Attention: Ms. Alanna Gillis, Acting Commission Secretary

Dear Ms. Gillis:

Re: FortisBC Energy Utilities (comprised of FortisBC Energy Inc. ("FEI"), FortisBC Energy Inc. Fort Nelson Service Area ("Fort Nelson"), FortisBC Energy (Whistler) Inc. ("FEW"), and FortisBC Energy (Vancouver Island) Inc.) ("FEVI")

2012 and 2013 Revenue Requirements and Natural Gas Rates Application

---

Attached please find the FortisBC Energy Utilities' ("FEU" or the "Companies") 2012 and 2013 Revenue Requirements and Rates Application (the "Application" or "RRA").

Summary of Requests

This Application follows two-year Negotiated Settlement Agreements for 2010 and 2011 for FEI and FEVI, a two-year revenue requirements decision for FEW for 2010 and 2011, and a single year revenue requirements decision for Fort Nelson for 2011. In this Application, each of the FEU is requesting rate approvals for 2012 and 2013. In particular:

- FEI is seeking approval of an increase in its rates for delivery service for a two-year period commencing January 1, 2012. The increase sought for 2012 is 5.0%, with an additional effective base rate delivery increase of 6.4% in 2013. These proposed increases result in modest changes to the annual bill of an average Lower Mainland residential customer with an approximate net increase of 2.4% or $24 in 2012 and an additional 3.0% or $31 in 2011.[1]

- FEW is seeking an increase in its rates for delivery service of 2.2 per cent in 2012, with an additional increase of 11.9 per cent (cumulative increase of 14.1 per cent) in 2013. This, results in an increase to the annual bill of an average Whistler residential

[1] Based on a typical annual consumption of a Lower Mainland residential customer consuming 95 GJ. This is also based on the current commodity and midstream charges effective April 1, 2011 and excludes the impacts of rate riders.

customer of 1.5 per cent or $22 in 2012 and an additional 7.1 per cent or $115 in 2013.[2]

- Fort Nelson is seeking an increase in its rates for delivery service of 6.5 per cent in 2012, with an additional increase of 1.6 per cent (cumulative increase of 8.1 per cent) in 2013. This, results in an increase to the annual bill of an average Fort Nelson residential customer of 2.3 per cent or $26 in 2012 and an additional 0.6 per cent or $7 in 2013.[3]

- FEVI is seeking to maintain current rates for all customers except those with specified rates in their transportation service agreements, for a two-year period commencing January 1, 2012. FEVI proposes to utilize part of the surplus that will exist in the Rate Stabilization Deferral Account ("RSDA") to allow for rates to remain at 2011 levels through to the end of 2013. The RSDA was approved as part of the last FEVI revenue requirements application, with the intention of using the accumulated balance to manage cost pressures unique to FEVI. The rate proposal in the present Application implements the previously developed strategy.

- FEI, FEW and Fort Nelson are also seeking approval of the Rate Stabilization Adjustment Mechanism ("RSAM") rider for 2012.

In the Fall of 2012, the Companies intend to seek the necessary approvals to amalgamate effective January 1, 2013 and to introduce harmonized rate structures effective on the same date. As the anticipated effective date of amalgamation and harmonized rates falls within this two year revenue requirements period, the orders sought in respect of 2013 rates for the individual entities have been expressed as being conditional upon amalgamation and harmonized rates not taking effect. And, in anticipation of the upcoming application to amalgamate and introduce harmonized rates, the FEU are collectively applying in the present Revenue Requirements Application for approval of the combined utility cost of service for 2013. The FEU believe, for the reasons described in Section 1.2.5 of the Application, that this is the most efficient way to proceed. In order to avoid any concern about predetermining in this Application the substantive merits of the Fall application to amalgamate and implement harmonized rates, this requested approval has been phrased to make it clear that the determination of the amalgamated cost of service in this Application is conditional upon future Commission orders and in no way speaks to the merits of amalgamation and harmonized rates. The FEU thus believe that all inquiries regarding amalgamation and harmonized rates should also be deferred to the Fall 2012 application.

