaries target a strong investment-grade credit rating to maintain capital market access at reasonable interest rates. As at December 31, 2008, the Company's credit ratings were as follows:

Credit ratings	DBRS	Moody's
Terasen Inc.		
Unsecured long-term debt	BBB (High)	Baa2
Capital securities	BBBy	Baa3
Terasen Gas Inc.		
Commercial paper	R-1 (Low)	-
Secured long-term debt	A	A2
Unsecured long-term debt	A	A3
Terasen Gas (Vancouver Island) Inc.		
Unsecured long-term debt	BBB (High)	A3

During the year, Terasen discontinued its commercial paper rating with DBRS.

A downward change in the credit ratings of the Company and its currently rated subsidiaries by one level on January 1, 2008 would have decreased earnings for the year ended December 31, 2008 by $0.7 million.

The following is an analysis of the contractual maturities of the Company's financial liabilities as at December 31, 2008.

In millions of dollars					
Financial liabilities	**≤ 1 year**	**> 1-3 years**	**4-5 years**	**> 5 years**	**Total**
Short-term notes	$ 353.5	$ -	$ -	$ -	$ 353.5
Accounts payable and accrued liabilities	455.0	-	-	-	455.0
Due to parent company	470.3	-	-	-	470.3
Long-term debt, including current portion	78.5	3.8	3.8	1,849.6	1,935.7
	$ 1,357.3	$ 3.8	$ 3.8	$ 1,849.6	$ 3,214.5
Derivative financial assets (liabilities)					
Commodity contracts	$ (69.4)	$ (22.4)	$ -	$ -	$ (91.8)
Foreign exchange forward	4.9	2.5	-	-	7.4

Market risk

Market risk is the risk that the fair value or future cash flows of a financial instrument will fluctuate due to changes in foreign exchange rates or market interest rates.

The Company's earnings are not exposed to changes in the US dollar-to-Canadian dollar exchange rate.

TGVI's US dollar payments under a contract for the construction of a LNG storage facility are exposed to fluctuations in the US dollar-to-Canadian dollar exchange rate. TGVI has entered into a foreign exchange forward contract to hedge this exposure. As at December 31, 2008, a 5 per cent appreciation of the US dollar-to-Canadian dollar exchange rate, as it impacts the measurement of the fair value of the foreign exchange forward contract, in the absence of rate regulation and with all other variables constant, would have increased earnings by $2.9 million for the year ended December 31, 2008. TGVI has regulatory approval to defer any increase or decrease in the fair value of the foreign exchange forward contract for recovery from, or refund to, customers in future rates. Therefore, any change in fair value would have impacted regulatory assets or liabilities rather than earnings.

Terasen Gas' and TGVI's natural gas derivatives are exposed to fluctuations in the US dollar-to-Canadian dollar exchange rate. The following sensitivity analysis estimates the impact on the fair value of natural gas commodity swaps and options of a 5 per cent appreciation and depreciation of the US dollar-to-Canadian dollar exchange rate, with all other variables remaining constant, for the year ended December 31, 2008. A 5 per cent appreciation of the US dollar-to-Canadian dollar exchange rate would change the fair value of natural gas commodity swaps and options by moving the fair value further out of the money by $0.8 million. This would result in an increase in "Accounts payable and accrued liabilities" and "Current Assets: Current portion of rate stabilization accounts." A 5 per cent depreciation of the US dollar-to-Canadian dollar exchange rate would change the fair value of natural gas commodity swaps and options by reducing the Company's out of the money position by $0.8 million. This would result in a decrease in "Accounts payable and accrued liabilities" and "Current Assets: Current portion of rate stabilization accounts."

The Company and its operating subsidiaries are exposed to interest rate risk associated with short-term borrowings and floating rate debt. The Company and its operating subsidiaries may enter into interest rate swaps to help reduce this risk. Approximately 100 per cent of the

Company's operating facilities are subject to interest rate risk while none of its long-term debt is subject to interest rate risk. In aggregate, the Company attempts to maintain an exposure of not more than 20 per cent of its debt portfolio in floating rate debt. A 50 basis point increase in interest rates would decrease earnings for the year ended December 31, 2008 by $1.8 million. The Company's regulated operations have existing regulatory deferrals that would absorb the impact of interest rate changes.

Commodity price risk

Terasen Gas and TGVI are exposed to risks associated with changes in the market price of natural gas as a result of the natural gas derivatives. Terasen Gas and TGVI's price risk management strategy covers a term of 36 months and aims to (i) improve the likelihood that natural gas prices remain competitive with electricity rates, (ii) dampen price volatility on customer rates and (iii) reduce the risk of regional price disconnects. Any differences between the effective cost of natural gas purchased and the price of natural gas included in rates are recorded in deferral accounts, and subject to regulatory approval, are passed through in future rates to customers. The accompanying Balance Sheet at December 31, 2008 includes a net deferral of $91.8 million included in the caption "Current Assets: Current portion of rate stabilization accounts" representing net unrealized losses on these hedges that are recoverable from customers through rates.

The Company's exposure to market risk includes forward-looking statements and represents an estimate of possible changes in fair value that would occur assuming hypothetical future movements in commodity prices. The Company's views on market risk are not necessarily indicative of actual results that may occur and do not represent the maximum possible gains and losses that may occur, since actual gains and losses will differ from those estimated, based on actual fluctuations in interest rates or commodity prices and the timing of transactions.

The following sensitivity analysis estimates the impact on the fair value of natural gas commodity swaps and options of a one dollar change in the value of the underlying price of natural gas, with all other variables remaining constant, for the year ended December 31, 2008. This analysis is for illustrative purposes only, as in practice market rates rarely change in isolation. If the price of natural gas decreased by one dollar per GJ, the change in the fair value of natural gas commodity swaps and options would be to move further out of the money by $51.5 million. This would result in an increase in "Accounts payable and accrued liabilities" and "Current Assets: Current portion of rate stabilization accounts." If the price of natural gas increased by one dollar per GJ, the change in the fair value of natural gas commodity swaps and options would be to reduce the Company's out of the money position by $53.9 million. This would result in a decrease in "Accounts payable and accrued liabilities" and "Current Assets: Current portion of rate stabilization accounts."

Capital management

The Company's principal business of regulated gas distribution utilities requires ongoing access to capital in order to allow it to fund the maintenance and expansion of infrastructure. Wherever possible, the Company raises debt at the subsidiary level to ensure regulatory transparency, tax efficiency and financing flexibility. In order to ensure access to capital is maintained, the Company targets a long-term consolidated capital structure of 35 per cent equity, including preference shares, 65 per cent debt and investment-grade credit ratings. As well, the Company and its subsidiaries have secured multi-year committed credit facilities to support short-term financing of capital expenditures and seasonal working capital requirements. Committed credit facilities at Terasen are available for general corporate purposes.

Each of the Company's regulated utilities maintains its own capital structure in line with the deemed capital structure approved by the BCUC and ranges between 35 and 40 per cent equity. The long-term capital structure is targeted to be no more than 35 per cent equity as the debt incurred is primarily in support of financing any premiums paid on acquisitions.

The consolidated capital structure of the Company is presented in the following table.

In millions of dollars	December 31, 2008			December 31, 2007		
			%			%
Total debt and capital lease obligations (net of cash and short-term investments)[1]	$	2,240.6	64.5	$	2,431.5	66.8
Shareholder's equity [2]	$	1,232.3	35.5	$	1,207.6	33.2
Total	$	3,472.9	100	$	3,639.1	100

1 Includes long-term debt, including current portion, and short-term borrowings, net of cash and short-term investments.

2 Includes preference shares classified as equity.

Certain of the Company's long-term debt obligations have covenants restricting the issuance of additional debt such that consolidated debt cannot exceed 75 per cent of the Company's capital structure, as defined by the long-term debt agreements. Similar restrictions on the issuance of additional debt also exist at the subsidiary level and are generally based on an interest coverage being at least two times available net earnings. In addition, certain of the Company's credit agreements require maintenance of certain financial covenants such as a maximum percentage of debt to equity or minimum interest coverage. As at December 31, 2008 and 2007, the Company and its subsidiaries were in compliance with these covenants.

The Company's credit ratings and credit facilities are disclosed under "Liquidity risk" in Note 15.

16. Related party transactions

The Company's current parent company Fortis Inc. provided corporate management services totalling approximately $4.3 million (2007 - $5.0 million provided by Fortis Inc. and former parent company, Kinder Morgan Inc.) for the year ended December 31, 2008.

The Company was charged interest of approximately $11.6 million (2007 - $3.7 million) during the year ended December 31, 2008 by Fortis Inc. on the borrowings from the parent company including borrowings for the purchase of FortisWest Inc. (FortisWest) shares. The amount due to the parent company is unsecured and due on demand and accrues interest at a bankers acceptance rate plus twenty five basis points.

On May 1, 2008, the Company borrowed $150.0 million from its parent company, Fortis Inc. The proceeds were used to purchase 6,000,000 Series C Preferred Shares (the Shares) of FortisWest, a subsidiary of Fortis Inc. The Shares entitle the Company to a fixed preferential cumulative cash dividend at a rate 6.75 per cent annually with dividends paid quarterly. The interest is also paid quarterly and the advance is due on demand and secured by a pledge of the Shares. For the period from May 1, 2008 to December 31, 2008, the Company paid interest of $6.5 million to Fortis Inc. on the demand loan and the Company received dividends from FortisWest of $6.7 million on the Shares.

The Company's parent, Fortis Inc., grants stock options to certain employees of the Company under its stock option plans. For the year ended December 31, 2008, the Company was charged and recorded an expense of $0.3 million (2007 - $0.1 million) for the fair value of the stock compensation granted by Fortis Inc.

Related party transactions are recorded at the exchange amount.

17. Commitments and contingencies

The Company's subsidiaries and proportionately consolidated entities have entered into operating leases for certain building space and natural gas transmission and distribution assets. In addition, Terasen Gas and TGVI have entered into gas purchase contracts that represent future purchase obligations.

The following table sets forth the Company's operating leases, gas purchase obligations and employee benefit plan contributions due in the years indicated:

In millions of dollars	Operating leases	Purchase obligations	Employee benefit plans	Total
2009	$ 17.4	$ 416.5	$ 10.8	$ 444.7
2010	16.1	26.9	8.5	51.5
2011	15.8	22.8	-	38.6
2012	15.3	-	-	15.3
2013	13.5	-	-	13.5
Thereafter	85.5	-	-	85.5
	$ 163.6	$ 466.2	$ 19.3	$ 649.1

Gas purchase contract commitments are based on market prices that vary with gas commodity indices. The amounts disclosed reflect index prices that were in effect at December 31, 2008. The employee benefit plan contributions have been estimated up to the date of the next actuarial valuation for each plan unless the valuation falls in the next twelve months then the Company has provided for an estimate of the contributions. Employee benefit plan contributions beyond the date of the next actuarial valuation cannot be accurately estimated.

In prior years, TGVI received non-interest bearing, repayable loans from the Federal and Provincial governments of $50 million and $25 million respectively, in connection with the construction and operation of the Vancouver Island natural gas pipeline. As approved by the BCUC, these loans have been recorded as government grants and have reduced the amounts reported for property, plant and equipment. The government loans are repayable in any fiscal year after 2002 and prior to 2012 under certain circumstances and subject to the ability of TGVI to obtain non-government subordinated debt financing on reasonable commercial terms. In 2006, all of the repayment criteria were met when TGVI obtained additional financing through a new credit agreement (Note 9(e)). In addition, since the conditions continue to be met (an annual test) TGVI is expected to make a repayment on the loans in 2009 of approximately $8.1 million (2008 - $6.5 million). As the loans are repaid and replaced with non-governmental loans, property, plant and equipment and long-term debt will increase in accordance with the approved capital structure, as will the rate base used in determining rates. The amounts are not included in the obligations in the table above as the amounts and timing of repayments is dependent upon the approved RDDA recovery each year and the ability to replace the loans with non-government subordinated debt financing on reasonable commercial terms.

Terasen Gas is disputing a $7.0 million assessment of BC Social Service Tax representing additional provincial sales tax and interest on the Southern Crossing Pipeline, which was completed in 2000. The amount was paid in full in 2006 to avoid the accrual of further interest and has been included in other assets. The matter is currently under appeal to the Supreme Court of British Columbia.

During 2007 and 2008 a non-regulated subsidiary of the Company received Notices of Assessment from Canada Revenue Agency for additional taxes related to its 1999 through 2003 taxation years. The Company has fully provided for the exposure in the financial statements. The Company has begun the appeal process on these assessments.

During the year the Company reached a settlement with Revenu Québec and Canada Revenue Agency related to amounts owing as a result of retroactive amending Québec tax legislation. In August 2008, the Company made payments of approximately $16.7 million to settle the tax liability. As a result of the tax settlement, an earnings benefit of $7.5 million was recorded during 2008.

In 2008, the Vancouver Island Gas Joint Venture commenced a claim against TGVI seeking damages for alleged past overpayments and a future reduction in their tolls. The Statement of Claim does not quantify damages and as such the Company cannot determine the amount of the claim at this time. It is the Company’s view that the claim is without merit.

A number of claims and lawsuits seeking damages and other relief are pending against the Company. Management is of the opinion, based upon information presently available, that it is unlikely that any liability, to the extent not provided for through insurance or otherwise, would be material in relation to the Company’s consolidated financial statements.

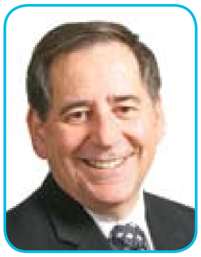
18. Guarantees

The Company has letters of credit outstanding at December 31, 2008 totalling $44.1 million (2007 - $98.8 million) to support its operations and capital projects, including $43.3 million (2007 - $42.9 million) for its unfunded supplemental pension benefit plans. As part of the sale of the Pipelines businesses and ultimate sale of Terasen to Fortis Inc, the Company received a letter of credit from Knight Inc. for those letters of credit that related to the Pipelines businesses. The letter of credit from Knight Inc. totals $0.5 million (2007 - $54.8 million) and would bring the total letters of credit outstanding at December 31, 2008 to $43.6 million (2007 - $44.0 million).

Board of Directors

The Board is responsible for the governance of Terasen Inc. and the Terasen Gas group of companies. Board members' diverse backgrounds and experience reflect the Fortis belief of community involvement in its companies.

With the Board's oversight, Terasen will successfully continue in its role as an energy solutions provider for British Columbians, supporting the Province's economic, energy and environmental goals into 2009 and beyond.



Harold G. Calla

Mr. Calla is Chair of the First Nations Financial Management Board. He is a member of the Squamish Nation and has served two terms on its Council. Since 1986 he has worked with the Squamish Nation representing its interests in commercial business, economic development and accommodation negotiations. Mr. Calla is on the Board of Directors of Partnerships BC and Canada Mortgage and Housing Corporation.

Brenda Eaton

Ms. Eaton is the Chair of BC Housing and is on the Board of Directors of Transelec, Powertech and several not-for-profit organizations. She has held a variety of senior positions in B.C. Public Service, most recently as Deputy Minister to the Premier and prior to that as Deputy Minister in Finance and Treasury Board, Energy Mines and Petroleum Resources and Social Services.

Ida J. Goodreau

Ms. Goodreau is President and CEO of Vancouver Coastal Health Authority. She has held executive positions in the health, forestry and natural gas sectors in Canada and internationally. She is on the Board of Directors of the Vancouver Board of Trade and serves as Chair of the Western Canada Health CEO Forum.

R.L. (Randy) Jespersen

Mr. Jespersen is the President and CEO of Terasen Inc. and the Terasen Gas group of companies. He has been with Terasen Gas Inc. since 1996. His extensive career spans more than 30 years in the energy industry including various roles in Calgary and Houston, Texas. He also serves on the Board of FortisBC Inc., and is a member of the Executive Committee of the Board of the Business Council of B.C. He is an immediate and Past Chair of the Board of the Canadian Gas Association and a former Chair of the Western Energy Institute.

H. Stanley Marshall

Mr. Marshall is the President and CEO of Fortis Inc., serving in this role since 1995. He is a member of the Law Society of Newfoundland and Labrador and is a Registered Professional Engineer. Mr. Marshall serves on the boards of several Fortis companies, is a Director of Toromont Industries Ltd. and is Chairman of the Terasen Inc. and Terasen Gas Inc. Boards.

Harry McWatters

Mr. McWatters is the President of Vintage Consulting Group Inc. and a leader in the British Columbia wine industry. He is the founding Chairman of the British Columbia Wine Institute, a Director of the Canadian Vintners Association, and the founding Chairman of the British Columbia Hospitality Foundation. He has served on the Board of Directors of FortisBC Inc. since 2005, served as Chairman since 2006, and has served on the Fortis Inc. Board since 2007.

Linda S. Petch

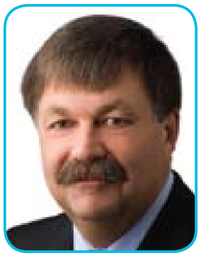
Ms. Petch is the President of Petch & Associates Management Consultants Ltd., a company providing governance and accountability framework services to boards. She is a member of the Board of Governors of RBC Mutual Funds and RBC Private Pools. Ms. Petch is a former director of the Vancouver Island Health Authority and the Health Employers Association of B.C.

Barry V. Perry

Mr. Perry is the Vice President, Finance and Chief Financial Officer of Fortis Inc. He has served in this position since 2004. Prior to his current position at Fortis, he held the position of Vice President, Finance and Chief Financial Officer of Newfoundland Power Inc. Mr. Perry also serves on the boards of several other Fortis companies.

David R. Podmore

Mr. Podmore is the President and CEO of Concert Properties Ltd., a national real estate enterprise he co-founded in 1989. He is the Chair of the B.C. Pavilion Corporation and a Director of LifeLabs Inc. and LifeLabs (B.C.) Inc. He is also Vice Chair of the British Columbia Institute of Technology Foundation, and Past President of the Urban Development Institute of B.C.



John C. Walker

Mr. Walker is the President and CEO of FortisBC Inc. He has worked with the Fortis group of companies since 1983, where he began his career with Newfoundland Power Inc. He is a member of several boards within the Fortis group of companies, including FortisBC Inc., FortisAlberta Inc. and Newfoundland Power Inc.

Leadership Team

Back row left to right: Douglas L. Stout, Dwain A. Bell, Robert M. Samels, Cynthia Des Brisay, Roger A. Dall'Antonia
Front row left to right: Scott A. Thomson, Jan A. Marston, R.L. (Randy) Jespersen, David C. Bennett

Dwain A. Bell *Vice President, Distribution, Terasen Gas*

Mr. Bell became Vice President, Distribution in 2005. He has more than 35 years of experience in the Canadian natural gas distribution business throughout BC and Alberta, including Terasen Gas and Centra Gas British Columbia Inc.

David C. Bennett *Vice President and General Counsel, Terasen Inc. and Terasen Gas group of companies*

Mr. Bennett practiced law in Vancouver until 2000 and then moved to London, England to practice in an international capital markets firm. He returned to BC in 2003 and was in private practice until joining FortisBC in 2004. Mr. Bennett also serves as Vice President, Regulatory Affairs and General Counsel for Fortis BC Inc.

Roger A. Dall'Antonia *Vice President, Corporate Development and Treasurer, Terasen Inc. and Terasen Gas group of companies*

Mr. Dall'Antonia rejoined Terasen in 2007, bringing 15 years of corporate finance and treasury experience. He has considerable experience in senior financial roles in the energy industry including positions with Terasen, Westcoast Energy and Versacold Income Fund.

Cynthia Des Brisay *Vice President, Gas Supply and Transmission, Terasen Gas*

Ms. Des Brisay has been with Terasen Gas since 1999. She has more than 23 years of experience in the energy industry, including oil, gas and independent power generation development in Canada and New Zealand. Her experience with Terasen Gas includes senior positions in major project and business development, most recently as Director, Business Development and Resource Planning.

R.L. (Randy) Jespersen *President and Chief Executive Officer, Terasen Inc. and the Terasen Gas group of companies*

Mr. Jespersen joined Terasen Gas Inc. in 1996. His extensive career spans more than 30 years in the energy industry including various roles in Calgary and Houston, Texas. He serves on the FortisBC Inc. Board, is past chair of the Canadian Gas Association Board and the Western Energy Institute, and is a member of the Executive Committee of the Business Council of British Columbia.

Jan A. Marston *Vice President, Human Resources and Operations Governance, Terasen Gas*

Ms. Marston has been with Terasen Gas since 1996. She has extensive knowledge in the oil and gas production industry and has held a variety of roles with Dome Petroleum, Amoco and Sceptre Resources Ltd. She is President of the Northwest Gas Association and serves on the Board of the Western Energy Institute.

Robert M. Samels *Vice President, Business Services and Chief Information Officer, Terasen Gas*

Mr. Samels joined Terasen Gas in 1991. He spent 12 years as an accountant in private practice prior to becoming Controller and Treasurer of Trans Mountain Pipe Line and holding various senior roles at Terasen Gas including Director of Internal Audit.

Douglas L. Stout *Vice President, Marketing and Business Development, Terasen Gas*

Mr. Stout joined the company in 2001 as Vice President, Gas Supply and Transmission. He has held senior roles with Belkorp Industries Inc. and Husky Energy Inc. and has served as Director for Sultran Ltd., Pacific Coast Terminals and Hillsborough Resources.

Scott A. Thomson *Vice President, Regulatory Affairs and Chief Financial Officer, Terasen Inc. and Terasen Gas group of companies*

Mr. Thomson joined Terasen Gas in 1999. He gained considerable accounting and management consulting experience with Ernst & Young, where he earned his CA in 1988. In 2003, he became Vice President, Finance and Regulatory Affairs for Terasen Gas.

Attachment 78.2

EXHIBIT 13
APPENDIX 3
THE SENSITIVITY OF THE FORWARD-LOOKING REQUIRED EQUITY RISK PREMIUM ON UTILITY STOCKS TO CHANGES IN INTEREST RATES

My estimate of the required equity risk premium on utility stocks is based on studies of the discounted cash flow ("DCF") expected return on comparable groups of utilities in each month of my study period compared to the interest rate on long-term government bonds. Specifically, for each month in my study period, I calculate the risk premium using the equation

$$RP_{COMP} = DCF_{COMP} - I_B$$

where:

RP_{COMP} = the required risk premium on an equity investment in the comparable companies,

DCF_{COMP} = average DCF expected rate of return on a portfolio of comparable companies; and

I_B = the yield to maturity on an investment in long-term U.S. Treasury bonds.

<u>Electric Company Ex Ante Risk Premium Analysis</u>. For my electric company ex ante risk premium analysis, I began with the Moody's group of 24 electric companies shown in Table 1. I used the Moody's group of electric companies because they are a widely followed group of electric utilities, and use of this constant group greatly simplified the data collection task required to estimate the ex ante risk premium over the months of my study. Simplifying the data collection task was desirable because the ex ante risk premium approach requires that the DCF model be estimated for every company in every month of the study period. Exhibit 5 displays the average DCF expected return on an investment in the portfolio of electric companies and the yield to maturity on long-term Treasury bonds in each month of the study.

Previous studies have shown that the ex ante risk premium tends to vary inversely with the level of interest rates, that is, the risk premium tends to increase when interest rates decline, and decrease when interest rates go up. To test whether my studies also indicate that the ex ante risk premium varies inversely with the level of interest rates, I performed a regression analysis of the relationship between the ex ante risk premium and the yield to maturity on long-term Treasury bonds, using the equation,

$$RP_{COMP} = a + (b \times I_B) + e$$

where:

RP_{COMP}	=	risk premium on comparable company group;
I_B	=	yield to maturity on long-term U.S. Treasury bonds;
e	=	a random residual; and
a, b	=	coefficients estimated by the regression procedure.

Regression analysis assumes that the statistical residuals from the regression equation are random. My examination of the residuals revealed that there is a significant probability that the residuals are serially correlated (non-zero serial correlation indicates that the residual in one time period tends to be correlated with the residual in the previous time period). Therefore, I made adjustments to my data to correct for the possibility of serial correlation in the residuals.

The common procedure for dealing with serial correlation in the residuals is to estimate the regression coefficients in two steps. First, a multiple regression analysis is used to estimate the serial correlation coefficient, *r*. Second, the estimated serial correlation coefficient is used to transform the original variables into new variables whose serial correlation is approximately zero. The regression coefficients are then re-estimated using the transformed variables as inputs in the regression equation. Based on my regression analysis of the statistical relationship between the yield to maturity on long-term Treasury bonds and the required risk premium, my estimate of the ex ante risk premium on an investment in my proxy electric company group as compared to an investment in long-term Treasury bonds is given by the equation:

$$RP_{COMP} = 12.10 \quad - \quad -1.123 \times I_B.$$

$$(12.96) \qquad (-8.44)^{[1]} \quad R^2 = 39.07 \text{ percent.}$$

This equation suggests that the ex ante risk premium on electric utility stocks increases by more than 100 basis points when the interest rate on long-term Treasury bonds declines by

[1] The t-statistics are shown in parentheses.

100 basis points. [2] Equivalently, this regression equation suggests that the cost of equity for electric utilities declines by less than 20 basis points when the interest rate on long-term Treasury bonds declines by 100 basis points. These data demonstrate that the AAM ROE Formula, which assumes that the cost of equity declines by 75 basis points when the yield to maturity on long Canada bonds declines by 100 basis points, is not appropriate for estimating the cost of equity.

Using the 2010 forecast 3.62 percent yield to maturity on long-term Canada bonds obtained from Consensus Economics as of March 2009, the regression equation produces an ex ante risk premium equal to 8.0 percent (12.1 – 1.123 x 3.62 = 8.0).

<u>Natural Gas Company Ex Ante Risk Premium Analysis</u>. I also conducted an ex ante risk premium study applied to a natural gas proxy group and followed the procedures described above. To select my ex ante risk premium natural gas proxy group of companies, I used the same criteria that I use when estimating the DCF cost of equity, namely, I selected all the companies in Value Line's groups of natural gas companies that: (1) paid dividends during every quarter of the last two years; (2) did not decrease dividends during any quarter of the past two years; (3) had at least three analysts included in the I/B/E/S mean growth forecast; (4) have an investment grade bond rating and a Value Line Safety Rank of 1, 2, or 3; and (5) have not announced a merger. Exhibit 6 displays the results of my ex ante risk premium study, showing the average DCF expected return on an

---

[2] Dr. Vander Weide uses the yield on long-term government bonds as the interest rate in his ex ante risk premium analyses. The unusual result that the ex ante risk premium on electric utility stocks increases by more than 100 basis points when the interest rate on long-term Treasury bonds decreases is significantly affected by the unusual capital market conditions since September 2008. Since that time, the DCF cost of equity for utilities has increased at the same time that the interest rate on long-term Treasury bonds has declined significantly due to the active intervention of the U. S. Government to lower interest rates in the face of difficult economic conditions. The unusual result disappears if the interest rate on A-rated utility bonds is used in the regression rather than the interest rate on long-term Government bonds. Specifically, when the yield on A-rated utility bonds in the regression, the bond coefficient is -0.5918, indicating that the risk premium over A-rated utility bonds increases by approximately 60 basis points when the yield on A-rated utility bonds declines by 100 basis points. Using a forecasted yield on A-rated utility bonds equal to 6.32 percent in the regression equation produces a required risk premium over A-rated utility bonds equal to 5.1 percent and a cost of equity equal to 11.4 percent.

investment in the portfolio of natural gas companies and the yield to maturity on long-term Treasury bonds in each month.[3]

Based on my knowledge of the statistical relationship between the yield to maturity on long-term Treasury bonds and the required risk premium, my estimate of the ex ante risk premium on an investment in my proxy natural gas companies as compared to an investment in long-term Treasury bonds is given by the equation:

$$RP_{COMP} = 10.26 - 7.73 \times I_B.$$
$$(15.44) \qquad (-6.20)\text{[4]} \quad R^2 = 23.40 \text{ percent}$$

This equation suggests that the ex ante risk premium on natural gas utility stocks increases by more than 75 basis points when the interest rate on long-term Treasury bonds declines by 100 basis points. Equivalently, this regression equation suggests that the cost of equity for natural gas utilities declines by less than 25 basis points when the interest rate on long-term Treasury bonds declines by 100 basis points. These data demonstrate that the AAM ROE Formula, which assumes that the cost of equity declines by 75 basis points when the yield to maturity on long Canada bonds declines by 100 basis points, is not appropriate for estimating the cost of equity.

Using the 3.62 percent forecast yield to maturity on long-term Canada bonds for 2010, the regression equation produces an ex ante risk premium equal to 7.46 percent (10.26 – 7.73 x 3.62 = 7.46).

As described above, my ex ante risk premium regression analysis indicates that the cost of equity for utilities is significantly less sensitive to interest rate changes than the AAM ROE Formula implies. Rather than declining by 75 basis points when the yield to maturity on long-term government bonds declines by 100 basis points, my analysis indicates that the cost of equity declines by significantly less than 50 basis points when interest rates decline by 100 basis points.

---

[3] My two ex ante risk premium studies cover slightly different time periods, with the natural gas company risk premium study extending over a longer period of time, because I began doing an ex ante study using natural gas companies before I began performing a similar study for the electric companies.

[4] The t-statistics are shown in parentheses.

Xcel Energy Inc.

Source of data: *Mergent Public Utility Manual*, August 2002. Of these 24 companies, I did not include three companies in my ex ante risk premium DCF analysis because there was insufficient data to perform a DCF analysis for most of my study period. Specifically, IPALCO merged with a company that is not in the electric utility industry; Reliant divested its electric utility operations; and CH Energy does not have any I/B/E/S analysts' estimates of long-term growth. In addition, Cinergy completed its merger with Duke Energy in 2006.

New Issue **March 7, 2007**

SHORT FORM PROSPECTUS

FORTIS INC.

$1,001,000,000
38,500,000 Subscription Receipts, each representing the right to receive one Common Share

Fortis Inc. (''Fortis'' or the ''Corporation'') is hereby qualifying for distribution (the ''Offering'') 38,500,000 subscription receipts (the ''Subscription Receipts''), each of which will entitle the holder thereof to receive, upon satisfaction of the Release Conditions (as defined below), and without payment of additional consideration, one common share of Fortis (a ''Common Share''). The gross proceeds from the sale of the Subscription Receipts (the ''Escrowed Funds'') will be held by Computershare Trust Company of Canada, as escrow agent (the ''Escrow Agent'') and invested in short-term interest bearing or discount debt obligations issued or guaranteed by the Government of Canada or a province, or one or more of the five largest Canadian chartered banks, provided that in all cases such obligation is rated at least R1 (middle) by DBRS Limited or an equivalent rating from an equivalent rating service, pending receipt by the Corporation of all regulatory and government approvals required to finalize the acquisition (the ''Acquisition'') by the Corporation of all of the issued and outstanding shares of Terasen Inc. (''Terasen''), a wholly owned subsidiary of Kinder Morgan, Inc., including that of the British Columbia Utilities Commission, and fulfillment or waiver of all other outstanding conditions precedent to closing the Acquisition as itemized in the Acquisition Agreement (as defined below) (collectively, the ''Release Conditions''). At the time of the Acquisition, Terasen will have divested itself of its petroleum transportation operations and will only hold its natural gas distribution business and an interest in CustomerWorks Limited Partnership. See ''The Acquisition'', ''The Acquired Business'' and ''Details of the Offering''.

If the Release Conditions are satisfied prior to 5:00 p.m. (Toronto time) on November 30, 2007, the Corporation will forthwith execute and deliver a notice of satisfaction and will issue and deliver to the Escrow Agent one Common Share for each Subscription Receipt then outstanding (subject to any applicable adjustment). The Common Shares will be available for delivery commencing on the second business day after the delivery of such notice. The holders of Subscription Receipts will receive, without payment of any additional consideration, one Common Share for each Subscription Receipt held plus an amount equal to the dividends declared on the Common Shares by the Corporation, if any, for which record dates have occurred during the period from the Closing Date (as defined below) to the date of issuance of the Common Shares in respect of the Subscription Receipts. Forthwith upon the Release Conditions being satisfied and the required notice being delivered to the Escrow Agent, the Escrowed Funds, together with interest earned and income generated thereon, will be released to Fortis. In the event that the Release Conditions are not satisfied prior to 5:00 p.m. (Toronto time) on November 30, 2007, or if the Acquisition Agreement is terminated prior to such time (in either case, the ''Termination Time''), holders of Subscription Receipts shall, commencing on the second business day following the Termination Time, be entitled to receive from the Escrow Agent an amount equal to the full subscription price thereof plus their *pro rata* share of the interest earned or income generated on such amount. See ''Details of the Offering''.

Price: $26.00 per Subscription Receipt

	Price to the Public	**Underwriters' Fee** (1)	**Net Proceeds to the Corporation** (2)
Per Subscription Receipt	$26.00	$1.04	$24.96
Total (3)	$1,001,000,000	$40,040,000	$960,960,000

(1) One-half of the Underwriters' fee is payable at the closing of the Offering. The other half of the Underwriters' fee is payable only if the Release Conditions have been satisfied prior to the Termination Time and the required notice has been delivered to the Escrow Agent. See ''Plan of Distribution''.

(2) Net proceeds to the Corporation exclude any interest earned and income generated on the Escrowed Funds and are calculated before deducting the expenses of the Offering, estimated at $1,250,000, which, together with the Underwriters' fee, will be paid out of the general funds of Fortis. See ''Plan of Distribution''.

(3) The Corporation has granted to the Underwriters an option (the ''Over-Allotment Option''), exercisable in whole or in part at any time until 30 days following the date of closing of the Offering, to purchase at the Offering Price up to 5,775,000 additional Subscription Receipts to cover over-allotments, if any. If the Over-Allotment Option is exercised in full, the total Price to the Public, Underwriters' Fee and Net Proceeds to the Corporation will be $1,151,150,000, $46,046,000 and $1,105,104,000, respectively. See ''Plan of Distribution''. This prospectus also qualifies the grant of the Over-Allotment Option and the distribution of the securities issuable on the exercise of the Over-Allotment Option.

Underwriters' Position	**Maximum Size**	**Exercise Period**	**Exercise Price**
Over-Allotment Option	5,775,000 Subscription Receipts	Within 30 days following the closing of the Offering	$26.00 per Subscription Receipt

There is currently no market through which the Subscription Receipts may be sold and purchasers may not be able to resell securities purchased under this short form prospectus (the ''Prospectus''). This may affect the pricing of the securities in the secondary market, the transparency and availability of trading prices, the liquidity of the securities, and the extent of issuer regulation. See ''Risk Factors''.

The Toronto Stock Exchange (the ''TSX'') has conditionally approved the listing of the Subscription Receipts, as well as the Common Shares issuable on the exchange of the Subscription Receipts. Listing is subject to the Corporation fulfilling all of the requirements of the TSX on or before June 3, 2007. The Corporation's outstanding Common Shares are listed on the TSX under the symbol ''FTS''. On March 6, 2007, the closing price of the Common Shares on the TSX was $26.80. The Subscription Receipts will be issued and sold by Fortis to the Underwriters (as defined below) at the price of $26.00 (the ''Offering Price'') per Subscription Receipt. The Offering Price and other terms of the Offering were determined by negotiation between the Corporation and the Underwriters.

An investment in the Subscription Receipts, and the Common Shares issuable upon the exchange thereof, involves certain risks that should be considered by a prospective purchaser. See ''Risk Factors''.

CIBC World Markets Inc. (''CIBCWM''), Scotia Capital Inc. (''Scotia Capital''), TD Securities Inc. (''TD Securities''), BMO Nesbitt Burns Inc. (''BMO Nesbitt Burns''), RBC Dominion Securities Inc. (''RBCDS''), National Bank Financial Inc. (''NB Financial''), Canaccord Capital Corporation, Beacon Securities Limited and HSBC Securities (Canada) Inc. (''HSBC Securities'') are acting as underwriters (collectively, the ''Underwriters'') of the Offering. The Underwriters, as principals, conditionally offer the Subscription Receipts, subject to prior sale, if, as and when issued, sold and delivered by the Corporation to, and accepted by, the Underwriters in accordance with the terms and conditions contained in the Underwriting Agreement referred to under ''Plan of Distribution'' and subject to the approval of certain legal matters on behalf of the Corporation by Davies Ward Phillips & Vineberg LLP, Toronto and McInnes Cooper, St. John's and on behalf of the Underwriters by Stikeman Elliott LLP, Toronto. Subject to applicable laws, the Underwriters may, in connection with the Offering, effect transactions which stabilize or maintain the market price of the Subscription Receipts or the Common Shares at levels other than those which may prevail on the open market. Such transactions, if commenced, may be discontinued at any time. See ''Plan of Distribution''.

CIBCWM is an affiliate of a Canadian chartered bank that has agreed to extend credit facilities to the Corporation in connection with financing the Acquisition. CIBCWM is also acting as financial advisor to Fortis in connection with the Acquisition and receiving a fee therefor. In addition, each of CIBCWM, Scotia Capital, TD Securities, BMO Nesbitt Burns, RBCDS, NB Financial and HSBC Securities is a subsidiary of a Canadian chartered bank that has, either solely or as a member of a syndicate of financial institutions, extended credit facilities to the Corporation and/or its subsidiaries. Consequently, the Corporation may be considered a ''connected issuer'' of these Underwriters within the meaning of applicable securities legislation. See ''Plan of Distribution''.

Subscriptions for the Subscription Receipts will be received subject to rejection or allotment in whole or in part and the right is reserved to close the subscription books at any time without notice. It is expected that the closing of the Offering will take place on or about March 15, 2007 (the ''Closing Date''), or such other date as may be agreed upon by the Corporation and the Underwriters, but not later than April 18, 2007. A book entry only certificate representing the Subscription Receipts distributed hereunder will be issued in registered form only to CDS Clearing and Depository Services Inc. (''CDS'') or its nominee and will be deposited with CDS on the Closing Date. The Corporation understands that a purchaser of Subscription Receipts will receive only a customer confirmation from the registered dealer who is a CDS participant from or through whom the Subscription Receipts are purchased. See ''Details of the Offering''.

TABLE OF CONTENTS

SPECIAL NOTE REGARDING FORWARD-LOOKING STATEMENTS

The Prospectus, including the documents incorporated herein by reference, contain forward-looking statements which reflect management's expectations regarding the future growth, results of operations, performance, and business prospects and opportunities of Fortis Inc. Wherever possible, words such as ''anticipate'', ''believe'', ''expect'', ''intend'' and similar expressions have been used to identify these forward-looking statements. These statements reflect management's current beliefs and are based on information currently available to the Corporation's management. Forward-looking statements involve significant risk, uncertainties and assumptions. A number of factors could cause actual results, performance or achievements to differ materially from the results discussed or implied in the forward-looking statements. These factors should be considered carefully and prospective investors should not place undue reliance on the forward-looking statements. Although the forward-looking statements contained in the Prospectus, including the documents incorporated herein by reference, are based upon what management believes to be reasonable assumptions, the Corporation cannot assure prospective purchasers that actual results will be consistent with these forward-looking statements. These forward-looking statements are made as of the date of the Prospectus, and the Corporation assumes no obligation to update or revise them to reflect new events or circumstances.

DOCUMENTS INCORPORATED BY REFERENCE

The disclosure documents of the Corporation listed below and filed with the appropriate securities commissions or similar regulatory authorities in each of the provinces of Canada are specifically incorporated by reference into and form an integral part of this Prospectus:

(a) annual information form dated March 29, 2006 for the year ended December 31, 2005;

(b) audited comparative consolidated financial statements as at December 31, 2005 and for the years ended December 31, 2005 and 2004, together with the notes thereto and the auditors' report thereon dated January 27, 2006 as contained in the Corporation's 2005 Annual Report;

(c) Management Discussion and Analysis of financial condition and results of operations for the year ended December 31, 2005 as contained in the Corporation's 2005 Annual Report;

(d) unaudited comparative interim consolidated financial statements as at September 30, 2006 and for the three- and nine-month periods ended September 30, 2006 and 2005, together with the notes thereto;

(e) Management Discussion and Analysis of financial condition and results of operations for the three- and nine-month periods ended September 30, 2006;

(f) Management Information Circular dated March 17, 2006 prepared in connection with the Corporation's annual meeting of shareholders held on May 2, 2006;

(g) material change report dated September 15, 2006 describing the entering into of an agreement between the Corporation and a syndicate of underwriters led by BMO Nesbitt Burns Inc. for the public offering by the Corporation of 5,000,000 4.90% cumulative redeemable First Preference Shares, Series F;

(h) material change report dated January 5, 2007 describing the entering into of an agreement between the Corporation and Scotia Capital Inc. and CIBCWM for the public offering by the Corporation of 5,170,000 Common Shares;

(i) press release dated February 8, 2007 with respect to the Corporation's unaudited comparative interim consolidated financial statements as at December 31, 2006 and for the three- and twelve-month periods ended December 31, 2006 and 2005, together with the notes thereto, and with respect to the related Management Discussion and Analysis of financial condition and results of operations for the three- and twelve-month periods ended December 31, 2006; and

(j) material change report dated February 28, 2007 describing the entering into of (i) an agreement pursuant to which the Corporation will acquire all of the outstanding shares of Terasen for a purchase price of $3.7 billion, including the assumption of approximately $2.3 billion of debt, and (ii) an agreement between the Corporation, CIBCWM, Scotia Capital and TD Securities for the public offering by the Corporation of 38,500,000 subscription receipts and up to an additional 5,775,000 subscription receipts pursuant to an over-allotment option.

Any document of the type referred to in the preceding paragraph (other than any confidential material change report) subsequently filed by the Corporation with such securities commissions or regulatory authorities after the date of the Prospectus, and prior to the termination of the Offering, shall be deemed to be incorporated by reference into the Prospectus.

Any statement contained in a document incorporated or deemed to be incorporated by reference herein shall be deemed to be modified or superseded for purposes of this Prospectus to the extent that a statement contained herein, or in any other subsequently filed document which also is incorporated or is deemed to be incorporated by reference herein, modifies or supersedes such statement. The modifying or superseding statement need not state that it has modified or superseded a prior statement or include any other information set forth in the document that it modifies or supersedes. The making of a modifying or superseding statement will not be deemed an admission for any purpose that the modified or superseded statement, when made, constituted a misrepresentation, an untrue statement of a material fact or an omission to state a material fact that is required to be stated or that is necessary to make a statement not misleading in light of the circumstances in which it was made. Any statement so modified or superseded shall not be deemed, except as so modified or superseded, to constitute a part of this Prospectus.

Copies of the documents incorporated herein by reference may be obtained on request without charge from the Secretary of the Corporation at Suite 1201, 139 Water Street, St. John's, Newfoundland and Labrador A1B 3T2 (telephone (709) 737-2800). These documents are also available through the Internet on the Corporation's website at www.fortisinc.com or on the Canadian System for Electronic Document Analysis and Retrieval (''SEDAR'') which can be accessed at www.sedar.com. Reference is also made to information regarding Terasen Inc. (''Terasen'') which is available through the internet at Terasen's website at www.terasen.com. The information contained on, or accessible through, any of these websites is not incorporated by reference into the Prospectus and is not, and should not be considered to be, a part of the Prospectus, unless it is explicitly so incorporated.

ELIGIBILITY FOR INVESTMENT

In the opinion of Davies Ward Phillips & Vineberg LLP, counsel to the Corporation, and Stikeman Elliott LLP, counsel to the Underwriters, the Subscription Receipts and the Common Shares issuable on the exchange of the Subscription Receipts, if issued on the date hereof, would be qualified investments under the *Income Tax Act* (Canada) (the ''Tax Act'') for a trust governed by a registered retirement savings plan, registered retirement income fund, deferred profit sharing plan or registered education savings plan provided that, in the case of the Subscription Receipts, the Corporation deals at arm's length (within the meaning of the Tax Act) with each person who is an annuitant, beneficiary, employer or subscriber under the governing plan of such trust.

DEFINED TERMS

For an explanation of certain terms and abbreviations used in the Prospectus, reference is made to the ''Glossary of Terms''.

SUMMARY

The following information is a summary only and is to be read in conjunction with, and is qualified in its entirety by, the more detailed information appearing elsewhere in the Prospectus and in the documents incorporated by reference herein.

The Offering

Issuer:	Fortis Inc. (''Fortis'' or the ''Corporation'').
Offering:	38,500,000 subscription receipts (the ''Subscription Receipts''), each representing the right to receive one common share of Fortis (a ''Common Share'').
Amount:	\$1,001,000,000 (\$1,151,150,000 if the Over-Allotment Option is exercised in full).
Over-Allotment Option:	The Corporation has granted to the Underwriters (as defined below) an option (the ''Over-Allotment Option''), exercisable in whole or in part at any time until 30 days following the date of closing of this offering (the ''Offering''), to purchase at the Offering Price up to 5,775,000 additional Subscription Receipts to cover over-allotments, if any. See ''Plan of Distribution''.
Price:	\$26.00 per Subscription Receipt.
Date of Closing:	On or about March 15, 2007 or such date as agreed to by the Corporation and the Underwriters, but not later than April 18, 2007 (the ''Closing Date'').
Escrow of Proceeds:	The gross proceeds from the sale of the Subscription Receipts (the ''Escrowed Funds'') will be held by Computershare Trust Company of Canada, as escrow agent (the ''Escrow Agent'') and invested in short-term interest bearing or discount debt obligations issued or guaranteed by the Government of Canada or a province, or one or more of the five largest Canadian chartered banks, provided that in all cases such obligation is rated at least R1 (middle) by DBRS Limited or an equivalent rating from an equivalent rating service, pending receipt by the Corporation of all regulatory and government approvals required to finalize the acquisition (the ''Acquisition'') by the Corporation of all of the issued and outstanding shares of Terasen Inc. (''Terasen''), a wholly owned subsidiary of Kinder Morgan, Inc. (''Kinder Morgan''), including that of the British Columbia Utilities Commission (the ''BCUC''), and fulfillment or waiver of all other outstanding conditions precedent to closing the Acquisition as itemized in the Acquisition Agreement (as defined below) (collectively, the ''Release Conditions''). If the Release Conditions are satisfied prior to 5:00 p.m. (Toronto time) on November 30, 2007, the Corporation will forthwith execute and deliver a notice of satisfaction and will issue and deliver to the Escrow Agent one Common Share for each Subscription Receipt then outstanding (subject to any applicable adjustment). The Common Shares will be available for delivery commencing on the second business day after the delivery of such notice. The holders of Subscription Receipts will receive, without payment of any additional consideration, one Common

	Share for each Subscription Receipt held plus an amount equal to the dividends declared on the Common Shares by the Corporation, if any, for which record dates have occurred during the period from the Closing Date (as defined below) to the date of issuance of the Common Shares in respect of the Subscription Receipts. Forthwith upon the Release Conditions being satisfied and the required notice being delivered to the Escrow Agent, the Escrowed Funds, together with interest earned and income generated thereon, will be released to Fortis. In the event that the Release Conditions are not satisfied prior to 5:00 p.m. (Toronto time) on November 30, 2007, or if the Acquisition Agreement is terminated prior to such time (in either case, the ''Termination Time''), holders of Subscription Receipts shall, commencing on the second business day following the Termination Time, be entitled to receive from the Escrow Agent an amount equal to the full subscription price thereof plus their *pro rata* share of the interest earned or income generated on such amount. See ''Details of the Offering''.
Use of Proceeds:	The proceeds of the Offering, after deducting the fee payable to CIBC World Markets Inc. (''CIBCWM''), Scotia Capital Inc. (''Scotia Capital''), TD Securities Inc. (''TD Securities''), BMO Nesbitt Burns Inc. (''BMO Nesbitt Burns''), RBC Dominion Securities Inc. (''RBCDS''), National Bank Financial Inc. (''NB Financial''), Canaccord Capital Corporation, Beacon Securities Limited and HSBC Securities (Canada) Inc. (''HSBC Securities'') (collectively, the ''Underwriters'') and expenses of the Offering, which are estimated to be $1,250,000, and assuming no exercise of the Over-Allotment Option, together with funds to be advanced under acquisition financing arranged by the Corporation, will be used to finance the cash portion of the consideration payable for the Acquisition. If the Over-Allotment Option is exercised in full, the estimated proceeds of the Offering will be $1,103,854,000 (after deducting the fee payable to the Underwriters and expenses of the Offering). The gross proceeds from the sale of the Subscription Receipts will be held in escrow pending the satisfaction of the Release Conditions, which is expected to occur in mid-2007. See ''Financing of the Acquisition'', ''Details of the Offering'' and ''Use of Proceeds''.
Subscription Receipts:	Each Subscription Receipt entitles the holder thereof to receive, without payment of additional consideration and upon satisfaction of the Release Conditions, one Common Share, plus an amount equal to the dividends declared on the Common Shares by the Corporation, if any, for which record dates have occurred during the period from the Closing Date to the date of issuance of the Common Shares in respect of the Subscription Receipts. If the Release Conditions are not met prior to the Termination Time, the Corporation will repay to holders of Subscription Receipts an amount equal to the full subscription price thereof plus their *pro rata* share of the interest earned or income generated on such amount. See ''Details of the Offering''.
Risk Factors:	An investment in the Subscription Receipts and the Common Shares issuable upon exchange thereof involves certain risks which should be carefully considered by prospective investors, including: regulation, forecasting accuracy, asset maintenance, operational risks, weather and other natural disasters, the supply and prices of natural gas, seasonality, risks relating to Terasen Gas (Vancouver Island) Inc., obtaining and maintaining government permits, impact of changes in economic

conditions, availability of capital resources and credit ratings, exposure to interest rate changes, counterparty credit risk, potential undisclosed liabilities associated with the Acquisition, ability to maintain satisfactory labour relations, matters relating to insurance, environmental matters, First Nations' Lands, results of operations and financing risks, management of expanding operations, the ability to realize benefits from the Acquisition, the Subscription Receipt structure and the lack of an existing market for the Subscription Receipts. See ''Risk Factors''.

The Acquisition

Overview

On February 26, 2007, Fortis entered into an agreement (the ''Acquisition Agreement'') with 3211953 Nova Scotia Company and Kinder Morgan for the purchase of all of the issued and outstanding shares of Terasen for aggregate consideration of $3.7 billion, including the assumption of approximately $2.3 billion of consolidated indebtedness of Terasen. Terasen is a holding company headquartered in Vancouver, British Columbia, operating two principal lines of business: natural gas distribution and petroleum transportation. Prior to the closing of the Acquisition, Kinder Morgan will cause Terasen to divest itself of its petroleum transportation operations, leaving only the natural gas distribution business operated by Terasen Gas (as defined below). As part of such divestiture, on March 5, 2007, Kinder Morgan announced that it had agreed to sell the Corridor pipeline system, which is owned by Terasen and serves the Athabasca oil sands, to Inter Pipeline Fund.

The closing of the Acquisition is subject to receipt of required regulatory and other approvals, including that of the BCUC, and the satisfaction of certain closing conditions. The closing of the Acquisition is expected to occur in mid-2007. See ''Acquisition Agreement''.

Based on financial information as at September 30, 2006, following the Acquisition, Fortis' total assets will increase by approximately 94% to $8.9 billion. Following the Acquisition, Fortis' regulated rate base assets will increase to approximately $6.0 billion, of which approximately 93% will be located in Canada.

Kinder Morgan

Kinder Morgan is one of the largest energy transportation, storage and distribution companies in North America. It owns an interest in or operates approximately 65,000 kilometers of pipelines that transport primarily natural gas, crude oil, petroleum products and carbon dioxide, and serves more than 1.1 million natural gas distribution customers in British Columbia, Colorado, Nebraska and Wyoming. Kinder Morgan owns the general partner interest of Kinder Morgan Energy Partners, L.P., one of the largest publicly traded pipeline limited partnerships in the United States.

On November 30, 2005, Kinder Morgan completed the acquisition of Terasen (formerly, BC Gas Inc.). On May 19, 2006, Terasen completed the disposition of its water, wastewater and utility services business carried on by Terasen Water and Utility Services Inc. to a consortium led by CAI Capital Management Co.

On August 14, 2006, Kinder Morgan announced that it was selling its natural gas retail distribution operations serving customers in Colorado, Nebraska, Wyoming and Hermosillo, Mexico, to GE Energy Financial Services. On December 19, 2006, management of Kinder Morgan received shareholder approval of a US$22 billion leveraged management buyout offer led by Richard Kinder, Chairman and Chief Executive Officer, Kinder Morgan. The completion of this buyout is pending.

Terasen Gas

The natural gas distribution business of Terasen is carried on by Terasen Gas Inc. (''TGI''), Terasen Gas (Vancouver Island) Inc. (''TGVI'') and Terasen Gas (Whistler) Inc. (''TGWI''). Terasen also owns a 30% interest in

CustomerWorks Limited Partnership (''CWP''). CWP is a non-regulated shared services business in partnership with Enbridge Inc. that provides customer service contact, meter reading, billing, support and credit and collection services primarily to Terasen Gas (as defined below) and Enbridge Gas Distribution Inc. CWP outsources these services to a company owned and operated by Accenture Inc. In this Prospectus, TGI, TGVI, TGWI and CWP are collectively referred to as ''Terasen Gas''.

Terasen Gas is the principal gas distribution utility in British Columbia, serving the populous lower mainland, Vancouver Island and the southern interior of the province. With approximately 900,000 customers in 125 communities, Terasen Gas provides service to over 95% of the gas customers in British Columbia. Terasen Gas owns and operates approximately 44,100 kilometers of natural gas distribution pipelines and approximately 4,300 kilometers of natural gas transmission pipelines. As of September 30, 2006, Terasen Gas had an aggregate of $3.6 billion of assets, an aggregate rate base of almost $3.0 billion and approximately 1,200 employees.

Acquisition Rationale

The business operated by Terasen Gas is attractive to Fortis for the following reasons: (i) Terasen Gas will significantly increase the earnings of Fortis from regulated utilities and be immediately accretive to earnings per share; (ii) the regulated gas distribution business of Terasen Gas complements the regulated electric distribution business of Fortis; and (iii) the service territory of Terasen Gas is experiencing strong economic growth and includes substantially all of the service territory of FortisBC Inc.