Proposed Process

In terms of process, the FEU are open to a negotiated settlement of all of the issues, should the parties believe that is a possibility. Otherwise, the FEU believe that this Application can be addressed efficiently and effectively through a written hearing process. The proposed regulatory timetable, and a discussion of issues that the FEU intend to address at the

[2] Based on a typical annual consumption of a Whistler residential customer consuming 90 GJ. This is also based on current commodity and midstream charges effective April 1, 2011.
[3] Based on a typical annual consumption of a Fort Nelson residential customer consuming 140 GJ. This is also based on current commodity charges effective April 1, 2011.

planned Procedural Conference proposed for May 24, 2011, are included in Section 8 of this Application titled Approvals Sought and Proposed Regulatory Process. The FEU are optimistic that the Commission will be in a position to make its determination regarding the type of hearing process, and the other issues identified, following the procedural conference proposed for May 24, 2011.

Request for Confidentiality

The FEU are submitting one component of the Application under separate cover requesting confidentially. In the Application, under Section 5.3.2.2 Labour Inflation and Benefits, certain paragraphs contain sensitive information which, if disclosed publicly, could compromise future negotiations between the Companies and their unionized labour bargaining units. The Companies are, therefore, submitting a redacted version of pages 147 and 148 for the public record.

If you require further information or have any questions regarding this submission, please contact the undersigned.

Yours very truly,

on behalf of the FORTISBC ENERGY UTILITIES

1 EXECUTIVE SUMMARY AND INTRODUCTION

With this Revenue Requirements Application ("RRA" or the "Application"), FortisBC Energy Inc. ("FEI" or "Mainland"), the Fort Nelson Service Area of FEI ("Fort Nelson"), FortisBC Energy (Whistler) Inc. ("FEW" or "Whistler"), FortisBC Energy (Vancouver Island) Inc. ("FEVI" or "Vancouver Island") (together, the "Utilities", the "FortisBC Energy Utilities", the "Companies" or the "FEU") are requesting rate approvals for 2012 and 2013. Specific requests for each of the FortisBC Energy Utilities for 2012 and 2013, are summarized in this Section. In addition, the FEU are collectively applying for a Commission determination of the combined utility cost of service for 2013, subject to the Companies obtaining, at a later date, the necessary approvals to amalgamate. The combined cost of service will provide the basis for a unified rate structure for an amalgamated entity. A complete list of approvals sought for all utilities is set out in Section 8. The Companies believe that the proposed rates, and associated orders sought, are just and reasonable and should be approved pursuant to the *Utilities Commission Act* (the "UCA" or the "Act").

1.1 Executive Summary

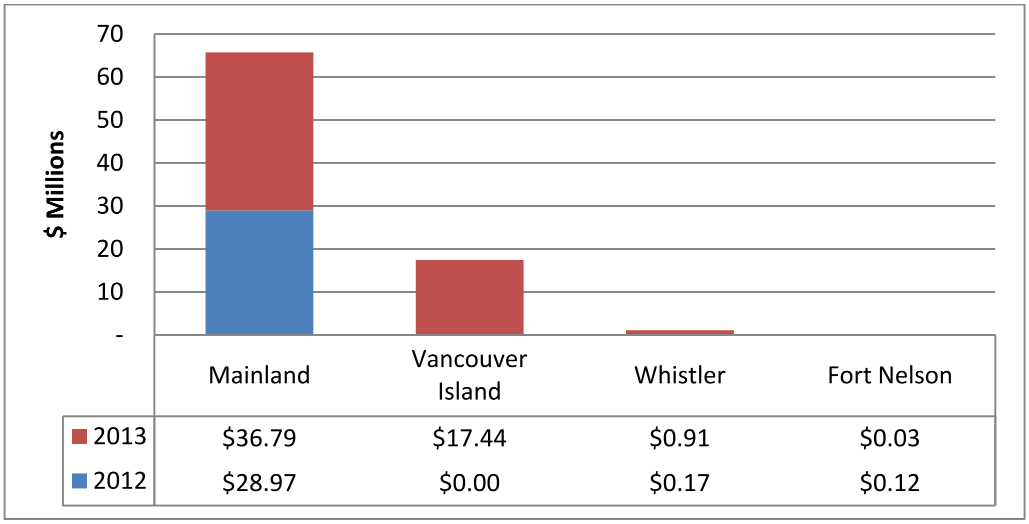
The FortisBC Energy Utilities remain focused and committed to providing cost effective, high-quality service to our customers, while ensuring employee and public safety, and operating in an environmentally responsible manner. In advancing these objectives, the FEU employs an appropriate management structure, a variety of metrics to assess corporate performance, and a compensation program that is tied to the achievement of objectives. The Companies' management structure, compensation philosophy and O&M and capital budgeting and control processes contribute to effective management of the costs that are incorporated into these revenue requirements.