Fortis believes that the principal benefits of the Acquisition are as follows:

(a) the purchase price represents approximately 1.2 times the approved rate base of Terasen Gas for 2007 and the Acquisition is expected to be immediately accretive to earnings per share;

(b) the Acquisition will increase the regulated rate base assets and utility earnings of Fortis. Similar to the electric distribution utilities of Fortis, Terasen Gas operates under principally cost-of-service regulation under which an appropriate return on capital is recovered in addition to prudently incurred operating and commodity costs;

(c) Terasen Gas has an attractive gas distribution franchise with a well-diversified, mature, principally residential, customer base. The Acquisition is expected to improve the risk profile of Fortis by providing it with a more economically diverse portfolio of assets;

(d) following the Acquisition, Fortis will be the largest investor-owned utility in gas and electric distribution in Canada with regulated electricity distribution utilities in five Canadian provinces and three Caribbean countries and regulated gas distribution utilities in British Columbia. Following the Acquisition, a large proportion of the business of Fortis will serve the high-growth economies of western Canada; and

(e) Fortis believes the regulated gas distribution business of Terasen Gas is complementary to the Corporation's proven core competencies in managing regulated electric distribution utilities. The Acquisition affords Fortis management an opportunity to deploy its regulatory, operating and financial management expertise to additional Canadian regulated utilities.

See ''Risk Factors — Realization of Acquisition Benefits'' and ''Special Note Regarding Forward-Looking Statements''.

Utility Management Approach of Fortis

Fortis' approach to utility management is based on creating value for customers that ultimately translates into long-term value for shareholders. Fortis structures its operations as separate operating companies in each jurisdiction. Focused local management teams have the benefit of access to utility management experience and expertise of Fortis. The senior management team of Terasen Gas, which Fortis expects to retain, will add valuable operational expertise in natural gas distribution to existing expertise in the electric distribution operations of Fortis. This approach allows local managers to build relationships with, and be responsive to, both customers and regulators. Fortis recognizes that regulation is a key aspect of its core business and has developed a disciplined, cost-conscious asset investment and operating philosophy which is responsive to regulation.

The management of Fortis has substantial experience in integrating newly acquired enterprises into the Fortis Group. In 2004, Fortis acquired all of the issued and outstanding shares of FortisBC Inc. (formerly, Aquila Networks Canada (British Columbia) Ltd.) and FortisAlberta Inc. (formerly, Aquila Networks Canada (Alberta) Ltd.), and has successfully integrated these utilities into the Fortis Group.

FORTIS

Fortis Inc. (''Fortis'' or the ''Corporation'') was incorporated as 81800 Canada Ltd. under the *Canada Business Corporations Act* on June 28, 1977. The Corporation was continued under the *Corporations Act* (Newfoundland) on August 28, 1987 and on October 12, 1987 the Corporation amended its articles to change its name to ''Fortis Inc.'' The address of the head office and principal place of business of the Corporation is The Fortis Building, Suite 1201, 139 Water Street, St. John's, Newfoundland and Labrador A1B 3T2.

Fortis is principally a diversified, international electric utility holding company that owns subsidiaries engaged in the regulated distribution of electricity. Regulated utility assets comprise approximately 86% of the Corporation's total assets, with the balance comprised primarily of non-regulated electricity generating assets, and commercial real estate and hotel investments owned and operated through its non-utility subsidiary. Fortis is the indirect owner of all of the common shares of FortisAlberta Inc. (''FortisAlberta'') (formerly, Aquila Networks Canada (Alberta) Ltd.) and FortisBC Inc. (''FortisBC'') (formerly, Aquila Networks Canada (British Columbia) Ltd.). FortisAlberta is a regulated electric utility that distributes electricity generated by other market participants in Alberta. FortisBC is a regulated electric utility that generates, transmits and distributes electricity in British Columbia. Fortis also holds all the common shares of Newfoundland Power Inc. (''Newfoundland Power'') and, through its wholly owned subsidiary Fortis Properties Corporation (''Fortis Properties''), holds all the common shares of Maritime Electric Company, Limited (''Maritime Electric''), which are the principal distributors of electricity in Newfoundland and on Prince Edward Island, respectively. As well, through its wholly owned subsidiary FortisOntario Inc. (''FortisOntario'') and its subsidiaries, Canadian Niagara Power Inc. (''CNPI'') and Cornwall Street Railway, Light and Power Company, Limited (''Cornwall Electric''), Fortis distributes electricity to customers primarily in Fort Erie, Port Colborne, Gananoque and Cornwall, Ontario.

The Corporation's regulated electric utility assets in the Caribbean consist of its ownership, through wholly owned subsidiaries, of a 70.1% interest in Belize Electricity Limited (''Belize Electricity''), the primary distributor of electricity in Belize, Central America, and an approximate 54% interest in Caribbean Utilities Company, Ltd. (''Caribbean Utilities''), the sole provider of electricity to the island of Grand Cayman, Cayman Islands. On August 28, 2006, Fortis acquired, through a wholly owned subsidiary, all of the outstanding shares of P.P.C. Limited (''PPC'') and Atlantic Equipment & Power (Turks and Caicos) Ltd. (''Atlantic''), (collectively, ''Fortis Turks and Caicos''), which together generate and distribute electricity to approximately 80% of electricity customers in the Turks and Caicos Islands.

The Corporation's non-regulated electricity generation operations consist of its 100% interest in each of Belize Electric Company Limited (''BECOL''), FortisUS Energy Corporation (''FortisUS Energy''), and FortisOntario, as well as non-regulated electricity generation assets owned by FortisBC and Fortis Properties.

Fortis Properties is the direct owner of a 51% interest in the Exploits River Hydro Partnership (the ''Exploits Partnership''). The Exploits Partnership was established with Abitibi-Consolidated Company of Canada (''Abitibi-Consolidated''), which holds the remaining 49% interest, to develop additional capacity at Abitibi-Consolidated's hydroelectric plant at Grand Falls-Windsor and redevelop the forestry company's hydroelectric plant at Bishop's Falls, both in Newfoundland and Labrador. Fortis Properties' assets also include six small hydroelectric generating stations in eastern Ontario with a combined capacity of 8 megawatts (''MW'').

BECOL owns and operates both the 25-MW Mollejon and 7-MW Chalillo hydroelectric facilities, both of which are located on the Macal River in Belize. Through FortisUS Energy, a wholly owned subsidiary of Fortis Properties, the Corporation owns and operates four hydroelectric generating stations in upper New York State with a total combined capacity of approximately 23 MW. FortisOntario includes 75 MW of water right entitlement associated with the Rankine Generating Station at Niagara Falls and the operation of a 5-MW gas-fired cogeneration plant that provides district heating to 17 commercial customers in Cornwall. The Rankine Generating Station assets have been written down following the lay-up of the Station as a result of the implementation of a water and power exchange agreement (the ''Niagara Exchange Agreement'') with Ontario Power Generation Inc. (''OPGI''). The Niagara Exchange Agreement assigns FortisOntario's water rights on the Niagara River to OPGI and facilitates the irrevocable exchange of 75 MW of wholesale electric power supply to FortisOntario from OPGI until April 30, 2009 in exchange for FortisOntario's agreement not to seek renewal of the water entitlement at that time. The non-regulated electricity generation operations of FortisBC consist of the 16-MW run-of-river Walden hydroelectric power plant near Lillooet, British Columbia.

Through its wholly owned subsidiary, Fortis Properties, the Corporation owns and operates hotels in seven provinces in Canada and commercial real estate in Atlantic Canada. Its holdings include 18 hotels with more than 3,200 rooms and approximately 2.7 million square feet of commercial real estate.

Regulated Utilities — Canadian

FortisAlberta

On May 31, 2004, Fortis, through an indirect wholly owned subsidiary, acquired all of the issued and outstanding shares of FortisAlberta. FortisAlberta distributes electricity to approximately 430,000 customers using approximately 104,000 kilometers of power lines and met a peak demand of 2,584 MW in 2006. FortisAlberta's business is the ownership and operation of regulated electricity distribution facilities that distribute electricity generated by other market participants from high-voltage transmission substations to end-use customers in southern and central Alberta. FortisAlberta is not involved in the generation, transmission or direct sale of electricity.

FortisBC

On May 31, 2004, Fortis, through an indirect wholly owned subsidiary, acquired all of the issued and outstanding shares of FortisBC. FortisBC is an integrated regulated electric utility that owns a network of generation, transmission and distribution assets located in the southern interior of British Columbia. FortisBC serves a diverse mix of more than 152,000 customers, with residential customers representing the largest customer segment, and met a peak demand of 718 MW in 2006. FortisBC owns four regulated hydroelectric generating plants with an aggregate capacity of 235 MW that provide approximately 45% of the Corporation's energy and 30% of its capacity needs. FortisBC's remaining electricity supply is acquired through long-term power purchase contracts and short-term market purchases. FortisBC includes non-regulated operating, maintenance and management services relating to the 450-MW Waneta hydroelectric generation facility owned by Teck Cominco Metals Ltd., the 149-MW Brilliant Hydroelectric Plant and the 185-MW Arrow Lakes Hydroelectric Plant owned by Columbia Power Corporation and Columbia Basin Trust, respectively, and the distribution system owned by the City of Kelowna.

FortisBC's assets include the electric utility formerly owned by Princeton Light and Power Company, Limited (the ''PLP Utility''). The PLP Utility serves approximately 3,500 customers, mainly in Princeton, British Columbia. The PLP Utility was purchased by Fortis through an indirect subsidiary on May 31, 2005 and became part of FortisBC on December 31, 2006 as the result of an internal corporate reorganization.

Newfoundland Power

Fortis holds all of the common shares of Newfoundland Power. Newfoundland Power is an electric utility that operates an integrated generation, transmission and distribution system throughout the island portion of the Province of Newfoundland and Labrador. Newfoundland Power serves approximately 230,000 customers, or approximately 85% of electricity customers in the Province, and met a peak demand of 1,166 MW in 2006. Approximately 90% of the electricity that Newfoundland Power sells to its customers is purchased from Newfoundland and Labrador Hydro Corporation (''Newfoundland Hydro''). Currently, Newfoundland Power has an installed generating capacity of 136 MW, of which 92 MW is hydroelectric generation.

Maritime Electric

Through its subsidiary, Fortis Properties, Fortis owns all of the common shares of Maritime Electric, which is the principal distributor of electricity on Prince Edward Island. Maritime Electric directly supplies approximately 71,000 customers, or approximately 90% of the electricity consumers on the Island, and met a peak demand of 216 MW in 2006. Maritime Electric purchases most of the energy it distributes to its customers from New Brunswick Power Corporation and maintains on-Island generating facilities at Charlottetown and Borden-Carleton with a combined capacity of 150 MW.

FortisOntario

The Corporation's regulated utility investments in Ontario are comprised of CNPI, including the operations of Port Colborne Hydro, and Cornwall Electric, all of which are owned through FortisOntario. In total, FortisOntario's distribution operations serve approximately 52,000 customers in the Fort Erie, Port Colborne, Cornwall and Gananoque areas of Ontario and met a combined peak demand of 233 MW in 2006. CNPI owns international transmission facilities at Fort Erie as well as a 10% interest in each of Westario Power Holdings Inc. and Rideau St. Lawrence Holdings Inc., two regional electric distribution companies formed in 2000 that, together, serve more than 27,000 customers.

Regulated Utilities — Caribbean

Belize Electricity

Fortis, through wholly owned subsidiaries, holds a 70.1% interest in Belize Electricity. Belize Electricity is the primary distributor of electricity in the Central American country of Belize. Belize Electricity directly supplies approximately 71,000 customers in Belize and met a peak demand of 67 MW in 2006.

Caribbean Utilities

Fortis, through a wholly owned subsidiary, holds an approximate 54% interest in Caribbean Utilities, the only public electric utility on Grand Cayman, Cayman Islands. Caribbean Utilities has the exclusive right to generate, distribute, transmit and supply electricity to the island of Grand Cayman, Cayman Islands, pursuant to a 25-year licence. The current licence remains in effect until January 2011 or until replaced by a new licence by the mutual consent of Caribbean Utilities and the Government of the Cayman Islands. Negotiations regarding the renewal of the licence are ongoing. Caribbean Utilities currently serves more than 22,000 customers, owns 120 MW of installed generating capacity, and met a peak demand of 87 MW in 2006.

The Class A Ordinary Shares of Caribbean Utilities are listed for trading on the Toronto Stock Exchange (the ''TSX'') under the symbol CUP.U. The Corporation's investment in Caribbean Utilities resulted from a series of transactions from March 2000 through November 2006, as a result of which Fortis beneficially owns 13,565,511, or approximately 54%, of the outstanding Class A Ordinary Shares. See ''Recent Developments''.

Fortis Turks and Caicos

The Corporation owns, through a wholly owned subsidiary, all of the outstanding shares of Fortis Turks and Caicos which serves approximately 7,700 customers, or approximately 80% of electricity customers, in the Turks and Caicos Islands. Fortis Turks and Caicos is the principal distributor of electricity in Providenciales, North Caicos and Middle Caicos pursuant to a 50-year licence that expires in 2037 and is the principal distributor of electricity in South Caicos pursuant to a 50-year licence that expires in 2036. Fortis Turks and Caicos has installed generating capacity of approximately 35 MW and met a peak demand of 25 MW in 2006.

Fortis Turks and Caicos is regulated under a traditional rate of return on rate base approach, with a fixed rate of return of 17.5% on a defined asset base of approximately US$50 million.

Non-Regulated — Fortis Generation

Ontario

Non-regulated generation assets in Ontario include the operations of FortisOntario and Fortis Properties. Fortis Properties' operations in Ontario consist of six small hydroelectric generating stations with a combined capacity of approximately 8 MW. FortisOntario's assets include 75 MW of water entitlement associated with the Rankine Generating Station at Niagara Falls and the operation of a 5-MW gas-fired cogeneration plant that provides district heating to 17 commercial customers in Cornwall. The Rankine Generating Station assets have been written down following the lay-up of the Station as a result of the implementation of the Niagara Exchange Agreement. The Niagara Exchange Agreement assigns FortisOntario's water rights on the Niagara River to OPGI and facilitates the irrevocable exchange of 75 MW of wholesale electric power supply to FortisOntario from OPGI until April 30, 2009 in exchange for FortisOntario's agreement not to seek renewal of the water entitlement at that time.

Belize

Non-regulated generation operations in Belize are conducted through the Corporation's wholly owned indirect subsidiary, BECOL, under a franchise agreement with the Government of Belize. BECOL owns and operates the 25-MW Mollejon hydroelectric facility and the 7-MW Chalillo hydroelectric facility, which was placed in service on November 15, 2005. Both facilities are located on the Macal River in Belize. These generating plants have the capability of delivering average annual energy production of approximately 160 gigawatt hours (''GWh''). BECOL sells its entire output to Belize Electricity under a 50-year power purchase agreement expiring in 2055.

Central Newfoundland

Non-regulated generation operations in central Newfoundland are conducted through the Corporation's indirect 51% interest in the Exploits Partnership. The Exploits Partnership is a partnership with Abitibi-Consolidated that constructed, installed and operates additional capacity at Abitibi-Consolidated's hydroelectric plant at Grand Falls-Windsor and redeveloped the forestry company's hydroelectric plant at Bishop Falls, both in Newfoundland and Labrador. The 51% interest in the partnership is owned by Fortis Properties. Abitibi-Consolidated continues to utilize the historical annual generation of approximately 450 GWh while the additional energy produced from the new facilities, approximately 140 GWh, is sold to Newfoundland Hydro under a 30-year take-or-pay power purchase agreement expiring in 2033, which is exempt from regulation.

Upper New York State

Non-regulated generation operations in upper New York State are conducted through the Corporation's wholly owned indirect subsidiary FortisUS Energy, which became a direct subsidiary of Fortis Properties on January 1, 2005 by way of a transfer from its subsidiary, Maritime Electric. Generating operations in upper New York State include the operations of four hydroelectric generating stations with a combined generating capacity of approximately 23 MW operating under licences from the United States Federal Energy Regulatory Commission.

British Columbia

Non-regulated generation operations in British Columbia were acquired as part of FortisBC in May 2004. Generating assets in British Columbia consist of the 16-MW run-of-river Walden hydroelectric power plant near Lillooet, British Columbia. This plant sells its entire output to British Columbia Hydro & Power Authority (''BC Hydro'') under a power purchase agreement expiring in 2013.

Non-Regulated — Fortis Properties

Fortis has owned all of the issued and outstanding shares of Fortis Properties since its inception in 1989. In addition to its non-regulated generation operations, Fortis Properties owns and operates hotels in seven provinces in Canada and commercial real estate in Atlantic Canada. Its holdings include 18 hotels with more than 3,200 rooms and approximately 2.7 million square feet of commercial real estate. On November 1, 2006, Fortis Properties completed the purchase of four hotels located in Alberta and British Columbia from Lodge Motel (Kelowna) Ltd. for approximately $52 million. See ''Recent Developments''.

RECENT DEVELOPMENTS

Acquisition of Hotels in Western Canada

On November 1, 2006, Fortis Properties completed the purchase of four hotels located in Alberta and British Columbia from Lodge Motel (Kelowna) Ltd. for approximately $52 million. The purchased hotels were: the Holiday Inn Express and Suites and the Best Western, both in Medicine Hat, Alberta; the Ramada Hotel and Suites, in Lethbridge, Alberta; and the Holiday Inn Express, in Kelowna, British Columbia. Through the purchase, Fortis Properties' hospitality operations were expanded by 454 rooms.

Acquisition of Additional Shares of Caribbean Utilities

On November 7, 2006, Fortis acquired an aggregate of 4,113,116, or approximately 16%, of the outstanding Class A Ordinary Shares of Caribbean Utilities from International Power and four other vendors affiliated with International Power for US$11.89 per share under a private agreement. Pursuant to this purchase, Fortis acquired control of Caribbean Utilities raising its beneficial ownership to 13,565,511, or approximately 54%, of the outstanding Class A Ordinary Shares. As a result of acquiring control of Caribbean Utilities, Fortis now consolidates the financial results of Caribbean Utilities into the financial statements of Fortis. Immediately prior to November 1, 2006, Fortis accounted for its investment in Caribbean Utilities on an equity basis, pursuant to which only its *pro rata* share of earnings of Caribbean Utilities was recorded in the consolidated statements of earnings of Fortis.

Private Placement of Convertible Debentures

On November 7, 2006, Fortis issued, by way of private placement, US$40 million aggregate principal amount of unsecured subordinated convertible debentures (the ''Debentures''). The Debentures bear interest at an annual rate of 5.5% and mature on November 7, 2016. The Debentures may be redeemed by Fortis at par at any time on or after November 7, 2011 and are convertible into common shares of Fortis (''Common Shares'') at the option of the holder at any time prior to their maturity, at US$29.11 per share.

Regulatory Matters

During the fourth quarter of 2006, the allowed regulated rate of return on common equity (''ROE'') for each of FortisBC, FortisAlberta and Newfoundland Power was reset in accordance with an automatic adjustment formula by each utility's respective regulator. The allowed ROEs for FortisAlberta, FortisBC and Newfoundland Power were reduced from 8.93%, 9.20% and 9.24% to 8.51%, 8.77% and 8.60%, respectively, effective January 1, 2007.

On December 5, 2006, Newfoundland Power received approval of its 2007 Amortization and Cost Deferral Accounting application from the Newfoundland and Labrador Board of Commissioners of Public Utilities. The order provided for a portion of the 2005 unbilled revenue balance amortization to offset increased taxes in 2007 and the deferral of increased amortization and replacement energy expenses in 2007. Recovery of these amounts will be addressed in Newfoundland Power's next general rate proceeding.

During the fourth quarter of 2006, the British Columbia Utilities Commission (the ''BCUC'') approved FortisBC's 2007 and 2008 capital plans of $135.8 million (before customer contributions of $7.2 million) and $119.6 million (before customer contributions of $8.0 million), respectively, subject to further approval processes for certain projects. Earlier in 2006, a Negotiated Settlement Agreement, approved by the Alberta Energy and Utilities Board, dealing with FortisAlberta's 2006/2007 Distribution Access Tariff Application included a 2007 capital expenditure program of $201 million (before customer contributions of $24 million and including $10 million in contributions to the Alberta Electric System Operator (''AESO'') for investment in transmission facilities). During the fourth quarter, FortisAlberta's 2007 capital plan was increased to approximately $273 million (before customer contributions of $33 million and including $17 million in contributions to the AESO for investment in transmission facilities), primarily driven by customer growth. The increase in the 2007 capital expenditure program will be included as part of FortisAlberta's 2008 rate application.

Issuance of Debentures by FortisAlberta

On January 3, 2007, FortisAlberta issued $110 million aggregate principal amount of senior unsecured debentures bearing interest at a rate of 4.99% per annum, payable semi-annually, due January 2047.

Issuance of Common Shares by Fortis

On January 18, 2007, Fortis completed the public offering of 5,170,000 Common Shares at a price of $29.00 per share for gross proceeds of $149,930,000.

Second Quarter Dividend

On February 8, 2007, Fortis announced that its Board of Directors had declared a second quarter dividend of $0.21 per Common Share payable on June 1, 2007 to holders of record on May 4, 2007. This dividend represents an increase of 10.5% in the quarterly Common Share dividend of the Corporation, which is the second increase in twelve months. Fortis has increased its annual dividend paid for 34 consecutive years.

2006 Results of Operations

On February 8, 2007, Fortis issued a media release announcing its unaudited results of operations for the year ended December 31, 2006 and the Corporation's unaudited interim consolidated financial statements and related Management Discussion and Analysis of financial condition and results of operations for the three- and twelve-month periods ended December 31, 2006.

Net earnings applicable to Common Shares in 2006 were $147.2 million, 7.4% higher than net earnings of $137.1 million in 2005. Earnings per Common Share were $1.42 compared to $1.35 in 2005. Earnings in 2005 included a $7.9 million after-tax gain resulting from the settlement of contractual matters between FortisOntario and OPGI (the ''Ontario Settlement''). Growth in annual earnings was primarily driven by the performance of FortisAlberta and FortisBC, hydroelectric generation in Belize, Fortis Properties, Belize Electricity and contributions from recently acquired Fortis Turks and Caicos.

Net earnings applicable to Common Shares for the fourth quarter of 2006 were $33.9 million, or $0.33 per Common Share, compared to $22.3 million, or $0.22 per Common Share in the fourth quarter of 2005. The increase in fourth quarter earnings was driven by earnings growth at FortisAlberta, the contribution from Fortis Turks and Caicos and a change in revenue recognition policy by Newfoundland Power in 2006.

Fortis' Canadian Regulated Utilities contributed $112.7 million to earnings in 2006, $7.9 million higher than earnings of $104.8 million in the previous year. The increase was primarily driven by earnings derived from the significant investments in electrical infrastructure made by FortisAlberta and FortisBC and lower corporate income taxes at FortisAlberta.

In 2006, FortisAlberta and FortisBC continued to maintain, enhance and expand their electricity systems to accommodate new customers and to improve system reliability and invested approximately $354 million in aggregate, before customer contributions, in capital projects, up 26% from 2005. The rate bases of FortisAlberta and FortisBC have increased approximately 29% and 36%, respectively, since the utilities were acquired in May 2004.

Fortis' Caribbean Regulated Utilities, comprised of Fortis Turks and Caicos, Belize Electricity and Caribbean Utilities, contributed earnings of $23.6 million in 2006, 21.6% higher than earnings of $19.4 million in 2005. Earnings growth was primarily attributable to $3.5 million of contribution from Fortis Turks and Caicos and improved earnings at Belize Electricity due to lower finance charges, growth in electricity sales and an overall 11% increase in electricity rates, effective July 1, 2005.

In 2006, Fortis Non-regulated Generation operations contributed earnings of $26.7 million compared to $29.6 million in the previous year. Excluding the $7.9 million after-tax Ontario Settlement gain in 2005, earnings were $5.0 million higher year over year. Improved performance in Belize driven by increased hydroelectric production and lower finance charges was partially offset by the impact of lower average wholesale energy prices in Ontario. Hydroelectric production in Belize was 178 GWh, more than two-and-a-half times the level of production in 2005 due to the first full year of operations for the Chalillo hydroelectric generation plant and storage facility. Energy sales in Ontario, which on an annual basis remained relatively consistent at approximately 700 GWh, were at an average annual wholesale energy price per megawatt hour of $46.38 compared to $68.49 in 2005.

Fortis Properties contributed earnings of $18.7 million in 2006, 32.6% higher than earnings of $14.1 million in 2005. The increase in earnings was largely driven by a $1.6 million after-tax gain on the sale of the Days Inn Sydney hotel, reduced corporate income taxes and growth at hotel operations in western Canada.

THE ACQUISITION

Overview

On February 26, 2007, Fortis entered into an agreement (the ''Acquisition Agreement'') with 3211953 Nova Scotia Company and Kinder Morgan Inc. (''Kinder Morgan'') for the purchase (the ''Acquisition'') of all of the issued and outstanding shares of Terasen Inc. (''Terasen'') for aggregate consideration of $3.7 billion, including the assumption of approximately $2.3 billion of consolidated indebtedness of Terasen. Terasen is a holding company headquartered in Vancouver, British Columbia, operating two principal lines of business: natural gas distribution and petroleum transportation. Prior to the closing of the Acquisition, Kinder Morgan will cause Terasen to divest itself of its petroleum transportation operations. As part of such divestiture, on March 5, 2007, Kinder Morgan announced that it had agreed to sell the Corridor pipeline system, which is owned by Terasen and serves the Athabasca oil sands, to Inter Pipeline Fund.

The closing of the Acquisition is subject to receipt of required regulatory and other approvals, including that of the BCUC, and the satisfaction of certain closing conditions. The closing of the Acquisition is expected to occur in mid-2007. See ''Acquisition Agreement''.

Under the Acquisition Agreement, Kinder Morgan or the Corporation may elect to terminate the Acquisition Agreement if the Acquisition is not completed prior to November 30, 2007. The Corporation intends to finance the cash portion of the purchase price for the Acquisition from the net proceeds of this offering (the ''Offering'') and funds to be advanced under acquisition financing arranged by the Corporation for this purpose. See ''Financing of the Acquisition'', ''Use of Proceeds'' and ''Acquisition Agreement''.

Based on financial information as at September 30, 2006, following the Acquisition, Fortis' total assets will increase by approximately 94% to $8.9 billion. Following the Acquisition, Fortis' regulated rate base assets will increase to approximately $6.0 billion, of which approximately 93% will be located in Canada.

Kinder Morgan

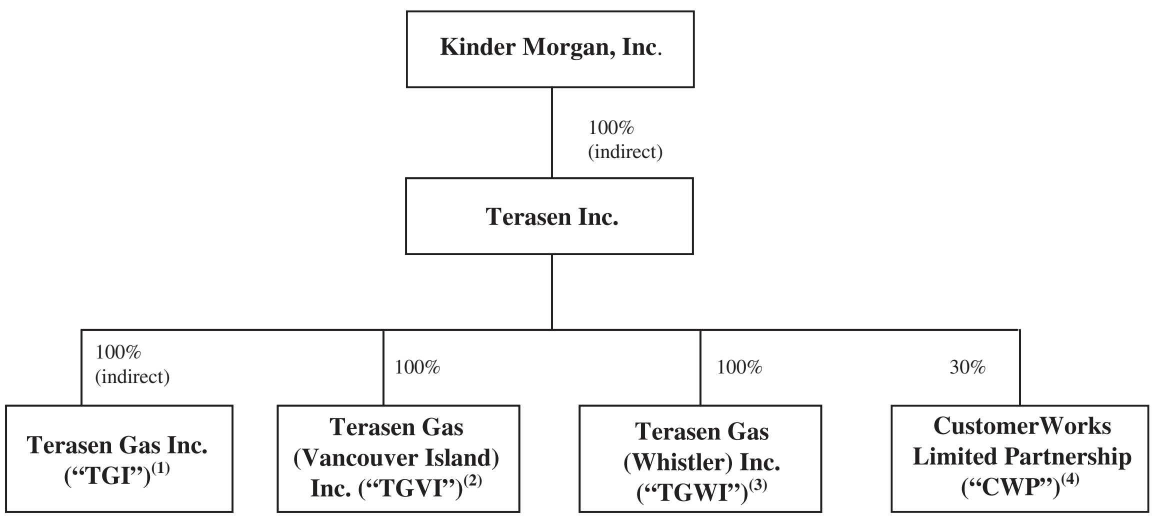
Kinder Morgan is one of the largest energy transportation, storage and distribution companies in North America. It owns an interest in or operates approximately 65,000 kilometers of pipelines that transport primarily natural gas, crude oil, petroleum products and carbon dioxide, and serves more than 1.1 million natural gas distribution customers in British Columbia, Colorado, Nebraska and Wyoming. Kinder Morgan owns the general partner interest of Kinder Morgan Energy Partners, L.P., one of the largest publicly traded pipeline limited partnerships in the United States.

On November 30, 2005, Kinder Morgan completed the acquisition of Terasen (formerly, BC Gas Inc.). On May 19, 2006, Terasen completed the disposition of its water, wastewater and utility services business carried on by Terasen Water and Utility Services Inc. to a consortium led by CAI Capital Management Co.

On August 14, 2006, Kinder Morgan announced that it was selling its natural gas retail distribution operations serving customers in Colorado, Nebraska, Wyoming and Hermosillo, Mexico, to GE Energy Financial Services. On December 19, 2006, management of Kinder Morgan received shareholder approval of a US$22 billion leveraged management buyout offer led by Richard Kinder, Chairman and Chief Executive Officer, Kinder Morgan. The completion of this buyout is pending.

Prior to the closing of the Acquisition, Kinder Morgan will cause Terasen to divest itself of its petroleum transportation operations (the ''Pre-Closing Reorganization''), leaving only the natural gas distribution business operated by Terasen Gas (as defined below). As part of the Pre-Closing Reorganization, on March 5, 2007, Kinder Morgan announced that it had agreed to sell the Corridor pipeline system, which is owned by Terasen and serves the Athabasca oil sands, to Inter Pipeline Fund. Under the Acquisition Agreement, Fortis will be indemnified with respect to claims relating to the Pre-Closing Reorganization. See ''Acquisition Agreement — Indemnities''.

The chart below sets out the material subsidiaries of Terasen following the Pre-Closing Reorganization.



(1) Terasen Gas Inc. provides gas distribution services to approximately 734,000 residential and 82,000 commercial and industrial customers in a service area extending from Vancouver to the Fraser Valley and the interior of British Columbia.

(2) Terasen Gas (Vancouver Island) Inc. owns a combined distribution and transmission system and serves approximately 85,000 residential, commercial and industrial customers along the Sunshine Coast and in various communities on Vancouver Island including Victoria and surrounding areas.

(3) Terasen Gas (Whistler) Inc. owns and operates the propane distribution system in the Whistler area of British Columbia and provides service to approximately 2,350 residential and commercial customers.

(4) CustomerWorks Limited Partnership is a non-regulated shared services business in partnership with Enbridge Inc. that provides customer service contact, meter reading, billing, credit, support and collection services primarily to the natural gas distribution operations of Terasen and Enbridge Gas Inc.

Terasen Gas

The natural gas distribution business of Terasen is carried on by Terasen Gas Inc. (''TGI''), Terasen Gas (Vancouver Island) Inc. (''TGVI'') and Terasen Gas (Whistler) Inc. (''TGWI''). Terasen also owns a 30% interest in CustomerWorks Limited Partnership (''CWP''). CWP is a non-regulated shared services business in partnership with Enbridge Inc. (''Enbridge'') that provides customer service contact, meter reading, billing, support and credit and collection services primarily to Terasen Gas (as defined below) and Enbridge Gas Distribution Inc. (''Enbridge Gas''). CWP outsources these services to a company owned and operated by Accenture Inc. (''Accenture''). In this Prospectus, TGI, TGVI, TGWI and CWP are collectively referred to as ''Terasen Gas''.

Terasen Gas is the principal gas distribution utility in British Columbia, serving the populous lower mainland, Vancouver Island and the southern interior of the province. With approximately 900,000 customers in 125 communities, Terasen Gas provides service to over 95% of the gas customers in British Columbia. Terasen Gas owns and operates approximately 44,100 kilometers of natural gas distribution pipelines and approximately 4,300 kilometers of natural gas transmission pipelines. As of September 30, 2006, Terasen Gas had an aggregate of $3.6 billion of assets, an aggregate rate base of almost $3.0 billion and approximately 1,200 employees.

Acquisition Rationale

The business operated by Terasen Gas is attractive to Fortis for the following reasons: (i) Terasen Gas will significantly increase the earnings of Fortis from regulated utilities and be immediately accretive to earnings per share; (ii) the regulated gas distribution business of Terasen Gas complements the regulated electric distribution business of Fortis; and (iii) the service territory of Terasen Gas is experiencing strong economic growth and includes substantially all of the service territory of FortisBC.

Fortis believes that the principal benefits of the Acquisition are as follows:

(a) the purchase price represents approximately 1.2 times the approved rate base of Terasen Gas for 2007 and the Acquisition is expected to be immediately accretive to earnings per share;

(b) the Acquisition will increase the regulated rate base assets and utility earnings of Fortis. Similar to the electric distribution utilities of Fortis, Terasen Gas operates under principally cost-of-service regulation under which an appropriate return on capital is recovered in addition to prudently incurred operating and commodity costs;

(c) Terasen Gas has an attractive gas distribution franchise with a well-diversified, mature, principally residential, customer base. The Acquisition is expected to improve the risk profile of Fortis by providing it with a more economically diverse portfolio of assets;

(d) following the Acquisition, Fortis will be the largest investor-owned utility in gas and electric distribution in Canada with regulated electricity distribution utilities in five Canadian provinces and three Caribbean countries and regulated gas distribution utilities in British Columbia. Following the Acquisition, a large proportion of the business of Fortis will serve the high-growth economies of western Canada; and

(e) Fortis believes the regulated gas distribution business of Terasen Gas is complementary to the Corporation's proven core competencies in managing regulated electric distribution utilities. The Acquisition affords Fortis management an opportunity to deploy its regulatory, operating and financial management expertise to additional Canadian regulated utilities.

See ''Risk Factors — Realization of Acquisition Benefits'' and ''Special Note Regarding Forward-Looking Statements''.

Utility Management Approach of Fortis

Fortis' approach to utility management is based on creating value for customers that ultimately translates into long-term value for shareholders. Fortis structures its operations as separate operating companies in each jurisdiction. Focused local management teams have the benefit of access to utility management experience and expertise of Fortis. The senior management team of Terasen Gas, which Fortis expects to retain, will add valuable operational expertise in natural gas distribution to existing expertise in the electric distribution operations of Fortis. This approach allows local managers to build relationships with, and be responsive to, both customers and regulators. Fortis recognizes that regulation is a key aspect of its core business and has developed a disciplined, cost-conscious asset investment and operating philosophy which is responsive to regulation.

The management of Fortis has substantial experience in integrating newly acquired enterprises into the Fortis Group. In 2004, Fortis acquired all of the issued and outstanding shares of FortisBC (formerly, Aquila Networks Canada (British Columbia) Ltd.) and FortisAlberta (formerly, Aquila Networks Canada (Alberta) Ltd.), and has successfully integrated these utilities into the Fortis Group.

THE ACQUIRED BUSINESSES

The description of Terasen Gas contained in the Prospectus is based on publicly available information filed by Terasen, TGI and Kinder Morgan and information provided by Kinder Morgan in connection with the Acquisition Agreement. Fortis, after making its purchase investigations, believes it to be accurate in all material respects.

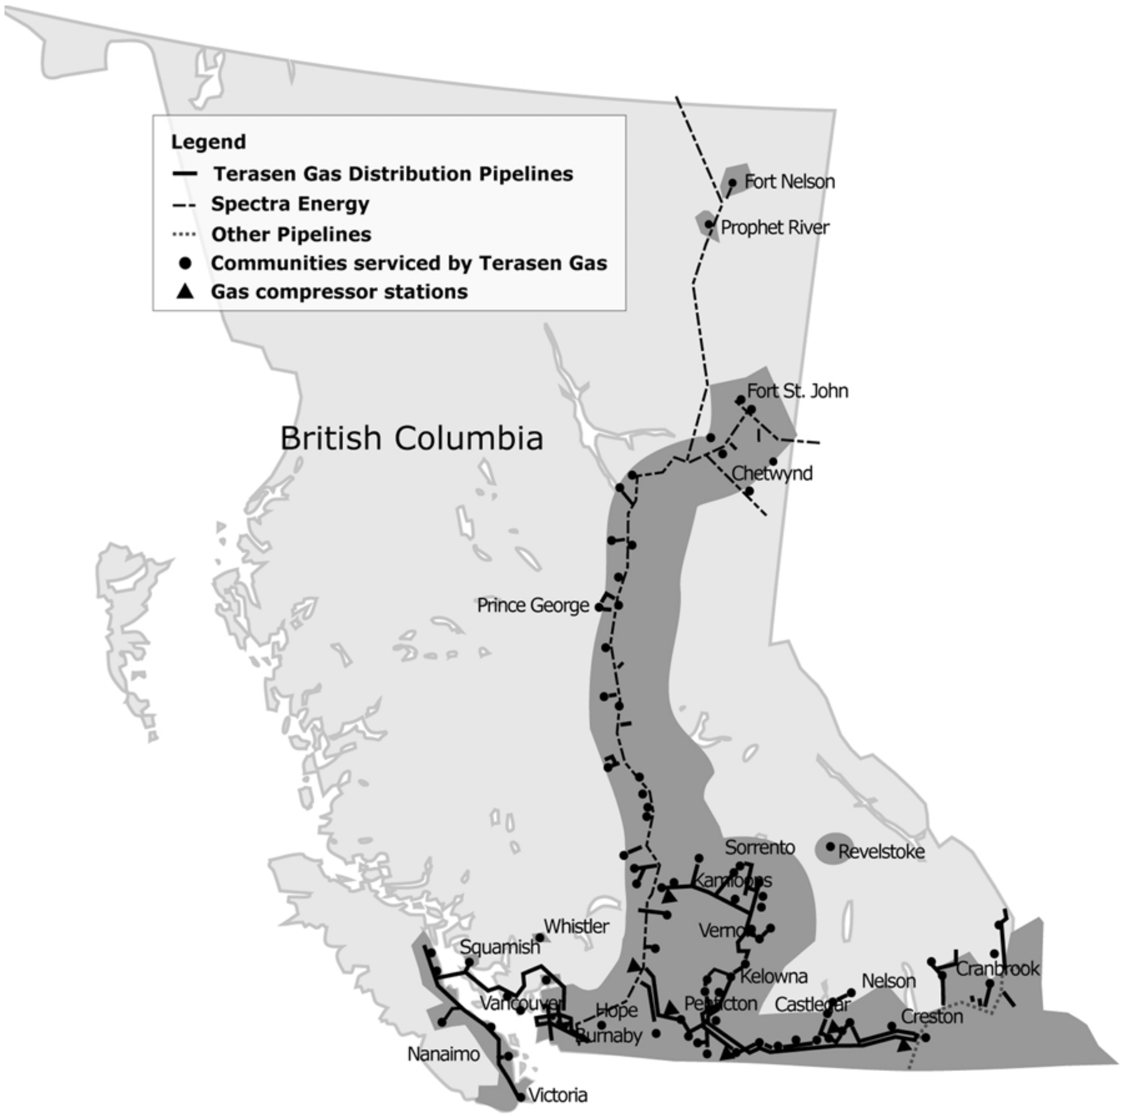
Terasen Inc.

Terasen is a holding company headquartered in Vancouver, British Columbia, operating two principal lines of business: natural gas distribution and petroleum transportation. Prior to the closing of the Acquisition, Kinder Morgan will cause Terasen to divest itself of its petroleum transportation operations. The natural gas distribution business of Terasen is carried on by TGI, TGVI and TGWI. Terasen also owns a 30% interest in CWP, a non-regulated shared services business in partnership with Enbridge that provides customer service contact, meter reading, billing, support and credit and collection services primarily to Terasen Gas and Enbridge Gas. CWP outsources these services to a company owned and operated by Accenture. Terasen has approximately 20 employees principally involved with finance, tax and legal matters.

Terasen was incorporated on August 15, 1985 under the *Company Act* (British Columbia), a predecessor to the *Business Corporations Act* (British Columbia). On April 25, 2003, its name was changed from BC Gas Inc. to Terasen Inc. For further information on Terasen, reference is made to the audited consolidated financial statements of Terasen for the years ended December 31, 2005 and 2004 and related Management Discussion and Analysis of financial condition and results of operations, and the unaudited consolidated financial statements of Terasen for the three- and nine-month periods ended September 30, 2006 and related Management Discussion and Analysis of financial condition and results of operations, which are included in this Prospectus.

Terasen Gas Service Territory

Terasen Gas is one of the largest natural gas distribution businesses in Canada. With approximately 900,000 customers in 125 communities, Terasen Gas provides service to over 95% of the gas customers in British Columbia. Its service area extends from Vancouver to the Fraser Valley, the interior of British Columbia, the area along the Sunshine Coast, as well as Whistler, Squamish and Vancouver Island.



Terasen Gas Inc.

TGI provides service to more than 100 communities with a service territory that has an estimated population of approximately 4,000,000. As at September 30, 2006, TGI and its subsidiaries transported and distributed natural gas to approximately 734,000 residential and 82,000 commercial and industrial customers, representing approximately 87% of the natural gas users in British Columbia. TGI's service area extends from Vancouver to the Fraser Valley and the interior of British Columbia. The transmission and distribution business is carried on under statutes and franchises or operating agreements granting the right to operate in the municipalities or areas served. TGI is regulated by the BCUC. The average rate base of TGI approved by the BCUC for 2007 is approximately $2,474 million.

TGI provides natural gas distribution services to residential, small commercial and industrial heating customers predominantly on a non-contractual basis, whereby the customers are charged based on general services provided. Larger commercial and industrial customers are normally provided with services on a contractual basis.

By early 2006, 16,000 commercial and industrial customers had arranged for some or all of their own gas supply and used TGI's transportation services for delivery. Notwithstanding shifts over time between utility supply and direct purchases, TGI's earnings remain unaffected since TGI's margins remain substantially the same whether or not customers choose to buy natural gas from TGI or arrange their own supply. Customers arranging for their own supply in fact reduce the credit risk to TGI. See ''— Terasen Gas Inc. — Unbundling'' below.

Of TGI's industrial customers, 158 are on interruptible service. The majority of these customers are capable of switching to alternative fuels. Of the various industries that comprise TGI's industrial market, the pulp and paper and wood products industries combined comprise approximately 47% of total system throughput. All other industries individually represent less than 10% of total consumption.

Gas Purchase Agreements

In order to acquire supply resources that ensure reliable natural gas deliveries to its customers, TGI purchases supply from a select list of producers, aggregators, and marketers by adhering to strict standards of counterparty creditworthiness and contract execution/management procedures. TGI contracts for approximately 137 petajoules (''PJ'') of baseload and seasonal supply, of which 120 PJ is delivered off the Spectra Energy Gas Transmission system (the ''Spectra Pipeline System''), and 17 PJ is comprised of Alberta-sourced supply transported into British Columbia via the Alberta and British Columbia systems of TransCanada Pipelines Limited (''TransCanada''). The majority of supply contracts in the current portfolio are one year in length, with the exception of one long-term contract expiring in October 2009. In order to recover its costs, TGI obtains advance BCUC approval of the supply agreements it proposes to enter into.

Peak Shaving Arrangements

TGI incorporates peak shaving and gas storage facilities into its portfolio to (i) manage the load factor of baseload supply contracts throughout the year, (ii) eliminate the risk of supply shortages during a peak throughput day, (iii) reduce the cost of gas during winter months, and (iv) balance daily supply and demand on the distribution system. TGI's peak shaving and storage assets and contracts for 2006 included up to 30 PJ in storage capacity at various locations throughout British Columbia, Alberta and the Pacific Northwest of the United States. These facilities can deliver a maximum daily rate of 600 TJ on a combined basis.

Unbundling

Over the past several years, TGI, the BCUC and a number of interested parties have laid the groundwork for the introduction of natural gas commodity unbundling. As of November 1, 2004, commercial customers of TGI became eligible to sign up to buy their natural gas commodity supply directly from third-party suppliers. TGI continues to provide delivery of the natural gas. Approximately 78,000 commercial customers are eligible to participate in commodity unbundling.

On August 14, 2006, the BCUC released a decision to open a portion of British Columbia's residential natural gas market to competition, allowing homeowners to sign long-term fixed-price contracts for natural gas with companies other than TGI. The BCUC decision was released in response to a proposal from TGI filed with the BCUC on April 18, 2006 and following several weeks of public hearings and submissions from TGI, natural gas marketers and stakeholders. As a result of the BCUC decision, independent marketing companies, known as gas marketers, will be allowed to start offering long-term, fixed-price contracts for natural gas for a period of time ranging from one year to five years, starting in May 2007. TGI will continue delivering the gas to the final consumer, charging for delivery and providing all billing and other services to all customers.

The choice of natural gas suppliers will only be available to TGI's residential customers in the Lower Mainland and the interior of British Columbia. It will not be available on Vancouver Island, the Sunshine Coast, Powell River or Whistler. The opening of a portion of British Columbia's residential natural gas market to competition will not affect TGI's earnings since TGI's margins remain substantially the same whether or not customers choose to buy natural gas from TGI or arrange their own supply.

Transmission Services

TGI serves Greater Vancouver and the Fraser Valley through a transmission and distribution system that connects to the Spectra Pipeline System near Huntingdon, British Columbia. This transmission system also supplies gas to TGVI for delivery to the Sunshine Coast, Vancouver Island and Squamish, British Columbia. In addition, TGI is connected at Huntingdon to Northwest Pipeline to facilitate gas movement both north and south.

In the interior of British Columbia, TGI serves municipalities with numerous connections to the Spectra Pipeline System. Communities in the East Kootenay region of British Columbia are served through connections with the British Columbia system of TransCanada. TGI is connected to TransCanada's British Columbia system through TGI's Southern Crossing Pipeline between Yahk and Oliver. TGI also operates a propane distribution system in Revelstoke, British Columbia.

In addition, TGI provides high-pressure transmission services to customers, such as TGVI, which moves natural gas from the Spectra Pipeline System or the TransCanada system across TGI's system to customers' own facilities.

Transportation tolls on the Spectra Pipeline System and the TransCanada system are regulated by the National Energy Board. TGI pays both fixed and variable charges for use of the pipelines, which are recovered through rates paid by TGI's customers.

Properties

As of September 30, 2006, TGI owned approximately 3,700 kilometers of natural gas transmission pipelines and approximately 41,000 kilometers of natural gas distribution pipelines. In addition to the pipelines, TGI owns properties and equipment utilized for service shops, warehouses, metering, and regulating stations, as well as its main operations center in Surrey, British Columbia.

Title to Properties

TGI's pipelines are constructed for the most part under highways and streets pursuant to permits or orders from the appropriate authorities, franchise or operating agreements entered into with municipalities and rights-of-way held directly or jointly with BC Hydro. Compressor stations and major regulator stations are located on freehold land, rights-of-way owned by TGI or properties shared with BC Hydro.

Franchise and Operating Agreements

TGI currently holds franchise or operating agreements with all of the incorporated municipalities in which it distributes gas in the Greater Vancouver and Fraser Valley service areas, other than Richmond, British Columbia, and with most of the incorporated municipalities in which it distributes gas in the interior of British Columbia. TGI has the right to serve all end users within its franchise area pursuant to these operating agreements. The terms of the franchise agreements range from 10 years to 21 years.

Historically, approximately one quarter of the agreements relating to the interior of British Columbia contained a provision enabling the municipality to purchase the distribution system at the end of the term of the agreement. Some of these agreements have expired and TGI has negotiated or is currently negotiating renewals and extensions of others whereby TGI enters into an arrangement whereby the relevant municipality leases TGI's gas distribution assets within the municipality's boundaries for a term of 35 years for an initial cash payment paid by the municipality to TGI. TGI, in turn, enters into a 17-year operating lease with the municipality whereby TGI operates the gas distribution assets and has the option to terminate the lease of the assets to the municipality at the end of the 17-year term in exchange for a payment to the municipality equal to the unamortized portion of prepaid rent initially paid by the municipality. As at December 31, 2005, TGI had entered into such arrangements having a total value of $153 million.

Capital Program

The 2007 revenue requirements approved by the BCUC for TGI include annual capital expenditures of $129.7 million. Capital expenditures relating to customer growth represent approximately 22% of the annual capital budget forecast, while the remaining amount relates to capital betterments, replacements and life extensions.

Operations

As part of its multi-year Performance-Based Rate (''PBR'') agreement, TGI is required to meet several service quality targets. These target measures include indicators such as emergency response time, speed of answering calls, system integrity, customer satisfaction, meter exchange appointment activity, number of customer complaints to the BCUC and number of prior period adjustments. TGI's operations meet or exceed these target measures.

Environment

In order to minimize impacts from its operations, TGI has developed an Environmental Management System based on a framework, purposes and objectives so as to be compliant with the international standard ISO 14001. TGI's operations meet or exceed legislative standards and environmental protection requirements.

TGI is an active participant in Canada's Voluntary Climate Change Challenge and Registry (''VCR'') and its successor, the Canadian GHG Challenge Registry. For seven consecutive years, TGI has received gold-level reporting status in recognition of its efforts to manage and reduce greenhouse gas emissions. TGI received the VCR Leadership Award in 2001 and 2003, the only company in its sector to have received this award twice. The VCR ranking acknowledges TGI's efforts to develop specific measures and voluntarily set reduction targets.

Employees

TGI has approximately 1,100 employees. Its organized employees are represented by the Canadian Office and Professional Employees Union (''COPEU'') and the International Brotherhood of Electrical Workers (''IBEW'') under collective agreements which expire on March 31, 2007 and March 31, 2011, respectively.

Tax Assessment

TGI has received a Notice of Assessment dated July 31, 2006 from the British Columbia Social Service Tax authority (the ''BC Tax Authority'') for the payment of $37.1 million of additional provincial sales tax and interest on the Southern Crossing Pipeline which was completed in 2000 (the ''Assessment''). In October 2006, TGI made a payment of $10 million pending its appeal of the Assessment as a good faith payment to forestall an order from the BC Tax Authority to provide full payment or security. On October 26, 2006, TGI filed an objection to the Assessment with the BC Tax Authority. The BCUC has allowed TGI to defer the $10 million payment pending resolution of TGI's objection to the Assessment.

Terasen Gas (Vancouver Island) Inc.

TGVI owns and operates the natural gas transmission pipeline from the Greater Vancouver area across the Georgia Strait to Vancouver Island and the distribution system on Vancouver Island and along the Sunshine Coast of British Columbia. TGVI is a franchise under development and is supported by the Vancouver Island Natural Gas Pipeline Agreement, as discussed in more detail below.

TGVI has been operating for almost 15 years. Its combined system consists of approximately 615 kilometers of natural gas transmission pipelines and 3,250 kilometers of distribution mains. The combined system has a designed throughput capacity of 144 million cubic feet per day (155 TJ per day). TGVI serves approximately 85,000 residential, commercial and industrial customers along the Sunshine Coast and in various communities on Vancouver Island including Victoria and surrounding areas. TGVI's largest customers are the Vancouver Island Gas Joint Venture, representing seven large pulp and paper mills on Vancouver Island and the Sunshine Coast, and BC Hydro's contracted gas-fired electricity cogeneration facility at Elk Falls, Vancouver Island. During 2005, TGVI delivered approximately 33.6 PJ of gas through its system. The average rate base of TGVI approved by the BCUC for 2007 is approximately $482 million.

TGVI's natural gas supply is transported through TGI's pipeline system. All natural gas flows to TGVI are from this single source on the mainland and are dependent on the use of two undersea high-pressure transmission pipes.

Vancouver Island Natural Gas Pipeline Agreement

The transmission line to Vancouver Island and the distribution systems on Vancouver Island that are currently owned by TGVI were originally constructed between 1989 and 1991 with financial support provided by the provincial and federal governments which included repayable contributions of an aggregate of $75 million from these governments (the ''Repayable Contributions''). In December 1995, the financial support arrangements with the governments were restructured under several agreements, including the Vancouver Island Natural Gas Pipeline Agreement (''VINGPA'') which was entered into between the predecessors of Terasen and TGVI and the Province of British Columbia (the ''Province'').

Under the VINGPA, which runs through to December 31, 2011, the Province has agreed to provide TGVI with financial support in the form of gas royalties on deemed volumes of natural gas transported through the Vancouver

Island pipeline from 1996 through 2011, which decreases the cost of purchased gas by approximately 20%. The royalty payment recognized in 2006 was approximately $36.3 million.

In turn, under the VINGPA, Terasen is required to provide financial support of up to $120 million over the period from 1996 to 2011 to finance the principal amount of the revenue deficiencies incurred by TGVI. Annual revenue deficiencies are calculated as the difference between the approved cost of service and revenue actually received. This funding can be by way of subscription for Class A Instruments (redeemable preferred shares of TGVI) or Class B Instruments (promissory notes issued by TGVI) (''Class B Instruments''), as determined by the BCUC.

Prior to 2003, rates charged by TGVI to its customers were insufficient to recover the cost of service of TGVI in aggregate, meaning that revenues from the sale and transportation of natural gas resulted in an annual revenue deficiency. Terasen and TGVI's former shareholder funded these annual revenue deficiencies in accordance with the VINGPA. The aggregate of the annual revenue deficiencies was funded with Class B Instruments bearing interest at a rate of 275 basis points over the applicable five-year Canada bond rate. The accumulated revenue deficiency resulting from overall revenues being below the cost of service has been recorded in a revenue deficiency deferral account (''RDDA''). Since 2003, the aggregate annual revenues have exceeded the full cost of service and therefore TGVI has been in a revenue surplus position. The revenue surplus is used, in part, to pay down the RDDA balance as well as to pay the interest on the Class B Instruments described above. The BCUC has been directed to include in the cost of service an amount to amortize the RDDA balance over the shortest period reasonably possible, having regard to competitive energy sources and the desirability of rates. As at September 30, 2006, TGVI had issued and outstanding approximately $42 million of Class B Instruments.

As part of the December 1995 restructuring discussed above and concurrently with the entering into of the VINGPA, the predecessor to TGVI entered into the Pacific Coast Energy Pipeline Agreement (the ''PCEPA'') with the Government of Canada and the Province which set out the mechanism for the repayment of the $75 million Repayable Contributions owed to the federal and provincial governments. The PCEPA provides for scheduled repayments but also contemplates earlier non-scheduled prepayments in certain circumstances. Repayments on the $75 million Repayable Contributions go towards increasing the rate base on a dollar-for-dollar basis.

Vancouver Island Gas Joint Venture Transportation Agreement

TGVI provides gas transportation service to the seven pulp and paper mills under the long-term Vancouver Island Gas Joint Venture Transportation Service Agreement that was amended effective January 1, 2005 to extend it beyond the original renewal period by two years to December 31, 2012. The maximum daily volume of firm transportation service under the agreement was 20 TJ per day for 2005. In 2006, the maximum daily volume changed to 12.5 TJ per day for the remainder of the renewal period. The committed volume can be reduced to 8 TJ on twelve months' notice at any time on or after January 1, 2007.

Contractual Arrangements

TGVI has entered into a firm transportation agreement with BC Hydro to serve BC Hydro's gas supply needs at a gas-fired cogeneration plant at Elk Falls, Vancouver Island. The agreement, for 45 TJ per day, expires on December 31, 2007. BC Hydro has an option to extend the agreement for one year. BC Hydro has indicated that it is considering changing the Elk Falls facility from a baseload facility to a dispatchable facility, which will change the transportation agreement from firm to interruptible. Accordingly, there is no certainty with respect to the terms under which the firm transportation agreement with BC Hydro may be extended beyond 2007. Failure to extend the agreement will result in a reduction in TGVI's transportation revenues of approximately $13 million, which would be expected to be recovered through increased rates approved by the BCUC.

On February 16, 2005, the BCUC approved the construction by TGVI of a $100 million liquid natural gas storage facility, subject to several conditions including the execution of a long-term Transportation Service Agreement with BC Hydro backed by the capacity demand requirements of the Duke Point generation project. On June 17, 2005, BC Hydro announced its intention to abandon the Duke Point generation project on Vancouver Island as a result of a continuing appeal process. As a result, the expected construction timeline for TGVI's proposed storage facility has been delayed and, pending re-evaluation, will require BCUC approval prior to proceeding.

Gas Purchase Agreements

In order to acquire effective supply resources that ensure reliable natural gas deliveries to its customers, TGVI purchases supply from a select list of producers, aggregators and marketers by adhering to strict standards of counterparty credit worthiness and contract execution/management procedures. As of November 1, 2005, TGVI contracted approximately 12.5 TJ per day of baseload supply delivered off the Spectra Pipeline System. TGVI also purchased approximately 31.8 TJ per day of seasonal supply to meet the higher loads during the winter months of December 2005 to February 2006.

TGVI maintains storage contracts with Unocal Canada Limited at Aitken Creek Storage facility in northern British Columbia and Northwest Natural Gas Company at Mist Storage facility in Oregon. As at March 14, 2006, TGVI's Aitken Creek Storage contract consisted of 2.1 PJ of capacity with 13.6 TJ of daily deliverability and its Mist storage agreement consisted of 0.69 PJ of capacity with 26.4 TJ of daily deliverability. As at March 14, 2006, TGVI also had access to an estimated 21.1 TJ of daily peaking supply deliverability from various peaking supply arrangements.

Capital Program

TGVI's capital projects for the upcoming years are primarily associated with the expansion of the distribution system and the addition of new customers. The capital expenditures are expected to increase the rate base and expand the customer base. The 2007 revenue requirements approved by the BCUC for TGVI include capital expenditures of $53.7 million, which includes $20.8 million for the Whistler pipeline. The capital expenditures relating to customer growth on Vancouver Island represent approximately 9.1% of the capital budget for 2007, while the remaining amount relates to system expansion, capital betterments, replacements and life extensions.

On June 28, 2006, TGVI and TGWI received final approval from the BCUC to extend natural gas service to Whistler. Under the proposed arrangements, TGVI will extend its transmission system to serve TGWI by the construction of a 50-kilometer pipeline lateral from Squamish to Whistler. It is expected that the pipeline will cost $42.8 million and TGVI's contribution to the pipeline costs, including system conversion, will be approximately $20.8 million. TGWI will pay the remainder of the costs of the pipeline.

Employees

TGVI has approximately 105 employees. Its organized employees are represented by the COPEU and the IBEW under the TGI Collective Agreements. See ''— Terasen Gas Inc. — Employees'' above.

Terasen Gas (Whistler) Inc.

TGWI has owned and operated the propane distribution system at Whistler since 1987. It provides service to approximately 2,350 residential and commercial customers in the Whistler area of British Columbia. TGWI owns and operates two propane storage and vaporization plants and approximately 100 kilometers of distribution pipelines serving customers in the Whistler area. The propane distribution system in Whistler has grown far beyond the original expectations and beyond the size and scale of other similar propane distribution systems in British Columbia and Canada. Today, with annual deliveries exceeding 750,000 GJ, TGWI's propane system is unique in terms of the size of the customer base it serves and the scale of the facilities required by its continued operations. The average rate base of TGWI for 2006 was approximately $16.5 million.

On June 28, 2006, TGVI and TGWI received final approval from the BCUC to extend natural gas service to Whistler. Under the proposed arrangements, TGVI will extend its transmission system to serve TGWI by the construction of a 50-kilometer pipeline lateral from Squamish to Whistler and TGWI will convert its current piped propane system to natural gas. The pipeline, which is scheduled for completion in 2008 and will be co-ordinated with the current Sea-to-Sky Highway upgrade project, will allow TGWI to better service future demand. It is expected that the pipeline will cost $42.8 million and TGWI's contribution to the pipeline costs, including system conversion, will be approximately $22.0 million. TGVI will pay the remainder of the cost of the pipeline. Customer, management and operations services are provided to TGWI by TGI.

Non-Regulated — CustomerWorks Limited Partnership

CWP is a partnership between Terasen and Enbridge that provides shared customer services primarily to the companies' respective regulated operations, Terasen Gas and Enbridge Gas. Enbridge owns a 70% interest in CWP and Terasen owns a 30% interest.

The provision of services by CWP is governed by a customer service agreement dated January 1, 2002, as amended (the ''Customer Service Agreement''). The Customer Service Agreement was initially entered into between BC Gas Utility Ltd. (the predecessor of TGI) and CWP and was subsequently amended to, among other things, provide for the outsourcing of the services by CWP to Accenture Business Services for Utilities Inc., a company indirectly owned and operated by Accenture, and to extend the provision of services to TGVI and TGWI. The Customer Service Agreement was entered into for a five-year term, renewable for additional one-year terms.

The services provided under the Customer Service Agreement include customer contact, meter reading, billing, support, and credit and collection services. The Customer Service Agreement has been approved by the BCUC. The rates under the Customer Service Agreement have both a fixed and service volume based component, include minimum service standards and penalties and are based on market prices. In providing these services, CWP uses a customer information services system under a licence from Enbridge Commercial Services, a subsidiary of Enbridge. During the nine-month period ended September 30, 2006, TGI paid approximately $33.1 million to CWP under the Customer Service Agreement.

Regulation

The Terasen Gas natural gas distribution system operates wholly within British Columbia. Gas utilities which operate wholly within British Columbia are subject to the regulatory jurisdiction of the BCUC which derives its powers from the *Utilities Commission Act* (British Columbia). In addition to approving the rate base and new financings of gas utilities, the BCUC also approves the rates charged to customers. These rates are designed to recover the utilities' costs of providing service and allow the opportunity to meet financial commitments and earn a reasonable and fair ROE. The BCUC has jurisdiction to regulate and approve the terms and conditions under which gas utilities provide service.

As part of the establishment of the rates that a gas utility charges its customers, the BCUC establishes a rate base, approves a capital structure with which to finance such rate base, and is responsible for setting a reasonable and fair rate of return on the debt and equity in the approved capital structure. Rate base is the aggregate of the depreciated cost of property, plant and equipment that is used or useful in serving the public, certain deferral accounts and a reasonable allowance for working capital. The fair rate of return is established by determining the cost of individual components of the capital structure, including ROE, and weighting such costs to determine an aggregate rate of return on rate base. The rates that are established and the terms and conditions of service are contained in a schedule of published and public tariffs. Before any tariff can be put into effect, it must be filed with the BCUC. The BCUC has jurisdiction to approve or refuse any amendment submitted for filing and to determine the rates which should be charged by a utility for its services. The BCUC is required to have due regard, among other things, to fixing rates that are not unjust or unreasonable. In fixing rates the BCUC must determine that such rates reflect a fair and reasonable charge for service of the nature and quality furnished by the utility to its customers and that such rates are sufficient to yield the utility fair and reasonable compensation for its services and a fair and reasonable rate of return on its rate base.

The BCUC uses a future test year in the establishment of rates for a utility. Pursuant to this method, the BCUC forecasts the volume of gas that will be sold and transported, together with all of the costs of the utility (including the rate of return) that the utility will incur in the test year. Rates are fixed to permit the utility to collect all of its costs (including the rate of return) if the forecast sales and transportation volumes are achieved. The forecast sales volumes assume normal weather. Certain costs are fixed and will be incurred regardless of the actual volume of gas sold. Accordingly, if the actual volumes of gas sales are less than those forecast in the test year, the utility might not recover all of the fixed costs. Interest expense, taxes other than income taxes, depreciation and amortization, certain operations and maintenance costs, the portion of the cost of gas that is fixed, such as demand charges or reservation fees, and the fixed portion of transportation costs have the effect of being virtually fixed costs.

In addition to application for approval of interim and annual rate changes, the gas utilities may apply from time to time to the BCUC for rate changes to give effect to the changes in costs beyond the control of the utilities.

The table below summarizes regulatory information pertaining to decisions made by the BCUC with respect to TGI and TGVI. While also regulated by the BCUC, similar regulatory information with respect to TGWI is not available from publicly available BCUC filings.

	Regulated Values				
	2007(1)	2006	2005	2004	2003
TGI					
Rate base ($M)	2,474	2,506	2,406	2,310	2,281
Deemed common equity component of total capital structure (%)	35	35	33	33	33
Allowed ROE (%)	8.37	8.80	9.03	9.15	9.42
TGVI					
Rate base ($M)	482	470	453	441	437
Deemed common equity component of total capital structure (%)	40	40	35	35	35
Allowed ROE (%)	9.07	9.50	9.53	9.65	9.92

(1) As approved by the BCUC.

Terasen Gas Inc.

TGI's allowed ROE is determined annually based on a formula that applies a risk premium to a forecast of long-term Government of Canada Bond yields. On June 30, 2005, TGI applied to the BCUC to increase the deemed equity components from 33% to 38%. The application also requested an increase in allowed ROEs from the levels that result from the then-current formula, which would have yielded 8.29% for TGI in 2006. The BCUC rendered its decision on the application on March 2, 2006, to be effective as of January 1, 2006. The generic ROE formula for a benchmark utility in British Columbia was changed such that it will be reset annually from a forecast of 30-year Canada Bonds plus a 3.90% risk premium when the forecast yield on 30-year Government of Canada Bonds is 5.25%. The risk premium is adjusted annually by 75% of the difference between 5.25% and the forecast yield on 30-year Government of Canada Bonds. For 2007, the forecast 30-year Canada Bond yield is 4.22% resulting in an ROE for TGI of 8.37%.

Two mechanisms to mitigate unanticipated changes in costs and sales volumes, such as changes caused by weather, have been implemented specifically for TGI. The first relates to the recovery of all gas costs through deferral accounts which capture all variances (overages and shortfalls) from forecasts. Balances are either refunded to or recovered from customers as determined by the BCUC. The deferral accounts are called the Commodity Cost Reconciliation Account (''CCRA'') and the Midstream Cost Reconciliation Account (''MCRA''). The second mechanism seeks to stabilize delivery revenues from residential and commercial customers through a deferral account that captures variances in the forecast-versus-actual customer use throughout the year. This mechanism is called the Revenue Stabilization Adjustment Mechanism (''RSAM''). In February 2001, the BCUC issued guidelines for quarterly calculations to be prepared to determine whether customer rate adjustments are needed to reflect prevailing market prices for natural gas and to ensure that rate stabilization account balances are recovered on a timely basis. The balance in the RSAM account at December 31, 2006 was approximately $36 million and the BCUC has approved $11.5 million of this balance to be recovered in 2007 through a rate rider.

The RSAM and CCRA/MCRA accounts reduce TGI's earnings exposure to risks associated with volatility of gas costs and consumer demand. Variances in demand by large volume, industrial transportation customers are not covered by these deferral accounts as their usage is more predictable and less likely to be significantly affected by weather.

The net balances of the RSAM and CCRA/MCRA accounts increased to a receivable of approximately $148.8 million as at September 30, 2006 from a payable of approximately $9.0 million as at December 31, 2005. In order to ensure that the balances in the CCRA/MCRA accounts are recovered on a timely basis, TGI prepares and files quarterly calculations with the BCUC to determine whether customer rate adjustments are needed to reflect prevailing market prices for natural gas costs.

TGI also has in place deferral accounts to absorb short-term and long-term interest rate fluctuations. The interest rate deferral accounts which were in place during 2006 effectively fixed the interest expense on short-term funds attributable to TGI's regulated assets at 4.00% during 2006. The effective fixed short-term interest rate for 2007 has been set at 4.75%. Any variations from these rates throughout the year are recorded in deferral accounts and are subsequently either refunded to or recovered from customers as determined by the BCUC.

In 2003, TGI received BCUC approval of a Negotiated Settlement of a 2004-2007 PBR Plan (the ''TGI Settlement''). The TGI Settlement, which took effect January 1, 2004, establishes a process for determining TGI's delivery charges and incentive mechanisms for improved operating efficiencies. The four-year agreement includes incentives for TGI to operate more efficiently through sharing of the benefits of cost reductions among TGI and its customers. It includes ten service quality indicators designed to ensure TGI provides appropriate service levels and sets out the requirements for an annual review process which will provide a forum for discussion between TGI and interested parties regarding TGI's current performance and future activities. In January 2007, TGI made application to the BCUC to extend the TGI Settlement to 2009.

Operation and maintenance costs and base capital expenditures are subject to an incentive formula which permits recovery of increasing costs due to customer growth and inflation. Operating costs are subject to an adjustment factor based on 50% of inflation during the first two years and 66% of inflation during the last two years. Base capital expenditure amounts are a function of customer numbers and projected customer additions. During the annual review process, non-controllable expenses and extraordinary capital expenditures can be added to or subtracted from revenue requirements under the terms of the TGI Settlement.

The TGI Settlement provides for a 50/50 customer/shareholder sharing mechanism of earnings above or below the allowed ROE. When TGI's earned ROE is greater than 150 basis points above or below the allowed ROE for two consecutive years, the PBR mechanism may be reviewed. The following table sets out the allowed ROE, the earned ROE (before sharing) and the customer share under the sharing mechanism.

TGI Earned ROEs and Shared Earnings through PBR

	2006(1)	2005	2004
Allowed ROE (%)	8.80	9.03	9.15
Earned ROE (%)	10.10	10.78	9.34
Customer share (pre-tax)($M)	8.2	10.5	1.1

(1) Projected as filed by TGI in the 2007 Revenue Requirement Filing.

Terasen Gas (Vancouver Island) Inc.

Pursuant to BCUC orders from 2003 onwards, TGVI's rates have been set so as to fully recover its cost of service plus an amount for the timely amortization of the RDDA in accordance with the government directives. To permit recovery of the outstanding balance in the RDDA, TGVI's rates for residential and commercial customers are set at levels in excess of TGVI's cost of service, but are effectively capped at a comparable price of competitive alternative fuels. TGVI renewed its regulatory settlement in late 2005 for a two-year period, effective January 1, 2006. It provides for a continuation of the operation and maintenance cost incentive arrangements previously in place. The allowed ROE for TGVI was 9.53% for 2005 compared to 9.65% in 2004. TGVI's ROE for 2006 is 9.50% and TGVI's deemed equity component of its capital structure for 2006 is 40%. The 2007 approved ROE for TGVI has been set at 9.07%.

TGVI's approved rate design methodology provides, in effect, that to the extent that cost of service inputs change over time, TGVI's rates will reflect a variable RDDA amortization. The rates generally are set to be equivalent to 90% of comparable electricity price. The RDDA amortization was approximately $12.4 million in 2005 and approximately $6.9 million in 2006. The RDDA has been amortized from approximately $87.9 million as at December 31, 2002 to approximately $41.4 million as at December 31, 2006.

In November 2005, TGVI received BCUC approval of a Negotiated Settlement (the ''TGVI Settlement'') of 2006-2007 revenue requirements. The two-year TGVI Settlement, which took effect as of January 1, 2006, establishes a process for determining TGVI's delivery charges and offers incentive mechanisms for improved operating efficiencies. TGVI is permitted to retain 100% of earnings from savings of controllable operating and maintenance expenses from forecast and TGVI will not be provided any relief from increased controllable operating and maintenance expenses. The operating and maintenance expense forecast is based on actual 2005 costs, adjusted for changes outside of management's control, expected savings from operational synergies with TGI, 66% of inflation and customer growth. TGVI has managed actual operating and maintenance expenses close to forecast. In January 2007, TGVI made an application to the BCUC to extend the TGVI Settlement to 2009.

Competition

Natural gas has maintained a competitive advantage in terms of pricing when compared with alternative sources of energy in British Columbia, despite the significant increase in natural gas commodity prices since 1999. Regulated electricity prices in British Columbia are currently set based on the historical average production costs which are lower than the market price of electricity. Current regulated electricity prices are only marginally higher than comparable, market-based natural gas prices. A further sustained increase in natural gas commodity prices could cause natural gas in British Columbia to be priced at or above electricity, thereby decreasing the use of natural gas by customers.

Hedging

Derivative instruments are used to hedge exposure to fluctuations in natural gas prices and interest rates. The majority of the natural gas supply contracts have floating, rather than fixed, prices. Natural gas price swap contracts are used to fix the effective purchase price. Any differences between the effective cost of natural gas purchased and the price of natural gas included in rates are recorded in deferral accounts (MCRA and CCRA) and, subject to BCUC approval, passed through to customers in future rates.

TGI's short-term borrowings and variable rate long-term debt are exposed to interest rate risk which TGI manages through the use of interest rate derivatives. Any resulting gains or losses are recorded in interest rate deferral accounts and, subject to BCUC approval, passed through to consumers in future rates.

Financing Arrangements

Debentures

Terasen has issued and outstanding two series of unsecured medium term note debentures (''Terasen MTN Debentures''), which are governed by a Trust Indenture dated November 21, 2001 between Terasen (as successor to BC Gas Inc.) and CIBC Mellon Trust Company (the ''2001 Indenture''), as amended and supplemented by a First Series Supplement dated November 22, 2001 (the ''First Supplement''). The aggregate principal amount of debentures that may be issued under the 2001 Indenture is unlimited, subject to the restrictions set forth therein. As at September 30, 2006, Terasen had issued and outstanding $200 million principal amount of 6.30% Series 1 MTN Debentures due December 1, 2008 and $125 million principal amount of 5.56% Series 3 MTN Debentures due September 15, 2014. The First Supplement includes a positive covenant of Terasen that, so long as any MTN Debentures remain outstanding, it shall not create, assume, issue or otherwise incur or become liable for any Funded Indebtedness unless immediately thereafter the Funded Indebtedness of Terasen and its subsidiaries will not be in excess of 75% of Total Consolidated Capitalization. Funded Indebtedness means indebtedness that matures more than 18 months after such indebtedness was incurred, except for non-recourse debt to finance specific assets or subordinated debt. Total Consolidated Capitalization means the sum of (a) the principal amount of consolidated Funded Indebtedness of Terasen and its subsidiaries, (b) the total capital of Terasen, (c) the principal amount of all subordinated debt of Terasen, (d) the sum of consolidated contributed or capital surplus and retained earnings of Terasen, and (e) provision for future income taxes of Terasen.

On April 19, 2000, Terasen issued $125 million of 8.0% unsecured capital securities (the ''Capital Securities'') with a term to maturity of 40 years. The Capital Securities were issued under the terms of a Trust Indenture dated April 19, 2000 between Terasen (as successor to BC Gas Inc.) and CIBC Mellon Trust Company (the ''2000 Indenture''). Terasen may elect to defer payments on the Capital Securities for extension periods not exceeding 10 consecutive semi-annual periods. Terasen may settle such deferred payments in either cash or common shares and has the option to settle principal at maturity through the issuance of common shares at 90% of their market price. The 2000 Indenture provides that if Terasen defers any interest payment on the Capital Securities, it is not permitted to pay dividends on, or purchase or redeem, its common shares for so long as such interest payments are deferred. The Capital Securities are exchangeable at the option of the holder on or after April 19, 2010 for common shares of Terasen at a price equal to the greater of $1 per share and 90% of the market price.Terasen may, at its option, redeem the Capital Securities in whole at a redemption price which, if the Capital Securities are redeemed prior to April 19, 2010, is equal to the greater of Canada Yield Price (as defined in the 2000 Indenture) and 100% of the principal amount of the Capital Securities, together in each case with accrued and unpaid interest, or if the Capital Securities are redeemed on or after April 19, 2010, at a price that is equal to 100% of the principal amount outstanding plus any accrued and unpaid interest.

TGI has issued and outstanding unsecured debentures and medium-term note debentures which are governed by a Trust Indenture dated November 1, 1977 between TGI (as successor to Inland Natural Gas Co. Ltd.) and CIBC Mellon Trust Company (as successor to National Trust Company, Limited), as amended and supplemented (the ''1977 Indenture''). The aggregate principal amount of debentures that may be issued under the 1977 Indenture is unlimited, subject to the restrictions set forth therein. As at September 30, 2006, TGI had issued and outstanding $59.9 million principal amount of 10.75% debentures, Series E due June 8, 2009, and an aggregate of $1,008 million of medium-term note debentures with fixed rates of interest ranging from 5.55% to 6.95% or with floating interest rates, and maturities of not less than one year. The Fourth Supplemental Indenture dated June 1, 1989 and the Tenth Supplemental Indenture dated November 15, 1993 contain certain restrictions on the ability of TGI to issue any debt securities with maturities of more than 18 months, unless certain financial tests are met and subject to certain exceptions.

TGI also has issued and outstanding Series A and Series B Purchase Money Mortgages (the ''Purchase Money Mortgages''), which are secured equally and rateably by a first fixed and specific mortgage and charge on TGI's gas distribution system in the lower mainland of British Columbia that was acquired by TGI from BC Hydro. The Purchase Money Mortgages are governed by a Trust Indenture dated December 3, 1990 between TGI (as successor to B.C. Gas Inc.), Inland Energy Corp. and CIBC Mellon Trust Company (as successor to National Trust Company), as amended and supplemented (the ''1990 Indenture''). The aggregate principal amount of Purchase Money Mortgages that may be issued under the 1990 Indenture is limited to $425 million. As at September 30, 2006, TGI had issued and outstanding $74.9 million aggregate principal amount of 11.80% Series A Purchase Money Mortgages due September 30, 2015 and $200 million aggregate principal amount of $10.30% Series B Purchase Money Mortgages due September 30, 2016.

Credit Facilities

On May 5, 2006, Terasen entered into a Credit Agreement with The Toronto-Dominion Bank, as administrative agent, and the institutions named therein, as lenders (the ''Terasen Credit Agreement''). The Terasen Credit Agreement provides a committed $450 million revolving credit facility which matures on May 5, 2009. The interest rate payable on advances under the credit facility varies based on the type of advance. The credit facility can be used for Terasen's general corporate purposes. The Terasen Credit Agreement contains customary representations and warranties and positive and negative covenants, including a requirement that Terasen maintain a total debt-to-capitalization ratio not higher than 0.75:1 and an interest coverage ratio not less than 1.25:1. The Terasen Credit Agreement contains customary events of default.

On June 21, 2006, TGI entered into a Credit Agreement with Canadian Imperial Bank of Commerce, as administrative agent, lead arranger and sole bookrunner, The Bank of Nova Scotia, as syndication agent and the other lenders identified therein (the ''TGI Credit Agreement''). The TGI Credit Agreement provides a committed $500 million revolving credit facility. The interest rate payable on accommodations under the TGI Credit Agreement varies based on the type of accommodation. The facility can be used for refinancing indebtedness of TGI and for general corporate purposes, including as back-up for TGI's commercial paper program. The TGI Credit Agreement is extendible annually for an additional 365 days at the option of the lenders and matures on June 21, 2009. The TGI Credit Agreement contains customary representations and warranties and positive and negative covenants, including a requirement that TGI maintain a total debt to capitalization ratio not higher than 0.75:1. The TGI Credit Agreement contains customary events of default.

On January 13, 2006, TGVI entered into a Credit Agreement with Royal Bank of Canada, as administrative agent, RBC Capital Markets, as lead arranger and bookrunner, National Bank Financial, as syndication agent, and The Bank of Nova Scotia, as documentation agent, and the other lenders identified therein (the ''TGVI Credit Agreement''). The TGVI Credit Agreement provides for a five-year unsecured, committed, revolving credit facility of $350 million. A portion of the facility was used to refinance TGVI's term facility of $209.5 million. While the borrowings under this facility are short-term bankers' acceptances, the underlying credit facility on which the advances are provided is committed through to January 2011 and the borrowings are primarily to support the longer-term rate base assets of TGVI. The facility can be used for refinancing indebtedness of TGVI and for general corporate purposes, including for capital expenditures. The TGVI Credit Agreement contains customary representations and warranties and positive and negative covenants, including a requirement that TGVI maintain a ratio of institutional indebtedness-to-total capitalization not higher than 0.70:1 and a ratio of earnings to interest expense of at least 2.0:1. The TGVI Credit Agreement contains customary events of default, including a cross default under the VINGPA and certain other agreements.

Concurrently with the TGVI Credit Agreement, TGVI also entered into a $20 million, seven-year unsecured, committed, non-revolving credit facility with Royal Bank of Canada which is to be used only for purposes of funding up to 65% of each repayment of the Repayable Contributions under the PCEPA. The terms of this facility are substantially similar to those contained in the TGVI Credit Agreement. This facility ranks junior to repayment of the Class B Instruments held by Terasen. See ''— Terasen Gas (Vancouver Island) Inc. — Vancouver Island Natural Gas Pipeline Agreement'' above.

The following summary outlines the credit facilities of Terasen, TGI and TGVI as at September 30, 2006.

(in millions of dollars)	Terasen	TGI	TGVI	Total
Total credit facilities	450	500	370	1,320
Credit facilities utilized Borrowings	176	207	284	667
Letters of credit outstanding	73	43.6	—	116.6
Credit facilities available	201	249.4	86	536.4

ACQUISITION AGREEMENT

Fortis has entered into the Acquisition Agreement dated February 26, 2007 with 3211953 Nova Scotia Company (''3211953'') and Kinder Morgan for the purchase of all of the issued and outstanding shares of Terasen. The Acquisition Agreement provides that prior to the closing of the Acquisition, Kinder Morgan will transfer all of the issued and outstanding shares of Terasen which it currently owns to 3211953. In this section of the Prospectus, ''Vendor'' means Kinder Morgan prior to such transfer, and 3211953 upon the occurrence of such transfer. The Acquisition is not a transaction with an informed person, associate or affiliate of Fortis (as such terms are defined in National Instrument 51-102 — *Continuous Disclosure Obligations*).

Purchase Price

The purchase price under the Acquisition Agreement is $3.7 billion, including the assumption of approximately $2.3 billion of consolidated indebtedness of Terasen and the balance in cash. The cash portion of the purchase price (the ''Cash Purchase Price'') will be equal to $1.801 billion minus the unconsolidated indebtedness of Terasen outstanding on the closing of the Acquisition, which management of Fortis expects to be at least $450 million.

Representations and Warranties

Under the Acquisition Agreement, the Vendor and Fortis have made various representations and warranties. The Vendor's representations and warranties relate to, among other things, organization and status, capitalization, title, authority to enter into the Acquisition Agreement and no conflict, consents and approvals, absence of defaults under constating documents or material agreements, absence of certain material changes or events since December 31, 2006, employment matters, pension and employee benefits, securities regulatory filings, reports and financial statements, compliance with laws, possession of permits, restrictions on business activities, legal or regulatory proceedings, material contracts, tax matters, intellectual property, books and records, environmental matters, insurance, brokerage fees, management controls and no U.S. operations. Fortis' representations and warranties relate to, among other things, organization and status, authority to enter into the Acquisition Agreement and no conflict, consents and approvals, availability of financing, legal proceedings, no knowledge of a breach of the Vendor's representations or warranties or disclosure, brokerage fees, nature of investment and independent investigation.

Covenants

The Vendor and Fortis have made covenants relating to the closing of the Acquisition and related matters. In particular, the Vendor has agreed to the following during the period from the date of the Acquisition Agreement until the closing:

(a) Conduct of Business. Terasen and Terasen Gas will carry on business in the usual and ordinary course of business consistent with past practices, maintain material properties and assets in good repair and use commercially reasonable efforts to preserve present business organizations, officers, employees, customers and suppliers;

(b) Dividends. Terasen and Terasen Gas will not declare or pay any dividends on capital stock, except for dividends (i) by TGI or TGVI to Terasen up to an amount such that, immediately after giving effect to such payment, TGI or TGVI, as the case may be, will have a ratio of common equity to total capital of at least 35% and 40%, respectively, and (ii) by Terasen up to but not exceeding the aggregate amount of dividends received by it from TGI and TGVI.

(c) Capital Expenditures. Terasen and Terasen Gas will not make or commit to make any capital expenditures in excess of $5 million, other than (i) to replace or repair damaged or destroyed facilities, (ii) budgeted capital expenditures, (iii) expenditures approved by the BCUC, or (iv) expenditures required by law;

(d) Employees and Benefits. Terasen and Terasen Gas will not increase compensation or benefits for employees, except nominal increases for people who are not officers or directors made in the ordinary course of business consistent with past practice;

(e) Rates. Subject to applicable law, Terasen and Terasen Gas will not implement any changes in any rates or charges (other than changes under existing tariffs, rate schedules or performance-based rate-making arrangements authorized by the BCUC), standards of service or accounting, or execute any agreement relating thereto that could reasonably be expected to materially decrease the revenues of the business unit implementing the change;

(f) Borrowings. Terasen and Terasen Gas will not incur any indebtedness other than in the ordinary course of business and subject to the specified exceptions in the Acquisition Agreement;

(g) Pre-Closing Reorganization. Terasen will complete the Pre-Closing Reorganization prior to closing; and

(h) Discharge of Guarantees. The Vendor shall cause Terasen and Terasen Gas to be discharged from all obligations under certain guarantees by Terasen and Terasen Gas for the benefit of the petroleum transportation business of Terasen.

In addition, the Vendor and Fortis have agreed to use their reasonable efforts to obtain all material authorizations, consents, orders and approvals and to make all necessary filings with the relevant government authorities as required under the Acquisition Agreement.

Indemnities

Pursuant to the Acquisition Agreement, the Vendor has agreed, subject to certain limits, to indemnify and save harmless Fortis and its affiliates, and Fortis, subject to certain limits, has agreed to indemnify and save harmless the Vendor and its affiliates in respect of all losses sustained or incurred by the other resulting from (i) certain misrepresentations or breaches of warranty relating to title to the shares of Terasen and Terasen Gas, organization, corporate status, authority to enter into the Acquisition Agreement, and no breach of constating documents or any laws (the ''Title Warranties''), (ii) any breach of the covenants or obligations to be performed following the closing of the Acquisition contained in the Acquisition Agreement, (iii) the Pre-Closing Reorganization and the operations of the petroleum transportation business of Terasen, in the case of indemnification by the Vendor, and (iv) in the case of indemnification by Fortis, the operations of the Terasen and Terasen Gas businesses (provided that the facts giving rise to the losses do not constitute a breach of the representations and warranties of the Vendor). The indemnities provided by the Vendor or Fortis, as the case may be, with respect to breaches of covenants and obligations to be performed following the closing of the Acquisition are limited in that claims may only be made when (i) the losses suffered exceed $500,000 in each instance or (ii) the aggregate of all such losses exceeds 2.5% of the Cash Purchase Price and, in the latter case, only to the extent of such excess. The maximum amount that can be claimed by Fortis under the indemnity provisions of the Acquisition Agreement is limited to 10% of the Cash Purchase Price with respect to claims for any breach of the covenants or obligations of the Vendor following the closing of the Acquisition, and 100% of the Cash Purchase Price with respect to claims for breaches of the Title Warranties. The maximum amount that can be claimed by the Vendor under the indemnity provisions of the Acquisition Agreement is limited to 10% of the Cash Purchase Price with respect to claims for any breach of the covenants or obligations of Fortis following the closing of the Acquisition contained in the Acquisition Agreement and 100% of the Cash Purchase Price with respect to claims for breaches of the Title Warranties. Claims sustained or incurred by Fortis as a result of the Pre-Closing Reorganization and the operations of the petroleum transportation business of Terasen, and by the Vendor in respect of the operations of the Terasen and Terasen Gas businesses, are not subject to any minimum or maximum limits.

Closing Conditions

The Acquisition Agreement provides that the obligation of Fortis or the Vendor to complete the Acquisition is subject to the fulfillment of a number of conditions, each of which may be waived by such party, including the following:

(a) Accuracy of Representations and Warranties. The representations and warranties of the other party under the Acquisition Agreement are true and correct as of the date of the Acquisition Agreement and as of the closing date (except for representations and warranties made as of an earlier date, which must be true and correct as of such earlier date), except where the failure of such representations and warranties to be true and correct would not be reasonably likely, individually or in the aggregate, to have a Material Adverse Effect on the other party. ''Material Adverse Effect'' is defined in the Acquisition Agreement to mean any adverse and material change relating to the condition (financial or otherwise), results of operations or business of either party that is material to such party and its subsidiaries, taken as a whole, or in the case of the Vendor, that is material to Terasen and Terasen Gas, taken as a whole;

(b) Performance of Covenants. The other party has performed and complied with its material covenants and agreements under the Acquisition Agreement in all material respects;

(c) Legal Proceedings. There must not be any decree, injunction or ruling that would prevent or otherwise make the Acquisition illegal;

(d) Consents and Approvals. Each party has received the governmental and regulatory consents and approvals required to be obtained by it under the Acquisition Agreement. The regulatory approvals that must be obtained prior to the closing of the Acquisition include:

   (i) approval by the BCUC of the transfer of the shares of Terasen to Fortis or a subsidiary of Fortis pursuant to the *Utilities Commission Act* (British Columbia); and

   (ii) one of the following has occurred: (i) an advance ruling certificate has been issued in respect of the Acquisition pursuant to section 102 of the *Competition Act* (Canada) (the ''Competition Act''); (ii) the parties have received written advice that the Commissioner has concluded that she does not have sufficient grounds to initiate proceedings before the Competition Tribunal to challenge the Acquisition under the merger provisions of the Competition Act; or (iii) any applicable waiting period pursuant to section 123 of the Competition Act has expired or been earlier terminated or waived.

(e) Pre-Closing Reorganization. The Pre-Closing Reorganization has been completed.

Termination

The Acquisition Agreement may be terminated by Fortis or the Vendor at any time prior to closing in certain circumstances, including:

(a) the mutual agreement of Fortis and the Vendor;

(b) if the other party has not satisfied the conditions that its representations and warranties under the Acquisition Agreement be true and correct and that it has performed in all material respects the material covenants and agreements required to be performed by it prior to the closing date, and such condition has not been waived on or before the closing date by the party wishing to terminate;

(c) if a government authority issues a final order or injunction restraining or prohibiting the Acquisition;

(d) if prior to the closing, the other party provides additional information disclosing facts that would constitute a breach of such other party's representations and warranties under the Acquisition Agreement and such breach would have a Material Adverse Effect on the party wishing to terminate the Acquisition Agreement, if notice of termination is provided within 10 days of receipt of the relevant information; or

(e) if the closing has not occurred on or before November 30, 2007, unless the failure to close by such date is due to the party wishing to terminate the Acquisition Agreement not having fulfilled its obligations under the agreement.

Kinder Morgan Guarantee

Pursuant to the Acquisition Agreement, Kinder Morgan has irrevocably and unconditionally guaranteed the full and complete performance by 3211953 of all of the obligations of 3211953 under the Acquisition Agreement, such guarantee to be effective upon the transfer by Kinder Morgan of all of the issued and outstanding shares of Terasen to 3211953 prior to the closing of the Acquisition.

FINANCING OF THE ACQUISITION

For purposes of financing the Acquisition, on February 26, 2007, Fortis obtained a commitment letter from Canadian Imperial Bank of Commerce providing for an aggregate of $1.425 billion non-revolving term credit facilities in favour of Fortis consisting of a facility in the amount of $925 million (''Facility A'') and a facility in the amount of $500 million (''Facility B'') (together with ''Facility A'', the ''Credit Facilities''). The Credit Facilities would be sufficient, if necessary, to fund the full Cash Purchase Price for the Acquisition.

The Credit Facilities are unsecured single borrowing credit facilities to be used by Fortis, to the extent required, to finance the payment of the Cash Purchase Price for the Acquisition. Any amount not drawn down under the Credit Facilities will be cancelled after the initial borrowing. Facility A and Facility B will mature on the second and third anniversary of the initial extension of credit under Facility A and Facility B, respectively.

The credit agreement pursuant to which the Credit Facilities will be extended (the ''Credit Agreement'') will contain certain prepayment options in favour of Fortis and certain prepayment obligations upon the occurrence of certain events. In particular, the net proceeds of any equity or debt offering by Fortis (other than certain permitted equity or debt offerings for strategic investments) will be required to be used to prepay the Credit Facilities and any prepayment under the Credit Facilities may not be re-borrowed. Fortis may prepay any balance outstanding under the Credit Facilities without penalty, provided that any such prepayment is in an amount of at least $10 million and subject to any breakage costs being for the account of Fortis.

The Credit Agreement will contain customary representations and warranties and affirmative and negative covenants of Fortis. As part of these covenants, Fortis will be required to maintain a consolidated debt to consolidated capitalization ratio of not more than 0.85:1 after the date of the Acquisition Agreement until the first anniversary of the closing of the Acquisition and 0.75:1 at any time thereafter. These ratios will reduce automatically to 0.75:1 and 0.70:1 at any time during those respective periods, if Fortis has received, free from any escrow conditions, aggregate proceeds from equity issuances of at least $700 million. The Credit Agreement will contain customary events of default. In addition, any failure by Fortis to maintain an investment grade credit rating will constitute an event of default under the Credit Agreement.

Customary fees are payable by Fortis in respect of the Credit Facilities and amounts outstanding under the Credit Facilities will bear interest at market rates.

The net proceeds from the Offering will be used to reduce the amount of the Credit Facilities. Fortis expects that the remainder of Credit Facilities will be repaid from the proceeds of one or more offerings of Common Shares, preferred shares and/or long-term debt.

CAPITALIZATION

The following table sets out the consolidated capitalization of the Corporation as at September 30, 2006 and after giving effect to the Offering (assuming no exercise of the Over-Allotment Option), the issue of 5,170,000 Common Shares on January 18, 2007, the issue of $110 million aggregate principal amount of senior unsecured debentures by FortisAlberta on January 3, 2007, the drawdown of $139.3 million under the Credit Facilities and completion of the Acquisition. The financial information set out below should be read in conjunction with the unaudited consolidated financial statements incorporated by reference into the Prospectus and the unaudited *pro forma* consolidated financial statements included in the Prospectus and, in each case, the notes thereto.

	Outstanding at September 30, 2006	*Pro forma* outstanding at September 30, 2006
	(in millions of dollars)	
Total debt (net of cash)	2,296.1	4,863.0(2)
Preference shares (1)	319.5	319.5
Shareholders' equity		
Securities offered hereby	Nil	974.2
Common shares	822.5	968.1(2)
Preference shares	122.5	122.5
Contributed surplus	4.3	4.3
Equity portion of convertible debentures	1.4	1.4
Foreign currency translation adjustment	(17.8)	(17.8)
Retained earnings	472.2	472.2
Total capitalization	4,020.7	7,707.4

(1) These preference shares are classified as long-term liabilities in the financial statements of Fortis.

(2) After giving effect to the Offering (assuming no exercise of the Over-Allotment Option), the issue of 5,170,000 Common Shares on January 18, 2007, the issue of $110 million aggregate principal amount of senior unsecured debentures by FortisAlberta on January 3, 2007, the drawdown of $139.3 million under the Credit Facilities and completion of the Acquisition.

PRICE RANGE AND TRADING VOLUME OF THE COMMON SHARES

The outstanding Common Shares of Fortis are traded on the TSX under the trading symbol ''FTS''. The following table sets forth the reported high and low trading prices and trading volumes of the Common Shares as reported by the TSX from January 2006.

Period	High	Low	Volume
2006			
January	$24.60	$22.76	3,981,812
February	23.76	22.00	7,087,013
March	23.50	21.65	6,775,211
April	22.95	20.89	3,813,271
May	24.84	20.36	7,241,148
June	24.60	21.16	3,707,157
July	23.40	21.99	2,328,812
August	25.48	22.15	6,214,513
September	25.40	24.00	2,553,872
October	25.65	24.12	7,362,894
November	28.74	25.15	6,234,745
December	30.00	28.01	2,793,265
2007			
January	30.00	26.72	6,030,480
February	27.96	26.00	8,612,015
March 1 to 6	26.81	26.16	2,204,514

On March 6, 2007, the closing price of the Common Shares was $26.80.

SHARE CAPITAL OF FORTIS

The authorized share capital of the Corporation consists of an unlimited number of Common Shares, an unlimited number of First Preference Shares issuable in series and an unlimited number of Second Preference Shares issuable in series, in each case without nominal or par value. As at March 6, 2007, 109,407,397 Common Shares, 5,000,000 First Preference Shares, Series C, 7,993,500 First Preference Shares, Series E and 5,000,000 First Preference Shares, Series F were issued and outstanding.

DIVIDEND POLICY

Dividends on the Common Shares are declared at the discretion of the Board of Directors of Fortis. The Corporation paid cash dividends on its Common Shares of $0.67 in 2006, $0.59 in 2005 and $0.54 in 2004. On December 7, 2006, the Fortis Board of Directors declared a first quarter dividend of $0.19 per Common Share, payable on March 1, 2007 to holders of record on February 2, 2007. On February 8, 2007, Fortis announced that its Board of Directors had declared a second quarter dividend of $0.21 per Common Share, payable on June 1, 2007 to holders of record on May 4, 2007. This dividend represents an increase of 10.5% in the quarterly Common Share dividend of the Corporation, which is the second increase in twelve months. Fortis has increased its annual dividend paid for 34 consecutive years.

Regular quarterly dividends at the prescribed annual rate have been paid on all of the First Preference Shares, Series C, the First Preference Shares, Series E and the First Preference Shares, Series F, respectively. On December 7, 2006, the Fortis Board of Directors also declared a first quarter dividend on each such series of First Preference Shares in accordance with the applicable prescribed annual rate, in each case payable on March 1, 2007 to holders of record on February 2, 2007.

DESCRIPTION OF COMMON SHARES

Dividends

Holders of Common Shares are entitled to dividends on a *pro rata* basis if, as and when declared by the Board of Directors of Fortis. Subject to the rights of the holders of the First Preference Shares and Second Preference Shares and any other class of shares of the Corporation entitled to receive dividends in priority to or rateably with the holders of the Common Shares, the Board of Directors of Fortis may declare dividends on the Common Shares to the exclusion of any other class of shares of the Corporation.

Liquidation, Dissolution or Winding-Up

On the liquidation, dissolution or winding-up of Fortis, holders of Common Shares are entitled to participate rateably in any distribution of assets of Fortis, subject to the rights of holders of First Preference Shares and Second Preference Shares and any other class of shares of the Corporation entitled to receive the assets of the Corporation on such a distribution in priority to or rateably with the holders of the Common Shares.

Voting Rights

Holders of the Common Shares are entitled to receive notice of and to attend all annual and special meetings of the shareholders of Fortis, other than separate meetings of holders of any other class or series of shares, and to one vote in respect of each Common Share held at such meetings.

DETAILS OF THE OFFERING

Subscription Receipts

The Subscription Receipts will be issued on the Closing Date (as defined below) pursuant to the Subscription Receipt Agreement. The Escrowed Funds will be delivered to and held by the Escrow Agent and invested in short-term interest bearing or discount debt obligations issued or guaranteed by the Government of Canada or a province, or one or more of the five largest Canadian chartered banks, provided in all cases that such obligation is rated at least R1 (middle) by DBRS Limited or an equivalent rating from an equivalent rating service, pending satisfaction of the Release Conditions.

If the Release Conditions are satisfied prior to 5:00 p.m. (Toronto time) on November 30, 2007, the Corporation will forthwith execute and deliver a notice of satisfaction and will issue and deliver to the Escrow Agent one Common Share for each Subscription Receipt then outstanding (subject to any applicable adjustment). The Common Shares will be available for delivery commencing on the second business day after the delivery of such notice. The holders of Subscription Receipts will receive, without payment of any additional consideration, one Common Share for each Subscription Receipt held plus an amount equal to the dividends declared on the Common Shares by the Corporation, if any, for which record dates have occurred during the period from the Closing Date to the date of issuance of the Common Shares in respect of the Subscription Receipts. Forthwith upon the Release Conditions being satisfied and the required notice being delivered to the Escrow Agent, the Escrowed Funds, together with interest earned and income generated thereon, will be released to Fortis.

In the event that the Release Conditions are not satisfied, or if the Acquisition Agreement is terminated, prior to the Termination Time, holders of Subscription Receipts shall, commencing on the second business day following the Termination Time, be entitled to receive from the Escrow Agent an amount equal to the full subscription price thereof plus their *pro rata* share of the interest earned or income generated on such amount. The Escrowed Funds will be applied toward payment of such amount.

In the event that, prior to the date of issue of a Common Share in respect of a Subscription Receipt, there is a subdivision, consolidation, reclassification or other change of the Common Shares or any reorganization, amalgamation, merger or sale of all or substantially all of the Corporation's assets, the Subscription Receipts will thereafter evidence the right of the holder to receive the securities, property or cash deliverable in exchange for or on the conversion of or in respect of the Common Shares to which the holder of a Common Share would have been entitled immediately after such event. Similarly, any distribution to all or substantially all of the holders of Common Shares of rights, options, warrants, evidences of indebtedness or assets will result in an adjustment in the number of Common Shares to be issued to holders of Subscription Receipts. Alternatively, such securities, evidences of indebtedness or assets may, at the option of the Corporation, be issued to the Escrow Agent and delivered to holders of Subscription Receipts on exercise thereof. In case the Corporation, after the Closing Date, takes any action affecting the Common Shares, other than the actions described above, which, in the reasonable opinion of the directors of the Corporation, would materially affect the rights of the holders of Subscription Receipts and/or the rights attached to the Subscription Receipts, then the number of Common Shares which are to be received pursuant to the Subscription Receipts shall be adjusted in such manner, if any, and at such time as the directors of the Corporation may, in their discretion, reasonably determine to be equitable to the holders of Subscription Receipts in such circumstances. The adjustments provided for in this paragraph are cumulative and shall apply to successive subdivisions, consolidations, changes, distributions, issues or other events resulting in any adjustment.

Under the Subscription Receipt Agreement, purchasers of Subscription Receipts will have a contractual right of rescission entitling the purchaser to receive the amount paid for the Subscription Receipts upon surrender of the Subscription Receipts or the Common Shares, as applicable, if the Prospectus and any amendment contains a misrepresentation, as such term is defined in the *Securities Act* (Ontario), provided such remedy for rescission is exercised within 180 days of the Closing Date.

Subject to applicable law, the Corporation will be entitled to purchase the Subscription Receipts in the open market or by private agreement or otherwise.

Subscriptions for the Subscription Receipts will be received subject to rejection or allotment in whole or in part and the right is reserved to close the subscription books at any time without notice. It is expected that the closing of the Offering will take place on or about March 15, 2007, or such other date as may be agreed upon by the Corporation and the Underwriters, but not later than April 18, 2007 (the ''Closing Date''). The Subscription Receipts will be issued in ''book entry only'' form and must be purchased or transferred through a registered dealer who is a CDS participant (a ''CDS Participant''). The Corporation will cause a global certificate or certificates representing newly issued Subscription Receipts to be delivered to and registered in the name of CDS or its nominee. All rights of Subscription Receipt holders must be exercised through, and all payments or other money to which such holders are entitled will be made or delivered by, CDS or the CDS Participant through which the holders hold such Subscription Receipts. Each person who acquires Subscription Receipts will receive only a customer confirmation of purchase from the registered dealer from or through which the Subscription Receipts are acquired in accordance with the practices and procedures of that registered dealer. The practices of registered dealers may vary, but generally customer confirmations are issued promptly after execution of a customer order. CDS is responsible for establishing and maintaining book entry accounts for its CDS Participants having interests in the Subscription Receipts.

The Subscription Receipt Agreement provides for modifications and alternations to the Subscription Receipts issued thereunder by way of an extraordinary resolution. The term ''extraordinary resolution'' is defined in the Subscription Receipt Agreement to mean, in effect, a resolution proposed at a meeting of holders of Subscription Receipts duly convened for that purpose and held in accordance with the Subscription Receipt Agreement at which there are present in person or by proxy at least two holders of Subscription Receipts entitled to receive more than 25% of the aggregate number of Common Shares issuable upon the exchange of the Subscription Receipts which could be received pursuant to all the then-outstanding Subscription Receipts and passed by the affirmative votes of holders of Subscription Receipts entitled to receive not less than 66⅔% of the aggregate number of such Common Shares which could be received pursuant to all the then-outstanding Subscription Receipts represented at the meeting and voted on the poll upon such resolution.

The holders of Subscription Receipts are not shareholders of the Corporation. Holders of Subscription Receipts are entitled only to receive Common Shares on the exchange of their Subscription Receipts and an amount equal to the dividends declared on the Common Shares by the Corporation, if any, for which record dates have occurred during the period from the Closing Date to the date of issuance of the Common Shares in respect of the Subscription Receipts, or to require the Corporation to purchase the Subscription Receipts at the issue price and to be paid a *pro rata* share of interest earned or income generated thereon as described above.

CHANGES IN SHARE AND LOAN CAPITAL STRUCTURE

The following describes the changes in the share and loan capital structure of Fortis since September 30, 2006:

- During the period from October 1, 2006 up to and including March 6, 2007, Fortis issued an aggregate of 531,345 Common Shares pursuant to the Corporation's Consumer Share Purchase Plan, Dividend Reinvestment Plan, Employee Share Purchase Plan and upon the exercise of options granted pursuant to the 2002 Stock Option Plan, the Executive Stock Option Plan and the Director Stock Option Plan for aggregate consideration of approximately $10.2 million.

- On October 30, 2006, Fortis made a draw down of $20.0 million under its credit facilities for the purpose of funding the acquisition by Fortis Properties of four hotels located in Alberta and British Columbia. See ''Recent Developments''.

- On November 7, 2006, Fortis made a draw down under its credit facilities of an amount of US$48.6 million for the purpose of funding, on an interim basis, the acquisition of approximately 16% of the outstanding Class A Ordinary Shares of Caribbean Utilities. See ''Recent Developments''.

- On November 7, 2006, Fortis issued, by way of private placement, US$40 million aggregate principal amount of Debentures. The Debentures bear interest at an annual rate of 5.5% and mature on November 7, 2016. The Debentures may be redeemed by Fortis at any time on or after November 7, 2011 and are convertible into Common Shares at the option of the holder at any time prior to their maturity at US$29.11 per share. The Debentures are subordinated to all other indebtedness of Fortis, other than subordinated indebtedness ranking equally with the Debentures. On November 7, 2006, Fortis repaid US$40 million owing under its credit facilities from the proceeds of the private placement.

- On January 3, 2007, FortisAlberta issued $110 million aggregate principal amount of senior unsecured debentures bearing interest at a rate of 4.99% per annum, payable semi-annually, due January 2047. The proceeds of the offering were primarily used to repay indebtedness under a credit facility.

- On January 18, 2007, the Corporation completed the public offering of 5,170,000 Common Shares at a price of $29.00 per share for gross proceeds of $149,930,000. As a result, shareholders' equity in the Corporation increased by approximately $145.6 million, being the gross proceeds of the offering net of tax-effected issue costs, to a total of $1.55 billion. Fortis used a portion of the proceeds of this offering to repay approximately $84.5 million owing under its credit facilities.

USE OF PROCEEDS

The proceeds to the Corporation from the Offering, after deducting the fee payable to the Underwriters and estimated expenses of the Offering, are expected to be $959,710,000, assuming no exercise of the Over-Allotment Option. If the Over-Allotment Option is exercised in full, the estimated proceeds of the Offering, after deducting the fee payable to the Underwriters and estimated expenses of the Offering, are expected to be $1,103,854,000.

The net proceeds of the Offering, together with funds to be advanced pursuant to the Credit Facilities, will be used to finance the Cash Purchase Price for the Acquisition. See ''Financing of the Acquisition'' and ''Acquisition Agreement''. The gross proceeds from the sale of the Subscription Receipts will be held in escrow pending the satisfaction of the Release Conditions. See ''Details of the Offering''.

PLAN OF DISTRIBUTION

Pursuant to an underwriting agreement dated February 27, 2007 (the ''Underwriting Agreement'') between Fortis and the Underwriters, Fortis has agreed to issue and sell, and the Underwriters have agreed to purchase, as principals, on the Closing Date, 38,500,000 Subscription Receipts offered hereby at the Offering Price of $26.00 per Subscription Receipt, subject to compliance with all the necessary legal requirements and to the conditions contained in the Underwriting Agreement. The Offering Price and other terms of the Offering were determined by negotiation between the Corporation and the Underwriters.

Pursuant to the Underwriting Agreement, the Corporation has granted the Underwriters an over-allotment option (the ''Over-Allotment Option''), exercisable at any time until 30 days following the closing of the Offering, to purchase up to an additional 5,775,000 Subscription Receipts at the Offering Price. The Over-Allotment Option is exercisable in whole or in part only for the purpose of covering over-allotments, if any. This Prospectus also qualifies the grant of the Over-Allotment Option and the distribution of the securities issuable on the exercise of the Over-Allotment Option.

The Underwriting Agreement provides that the Underwriters will be paid a fee of $40,040,000 (assuming no exercise of the Over-Allotment Option) ($1.04 per Subscription Receipt) in consideration for its services in connection with the Offering. One-half of the Underwriters' fee in respect of the Offering is payable on the Closing Date and the other half of the Underwriters' fee is payable only if the Release Conditions have been satisfied prior to the Termination Time and the required notice has been delivered to the Escrow Agent.

Pursuant to rules and policy statements of certain Canadian securities regulators, the Underwriters may not, at any time during the period ending on the date the selling process for the Subscription Receipts ends and all stabilization arrangements relating to the Subscription Receipts are terminated, bid for or purchase Subscription Receipts or Common Shares. The foregoing restrictions are subject to certain exceptions including (a) a bid for or purchase of Subscription Receipts or Common Shares if the bid or purchase is made through the facilities of the TSX, in accordance with the Universal Market Integrity Rules of Market Regulation Services Inc., (b) a bid or purchase on behalf of a client, other than certain prescribed clients, provided that the client's order was not solicited by the Underwriter, or if the client's order was solicited, the solicitation occurred before the commencement of a prescribed restricted period, and (c) a bid or purchase to cover a short position entered into prior to the commencement of a prescribed restricted period. The Underwriters may engage in market stabilization or market balancing activities on the TSX where the bid for or purchase of the Subscription Receipts or the Common Shares is for the purpose of maintaining a fair and orderly market in the Subscription Receipts or Common Shares, subject to price limitations applicable to such bids or purchases. Such transactions, if commenced, may be discontinued at any time.

The Subscription Receipts and the Common Shares for which such Subscription Receipts may be exchanged have not been, and will not be, registered under the United States *Securities Act of 1933*, as amended (the ''1933 Act'') or any state securities laws and, subject to certain exceptions, may not be offered, or delivered, directly or indirectly, or sold in the United States except in certain transactions exempt from the registration requirements of the 1933 Act and in compliance with any applicable state securities laws. The Underwriters have agreed that they will not offer or sell the Subscription Receipts within the United States, its territories, its possessions and other areas subject to its jurisdiction or to, or for the account or benefit of, a ''U.S. person'' (as defined in Regulation S under the 1933 Act), except in accordance with the Underwriting Agreement pursuant to an exemption from the registration requirements of the 1933 Act provided by Rule 144A thereunder and in compliance with applicable state securities laws. In addition, until 40 days after the commencement of the Offering, an offer or sale of Subscription Receipts or Common Shares within the United States by any dealer (whether or not participating in the Offering) may violate the registration requirements of the 1933 Act if such offer is made otherwise than in reliance on Rule 144A.

The obligations of the Underwriters under the Underwriting Agreement are several and may be terminated at their discretion in certain circumstances, including upon the occurrence of certain stated events. The Underwriters are, however, obligated to take up and pay for all of the Subscription Receipts if any are purchased under the Underwriting Agreement. Under the terms of the Underwriting Agreement, the Underwriters may be entitled to indemnification by the Corporation against certain liabilities, including liabilities for misrepresentation in the Prospectus.

CIBCWM is an affiliate of a Canadian chartered bank that has agreed to extend credit facilities to the Corporation in connection with financing the Acquisition. CIBCWM is also acting as financial advisor to Fortis in connection with the Acquisition and receiving a fee therefor. In addition, each of CIBCWM, Scotia Capital, TD Securities, BMO Nesbitt Burns, RBCDS, NB Financial and HSBC Securities is a subsidiary of a Canadian chartered bank that has, either solely or as a member of a syndicate of financial institutions, extended credit facilities to the Corporation and/or its subsidiaries (the ''Existing Facilities''). Consequently, the Corporation may be considered a ''connected issuer'' of these Underwriters within the meaning of applicable securities legislation. None of these Underwriters will receive any direct benefit from the Offering other than the underwriting commission relating to the Offering. The decision to distribute the Subscription Receipts hereunder and the determination of the terms of the Offering were made through negotiation between the Corporation and the Underwriters. No bank had any involvement in such decision or determination. The proceeds of the Offering will be used to finance the Cash Purchase Price for the Acquisition and will not be used to repay the Existing Facilities. As at January 31, 2007, an aggregate of approximately $338 million was outstanding under the Existing Facilities. Fortis and/or its subsidiaries are in compliance with their respective obligations under the Existing Facilities. Since the execution of the Existing Facilities, no breach thereunder has been waived by the lenders thereunder. See ''Use of Proceeds''.

The TSX has conditionally approved the listing of the Subscription Receipts, as well as the Common Shares issuable on the exchange of the Subscription Receipts. Listing is subject to the Corporation fulfilling all of the requirements of the TSX on or before June 3, 2007.

CANADIAN FEDERAL INCOME TAX CONSIDERATIONS

In the opinion of Davies Ward Phillips & Vineberg LLP, counsel to the Corporation, and Stikeman Elliott LLP, counsel to the Underwriters, the following is a general summary of the principal Canadian federal income tax considerations generally applicable to a holder who acquires Subscription Receipts pursuant to the Offering who, within the meaning of the *Income Tax Act* (Canada) (the ''Tax Act''), and at all relevant times, is or is deemed to be resident in Canada, deals at arm's length with, and is not affiliated with, the Corporation and holds or will hold the Subscription Receipts and any Common Shares as capital property. Generally, the Subscription Receipts and the Common Shares will be considered to be capital property to a holder provided the holder does not hold the Subscription Receipts and the Common Shares in the course of carrying on a business and has not acquired them in a transaction or transactions considered to be an adventure in the nature of trade. Certain holders whose Common Shares might not otherwise qualify as capital property may, in certain circumstances, make the irrevocable election under subsection 39(4) of the Tax Act to have their Common Shares and every ''Canadian security'' (as defined in the Tax Act) owned by such holder in the taxation year of the election, and in all subsequent years, deemed to be capital property.

The Tax Act contains certain provisions (the ''Mark-to-Market Rules'') relating to securities held by certain financial institutions, registered securities dealers and corporations controlled by one or more of the foregoing. This summary does not take into account the Mark-to-Market Rules and taxpayers that are ''financial institutions'' as defined for the purpose of the Mark-to-Market Rules should consult their tax advisors. This summary is not applicable to a purchaser that is a ''specified financial institution'' or to a purchaser an interest in which is a tax shelter investment, as defined in the Tax Act. Such purchasers should consult their own tax advisors.

This summary is based upon the provisions of the Tax Act and regulations thereunder (the ''Regulations'') in force as at the date hereof, all specific proposals (the ''Tax Proposals'') to amend the Tax Act or Regulations that have been publicly announced by or on behalf of the Minister of Finance (Canada) prior to the date hereof and counsel's understanding of the current published administrative practices of the Canada Revenue Agency. This summary does not otherwise take into account or anticipate any changes in applicable law, whether by legislative, governmental or judicial decision or action, nor does it take into account provincial, territorial or foreign tax laws or considerations, which might differ significantly from those discussed herein.

This summary is of a general nature only and is not intended to be, nor should it be construed to be, legal or tax advice to any particular holder. This summary is not exhaustive of all possible income tax considerations under the Tax Act that may affect a holder. The income tax consequences of acquiring and disposing of Subscription Receipts and Common Shares will vary depending on a number of facts, including the legal status of the holder as an individual, corporation, trust or partnership. Accordingly, prospective holders of Subscription Receipts and Common Shares should consult their own tax advisors with respect to their particular circumstances and the tax consequences to them of holding and disposing of Subscription Receipts and Common Shares.

Exchange of Subscription Receipts

No gain or loss will be realized by a holder on the exchange of Subscription Receipts for Common Shares.

The cost of a Common Share issued to a holder of a Subscription Receipt acquired pursuant to the Offering will be equal to the cost of the Subscription Receipt to the holder. The adjusted cost base to the holder of Common Shares so acquired will be determined by averaging the cost of such Common Shares with the adjusted cost base of all other Common Shares owned at that time by the holder as capital property.

Termination of Subscription Receipts

As described above under ''Details of the Offering'', in the event that the Release Conditions are not satisfied or if the Acquisition Agreement is terminated prior to the Termination Time, holders of Subscription Receipts will be entitled to receive from the Escrow Agent an amount equal to the full subscription price thereof plus their *pro rata* share of the interest earned or income generated thereon. In that event, the amount of such interest or income received or receivable by a holder of Subscription Receipts (depending on the method regularly followed by the holder in computing income) must be included in the income of the holder.

Payment of Dividend Equivalent

As described above under ''Details of the Offering'', if Common Shares are issued in exchange for Subscription Receipts, and if dividends have been declared on the Common Shares of the Corporation to holders of record on a date during the period from the Closing Date to the date of such issuance of Common Shares, the Corporation will make a cash payment to the holders of Subscription Receipts in respect of each Subscription Receipt in an amount equal to the per share amount of such dividend. The equivalent to dividend amount, if any, paid to a holder of Subscription Receipts by the Corporation must be included in the income of the holder. Any amount so included will be taxed as ordinary income and not as a dividend and, as such, will not be subject to the gross-up and dividend tax credit rules described below.

Other Dispositions of Subscription Receipts

A disposition or deemed disposition by a holder of a Subscription Receipt, other than on the exchange of a Subscription Receipt for a Common Share or a disposition of the Subscription Receipt to the Corporation in the event the Release Conditions are not satisfied or if the Acquisition Agreement is terminated prior to the Termination Time, will generally result in the holder realizing a capital gain (or a capital loss) equal to the amount by which the proceeds of disposition exceed (or are less than) the aggregate of the holder's adjusted cost base thereof and any reasonable costs of disposition.

Dividends on Common Shares

Dividends received on Common Shares by a holder who is an individual will be included in the individual's income and will be subject to the gross-up and dividend tax credit rules normally applicable to taxable dividends received from taxable Canadian corporations, including the enhanced gross-up and dividend tax credit for ''eligible dividends'' paid after 2005. A dividend will be eligible for the enhanced gross-up and dividend tax credit if the paying corporation designates the dividend as an eligible dividend. There may be limitations on the ability of a corporation to designate dividends as eligible dividends. The Corporation has advised counsel that it intends to designate all dividends paid on the Common Shares as eligible dividends for these purposes. Taxable dividends received by an individual may give rise to alternative minimum tax under the Tax Act, depending on the individual's circumstances.

Dividends received on Common Shares by a holder that is a corporation will be included in income and normally will be deductible in computing such corporation's taxable income. However, the Tax Act will generally impose a 33⅓% refundable Part IV tax on such dividends received by a corporation that was, at any time in the taxation year in which such dividends were received, a ''private corporation'' as defined in the Tax Act, or a corporation resident in Canada that is controlled by or for the benefit of an individual (other than a trust) or a related group of individuals (other than trusts), to the extent that such dividends are deductible in computing the corporation's taxable income.

Disposition of Common Shares

In general, a disposition or a deemed disposition of a Common Share will give rise to a capital gain (or a capital loss) equal to the amount by which the proceeds of disposition of the Common Share, net of any reasonable costs of disposition, exceed (or are less than) the adjusted cost base to the holder of the Common Share immediately before the disposition.

Tax Treatment of Capital Gains and Losses

Generally, one-half of any capital gain realized by a holder in a taxation year will be included in computing the holder's income in such year. One-half of any capital loss realized by a holder in a taxation year normally may be deducted as an allowable capital loss by the holder against taxable capital gains realized by the holder in the year. Any allowable capital loss not deductible in the year it is realized generally may be carried back and deducted against taxable capital gains in any of the three preceding years or carried forward and deducted against taxable capital gains in any subsequent year (in accordance with the rules contained in the Tax Act). Capital gains realized by an individual will be relevant in computing possible liability for the alternative minimum tax.

The amount of any capital loss realized on the disposition or deemed disposition of a Common Share by a holder that is a corporation may be reduced by the amount of dividends received by the holder on the Common Share to the extent and in the circumstances prescribed by the Tax Act. Similar rules may apply where a corporation is a member of a partnership or a beneficiary of a trust that owns Common Shares and where a trust is a member of a partnership that owns Common Shares or a partnership or trust is a beneficiary of a trust that owns Common Shares. Holders to whom these rules may be relevant should consult their own tax advisors.

Additional Refundable Tax

A holder that is a ''Canadian-controlled private corporation'' (as defined in the Tax Act) may be liable to pay an additional refundable tax of 6⅔% on certain investment income, including amounts in respect of taxable capital gains and interest (but not dividends deductible in computing taxable income).

RISK FACTORS

An investment in the Subscription Receipts offered hereby and the Common Shares issuable upon the exchange thereof involves certain risks in addition to those described in the Management Discussion and Analysis of financial condition and results of operations contained in the Corporation's annual information form dated March 29, 2006 incorporated by reference herein. Before investing, prospective purchasers of Subscription Receipts should carefully consider, in light of their own financial circumstances, the factors set out below, as well as the other information contained or incorporated by reference in the Prospectus.

Regulation

The regulated operations of Terasen Gas are subject to the normal uncertainties faced by regulated companies. These uncertainties include the approval by the BCUC of customer rates which permit a reasonable opportunity to recover on a timely basis the estimated costs of providing services, including a fair rate of return on rate base. Upgrades of existing facilities and the addition of new facilities require the approval of the BCUC. There is no assurance that capital projects perceived as required by the management of Terasen Gas will be approved or that conditions to such approval will not be imposed. Capital cost overruns relative to approvals granted might not be recoverable. The ability of Terasen Gas to recover the actual costs of providing services and to earn the approved rates of return depends on achieving the forecasts established in the rate-setting process. Fair regulatory treatment by the BCUC that allows Terasen Gas the opportunity to earn a risk-adjusted ROE comparable to that available on alternative, similar investments is essential for maintaining service quality, as well as for ongoing capital attraction and growth.

The ROEs of Terasen Gas are determined annually by a formula based upon a forecast of long-term interest rates. The ability of Terasen Gas to earn the approved ROEs depends on the accuracy of the forecast for the test year. Actual required ROEs may differ from approved ROEs based on forecast long-term interest rates.

Rate applications that establish revenue requirements may be subject to negotiated settlement procedures. Failing a negotiated settlement, rate applications may be pursued through public hearing processes. There can be no assurance that the rate orders issued will permit Terasen Gas to recover all costs actually incurred and to earn the allowed rate of return. A failure to obtain acceptable rate orders may adversely affect the business carried on by Terasen Gas, the undertaking or timing of proposed expansion projects, the issue and sale of securities, ratings assigned by rating agencies, and other matters which may, in turn, negatively impact Terasen Gas' results of operations or financial position, as well as those of the Corporation.

The TGI Settlement includes incentive mechanisms that provide TGI with an opportunity to earn rates of return in excess of the allowed ROEs determined by the BCUC. While TGI has applied to extend the TGI Settlement to 2009, there is no certainty as to whether this application will be approved, whether and how the terms may be modified, or what the terms of an extended, or new, settlement might be.

Traditionally, British Columbia's regulatory framework was generally based on traditional cost of service methodologies for designing and setting rates. Since 1996, however, incentive-based regulation has been used in the rate setting process. Although Fortis considers the regulatory frameworks in British Columbia to be fair and balanced, uncertainties do exist.

Forecasting Accuracy

Through the forecasting process, it is intended that any changes in cost of service, regardless of whether they are caused by inflation or by level of business activity, would be reflected in new rates approved for that fiscal year based on the anticipated distribution volume. However, as rates are established in advance, based on anticipated distribution volume by class of customer, forecasting accuracy is a risk. Forecasts are also made for the future cost of capital, including the yield rate for long-term Canada Bonds used in the determination of the ROE.

Asset Maintenance

The asset base for Terasen Gas requires maintenance, improvement and expansion. The utility could experience service disruptions and increased costs if it is unable to maintain and replace its assets. The failure to carry out capital expenditure programs could have a material adverse effect on Terasen Gas. Large capital projects can proceed only with the approval of the BCUC. If actual costs exceed the costs forecast in obtaining the approval, it is uncertain as to whether any cost overruns will be approved and recovered.

Operational Risks

The business of Terasen Gas is exposed to various operational risks, such as pipeline leaks, accidental damage to or fatigue cracks in mains and service lines, corrosion in pipes, pipeline or equipment failure, other issues that can lead to outages and leaks, and any other accidents involving natural gas, which could result in significant operational and environmental liability. The facilities of Terasen Gas are also exposed to the effects of severe weather conditions and other acts of nature. In addition, many of these facilities are located in remote areas, which makes access for repair of damage due to weather conditions and other acts of nature difficult. Terasen Gas operates facilities in a terrain with a risk of loss or damage from earthquakes, forest fires, floods, washouts, landslides, avalanches and similar acts of nature. Terasen Gas has insurance which provides coverage for business interruption, liability and property damage, although the coverage offered by this insurance is limited. In the event of a large uninsured loss caused by severe weather conditions or other natural disasters, application will be made to the BCUC for the recovery of these costs through higher rates to offset any loss. However, there can be no assurance that the BCUC would approve any such application. Losses resulting from any operational accidents or failures or natural disasters could substantially exceed insurance coverage and actual recovery from increased rates approved by the BCUC. Furthermore, Terasen Gas could be subject to claims from its customers for damages caused by the failure to transmit or distribute gas to them in accordance with its contractual obligations. Thus, any major damage to Terasen Gas' facilities could result in lost revenues, repair costs and customer claims that are substantial in amount, which amount could have a material adverse effect on Terasen Gas.

Natural Gas Prices

Prior to 2000, natural gas consistently had a substantial competitive advantage when compared with alternative sources of energy in British Columbia. However, with the increasing price of natural gas, the price of electricity for residential customers in British Columbia is now only marginally higher than the comparable price for natural gas. There is no assurance that natural gas will continue to maintain a competitive price advantage in the future.

If natural gas pricing becomes uncompetitive with electricity pricing, Terasen Gas' ability to add new customers could be impaired, and existing customers could reduce their consumption of natural gas or eliminate its usage altogether as furnaces, water heaters and other appliances are replaced. This may result in higher rates and, in an extreme case, could ultimately lead to an inability to fully recover Terasen Gas' cost of service in rates charged to customers.

The ability of Terasen Gas to add new customers and sales volumes could also be affected by lower prices of other competitive energy sources as some commercial and industrial customers have the ability to switch to an alternative fuel.

Terasen Gas employs a number of tools to reduce its exposure to natural gas price volatility. These include purchasing gas for storage and adopting hedging strategies to reduce price volatility and ensure, to the extent possible, that natural gas commodity costs remain competitive with electricity rates. Activities related to the hedging of gas prices are currently approved by the BCUC and gains or losses effectively accrue entirely to customers. Future BCUC determinations could materially impact the ability of Terasen Gas to recover the future cost of the natural gas it delivers to its customers.

Weather and Seasonality

Weather during the year has a significant impact on distribution volume as a major portion of the gas distributed by Terasen Gas is ultimately used for space heating. Because of natural gas consumption patterns, the natural gas distribution operations of Terasen Gas normally generate quarterly earnings that vary by season. Typically, higher net earnings are experienced in the first and fourth quarters, but are offset by net losses in the second and third quarters. See ''The Acquired Business — Regulation''.

Risks Related to Terasen Gas (Vancouver Island) Inc.

TGVI is a franchise under development in the price-competitive service area of Vancouver Island, with a customer base and revenue that is insufficient to meet its current cost of service and recover revenue deficiencies from prior years. Recovery of the accumulated deficit puts gas at a cost disadvantage to electricity.

To assist with competitive rates during franchise development, the VINGPA provides royalty revenues from the provincial government which currently cover approximately 20% of the current cost of service. These revenues are due to expire at the end of 2011, after which TGVI's customers will be required to absorb the full commodity cost of gas and the recovery of any remaining accumulated deficit. When the VINGPA expires in 2011, the $75 million non-interest-bearing senior government debt which is currently treated as a government contribution against rate base will become repayable. As this debt is repaid, the cost of the higher rate base will increase the cost of service and customer rates making gas less competitive with electricity on Vancouver Island.

Industrial load accounts for more than 65% of the system's throughput for which approximately two thirds is contracted on a year-to-year basis with no long-term commitment. A loss of industrial customers will increase the cost of service to be recovered from residential and commercial customers which may impact the competitiveness of rates.

While the BCUC has approved a rate-setting mechanism for TGVI whereby customer rates are set at levels in excess of TGVI's cost of service to recover amortization of the RDDA, the amount of recovery is limited by the price of competitive alternative fuels. Significant RDDA amortization was recovered in both 2005 and 2006. However, RDDA recovery is sensitive to the relative pricing of natural gas and electricity in TGVI's service area, as well as to margin generated under TGVI's firm transportation agreements discussed below. There is no certainty that TGVI will be able to charge rates that will be sufficient to fully recover the RDDA prior to the expiry of the provincial royalty payments at the end of 2011. Failure by TGVI to recover the RDDA by 2011 may result in an increase in the cost of service.

Government Permits

The acquisition, ownership and operation of gas businesses and assets require numerous permits, approvals and certificates from federal, provincial and local government agencies. Terasen Gas may not be able to obtain or maintain all required regulatory approvals. If there is a delay in obtaining any required regulatory approval or if Terasen Gas fails to maintain or obtain any required approval or fails to comply with any applicable law or regulation, or condition of approval, the operation of its assets and its distribution of gas could be prevented or become subject to additional costs, any of which could have a material adverse effect on Terasen Gas.

Impact of Changes in Economic Conditions

New customer additions at Terasen Gas are typically a result of population growth and new housing starts, which are affected by the state of the British Columbia economy. Terasen Gas is also affected by changes in trends in housing starts from single-family dwellings to multi-family dwellings, for which natural gas has a lower penetration rate. While new housing starts have increased in British Columbia in 2006, growth of new multi-family housing starts continues to significantly outpace that of new single-family housing starts. In addition, more efficient building construction and consistent customer conservation efforts place downward pressure on annual average consumption of natural gas. Prevailing economic conditions also impact sales and transportation service to large-volume commercial and industrial customers.

Natural Gas Supply

Terasen Gas is dependent on a limited selection of pipeline and storage providers, particularly in the Vancouver, Fraser Valley and Vancouver Island service areas where the majority of Terasen Gas' natural gas distribution customers are located. As a result, regional market prices have been higher from time to time than prices elsewhere in North America as a result of insufficient seasonal and peak storage and pipeline capacity to serve the increasing demand for natural gas in British Columbia.

In addition, Terasen Gas is critically dependent on a single-source transmission pipeline. In the event of a prolonged service disruption on the Spectra Pipeline System, Terasen Gas' residential customers could experience outages, thereby affecting revenues and incurring costs to safely relight customers.

Access to Capital and Credit Ratings

In order to meet the capital investment and debt repayment requirements of its business, Terasen Gas must have reliable access to sufficient and cost-effective capital. The ability to arrange sufficient and cost-effective financing is subject to numerous factors, including the regulatory environment in British Columbia, the results of operations and financial position of Terasen Gas, conditions in the capital and bank credit markets, the ratings assigned by rating agencies and general economic conditions. There can be no assurance that sufficient capital will be available on acceptable terms to fund such capital expenditures and to repay existing debt.

An inability to maintain an investment-grade credit rating could materially adversely impact Terasen Gas' access to debt financing. In addition, a downgrade of Terasen Gas below investment grade by any of the major credit rating agencies could trigger margin calls and other cash requirements under Terasen Gas' gas purchase and commodity derivative contracts.

Interest Rates

Terasen Gas is exposed to the interest rate risks associated with floating rate debt. Terasen Gas has hedging programs in place to reduce its interest rate risks. The allowed ROEs for TGI and TGVI are determined by formulae that result in lower allowed ROEs if long-term Canada Bond yields decline.

Counterparty Credit Risk

Terasen Gas is exposed to credit risk in the event of non-performance by counterparties to derivative instruments. Terasen Gas is also exposed to significant credit risk on physical off-system sales. Because it deals with high credit quality institutions in accordance with established credit approval practices, Terasen Gas does not expect any counterparties to fail to meet their obligations.

Potential Undisclosed Liabilities Associated with the Acquisition

In connection with the Acquisition, there may be liabilities that the Corporation failed to discover or was unable to quantify in its due diligence which it conducted prior to the execution of the Acquisition Agreement and the Corporation may not be indemnified for some or all of these liabilities. The discovery or quantification of any material liabilities could have a material adverse effect on the Corporation's business, financial condition or future prospects. In addition, the Acquisition Agreement limits the amount for which the Corporation is indemnified. See ''Acquisition Agreement — Indemnities''.

Labour Relations

The organized employees of TGI and TGVI are members of labour unions which have entered into collective bargaining agreements with TGI. The provisions of such collective bargaining agreements affect the flexibility and efficiency of the business carried on by TGI, TGVI and TGWI (which depends on TGI for its customer, management and operation services). TGI considers its relationships with its labour unions to be satisfactory, but there can be no assurance that current relations will continue in future negotiations or that the terms under the present collective bargaining agreements will be renewed. The inability to maintain, or to renew the collective bargaining agreements on acceptable terms, could result in increased labour costs or service interruptions arising from labour disputes for TGI that are not provided for in approved orders, which could have an adverse effect on the results of operations, cash flow and net income of Terasen Gas.

Underinsured and Uninsured Losses

Fortis and Terasen Gas maintain at all times insurance coverage in respect of potential liabilities and the accidental loss of value of certain of their assets from risks, in amounts, with such insurers, as is considered appropriate, taking into account all relevant factors including the practices of owners of similar assets and operations. It is anticipated that such insurance coverage will be maintained. However, not all risks are covered by insurance and no assurance can be given that insurance will be consistently available or will be consistently available on economically feasible terms or that the amounts of insurance will be sufficient to cover losses or claims that may occur involving the assets or operations of Fortis or Terasen Gas.

Environmental Matters

Terasen Gas is subject to numerous laws, regulations and guidelines governing the management, transportation and disposal of hazardous substances and other waste materials and otherwise relating to the protection of the environment and health and safety. Potential environmental damage and costs could arise due to a severe weather event or a major equipment failure. However, there can be no assurance that such costs will be recoverable and, if substantial, unrecovered costs may have a material effect on the business, results of operations and prospects of Terasen Gas.

Terasen Gas is exposed to environmental risks that property owners in British Columbia generally face. These risks include the responsibility of any property owner for the site remediation of any properties determined to be contaminated, whether or not such contamination was actually caused by the owner. Most of Terasen Gas' distribution and transmission facilities have been in place for many years with no apparent adverse environmental impact. However, as facilities are upgraded and as new facilities are added, environmental assessments and regulatory approvals will be required in the ordinary course.

Applicable environmental and safety laws make owners, operators and persons in charge of management and control of facilities subject to prosecution or administrative action for breaches of environmental and safety laws, including the failure to obtain certificates of approval for the discharge of contaminants causing an adverse effect. Terasen Gas has not been notified of any such regulatory action in regard to its operation or occupation of its facilities. However, it is not possible to predict with absolute certainty the position that a regulatory authority will take regarding matters of non-compliance with environmental and safety laws. Changes in environmental, health and safety regulations could also lead to significant increases in costs to Terasen Gas.

First Nations' Lands

Terasen Gas provides service to customers on First Nations reserves in British Columbia and maintains gas distribution facilities on lands that are subject to land claims by various First Nations. A treaty negotiation process involving various First Nations and the Government of British Columbia is underway in British Columbia but the basis upon which settlements might be reached in Terasen Gas' service area is not clear. Furthermore, not all First Nations are participating in the process. To date, the policy of the Government of British Columbia has been to endeavour to structure settlements without prejudicing existing rights held by third parties such as Terasen Gas. However, there can be no certainty that the settlement process will not adversely affect the business of Terasen Gas.

Results of Operations and Financing Risks

Management of the Corporation believes, based on its expectations as to the Corporation's future performance (which reflects, among other things, the completion of the Acquisition), that the cash flow from its operations and funds available to it under its credit facilities will be adequate to enable the Corporation to finance its operations, execute its business strategy and maintain an adequate level of liquidity. However, expected revenue and the costs of planned capital expenditures are only estimates. Moreover, actual cash flows from operations are dependent on regulatory, market and other conditions that are beyond the control of the Corporation. As such, no assurance can be given that management's expectations as to future performance will be realized. In addition, management's expectations as to the Corporation's future performance reflect the current state of its information about Terasen Gas and its operations and there can be no assurance that such information is correct and complete in all material respects.

Management of Expanding Operations

As a result of the Acquisition, significant demands will be placed on the Corporation's managerial, operational and financial personnel and systems. No assurance can be given that the Corporation's systems, procedures and controls will be adequate to support the expansion of the Corporation's operations resulting from the Acquisition. The Corporation's future operating results will be affected by the ability of its officers and key employees to manage changing business conditions and to implement and improve its operational and financial controls and reporting systems.

Realization of Acquisition Benefits

As described in ''The Acquisition — Acquisition Rationale'', the Corporation believes that the Acquisition will provide benefits to Fortis. However, there is a risk that some or all of the expected benefits of the Acquisition may fail to materialize, or may not occur within the time periods anticipated by the Corporation. The realization of such benefits may be affected by a number of factors, many of which are beyond the control of the Corporation.

Subscription Receipt Structure

The Subscription Receipts will be automatically exchanged for Common Shares upon the satisfaction of the Release Conditions. The Corporation may, in its sole discretion, waive certain closing conditions in its favour in the Acquisition Agreement or agree with the Vendor to amend the Acquisition Agreement and consummate the Acquisition on terms that may be substantially different from those contemplated in this Prospectus. As a result, the expected benefits of the Acquisition may not be fully realized. See ''Acquisition Agreement''. There can be no assurance that the Release Conditions will be satisfied on or prior to the Termination Time. Until the Release Conditions are satisfied and the Common Shares are delivered pursuant to the Subscription Receipt Agreement, holders of Subscription Receipts have the rights as described under ''Details of the Offering — Subscription Receipts''.

Market for Securities

There is currently no market through which the Subscription Receipts may be sold. There can be no assurance that an active trading market will develop for the Subscription Receipts after the Offering or, if developed, that such a market will be sustained at the price level of the Offering. The TSX has conditionally approved the listing of the Subscription Receipts, as well as the Common Shares issuable on the exchange of the Subscription Receipts. Listing is subject to the Corporation fulfilling all of the requirements of the TSX on or before June 3, 2007.

AUDITORS

The auditors of the Corporation are Ernst & Young LLP, Chartered Accountants (''Ernst & Young''), The Fortis Building, 7th Floor, 139 Water Street, St. John's, Newfoundland and Labrador, A1C 1B2. Ernst & Young report that they are independent of the Corporation in accordance with the Rules of Professional Conduct of the Institute of Chartered Accountants of Newfoundland.

The auditors of Terasen as at December 31, 2005 were KPMG LLP, Chartered Accountants (''KPMG''), of Vancouver, British Columbia. KPMG report that, as at March 31, 2006 and during the years ended December 31, 2005 and 2004 on which they reported, they were independent of Terasen within the meaning of the Rules of Professional Conduct of the Institute of Chartered Accountants of British Columbia.

LEGAL MATTERS

Certain legal matters relating to this Offering will be passed upon on behalf of the Corporation by Davies Ward Phillips & Vineberg LLP, Toronto and McInnes Cooper, St. John's and on behalf of the Underwriters by Stikeman Elliott LLP, Toronto. At the date hereof, partners and associates of each of Davies Ward Phillips & Vineberg LLP, McInnes Cooper and Stikeman Elliott LLP own beneficially, directly or indirectly, less than 1% of any securities of the Corporation or any associate or affiliate of the Corporation.

TRANSFER AGENT AND REGISTRAR

The transfer agent and registrar for the Subscription Receipts is Computershare Trust Company of Canada in Toronto and Montréal.

PURCHASERS' STATUTORY RIGHTS

Securities legislation in certain of the provinces of Canada provides purchasers with the right to withdraw from an agreement to purchase securities. This right may be exercised within two business days after receipt or deemed receipt of a prospectus and any amendment. In several of the provinces, the securities legislation further provides a purchaser with remedies for rescission or, in some jurisdictions, damages if the prospectus and any amendment contains a misrepresentation or is not delivered to the purchaser, provided that the remedies for rescission or damages are exercised by the purchaser within the time limit prescribed by the securities legislation of the purchaser's province. The purchaser should refer to any applicable provisions of the securities legislation of the purchaser's province for the particulars of these rights or consult with a legal advisor.

GLOSSARY OF TERMS

In the Prospectus, unless the context otherwise requires, the following terms have the meanings set forth below.

''1933 Act'' means the United States *Securities Act of 1933*, as amended;

''Acquisition'' means the acquisition by Fortis of all of the issued and outstanding shares of Terasen;

''Acquisition Agreement'' means the acquisition agreement dated February 26, 2007 between Fortis, 3211953 Nova Scotia Company and Kinder Morgan;

''CDS'' means CDS Clearing and Depository Services Inc.;

''Closing Date'' means on or about March 15, 2007, or such other date as agreed to by the Corporation and the Underwriters, but not later than April 18, 2007;

''Corporation'' or **''Fortis''** means Fortis Inc.;

''Credit Facilities'' means the senior unsecured, non-revolving term credit facilities in the aggregate amount of $1.425 billion, consisting of a facility in the amount of $925 million and a facility in the amount of $500 million, to be extended to Fortis pursuant to a commitment letter dated February 26, 2007 from Canadian Imperial Bank of Commerce;

''CWP'' means CustomerWorks Limited Partnership;

''Escrow Agent'' means Computershare Trust Company of Canada or its successor as escrow agent under the Subscription Receipt Agreement;

''Escrowed Funds'' means the gross proceeds from the sale of the Subscription Receipts;

''Offering'' means the distribution of Subscription Receipts pursuant to the Prospectus;

''Release Conditions'' means the receipt by the Corporation of all regulatory and government approvals required to finalize the Acquisition, including that of the BCUC, and fulfillment or waiver of all other outstanding conditions precedent to closing the Acquisition as itemized in the Acquisition Agreement;

''ROE'' means return on equity;

''SEDAR'' means the Canadian System for Electronic Document Analysis and Retrieval;

''Subscription Receipt Agreement'' means the agreement dated as of the Closing Date among the Corporation, CIBC World Markets Inc. and the Escrow Agent governing the terms of the Subscription Receipts;

''Subscription Receipts'' means the subscription receipts of the Corporation offered hereby;

''Terasen'' means Terasen Inc.;

''Terasen Gas'' means, collectively, TGI, TGVI, TGWI and CWP;

''Termination Time'' means the earlier of 5:00 p.m. (Toronto time) on November 30, 2007 or the date on which the Acquisition Agreement is terminated;

''TGI'' means Terasen Gas Inc.;

''TGVI'' means Terasen Gas (Vancouver Island) Inc.;

''TGWI'' means Terasen Gas (Whistler) Inc.;

''TSX'' means the Toronto Stock Exchange;

''Underwriters'' means, collectively, CIBC World Markets Inc., Scotia Capital Inc., TD Securities Inc., BMO Nesbitt Burns Inc., RBC Dominion Securities Inc., National Bank Financial Inc., Canaccord Capital Corporation, Beacon Securities Limited and HSBC Securities (Canada) Inc.; and

''Underwriting Agreement'' means the underwriting agreement dated February 27, 2007, between the Corporation and the Underwriters relating to the sale of the Subscription Receipts offered under the Prospectus.

All dollar amounts in the Prospectus are expressed in Canadian dollars.

AUDITORS' CONSENT

We have read the short form prospectus of Fortis Inc. (the ''Corporation'') dated March 7, 2007 relating to the issue and sale of 38,500,000 subscription receipts of the Corporation. We have complied with Canadian generally accepted standards for an auditor's involvement with offering documents.

We consent to the incorporation by reference, in the above-mentioned prospectus, of our report to the shareholders of the Corporation on the consolidated balance sheets of the Corporation as at December 31, 2005 and 2004 and the consolidated statements of earnings, retained earnings and cash flows for the years then ended. Our report is dated January 27, 2006.

INDEX TO FINANCIAL STATEMENTS

Terasen Inc.

Consolidated Financial Statements
Years ended December 31, 2005 and 2004

Together with Auditors' Report

AUDITORS' REPORT TO THE SHAREHOLDER

We have audited the consolidated statements of financial position of Terasen Inc. as at December 31, 2005 and 2004 and the consolidated statements of earnings, retained earnings and cash flows for the years then ended. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these consolidated financial statements present fairly, in all material respects, the financial position of the Company as at December 31, 2005 and 2004 and the results of its operations and its cash flows for the years then ended in accordance with Canadian generally accepted accounting principles.

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS
(Tabular amounts in millions of dollars, except where stated otherwise)
YEARS ENDED DECEMBER 31, 2005 AND 2004

Terasen Inc. (''Terasen'' or the ''Company'') provides energy transportation and utility asset management services. Terasen operates in three primary business segments which are separately managed to assess operational performance.

(a) Natural gas distribution operations involve the transmission and distribution of natural gas and propane for residential, commercial, institutional, and industrial customers in British Columbia. The operations are conducted through Terasen Gas Inc. (''Terasen Gas''), serving the Lower Mainland and interior of British Columbia, Terasen Gas (Vancouver Island) Inc. (''TGVI''), serving Vancouver Island and the Sunshine Coast, Terasen Gas (Whistler) Inc., and Terasen Gas (Squamish) Inc.

(b) Petroleum transportation operations are carried out through Terasen Pipelines (Trans Mountain) Inc. (''Trans Mountain''), which owns and operates a common carrier pipeline system for crude and refined petroleum products transported from Edmonton, Alberta to Vancouver, British Columbia and Washington State, Terasen Pipelines (Corridor) Inc. (''Corridor''), which owns a pipeline in northern Alberta transporting diluted bitumen, and the one-third owned entities Express Pipeline LP and Express US Holdings LP (''the Express System''). The Express System transports crude oil from Hardisty, Alberta, through the Rocky Mountain region of the United States and on to Wood River, Illinois.

(c) Water and utility services operations includes providing water and wastewater treatment services, water distribution and wastewater collection, meter reading, meter fleet management and installation services as well as product sales related to the water, sewer and irrigation markets. These operations are provided through Terasen Waterworks (Supply) Inc., Terasen Utility Services Inc., Terasen Utility Services (U.S.) Inc. (collectively ''Terasen Water and Utility Services''), and the Company's 50% interest in Fairbanks Sewer and Water Inc. (''FSW''). These operations have been reclassified to Discontinued Operations as described in Note 3.

(d) Other activities include international consulting activities, the Company's 30% interest in CustomerWorks LP (''CWLP''), corporate financing costs and administration charges, and the Company's 40% (2004 — 45%) interest in Clean Energy Fuels Corp. (''Clean Energy''), which was proportionately consolidated until the first quarter of 2005 and was then equity-accounted for until the investment was sold on October 31, 2005 (Note 4).

The Company operates in Canada and the United States, but at the present time the United States operations are not of sufficient size to be reportable as either operating or geographic segments.

On November 30, 2005, all of the shares of the Company were acquired by Kinder Morgan, Inc. (''KMI'') pursuant to a Combination Agreement dated as of August 1, 2005. The Company's shareholders were able to elect, for each Terasen share held, either (i) $35.75 in cash, (ii) 0.3331 shares of KMI common stock, or (iii) $23.25 in cash plus 0.1165 shares of KMI common stock. In the aggregate, approximately 12.5 million shares of KMI common stock was issued together with cash payments of approximately $2.49 billion to Terasen securityholders. The Company has charged to earnings after-tax costs of $42.9 million associated with the transaction in earnings in the year ended December 31, 2005, mainly from pre-tax investment banking costs of $14.7 million, severance and employee-related costs of $14.4 million, share option costs of $3.6 million as described in Note 12, and the write-off of approximately $15.3 million of income tax expense related to restricted tax loss carry-forwards.

1. SIGNIFICANT ACCOUNTING POLICIES

The preparation of these consolidated financial statements in conformity with Canadian generally accepted accounting principles requires management to make estimates and assumptions that affect the reported amounts of assets, liabilities, revenues and expenses in the financial statements, as well as the disclosure of contingent assets and liabilities. Actual results could differ from those estimates.

In the opinion of management, these consolidated financial statements have been properly prepared within reasonable limits of materiality and reflect the following summary of significant accounting policies.

(a) BASIS OF PRESENTATION

The consolidated financial statements include the accounts of the Company, its subsidiaries, and its proportionate share of the accounts of jointly-controlled entities. Investments in entities which are not subsidiaries or joint ventures, but over which the Company exercises significant influence, are accounted for using the equity method.

Certain of the prior year comparative figures have been reclassified to conform with the current year's presentation.

(b) FOREIGN CURRENCY TRANSLATION

The Company translates its self-sustaining US dollar denominated water and utility service businesses' and Clean Energy's financial statements into Canadian dollars using the current rate method of foreign currency translation. Under this method, assets and liabilities are translated at the rate of exchange in effect at the balance sheet date, revenue and expense items are translated at average rates of exchange for the period, and the exchange gains and losses arising on the translation of the financial statements are recorded in the cumulative currency translation adjustment account in Shareholders' equity.

The Company's US-based petroleum transportation operations are integrated and are translated into Canadian dollars using the temporal method. Under this method, monetary assets and liabilities denominated in foreign currencies are translated at exchange rates in effect at the balance sheet date, with the exception of certain long-term debt in the Express System, which is considered to be a hedge of

1. SIGNIFICANT ACCOUNTING POLICIES (CONTINUED)

U.S. dollar denominated revenues in the Express System. Non-monetary assets and liabilities denominated in foreign currencies are translated at exchange rates in effect on the dates the assets were acquired or liabilities assumed. Revenues and expenses are translated at the average rates of exchange prevailing during the month the transactions occurred. Under this method, exchange gains and losses on translation are reflected in income when incurred.

(c) REGULATION

The natural gas distribution companies are subject to the regulation of the British Columbia Utilities Commission (''the BCUC''), an independent regulatory authority. Both Terasen Gas and TGVI have multi-year agreements that will expire at the end of 2007. These multi-year agreements are cost-of-service based agreements with allowed rates of return on approved rate base set by the BCUC. For 2005, Terasen Gas's allowed rate of return was 9.03% and TGVI's allowed rate of return was 9.53%. The allowed rates of return are based on a notional debt-equity ratio of 67% debt and 33% equity for Terasen Gas and 65% debt and 35% equity for TGVI. The entities have annual review processes for rate approvals, and the allowed rates of return are reset annually unless directed differently by the BCUC.

The Trans Mountain and Express System operations are governed by contractual arrangements with shippers and are regulated in Canada by the National Energy Board and, in the United States, tariff matters are regulated by the Federal Energy Regulatory Commission. Both of these regulatory authorities are independent bodies. Trans Mountain has entered into a memorandum of understanding with shippers on a new five-year agreement which will expire at the end of 2010. The Express System has firm service agreements that extend until 2015.

Corridor's operations are governed by contractual arrangements with shippers and are subject to regulation by the Alberta Energy and Utilities Board (''the AEUB''), an independent regulatory authority. Corridor's rates are cost-of-service based and determined using formulas embedded in agreements with shippers.

FSW is regulated by the Regulatory Commission of Alaska, an independent regulatory authority. FSW has a cost-of-service based agreement with allowed rates of return set by the Regulatory Commission. FSW is currently operating on an interim rate basis while the Commission is hearing a new rate case.

Approximately 95% of the Company's operations are subject to rate regulation by independent regulatory agencies. These regulatory authorities exercise statutory authority over such matters as rates of return, construction and operation of facilities, accounting practices, rates and tolls, and contractual agreements with customers.

In order to recognize the economic effects of regulation, the timing of recognition of certain revenues and expenses in these operations may differ from that otherwise expected under generally accepted accounting principles for non-regulated businesses.

The impacts of rate regulation on the Company's operations for the twelve months ending December 31, 2005 and as at December 31, 2005 are described in these Significant Accounting Policies, and in Note 6 ''Property, Plant and Equipment'', Note 7 ''Rate Stabilization Accounts'', Note 8 ''Other Assets'', Note 10 ''Other Long-Term Liabilities and Deferred Credits'', Note 13 ''Employee Benefit Plans'', Note 14 ''Financing Costs'', and Note 15 ''Income Taxes''.

(d) INVENTORIES

Inventories of gas in storage are valued at weighted-average cost. Supplies and other inventories are valued at the lower of cost and net realizable value.

(e) PROPERTY, PLANT AND EQUIPMENT

Property, plant and equipment are recorded at cost less accumulated depreciation and unamortized contributions in aid of construction. Cost includes all direct expenditures for system expansions, betterments and replacements, an allocation of overhead costs and an allowance for funds used during construction. When allowed by the regulators, regulated operations capitalize an allowance for equity funds used during construction at approved rates.

Depreciation of regulated assets is recorded on a straight-line basis over their useful lives. Depreciation rates for regulated assets are approved by the respective regulator, and for non-regulated assets requires the use of management estimates of the useful lives of assets. Depreciation of non-regulated equipment is recorded using the declining balance method.

The cost of regulated depreciable property retired, together with removal costs less salvage, is charged to accumulated depreciation, as is any gain or loss incurred on disposal.

(f) IMPAIRMENT OF LONG-LIVED ASSETS

Long-lived assets are reviewed for impairment whenever events or changes in circumstances indicate that the carrying amount of an asset may not be recoverable. Recoverability of assets is measured by a comparison of the carrying amount of an asset to estimated undiscounted future cash flows expected to be generated by the asset. If the carrying amount of an asset exceeds its estimated future cash flows, an impairment charge is recognized by the amount by which the carrying amount of the asset exceeds the fair value of the asset.

(g) ASSET RETIREMENT OBLIGATIONS

The Company recognizes the fair value of a future asset retirement obligation as a liability in the period in which it incurs a legal obligation associated with the retirement of tangible long-lived assets that results from the acquisition, construction, development, and/or normal use of the assets. The Company concurrently recognizes a corresponding increase in the carrying amount of the related long-lived asset that is depreciated over the life of the asset. The fair value of the asset retirement obligation is estimated using the expected cash

1. **SIGNIFICANT ACCOUNTING POLICIES (CONTINUED)**

flow approach that reflects a range of possible outcomes discounted at a credit-adjusted risk-free interest rate. Subsequent to the initial measurement, the asset retirement obligation is adjusted at the end of each period to reflect the passage of time and changes in the estimated future cash flows underlying the obligation. Changes in the obligation due to the passage of time are recognized in income as an operating expense using the interest method. Changes in the obligation due to changes in estimated cash flows are recognized as an adjustment of the carrying amount of the related long-lived asset that is depreciated over the remaining life of the asset.

As the fair value of future removal and site restoration costs for the Company's natural gas distribution and petroleum transportation systems are not currently determinable, the Company has not recognized an asset retirement obligation as at December 31, 2005 and 2004. For regulated operations there is a reasonable expectation that asset retirement costs would be recoverable through future rates or tolls.

(h) RATE STABILIZATION ACCOUNTS

TGVI maintains a BCUC approved Revenue Deficiency Deferral Account (''RDDA'') to accumulate unrecovered costs of providing service to customers or to drawdown such costs where earnings exceed an allowed return as set by the BCUC. The RDDA has accumulated the allowed earnings in excess of achieved earnings prior to 2003 and is to be recovered through future rates. During the years ended December 31, 2005 and 2004, the RDDA has decreased as achieved earnings have exceeded the allowed return.

Terasen Gas is authorized by the BCUC to maintain rate stabilization accounts which mitigate the effect on its earnings of unpredictable and uncontrollable factors, namely volume volatility caused principally by weather and natural gas cost volatility. The Revenue Stabilization Adjustment Mechanism (''RSAM'') accumulates the margin impact of variations in the actual versus forecast volume use for residential and commercial customers.

In 2004, the Gas Cost Reconciliation Account (''GCRA''), which accumulates differences between actual natural gas costs and forecast natural gas costs as recovered in base rates, was replaced by the Commodity Cost Reconciliation Account (''CCRA'') and the Midstream Cost Reconciliation Account (''MCRA''). The two new accounts were approved by the BCUC to segregate costs that are allocable to all sales customers (MCRA) and all residential customers and certain commercial and industrial customers for whom Terasen Gas acquires gas supply (CCRA). TGVI has a Gas Cost Variance Account (''GCVA'') which mitigates the effect on its earnings of natural gas cost volatility. The GCVA is recoverable in rates from customers in TGVI's service areas in future periods.

All rate stabilization account balances for both TGVI and Terasen Gas are amortized and recovered through rates as approved by the BCUC.

(i) DEFERRED CHARGES

The Company defers certain costs which the regulatory authorities or contractual arrangements require or permit to be recovered through future rates or tolls. Deferred charges are amortized over various periods as approved by the regulator and depending on the nature of the costs.

Deferred charges include long-term debt issue costs which are amortized over the term of the related debt.

Deferred charges not subject to regulation relate to projects which are expected to benefit future periods and will be capitalized on completion, expensed on project abandonment, or amortized over their useful lives.

(j) GOODWILL

Goodwill represents the excess of an investment over the fair value of the net assets acquired. Goodwill is not amortized and is tested annually for impairment by comparing the book value with the fair value of the goodwill of the reporting unit to which the goodwill is attributable. Any deficiency in the book value compared to the fair value will be recognized as an impairment loss.

(k) REVENUE RECOGNITION

The Company recognizes revenues when products have been delivered or services have been performed.

The natural gas distribution utilities record revenues from natural gas sales on the basis of regular meter readings and estimates of customer usage since the last meter reading date to the end of the year and are adjusted for the Revenue Stabilization Adjustment Mechanism and other BCUC approved orders.

For the petroleum transportation operations, revenues are recorded when products are delivered and adjusted according to terms prescribed by toll settlements with the shippers and approved by the respective regulator.

For the water and utility services operations revenues are recorded when services have been performed or products have been delivered.

(l) DERIVATIVE FINANCIAL INSTRUMENTS

The Company utilizes derivatives and other financial instruments to manage its exposure to changes in foreign currency exchange, interest rates and energy commodity prices.

A derivative must be designated and effective to be accounted for as a hedge. The Company designates each derivative instrument as a hedge of specific assets or liabilities on the balance sheet, specific firm commitments or anticipated transactions. The Company also assesses, both at inception and on an ongoing basis, whether the derivative instruments that are used in each hedging transaction are highly effective in offsetting changes in fair values or cash flows of the hedged items. Derivatives accounted for as a hedge are not recognized in the consolidated financial statements.

1. SIGNIFICANT ACCOUNTING POLICIES (CONTINUED)

Derivative financial instruments not designated as effective as a hedge are recorded at fair value at the balance sheet date. The carrying amount of these derivatives, which comprise unrealized gains and losses, are included in accounts receivable in the case of contracts in a gain position and accounts payable and accrued liabilities in the case of contracts in a loss position. The offsetting gain/loss is recorded in the rate stabilization accounts, as realized gains/losses are passed on to customers when realized.

The Company formally documents all relationships between hedging instruments and hedged items, as well as its risk management objective and strategy for undertaking various hedge transactions.

As approved by the regulator, derivatives are used to manage natural gas commodity price risk in the natural gas distribution operations. The majority of natural gas supply contracts have floating, rather than fixed prices. The Company uses natural gas price swap contracts to fix the effective purchase price. Any differences between the effective cost of natural gas purchased and the price of natural gas included in rates are recorded in deferral accounts (CCRA and MCRA), and subject to regulatory approval, are passed through in future rates to customers.

Foreign currency risk in natural gas distribution operations relates mainly to purchases and sales of natural gas denominated in U.S. dollars, and is thereby managed through regulatory deferral accounts.

The Company's short-term borrowings and variable rate long-term debt are exposed to interest rate risk. The Company manages interest rate risk through the use of interest rate derivatives with payments and receipts under interest rate swap contracts being recognized as adjustments to financing costs.

The Company's earnings from the U.S. portion of Trans Mountain's crude oil pipeline system and the Company's investment in the Express System are subject to foreign currency risk. The Company manages some of these foreign currency exposures through the use of foreign currency derivatives.

Unless otherwise approved by regulation, if a derivative instrument is terminated or ceases to be effective prior to maturity, the gain or loss at that date is deferred and recognized in income concurrently with the hedged item. Any subsequent changes in the value of the derivative instrument are reflected in income.

Non-hedge derivatives not subject to regulation are marked to market at the balance sheet date with fluctuations in value charged to earnings.

(m) POST-EMPLOYMENT BENEFIT PLANS

The Company sponsors a number of employee benefits plans. These plans include both defined benefit and defined contribution pension plans, and various other post-retirement benefit plans.

The cost of pensions and other post-retirement benefits earned by employees is actuarially determined as the employee provides service, except when the regulator requires costs to be expensed as paid. The Company uses the projected benefit method based on years of service and management's best estimates of expected returns on plan assets, salary escalation, retirement age of employees, mortality and expected future health-care costs. The discount rate used to value liabilities is based on AA Corporate bond yields. The Company accrues the cost of defined benefit pensions and post-employment benefits as the employee provides services, except when the regulator requires costs to be expensed as paid.

The expected return on plan assets is based on management's estimate of the long-term expected rate of return on plan assets and a market-related value of plan assets. The market-related value of assets as of December 31, 2005 is calculated as the average of the market value of invested assets at December 31, 2005 and two actuarially determined extrapolated market values of invested assets at December 31, 2005. The two extrapolated market values are calculated by using the market value of invested assets at December 31, 2003 rolled forward to December 31, 2005 using 2004 and 2005 net contributions and assumed investment returns, and the market value of invested assets at December 31, 2004 rolled forward to December 31, 2005 using 2005 net contributions and assumed investment returns. These three amounts are then averaged to determine the market-related value of plan assets used in calculating net benefit expense.

Adjustments, in excess of 10% of the greater of the accrued benefit obligation and plan asset fair value, that result from plan amendments, changes in assumptions and experience gains and losses, are amortized over the expected average remaining service life of the employee group covered by the plan. Experience will often deviate from the actuarial assumptions resulting in actuarial gains and losses.

Defined contribution plan costs are expensed by the Company as contributions are payable.

(n) INCOME TAXES

The Company's regulated gas and petroleum operations account for and recover income tax expense in rates as prescribed by their respective regulators. This includes accounting for income taxes by the taxes payable method and accounting for certain deferral and rate stabilization accounts on a net of realized tax basis. Therefore, future income taxes related to temporary differences are not recorded. The taxes payable method is followed as there is a reasonable expectation that all future income taxes will be recovered in rates when they become payable.

The Company's non-regulated operations and FSW follow the asset and liability method of accounting for income taxes. Future income tax assets and liabilities are determined based on temporary differences between the tax bases of assets and liabilities and their carrying values for accounting purposes. Future income tax assets and liabilities are measured at the tax rate that is expected to apply when the temporary differences reverse.

1. SIGNIFICANT ACCOUNTING POLICIES (CONTINUED)

(o) STOCK-BASED COMPENSATION

The Company had a Share Option Plan whereby officers, directors and certain key employees may be granted options to purchase common shares. The Company uses the fair value based method for valuing stock options granted on or after January 1, 2003. Under the fair value based method, compensation cost is measured at the fair value at the date of grant and is expensed over the award's vesting period.

Prior to January 1, 2003, the Company used the settlement method of accounting for stock options, whereby any consideration paid by employees on the exercise of stock options was credited to common shares and no compensation expense was recognized.

The Company's Share Option Plan was discontinued on November 30, 2005 as a result of the acquisition of the Company by KMI.

The Company issued Deferred Share Units (''DSU's'') to senior management and Board members under long-term compensation programs and also as an optional form of compensation to Board members. The DSU's were marked-to-market at the end of each quarter and gains or losses were recognized in earnings. The DSU's notionally earned dividends that were reinvested as additional DSU's when dividends were paid, and were paid out in cash only on retirement or termination of the individual receiving them. The DSU's were paid out in cash upon the acquisition of the Company by KMI on November 30, 2005.

(p) LIABILITIES AND EQUITY

In accordance with recent changes to the CICA Handbook Section 3861 ''Financial Instruments — Disclosures and Presentation'', the Company's $125 million 8% Capital Securities have been reclassified from shareholders' equity to liabilities because the Capital Securities can be settled by issuing equity at a variable price dependent upon the market value of the Company's common shares at the settlement date. As a result of the change, distributions associated with the Capital Securities are now recorded as financing costs and the related income-tax benefits are recorded within income tax expense. Previously, the distributions were recorded on an after-tax basis as a deduction from net earnings to determine earnings applicable to common shares. There is no impact to earnings applicable to common shares or earnings per share. The changes have been applied retroactively and have increased long-term debt and decreased shareholders' equity, both by $125.0 million, compared to the amounts previously reported as at December 31, 2004. The restatement has also increased financing costs by $10.0 million, decreased income tax expense by $3.4 million and capital securities distributions by $6.6 million compared to the amounts previously reported for the year ended December 31, 2004.

(q) VARIABLE INTEREST ENTITIES

Effective January 1, 2005, the Company adopted the CICA Handbook Accounting Guideline 15 ''Consolidation of Variable Interest Entities''. The Company has performed a review of the entities with whom it conducts business and determined that under the definitions in the Guideline the Company's investment in Express US Holdings LP, part of the Express System, is deemed to be a variable interest entity. As the Company has not been identified as the primary beneficiary of Express US Holdings LP, the Company continues to account for its investment in the Express System on an equity basis. The Company's future exposure to loss regarding its investment is represented by the carrying value of the investment.

2. SEGMENT DISCLOSURES

2005

Total assets	3,386.2	1,350.4	245.2	4,981.8
Goodwill	76.4	—	51.6	128.0
Capital expenditures	112.3	31.0	11.1	154.4

The segmented disclosures in these consolidated financial statements have been changed from those reported in the December 31, 2004 annual financial statements and no longer include the water and utility services business which are now reported as discontinued operations. Terasen's 30% share of CWLP is now included in other activities. The comparative segment information has been restated to reflect this change.

3. DISCONTINUED OPERATIONS

In January 2006, the Company entered into an agreement to sell Terasen Water and Utility Services, including the Company's 50% equity interest in FSW, to a consortium of external third parties and Terasen Water and Utility Services senior management. The sale does not include the Company's interest in CWLP. The proceeds are anticipated to approximate the consolidated net carrying value of the discontinued operations at December 31, 2005, and no significant gains or losses are expected to occur upon the disposition. The Company anticipates that the sale will be completed at the end of April 2006.

The Company has classified, at December 31, 2005, the assets and liabilities of the entities being sold as assets and liabilities held for sale. The revenue and expense items for 2005 have been classified as net earnings (loss) from discontinued operations and the comparative figures have been restated to conform with this presentation. Gross revenues applicable to the Terasen Water and Utility Services group were $205.1 million in 2005 (2004 — $158.9 million) and pre-tax income was $1.4 million (2004 — $6.4 million). The 2005 pre-tax income includes a charge to earnings of $7.2 million related to currency translation losses arising on the Company's investment in self sustaining foreign operations. Income taxes from discontinued operations includes a charge of $3.4 million on operating earnings from the entities and a write-off of $2.9 million of tax losses expiring as a result of the change in control.

4. ACQUISITIONS AND DISPOSITIONS

DISPOSITION OF CLEAN ENERGY

On October 31, 2005, the Company sold its 40.38% ownership in Clean Energy for proceeds of approximately U.S. $35.9 million. The sale, together with equity earnings of Clean Energy for the nine months ended September 30, 2005, resulted in a gain of $2.5 million, including the recognition of all unrealized gas forward contract gains of Clean Energy in 2005 totalling $10.9 million and the recognition of currency translation losses previously included in shareholders' equity totalling $8.4 million.

WATER AND UTILITY SERVICES ACQUISITIONS

In 2005 the Company purchased two water and utility services businesses for total cash proceeds of $11.2 million. The cash used to purchase these businesses has been included in Investing activities of Discontinued Operations on the Statements of Cash Flow.

On July 31, 2004, the Company acquired a 50 per cent interest in FSW. FSW provides water and wastewater treatment and water distribution and wastewater collection services to Fairbanks, Alaska. The Company paid $40.8 million for its 50 per cent interest after working capital adjustments. The Company has accounted for the acquisition of FSW using the purchase method and has proportionately consolidated its 50% of operations since the date of acquisition.

The Company and the other owners of FSW each have the option to have Terasen acquire the remaining 50 per cent interest in FSW at fair market value in 2009.

During 2004, the Company also acquired 100% of two businesses and increased its investment in two other businesses that provide meter reading, meter fleet management and installation services in Canada and the United States. The Company paid $17.1 million for the interest in

4. ACQUISITIONS AND DISPOSITIONS (CONTINUED)

these businesses after working capital adjustments. The earnings of these acquired businesses have been included in the statement of earnings from the date of acquisition.

The following table provides the allocation of the purchase price over the assets and liabilities acquired in 2004:

	FSW	Other	Total
Working capital	$ 2.2	$ 7.1	$ 9.3
Property, plant and equipment	27.0	1.6	28.6
Goodwill	24.0	8.0	32.0
Other assets	0.5	0.4	0.9
Future income taxes	(2.0)	—	(2.0)
Long-term debt assumed	(10.9)	—	(10.9)
Total cash paid	$ 40.8	$17.1	$ 57.9

5. INVESTMENTS IN JOINTLY-CONTROLLED ENTITIES

As at December 31, 2005, the Company has a 30% interest in CWLP and a 50% interest in FSW for which it uses the proportionate consolidation method of accounting. The comparative information for 2004 in the table below includes the Company's interest in Clean Energy which was accounted for under the proportionate consolidated method until the first quarter of 2005, and then equity-accounted until the interest in Clean Energy was sold in 2005. The revenue, expenses, and net income for 2004 has been restated to present the net earnings of the Company's 50% interest in FSW's as earnings from discontinued operations. The Company's proportionate interest in the assets and liabilities of FSW are excluded from the table below as they are classified as assets and liabilities held for sale at December 31, 2005. The Company's proportionate interest in FSW at December 31, 2005 includes $52.8 million of assets and $16.0 million of liabilities, all of which are classified as held for sale.

The Company's proportionate share of assets, liabilities, revenues, expenses, and cash flows related to these entities proportionately consolidated is summarized as follows:

	2005	2004
Current assets	**$10.2**	$ 27.1
Long-term assets (including property, plant and equipment and goodwill)	**35.6**	121.0
Current liabilities	**39.4**	41.3
Long-term liabilities	**—**	20.4
Revenues	**43.5**	73.0
Expenses (including financing costs and income tax)	**36.4**	67.7
Net earnings from continuing operations	**7.1**	5.3
Earnings from discontinued operations	**1.7**	0.6
Cash flows from operating activities	**13.9**	7.8
Cash flows from investing activities	**(0.1)**	(7.5)
Cash flows from financing activities	**—**	0.2

6. PROPERTY, PLANT AND EQUIPMENT

2005

	Weighted average depreciation rate	Cost	Accumulated depreciation	Net book Value
Natural gas distribution systems	**2.31%**	**$3,093.9**	**$ 596.7**	**$2,497.2**
Petroleum pipeline systems	**2.59%**	**1,329.5**	**329.7**	**999.8**
Plant, buildings and equipment	**9.13%**	**427.4**	**167.0**	**260.4**
Land and land rights	**0.15%**	**153.2**	**2.7**	**150.5**
		$5,004.0	**$1,096.1**	**$3,907.9**

2004

	Weighted average depreciation rate	Cost	Accumulated depreciation	Net book Value
Natural gas distribution systems	2.40%	$3,009.6	$ 542.5	$2,467.1
Petroleum pipeline systems	2.51%	1,295.0	295.9	999.1
Water and utility plant and distribution systems	3.71%	34.0	1.8	32.2
Plant, buildings and equipment	8.98%	404.4	160.3	244.1
Land and land rights	0.25%	152.6	2.6	150.0
		$4,895.6	$1,003.1	$3,892.5

6. PROPERTY, PLANT AND EQUIPMENT (CONTINUED)

As allowed by the regulators, during the year ended December 31, 2005 the Company capitalized an allowance for equity funds during construction at approved rates of $1.0 million (2004 — $1.0 million) and approved capitalized overhead of $31.1 million (2004 — $31.1 million), with offsetting inclusions in earnings.

7. RATE STABILIZATION ACCOUNTS

	2005	2004
Current Assets		
RDDA	**$12.8**	$12.9
RSAM	**13.0**	11.1
CCRA	**—**	2.7
Gas Cost Variance Account (TGVI)	**2.6**	0.4
	28.4	27.1
Long-Term Assets		
RDDA	**22.4**	32.7
RSAM	**25.9**	27.9
	48.3	60.6
Current Liabilities		
CCRA	**(21.3)**	—
MCRA	**(26.6)**	(27.6)
	(47.9)	(27.6)
Net rate stabilization accounts	**$28.8**	$60.1

The current portion of the rate stabilization accounts represents the amounts expected to be recovered or refunded in rates over the next year. Actual recoveries/(refunds) will vary depending on actual natural gas consumption and recovery amounts approved by the BCUC.

The RSAM account is anticipated to be recovered in rates over three years. Recovery of the RSAM balance is dependent upon annually approved rates and actual gas consumption volumes. The MCRA and CCRA accounts, which succeeded the GCRA account in 2004, are anticipated to be fully recovered or paid within the next fiscal year.

8. OTHER ASSETS

	2005	2004
Deferred charges		
Subject to rate regulation and approved for recovery in rates		
Income taxes recoverable on post-employment benefits	**$10.6**	$ 8.4
Long-term debt issue costs	**9.5**	8.6
Commercial commodity unbundling costs	**3.2**	4.0
Replacement transportation agreement	**3.2**	3.6
Other items included approved for recovery in rates	**12.2**	10.9
Subject to rate regulation but not yet approved for recovery in rates		
Deferred development costs for capital projects	**19.5**	7.9
Corporate capital tax deferrals	**7.5**	7.7
Inland Pacific Connector Development costs	**—**	5.4
Other items subject to rate regulation but not yet approved	**1.7**	0.9
Included in non-regulated entities		
Long-term debt issue costs	**1.0**	1.6
Other items included in non-regulated entities	**2.7**	12.4
	71.1	71.4
Investments	**2.2**	1.3
Long-term receivables	**11.5**	14.7
	$84.8	$87.4

Amortization of these deferred charges in rates for the year ended December 31, 2005 totalled $11.3 million (2004 -$9.0 million).

The deferral account for income taxes on post-employment benefits relates to income tax amounts on post employment benefit expense. The BCUC allows post-employment benefits to be collected from customers through rates calculated on the accrual basis, rather than a cash paid basis, which produces timing differences for income tax purposes. Since Terasen Gas accounts for income taxes using the taxes payable basis of accounting, the tax effect of this timing difference is included in other assets, and will be reduced as cash payments for post-employment benefits exceed required accruals and amounts collected from customers in rates.

Long-term debt issue costs are amortized over the terms of the related debt, whose maturity dates are provided in Note 9 ''Long-Term Debt''.

8. OTHER ASSETS (CONTINUED)

The commercial commodity unbundling costs deferred are costs incurred to develop a third-party marketer alternative for commercial customers to purchase natural gas from suppliers other than Terasen Gas. The BCUC has approved the recovery of these costs in rates over a five-year period, of which four years remain at December 31, 2005.

The deferral account for the replacement transportation agreement relates to amounts that Terasen Gas is allowed to recover from customers in rates in order to cover any shortfall in revenues relative to a minimum amount approved by the BCUC on the Company's Southern Crossing Pipeline. The deferral account is being amortized and recovered in rates over a five-year period, of which four years remain at December 31, 2005.

Deferred development costs for capital projects include costs for projects under development that are expected to be added to regulated rate-base in future periods. These costs include approximately $16.2 million for Trans Mountain TMX expansion costs and $3.3 million for capital projects that are currently in progress by the natural gas distribution operations.

The deferral for corporate capital tax relates to tax payments that were made to the province of British Columbia (''the Province'') related to assessments for corporate capital tax for TGVI and Terasen Gas which the Company believes were incorrectly assessed. The Company is currently in the process of appealing the tax assessments and depending on the success of the appeals, the Company will either be refunded these amounts from the Province or alternatively expects to recover the costs from customers in future rates.

On October 5, 2005, the British Columbia Utilities Commission issued a decision that denied recovery of approximately $5.4 million of costs that Terasen Gas incurred to develop the Inland Pacific Connector pipeline project that is planned to bring new gas transmission capacity to the Lower Mainland of British Columbia when economic conditions make the project viable. The Company still believes that the project is viable and intends to keep all existing permits and land right approvals in place that have already been granted. Terasen Gas has filed an application to have the decision reconsidered, but has recorded an after-tax provision of $3.6 million at December 31, 2005.

Deferred charges for rate regulated entities that have been aggregated in the table above and in the table in ''Other Long-term Liabilities and Deferred Credits'' in Note 10 relate to more than fifty deferral accounts, none of which exceed $1.6 million individually. All of these accounts have been approved by regulators in prior annual rate approvals or orders and are being amortized over various periods depending on the nature of the costs.

9. LONG-TERM DEBT

	2005	2004
Terasen Inc.		
(a) Medium Term Note Debentures:		
6.30% Series 1, due December 1, 2008	**$ 200.0**	$ 200.0

Total long-term debt	**2,411.1**	2,708.3
Less: current portion of long-term debt	**398.2**	416.7
	$2,012.9	$2,291.6

(a) TERASEN INC. MEDIUM TERM NOTE DEBENTURES:
The Company's Medium Term Note Debentures are unsecured obligations but are subject to the restrictions of the Trust Indenture dated November 21, 2001.

(b) TERASEN INC. CAPITAL SECURITIES:
On April 19, 2000, the Company issued $125.0 million of 8.0% Capital Securities with a term to maturity of 40 years for gross proceeds of $123.7 million. The Company may elect to defer payments on these securities and settle such deferred payments in either cash or common shares, and has the option to settle principal at maturity through the issuance of common shares. The securities are exchangeable at the option of the holder on or after April 19, 2010 for common shares of the Company at 90% of the market price, subject to the right of the Company to redeem the securities for cash. Distributions on these securities, net of related income taxes, are deducted from net earnings for the purposes of calculating earnings applicable to common shares.

9. LONG-TERM DEBT (CONTINUED)

(c) TERASEN GAS INC. PURCHASE MONEY MORTGAGES:
The Series A and Series B Purchase Money Mortgages are secured equally and rateably by a first fixed and specific mortgage and charge on Terasen Gas' Coastal Division assets, and are subject to the restrictions of the Trust Indenture dated December 3, 1990. The aggregate principal amount of Purchase Money Mortgages that may be issued under the Trust Indenture is limited to $425 million.

(d) TERASEN GAS INC. DEBENTURES AND MEDIUM TERM NOTE DEBENTURES:
Terasen Gas' debentures are unsecured obligations but are subject to the restrictions of the Trust Indenture dated November 1, 1977, as amended and supplemented.

(e) TERASEN GAS (VANCOUVER ISLAND) INC. BANK SYNDICATE:
The credit facility from the syndicate of banks is secured by a first floating charge over all of the assets of TGVI, assignment of certain material contracts, and assignment of royalty revenue and interruptible incentive payments. Subsequent to year-end the credit facility was renegotiated, and further information is disclosed in Note 19 ''Subsequent Events''.

(f) TERASEN PIPELINES (TRANS MOUNTAIN) INC. DEBENTURES:
The Trans Mountain debentures were unsecured obligations but were subject to the restrictions of the Trust Indenture dated February 18, 1987, as amended and supplemented.

On November 1, 2005, Trans Mountain redeemed the 11.50% Series C Debentures, due June 20, 2010. The total redemption price for the Debentures included a redemption premium of $10.9 million which has been reflected in financing costs for the year ended December 31, 2005. The Company has recognized an income tax benefit associated with the redemption costs of $3.6 million in income taxes for the year ended December 31, 2005.

(g) TERASEN PIPELINES (CORRIDOR) INC. DEBENTURES PAPER:
On February 1, 2005, Terasen Pipelines (Corridor) Inc. (''Corridor'') issued $150 million Series A Debentures and $150 million Series B Debentures. The debentures are unsecured and subject to restrictions of the Trust Indenture. The proceeds were used to repay a portion of Corridor's outstanding commercial paper.

Concurrent with the debenture issuance, Corridor entered into an operating credit facility which has annual renewal provisions. The credit facility is unsecured and will backstop Corridor's commercial paper issuance.

The Company's Series 1 and Series 3 Medium Term Note Debentures and Capital Securities, Terasen Gas' Series B Purchase Money Mortgages, Series E Debentures, and Series 11, Series 13, Series 16, Series 18, and Series 19 Medium Term Note Debentures, and Terasen Pipelines (Corridor) Inc. Series A and Series B Debentures are redeemable in whole or in part at the option of the Company at a price equal to the greater of the Canada Yield Price, as defined in the applicable Trust Indenture, and the principal amount of the debt to be redeemed, plus accrued and unpaid interest to the date specified for redemption. The Canada Yield Price is calculated as an amount that provides a yield slightly above the yield on an equivalent maturity Government of Canada bond.

Required principal repayments over the next five years are as follows:

2006	$398.2
2007	251.8
2008	389.7
2009	94.6
2010	151.8

10. OTHER LONG-TERM LIABILITIES AND DEFERRED CREDITS

	2005	2004
Pension and other post-employment benefit liabilities	**$ 39.7**	$ 30.8
Deferred gains on sale of natural gas distribution assets	**59.2**	60.3
Deferred payment	**36.0**	33.9
Deferred credits		
Subject to rate regulation and approved for refund in rates		
Earnings Sharing Mechanism	**8.8**	1.6
Deferred Interest Mechanism	**2.4**	2.5
Other items included approved for repayment in rates	**6.8**	8.2
Other deferred credits in entities subject to rate regulation	**1.7**	1.8
Other deferred credits/liabilities	**13.9**	16.9
	$168.5	$156.0

The deferred gains on sale of natural gas distribution assets occurred upon the sale and leaseback of pipeline assets to certain municipalities in 2001, 2002, 2004 and 2005. The pre-tax gains of $70.5 million on combined cash proceeds of $141.1 million are being amortized over the 17-year terms of the operating leases that commenced at the time of the sale transactions. These operating lease commitments are included in the table in Note 17.

10. OTHER LONG-TERM LIABILITIES AND DEFERRED CREDITS (CONTINUED)

The deferred payment resulted from the Company's acquisition of TGVI effective January 1, 2002. The deferred payment has a face value of $52.0 million but was discounted at January 1, 2002 to a present value of $28.2 million. The payment is due on December 31, 2011 or sooner if TGVI realizes revenues from transportation revenue contracts to serve power-generating plants which may be constructed in TGVI's service area. If any part of the deferred payment is paid prior to December 31, 2011, the difference between the payment and the carrying value of the debt will be treated as contingent consideration for the acquisition of TGVI and will be added to the cost of the purchase at that time.

The Earnings Sharing Mechanism is a mechanism agreed to in Terasen Gas' multi-year agreement to share, on a 50/50 basis, amounts earned by Terasen Gas on its regulated activities that exceed or are less than amounts allowed by the BCUC in the cost-of-service allowed return calculations. These amounts are shared on an after-tax basis, and are returned to customers in rates.

Terasen Gas has a deferred interest mechanism which has been approved by the BCUC which requires that variances due to differences in long-term and short-term borrowings and interest rates from those that have been approved in rates be returned to customers in future rates. The impact of this mechanism was to increase financing costs for the year ended December 31, 2005 by $2.0 million (2004 — $1.4 million) from what otherwise would be reported. The balance of the deferred interest account is being amortized on a straight-line basis over three years.

Other deferred credits/liabilities includes amounts resulting from the Company's acquisition of TGVI effective January 1, 2002.

Amortization of deferred credits in entities that are subject to rate regulation in rates for the year ended December 31, 2005 totalled $4.5 million (2004 — $3.8 million).

11. SHARE CAPITAL

AUTHORIZED SHARE CAPITAL
The Company is authorized to issue 750,000,000 common shares, 100,000,000 first preference shares and 100,000,000 second preference shares, all without par value.

STOCK SPLIT
On June 14, 2004 the Company carried out a two-for-one stock split effected by paying a stock dividend of one additional common share for each common share held as of June 7, 2004.

All equity-based benefit plans have been amended to reflect the additional shares or options resulting from the stock split. All share and per share data has been amended for comparative and current periods to reflect the stock split.

COMMON SHARES
Changes in the issued and outstanding common shares are as follows:

	2005		2004	
	Number	**Amount**	Number	Amount
Outstanding, beginning of year	**114,355,665**	**$883.4**	113,338,942	$868.7
Issued under:				
Share option plan	**1,283,146**	**21.3**	1,009,761	14.5
Employee share purchase plan	**4,351**	**0.2**	6,962	0.2
	115,643,162	**$904.9**	114,355,665	$883.4
Less common shares held by Trans Mountain	**9,184,188**		9,184,188	
Outstanding, end of year	**106,458,974**		105,171,477	

As at December 31, 2005, Trans Mountain owned 7.9% (2004 — 8.0%) of the common shares of Terasen Inc. The cost of these shares is shown as a deduction from shareholder's equity.

All of the shares outstanding at December 31, 2005 are owned by KMI.

12. SHARE OPTION PLAN AND STOCK-BASED COMPENSATION

SHARE OPTION PLAN
The Company had a Share Option Plan whereby officers and certain key employees could be granted options to purchase a maximum of 12,600,000 unissued common shares with terms up to ten years. There were two categories of options which were issued under the Share Option Plan, Regular Share Options and Performance Based Share Options. The option exercise price was the closing sale price of the common shares on the Toronto Stock Exchange on the trading day prior to the date the option was granted. The Share Option Plan was discontinued on November 30, 2005 as a result of the acquisition of the Company by KMI.

REGULAR SHARE OPTIONS
Since 2000, the Company had granted options with eight-year terms which were exercisable on a cumulative basis and vested at one-third per year on the anniversary of the option grant date. Prior to 2000, the Company granted options with ten-year terms which were exercisable on a cumulative basis at 20% per year.

12. SHARE OPTION PLAN AND STOCK-BASED COMPENSATION (CONTINUED)

REGULAR SHARE OPTIONS OUTSTANDING

	2005		2004	
	Shares under option	**Weighted-average exercise price**	Shares under option	Weighted-average exercise price
Outstanding, beginning of year	**565,868**	**$15.53**	1,118,822	$14.31
Options granted during the year	**5,000**	**29.45**	24,800	23.93
Options exercised	**(287,165)**	**15.15**	(537,716)	13.39
Options forfeited, cancelled and expired	**(82,991)**	**11.59**	(40,038)	17.46
Options purchased by KMI and cancelled	**(200,712)**	**18.12**	—	—
Outstanding, end of year	**—**	**$ —**	565,868	$15.40
Options exercisable, end of year	**—**	**$ —**	348,857	$13.25

PERFORMANCE BASED SHARE OPTIONS

The Company had granted performance based share options with eight-year terms. The options vested at one-third per year on the anniversary of the option grant dates, subject to the market price of the Company's common shares reaching 125% of the option's exercise price for at least 10 out of 15 consecutive trading days within four years of the option grant date. If the market price requirement was not attained within four years of grant date, the participant was still eligible to exercise two-thirds of the granted options if the common share price reached 125% of the option's exercise price for at least 10 out of 15 consecutive trading days during the subsequent four years.

PERFORMANCE BASED SHARE OPTIONS OUTSTANDING

	2005		2004	
	Shares under option	**Weighted-average exercise price**	Shares under option	Weighted-average exercise price
Outstanding, beginning of year	**2,339,619**	**$19.28**	2,304,398	$17.08
Options granted during the year	**850,200**	**29.45**	716,600	23.88
Options exercised	**(995,981)**	**16.96**	(472,045)	15.53
Options forfeited, cancelled and expired	**(262,574)**	**17.09**	(209,334)	19.68
Options purchased by KMI and cancelled	**(1,931,264)**	**25.12**	—	—
Outstanding, end of year	**—**	**$ —**	2,339,619	$19.24
Options exercisable, end of year	**—**	**$ —**	1,020,508	$16.27

STOCK-BASED COMPENSATION

In 2005, 855,200 stock options were granted (2004 — 741,400) at an average exercise price of $29.45 (2004 — $23.88) under the Company's Share Option Plan. The Company has applied the fair value based method of accounting for stock options granted after January 1, 2003. Reported earnings for 2005 include a compensation charge of $2.0 million (2004 — $1.2 million) representing the fair value of options granted in 2003, 2004 and 2005 amortized over their respective vesting periods, with a corresponding increase to contributed surplus. Just prior to the acquisition of the Company by KMI, any outstanding but not yet exercisable options became immediately exercisable and an additional pre-tax charge of $3.6 million was recorded to recognize the accelerated vesting of the remaining options. The options were then purchased by KMI and subsequently cancelled. Had the Company used the fair value based method to account for stock options granted during 2002, pro forma earnings and earnings per share would have been as follows:

		Year ended December 31, 2004
Net earnings	As reported	$149.8 million
	Pro forma	$148.6 million

A Black-Scholes model was used to calculate stock option fair values. The weighted average fair value of options granted in 2005 was $4.33 (2004 — $2.40). Significant assumptions in valuing the options were as follows:

	2005		2004	
	Regular Options	**Performance Based**	Regular Options	Performance Based
Interest rate	3.6%	3.7%	3.5 - 3.7%	3.5%
Expected volatility	16.5%	16.5%	15.1 - 15.4%	15.4%
Expected life	5 years	6 years	5 years	6 years

12. SHARE OPTION PLAN AND STOCK-BASED COMPENSATION (CONTINUED)

DEFERRED SHARE UNITS

The Company had issued Deferred Share Units (''DSU's'') to certain senior employees and directors. At December 31, 2005, there were no (2004 — 52,859) DSU's outstanding due to the payment of all outstanding DSU's at the acquisition of the Company by KMI on November 30, 2005. The liability at December 31, 2005 was nil (2004 — $1.5 million) and was included in other long-term liabilities and deferred credits.

13. EMPLOYEE BENEFIT PLANS

The Company is a sponsor of pension plans for eligible employees. The plans include registered defined benefit pension plans, supplemental unfunded arrangements, which provide pension benefits in excess of statutory limits, and defined contributory plans. The Company also provides post-employment benefits other than pensions for retired employees. The following is a summary of each type of plan:

DEFINED BENEFIT PLANS

Retirement benefits under the defined benefit plans are based on employees' years of credited service and remuneration. Company contributions to the plan are based upon independent actuarial valuations. The most recent actuarial valuations of the defined benefit pension plans for funding purposes were at December 31, 2004 and December 31, 2002 and the date of the next required valuations are December 31, 2005 and December 31, 2007. The December 31, 2005 valuations will not be completed until the second quarter of 2006. The expected weighted average remaining service life of employees covered by the defined benefit pension plans is 11.8 years (2004 — 11.8 years).

DEFINED CONTRIBUTION PLAN

Effective in 2000 for Terasen Gas and 2003 for petroleum transportation operations, all new non-union employees become members of defined contribution pension plans. Company contributions to the plan are based upon employee age and pensionable earnings for employees of the natural gas distribution operations and pensionable earnings for employees of the petroleum transportation operation.

SUPPLEMENTAL PLANS

Certain employees are eligible to receive supplemental benefits under both the defined benefit and defined contribution plans. The supplemental plans provide pension benefits in excess of statutory limits. The supplemental plans are unfunded and are secured by letters of credit.

OTHER POST-EMPLOYMENT BENEFITS

The Company provides retired employees with other post-employment benefits that include, depending on circumstances, supplemental health, dental and life insurance coverage. Post-employment benefits are unfunded and annual expense is recorded on an accrual basis based on independent actuarial determinations, considering among other factors, health care cost escalation. The most recent actuarial valuations were completed as at December 31, 2002 and the December 31, 2005 valuation will not be completed until second quarter of 2006. The expected weighted average remaining service life of employees covered by these benefit plans is 9.9 years (2004 — 9.9 years).

13. EMPLOYEE BENEFIT PLANS (CONTINUED)

The Company measures its accrued benefit obligations and the fair value of plan assets for accounting purposes as at December 31 each year. The financial positions of the employee defined benefit pension plans and other benefit plans are presented in aggregate in the tables below:

	Pension benefit plans		Other benefit plans	
	2005	2004	**2005**	2004
Plan assets				
Fair value, beginning of year	**$274.5**	$255.3	**$ —**	$ —
Company contributions	**6.9**	5.5	**1.6**	1.5
Contributions by members	**3.3**	2.9	**—**	—
Actual return on plan assets	**28.6**	26.7	**—**	—
Benefits paid	**(14.3)**	(15.2)	**(1.5)**	(1.4)
Other	**(0.5)**	(0.7)	**(0.1)**	(0.1)
Fair value, end of year	**298.5**	274.5	**—**	—
Accrued benefit obligation				
Balance, beginning of year	**298.0**	276.7	**67.3**	61.0
Service cost	**8.5**	8.1	**1.4**	1.3
Interest cost	**17.9**	17.2	**4.1**	3.9
Benefit payments	**(14.3)**	(15.2)	**(1.5)**	(1.4)
Contributions by members	**3.3**	2.9	**—**	—
Plan amendments and curtailments	**0.9**	—	**—**	—
Past service cost	**0.3**	0.5	**0.4**	—
Actuarial loss	**2.8**	—	**—**	—
Change in discount rate	**27.0**	7.8	**10.2**	2.5
Balance, end of year	**344.4**	298.0	**81.9**	67.3
Plan surplus (deficiency)	**(45.9)**	(23.5)	**(81.9)**	(67.3)
Unamortized transitional obligation (benefit)	**(23.8)**	(27.2)	**4.7**	6.2
Unamortized actuarial loss	**62.7**	43.2	**39.7**	32.0
Unamortized past service costs	**7.4**	9.0	**(2.6)**	(3.2)
Accrued benefit asset (liability)	**$ 0.4**	$ 1.5	**$(40.1)**	$(32.3)

The net accrued benefit liability is included in other long-term liabilities and deferred credits (Note 10).

Included in the accrued benefit obligation and fair value of the plan assets at year-end are the following amounts in respect of plans with accrued benefit obligations in excess of fair value of assets:

	Pension benefit plans		Other benefit plans	
	2005	2004	**2005**	2004
Accrued benefit obligations:				
Unfunded plans	**$ 35.9**	$ 28.0	**$ 81.9**	$ 67.3
Funded plans	**258.0**	156.5	**—**	—
	293.9	184.5	**81.9**	67.3
Fair value of plan assets	**246.2**	151.9	**—**	—
Funded status deficit	**$ (47.7)**	$ (32.6)	**$(81.9)**	$(67.3)

The accrued benefit obligations for unfunded pension benefit plans are secured by letters of credit.

13. EMPLOYEE BENEFIT PLANS (CONTINUED)

The net benefit plan expense is as follows:

	Pension benefit plans		Other benefit plans	
	2005	2004	**2005**	2004
Current service cost	**$ 8.7**	$ 8.1	**$1.6**	$1.3
Interest cost on projected benefit obligations	**17.9**	17.2	**4.1**	3.9
Actual return on plan assets	**(28.6)**	(26.7)	**—**	—
Net actuarial gains	**29.8**	7.8	**9.0**	2.5
Past service costs	**0.3**	0.5	**—**	—
Impact of curtailment/settlement	**0.9**	—	**—**	—
Net benefit plan expense before adjustments	**29.0**	6.9	**14.7**	7.7
Adjustments to recognize the long-term nature of employee future benefit costs:				
Difference between actual and expected return on plan assets	**9.2**	7.7	**—**	—
Difference between actual and recognized actuarial gains (losses) in year	**(26.8)**	(5.2)	**(6.4)**	0.1
Difference between actual and recognized past service costs in year	**0.4**	0.1	**(0.3)**	(0.3)
Special termination benefits	**(0.7)**	—	**—**	—
Amortization of transitional obligation (benefit)	**(3.4)**	(3.4)	**1.6**	1.6
Other	**—**	1.5	**—**	—
Net benefit plan expense	**$ 7.7**	$ 7.6	**$9.6**	$9.1
Defined contribution plan expense	**$ 1.6**	$ 2.3		
	$ 9.3	$ 9.9		

BENEFIT PLAN ASSETS

The weighted-average asset allocation by asset category of the Company's funded defined benefit pension plans is as follows:

	Pension benefit plans	
	2005	2004
Equity securities	**57%**	55%
Fixed income securities	**38%**	40%
Other assets	**5%**	5%
Total assets	**100%**	100%

The investment policy for benefit plan assets is to optimize the risk-return using a portfolio of various asset classes. The Company's primary investment objectives are to secure registered pension plans, and maximize investment returns in a cost-effective manner while not compromising the security of the respective plans. The pension plans utilize external investment managers to manage the investment policy. Assets in the plan are held in trust by independent third parties.

The pension plans do not directly hold any shares of the Company.

SIGNIFICANT ASSUMPTIONS

The discount rate assumption used in determining pension and post-retirement benefit obligations and net benefit expense reflects the market yields, as of the measurement date, on high-quality debt instruments. The expected rate of return on plan assets assumption is reviewed annually by management, in conjunction with actuaries. The assumption is based on the expected returns for the various asset classes, weighted by the portfolio allocation.

The weighted average significant actuarial assumptions used to determine the accrued benefit obligation and the benefit plan expense are as follows:

	Pension benefit plans		Other benefit plans	
	2005	2004	**2005**	2004

Expected rate of return on plan assets	**7.50%**	7.50%	**—**	—

13. EMPLOYEE BENEFIT PLANS (CONTINUED)

The assumed health-care cost trend rates for other post-employment benefit plans are as follows:

	2005	2004
Extended health benefits		
Initial health care cost trend rate	**9.0%**	9.0%
Annual rate of decline in trend rate	**1.0%**	1.0%
Ultimate health care cost trend rate	**5.0%**	5.0%
Year that the rate reaches the ultimate trend rate	**2008**	2008
Medical Services Plan Benefits Premium trend rate	**4.0%**	4.0%

A one percentage-point change in assumed health-care cost trend rates would have the following effects:

2005	**One percentage-point increase**	**One percentage-point decrease**
Effect on the total of the service cost and interest cost components of the benefit plan expense	$ 1.5	$ (1.2)
Effect on accrued benefit obligation	15.5	(12.9)

CASH FLOWS

Total cash contributions for employee benefit plans consist of:

	Employee benefit plans	
	2005	2004
Funded plans	**$ 5.3**	$4.3
Beneficiaries of unfunded plans	**3.2**	2.7
Defined contribution plans	**1.6**	2.3
Total	**$10.1**	$9.3

The contributions for 2006 are anticipated to be approximately the same as 2005 for both the defined pension benefit plans and other benefit plans.

BENEFIT CHANGES

Effective January 1, 2004, the Company modified its post-employment benefit program for non-union active employees in order to provide future retirees with more choice of coverage and to reduce the Company's exposure to future health and group life cost increases. The new plan is predominantly a defined contribution plan incorporating a Company-paid health spending account, a security health plan and life insurance. Provincial medical services plan premiums will now be paid by the retiree.

All plan members who have retired on or before December 31, 2004 receive benefits under the plans that were in effect when they retired, which includes the payment of provincial medical services plan premiums by the Company. Employees electing to retire during 2005 will have a choice between the new and old plan, and employees retiring after December 31, 2005 will participate in the new plan.

These assumptions, including the post-employment benefit plan changes, were included in the calculation of the accrued benefit obligation at December 31, 2003, 2004 and 2005.

IMPACT OF RATE REGULATION

As required by the regulator, Terasen Gas is required under its approved cost of service model to defer the amounts of pension benefit expense that exceed or are less than the amounts approved by the regulator to be recovered in rates each year. During the year ended December 31, 2005 the Company has deferred pension expense of $0.3 million that exceeded the amount approved by the regulator to be recovered in rates for 2005.

14. FINANCING COSTS

	2005	2004
Interest and expense on long-term debt	**$177.9**	$151.6
Interest on short-term debt	**15.0**	25.1
Interest capitalized	**(1.5)**	(1.1)
	$191.4	$175.6

Included in interest expense on long-term debt for the year ended December 31, 2005 is $10.9 million of redemption premium paid on the redemption of Trans Mountain Debentures during the year.

As allowed by the regulators, during the year ended December 31, 2005, the Company capitalized interest for borrowing requirements for construction of assets that have not been included in rate base of $1.5 million (2004 — $1.1 million).

15. INCOME TAXES

PROVISION FOR INCOME TAXES

	2005	2004
Current income taxes	**$48.7**	$66.3
Future income taxes	**2.9**	(2.6)
	$51.6	$63.7

VARIATION IN EFFECTIVE INCOME TAX RATE

Consolidated income taxes vary from the amount that would be computed by applying the Canadian and United States Federal, British Columbia and Alberta combined statutory income tax rate of 33.77% (2004 — 34.52%) to earnings before income taxes as shown in the following table:

	2005	2004
Earnings before income taxes	**$157.7**	$210.2
Combined statutory income tax rate	**33.77%**	34.52%
Combined income taxes at statutory rate	**$ 53.3**	$ 72.6
Increase (decrease) in income taxes resulting from:		
Capital cost allowance and other deductions claimed for income tax purposes over amounts recorded for accounting purposes	**(10.0)**	(14.7)
Large Corporations Tax in excess of surtax	**6.1**	6.5
Non-deductible expenses and non-taxable income	**9.6**	5.5
Benefit of tax rate changes on losses	**—**	(0.4)
Equity income not subject to tax	**(4.7)**	(3.3)
Write-off of restricted tax loss carryforwards	**5.9**	—
Other permanent differences	**(8.0)**	(2.6)
Other	**(0.6)**	0.1
Actual consolidated income taxes	**$ 51.6**	$ 63.7
Effective income tax rate	**32.72%**	30.30%

FUTURE INCOME TAXES

The net future income tax liability of the Company of $88.7 million (2004 — $68.7 million) relates primarily to the tax effect of temporary differences on non-regulated property, plant and equipment balances and tax benefits repayable to shippers in future periods.

As a result of the Company accounting for income taxes following the taxes payable method for its natural gas distribution and petroleum transportation regulated operations, the Company has not recognized net future income tax liabilities amounting to $301.8 million at December 31, 2005 (2004 — $278.7 million) and has not recognized a future income tax expense of $23.1 million for the year ended December 31, 2005 (2004 — $15.2 million), all of which were calculated using the asset and liability method.

16. FINANCIAL INSTRUMENTS

FAIR VALUE ESTIMATES

The carrying values of cash and short-term investments, accounts receivable, short-term notes and accounts payable and accrued liabilities approximate their fair values due to the relatively short period to maturity of the instruments.

The fair value of the Company's investment in the Express System is estimated to approximate its carrying value.

The fair value of the Company's long-term debt, calculated by discounting the future cash flow of each debt issue at the estimated yield to maturity for the same or similar issues at December 31, 2005, or by using available quoted market prices, is estimated at $2,673.4 million (2004 — $2,818.2 million). The majority of the Company's long-term debt relates to regulated operations which enables the Company to recover the existing financing charges through rates or tolls.

Fair value estimates are made at a specific point in time, based on relevant market information and information about the financial instrument. These estimates cannot be determined with precision as they are subjective in nature and involve uncertainties and matters of judgment.

DERIVATIVE INSTRUMENTS

The Company uses derivative instruments to hedge its exposures to fluctuations in natural gas prices, interest rates and foreign currency exchange rates.

16. FINANCIAL INSTRUMENTS (CONTINUED)

Asset (Liability)	Number of swaps and options	Term to maturity (years)	December 31 2005 Carrying Value	2005 Fair Value	2004 Carrying Value	2004 Fair Value

Foreign Currency Swaps						
Terasen Inc.	**—**	**—**	**—**	**—**	(0.6)	(0.6)

The natural gas derivatives fair value reflects only the value of the natural gas derivatives and not the offsetting change in value of the underlying future purchases of natural gas. These fair values reflect the estimated amounts the Company would receive or pay to terminate the contracts at the stated dates.

Included in the carrying value of the natural gas derivatives is $22.2 million of unrealized fair value gains associated with derivative instruments which were deemed to be ineffective at December 31, 2005, and $1.0 million of derivative instruments which did not qualify for hedge accounting that are in a liability position.

Clean Energy, an entity in which the Company held an interest, had historically purchased gas forward contract positions to offset future commodity supply contracts. Since these contracts were not specifically designated as hedges, these positions were marked-to-market at each balance sheet date and gains or losses were reported in the statement of earnings as cost of revenues from other activities. During the year ended December 31, 2005 the Company included in earnings an amount of $10.9 million (2004 — $3.3 million) net of tax and estimated selling expenses pertaining to the Company's proportionate share of Clean Energy's gas forward contracts.

The derivatives entered into by Terasen Gas and TGVI relate to regulated operations and any resulting gains or losses are recorded in rate stabilization accounts, subject to regulatory approval, and passed through to customers in future rates.

The Company is exposed to credit risk in the event of non-performance by counterparties to derivative instruments. Because it deals with high credit quality institutions in accordance with established credit approval practices, the Company does not expect any counterparties to fail to meet their obligations.

17. COMMITMENTS & CONTINGENCIES

The Company's subsidiaries and proportionately consolidated entities have entered into operating leases for certain building space and natural gas distribution assets. In addition, Terasen Gas and TGVI have entered into gas purchase contracts which represent future purchase obligations.

The following table sets forth the Company's operating lease and gas purchase obligations due in the years indicated:

	Operating leases	Purchase obligations	Total
2006	$ 21.3	$ 873.8	$ 895.1
2007	20.2	113.6	133.8
2008	20.6	33.2	53.8
2009	19.3	30.2	49.5
2010	18.2	—	18.2
2011 and later	127.5	—	127.5
	$227.1	$1,050.8	$1,277.9

Gas purchase contract commitments are based on market prices that vary with gas commodity indices. The amounts disclosed reflect index prices that were in effect at December 31, 2005.

In prior years, TGVI received non-interest bearing, repayable loans from the Federal and Provincial governments of $50 million and $25 million respectively, in connection with the construction and operation of the Vancouver Island natural gas pipeline. The government loans are repayable in any fiscal year after 2002 and prior to 2012 under certain circumstances and subject to the ability of TGVI to obtain non-government subordinated debt financing on reasonable commercial terms. As approved by the BCUC, these loans have been recorded as a government grant and have reduced the amounts reported for property, plant and equipment. The Company anticipates that all of the repayment criteria may be met in 2006 and, if met, will result in an estimated repayment of $4.5 million of these loans in 2006. As the loans are repaid and replaced with non-governmental loans, plant and equipment and long-term debt will increase in accordance with the approved capital structure, as will the rate base used in determining rates. The amounts are not included in the obligations in the table above as the amounts and timing of

17. COMMITMENTS & CONTINGENCIES (CONTINUED)

repayments is dependent upon the approved RDDA recovery each year and the ability to replace the loans with non-government subordinated debt financing on reasonable commercial terms.

A number of claims and lawsuits seeking damages and other relief are pending against the Company. Management is of the opinion, based upon information presently available, that it is unlikely that any liability, to the extent not provided for through insurance or otherwise, would be material in relation to the Company's consolidated financial statements.

18. GUARANTEES

The Company has, for a fee, arranged for the issuance of a letter of credit in the amount of US$15.1 million on behalf of co-investors in the Express System to fund the Debt Service Reserve Account required under the Express System's trust indenture. The letter of credit is subject to annual renewal. If the letter of credit is drawn upon, the Company will have recourse to the co-investors, major Canadian pension funds.

The Company has, for a fee, provided indemnities with respect to performance bonds issued on behalf of Clean Energy in the amount of US$3.5 million. These performance bonds secure construction projects undertaken by Clean Energy, and expire at various dates before October 31, 2006.

The Company has letters of credit outstanding at December 31, 2005 totalling $118.5 million to support its operations and capital projects, including $50.8 million for its unfunded supplemental pension benefit plans and $17.6 million for the letter of credit referred to above on behalf of co-investors in the Express System.

19. SUBSEQUENT EVENTS

(a) On January 13, 2006, Terasen Gas (Vancouver Island) Inc. entered into a five-year unsecured, committed, revolving credit facility of $350 million with a syndicate of banks, of which $296 million was drawn against the facility on January 17, 2006. A portion of the facility was used to refinance TGVI's existing term facility of $209.5 million. The facility will also be utilized to finance working capital requirements and general corporate purposes.

Concurrently with executing the above noted facility, TGVI entered into a $20 million, seven-year unsecured, committed, non-revolving credit facility with one bank. This facility will be utilized for purposes of refinancing any annual prepayments TGVI may be required to make on non-interest bearing government contributions. The terms and conditions are primarily the same as the aforementioned TGVI facility except this facility ranks junior to repayment of TGVI's Class B subordinated debt which is held by the Company.

(b) On March 2, 2006 a Decision was issued by the BCUC approving changes to Terasen Gas' and TGVI's deemed equity components from 33% to 35% and from 35% to 40%, respectively, with effective from January 1, 2006. The same Decision also modified the previously existing generic return on equity (''ROE'') reset formula resulting in an increase in allowed ROE's from the levels that would have resulted from the old formula. The changes increased the allowed ROE for 2006 from 8.29% to 8.80% for Terasen Gas and from 8.79% to 9.50% for TGVI.

(c) Subsequent to year-end, the Company received a letter dated March 31, 2006 from the British Columbia Social Service tax authority indicating their intention to assess additional provincial sales tax on the Southern Crossing Pipeline which was completed in 2000. The letter received does not indicate the amount to be assessed and a formal notice of assessment has not been received. Any assessment will be appealed when it is received and the Company believes this assessment is without merit and it will not have a material adverse impact on the financial results of the Company.

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS
(Unaudited)

1. BASIS OF PRESENTATION

The accounting policies and methods of application used in the preparation of these interim consolidated financial statements are consistent with the accounting policies used in the Company's year end audited consolidated financial statements of December 31, 2005. These consolidated financial statements do not include all disclosures required for annual financial statements, and therefore these statements should be read in conjunction with the consolidated financial statements for the year ended December 31, 2005. Certain comparative figures have been restated to conform with the current period presentation.

2. SEGMENT DISCLOSURES

3. SEASONAL OPERATIONS

Due to the seasonal nature of the Company's natural gas distribution operations, quarterly earnings statements are not indicative of earnings on an annual basis.

4. RELATED PARTY TRANSACTIONS

The Company estimates that its parent company, Kinder Morgan Inc., provided management services totalling approximately $1.1 million (2005 — nil) for the three months ended September 30, 2006 and $8.5 million (2005 — nil) for the nine months ended September 30, 2006.

5. EMPLOYEE BENEFIT PLANS

The Company and its subsidiaries have defined benefit pension plans and defined contribution pension plans for employees. The Company also provides post-employment benefits other than pensions for retired employees. Additional information about these benefit plans can be found in the Company's 2005 Annual Report. The Company's estimated contributions to defined benefit pension plans for 2006 are anticipated to be $10.0 million (2005 actual $10.1 million).

Costs recognized in the periods are presented in the following tables:

	Three months ended September 30			
	Pension benefit plans		Other benefit plans	
	2006	2005	**2006**	2005
	(in millions of dollars)

6. CONTINGENCY AND COMMITMENTS

Terasen Gas, a subsidiary of the Company, received a Notice of Assessment dated July 31, 2006 from the British Columbia Social Service Tax authority for $37.1 million of additional provincial sales tax and interest on the Southern Crossing Pipeline, which was completed in 2000. This has not been provided for as the Company will appeal this assessment. Management believes that this assessment is without merit and will not have a material adverse impact on our business, financial position, results of operations or cash flows. In October 2006, the Company made a payment of $10 million pending resolution of the appeal as a good faith payment in order to forestall an order from the Province to provide full payment or security. The payment has been recorded as a long term receivable and a request for regulatory deferral account treatment has been made. This payment does not reflect Management's belief as to the ultimate sustainability of the assessment.

PRO FORMA CONSOLIDATED FINANCIAL STATEMENTS

FORTIS INC.

(Unaudited)

As at September 30, 2006 and for the nine-month period ended September 30, 2006 and the year ended December 31, 2005

UNAUDITED PRO FORMA CONSOLIDATED FINANCIAL STATEMENTS

The following unaudited *pro forma* consolidated financial statements give effect to the proposed acquisition (the ''Acquisition'') of Terasen Inc. (''Terasen'') under the purchase method of accounting. The unaudited *pro forma* consolidated balance sheet gives effect to the Acquisition as if it had occurred on September 30, 2006. The unaudited *pro forma* consolidated statements of earnings for the nine-month period ended September 30, 2006 and for the year ended December 31, 2005 give effect to the Acquisition as if it was completed on January 1, 2005.

These unaudited *pro forma* consolidated financial statements are presented for illustrative purposes only. The *pro forma* adjustments are based upon available information and certain assumptions that we believe are reasonable in the circumstances, as described in the notes to the unaudited *pro forma* consolidated financial statements.

Terasen is a holding company headquartered in Vancouver, British Columbia, operating two principal lines of business: natural gas distribution and petroleum transportation. Prior to the closing of the Acquisition, Kinder Morgan, Inc. (''Kinder Morgan'') will cause Terasen to divest itself of its petroleum transportation operations. These unaudited *pro forma* consolidated financial statements are based on Terasen's financial statements as at and for the nine months ended September 30, 2006 and for the year ended December 31, 2005. The financial position and results of the petroleum transportation operations have been excluded from the unaudited *pro forma* consolidated balance sheet and statements of earnings, respectively, by way of *pro forma* adjustments. Refer to Notes 2[b] and 2[d].

The *pro forma* information presented, including allocation of purchase price, is based on preliminary estimates of fair values of assets acquired and liabilities assumed, available information and assumptions and may be revised as additional information becomes available. The actual adjustments to our consolidated financial statements upon the closing of the Acquisition will depend on a number of factors, including additional information available and the net assets on the closing date of the Acquisition. Therefore, we believe that the actual adjustments will differ from the *pro forma* adjustments, and the differences may be material. For example, the final purchase price allocation is dependent on, among other things, the finalization of asset and liability valuations. A final determination of these fair values will reflect our consideration of a final valuation prepared by independent third-party appraisers. This final valuation will be based on the actual net tangible and intangible assets and liabilities that exist as of the closing date of the Acquisition. Any final adjustment may change the allocation of purchase price, which could affect the fair value assigned to the assets and liabilities and could result in a change to the unaudited *pro forma* consolidated financial statements, including a change to goodwill.

NOTES TO PRO FORMA CONSOLIDATED FINANCIAL STATEMENTS
(Unaudited)

1. BASIS OF PRESENTATION

The accompanying unaudited *pro forma* consolidated financial statements give effect to the acquisition (the ''Acquisition'') of all of the issued and outstanding shares in Terasen Inc. (''Terasen'') as described in the short form prospectus dated March 7, 2007 (the ''Prospectus''). The accompanying unaudited *pro forma* consolidated financial statements have been prepared by management of Fortis Inc. (''Fortis'' or the ''Corporation'') and are derived from the unaudited and audited consolidated financial statements of Fortis as at and for the nine-month period ended September 30, 2006 and for the year ended December 31, 2005, respectively; and the unaudited and audited financial statements of Terasen as at and for the nine-month period ended September 30, 2006, and for the year ended December 31, 2005, respectively.

The accounting policies used in the preparation of these unaudited *pro forma* consolidated financial statements are those disclosed in the Corporation's audited financial statements. Management has determined that no adjustments to Terasen's financial statements are required to comply with the accounting policies used by Fortis in the preparation of its consolidated financial statements. Certain accounting policies followed by Terasen are different from that of Fortis due to rate regulation associated with a gas utility imposed by the British Columbia Utilities Commission (''BCUC'').

As is standard with similar transactions in regulated utilities, the purchase price is primarily based upon the regulated assets at the point of closing. Based on the purchase price calculation as detailed in the acquisition agreement dated February 26, 2007 (the ''Acquisition Agreement''), the estimated net purchase price of Terasen is $1,099.0 million (refer to Note 2[a]).

The unaudited *pro forma* consolidated balance sheet and unaudited *pro forma* consolidated statements of earnings reflect the acquisition effected on September 30, 2006 and January 1, 2005, respectively. The unaudited *pro forma* consolidated financial statements are not necessarily indicative of the results that actually would have been achieved if the transactions reflected therein had been completed on the dates indicated or the results which may be obtained in the future. For instance, the actual purchase price allocation will reflect the fair value, at the purchase date, of the assets acquired and liabilities assumed based upon the acquirer's evaluation of such assets and liabilities following the closing of the transaction and, accordingly, the final purchase price allocation, as it relates principally to intangible assets, may differ significantly from the preliminary allocation reflected herein.

These unaudited *pro forma* consolidated financial statements should be read in conjunction with the description of the transaction described in the Prospectus; the audited and unaudited financial statements of Terasen, including the notes thereto, included in the Prospectus; and the audited and unaudited consolidated financial statements of Fortis including the notes thereto, incorporated by reference in the Prospectus.

The underlying assumptions for the *pro forma* adjustments provide a reasonable basis for presenting the significant financial effect directly attributable to the Acquisition. These *pro forma* adjustments are tentative and are based on available financial information and certain estimates and assumptions. The actual adjustments to the consolidated financial statements will depend on a number of factors. Therefore, we believe that the actual adjustments will differ from the *pro forma* adjustments, and the differences may be material.

2. PRO FORMA ASSUMPTIONS AND ADJUSTMENTS

[a] These *pro forma* consolidated financial statements give effect to the completion of the Acquisition, as if it had occurred on September 30, 2006 in respect of the *pro forma* consolidated balance sheet, and on January 1, 2005 in respect of the *pro forma* consolidated statements of earnings for the year ended December 31, 2005 and for the nine-month period ended September 30, 2006. The Acquisition has been reflected in the *pro forma* consolidated financial statements using the purchase method.

Estimated Net Purchase Price

	($ millions)
Unadjusted purchase price	1,801.0
Estimated acquisition costs (Note 2[h])	25.0
Estimated net purchase price, before assumed debt	1,826.0

Common share issuance (Note 2[g])	1,001.0
Incremental long-term debt issuance (Note 2[e])	139.3
	1,907.3

[b] Petroleum Transportation segment net assets and allocation of estimated net purchase price

The estimated net purchase price has been allocated to the fair values of Terasen net assets and liabilities at September 30, 2006, excluding the net assets and liabilities of the petroleum transportation segment which are not being acquired, in accordance with the purchase method, as follows:

	($ millions)				
	Terasen Inc.	Petroleum Transportation	Note	Fair Value and Other Adjustments	Net Total
Assets acquired:					
Cash and cash equivalents	82.8	—		—	**82.8**
Accounts receivable	188.1	(22.3)		—	**165.8**
Prepaid expenses	8.8	(3.2)		—	**5.6**
Regulatory assets	142.5	—		—	**142.5**
Gas inventories, materials and supplies	249.7	(3.2)		—	**246.5**
Current assets	**671.9**	**(28.7)**		—	**643.2**
Deferred charges and other assets	86.8	(31.0)	2[n]	2.4	**58.2**
Regulatory assets	49.8	—		—	**49.8**
Future income taxes	—	—	2[f]	8.4	**8.4**
Utility capital assets	3,994.8	(1,158.4)		—	**2,836.4**
Investments	254.5	(254.5)		—	**—**
Intangibles	—	—		—	**—**
	5,057.8	**(1,472.6)**		10.8	**3,596.0**
Liabilities assumed:					
Short-term borrowings	524.0	—		—	**524.0**
Accounts payable and accrued charges	433.5	(85.0)	2[l]	10.0	**358.5**
Income taxes payable	20.0	2.2		—	**22.2**
Current installments of long-term debt and capital lease obligations	41.0	—		—	**41.0**
Other long-term liabilities and deferred credits	176.9	(16.8)		—	**160.1**
Future income taxes	71.7	(63.5)		—	**8.2**
Long-term debt and capital lease obligations	2,367.0	(300.0)	2[f]	24.0	**2,091.0**
	3,634.1	**(463.1)**		34.0	**3,205.0**
Net assets at fair value, as at September 30, 2006	1,423.7	(1,009.5)		(23.2)	**391.0**
Net purchase price					**1,099.0**
Goodwill					**708.0**
Goodwill previously recorded by Terasen					**(76.4)**
Additional goodwill					**631.6**

Terasen's natural gas distribution business is regulated under traditional cost of service. The determination of revenues and earnings is based on regulated rates of return that are applied to historic values and does not change with a change of ownership. Therefore, for the regulated business, no fair market value adjustments are recorded as part of the purchase price on individual assets and liabilities, including intangibles, to be acquired, because all of the economic benefits and obligations associated with them beyond regulated rates of return accrue to the customers. The book value of the assets and liabilities of the regulated business to be acquired has been assigned as fair value for the purchase price allocation.

[c] Goodwill

The excess of the purchase price, including estimated fees and expenses related to the Acquisition, over the preliminary fair value of net assets acquired from Terasen is classified as goodwill on the accompanying *pro forma* consolidated balance sheet.

[d] Results of Petroleum Transportation segment

The acquisition of Terasen does not include the petroleum transportation segment and, as such, the results of this segment for the year ended December 31, 2005 and for the nine months ended September 30, 2006 have been excluded, as follows:

	($ millions)	
	Nine-month period ended Sept 30, 2006	Year ended December 31, 2005
Operating revenues	168.2	227.8
Equity income	16.2	21.9
	184.4	249.7
Expenses		
Operating	74.3	106.9
Amortization	28.1	37.6
Finance charges	20.1	31.7
Income taxes	10.3	9.0
	132.8	185.2

[e] Financing

The Corporation has entered into a bridge financing agreement with its bankers at an assumed rate of 5.10%. This bridge will be refinanced with the issuance of other permanent capital including long-term debt facilities. It is assumed the anticipated debt funding requirement of $139.3 million will be initially financed by the bridge acquisition facility and will be subsequently refinanced at an average rate of 5.25%.

Additional interest expense of the following has been assumed:

	($ millions)	
	Nine-month period ended Sept 30, 2006	Year ended December 31, 2005
Interest on $139.3 million of refinanced incremental debt at 5.25%	5.5	7.3

[f] Assumed debt

Terasen has long-term debt outstanding of $450.0 million, in various series with due dates ranging from 2008 to 2040. The rates range from 5.56% to 8.0%, resulting in the fair market value of the debt exceeding book value by $24.0 million, ($15.6 million, net of future income taxes of $8.4 million), calculated as at September 30, 2006. No adjustment was made to the carrying value of the debt securities of Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc. This is due to the rate regulated nature of their businesses in which recovery in rates of the costs related to these debt securities is subject to the regulation of the BCUC.

Terasen also has short-term notes of $317.0 million that are being assumed. The remaining short-term notes balance of $207.0 million relates to the BCUC regulated business.

[g] Common share issuance

To fund a portion of the Acquisition purchase price, the Corporation plans to issue approximately 38.5 million common shares on closing resulting in estimated gross proceeds of $1,001.0 million, or net proceeds after common share issuance costs of $974.2 million ($41.3 million common share issuance costs less $14.5 million of future income taxes). The price of $26.00 per share, being the offering price for the issuance of 38.5 million subscription receipts of the Corporation pursuant to the Prospectus dated March 7, 2007, has been used as the issue price per share in the *pro forma* consolidated financial statements.

[h] Acquisition costs

It is assumed Acquisition costs will approximate $25.0 million, and will form part of the investment cost base. These primarily relate to investment banking and legal fees.

[i] Income taxes

Income taxes applicable to the *pro forma* adjustments are tax effected at Fortis' average tax rates of 35.0% and 35.0% for the year ended December 31, 2005 and the nine-month period ended September 30, 2006, respectively.

[j] Earnings per common share

The calculation of the *pro forma* earnings per common share for the year ended December 31, 2005, and for the nine-month period ended September 30, 2006, considers the issuance of 38.5 million common shares as contemplated in the Prospectus dated March 7, 2007, as if the issuance had taken place as at January 1, 2005.

[k] Terasen historical shareholder's equity balances

The historical shareholder's equity, contributed surplus, foreign currency translation and retained earnings balances of Terasen have been eliminated.

[l] Transition costs

Estimated known restructuring costs of $10.0 million are related to an after-tax estimate of expenses associated with a transition plan. The assessment of this plan will be completed as soon as possible after the consummation of the Acquisition and actions under the plan will begin as soon as possible thereafter.

[m] Long-term debt financing costs

Long-term debt financing costs are assumed to approximate $3.0 million, and will be deferred and amortized over the estimated term of the long-term debt of five years.

[n] Fair value of interest rate swaps and related amortization

The fair value of interest rate swaps of Terasen is an asset of $2.4 million as at September 30, 2006. The fair value adjustment will be amortized over the term of the related debt.

[o] Amortization of fair value debt adjustment

The debt fair value adjustment will be amortized over the term of the related debt. Refer to Note 2[f].

[p] Segmentation of short-term interest expense

The $317 million of assumed short-term notes of Terasen includes $110 million which had previously been allocated to the petroleum transportation segment by Terasen. With the acquisition of Terasen and the removal of the petroleum transportation segment, interest on the $110 million of short-term notes has been reallocated back to the remaining business being acquired as follows:

INDEX TO MANAGEMENT DISCUSSION AND ANALYSIS

Terasen Inc.

2005 Management Discussion and Analysis
For the Year Ended December 31, 2005
April 10, 2006

This discussion should be read in conjunction with the consolidated financial statements of the Company and related notes for the years ended December 31, 2005 and 2004. In this MD&A, we, us, our, the Company and Terasen mean Terasen Inc., its subsidiaries, joint ventures and investments in significantly influenced companies. Terasen Gas refers to Terasen Gas Inc., TGVI refers to Terasen Gas (Vancouver Island) Inc., Trans Mountain refers to Terasen Pipelines (Trans Mountain) Inc., Corridor refers to Terasen Pipelines (Corridor) Inc., Terasen Pipelines refers to Terasen Pipelines Inc., Express refers to the Express and Platte Pipeline Systems; and Water and Utility Services refers to Terasen Waterworks (Supply) Inc., Terasen Utility Services Inc. and Terasen's 50% interest in Fairbanks Sewer and Water Inc. KMI refers to Kinder Morgan, Inc.

The financial data included in this discussion has been prepared in accordance with Canadian generally accepted accounting principles, and all dollar amounts are in Canadian dollars unless otherwise stated.

About Terasen

On November 30, 2005, all of the shares of the Company were acquired by Kinder Morgan, Inc. (''KMI''), through a subsidiary, pursuant to a Combination Agreement dated as of August 1, 2005. The Company's shareholders were able to elect, for each Terasen share held, either (i) $35.75 in cash, (ii) 0.3331 shares of KMI common stock, or (iii) $23.25 in cash plus 0.1165 shares of KMI common stock. In the aggregate, approximately 12.5 million shares of KMI common stock was issued together with cash payments of approximately $2.49 billion to Terasen securityholders.

Natural Gas Distribution

Terasen's natural gas distribution operations consist primarily of Terasen Gas and TGVI in addition to several small related utility operations. Terasen Gas is the largest distributor of natural gas in British Columbia, serving more than 804,000 customers in more than 100 communities. Major areas served by Terasen Gas are Greater Vancouver, the Fraser Valley and the Thompson, Okanagan, Kootenay and North Central Interior regions of the province. TGVI serves approximately 85,000 customers on Vancouver Island and the Sunshine Coast area and Terasen Gas (Whistler) serves approximately 2,000 customers in the Whistler region. Terasen Gas and TGVI provide transmission and distribution services to their customers, and obtain natural gas supplies on behalf of residential and commercial customers. Gas supplies are sourced primarily from northeastern British Columbia and, through the Company's Southern Crossing Pipeline, from Alberta.

Petroleum Transportation

Terasen's petroleum transportation operations are the Trans Mountain, Corridor, Express and Platte pipelines. These operations are conducted under the Kinder Morgan Canada name. Trans Mountain transports crude oil and refined products from Edmonton, Alberta to Burnaby, British Columbia and also delivers Canadian crude oil to several refineries in Washington State. Trans Mountain also owns the Westridge Marine Terminal, which is located at tidewater in the Port of Vancouver, and a jet fuel pipeline connecting to Vancouver International Airport. Corridor owns a dual pipeline system which transports diluted bitumen and diluent between the Muskeg River mine near Fort McMurray and the Shell upgrader north of Edmonton, Alberta. Corridor commenced commercial operations in May 2003. Terasen also owns a one-third interest in the Express Pipeline and the Platte Pipeline which transports crude oil from Hardisty, Alberta to the Rocky Mountain region of the United States and on to Wood River, Illinois.

Other Activities

In addition to Terasen's core businesses of Natural Gas Distribution and Petroleum Transportation, Terasen owns interests in several smaller businesses including a 30% interest in CustomerWorks LP. CustomerWorks provides billing and customer care services to utilities, municipalities and retail energy companies. CustomerWorks has outsourced the provision of its customer care services to an entity owned and operated by Accenture Inc. Prior to the disposition of Terasen's 40.4% ownership interest in Clean Energy on October 31, 2005, the other activities segment also included Clean Energy Fuel Corp. (''Clean Energy''), a provider of natural gas vehicle refueling infrastructure.

In January 2006, Terasen entered into a Purchase and Sale Agreement to dispose of its interest in its water and utility services operations for proceeds of approximately $125 million. The disposition is expected to be completed by the end of April 2006, subject to regulatory approvals. The water and utility services business has accordingly been reclassified as assets and liabilities held for sale and as discontinued operations. The disposition is not expected to give rise to a material gain or loss.

Results of Operations

Net Earnings

	Years ended December 31	
	2005	2004
	(in millions of dollars)	
Natural gas distribution		
Terasen Gas	**$ 65.3**	$ 69.7
TGVI	**25.5**	26.2
	90.8	95.9
Petroleum transportation		
Trans Mountain	**25.4**	39.4
Corridor	**13.6**	15.6
Express System	**25.5**	15.9
	64.5	70.9
Discontinued operations	**(4.9)**	3.3
Other activities	**(49.2)**	(20.3)
Net earnings	**$101.2**	$149.8

Net earnings for 2005 decreased by $48.6 million compared to 2004. Significant items that impacted net earnings in 2005 were as follows:

Certain items

	($ millions)
KMI transaction costs	$42.9
Inland Pacific Connector costs	3.6
Clean Energy hedging gains and disposition costs	(2.5)
Premium on Trans Mountain debt redemption	7.3
	$51.3

In 2005 the Company has charged to earnings after-tax costs of $42.9 million associated with the acquisition by KMI, mainly from pre-tax investment banking costs of $14.7 million, severance and employee-related costs of $14.4 million, share option costs of $3.6 million, and the write-off of approximately $15.3 million of income tax expense related to restricted tax loss carry-forwards.

In the fourth quarter of 2005 Terasen Gas expensed $3.6 million (after-tax) of costs incurred in connection with the Inland Pacific Connector project that were not permitted recovery in rates by the BCUC.

On October 31, 2005, the Company sold its 40.4% ownership in Clean Energy for proceeds of approximately U.S. $35.9 million. The sale, together with equity earnings of Clean Energy for the ten months ended October 31, 2005, has resulted in a gain of approximately $2.5 million, including the recognition of all unrealized gas forward contract gains of Clean Energy in 2005 totalling $10.9 million and the recognition of currency translation losses previously included in Shareholders' Equity totalling $8.4 million.

On November 1, 2005, Trans Mountain exercised its right to redeem the $35 million Series C Debentures. An after-tax charge to earnings of $7.3 million was incurred in connection with the premium that was paid to redeem the debentures.

The water and utility services business operations earnings have been reclassified to discontinued operations for both 2005 and 2004.

Selected Annual Information

	Years ended December 31		
	2005	2004	2003
	(in millions of dollars)		
Total revenues[1]	**$1,952.5**	$1,798.1	$1,763.1
Net income before discontinued operations[1]	**106.1**	146.5	130.7
Net income[2]	**101.2**	149.8	132.7
Common dividends paid	**95.1**	86.4	79.4
Total assets (restated)[1]	**5,316.1**	4,981.8	4,933.1
Long-term debt[1,3]	**2,012.9**	2,291.6	2,426.1
Current portion of long-term debt	**398.2**	416.7	51.8

1. Total revenues in 2004 and 2003 have been restated to reflect the reclassification of the water and utility services business as discontinued operations. Net income before discontinued operations and long-term debt for 2004 and 2003 have been restated for the reclassification of the Company's capital securities from equity to long-term debt, and the reclassification of the respective financing costs and income taxes. Total assets for 2004 and 2003 have been restated to reflect the reclassification of deferred charges to other long-term liabilities and deferred credits.

2. Terasen is a wholly-owned subsidiary of KMI and accordingly earnings per share information is not disclosed.

3. Excluding current portion of long-term debt.

Growth in total revenues has been caused mainly by higher natural gas commodity prices, particularly in 2005, which are flowed through in customer rates. Net income, when adjusted for the KMI transaction costs and Trans Mountain Series C redemption costs in 2005, has grown since 2003 mainly as a result of strong earnings growth in petroleum transportation. The completion of the Corridor Pipeline project in April 2003 and the Express System expansion in 2005 and throughput growth on the Trans Mountain system have been the main contributors to earnings growth. The increase in total assets from 2004 to 2005 reflected both capital expenditures and growth in natural gas inventories and accounts receivable as a result of higher natural gas commodity prices.

Results by Business Segment

Natural Gas Distribution

	Years ended December 31	
	2005	2004
	(in millions of dollars)	
Natural gas distribution revenues	**$1,678.0**	$1,494.1
Natural gas distribution net earnings	**90.8**	95.9

Revenues from natural gas distribution increased in 2005 compared to 2004 mainly as a result of higher market prices for natural gas, which are flowed through in customer rates. Cost of natural gas increased by a corresponding amount.

Earnings from natural gas distribution declined from $95.9 million in 2004 to $90.8 million in 2005 related to the expensing of costs associated with the KMI acquisition and the expensing of costs associated with the Inland Pacific Connector project, as well as a lower allowed return on equity in both Terasen Gas and TGVI and reduced earnings from accretion of the RDDA acquisition discount in TGVI. These factors were partially offset by strong operating performance in both Terasen Gas and TGVI as discussed below.

TERASEN GAS

Earnings from Terasen Gas decreased from $69.7 million to $65.3 million due to the expensing of $6.4 million of costs related to the KMI acquisition primarily from the expiry of loss carryforwards due to the change in control, a lower allowed return on equity in 2005 compared to 2004, and the expensing of $3.6 million (after-tax) of costs incurred in connection with the Inland Pacific Connector project that were not permitted recovery in rates by the BCUC. These factors were partially offset by strong operating performance, including higher transportation revenue, rate base growth and reduced bad debt expense.

Terasen Gas net customer additions during 2005 were 12,613, up from 11,750 customer additions in 2004. Solid economic conditions and continued strength in new housing starts in British Columbia helped drive the net customer additions in 2005. Terasen Gas industrial sales volumes decreased by 755 terajoules while transportation volumes increased by 1,113 terajoules from the previous year. Terasen Gas earns approximately the same margin regardless of whether a customer contracts for sales or transportation service.

Regulation

Terasen Gas' rates are based on estimates of several items, such as natural gas sales volumes, cost of natural gas, and interest rates. In order to manage the risks associated with some of these estimates, a number of regulatory deferral accounts are in place.

Two mechanisms to ameliorate unanticipated changes in sales volumes, such as changes caused by weather, have been implemented specifically for Terasen Gas. The first, originally called the Gas Cost Reconciliation Account (GCRA), relates to the recovery of all gas costs through a deferral account which captures all variances (overages and shortfalls) from forecasts. Balances are either refunded to or recovered from customers via an application with the BCUC. Creation of the GCRA was approved by the BCUC in October 1993; effective April 2004 the GCRA was split into two new deferral accounts called the Commodity Cost Reconciliation Account (CCRA) and the Midstream Cost Reconciliation Account (MCRA). The CCRA and MCRA were created to support commodity unbundling and the refund/recovery mechanism works the same as that used for the GCRA. The second mechanism seeks to stabilize revenues from residential and commercial customers through a deferral account that captures variances in the forecast versus actual customer use throughout the year. This mechanism is called the Revenue Stabilization Adjustment Mechanism (RSAM).

The RSAM and CCRA/MCRA accounts reduce Terasen Gas' earnings exposure to related risks by deferring any variances between projected and actual gas consumption and gas costs, and refunding or recovering those variances in rates in subsequent periods. Variances in usage by large volume, industrial transportation and sales customers are not covered by these deferral accounts as their usage is more predictable and less likely to be significantly affected by weather.

In 2005, the net balances of the RSAM and CCRA/MCRA accounts decreased to a payable of $9.0 million from a receivable of $14.1 million in 2004. In order to ensure that the balances in the CCRA/MCRA account are recovered on a timely basis, Terasen Gas prepares and files quarterly calculations with the BCUC to determine whether customer rate adjustments are needed to reflect prevailing market prices for natural gas costs.

Short-term and long-term interest rate deferral accounts are also in place to absorb interest rate fluctuations. The interest rate deferral accounts which were in place during 2004 effectively fixed the interest expense on short-term funds attributable to Terasen Gas' regulated assets at 4.00% during 2005, up from 3.25% in 2004. The effective fixed short-term interest rate for 2006 has been set at 4.00%. Any variations from this rate throughout the year are recorded in deferral accounts.

Allowed Return on Equity (ROE) and Capital Structure

Terasen Gas' allowed ROE is determined annually based on a formula that applies a risk premium to a forecast of long-term Government of Canada bond yields. For 2005, the application of the ROE formula set Terasen Gas' allowed ROE at 9.03%, down from 9.15% in 2004. Terasen Gas and TGVI applied to the BCUC in June 2005 to increase their deemed equity components from 33% to 38% and from 35% to 40%, respectively. The same application also requested an increase in allowed ROEs from the levels that would have resulted from the historic formula, which would have been 8.29% for Terasen Gas and 8.79% for TGVI in 2006.

The BCUC rendered its decision on the application on March 2, 2006, to be effective as of January 1, 2006. The generic ROE formula for a benchmark utility in British Columbia was changed such that it will be reset annually off a forecast of 30 Year Canada Bonds plus a 3.90% risk premium when the forecast yield on 30 Year Canada Bond is 5.25% The risk premium is adjusted annually by 75% of the difference between 5.25% and the forecast yield on 30 Year Canada Bonds. The changes increased the allowed ROE from 8.29% to 8.80% for Terasen Gas and from 8.79% to 9.50% for TGVI in 2006. The Decision also resulted in increases in the deemed equity components of Terasen Gas and TGVI to 35% and 40%, respectively.

2004-2007 Performance Based Rate Plan (PBR)

In July 2003, Terasen Gas received BCUC approval of a negotiated settlement for a 2004-2007 PBR. The PBR Settlement establishes a process for determining Terasen Gas' delivery charges and incentive mechanisms for improved operating efficiencies. The four-year agreement includes incentives for Terasen Gas to operate more efficiently through the sharing of the benefits between Terasen Gas and its customers. The PBR Settlement includes ten service quality measures designed to ensure Terasen Gas maintains service levels. It also sets out the requirements for an annual review process which will provide a forum for discussion between Terasen Gas and interested parties regarding its current performance and future activities.

Operation and maintenance costs and base capital expenditures are subject to an incentive formula reflecting increasing costs due to customer growth and inflation, less an adjustment factor based on 50 percent of inflation during the first two years of the PBR and 66 percent of inflation during the last two years. Base capital expenditure amounts are a function of customer numbers and projected customer additions. The PBR Settlement provides for a 50/50 sharing mechanism of earnings above or below the allowed return on equity beginning in 2004.

Upon expiry of the 2004-2007 PBR, there is no certainty as to whether a new negotiated settlement will be entered into, or what the terms of a new settlement might be.

Municipal Leasing Transactions
Certain municipalities in Terasen Gas' service area have an option to purchase the gas distribution franchise within their municipal boundary. In order to address these purchase options, the Company has developed a leasing arrangement that allows Terasen Gas to continue to operate the gas distribution assets by effectively selling the assets to the municipality and leasing them back for a 17 year period. After 17 years, Terasen Gas has an option to repurchase the assets at depreciated value. At December 31, 2005, Terasen Gas had entered into transactions involving a total value of $152.7 million, and the value of future transactions is not expected to be material.

TGVI
Earnings from TGVI remained steady, decreasing only slightly from $26.2 million to $25.5 million.

TGVI net customer additions during 2005 were 4,354, up from 4,233 customer additions in 2004.

Regulation
TGVI is also regulated by the BCUC. In 1995, an agreement was entered into between TGVI, the Province of British Columbia (the Province) and the Government of Canada, which included a Special Direction that was issued to the BCUC. The agreement, which expires no sooner than December, 2011, includes the following terms:

- TGVI receives, for the benefit of its customers, an annual payment until 2011 from the Province based on the wellhead price of natural gas in B.C. This payment amounted to $46.7 million in 2005, up from $33.2 million in 2004.
- The accumulated revenue deficiency resulting from overall revenues being below the cost of service prior to 2003 had been recorded in a Revenue Deficiency Deferral Account (RDDA). When Terasen acquired TGVI, the amount of the RDDA was $85 million, for which Terasen paid a price of $61 million. The accumulated RDDA recorded on Terasen's consolidated financial statements totaled $35.2 million as at December 31, 2005, corresponding to a balance for TGVI regulatory purposes of $48.3 million. The balance on Terasen's consolidated financial statements is down $10.4 million from December 31, 2004. Terasen is committed to fund these revenue deficiencies by purchasing preferred shares or subordinated debt issued by TGVI. The BCUC was directed to set rates beginning in 2003 that amortize the RDDA balance over the shortest period reasonably possible, having regard for TGVI's competitive position relative to alternative energy sources and the desirability of reasonable rates. The earnings impact of the RDDA discount is discussed under Results — Natural Gas Distribution.
- Any variances in the achieved ROE in a particular year from the allowed ROE (other than variances resulting from operation and maintenance costs) are deferred and recorded in the RDDA. The RDDA accumulated by TGVI is funded by the Company. Recovery of the deficiency through rates charged to customers is dependent upon regulatory approval and must be balanced against maintaining the competitiveness of TGVI's service relative to alternative energy sources. As a result, most risks associated with TGVI's annual financial results (other than operating costs) are, subject to BCUC approval, transferred to customers through the RDDA. The Company began recovery of the deficiency in 2003.

TGVI renewed its regulatory settlement in late 2005 for a two-year period effective January 1, 2006. It provides for a continuation of the operation and maintenance cost incentive arrangements previously in place. The allowed ROE for TGVI was 9.53% for 2005, compared to 9.65% in 2004. As described above, TGVI's ROE for 2006 is 9.50% and TGVI's deemed equity component of its capital structure for 2006 is 40%.

To ensure prompt recovery of the RDDA, the BCUC has approved a rate-setting mechanism for TGVI whereby customer rates are set at levels in excess of TGVI's cost of service, but effectively capped by the price of competitive alternative fuels (electricity or heating oil). This has resulted in significant RDDA amortization in both 2004 and 2005. However, RDDA recovery is sensitive to the relative pricing of natural gas and electricity in TGVI's service area, as well as to margin generated under TGVI's firm transportation agreements discussed below. There is no certainty that TGVI will be able to charge rates that will be sufficient to fully recover the RDDA prior to the expiry of the Provincial royalty payments at the end of 2011.

Contractual Arrangements

During 2005 TGVI's firm transportation agreements with the Vancouver Island Gas Joint Venture were renewed. The new agreements extend until 2012, and the committed volume under the contracts were set at 12.5 TJ per day for 2006 to 2012, inclusive, down from 20 TJ per day in 2005.

TGVI has also entered into a firm transportation agreement with BC Hydro to serve BC Hydro's gas supply needs to a gas-fired cogeneration plant at Elk Falls, B.C. The agreement, for 45 TJ per day, expires on December 31, 2007. BC Hydro has an option to extend the agreement for one year. BC Hydro has indicated that it is considering changing the Elk Falls facility from a baseload facility to a dispatchable facility. Accordingly, there is no certainty that the firm transportation agreement with BC Hydro will be extended beyond 2007.

On February 16, 2005, the BCUC approved TGVI's proposed liquefied natural gas (LNG) storage facility, subject to several conditions including the execution of a long-term Transportation Service Agreement (TSA) with BC Hydro backed by the capacity demand requirements of the Duke Point Power project. On June 17, 2005, BC Hydro announced its intention to abandon the Duke Point Power project on Vancouver Island as a result of a continuing appeal process. As a result, the expected construction timeline for TGVI's proposed storage facility has been delayed and, pending re-evaluation, will require BCUC approval prior to proceeding.

Petroleum Transportation

	Years ended December 31	
	2005	2004
	(in millions of dollars)	
Petroleum transportation revenues	**$227.8**	$225.5
Petroleum transportation net earnings	**64.5**	70.9

Revenues from petroleum transportation increased by $2.3 million in 2005 compared to 2004 as a result of higher revenues on the Corridor system, which offset lower throughput on the Trans Mountain system in the first quarter of 2005 as discussed below. Corridor revenues were higher in 2005 as a result of the refund in 2004 of deferral account balances to the Corridor shippers.

Earnings from petroleum transportation declined from $70.9 million in 2004 to $64.5 million in 2005 mainly as a result of lower throughput on the Trans Mountain system and a lower allowed return on equity on the Corridor system, offset in part by higher earnings from the Express System as a result of the completion of the Express expansion project. Earnings in 2005 were also impacted by a $7.3 million aftertax charge to earnings associated with the redemption of the Trans Mountain Series C Debentures.

TRANSPORTATION VOLUMES

	Years ended December 31	
	2005	2004
	(barrels per day)	
Trans Mountain Canadian mainline	**220,900**	236,100
Trans Mountain U.S. mainline	**74,600**	91,700
Express System	**213,000**	175,900

Actual throughput on the Corridor Pipeline does not impact earnings as all of Corridor's capacity is contracted through ship-or-pay arrangements.

Throughput in the first quarter of 2005 on the Trans Mountain system was impacted by the decline in production from the Alberta oilsands resulting from temporary production outages, as well as turnarounds at refineries connected to the Trans Mountain pipeline. These issues affected throughput on both the Canadian and U.S. mainlines. Volumes returned to more normal levels for the remainder of 2005.

Throughput on the Express System increased in 2005 as a result of the completion of the Express expansion project in April 2005.

TRANS MOUNTAIN

Earnings from Trans Mountain were $25.4 million in 2005, down from $39.4 million in 2004 mainly as a result of the costs of the Trans Mountain Series C Debenture redemption and the reduction in throughput on the Trans Mountain system in the first quarter of 2005.

Regulation

The National Energy Board (NEB) regulates the Canadian portion of Trans Mountain's crude oil and refined products pipeline system. The NEB authorizes pipeline construction and establishes tolls and conditions of service.

In November 2000, Trans Mountain and shipper representatives reached a negotiated agreement to determine Trans Mountain's tolls for the period 2001-2005. This Incentive Toll Settlement (ITS) was approved by the NEB on March 22, 2001 to take effect as of January 1, 2001.

The 2001-2005 ITS establishes base tolls, within a band of approximately 179,000 to 201,000 bpd, on Trans Mountain's Canadian mainline for the term of the settlement. Base tolls are set using a throughput level of approximately 189,000 bpd. Any revenue shortfalls arising from annual throughput levels below 179,000 bpd are recovered from the shippers. Incremental revenues arising from annual throughput above 201,000 bpd are shared equally between Trans Mountain and the shippers. The base tolls do not escalate with inflation unless Canadian inflation rates increase above 3.5%. Trans Mountain keeps all of the benefits achieved through productivity initiatives and operating efficiencies.

In January 2006, Kinder Morgan Canada entered into a memorandum of understanding with the Canadian Association of Petroleum Producers (CAPP) for a new Incentive Toll Settlement (the 2006-2010 ITS). The 2006-2010 ITS will determine the tolls to be charged on the Trans Mountain system over the five-year term of the agreement, to take effect as of January 1, 2006. The agreement will also govern the financial arrangements for the Pump Station Expansion and Anchor Loop projects. The 2006-2010 ITS is subject to National Energy Board (NEB) approval, and Kinder Morgan Canada and CAPP will work toward a final agreement by the end of June 2006. In addition to tolling and expansion parameters, the formal agreement will allow for new pipeline rules and regulations, capacity allocation procedures for the Westridge Marine Terminal and enhanced service standards.

The toll charged for the U.S. portion of Trans Mountain's pipeline in Washington State falls under the jurisdiction of the Federal Energy Regulatory Commission (FERC). Regulation by FERC is on a complaint basis. There were no complaints in 2005.

Trans Mountain Pump Station Expansion Project

On Nov. 10, 2005, Kinder Morgan Canada received approval from the National Energy Board (NEB) to increase the capacity of the Trans Mountain pipeline system from 225,000 bpd to 260,000 bpd. The $230 million expansion is designed to add 35,000 bpd of heavy crude oil capacity by building new and upgrading existing pump stations along the pipeline system between Edmonton, Alberta, and Burnaby, British Columbia. Construction began in early 2006 and the expansion will be in service in early 2007.

Trans Mountain Anchor Loop Project

Kinder Morgan Canada filed a comprehensive environmental report with the Canadian Environmental Assessment Agency on Nov. 15, 2005, and filed a complete NEB application for the Anchor Loop project on February 17, 2006. The $400 million project involves twinning a 158-kilometre section of the existing Trans Mountain pipeline system between Hinton, Alberta, and Jackman, British Columbia, and the addition of three new pump stations. With construction of the Anchor Loop, the Trans Mountain system's capacity will increase from 260,000 bpd to 300,000 bpd by the end of 2008.

Based on management's expectations for petroleum transportation demand to the West Coast of British Columbia and shipper feedback, Kinder Morgan Canada has decided not to seek long-term contracts with shippers for the Pump

Station Expansion Project or the Anchor Loop Project. As a result, there is no certainty that shipments on the Trans Mountain system will be sufficient to adequately recover the entire capital costs of the Pump Station and Anchor Loop expansions. However, the provisions of the 2006-2010 ITS will mitigate Trans Mountain's financial exposure to throughput shortfalls during that timeframe.

Beyond the Anchor Loop project, Kinder Morgan Canada is actively pursuing TMX 2, an approximately $1 billion project that would loop the Trans Mountain pipeline between Valemont and Kamloops and back to Edmonton, increasing throughput by 100,000 bpd, and TMX 3, a $900 million project that would loop the Trans Mountain pipeline between Kamloops and the Lower Mainland, increasing throughput by 300,000 bpd. Kinder Morgan Canada plans to conduct open seasons for both projects in 2006. Further into the future, Kinder Morgan Canada is considering building a new 400,000 bpd pipeline across northern British Columbia to a new deep-water port facility in Kitimat, British Columbia at a projected cost of $2.0 billion.

Kinder Morgan Canada is no longer pursuing the previously announced Spirit Pipeline due to the termination of arrangements with its project partner.

CORRIDOR

Earnings from the Corridor system were $13.6 million in 2005, down from $15.6 million in 2004 as a result of a lower allowed return on equity caused by lower long Canada bond yields in 2005 compared to 2004. The Firm Service Agreement (FSA) between Corridor and its shippers sets pipeline tolls based on conventional cost of service mechanisms. The FSA is a 25-year agreement, with return on equity linked to prevailing long Canada bond yields. Shell Canada Limited, Chevron Canada Limited and Western Oil Sands L.P. have entered into a long-term ship-or-pay contract with Corridor for 60%, 20% and 20%, respectively, of the available capacity on the Corridor Pipeline.

Corridor Pipeline Expansion

Kinder Morgan Canada has initiated engineering, environmental and consultation activities on its proposed Corridor pipeline expansion project. The $1.0 billion expansion includes building a new 42-inch diluent/bitumen (dilbit) pipeline, a new 20 inch products pipeline, tankage and upgrading existing pump stations along the existing pipeline system from the Muskeg River Mine north of Fort McMurray to the Edmonton region. The Corridor pipeline expansion will add an initial 200,000 bpd of dilbit capacity to accommodate the new bitumen production from the Muskeg River Mine. The current dilbit capacity is approximately 258,000 bpd. It is expected to climb to 278,000 by April 2006 by upgrading existing pump station facilities. By 2009, the dilbit capacity of the Corridor system is expected to be approximately 500,000 bpd. An application for the Corridor Pipeline Expansion Project was filed with the Alberta Energy and Utilities Board on December 22, 2005. Pending regulatory and definitive shipper approval, construction will begin in late 2006.

EXPRESS SYSTEM

Earnings from the Express System were $25.5 million in 2005, up $9.6 million from 2004, as a result of the completion of the Express System capacity expansion in April 2005, and the additional throughput that the Express System was able to transport due to the expansion, and due to the realization of additional tax benefits.

In late 2003 and 2004, Terasen conducted open seasons to obtain long-term commitments for a portion of the Express System's uncommitted capacity and for expansion capacity. Express has 84% of its 280,000 bpd post-expansion total capacity contracted. These contracts expire in 2007, 2012, 2014 and 2015 in amounts of 1%, 40%, 11% and 32% of total capacity, respectively. These contracts provide for committed tolls for transportation on the Express System, which can be increased each year by up to 2%. The remaining capacity is made available to shippers as uncommitted capacity.

Other Activities

	Years ended December 31	
	2005	2004
	(in millions of dollars)	
Other activities revenues	**$46.7**	$78.5
Other activities net (loss)	**(49.2)**	(20.3)

Revenues from other activities declined from $78.5 million in 2004 to $46.7 million in 2005 as a result of the change in accounting treatment for Clean Energy from proportionate consolidation to equity accounting.

The loss from other activities increased from $20.3 million in 2004 to $49.2 million in 2005 primarily as a result of $34.4 million of costs incurred in connection with the acquisition of the Company by KMI.

Discontinued Operations

The water and utility services operations incurred a loss of $4.9 million in 2005, compared to earnings of $3.3 million in 2004. The decline in earnings was due to the expiry of tax loss carryforwards associated with the KMI acquisition and the recognition of a currency translation loss resulting from the pending sale of the business, somewhat offset by strong operating performance in the business.

Summary of Quarterly Results

	For the three months ended				
	Mar-31	Jun-30	Sep-30	Dec-31	Total
			($ millions)		
2005					
Revenues (restated)[1]	$627.5	$354.3	$282.6	$688.1	$1,952.5
Net income before discontinued operations	66.9	27.1	0.9	11.2	106.1
Net income	66.3	29.5	4.0	1.4	101.2
2004					
Revenues (restated)[1]	625.1	321.6	275.6	575.8	1,798.1
Net income before discontinued operations	68.6	16.1	7.6	54.2	146.5
Net income	67.9	17.9	10.1	53.9	149.8

1. Revenues for 2004 and 2005 have been restated to reflect the reclassification of the water and utility services business as a discontinued operation, and to reclassify certain revenues from Clean Energy to equity accounting.

Because of natural gas consumption patterns, the natural gas distribution operations of Terasen Gas normally generate higher net earnings in the first and fourth quarters, which are offset by net losses in the second and third quarters. The Company's water and utility services business, which has been reclassified as a discontinued operation, typically experiences stronger second and third quarter results, offset by weaker first and fourth quarter results, based on the level of construction and general economic activity. Earnings from Terasen's petroleum pipeline operations are not subject to material fluctuations due to seasonality. As a result, interim earnings statements are not indicative of earnings on an annual basis.

Revenues in 2005 were generally higher than in 2004 on a quarterly and annual basis as a result of higher natural gas commodity prices in 2005.

March 2005/2004 — Earnings declined by $1.6 million due to temporary lower petroleum transportation throughput resulting from the decline in production from the Alberta oilsands and maintenance turnarounds at refineries connected to the Trans Mountain pipeline. Strong operating results from the other business units were able to offset the majority of the earnings decline from petroleum transportation.

June 2005/2004 — Earnings increased by $11.6 million, driven by growth in earnings from all areas of operations. Customer growth and operating efficiencies in the quarter were the primary factors in the $2.6 million growth in earnings from natural gas distribution. Higher throughput on the Trans Mountain mainline and the implementation of the Express System expansion resulted in a $4.7 million increase in contribution from petroleum transportation. Growth in earnings from Waterworks and Clean Energy were the key drivers of the improvement in year-over-year earnings contribution from water and utility services and other activities.

September 2005/2004 — Earnings declined by $6.1 million over the prior year third quarter, but include the hedging activities and disposition costs associated with Clean Energy and transaction costs associated with the KMI acquisition. After excluding these items, earnings increased by $4.2 million through a combination of growth in earnings from all three business units, which more than offset increased corporate expenses for the quarter.

December 2005/2004 — Earnings declined by $52.5 million mainly as a result of costs incurred in connection with the acquisition of the Company by KMI of $38.9 million, as well as a charge to earnings associated with the redemption of the Trans Mountain Series C Debentures of $7.3 million.

Liquidity and Capital Resources

Consolidated Cash Flow

	Years ended December 31	
	2005	2004
	(in millions of dollars)	
Cash flow provided by (used for):		
Operating activities	**$195.4**	$335.4
Investing activities	**(212.5)**	(160.2)
Financing activities	**76.5**	(156.7)
Net increase in cash	**$ 59.4**	$ 18.5

CASH FLOW FROM OPERATING ACTIVITIES

Cash flow from operating activities declined from $335.4 million in 2004 to $195.4 million in 2005 due to a number of factors. Net earnings were lower in 2005 as a result of the items disclosed above in the ''Certain Items'' table. The net recovery of rate stabilization accounts in 2005 was $10.1 million compared with $31.0 million in 2004, mainly due to higher rate stabilization account receivable balances at the beginning of 2004. In addition, changes in non-cash working capital were a use of $68.3 million in 2005 compared to a source of $14.7 million in 2004, mainly as a result of the impact of higher gas prices on the value of natural gas inventory and accounts receivable.

INVESTING ACTIVITIES

Proceeds from the sale of natural gas distribution assets in municipal leasing transactions largely offset the acquisition of water and utility services businesses in 2004, whereas expenditures on the water and utility services business in 2005 were largely offset by proceeds from the disposition of the Company's interest in Clean Energy.

Capital expenditures totaled $214.7 million in 2005 compared with $154.4 million in 2004. The increase in capital expenditures was primarily attributable to the acquisition of the Coastal Facilities buildings. Prior to January 2005, the Coastal Facilities synthetic lease agreement had been accounted for as an off-balance sheet item. In 2004, Terasen Gas applied to the BCUC for and received approval to unwind the synthetic lease and include the Coastal Facilities assets in rate base. On January 4, 2005, Terasen Gas paid approximately $49.4 million to BCG Coastal Facilities Trust to unwind the synthetic lease. The Coastal Facilities assets have been included in the Terasen Gas rate base commencing January 2005.

FINANCING ACTIVITIES

In February 2005, Terasen Gas issued $150 million of 30-year medium term note debentures at an interest rate of 5.90%. In October 2005, Terasen Gas issued $150 million of two-year medium term note debentures at a floating rate of interest. In the second quarter of 2004, Terasen Gas issued $150 million of medium term note debentures at an interest rate of 6.50%. Funds generated from the issuance of medium term note debentures were used for general corporate purposes of Terasen Gas and to refinance maturing medium term debentures.

In February 2005, Corridor issued $150 million each of 5-year and 10-year unsecured debentures at rates of 4.24% and 5.033%, respectively. Proceeds were used to repay commercial paper issued by Corridor.

In September 2005, Trans Mountain announced that it had exercised its right to redeem the $35 million principal amount 11.50% Series C Debentures, due June 20, 2010. The redemption took place on November 1, 2005. The total redemption price for the Debentures was $1,353.7615 per $1,000 principal amount, which includes accrued and unpaid interest to the redemption date. The redemption price was determined based on the Canada Yield Price, as defined in the Trust Indenture governing the Debentures.

As at December 31, 2005, the Company and its subsidiaries had lines of credit in place totaling $1,175 million to finance cash requirements. These lines enable the respective companies to borrow directly from their bankers, issue bankers' acceptances and support commercial paper issuance. Bank lines of $375 million were unutilized at the end of 2005. Virtually all short-term cash needs are funded through commercial paper and bankers' acceptances in the

Canadian market at rates generally below bank prime. Terasen does not have, nor does it expect to have, any defaults or arrears.

On January 13, 2006, Terasen Gas (Vancouver Island) Inc. entered into a five-year unsecured, committed, revolving credit facility of $350 million with a syndicate of banks, of which $296 million was drawn against the facility on January 17, 2006. A portion of the facility was used to refinance TGVI's existing term facility of $209.5 million. The facility will also be utilized to finance working capital requirements and general corporate purposes.

Concurrently with executing the above noted facility, TGVI entered into a $20 million, seven-year unsecured, committed, non-revolving credit facility with one bank. This facility will be utilized for purposes of refinancing any annual prepayments TGVI may be required to make on non-interest bearing government contributions. The terms and conditions are primarily the same as the aforementioned TGVI facility except this facility ranks junior to repayment of TGVI's Class B subordinated debt which is held by the Company.

Dividends on common shares totaled $95.1 million in 2005, compared to $86.4 million in 2004. The increase reflects an increase in the dividend rate paid on common shares in 2005.

Financial Position

The following table outlines the significant changes in the consolidated balance sheets as at December 31, 2005 compared to December 31, 2004, other than changes arising from the reclassification of the water and utility services business as a discontinued operation.

Balance Sheet Item	Increase (Decrease) ($ millions)	Explanation
Cash and short-term investments	$ 59.4	Increased as a result of significant cash flow in late 2005 that was used to repay short-term notes subsequent to year end.
Accounts receivable	119.5	Increased mainly as a result of the impact of higher gas prices on accounts receivable for Terasen Gas and TGVI, partially offset by the reclassification of accounts receivable in the water and utilities services segment into assets held for resale.
Goodwill	(51.6)	Declined as a result of the disposition of Clean Energy and the reclassification of water and utility services as long lived assets held for resale.
Short-term notes	433.0	The refinancing of the Corridor bank credit facility resulted in the reclassification of Corridor's remaining commercial paper outstanding from long-term debt to short-term notes. In addition, short-term note balances at the end of 2004 were relatively low as a result of long-term debt issuance in 2004 that pre-funded long-term debt maturities in 2005.
Accounts payable and accrued liabilities	68.1	Increased mainly as a result of the impact of higher gas prices on accounts payable for Terasen Gas and TGVI, offset by the reclassification of accounts payable in the water and utilities services segment into liabilities held for resale.
Long-term debt (including current portion)	(297.2)	The refinancing of the Corridor bank credit facility resulted in the reclassification of Corridor's remaining commercial paper outstanding from long-term debt to short-term notes. In addition, long-term debt maturities in 2005 were partially pre-funded by long-term debt issuance in 2004.

Working Capital

Terasen's working capital requirements fluctuate seasonally based on natural gas consumption. Given the regulated nature of its business, Terasen is able to maintain negative working capital balances. Terasen maintains adequate committed credit facilities to meet its working capital requirements. On an annual basis, Terasen generates sufficient cash flow to meet its working capital requirements.

Dividend Restrictions

As part of its approval of the acquisition of Terasen by KMI, the BCUC imposed a number of conditions intended to ring-fence Terasen Gas and TGVI from Terasen. These restrictions included a prohibition on the payment of dividends unless Terasen Gas or TGVI has in place at least as much common equity as that deemed by the BCUC for rate-making purposes. As a result of this and the Decision issued by the BCUC on March 2, 2006 Terasen Gas and TGVI must maintain a percentage of common equity to total capital that is at least as much as that determined by the BCUC from time to time for ratemaking purposes. Dividend payments will not be allowed by the regulator if the requisite equity is not in place.

Dividend policies are set to ensure that Terasen Gas and TGVI maintain at least as much common equity as that deemed by the BCUC for rate-making purposes.

Corridor's credit agreement restricts its ability to issue dividends subject to certain debt-to-total capital requirements. Cash distributions from Express are subject to limitations in the Express financing agreements and decisions made by the Express Board of Directors, which Terasen does not control.

In 2005, none of these restrictions constrained the distribution of subsidiary earnings not otherwise needed for reinvestment.

Credit Ratings

Securities issued by Terasen, Terasen Gas and Corridor are rated by DBRS Inc. (DBRS) and Moody's Investors Service Inc. (Moody's). The ratings assigned to securities issued by the Terasen group of companies are reviewed by these agencies on an ongoing basis.

The table below summarizes the ratings assigned to the Company's various securities at December 31, 2005.

CREDIT RATINGS	DBRS	MOODY'S
Terasen Inc.		
Commercial paper	R-2 (High)	
Unsecured long-term debt	BBB (High)	Baa2
Capital securities	BBBy	Baa3
Terasen Gas Inc.		
Commercial paper	R-1 (Low)	
Secured long-term debt	A	A2
Unsecured long-term debt	A	A3
Terasen Pipelines (Corridor) Inc.		
Commercial paper	R-1 (Low)	
Unsecured long-term debt	A	A2

Trans Mountain's ratings were withdrawn by DBRS in late 2005 following the redemption of Trans Mountain's Series C Debentures. Trans Mountain no longer has indebtedness to third parties.

A number of ratings actions were taken on Terasen in December 2005 following the acquisition of Terasen by KMI to make the ratings consistent with those of KMI. Moody's downgraded the ratings on Terasen's unsecured long-term debt and capital securities by two gradations each (from A3 to Baa2 in the case of unsecured long-term debt). DBRS downgraded Terasen's ratings on unsecured long-term debt and capital securities by one gradation each (from A (Low) to BBB (High) in the case of unsecured long-term debt). DBRS also downgraded Terasen's commercial paper rating from R-1 (Low) to R-2 (High). As a result, it is no longer economic for Terasen to issue commercial paper in the Canadian market, and Terasen is issuing Bankers' Acceptances under its committed credit facilities to fund its short-term borrowing requirements.

Also in December 2005, Moody's downgraded Terasen Gas' long-term debt ratings by one gradation. However, Moody's noted that this downgrade was unrelated to the KMI acquisition, and was a result of Terasen Gas' weak financial profile compared to its peers.

After reassessing its relationship with Standard & Poor's Ratings Services, a division of the McGraw-Hill Companies (Canada) Corporation (S&P), Terasen decided early in 2004 to discontinue the engagement of S&P to provide credit ratings on the debt of Terasen and Terasen Gas. Terasen believes the credit ratings issued by Moody's and DBRS will be sufficient to service the requirements of creditors and maintain the Company's access to capital. S&P continues to provide an unsolicited rating on Terasen's outstanding debt based on publicly available information. As of December 31, 2005, Terasen's unsecured long-term debt was rated BBB– by S&P.

There is a provision in Terasen's $450 million credit facilities that a downgrade of Terasen's unsecured long-term debt rating below BBB (low) or Baa3 by DBRS or Moody's, respectively, would shorten the remaining term of Terasen's credit facility to ten months. In addition, a downgrade of Terasen Gas below investment grade by any of the major credit rating agencies could trigger margin calls and other cash requirements under Terasen Gas' gas purchase and commodity derivative contracts.

Projected Capital Expenditures

Terasen has estimated total 2006 consolidated capital expenditures of $501 million. Major capital expenditures in 2006 include construction on the Trans Mountain Pump Station Expansion project ($168 million), initial expenditures on the Corridor Pipeline Expansion ($95 million) and upgrades to the Trans Mountain U.S. mainline in Washington State to support future expansion ($31 million).

The Company expects to finance capital expenditures in 2006 with a combination of proceeds from the refinancing of TGVI's credit facility and shareholder advances, short-term borrowings and internally generated funds. The Company does not expect to pay common dividends to its shareholder in 2006, instead retaining its earnings for reinvestment in growth opportunities.

Off-Balance Sheet Arrangements

In 2000, Terasen Gas entered into a leasing arrangement with a syndicate of Canadian banks and the BCG Coastal Facilities Trust, a special-purpose entity, to finance new building facilities in the Greater Vancouver area. The Coastal Facilities synthetic lease agreement had been accounted for as an off-balance sheet item. As at December 31, 2004, the value of the Coastal Facilities leasing agreement was approximately $49.4 million. Lease payments of approximately $4.5 million were made by Terasen Gas in 2004.

In 2004, Terasen Gas applied to the BCUC for and received approval to unwind the synthetic lease and include the Coastal Facilities assets in rate base. On January 4, 2005, Terasen Gas paid approximately $49.4 million to BCG Coastal Facilities Trust to unwind the synthetic lease. The Coastal Facilities assets have been included in the Terasen Gas rate base commencing January 2005.

Other than the Coastal Facilities lease, which has been refinanced, there are no other material off-balance sheet agreements.

Transactions with Related Parties

The Company has not had any significant transactions with related parties outside of the consolidated group in 2005.

Changes in Accounting Policies

Liabilities and Equity

In accordance with recent changes to the CICA Handbook Section 3861 ''Financial Instruments — Disclosures and Presentation'', the Company's $125 million 8% Capital Securities have been reclassified from shareholders' equity to liabilities because the Capital Securities can be settled by issuing equity at a variable price dependent upon the market value of the Company's common shares at the settlement date. As a result of the change, distributions associated with the Capital Securities are now recorded as financing costs and the related income-tax benefits are recorded within income tax expense. Previously, the distributions were recorded on an after-tax basis as a deduction from net earnings to determine earnings applicable to common shares. There is no impact to earnings applicable to common shares or earnings per share. The changes have been applied retroactively and have increased long-term debt and decreased shareholders' equity, both by $125.0 million, compared to the amounts previously reported as at December 31, 2004. The restatement has also increased financing costs by $10.0 million, decreased income tax expense by $3.4 million and capital securities distributions by $6.6 million compared to the amounts previously reported for the year ended December 31, 2004.

Variable Interest Entities
In January 2005, the Company adopted the CICA Handbook Accounting Guideline 15 ''Consolidation of Variable Interest Entities''. The Company has performed a review of the entities with whom it conducts business and determined that under the definitions in the Guideline the Company's investment in Express US Holdings LP, part of the Express System (the ''Express System''), is deemed to be a variable interest entity. As the Company has not been identified as the primary beneficiary of Express US Holdings LP, the Company continues to account for its investment in the Express System on an equity basis. The Company's future exposure to loss regarding its investment is represented by the carrying value of the investment.

Rate Regulated Entities
The Canadian Institute of Chartered Accountants have undertaken a project to review and change how rate regulated enterprises recognize and measure regulated assets and liabilities. The results of this project could introduce significant volatility into the earnings of such businesses, which may include the elimination of regulatory deferral accounts. The project could also require rate regulated enterprises to include future income taxes payable on their balance sheets. There is very real risk that this could negatively affect debt covenant compliance and impact utilities' ability to attract financing and equity capital. The industry has actively intervened in this process over the past two years, and an exposure draft on this matter is anticipated in late 2006.

Disclosure Controls and Procedures
The President and the Chief Financial Officer evaluated the effectiveness of the Company's disclosure controls and procedures (as defined in Multilateral Instrument 52-109) and concluded that the company's disclosure controls and procedures were effective as of December 31, 2005.

Financial Instruments
Fair Value Estimates
The fair value of the Company's long-term debt, calculated by discounting the future cash flow of each debt issue at the estimated yield to maturity for the same or similar issues at December 31, 2005, or by using available quoted market prices, is estimated at $2,673.4 million. The majority of the Company's long-term debt relates to regulated operations which enables the Company to recover the existing financing charges through rates or tolls.

Fair value estimates are made at a specific point in time, based on relevant market information and information about the financial instrument. These estimates cannot be determined with precision as they are subjective in nature and involve uncertainties and matters of judgment.

Derivative Instruments
The Company uses derivative instruments to hedge its exposures to fluctuations in natural gas prices and interest rates. As approved by the regulator, derivatives are used to manage natural gas price risk in the natural gas distribution operations. The majority of the natural gas supply contracts have floating, rather than fixed prices. The Company uses natural gas price swap contracts to fix the effective purchase price. Any differences between the effective cost of natural gas purchased and the price of natural gas included in rates are recorded in a deferral account (MCRA and CCRA), and subject to regulatory approval, are passed through in future rates to customers.

The Company's short-term borrowings and variable rate long-term debt are exposed to interest rate risk. The Company manages interest rate risk through the use of interest rate derivatives. Foreign currency risk in natural gas distribution operations relates mainly to purchases and sales of natural gas denominated in U.S. dollars, and is thereby managed through regulatory deferral accounts.

The Company's earnings from the U.S. portion of Trans Mountain's crude oil pipeline system and the Company's investment in the Express System are subject to foreign currency risk. The Company's earnings are also subject to translation risk associated with certain Express System assets and liabilities.

			December 31, 2005		December 31, 2004	
Asset (Liability)	**Number of swaps and options**	**Term to maturity (years)**	**Carrying Value**	**Fair Value**	**Carrying Value**	**Fair Value**
			(in millions)			
Interest Rate Swaps[1]						
Terasen Inc.	3	1 - 9	$ —	$ 3.6	$ —	$5.4
TGI	3	2	—	(1.6)	—	—
TGVI	4	1 - 4	—	(0.6)	—	(3.2)
Corridor	2	5 - 10	—	0.3	—	—
Natural Gas Commodity Swaps and Options						
Terasen Gas and TGVI[2]	161	Up to 3	21.2	105.6	—	(8.3)
Clean Energy[3]	—	—	—	—	6.5	6.5
Foreign Currency Swaps						
Terasen Inc.[4]	—	—	—	—	(0.6)	(0.6)

1 The interest rate derivatives entered into by Terasen Inc. resulted in lower interest expense of $4.8 million in 2005, compared with a $3.6 million interest expense reduction in 2004. The derivatives entered into by TGI and TGVI relate to regulated operations and any resulting gains or losses are recorded in deferral accounts, subject to regulatory approval, and passed through to customers in future rates. The gains and losses associated with derivatives entered into by Corridor are similarly passed through to shippers in future rates.

2 The natural gas derivatives fair value reflects only the value of the natural gas derivatives and not the offsetting change in value of the underlying future purchases of natural gas. These fair values reflect the estimated amounts the Company would receive or pay to terminate the contracts at the stated dates. Included in the carrying value of the natural gas derivatives is $22.2 million of unrealized fair value gains associated with derivative instruments which were deemed to be ineffective at December 31, 2005, and $1.0 million of derivative instruments which did not qualify for hedge accounting that are in a liability position. The gains and losses associated with natural gas derivatives are recorded in deferral accounts, subject to regulatory approval, and passed through to customers in future rates.

3 Clean Energy entered into natural gas commodity derivatives to manage its exposure to the cost of natural gas. These transactions resulted in a $10.9 million contribution to earnings in 2005, compared with a $3.3 million contribution in 2004. The carrying and fair value of Clean Energy's natural gas commodity swaps at December 31, 2004 reflected Terasen's 45.0% ownership interest at that time. Terasen disposed of its interest in Clean Energy on October 31, 2005.

4 The change in fair value of the derivatives of $1.6 million in 2005 and $0.7 million in 2004 has been included in the earnings contribution from the Express System for the respective periods.

Outstanding Share Data

December 31, 2005

Common shares issued and outstanding	115,643,162
Less: Common shares held by Terasen Pipelines (Trans Mountain) Inc.	9,184,188
	106,458,974
8.0% capital securities issued and outstanding	$125,000,000

Terasen is an indirect wholly-owned subsidiary of Kinder Morgan, Inc. At December 31, 2005 all of the common shares of the Company are owned by Kinder Morgan, Inc.

The 8.0% capital securities are exchangeable on or after April 19, 2010 for common shares of the Company at 90% of the market price, subject to the right of the Company to redeem the securities for cash. A maximum of 125,000,000 common shares could be issued if this right was exercised.

Forward Looking Statement

When used in this report, the words ''anticipate'', ''expect'', ''project'', ''believe'', ''estimate'', ''forecast'' and similar expressions are intended to identify forward looking statements, which include statements relating to pending and proposed projects or possible acquisitions. Such statements are subject to certain risks, uncertainties and assumptions pertaining to operating performance, regulatory parameters, economic conditions and, in the case of pending and proposed projects, risks relating to design and construction, regulatory processes, obtaining financing and performance of other parties, including partners, contractors and suppliers and in the case of possible acquisitions, obtaining financing, acquiring assets or companies at an appropriate price and the ability to effect synergies in a timely and cost-effective manner.

Terasen Inc.

Interim Management's Discussion and Analysis
For the three and nine Months Ended September 30, 2006
Dated November 27, 2006

The following discussion of the financial condition and the results of operations of Terasen Inc. (Terasen or the Company) should be read in conjunction with the Company's December 31, 2005 annual audited consolidated financial statements and related notes together with Management's Discussion and Analysis and the unaudited interim consolidated financial statements and related notes for the periods ended September 30, 2006.

In this MD&A, we, us, our, the Company and Terasen mean Terasen Inc., its subsidiaries, joint ventures and investments in significantly influenced companies. Terasen Gas refers to Terasen Gas Inc., TGVI refers to Terasen Gas (Vancouver Island) Inc., Trans Mountain refers to Terasen Pipelines (Trans Mountain) Inc., Corridor refers to Terasen Pipelines (Corridor) Inc., Kinder Morgan Canada refers to Kinder Morgan Canada Inc., Express refers to the Express and Platte Pipeline Systems; and Water and Utility Services refers to Terasen Waterworks (Supply) Inc., Terasen Utility Services Inc. and Terasen's 50% interest in Fairbanks Sewer and Water Inc. KMI or the parent refers to Kinder Morgan, Inc.

The financial data included in the discussion provided in this report has been prepared in accordance with Canadian generally accepted accounting principles, and all dollar amounts are in Canadian dollars.

THIRD QUARTER 2006 FINANCIAL RESULTS

Result of Operations

	Three months ended September 30		Nine months ended September 30	
NET EARNINGS	**2006**	2005	**2006**	2005
	In millions of dollars			
Natural gas distribution	**$(6.8)**	$(3.6)	**$48.3**	$59.8
Petroleum transportation	**17.4**	17.2	**51.6**	50.8
Discontinued operations[1]	**(4.1)**	3.1	**(17.0)**	4.9
Other activities	**(4.0)**	(12.7)	**(17.7)**	(15.7)
Net earnings	**$ 2.5**	$ 4.0	**$65.2**	$99.8

1 In January 2006, Terasen entered into a Purchase and Sale Agreement to dispose of its interest in its water and utility services operations for proceeds of approximately $132 million. The disposition was completed on May 19, 2006 with the proceeds from the sale being used to reduce debt. The disposition gave rise to a $17.0 million loss which has been fully recorded.

Terasen reported earnings of $2.5 million for the three months ended September 30, 2006 compared with earnings of $4.0 million in the corresponding quarter of 2005. For the nine months ended September 30, 2006, earnings were $65.2 million compared to $99.8 million in the nine months of 2005. The decrease in earnings for the nine months is mainly due to a provision of $14.5 million made for retroactive tax amending legislation that was introduced in a provincial legislature, a loss of $17.0 million recorded on the sale of water and utility services operations and the $2.2 million loss of earnings from Clean Energy operations which was disposed on October 31, 2005.

Natural Gas Distribution

	Three months ended September 30		Nine months ended September 30	
	2006	2005	**2006**	2005
	In millions of dollars			
Revenues	**$217.0**	$213.7	**$1,204.6**	$1,065.8
Net earnings	**$ (6.8)**	$ (3.6)	**$ 48.3**	$ 59.8

For the three and nine months ending September 30, 2006, revenues from natural gas distribution increased by $3.3 million and $138.8 million, respectively, compared to the corresponding periods in 2005. Cost of natural gas, on a year-over-year basis, decreased $1.0 million in the third quarter and increased $130.2 million for the nine months ended September 30, 2006. Higher revenues and cost of natural gas reflected mainly the higher commodity cost of gas charged to customers due to higher market prices and some customer growth in the quarter. Changes in both consumption levels and the commodity cost of natural gas do not materially impact earnings as a result of regulatory deferral accounts.

As noted in the Company's annual 2005 Management's Discussion and Analysis, the allowed Return on Equity (''ROE'') for 2006 for Terasen Gas has been set at 8.80% (9.03% in 2005) and at 9.50% for TGVI (9.53% in 2005), In addition, the deemed equity components for Terasen Gas and TGVI, with the approval of the British Columbia Utilities Commission (''BCUC'') were increased to 35% and 40% respectively in 2006 compared to 33% and 35% in 2005.

For the three months ended September 30, 2006, Terasen Gas and TGVI net customer additions were 1,102 and 1,150 respectively, bringing the total number of utility customers to 896,488 at September 30, 2006. Although the net increase of 6,126 customers for the first three quarters of 2006 is lower than the 8,446 net new customers reported in the same period of 2005, favorable economic conditions and housing activity in British Columbia continue to drive customer growth in the region.

Although the above items result in higher earnings for both Terasen Gas and TGVI, overall loss for the gas distribution segment have increased by $3.2 million in the third quarter of 2006, mainly due to higher non-recurring bad debt expenses related to the unbilled basic charge revenues in the current quarter compared to the same quarter in the prior year. Earnings for the first nine months of 2006 were $48.3 million compared to $59.8 million in 2005. The decline in the earnings in 2006 compared to 2005 is mainly due to a tax provision made in the second quarter related to the retroactive tax amending legislation in the Province of Quebec. The remaining difference is a result of TGVI's operations and maintenance (''O&M'') expenses which were rebased as part of its 2006-2007 rate settlement and reduced the contribution of incentive earnings in 2006. In addition, Terasen Gas has changed the timing of its recognition of earnings sharing obligation related to its forecast O&M and capital expenditures incentives to coincide with the timing of revenues received. Previously, these obligations were recognized on a straight line basis. This change affects the timing of revenues and net earnings for each quarter but is not a material amount.

Petroleum Transportation

	Three months ended September 30		Nine months ended September 30	
	2006	2005	**2006**	2005
	In millions of dollars			
Revenues	**$60.4**	$57.3	**$168.2**	$163.0
Net earnings	**$17.4**	$17.2	**$ 51.6**	$ 50.8

Transportation volumes	Three months ended September 30		Nine months ended September 30	
	2006	2005	**2006**	2005
	(barrels per day)			
Trans Mountain Canadian mainline	**236,700**	229,100	**230,700**	213,900
Trans Mountain U.S. mainline	**103,000**	84,900	**97,800**	68,200
Express System	**249,200**	224,600	**230,700**	205,200

Actual throughput on the Corridor Pipeline does not impact earnings as all of Corridor's capacity is contracted through ship-or-pay arrangements.

Revenues from petroleum transportation were $60.4 million in the third quarter of 2006, up $3.1 million from the same quarter of 2005 mainly due to higher throughput in the third quarter of 2006 offset partially by lower tolls. For the first three quarters of 2006, revenues were $168.2 million as compared to $163.0 million in the same period of 2005. Year-to-date revenues were slightly higher than the previous year's nine months as the first quarter of 2005 was negatively impacted by temporary production outages and turnarounds at refineries, the impact of which is shown in the throughput figures.

Earnings from petroleum transportation were $17.4 million in the third quarter of 2006, up $0.2 million from the previous year's third quarter mainly due to higher revenues, as described above, offset by higher power and O&M expenses. Earnings increased to $51.6 million in the first nine months of 2006 compared to $50.8 million in the corresponding period of 2005, mainly due higher earnings in TransMountain due to the increase in revenues described above.

Other activities

	Three months ended September 30		Nine months ended September 30	
	2006	2005	**2006**	2005
	In millions of dollars			
Revenues	**$10.9**	$ 11.6	**$ 33.3**	$ 35.6
Net loss before discontinued operations	**$ (4.0)**	$ (12.7)	**$ (17.7)**	$ (15.7)

During the third quarter of 2006, revenues from other activities decreased by $0.7 million on a year-over-year basis as a result of a decrease in international operations revenues and a slight decrease in revenues from CustomerWorks LP due to some lower rates from contracts renegotiated in 2006. The loss from other activities decreased from $12.7 million in the third quarter of 2005 to $4.0 million in the third quarter of 2006. On a year to date basis, the loss increased to $17.7 million from a loss $15.7 million in the first nine months of 2005. The year over year change is primarily due to the inclusion of earnings and gains from hedging activities from Clean Energy in 2005, which Terasen disposed of on October 31, 2005, a tax provision of $3.5 million made in the second quarter of 2006 for retroactive tax amending legislation that was introduced in a provincial legislature and higher operating expenses due to management fees to KMI and $4.0 million of non-recurring charges in 2005 related to the acquisition of Terasen by Kinder Morgan.

Discontinued Operations

The water and utility operations incurred an incremental loss of $4.1 million in the third quarter of 2006 compared to $3.1 million of income in the corresponding period of 2005. The total loss recorded on the disposition of these operations amounted to $17.0 million.

QUARTERLY FINANCIAL INFORMATION

	2006			**2005**				**2004**
	Sept.	**June**	**Mar.**	**Dec.**	**Sept.**	**June**	**Mar.**	**Dec.**
Revenues	$288.3	$367.3	$750.5	$688.1	$282.6	$354.3	$627.5	$575.8
Net earnings before discontinued operations	$ 6.6	$ 6.1	$ 69.5	$ 11.2	$ 0.9	$ 27.1	$ 66.9	$ 54.2
Net (loss) earnings	$ 2.5	$ (1.6)	$ 64.3	$ 1.4	$ 4.0	$ 29.5	$ 66.3	$ 53.9

December 2005/2004 — Earnings declined by $52.5 million mainly as a result of costs incurred in connection with the acquisition of the Company by KMI of $38.9 million, as well as a charge to earnings associated with the redemption of the Trans Mountain Series C Debentures of $7.3 million.

March 2006/2005 — Earnings decreased by $2.0 million due to the expected loss of $5.0 million on the sale of the water and utility operation, offset by higher petroleum transportation throughput as the first quarter of 2005 was negatively impacted by the decline in production from the Alberta oilsands and maintenance turnarounds at refineries connected to the Trans Mountain pipeline. Higher throughput in the Express system also contributed to higher earnings as the expansion Project was completed in April 2005.

June 2006/2005 — Earnings decreased by $31.1 million due to a provision of $14.5 million made for retroactive tax amending legislation that was introduced in a provincial legislature, an incremental loss of $7.7 million recorded on the sale of water and utility services operations, the loss of earnings from Clean Energy operations which was disposed on October 2005, and higher operating expenses due to higher management fees.

September 2006/2005 — Earnings decreased by $1.5 million due to a loss on disposal of the water business offset by lower costs in 2006 due to 2005 one time transaction costs of $4.1 million on the sale of Clean Energy and $4.0 million of transaction costs associated with the Kinder Morgan acquisition incurred in 2005.

SEASONALITY

Because of natural gas consumption patterns, the natural gas distribution operations of Terasen Gas normally generate higher net earnings in the first and fourth quarters, which are offset by net losses in the second and third quarters. Earnings from Terasen's petroleum pipeline operations are not subject to material fluctuations due to seasonality. As a result, interim earnings statements are not indicative of earnings on an annual basis.

LIQUIDITY AND CAPITAL RESOURCES

Terasen expects to generate sufficient cash from operations to meet its working capital needs and to maintain its financial capacity and flexibility. The Company's liquidity and capacity to access capital markets to maintain operations and fund growth remain substantially unchanged since December 31, 2005.

CONSOLIDATED CASH FLOW

	Three months ended September 30		Nine months ended September 30	
	2006	2005	**2006**	2005
	In millions of dollars			
Cash flow provided by (used for):				
Operating activities	**$ (52.6)**	$ (17.0)	**$ 223.0**	$ 160.7
Investing activities	**$ (78.0)**	$ (53.1)	**$ (65.5)**	$ (182.9)
Financing activities	**$176.5**	$ 11.7	**$ (154.1)**	$ 35.4
Net increase in cash	**$ 45.9**	$ (58.4)	**$ 3.4**	$ 13.2

CASH FLOW FROM OPERATING ACTIVITIES

Cash from operations refers to cash generated before the impact of working capital and rate-stabilization deferral account changes. Cash from operations for the three months ended September 30, 2006 was $21.3 million, compared to $47.8 million in the corresponding period of 2005. Cash flow from for operating activities, which includes the impact of changes in working capital and deferral accounts, was $223.0 million in the first nine months of 2006 compared with $160.7 million in the corresponding period of 2005.

Between December 31, 2005 and September 30, 2006, accounts receivable, accounts payable and accrued liabilities declined while gas in storage inventory increased as a result of the typical seasonal increase in natural gas consumption during the period. These changes in working capital accounts and rate stabilization accounts generated increased cash flow from operating activities compared to 2005.

INVESTING ACTIVITIES

Capital expenditures totaled $84.1 million in the third quarter of 2006 compared to $43.4 million in the corresponding period in 2005. Year to date capital expenditures were $194.2 million in 2006 compared to $170.3 million in the first nine months of 2005. The increase in the third quarter is mainly due to expenditures incurred in the pipeline operations as construction of the first phase of the expansion of the Trans Mountain system West Coast pipeline expansion (''TMX'') is underway. The increase in capital expenditures on a year to date basis was primarily attributable to the TMX expansion which is currently underway. The decrease in the overall investing activities is due to the proceeds from the sale of the water and utility services business.

There have been no material changes to Terasen's planned capital expenditures from those reported in the Company's Annual 2005 Management's Discussion and Analysis.

FINANCING ACTIVITIES

On January 13, 2006, TGVI entered into a five-year unsecured, committed, revolving credit facility of $350 million with a syndicate of banks, of which $296 million was drawn against the facility on January 17, 2006. A portion of the facility was used to refinance TGVI's existing term facility of $209.5 million. The facility will also be utilized to finance working capital requirements and general corporate purposes.

Concurrently with executing the above noted facility, TGVI entered into a $20 million, seven-year unsecured, committed, non-revolving credit facility with one bank. This facility will be utilized for purposes of refinancing any annual prepayments TGVI may be required to make on non-interest bearing government contributions. The terms and conditions are primarily the same as those for the aforementioned TGVI facility except this facility ranks junior to repayment of TGVI's Class B subordinated debt which is held by the Company. Borrowings outstanding under this facility were $3.7 million as of September 30th, 2006.

On May 9, 2006, Terasen Inc. entered into a $450 million three-year revolving credit facility. This facility replaces three bi-lateral facilities aggregating $450 million and includes terms and conditions similar to the facilities it replaced.

On June 21, 2006, Terasen Gas Inc. entered into a $500 million three-year revolving credit facility, extendible annually for an additional 364 days at the option of the lenders. This facility replaces five bi-lateral facilities aggregating $500 million and includes terms and conditions similar to the facilities it replaced.

In September 2006, Terasen Gas issued $120 million of 30-year medium term note debentures at an interest rate of 5.55%. Funds generated from the issuance of medium term note debentures were used to repay $100 million which matured in the quarter with the remainder available to fund the retirement of a $20 million debenture which is due to mature in the fourth quarter.

As at September 30, 2006, the Company and its subsidiaries had lines of credit in place totaling $1,175 million to finance cash requirements. These lines enable the respective companies to borrow directly from their bankers, issue bankers' acceptances and support commercial paper issuance. Bank lines of $534 million were unutilized at September 30, 2006. Utilized lines are used for short term borrowings and letters of credit. Virtually all short-term cash needs are funded through commercial paper and bankers' acceptances in the Canadian market at rates generally below bank prime. Terasen does not have, nor does it expect to have, any defaults or arrears. The company has thirty eight letters of credit outstanding totaling $117 million.

In addition to the above lines of credit, TGVI on its $350 million credit facility had borrowings outstanding at September 30, 2006 of $284 million. While the borrowings are short-term bankers acceptances, the underlying credit facility on which the advances are provided is committed through to January 2011 and the borrowings are primarily to support the longer term rate base assets of TGVI. Accordingly, a portion of the borrowings have been classified as long term debt in the consolidated balance sheet.

On June 30, 2006, TGVI made a $6.2 million payment on its government loans, of which, approximately $3.7 million was refinanced through borrowings under its $20 million non-revolving credit facility and the remaining amount funded with cash on hand.

No dividends were declared in the first nine months of 2006 compared to $23.8 million in the third quarter of 2005 and $71.2 million in the first nine months of 2005.

FINANCIAL POSITION

The following table outlines the significant changes in the consolidated balance sheets as at September 30, 2006 compared to December 31, 2005, other than changes arising from the reclassification of the water and utility services business as a discontinued operation.

Balance Sheet Item	Increase (Decrease) ($ millions)	Explanation
Accounts receivable	$(280.0)	Decrease is mainly due to lower sales of gas in the summer months compared to winter.
Rate stabilization accounts (including current and long term)	163.5	The increase in the net asset position of rate stabilization accounts is mainly due to the fair value mark to market for the gas derivatives. The derivatives are ''out of the money'' and any losses are passed through to customers.
Short-term notes	(157.0)	Decrease is due to the repayment of short-term notes from the refinancing of TGVI and due to the lower debt requirements in the utility operations as a result of the higher equity requirements as rendered by the BCUC decision.
Inventories of gas in storage and supplies	44.0	Increase is mainly due a build up in supply in anticipation for usage in the cooler winter months.

WORKING CAPITAL

Terasen's working capital requirements fluctuate seasonally based on natural gas consumption. Given the regulated nature of its business, Terasen is able to maintain negative working capital balances. Terasen maintains adequate committed credit facilities to meet its working capital requirements. On an annual basis, Terasen generates sufficient cash flow to meet its working capital requirements.

LETTERS OF CREDIT

$117 million of letters of credit were outstanding at September 30, 2006 primarily related to unfunded pension plans and guarantees to third parties for power purchases and on behalf of co-investors in the Express System to fund the Debt Service Account.

CREDIT RATINGS

Following the Kinder Morgan Inc management buyout offer announced in May 2006, both DBRS and Moody's have placed Terasen Inc.'s credit ratings under review with negative implications and possible downgrades. There have been no other changes to the Company's credit ratings from those reported in the annual 2005 Management's Discussion and Analysis.

TRANSACTIONS WITH RELATED PARTIES

The Company estimates that its parent company, Kinder Morgan Inc., provided corporate management services it receives totaling approximately $1.2 million for the three-months ended September 30, 2006. Year to date corporate management service fees were $8.5 million.

FINANCIAL AND OTHER INSTRUMENTS

The Company hedges its exposure to fluctuations in natural gas prices and interest rates through the use of derivative instruments. The table below indicates the valuation of the derivative instruments as at September 30, 2006. For more information on Terasen's derivatives please refer to Terasen's 2005 Annual Management's Discussion and Analysis.

			September 30, 2006		December 31,2005	
Asset (Liability)	**Number of swaps**	**Term to maturity (years)**	**Carrying Value**	**Fair Value**	**Carrying Value**	**Fair Value**
			(in millions)			
Interest Rate Swaps						
Terasen Inc.	2	2 - 9	$	$ 1.6	$ —	$ 3.6
Terasen Gas[1]	3	2	—	(1.1)	—	(1.6)
TGVI[1]	2	3	—	(0.5)	—	(0.6)
Corridor[1]	2	4 - 9		(0.4)	—	(0.3)
Natural Gas Commodity Swaps Terasen Gas and TGVI[1,2]	263	Up to 3	(162.8)	(176.5)	21.2	105.6

1 The derivatives entered into by Terasen Gas and TGVI relate to regulated operations and any resulting gains or losses are, subject to regulatory approval, passed through to customers in future rates. The derivatives entered into by Corridor are done so on behalf of its shippers and any gains are losses are passed through directly to its shippers.

2 The natural gas derivatives fair value reflects only the value of the natural gas derivatives and not the offsetting change in value of the underlying future purchases of natural gas. These fair values reflect the estimated amounts the Company would receive or pay to terminate the contracts at the stated dates.

BUSINESS DEVELOPMENT

The following is an update on Terasen's business development activities during the first nine months of 2006. More information on the Company's business development activities is provided in Terasen's 2005 annual Management's Discussion and Analysis.

TERASEN GAS (WHISTLER) (''TGW'') AND TERASEN GAS VANCOUVER ISLAND (''TGVI'')

On June 28, 2006, TGW and TGVI received final approval from the BCUC to extend natural gas service to Whistler. Under the proposed arrangements, TGVI will extend its transmission system to serve TGW by the construction of a 50 kilometre pipeline lateral from Squamish to Whistler and TGW will convert its current piped propane system to natural gas. The pipeline construction is expected to commence in the fall of 2006 and will be co-ordinated with the current Sea to Sky Highway upgrade project. Gas service is expected to be available by November 2008.

CORRIDOR EXPANSION

We have initiated engineering, environmental, consultation and procurement activities on the proposed Corridor pipeline expansion project, as authorized and supported by shipper resolutions and the underlying firm service agreement. The proposed C$1.6 billion expansion includes building a new 42-inch diameter diluent/bitumen (''dilbit'') pipeline, a new 20-inch diameter products pipeline, tankage and upgrading existing pump stations along the existing pipeline system from the Muskeg River Mine north of Fort McMurray to the Edmonton region. The Corridor pipeline expansion would add an initial 180,000 bpd of dilbit capacity to accommodate the new bitumen production from the Muskeg River Mine. An expansion of the Corridor pipeline system has been completed in 2006 increasing the dilbit capacity to 278,000 barrels per day (''bpd'') by upgrading existing pump station facilities. By 2009, the dilbit capacity of the Corridor system is expected to be approximately 460,000 bpd. An application for the Corridor pipeline expansion project was filed with the Alberta Energy Utilities Board and Alberta Environment on December 22, 2005, and approval was received in August 2006. Construction of the Corridor pipeline expansion is expected to begin in November 2006 as the shippers have received definitive approval of their Muskeg River Mine expansion.

TMX

On February 17, 2006, Kinder Morgan Canada filed a complete National Energy Board (''NEB'') application for the Anchor Loop project. On November 15, 2005, Kinder Morgan Canada filed a comprehensive environmental report with the Canadian Environmental Assessment Agency regarding the project. The C$435 million project involves looping a 98-mile section of the existing Trans Mountain pipeline system between Hinton, Alberta, and Jackman, British Columbia, and the addition of three new pump stations. With construction of the Anchor Loop, the Trans Mountain system's capacity will increase from 260,000 bpd to 300,000 bpd by the end of 2008. The public hearing of the application was held the week of August 8, 2006. On October 26, 2006, the NEB released its favorable decision on the application.

RISK ASSESSMENT

The risk profile of Terasen remains substantially unchanged from the profile outlined in Terasen's 2005 Annual Management's Discussion and Analysis.

FORWARD LOOKING STATEMENT

When used in this report, the words ''anticipate'', ''expect'', ''project'', ''believe'', ''estimate'', ''forecast'' and similar expressions are intended to identify forward looking statements, which include statements relating to pending and proposed projects or possible acquisitions. Such statements are subject to certain risks, uncertainties and assumptions pertaining to operating performance, regulatory parameters, economic conditions and, in the case of pending and proposed projects, risks relating to design and construction, regulatory processes, obtaining financing and performance of other parties, including partners, contractors and suppliers and in the case of possible acquisitions, obtaining financing, acquiring assets or companies at an appropriate price and the ability to effect synergies in a timely and cost-effective manner.

ADDITIONAL INFORMATION

(1) Terasen primarily includes the operations of Terasen Gas Inc., Terasen Gas (Vancouver Island) Inc. and Terasen Gas (Whistler) Inc., collectively known as the "Terasen Gas companies".

(2) Forecast mid-year 2009

(3) Rate of return on common shareholders' equity ("ROE"). For Terasen, ROE is for Terasen Gas Inc. ROE for Terasen Gas (Vancouver Island) Inc. is 70 basis points higher.

(4) Interim ROE pending outcome of regulatory proceeding

(5) Information in table represents 100% of Belize Electricity's operations except for earnings data. Earnings represent Belize Electricity's contribution to the consolidated earnings of Fortis, based on the Corporation's 70.1% ownership interest.

(6) Regulated rate of return on rate base assets ("ROA")

(7) Based on the June 2008 Final Decision on Belize Electricity's 2008/2009 rate application

(8) Fortis holds a 57% interest in Caribbean Utilities. Information in table represents 100% of Caribbean Utilities' operations as at and for the 14 months ended December 31, 2008 due to a change in the utility's fiscal year end. Earnings represent Caribbean Utilities' contribution to the Corporation's consolidated earnings for the 14 months ended December 31, 2008.

(9) Significant investment is currently occurring at the utility. 2008 achieved ROA was lower than the ROA allowed under the licence.

Non-Regulated

Fortis Generation[1]

	Generating Capacity (MW)	Energy Sales (GWh)	Assets[3] ($B)	Earnings[4] ($M)	Capital Program ($M)
Total	**195**	**1,217**	**0.4**	**30**	**28**

Fortis Properties[2]

	Employees (#)	Assets ($B)	Earnings[4] ($M)	Capital Program ($M)

(1) Includes operations in Belize, Ontario, central Newfoundland, British Columbia and Upper New York State

(2) Includes approximately 2.8 million square feet of commercial real estate primarily in Atlantic Canada and 20 hotels across Canada

(3) Includes $126 million in "Other" non-regulated assets

(4) Contribution to Fortis Inc. consolidated earnings for the fiscal year ended December 31, 2008

Information is for the fiscal year ended December 31, 2008 unless otherwise indicated.

Left – The Terasen Gas companies own and operate more than 46,000 kilometres of natural gas distribution and transmission pipelines and met a peak day demand of 1,402 TJ in 2008.

Right – Fortis electric utilities own and/or operate approximately 136,000 kilometres of transmission and distribution lines and met a combined peak demand of more than 5,700 MW in 2008.

Report to Shareholders

2008 has been another successful year for your company and marks the 9th consecutive year Fortis has delivered record earnings to shareholders.

Fortis achieved net earnings applicable to common shares of $245 million, 27 per cent higher than earnings of $193 million in 2007. Earnings per common share were $1.56, 16 cents higher than earnings per common share of $1.40 for the previous year.

Growth in earnings, excluding one-time items, was primarily attributable to a full year of earnings from Terasen and increased contributions from non-regulated hydroelectric generation. Earnings in 2008 were enhanced by a one-time $7.5 million tax reduction ($5.5 million at the Terasen Gas companies and $2 million at Terasen Inc.) associated with the settlement of historical corporate tax matters at Terasen but were reduced by a one-time $13 million charge that represented the Corporation's share of fuel and purchased power costs disallowed by Belize Electricity's regulator.

Dividends paid per common share grew to $1.00 in 2008, 22 per cent higher than 82 cents paid per common share in the previous year. The dividend payout ratio was approximately 64 per cent in 2008. Fortis increased its quarterly common share dividend to 26 cents, commencing with the first quarter dividend paid in 2009. The 4 per cent increase in the quarterly common share dividend translates into an annualized dividend of $1.04 and extends the Corporation's record of annual common share dividend increases to 36 consecutive years, the longest record of any public corporation in Canada.

In December, Fortis amended and restated its Dividend Reinvestment and Share Purchase Plan to provide shareholders with a 2 per cent discount on the purchase of common shares, issued from treasury, with reinvested dividends. The discount became effective with dividends paid on March 1, 2009.

Over the past five years, Fortis delivered an average annualized total return of 14.3 per cent, the highest in its sector, and outperformed both the S&P/TSX Capped Utilities Index and S&P/TSX Composite Index, which delivered average annualized total returns of 7.3 per cent and 4.2 per cent, respectively, over that period.

In October 2008, Fortis was placed in the S&P/TSX 60, 60 Capped and Equity 60 indices. The average daily trading volume for the 46 trading days in 2008 that Fortis was a member of these indices was approximately 662,000 common shares, almost 35 per cent higher than the average daily trading volume for the year-to-date period prior to inclusion. Over the past five years, the average daily trading volume of Fortis common shares has increased 4.5 times, exceeding, on average, 525,000 common shares traded daily in 2008.

Fortis is the largest investor-owned distribution utility in Canada, serving more than 2,000,000 gas and electricity customers. At the end of 2008, regulated rate base assets approached $7 billion; total assets of Fortis exceeded $11 billion, more than five times the amount five years ago. Growth has been driven by two large acquisitions: the $3.7 billion acquisition of Terasen in May 2007 and the $1.5 billion acquisition of FortisAlberta and FortisBC in May 2004. As well, growth has occurred organically through the continued investment in energy infrastructure. Over the past five years, Fortis utilities have invested approximately $2.9 billion in capital projects to ensure reliability of service to customers and meet growth in energy demand.

Left – Fortis, through its regulated and non-regulated businesses, owns and/or operates more than 1,800 MW of generation, mainly hydroelectric.
Right – The regulated utilities of Fortis serve more than 2,000,000 customers in five Canadian provinces and three Caribbean countries.

Report to Shareholders

2008 marked the largest annual capital investment program in the history of Fortis. Consolidated capital expenditures, before customer contributions, were $904 million. Much of this investment was driven by the Terasen Gas companies, FortisAlberta, FortisBC and regulated and non-regulated electric utility operations in the Caribbean. Terasen Gas (Vancouver Island) started construction of its approximate $200 million liquefied natural gas storage facility, which will enhance reliability of supply to customers when it comes into service in late 2011. FortisAlberta continued work on its four-year Automated Meter Infrastructure Project, estimated at a total cost of $124 million, which will enable customers to better monitor and manage energy consumption. FortisBC received regulatory approval to proceed in 2009 with the $141 million Okanagan Transmission Reinforcement Project, the largest capital initiative ever to be undertaken by the utility. The project will provide needed system enhancements in the Okanagan region and help ensure the delivery of safe, reliable energy to customers. Construction continued on the US$53 million 19-megawatt ("MW") Vaca hydroelectric generating facility in Belize. When it comes online, expected at the beginning of 2010, the amount of energy Belize Electricity sources from hydroelectricity, the least-cost source of energy supply available, will increase to approximately 45 per cent.

The Terasen acquisition became accretive to earnings per common share of Fortis in the first quarter of 2008. The Terasen Gas companies contributed $118 million to earnings for the full year in 2008 compared to $50 million for the 7½ months of ownership in 2007. Results for 2008 were favourably impacted by an approximate $5.5 million tax reduction related to the settlement of historical corporate tax matters and a higher allowed rate of return on common shareholder's equity ("ROE") compared to 2007. Results for 2007 included a $7 million after-tax gain on the sale of surplus land.

Canadian Regulated Electric Utilities contributed earnings of $126 million compared to $125 million for 2007. Earnings grew $5 million year over year, excluding the impact of a one-time gain of $2 million in 2007 associated with an interconnection agreement-related refund at FortisOntario and the subsequent regulator-required repayment of the refund in 2008 by the utility. The key performance drivers were rate base growth and the higher allowed ROEs at FortisAlberta, FortisBC and Newfoundland Power, partially offset by lower corporate tax recoveries at FortisAlberta.

Customer rates for 2009 have been approved for the four largest utilities, which account for approximately 77 per cent of the total assets of Fortis. The allowed ROEs for 2009 at Terasen Gas Inc. and FortisBC declined slightly to 8.47 per cent and 8.87 per cent, respectively. The allowed ROE for 2009 at Newfoundland Power remains at 8.95 per cent. FortisAlberta is currently engaged in a generic cost of capital proceeding with its regulator and a decision on the utility's allowed ROE for 2009 is not expected until later in the year. In the interim, as directed by its regulator, customer rates for 2009 at FortisAlberta have been set using the utility's allowed ROE for 2007 of 8.51 per cent.

Caribbean Regulated Electric Utilities contributed earnings of $17 million compared to $31 million for 2007. Earnings were $3 million lower year over year, excluding the impact of a one-time loss of $13 million in 2008 related to a regulatory order received at Belize Electricity, which is being legally contested by the Company, and a one-time loss of $2 million in 2007 associated with the disposal of steam-turbine assets at Caribbean Utilities. Overall electricity sales growth and two additional months of earnings from Caribbean Utilities, associated with a change in the utility's fiscal year end, were more than offset by the impact of a 3.25 per cent reduction in base electricity rates at Caribbean Utilities, effective January 1, 2008; a lower allowed rate of return on rate base assets ("ROA") at Belize Electricity; and an approximate $2 million revenue loss at Fortis Turks and Caicos associated with Hurricane Ike.

Over the past five years, Fortis utilities have invested approximately $2.9 billion in capital projects to ensure reliability of service to customers and meet growth in energy demand.

Report to Shareholders

Non-Regulated Fortis Generation contributed earnings of $30 million, $6 million higher than for 2007. Performance was driven by increased hydroelectric production in central Newfoundland, Belize and Upper New York State, as a result of higher rainfall, and higher average wholesale energy prices in Upper New York State and Ontario.

Commencing in May 2009, Fortis will no longer have the benefit of the 75-MW Rankine generating facility in Ontario due to the expiration of the water rights on the Niagara River. However, earnings' projections for Vaca, combined with the planned substantial consolidated capital program over the next couple of years, are expected to more than offset the loss of earnings associated with the expiry of the Rankine water rights.

Fortis Properties delivered earnings of $23 million compared to $24 million for 2007. Excluding a $2 million favourable tax adjustment in 2007, earnings were $1 million higher year over year, mainly due to a full year of earnings from Delta Regina, which was acquired in August 2007.

Fortis continues to maintain strong investment-grade credit ratings, allowing it to have good access to the debt capital markets. Fortis is rated A– by Standard & Poor's and BBB(high) by DBRS. Its four largest utilities all have strong investment-grade credit ratings.

Fortis and its subsidiaries raised almost $1.2 billion in the capital markets in 2008. In December, the Corporation completed a $300 million common share issue, the net proceeds of which were used to repay short-term debt primarily incurred to retire $200 million of debt at Terasen that matured on December 1, 2008 and for general corporate purposes. In the second quarter of 2008, Fortis issued preference shares for gross proceeds of $230 million, the net proceeds of which were mainly used to repay $170 million borrowed under the Corporation's committed credit facility and to fund subsidiary equity requirements. Canadian Regulated Utilities issued $660 million of 30-year long-term debt at rates ranging from 5.80 per cent to 6.05 per cent. The proceeds provide long-term funding for capital programs to enhance reliability of gas and electricity service and meet customer growth.

At December 31, 2008, Fortis had consolidated credit facilities of $2.2 billion, of which $1.5 billion was unused. Approximately $2 billion of the total credit facilities are committed facilities, the majority of which have maturities ranging from 2011 to 2013. The credit facilities are syndicated almost entirely with the seven largest Canadian banks, with no one bank holding more than 25 per cent of these facilities. The Corporation's long-term debt maturities and repayments are expected to average approximately $180 million annually over the next five years. With its substantial credit facilities and conservative capital structure, we believe Fortis has the financial flexibility to respond to the global economic downturn and volatility in the capital markets anticipated to continue in 2009.

Employee success underpins corporate success. To each of our more than 6,200 employees, thank you for your commitment to customers. We extend our appreciation to the Board of Directors of Fortis for your governance and counsel. We also offer our gratitude and best wishes to Dr. Linda Inkpen who retires from the Board in 2009.

Left – The Fortis Emergency Response Network, consisting of more than 60 employees throughout the Fortis Group of Companies, assisted Fortis Turks and Caicos with its restoration efforts following Hurricane Ike, a Category 4 hurricane.

Right – Geoffrey F. Hyland, Chair of the Board, Fortis Inc. (left) and Stan Marshall, President and CEO, Fortis Inc. (right)

Report to Shareholders

Fortis is focused on executing its 2009 consolidated capital program, estimated at approximately $1 billion, to meet customers' expectations and growth in energy demand. Over the next five years, the consolidated capital expenditure program is expected to be approximately $4.5 billion, substantially all of which will be funded at the subsidiary level. This capital investment, which will mainly occur in western Canada, will add value for customers and shareholders and fortify the position of Fortis as a leading owner of energy infrastructure in Canada.

On behalf of the Board of Directors,

Geoffrey F. Hyland
Chair of the Board
Fortis Inc.

H. Stanley Marshall
President and Chief Executive Officer
Fortis Inc.

The vision of Fortis is to be the world leader in those segments of the regulated utility industry in which it operates and the leading service provider within its service areas. In all its operations, Fortis will manage resources prudently and deliver quality service to maximize value to customers and shareholders.

The Corporation will continue to focus on three primary objectives:

i) The growth in assets and market capitalization should be greater than the average of other North American public gas and electric utilities of similar size.

ii) Earnings should continue at a rate commensurate with that of a well-run North American utility.

iii) The financial and business risks of Fortis should not be substantially greater than those associated with the operation of a North American utility of similar size.

Left – Officers of Terasen (back row l-r): Douglas Stout, VP, Marketing and Business Development; Dwain Bell, VP, Distribution; Robert Samels, VP, Business Services and CIO; Cynthia Des Brisay, VP, Gas Supply and Transmission; Roger Dall'Antonia, VP, Corporate Development and Treasurer; (front row l-r): Scott Thomson, VP, Regulatory Affairs and CFO; Jan Marston, VP, HR and Operations Governance; Randall Jespersen, President and CEO; David Bennett, VP, Regulatory Affairs and General Counsel

Right – Terasen began construction on the approximate $200 million 1.5 billion-cubic foot Mount Hayes liquefied natural gas storage facility on Vancouver Island in May 2008.

Terasen

Regulated Gas Operations

Terasen Inc. ("Terasen") is the largest distributor of natural gas in British Columbia, serving 931,400 customers in more than 125 communities or 96 per cent of gas users in the province. The Company delivers more than 20 per cent of the total energy consumed in British Columbia, comparable to the amount of electricity used in the province, making it a significant contributor to the province's energy mix.

Terasen's regulated natural gas and piped-propane distribution business is carried out by Terasen Gas Inc. ("TGI"), Terasen Gas (Vancouver Island) Inc. ("TGVI") and Terasen Gas (Whistler) Inc. ("TGWI"), collectively known as the "Terasen Gas companies". Its operations also include Terasen Energy Services, which designs, owns and operates geothermal systems, community piping and energy-transfer systems to harness renewable energy sources.

TGI, the largest subsidiary of Terasen, provides natural gas transmission and distribution services and propane distribution to approximately 834,000 customers. Its service territory extends from Vancouver to the Fraser Valley and the interior of British Columbia. TGVI owns and operates the natural gas transmission pipeline from the Greater Vancouver area across the Georgia Strait to Vancouver Island and the distribution system on Vancouver Island and along the Sunshine Coast. The Company serves approximately 95,000 customers. TGWI owns and operates the propane distribution system in Whistler, providing service to approximately 2,400 customers.

The Terasen Gas companies own and operate more than 46,000 kilometres of natural gas distribution and transmission pipelines. In 2008, gas volumes exceeded 221,000 terajoules ("TJ") and a peak day demand of 1,402 TJ was met.

Terasen achieved an all-time high Customer Satisfaction Rating of 79.7 per cent in 2008. The Company has improved its Customer Satisfaction Rating for each of the past five years.

Approximately $220 million, before customer contributions, was invested in capital programs in 2008 to ensure the safe, reliable delivery of piped energy to customers.

Construction started on the approximate $200 million 1.5 billion-cubic foot Mount Hayes liquefied natural gas storage facility on Vancouver Island in May 2008. The facility will allow for more efficient use of existing pipeline systems and improve reliability and security of supply during periods of system interruptions or increased energy demand. It is expected to come into service by late 2011.

Construction continued on the 50-kilometre natural gas pipeline from Squamish to Whistler. The pipeline, a key component of the Sustainable Energy Plan of the Resort Municipality of Whistler, is expected to be completed in spring 2009, followed by the conversion of the community's propane system. The total cost of the pipeline and conversion is expected to be approximately $51 million.

Completed under budget and almost two months ahead of schedule, the $24 million Vancouver Low-Pressure Replacement Project concluded with the seismic upgrade of 95 kilometres of natural gas distribution pipelines and 7,100 service connections. In addition to ensuring the safety and integrity of the gas distribution system, the project enhances delivery service by accommodating modern high-efficiency appliances.

Left – The four-year Automated Meter Infrastructure ("AMI") Project, estimated at a total capital cost of $124 million, entails the scheduled replacement of conventional meters with AMI technology for all FortisAlberta customers by the end of 2010.

Right – Officers of FortisAlberta (l-r): Annette Butt, VP, Human Resources and Corporate Communications; Cynthia Johnston, VP, Regulatory and Legal; Karl Smith, President and CEO; Nipa Chakravarti, VP, Customer Service; Alan Skiffington, VP, Business Services and CIO; Ian Lorimer, VP, Finance and CFO; Phonse Delaney, VP, Operations and Engineering

FortisAlberta

Regulated Electric Operations

FortisAlberta is an electric utility that distributes electricity, generated by other market participants, to end-use customers in southern and central Alberta. Its electricity system includes approximately 108,000 kilometres of distribution lines, which comprise more than 60 per cent of Alberta's total electricity distribution network. The Company serves approximately 461,000 customers in 175 communities and met a peak demand of 3,150 MW in 2008.

FortisAlberta achieved a Customer Satisfaction Rating of 81 per cent in 2008, a marked improvement from its average annual rating for the past three years of 76 per cent.

A record $302 million, before customer contributions, was invested in capital assets in 2008, primarily to meet growth in customer demand. More than 12,000 new customers were connected to the utility's distribution system. The Company worked closely with the transmission service provider and the Alberta Electric System Operator to add substation capacity, improve reliability and meet customer load growth in Balzac, Tilley, Stavely, Bruderheim and Blackfalds.

The Automated Meter Infrastructure ("AMI") Project involved the installation of more than 70,000 electronic meters at customer sites in 2008. AMI technology, which replaces the manual meter reading system, will help reduce operating costs and enable customers to better monitor and manage their energy usage on a monthly basis. The four-year AMI Project, estimated at a total capital cost of $124 million, entails the scheduled replacement of conventional meters with AMI technology for all FortisAlberta customers by the end of 2010.

Approximately $50 million was invested in projects to improve system reliability, customer service and safety. Projects included the replacement of more than 4,000 deteriorated poles, the installation of distribution automation equipment in Airdrie and St. Albert to enable fast restoration of service following an outage and the introduction of new technology that involves the injection of silicone to extend the service life of underground cables.

Construction was completed on the utility's $26 million 88,000-square foot operations and customer service facility in Airdrie. The new facility houses approximately 30 per cent of FortisAlberta's workforce, previously located in leased office space in Calgary. The Company earned the City of Airdrie's 2008 Eco Edge Award as a result of environmental leadership at the new facility, which features innovative environmental considerations including a 95,000-litre rainwater cistern and energy-efficient windows and lighting.

As a result of productivity improvements, FortisAlberta achieved an operating cost per customer of $209 compared to $216 in 2007. Better performance was achieved as a result of revised work practices to improve the time to complete projects and enhance work capacity. New conductor installation equipment helped improve field work practices, resulting in increased efficiency and higher quality of work. Efficiencies were also created through the utility's ability to assign resources, bundle work and reduce employee travel time.

The Company implemented an environmental management system consistent with the international ISO 14001 standard. The system and related training initiatives provide a new tool to manage environmental issues and improve operational performance.

Left – Officers of FortisBC (l-r): David Bennett, VP, Regulatory Affairs, General Counsel and Corporate Secretary; Michele Leeners, VP, Finance and CFO; John Walker, President and CEO; Don Debienne, VP, Power Supply and Strategic Planning; Doyle Sam, VP, Engineering and Operations; Michael Mulcahy, VP, Customer and Corporate Services

Right – FortisBC invested approximately $117 million, before customer contributions, in capital projects in 2008 to meet growing energy demand and replace aging infrastructure.

FortisBC

Regulated Electric Operations

FortisBC is an integrated electric utility operating in the southern interior of British Columbia, serving more than 157,000 customers directly and indirectly. Its utility assets include approximately 7,000 kilometres of transmission and distribution lines and four regulated hydroelectric generating plants on the Kootenay River with a combined capacity of 223 MW. The annual gross energy entitlement from the plants is about 1,591 gigawatt hours ("GWh"). FortisBC also manages 904 MW of hydroelectric generation through contract services. It generates approximately 45 per cent of its electricity requirements, with the balance met through power purchase agreements. The Company met a record peak demand of 746 MW in 2008, exceeding the previous record of 718 MW reached in 2006.

FortisBC achieved a Customer Satisfaction Rating of 86 per cent in 2008, consistent with its rating in 2007.

An intense wind storm swept through the utility's service territory in July, causing power outages to approximately 25,000 customers. More than 150 employees, including power-line technicians, call centre and system control centre personnel and meter readers, were involved in safely restoring power to the majority of customers within 24 hours. Call centre personnel fielded more than 5,000 calls during one storm day, ten times the normal daily call volume.

FortisBC is focused on providing the highest level of customer service and ensuring the timely and cost-efficient installation of new service connections. In 2008, 454 residential extension quotes were processed and 1,664 new service installations were completed. Electronic billing (eBills) was introduced, with more than 6,400 customers choosing to receive their electricity bills this way.

In 2008, approximately $117 million, before customer contributions, was invested in capital projects to meet growing energy demand and replace aging infrastructure. Construction was completed on the $6.2 million Ootischenia substation, creating an additional source of power supply to the Castlegar area in the West Kootenays. The new substation at Big White ski area, the final phase of the $20.5 million Big White Project, was commissioned and the $27 million Kettle Valley Substation Project in Rock Creek was energized. Work began on the $14.4 million Black Mountain substation and associated distribution line, servicing growth to areas northeast of Kelowna. The first phase of the $17.2 million Ellison Substation Project in Kelowna began with the upgrading of six kilometres of distribution and transmission lines.

Approximately $11 million was invested in the utility's ongoing hydroelectric generation Upgrade and Life-Extension Program. The program, which involves rebuilding 11 of the 15 hydroelectric generating units in the Company's four generating stations, is expected to be completed in 2012. The program will improve efficiency, safety and environmental stewardship and maintain the overall reliability of the plants.

Regulatory approval was received in 2008 for the $141 million Okanagan Transmission Reinforcement Project, the largest capital project to be undertaken by FortisBC. The project entails upgrades to the utility's existing transmission lines and substations and the building of a new 230-kilovolt ("kV") transmission line and substation. It will provide needed system enhancements in the Okanagan area, ensuring customers have safe and reliable energy as residential and business growth continues in the region. Construction is scheduled to commence spring 2009 with completion in mid-2011.

Left – Newfoundland Power achieved a Customer Satisfaction Rating of 89 per cent in 2008.

Right – Officers of Newfoundland Power (l-r): Jocelyn Perry, VP, Finance and CFO; Gary Smith; VP, Engineering and Operations; Earl Ludlow, President and CEO; Lisa Hutchens, VP, Customer Relations and Corporate Services; Peter Alteen, VP, Regulatory Affairs and General Counsel

Newfoundland Power

Regulated Electric Operations

Newfoundland Power operates an integrated generation, transmission and distribution system in Newfoundland. The Company serves approximately 236,000 customers or 85 per cent of electricity consumers in the province. It owns and operates 30 small generating stations with an installed generating capacity of approximately 140 MW, of which 97 MW is hydroelectric generation, and has approximately 11,000 kilometres of transmission and distribution lines. Newfoundland Power met a peak demand of 1,181 MW in 2008. Approximately 92 per cent of its energy requirement is purchased from Newfoundland and Labrador Hydro Corporation ("Newfoundland Hydro").

Despite the impact to customers of rising energy prices, Newfoundland Power achieved a Customer Satisfaction Rating of 89 per cent in 2008, slightly higher than the rating achieved in the previous year. Strategic capital investments and employee commitment to customer service enabled electricity to be delivered to customers 99.97 per cent of the time in 2008.

Approximately $67 million, before customer contributions, was invested in capital projects to help strengthen the electricity system, including $18.3 million to provide service to new customers. The Company invested $1.5 million and worked jointly with Newfoundland Hydro and two independent developers to connect 54 MW of renewable wind energy to the island's electricity system. To further enhance system reliability, Newfoundland Power completed a $3.4 million upgrade of the transmission lines on the Bonavista Peninsula and Southern Shore of the Avalon Peninsula and refurbished several of its substations across the island at a total cost of $2.4 million. Performance optimization of 43 distribution feeders in high-growth areas was undertaken to prevent power outages and the use of handheld computers was increased to streamline maintenance workflow.

The Company partnered with Newfoundland Hydro to provide customers with the information, tools and programs they need to be energy efficient. The two utilities completed a Five-Year Energy-Conservation Plan with the goal of conserving an estimated 70 GWh of energy annually through 2013, scheduled to begin in 2009. Newfoundland Power became an active partner in the Energy Conservation and Efficiency Partnership under the Government of Newfoundland and Labrador's Energy Plan, coordinating and assisting with energy conservation and efficiency initiatives.

Online connection with customers improved throughout the year. Customer visits to the corporate website increased 20 per cent over the previous year.

Newfoundland Power completed its first year under the internationally recognized OHSAS 18001 Health and Safety Management System standard. Safety education, training and awareness initiatives included comprehensive employee programs dealing with hazard assessment through risk management/job planning, high-voltage electricity switching and safe work practices around de-energized equipment. The Company launched a new contractor website, which provides easy online access to safety training requirements, practices and policies. Electrical safety presentations were delivered to more than 2,600 children in 53 schools throughout the province. Newfoundland Power delivered safety training to 190 firefighters across the island and training was provided to members of the Canadian military in preparation for their power-restoration efforts in Afghanistan.

Left – Officers of Maritime Electric (l-r): John Gaudet, VP, Corporate Planning and Energy Supply; Steve Loggie, VP, Customer Service; Fred O'Brien, President and CEO; Bill Geldert, VP, Finance, CFO and Corporate Secretary

Right – Maritime Electric serves approximately 73,000 customers, or 90 per cent of electricity consumers, on Prince Edward Island.

Maritime Electric

Regulated Electric Operations

Maritime Electric, the principal electric utility on Prince Edward Island ("PEI" or the "Island"), serves approximately 73,000 customers or 90 per cent of electricity consumers in the province. The Company owns and operates a fully integrated system comprised of approximately 5,300 kilometres of transmission and distribution lines, providing for the generation, transmission and distribution of electricity throughout the Island. Maritime Electric maintains on-Island generating facilities at Charlottetown and Borden-Carleton with a combined total capacity of 150 MW. The electricity system is connected to the mainland power grid via two submarine cables under the Northumberland Strait. The utility met a peak demand of 223 MW in 2008.

Maritime Electric purchases approximately 87 per cent of the energy required to serve customers from New Brunswick Power ("NB Power"). It has entitlement to energy and capacity from NB Power's Point Lepreau and Dalhousie Generating Stations through agreements that extend for the life of these stations.

In April 2008, a refurbishment began on the Point Lepreau Generating Station that will extend its life by 25 years and provide additional stability with respect to long-term energy supply. The balance of the Company's energy requirements is obtained from on-Island wind-powered generation facilities and from the utility's own generating plants. Approximately 13 per cent of total energy supply was derived from wind-powered generation in 2008.

The Government of Prince Edward Island requires Maritime Electric to have a total of 30 per cent of its annual energy sales sourced from on-Island wind farms by 2013. The Company is working with the Government of Prince Edward Island and PEI Energy Corporation on the development of additional wind-powered generation. It is expected that a request for proposal for the additional wind-powered energy expansion will be issued by the provincial government by mid-2009.

Approximately $35 million, before customer contributions, was invested in capital projects to improve system reliability and customer service. Construction continued on the $14 million 138-kV transmission line and power corridor in western PEI. The 71-kilometre transmission line will deliver wind-powered energy from current and future commercial operations in western PEI to the North American grid. The power corridor, which will be jointly funded by the Government of Prince Edward Island and SUEZ Energy North America, will facilitate further expansion of wind-powered generation.

Despite the impact of high world fossil fuel prices on the cost of energy purchased to meet the Island's energy demand, Maritime Electric achieved a Customer Satisfaction Rating of 80 per cent in 2008 compared to 73 per cent for the previous year. Several customer service initiatives were completed in 2008, including an upgrade of the Company's website. A number of new and improved website features were added, such as the Energy Calculator, which will assist customers in better understanding and managing their electricity consumption.

Left – By mid-2009, FortisOntario is scheduled to begin the installation of smart meters, which track time-of-use consumption data.

Right – Officers of FortisOntario (l-r): Scott Hawkes, VP, Corporate Services, General Counsel and Corporate Secretary; Glen King, VP, Finance and CFO; William Daley, President and CEO; Angus Orford, VP, Operations

FortisOntario

Regulated Electric Operations

FortisOntario is an integrated electric utility which owns and operates Canadian Niagara Power and Cornwall Electric and serves approximately 52,000 customers, mainly in Fort Erie, Port Colborne, Cornwall and Gananoque, Ontario. Its regulated assets include approximately 1,570 kilometres of distribution and transmission lines in the Niagara and Cornwall regions, including an international interconnection between New York State and Fort Erie. FortisOntario owns a 10 per cent interest in Westario Power Inc. and Rideau St. Lawrence Holdings Inc., two regional electric distribution companies that together serve more than 27,000 customers. The Company purchases its electricity from the Independent Electricity System Operator in Ontario, with the exception of Cornwall Electric which is supplied by Hydro-Québec. FortisOntario met a combined peak demand of 227 MW in 2008.

In October 2008, the Company entered into a definitive agreement to acquire a 10 per cent strategic ownership in the electricity distribution business of Grimsby Power Inc., which serves approximately 10,000 distribution customers in the western area of the Niagara region. The transaction has been approved by the Ontario Energy Board ("OEB") and is pending approval from the Ontario Ministry of Finance.

The Company achieved an overall Customer Satisfaction Rating of 84 per cent in 2008, slightly higher than its rating for the previous year. Customers continue to rate the utility's reliability/safe delivery of electricity and quality of service at 91 per cent and 88 per cent, respectively.

FortisOntario again exceeded performance standards set by the OEB with respect to response times, service connections and call answer statistics. OEB standards will be expanded in 2009 and the Company will ensure all reporting requirements are met.

FortisOntario undertook two electricity conservation and demand management programs during the year. Almost 700 customers enrolled in the Summer Sweepstakes Program, which encouraged customers to reduce their electricity consumption by 10 per cent in July and August.

The Company invested $11 million, before customer contributions, in capital projects involving new service connections and rebuild projects designed to improve the safety and reliability of its distribution systems. In Port Colborne, construction began on a new $1.5 million substation that will support load growth and replace an existing substation near the end of its useful life.

The Government of Ontario has mandated all regulated electric utilities in the province to install smart meters, which track time-of-use consumption data, at customer sites by the end of 2010. During 2008, FortisOntario selected a supplier of smart meters and installation of this new technology is scheduled to begin by mid-2009. Approximately 27,000 of the utility's metered customers will move to time-of-use rates by the end of 2010.

Left – Officers of Belize Electricity (l-r): Juliet Estell, Manager, Executive Services and Company Secretary; Curtis Eck, VP, Customer Care and Operations; Lynn Young, President and CEO; Rene Blanco, VP, Finance & Administration and CFO; Joseph Sukhnandan, VP, Engineering and Energy Supply

Right – Belize Electricity earned a record Customer Satisfaction Rating of 86 per cent in 2008.

Belize Electricity

Regulated Electric Operations

Belize Electricity is the primary distributor of electricity in Belize, Central America. Serving approximately 74,000 customers, the utility met a peak demand of 74 MW in 2008 from multiple sources of energy, including power purchases from Belize Electric Company Limited ("BECOL"), Comisión Federal de Electricidad ("CFE") (the Mexican state-owned power company), Hydro Maya Limited and its own diesel-fired and gas-turbine generation. All major load centres are connected to the country's national electricity system, which is interconnected with the Mexican national electricity grid, allowing the Company to optimize its power supply options. Belize Electricity has an installed generating capacity of 34 MW and owns approximately 2,840 kilometres of transmission and distribution lines. Fortis holds an approximate 70 per cent controlling ownership interest in Belize Electricity.

The ability of Belize Electricity to meet the energy needs of its customers was significantly challenged by regulatory decisions received in 2008. During the year, the Company was forced to delay several planned initiatives aimed at system expansion and improvement as a result of a US$12.5 million limit on capital expenditures imposed by the Public Utilities Commission of Belize.

While regulatory approval was granted in the latter part of the year to complete rural electrification projects and build interconnection facilities to connect with new generation sources, cash flow challenges continued to restrict Belize Electricity's ability to proceed with these projects and other key capital works. Revisions were made to various project schedules to reflect the capital work suspensions, including the construction of substations to connect with independent power producers, now scheduled for completion in the second quarter in 2009.

The Company invested approximately $22 million, before customer contributions, in capital expenditures in 2008. Projects completed during the year included the connection of several rural communities in the Belize and Cayo Districts to the national grid and the construction of an alternate feeder to serve the popular tourist destination of Placencia Village in Southern Belize. The new feeder will address Placencia's load growth, provide an alternate distribution line to the service area and enable service upgrades with fewer interruptions. A US$2 million mobile substation was also procured to maintain service while substation repairs and maintenance are being carried out.

The Company signed a revised Power Purchase Agreement ("PPA") with CFE during the year. Under the revised contract, Belize Electricity has the option to purchase up to 50 MW of energy at a firm rate with the option to purchase the 50 MW of energy at an economic rate if available and less expensive. The utility also signed a PPA with Belize Aquaculture Limited for the supply of approximately 15 MW of power sourced from a heavy fuel oil-fired generating facility in Southern Belize. Connection to the utility's electricity system, which is expected to occur in the second quarter of 2009, will enable the facility to provide backup power to improve system reliability. It will also reduce reliance on Belize Electricity's diesel generators, which are more costly to operate.

Despite the significant operational constraints imposed as a result of the regulatory decisions received, the Company earned a record Customer Satisfaction Rating of 86 per cent in 2008. Several improvement initiatives focused on enhancing service delivery. Operational regions were defined and a service-order management team was established to ensure customer requests are met expeditiously. As well, several new line vehicles were purchased and deployed to various load centres as necessary.

Left – Caribbean Utilities' electricity system has an installed generating capacity of approximately 137 MW and the Company met a record peak demand of 94 MW in 2008.

Right – Officers of Caribbean Utilities (l-r): Douglas Murray, Corporate Secretary; David Watler, VP, Production; Letitia Lawrence, VP, Finance and CFO; Richard Hew, President and CEO; Andrew Small, VP, Transmission and Distribution

Caribbean Utilities

Regulated Electric Operations

Caribbean Utilities generates, transmits and distributes electricity to more than 24,000 customers on Grand Cayman, Cayman Islands. The utility owns and operates approximately 555 kilometres of transmission and distribution lines and 24 kilometres of high-voltage submarine cable. Its electricity system has an installed generating capacity of approximately 137 MW and the Company met a record peak demand of 94 MW in 2008.

The Class A Ordinary Shares of Caribbean Utilities are listed in US funds on the Toronto Stock Exchange under the symbol CUP.U. Fortis has an approximate 57 per cent controlling ownership interest in the utility.

Caribbean Utilities is one of the most reliable and efficient utilities in the Caribbean region. A Customer Satisfaction Rating of 90 per cent was achieved in 2008 compared to 84 per cent in 2007. For the six-month period ended October 31, 2008, an Average Service Availability Index of 99.9 per cent was posted, with customers experiencing, on average, a total of less than one hour of outages for that period.

The Company successfully completed a Class A Ordinary Share Rights Offering (the "Offering") and related stand-by agreement in August 2008. Under the Offering, Caribbean Utilities raised US$28.2 million, the proceeds of which are supporting the ongoing capital programs necessary to meet energy demand and sustain reliability in the existing generation, transmission and distribution infrastructure.

Capital investments totalled approximately $44 million in 2008. A significant project included ongoing work to complete the 69-kV distribution line from Rum Point to Old Man Bay. Under a strategic alliance relationship, Caribbean Utilities has contracted MAN Diesel SE to manufacture, install and commission an additional 16 MW of capacity, scheduled for completion in September 2009, which will bring total installed MAN Diesel SE supplied generation to approximately 66 MW.

The Company continues to offer its Energy Smart Program to promote energy conservation and has been conducting complementary Energy Smart audits for customers for six years. Caribbean Utilities also participated in the Chamber of Commerce Business Expo, a three-day event that showcased local businesses and attracted more than 3,000 visitors.

The Company continues to demonstrate its environmental commitment through its ISO 14001:2004 registered Environmental Management System associated with its generation operations. Employee-development initiatives continue to demonstrate the ongoing commitment to the "Investors in People" certification that Caribbean Utilities achieved in 2006. The utility awarded a scholarship for the Masters Program in Renewable Energy Development at Heriot-Watt University in Scotland.

As part of its initiative to enhance specialized employee skills to meet future energy demand, Caribbean Utilities is focused on the ongoing apprenticeship training of employees who work in areas such as operations, mechanical and electrical. The Company implemented a management development program accredited by the Institute of Leadership and Management, one of the main organizations for supervisory training in the United Kingdom, for all supervisory staff.

Caribbean Utilities launched an electrical safety education program for schools on Grand Cayman. The program uses a model city to demonstrate electrical hazards associated with transmission and distribution systems as well as residential electricity use.

Left – Officers of Fortis Turks and Caicos (l-r): Ruth Gardiner-Forbes, VP, Finance and CFO; Ernest Jackson, VP, Generation and Engineering; Eddinton Powell, President and CEO; Brian Walsh, VP, Operations; Allan Robinson, VP, Customer and Corporate Services

Right – Fortis Turks and Caicos serves more than 9,000 customers, or 85 per cent of electricity consumers, on the Turks and Caicos Islands.

Fortis Turks and Caicos

Regulated Electric Operations

Fortis Turks and Caicos serves more than 9,000 customers, or 85 per cent of electricity consumers, on the Turks and Caicos Islands. The Company owns and operates a fully integrated system providing for the generation, transmission and distribution of electricity in Providenciales, North Caicos and Middle Caicos pursuant to a 50-year licence that expires in 2037. Fortis Turks and Caicos also owns and operates an independent generating station and transmission and distribution system on South Caicos and is the sole provider of electricity for that island pursuant to a 50-year licence that expires in 2036. In May, the Company began supplying electricity to Dellis Cay. Its regulated assets include 335 kilometres of transmission and distribution lines. The utility has a combined diesel-fired generating capacity of 48 MW and met a combined peak demand of 29 MW in 2008.

While challenged by increasing energy prices and severe weather conditions, the Company achieved a Customer Satisfaction Rating of 75 per cent in 2008.

In early September 2008, the Turks and Caicos Islands were struck by Tropical Storm Hanna followed by Hurricane Ike, a Category 4 hurricane which caused major damage to the utility's transmission and distribution system on South Caicos, with lesser damage occurring on North Caicos and Middle Caicos. Providenciales, the Company's major service territory and home to 80 per cent of its customers, was spared a direct hit. Generation facilities sustained minimal impact as a result of the hurricane. The Fortis Emergency Response Network, consisting of more than 60 employees throughout the Fortis Group of Companies, assisted Fortis Turks and Caicos with its restoration efforts. By the end of October, electricity had been restored to all customers ready to receive service.

Capital expenditures of approximately $44 million, before customer contributions, in 2008 primarily reflected investment in generation, transmission and distribution infrastructure, information technology platforms and systems, as well as land purchases necessary to meet energy demand and improve customer service.

The 2008/09 Generation Expansion Project is on schedule and will increase the Company's generating capacity by approximately 7 MW with the commissioning of two Caterpillar 3612 series units in early 2009. Capital projects undertaken to improve transmission and distribution reliability included the completion of dedicated underground feeders to Beaches Resort, the Islands' largest hotel, and the Provo Water Plant; the installation of a second power transformer at Grace Bay substation; and the completion of a transmission loop to Grace Bay substation. As a result of these initiatives, Fortis Turks and Caicos experienced a marked reduction in feeder outages in 2008.

New service connections included a number of large customers, among them Seven Stars Resort, Niki Beach Resort and Beach Club Resort.

The Company continued to implement recommendations from its environmental impact evaluation study. An environmental officer designate was appointed and received environmental training from Fortis Group personnel. Fortis Turks and Caicos plans to implement an environmental management system in 2009 that will be consistent with the international ISO 14001 standard by 2012.

Left – Construction of the US$53 million 19-MW Vaca hydroelectric generating facility on the Macal River in Belize is scheduled for completion at the beginning of 2010.
Right – Fortis Generation has a combined generating capacity of 195 MW, 190 MW of which is hydroelectric generation.

Fortis Generation

Non-Regulated Operations

Fortis Generation includes the operations of non-regulated generating assets in Belize, Ontario, central Newfoundland, British Columbia and Upper New York State with a combined generating capacity of 195 MW, 190 MW of which is hydroelectric generation.

In Belize, BECOL owns and operates the 25-MW Mollejon and 7-MW Chalillo hydroelectric generating facilities located on the Macal River. Mollejon and Chalillo are the largest commercial hydroelectric generating facilities in Belize. Energy production hit a record high of 192 GWh in 2008 due to above-average rainfall. The Belize Meteorological Office confirmed that the flood-control features of the Chalillo facility significantly reduced the impact on downstream communities of widespread flooding related to heavy rainfall in November. Construction of the US$53 million 19-MW Vaca hydroelectric generating facility continued and is scheduled for completion at the beginning of 2010. Vaca, a run-of-river plant situated approximately five kilometres downstream from Mollejon, is the final phase of the three-part hydroelectric development plan for the Macal River. BECOL sells its entire output to Belize Electricity under a 50-year PPA. Belize Electricity has signed a 50-year PPA with BECOL for the purchase of energy generated by Vaca. When it comes online, Vaca is expected to increase the average annual energy production from the Macal River by approximately 80 GWh to 240 GWh.

In Ontario, non-regulated operations include 75 MW of water-right entitlement associated with the Rankine hydroelectric generating station at Niagara Falls, which expires in April 2009; a 5-MW gas-fired cogeneration plant in Cornwall; and six small hydroelectric generating stations in eastern Ontario with a combined capacity of 8 MW. With the exception of the cogeneration plant in Cornwall, the electricity produced from these facilities is sold in Ontario at market prices.

In central Newfoundland, Fortis Generation holds a 51 per cent interest in the Exploits River Hydro Partnership ("Exploits Partnership") with Abitibi-Consolidated Company of Canada ("Abitibi-Consolidated"). The Exploits Partnership was established in 2001 and commenced operations in 2003 following the development of additional capacity at Abitibi-Consolidated's two hydroelectric generating plants in central Newfoundland. The Exploits Partnership achieved annual production of 177 GWh in 2008. In December 2008, the Government of Newfoundland and Labrador passed legislation expropriating most of Abitibi-Consolidated's assets in Newfoundland including those assets associated with the generation of electricity, some of which included the capital assets of the Exploits Partnership. The provincial government has publicly stated that it is not its intention to adversely affect the business interests of lenders or independent partners of Abitibi-Consolidated in the province.

In British Columbia, the non-regulated generating asset is the 16-MW run-of-river Walden hydroelectric generating plant near Lillooet, which was acquired in May 2004 as part of the assets of FortisBC. The plant sells its entire output to BC Hydro under a long-term contract.

In Upper New York State, the non-regulated generating assets are four hydroelectric generating stations located in Moose River, Philadelphia, Dolgeville and Diana. The plants have a combined capacity of approximately 23 MW. The average annual 85 GWh of energy output from these modern facilities is sold at the wholesale level through a series of renewable contracts.

Left – Officers of Fortis Properties (l-r): Terry Chaffey, VP, Real Estate; Nora Duke, President and CEO; Jamie Roberts, VP, Finance and CFO

Right – In November 2008, Fortis Properties acquired Hotel Newfoundland. The 4½-star hotel, situated in historic downtown St. John's, features 301 guest rooms and approximately 16,000 square feet of premium meeting space, including 17 conference and special event rooms.

Fortis Properties

Non-Regulated Operations

Fortis Properties owns and operates 20 hotels, offering more than 3,800 rooms, in eight Canadian provinces and approximately 2.8 million square feet of commercial office and retail space primarily in Atlantic Canada. The Company, a wholly owned subsidiary of Fortis, is the primary vehicle for non-utility diversification and growth.

The Hospitality Division continued to demonstrate strong growth through property enhancement, expansion and acquisition. Revenue per available room increased for the 13th consecutive year, reaching $80.39, primarily due to a higher average daily room rate. In November 2008, Fortis Properties acquired Hotel Newfoundland for approximately $22 million. The 4½-star hotel, situated in historic downtown St. John's, features 301 guest rooms and approximately 16,000 square feet of premium meeting space, including 17 conference and special event rooms. Aligning with guest expectations for a high-quality service experience, this premier hotel was rebranded as Sheraton Hotel Newfoundland in early 2009. Over the next three years, an approximate $9 million capital investment will be made to upgrade the hotel.

A $14 million 70-room expansion of Holiday Inn Express Kelowna commenced in 2008, which includes the addition of an exclusive executive floor, business and family suites, more meeting space, an enhanced fitness facility and two indoor waterslides. A $0.7 million expansion of the Four Points by Sheraton Conference Centre in Halifax, Nova Scotia was completed during the year. The project utilized space in the Maritime Centre, enabling the hotel to attract larger groups and conventions while providing enhanced service for real estate tenants. The expanded facility includes 12,000 square feet of convention space, in-house audiovisual technology services and courtyard meeting space.

The Real Estate Division's stable performance is supported by long-term leases with quality tenants and strong tenant relations. The year-end occupancy rate was 96.8 per cent, outpacing the national rate of 93.3 per cent. Company buildings have virtually zero vacancy in a number of downtown markets, including St. John's and Halifax. Capital improvements to real estate assets included a $1.4 million investment at Brunswick Square for electrical equipment replacement and entrance renovations and upgrades.

Approximately $0.7 million was invested in technology solutions to improve productivity and provide optimal customer service. A new financial management system was installed and a multiphase project to install a new payroll system is ongoing.

The Hospitality Division continued to demonstrate quality customer service. The Delta St. John's Hotel and Conference Centre won *Hospitality Newfoundland and Labrador's Accommodation of the Year Award* for demonstrating dedication to quality service, commitment to the tourism industry and community contribution. For the 11th consecutive year, Holiday Inn Peterborough-Waterfront won the *Readers' Choice Award for Best Hotel in Peterborough* from the region's newspaper, *The Peterborough Examiner*.

Significant emphasis continued to be placed on ensuring compliance with health and safety regulations and raising awareness of health and safety practices. Safety audits were conducted at all properties in 2008.

Leadership development remains a priority as Fortis Properties continues to focus on the growth of high-potential employees through mentoring, professional development courses, special projects, temporary assignments, lateral moves and job promotion.

In 2008, almost $3 million in financial and in-kind donations was distributed to a wide selection of well-deserving community causes.

Our Community

Fortis remains focused on making a difference in the communities where our employees work and live. In 2008, almost $3 million in financial and in-kind donations was distributed to a wide selection of well-deserving community causes. Hundreds of employees throughout the Fortis Group of Companies were there to help.

Terasen sponsored the *2008 Environmental Mind Grind* organized by the Environmental Educators of the Central Okanagan Heroes. The event motivated 95 school teams and 450 students throughout British Columbia to display their environmental stewardship knowledge in a game show-style trivia contest.

FortisAlberta employees in Calgary, Red Deer and Edmonton raised $25,000 for the *CIBC Run for the Cure* in 2008. It was a record-setting year for participation by employees, who raised twice the amount collected in 2007.

FortisBC employees came together and raised almost $6,000 for the *Hour Kids Campaign*, a fundraiser to help complete upgrades to the maternity and pediatric departments at the Kootenay Boundary Regional Hospital.

Newfoundland Power employees were recognized with a national award at the 9th annual Canadian Blood Services *Honouring Our Lifeblood* event. Since joining the *Partners for Life* program in 2004, employees have made more than 1,400 blood donations.

Maritime Electric offered its *Electrical Safety Presentation* as part of the Grade Six science and math curriculum throughout the school system on Prince Edward Island.

FortisOntario donated $5,000 to the *Port Cares Reach Out Centre* in Port Colborne. The Centre offers a drop-in service and meal program, serving approximately 12,000 meals to the general public each year.

Belize Electricity awarded a three-year scholarship, valued at BZ$36,000 per annum, to a Belizean student to pursue a *Diploma in Engineering Technology* at the College of the North Atlantic in Newfoundland.

Caribbean Utilities enhanced its partnership with the *Central Caribbean Marine Institute*, an international non-profit organization that is extending its Coral Reef Awareness Program to schools across Grand Cayman through its Ocean Literacy education curriculum.

Fortis Turks and Caicos joined the campaign to redevelop the sport of cricket on the Turks and Caicos Islands by making a $4,000 donation and becoming the title sponsor of the *Provo Cricket Association's Men's League*.

Fortis Properties was the title sponsor of the *Business Community Anti-Poverty Initiative Annual Golf Tournament* in New Brunswick. Through its participation during the past six years, the Company has assisted in raising more than $240,000 in support of the Resource Centre for Youth in Saint John.

Management Discussion and Analysis

Barry Perry, VP, Finance and CFO, Fortis Inc.

Dated March 11, 2009

The following Management Discussion and Analysis ("MD&A") should be read in conjunction with the 2008 Consolidated Financial Statements and Notes to the 2008 Consolidated Financial Statements included in the Fortis Inc. ("Fortis" or the "Corporation") 2008 Annual Report. The MD&A has been prepared in accordance with National Instrument 51-102 – *Continuous Disclosure Obligations*. Financial information in the MD&A has been prepared in accordance with Canadian generally accepted accounting principles ("GAAP") and is presented in Canadian dollars unless otherwise specified.

Fortis includes forward-looking information in the MD&A within the meaning of applicable securities laws in Canada ("forward-looking information"). The purpose of the forward-looking information is to provide management's expectations regarding the Corporation's future growth, results of operations, performance, business prospects and opportunities, and it may not be appropriate for other purposes. All forward-looking information is given pursuant to the "safe harbour" provisions of applicable Canadian securities legislation. The words "anticipates", "believes", "budgets", "could", "estimates", "expects", "forecasts", "intends", "may", "might", "plans", "projects", "schedule", "should", "will", "would" and similar expressions are often intended to identify forward-looking information, although not all forward-looking information contains these identifying words. The forward-looking information reflects management's current beliefs and is based on information currently available to the Corporation's management. The forward-looking information in the MD&A includes, but is not limited to, statements regarding: the expected timing of regulatory decisions; the electricity sales growth rate expected at the Corporation's regulated utilities in the Caribbean in 2009; consolidated forecasted gross capital expenditures for 2009 and in total over the next five years, as well as the expected significant capital projects in 2009 and their expected costs and time to complete; the expected impacts on Fortis of the downturn in the global economy; the expected increase in activities at Terasen Energy Services; no significant decrease in subsidiary operating cash flows is expected in 2009; the subsidiaries expect to be able to source the cash required to fund their 2009 capital expenditure programs; the Corporation and its subsidiaries expect to continue to have reasonable access to long-term capital in 2009; expected long-term debt maturities and repayments in 2009 and on average annually over the next five years; no material increase in interest expense and/or fees associated with renewed and extended credit facilities is expected in 2009; no material adverse credit rating actions are expected in the near term; the expected impact of a change in the US dollar-to-Canadian dollar foreign exchange rate on basic earnings per common share in 2009; the estimated impact a decease in revenue at Fortis Properties' Hospitality Division would have on basic earnings per common share; the expectation that counterparties to the Terasen Gas companies' gas derivative contracts will continue to meet their obligations; and the expectation of no material increase in defined benefit pension expense in 2009. The forecasts and projections that make up the forward-looking information are based on assumptions which include, but are not limited to: the receipt of applicable regulatory approvals and requested rate orders; no significant operational disruptions or environmental liability due to a catastrophic event or environmental upset caused by severe weather, other acts of nature or other major event; the continued ability to maintain the gas and electricity systems to ensure their continued performance; no significant decline in capital spending in 2009; no severe and prolonged downturn in economic conditions; sufficient liquidity and capital resources; the continuation of regulator-approved mechanisms to flow through the commodity cost of natural gas and energy supply costs in customer rates; the continued ability to hedge exposures to fluctuations in interest rates, foreign exchange rates and natural gas commodity prices; no significant variability in interest rates; no significant counterparty defaults; the continued competitiveness of natural gas pricing when compared with electricity and other alternative sources of energy; the continued availability of natural gas supply; the continued ability to fund defined benefit pension plans; the absence of significant changes in government energy plans and environmental laws that may materially affect the operations and cash flows of the Corporation and its subsidiaries; maintenance of adequate insurance coverage; the ability to obtain and maintain licences and permits; retention of existing service areas; no material decrease in market energy sales prices; favourable relations with First Nations; favourable labour relations; and sufficient human resources to deliver service and execute the capital program. The forward-looking information is subject to risks, uncertainties and other factors that could cause actual results to differ materially from historical results or results anticipated by the forward-looking information. Factors which could cause results or events to differ from current expectations include, but are not limited to: regulatory risk; operating and maintenance risks; economic conditions; capital resources and liquidity risk; weather and seasonality; an ultimate resolution of the Exploits River Hydro Partnership that differs from what is currently expected by management; commodity price risk; derivative financial instruments and hedging; interest rate risk; counterparty risk;

competitiveness of natural gas; natural gas supply; defined benefit pension plan performance and funding requirements; risks related to the development of the Terasen Gas (Vancouver Island) Inc. franchise; the Government of British Columbia's Energy Plan; environmental risks; insurance coverage risk; an unexpected outcome of legal proceedings currently against the Corporation; licences and permits; loss of service area; market energy sales prices; transition to International Financial Reporting Standards; changes in tax legislation; First Nations' lands; labour relations and human resources. For additional information with respect to the Corporation's risk factors, reference should be made to the Corporation's continuous disclosure materials filed from time to time with Canadian securities regulatory authorities and to the heading "Business Risk Management" in this MD&A for the year ended December 31, 2008.

All forward-looking information in the MD&A is qualified in its entirety by the above cautionary statements and, except as required by law, the Corporation undertakes no obligation to revise or update any forward-looking information as a result of new information, future events or otherwise after the date hereof.

Corporate Overview and Strategy

Fortis is the largest investor-owned distribution utility in Canada serving more than 2,000,000 gas and electricity customers. Its regulated holdings include electric utilities in five Canadian provinces and three Caribbean countries and a natural gas utility in British Columbia. Fortis owns non-regulated generation assets, primarily hydroelectric, across Canada and in Belize and Upper New York State and hotels and commercial real estate in Canada. In 2008, the Corporation's electricity distribution systems met a combined peak electricity demand of more than 5,700 megawatts ("MW") and its gas distribution systems met a peak day demand of 1,402 terajoules ("TJ").

The vision of Fortis is to be the world leader in those segments of the regulated utility industry in which it operates and the leading service provider within its service areas. Fortis has adopted a strategy of profitable growth with earnings per common share as the primary measure of performance. The Corporation's first priority is to pursue organic growth opportunities in existing operations. Additionally, Fortis pursues profitable growth through acquisitions.

The key goals of the Corporation's regulated utilities are to operate sound gas and electricity distribution systems, deliver gas and electricity safely and reliably to customers at reasonable rates, and conduct business in an environmentally responsible manner. The Corporation's main business, utility operations, is highly regulated. It is segmented by franchise area and, depending on regulatory requirements, by the nature of the assets. The operating segments of the Corporation are: (i) Regulated Gas Utilities – Canadian; (ii) Regulated Electric Utilities – Canadian; (iii) Regulated Electric Utilities – Caribbean; (iv) Non-Regulated – Fortis Generation; (v) Non-Regulated – Fortis Properties; and (vi) Corporate and Other. The earnings of the Corporation's regulated utilities are primarily determined under traditional cost of service and rate of return methodologies. Earnings of the Canadian regulated utilities are generally exposed to changes in interest rates which factor into customer rate-setting mechanisms.

Fortis holds investments in non-regulated generation, and commercial real estate and hotels, which are treated as two separate segments. The Corporation's non-regulated generation assets operate in three countries and have a combined generating capacity of 195 MW, mainly hydroelectric. Except for non-regulated hydroelectric generation operations in Belize and British Columbia, the Corporation's non-regulated generation operations are owned and/or managed by Fortis Properties to ensure standard operating practices, enable leveraging of expertise across the various jurisdictions and allow the pursuit of non-regulated hydroelectric projects. The Corporation's investments in non-regulated assets provide for financial, tax and regulatory flexibility and enhance shareholder return.

The Corporation's reporting segments allow senior management to evaluate the operational performance and assess the overall contribution of each segment to the Corporation's long-term objectives. Each reporting segment operates as an autonomous unit, assumes profit and loss responsibility and is accountable for its own resource allocation.

The following summary describes the operations included in each of the Corporation's reportable segments.

Regulated Utilities

The following summary describes the Corporation's interests in regulated gas and electric utilities in Canada and the Caribbean by utility:

Regulated Gas Utilities – Canadian

Terasen Gas Companies: Includes Terasen Gas Inc. ("TGI"), Terasen Gas (Vancouver Island) Inc. ("TGVI") and Terasen Gas (Whistler) Inc. ("TGWI"), which Fortis acquired through the acquisition of Terasen Inc. ("Terasen") on May 17, 2007.

TGI is the largest distributor of natural gas in British Columbia, serving approximately 834,000 residential, commercial and industrial customers in a service area that extends from Vancouver to the Fraser Valley and the interior of British Columbia.

TGVI owns and operates the natural gas transmission pipeline from the Greater Vancouver area across the Georgia Strait to Vancouver Island and the distribution system on Vancouver Island and along the Sunshine Coast of British Columbia, serving approximately 95,000 residential, commercial and industrial customers.

In addition to providing transmission and distribution ("T&D") services to customers, TGI and TGVI also obtain natural gas supplies on behalf of most residential and commercial customers. Gas supplies are sourced primarily from northeastern British Columbia and, through TGI's Southern Crossing Pipeline, from Alberta.

TGWI owns and operates the propane distribution system in Whistler, British Columbia, providing service to approximately 2,400 residential and commercial customers.

Regulated Electric Utilities – Canadian

a. *FortisAlberta:* FortisAlberta owns and operates the electricity distribution system in a substantial portion of southern and central Alberta, serving approximately 461,000 customers.

b. *FortisBC:* Includes FortisBC Inc., an integrated electric utility operating in the southern interior of British Columbia, serving more than 157,000 customers. FortisBC Inc. owns four hydroelectric generating facilities with a combined capacity of 223 MW. Included with the FortisBC component of the Regulated Electric Utilities – Canadian segment are the operating, maintenance and management services relating to the 450-MW Waneta hydroelectric generating facility owned by Teck Cominco Metals Ltd., the 269-MW Brilliant Hydroelectric Plant owned by Columbia Power Corporation and the Columbia Basin Trust ("CPC/CBT"), the 185-MW Arrow Lakes Hydroelectric Plant owned by CPC/CBT and the distribution system owned by the City of Kelowna.

c. *Newfoundland Power:* Newfoundland Power is the principal distributor of electricity in Newfoundland, serving approximately 236,000 customers. Newfoundland Power has an installed generating capacity of approximately 140 MW, of which 97 MW is hydroelectric generation.

d. *Other Canadian:* Includes Maritime Electric and FortisOntario. Maritime Electric is the principal distributor of electricity on Prince Edward Island, serving approximately 73,000 customers. Maritime Electric also maintains on-Island generating facilities with a combined capacity of 150 MW. FortisOntario provides integrated electric utility service to approximately 52,000 customers in Fort Erie, Cornwall, Gananoque and Port Colborne in Ontario. FortisOntario's operations primarily include Canadian Niagara Power Inc. ("Canadian Niagara Power") and Cornwall Street Railway, Light and Power Company, Limited ("Cornwall Electric"). Included in Canadian Niagara Power's accounts is the operation of the electricity distribution business of Port Colborne Hydro Inc., which has been leased from the City of Port Colborne under a 10-year lease agreement that expires in April 2012.

Regulated Electric Utilities – Caribbean

a. *Belize Electricity:* Belize Electricity is the principal distributor of electricity in Belize, Central America, serving approximately 74,000 customers. The Company has an installed generating capacity of 34 MW. Fortis holds an approximate 70 per cent controlling ownership interest in Belize Electricity.

b. *Caribbean Utilities:* Caribbean Utilities is the sole provider of electricity on Grand Cayman, Cayman Islands, serving more than 24,000 customers. The Company has an installed generating capacity of approximately 137 MW. Fortis has an approximate 57 per cent controlling ownership interest in Caribbean Utilities. Caribbean Utilities is a public company traded on the Toronto Stock Exchange (TSX:CUP.U). Caribbean Utilities had an April 30 fiscal year end whereby, up to and including the third quarter of 2008, Caribbean Utilities' financial statements were consolidated in the financial statements of Fortis on a two-month lag basis. Caribbean Utilities changed its fiscal year end to December 31, which has resulted in the Corporation consolidating 14 months of financial results of Caribbean Utilities during 2008. Going forward, this change in the Company's fiscal year end will eliminate the previous two-month lag in consolidating Caribbean Utilities' financial results.

c. *Fortis Turks and Caicos:* Includes P.P.C. Limited and Atlantic Equipment & Power (Turks and Caicos) Ltd. Fortis Turks and Caicos is the principal distributor of electricity on the Turks and Caicos Islands, serving more than 9,000 customers. The Company has a combined diesel-fired generating capacity of 48 MW.

Non-Regulated – Fortis Generation

The following summary describes the Corporation's non-regulated generation assets by location:

a. *Belize:* Operations consist of the 25-MW Mollejon and 7-MW Chalillo hydroelectric generating facilities in Belize. All of the output of these facilities is sold to Belize Electricity under a 50-year power purchase agreement expiring in 2055. The hydroelectric generation operations in Belize are conducted through the Corporation's indirect wholly owned subsidiary Belize Electric Company Limited ("BECOL") under a franchise agreement with the Government of Belize.

b. *Ontario:* Includes 75 MW of water-right entitlement associated with the Niagara Exchange Agreement, which expires April 30, 2009; a 5-MW gas-fired cogeneration plant in Cornwall; and six small hydroelectric generating stations in eastern Ontario with a combined capacity of 8 MW.

c. *Central Newfoundland:* Through the Exploits River Hydro Partnership ("Exploits Partnership"), a partnership between the Corporation, through its wholly owned subsidiary, Fortis Properties, and Abitibi-Consolidated Company of Canada ("Abitibi-Consolidated"), 36 MW of additional capacity was developed and installed at two of Abitibi-Consolidated's hydroelectric generating plants in central Newfoundland. Fortis Properties holds directly a 51 per cent interest in the Exploits Partnership and Abitibi-Consolidated holds the remaining 49 per cent interest. The Exploits Partnership sells its output to Newfoundland and Labrador Hydro Corporation ("Newfoundland Hydro") under a 30-year power purchase agreement expiring in 2033. For a further discussion of the Exploits Partnership and pending changes related to it refer to the "Liquidity and Capital Resources – Cash Flow Requirements" and "Critical Accounting Estimates – Contingencies" sections of this MD&A.

d. *British Columbia:* Includes the 16-MW run-of-river Walden hydroelectric power plant near Lillooet, British Columbia. This plant sells its entire output to BC Hydro under a long-term contract expiring in 2013.

e. *Upper New York State:* Includes the operations of four hydroelectric generating stations in Upper New York State, with a combined capacity of approximately 23 MW, operating under licences from the US Federal Energy Regulatory Commission. Hydroelectric operations in Upper New York State are conducted through the Corporation's indirect wholly owned subsidiary FortisUS Energy Corporation ("FortisUS Energy").

Non-Regulated – Fortis Properties

Fortis Properties owns and operates 20 hotels comprised of more than 3,800 rooms in eight Canadian provinces and approximately 2.8 million square feet of commercial real estate primarily in Atlantic Canada.

Corporate and Other

The Corporate and Other segment captures expense and revenue items not specifically related to any reportable segment. This segment includes finance charges, including interest on debt incurred directly by Fortis and Terasen Inc. and dividends on preference shares classified as long-term liabilities; dividends on preference shares classified as equity; other corporate expenses, including Fortis and Terasen Inc. corporate operating costs, net of recoveries from subsidiaries; interest and miscellaneous revenues; and corporate income taxes.

Also included in the Corporate and Other segment are the financial results of CustomerWorks Limited Partnership ("CWLP"). CWLP is a non-regulated shared-services business in which Terasen holds a 30 per cent interest. CWLP operates in partnership with Enbridge Inc. and provides customer service contact, meter reading, billing, credit, support and collection services to the Terasen Gas companies and several smaller third parties. CWLP's financial results are recorded using the proportionate consolidation method of accounting. While currently not significant, financial results of Terasen Energy Services Inc. ("TES") are also reported in the Corporate and Other segment. TES is a non-regulated wholly owned subsidiary of Terasen that provides alternative energy solutions.

Acquisitions: In November 2008, Fortis Properties acquired the Fairmont Newfoundland hotel for approximately $22 million, increasing hospitality operations by 301 rooms and 16,000 square feet of convention space.

On May 17, 2007, Fortis completed the acquisition of all of the issued and outstanding common shares of Terasen, formerly a wholly owned subsidiary of Kinder Morgan, Inc., for aggregate consideration of $3.7 billion, including the assumption of approximately $2.4 billion of consolidated debt. Terasen owns and operates a gas distribution business carried on by TGI, TGVI and TGWI. The acquisition did not include the petroleum transportation assets of Kinder Morgan Canada (formerly Terasen Pipelines), which are comprised primarily of refined and crude oil pipelines.

A significant portion of the net cash purchase price of Terasen was satisfied with the net proceeds of the public offering of Subscription Receipts completed by Fortis on March 15, 2007. Fortis issued approximately 44.3 million Subscription Receipts for gross proceeds of approximately $1.15 billion. Upon closing of the acquisition on May 17, 2007, each Subscription Receipt was automatically exchanged, without payment of additional consideration, for one common share of Fortis. The remaining net cash purchase price was financed, on an interim basis, by drawing $125 million on the Corporation's existing credit facility.

On August 1, 2007, Fortis Properties purchased the Delta Regina, comprised of the 274-room Delta Regina hotel, the Saskatchewan Trade and Convention Centre, 52,000 square feet of commercial office space and a parking garage in Regina, Saskatchewan, for an aggregate cash purchase price of approximately $50 million.

Key Trends and Risks: Terasen improved the risk profile of Fortis by providing the Corporation with a more economically diverse portfolio of assets and earnings. The expansion into natural gas added a new business segment, doubled the regulated rate base of Fortis and was complementary to the Corporation's proven core competencies in managing regulated electric distribution utilities. The distribution franchises of the Terasen Gas companies have a well-diversified, mature, principally residential customer base and operate in a service territory that has experienced steady economic growth and includes substantially all of the service territory of FortisBC. The expansion into natural gas distribution provides Fortis with a platform for future growth in the regulated natural gas business in Canada and the United States.

A large proportion of the businesses of Fortis serve the economies of western Canada, which have been growing faster than other regions of Canada. As at December 31, 2008, regulated utility assets comprised 92 per cent of total assets (December 31, 2007 – 92 per cent) and regulated utility assets in Canada comprised 82 per cent of total assets (December 31, 2007 – 84 per cent).

Declining long-term interest rates in Canada since 2005 have negatively impacted the formula-based allowed rate of return on common shareholders' equity ("ROE") used to set customer rates at each of the Corporation's four largest regulated utilities. The chart below highlights the trend in the regulator-allowed ROEs at each of the Corporation's four largest regulated utilities.

Regulator-Allowed ROE

(%)	2005	2006	2007	2008	2009
Terasen Gas Inc.	9.03	8.80	8.37	8.62	8.47
FortisAlberta	9.50	8.93	8.51	8.75	8.51[(1)]
FortisBC	9.43	9.20	8.77	9.02	8.87
Newfoundland Power	9.24	9.24	8.60	8.95	8.95

[(1)] Interim ROE pending outcome of regulatory proceeding

The impact on the Corporation's consolidated earnings of lower allowed ROEs has been more than offset by earnings derived from increased rate bases and energy sales and the realization of operating cost efficiencies.

Economic growth in the province of Alberta has been robust in the past few years translating into strong customer, energy sales and rate base growth at FortisAlberta. The rate of growth may decrease in 2009 due to the current global economic environment and depressed world oil prices. FortisAlberta's service territory includes the environs of Calgary and Edmonton as well as the corridor between these cities. A healthy British Columbia provincial economy and population growth in the Okanagan region have favourably impacted customer and sales growth at FortisBC and the Terasen Gas companies over the past few years. Sales growth in 2008 at FortisBC was tempered due to decreased activity in the forestry sector. Organic earnings growth from the Corporation's regulated utilities in Canada is expected to be primarily driven by rate base growth at FortisAlberta, FortisBC and the Terasen Gas companies. The Corporation's other Canadian regulated electric utilities, Newfoundland Power, Maritime Electric and FortisOntario, are expected to generate slower earnings' growth.

Regulated assets in the Caribbean region, as a percentage of the Corporation's total regulated assets, were 10 per cent at December 31, 2008 (December 31, 2007 – 8 per cent). The regulated rate of return on rate base assets ("ROA") achieved in the Caribbean is higher than that achieved in Canada. The higher return is correlated with increased operating risks associated with local economic and political factors and weather conditions. However, the allowed ROAs at Caribbean Utilities and Belize Electricity were lowered in 2008 due to the negotiation of new licences at Caribbean Utilities and the impact of a regulatory rate decision at Belize Electricity. Economic growth has been strong in the Corporation's service territories in the Caribbean, positively impacting customer and sales growth. The rate of growth is expected to be lower in 2009 due to the impact of the global economic downturn. The Corporation's operations in the Caribbean are exposed to hurricane risk. Fortis uses external insurance to help mitigate the impact on its operations of potential damage and related business interruption associated with hurricanes.

The key business risk to Fortis is regulatory risk. Except for the Terasen Gas companies and FortisBC, which have the same regulator, the Corporation's other utilities are regulated by different regulatory authorities. Relationships with the regulatory authorities are managed at the local utility level and such relationships have generally been positive. However, the relationship of Belize Electricity with its regulator became tenuous in 2008 when the regulator issued a decision disallowing previously incurred fuel and purchased power costs and lowering the regulated ROA. The decision has negatively impacted Belize Electricity's financial health. Although the receipt of an adverse regulatory decision may materially affect the ability of any utility to recover the cost of providing its services and achieving a reasonable rate of return, the impact on the Corporation as a whole is lessened due to the geographic and regulatory diversity of its operations. The total assets of Belize Electricity comprise approximately 2 per cent of the Corporation's total assets.

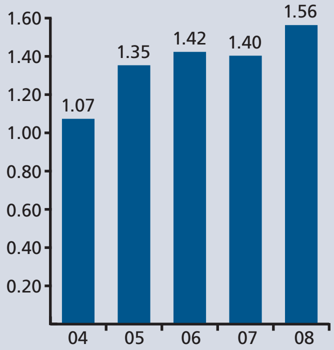
In Canada, regulator-approved negotiated settlement agreements were reached at FortisAlberta and FortisBC for 2008 and 2009 electricity rates and at Newfoundland Power for 2008 electricity rates. Achieving regulator-approved negotiated settlement agreements eliminates the cost of full-scale public hearing processes. Customer rates at Newfoundland Power and the Terasen Gas companies have also been set for 2009.

The Corporation's regulated gas and electric utilities require continual access to long-term capital to fund investments in infrastructure necessary to provide service to customers. Long-term capital required to carry out the subsidiary capital expenditure programs is mostly obtained at the regulated utility level. The subsidiaries issue debt mostly at terms ranging between 10 years and 30 years. As at December 31, 2008, approximately 84 per cent of the Corporation's consolidated long-term debt and capital lease obligations had maturities beyond five years. To help ensure uninterrupted access to capital and sufficient liquidity to fund capital programs and working capital requirements, the Corporation and its subsidiaries have $2.2 billion in credit facilities of which approximately $1.5 billion was available as at December 31, 2008. During 2008, Fortis and its subsidiaries issued almost $1.2 billion in equity and long-term debt. With strong credit ratings and conservative capital structures, the Corporation and its subsidiaries expect to continue to have reasonable access to long-term capital in 2009.

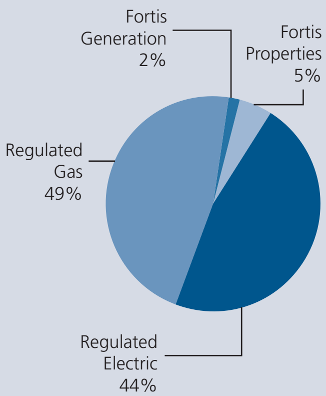
Common share dividend payments increased to $1.00 per common share in 2008. Effective for the first quarter of 2009, a 4 per cent increase in the quarterly common share dividend to 26 cents from 25 cents extends the Corporation's record of annual common share dividend increases to 36 consecutive years, the longest record of any public corporation in Canada.

For a complete discussion of the Corporation's business risks, including regulatory risk and the impact on the Corporation and its subsidiaries of recent economic conditions, refer to the "Regulatory Highlights", "Business Risk Management" and "Outlook" sections of this MD&A.

Basic Earnings per Common Share *($)*

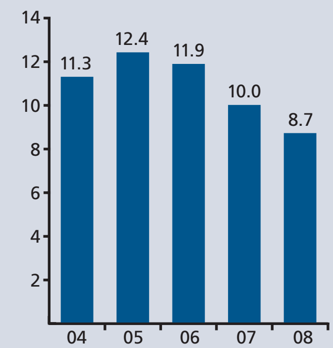


Revenue[(1)]
(year ended December 31, 2008)



[(1)] Excludes Corporate and Other

Return on Average Common Shareholders' Equity *(%)*



Net Earnings Applicable to Common Shares and Earnings per Common Share: Fortis achieved net earnings applicable to common shares of $245 million in 2008, a 26.9 per cent increase over earnings of $193 million in the previous year. The increase in earnings was primarily due to earnings' contributions from the Terasen Gas companies for a full year in 2008 compared to a partial year in 2007, rate base growth and higher allowed ROEs at the Corporation's Canadian regulated utilities, and increased non-regulated hydroelectric production due to higher rainfall. The increase was tempered by a one-time $13 million loss related to a June 2008 regulatory rate decision at Belize Electricity and lower corporate tax recoveries at FortisAlberta. Results for 2008 also reflected a $7.5 million tax reduction ($5.5 million at the Terasen Gas companies and $2 million at Terasen Inc.) associated with the settlement of historical corporate tax matters at Terasen. Results for 2007 reflected a $7 million after-tax gain on the sale of surplus land at TGI.

Basic earnings per common share were $1.56 in 2008, an 11.4 per cent increase over $1.40 in the previous year. The increase was primarily due to growth in earnings associated with the Terasen Gas companies and increased non-regulated hydroelectric production. Basic earnings per common share in 2007 were diluted by the common shares issued to fund the acquisition of Terasen and by the seasonality of earnings at the Terasen Gas companies.

Revenue: Revenue increased 43.6 per cent to approximately $3.9 billion from approximately $2.7 billion in 2007. The increase was driven by contributions from the Terasen Gas companies for a full year in 2008 compared to a partial year in 2007. The remainder of the increase was mainly the result of customer rate increases, which included the impact of higher allowed ROEs for 2008 and the flow through to customers of higher energy supply costs; two additional months of contribution from Caribbean Utilities due to a change in the utility's fiscal year end; and customer growth.

Return on Average Common Shareholders' Equity: Return on average common shareholders' equity was 8.7 per cent in 2008 compared to 10.0 per cent in 2007. The decline largely related to higher average common shareholders' equity associated with the May 2007 acquisition of Terasen.

Cash Flow from Operating Activities: Cash flow from operating activities, after working capital adjustments, was $663 million in 2008, 77.7 per cent higher than $373 million in the previous year. The increase primarily reflected a full year of contributions from the Terasen Gas companies in 2008.

2008 Capital Expenditures: During 2008, consolidated capital expenditures, before customer contributions ("gross capital expenditures"), were $904 million, including capital expenditures of approximately $220 million at the Terasen Gas companies. Total capital investment at FortisAlberta and FortisBC during 2008 was approximately $419 million, representing approximately 46 per cent of total gross capital expenditures. Much of the capital investment was driven by customer growth and the need to enhance the reliability of electricity systems.

Management Discussion and Analysis

Dividends: Dividends paid per common share increased to $1.00 in 2008, up 22.0 per cent from 82 cents in 2007. Commencing with the first quarter dividend paid on March 1, 2009, Fortis increased its quarterly common share dividend 4 per cent to 26 cents from 25 cents. The Corporation's dividend payout ratio was 64.1 per cent in 2008 compared to 58.6 per cent in 2007.

In December 2008, the Corporation amended and restated its Dividend Reinvestment and Share Purchase Plan to provide a 2 per cent discount on the purchase of common shares issued from treasury, with reinvested dividends, effective March 1, 2009.

Asset Growth: Total assets increased 8.8 per cent to approximately $11.2 billion at the end of 2008 compared to approximately $10.3 billion at the end of 2007. The increase was primarily due to the Corporation's continued investment in energy systems at FortisAlberta, FortisBC and the Terasen Gas companies, combined with the impact of foreign exchange associated with translation of foreign currency-denominated assets.