This Application has been prepared using accounting policies and estimates assuming the continuation of the IFRS compliant policies that were approved in the setting of rates for 2011 for the Utilities. The accounting policy changes approved at that time are still allowed under IFRS, and are also allowed under US GAAP. Section 3.2 of this Application discusses the impacts on revenue requirements of either fully implementing IFRS but with deferral accounts, or adopting US GAAP.

The revenue requirements reflect all of the inputs in the financial schedules, and take into consideration all of the impacts described in this Application. The revenue requirement changes that the Companies are requesting are based on sound research and forecasting, using our knowledge and experience to determine what the Companies believe is the likely course of events over the upcoming forecast periods of 2012 and 2013.

The following Figure provides the 2012 and 2013 revenue deficiencies for the FortisBC Energy Utilities. The revenue deficiency is determined by comparing the forecast cost of service to the forecast revenue at existing 2011 rates for each year.

Figure 1.1-1: Forecast 2012 and 2013 Revenue Deficiencies for the FortisBC Energy Utilities[1]



The revenue deficiencies result in 2012 and 2013 delivery rate changes for Mainland, Whistler and Fort Nelson as shown in Table 1.1-1. There is no revenue deficiency in 2012 for Vancouver Island, as the forecast revenues at existing rates equal the forecast cost of service. In 2013, the forecast revenue deficiency is being offset by part of the projected December 31, 2012 surplus balance of $71.6 million (before tax) in the Rate Stabilization Deferral Account ("RSDA"). In this Application, Vancouver Island is seeking approval for a rate freeze for 2012 (which equals the forecast cost of service) and 2013.

Table 1.1-1: Mainland, Whistler and Fort Nelson Delivery Rate Increases[2,3]

Utility/Region	2012	2013	Total
Mainland	5.04%	6.36%	11.40%
Whistler	2.23%	11.90%	14.12%
Fort Nelson	6.51%	1.64%	8.15%

Overall, the primary drivers for the revenue deficiencies are in the four categories described below.

1. Rate base growth

Increases in rate base are a major driver of the revenue deficiencies for 2012 and 2013. The 2012 and 2013 rate base amounts represent the investment by the Companies in utility assets necessary to provide service to our customers. 95 percent of the total FEU rate base of $3.6

1 Section 7.1 to 7.4, Schedules 2 and 3

2 Approximate delivery rate change percent is equal to the revenue deficiency divided by the forecast delivery margin revenue at existing 2011 delivery rates (i.e. excluding cost of gas).

3 Section 7.1 to 7.4, Schedule 14

billion is comprised of net gas plant in service (gross plant in service, less contribution in aid of construction, less accumulated depreciation relating to both, and negative salvage). The remaining portion of rate base consists of:

- work-in-progress not attracting allowance for funds used during construction;
- the mid-year balance of unamortized deferral accounts (regulatory assets and liabilities);
- the thirteen-month average of cash working capital and other working capital;
- mid-year future income tax asset and offsetting liability; and
- in the case of the Mainland, the LILO benefit arising from LILO agreements with several Interior municipalities.

The table below sets out the forecast rate base for 2012 and 2013, for each FortisBC Energy Utility.

Table 1.1-2: Rate Base in 2012 and 2013

($ thousands) **Utility/Region**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
Mainland	$ 2,629,185	$ 2,736,507	$ 2,788,327
Vancouver Island	728,993	787,864	814,078
Whistler	42,594	42,139	41,502
Fort Nelson	6,839	8,889	9,127
	$ 3,407,611	**$ 3,575,399**	**$ 3,653,034**

The increases to rate base in 2012 and 2013 are a result of both regular capital expenditures, including the incremental capital related to the Long Term Sustainment Plan as discussed in section 1.2.4.3 below, and the implementation of large projects, such as the Mount Hayes LNG Facility, the Customer Care Enhancement ("CCE") Project, the Fraser River, Kootenay River, Muskwa River and Tilbury projects, and the recently approved Victoria Regional Operations Centre. Balances in the Energy Efficiency and Conservation and other deferral accounts are also significant contributors to changes in rate base. Offsetting these increases are reductions in Gas In Storage due primarily to lower commodity rates.

Increases to rate base increase the revenue deficiency primarily through the rate of return on assets and higher depreciation expense.

2. Increases to O&M (net of overheads capitalized)

O&M expenditures are influenced by a number of drivers with cost pressures coming from different sources including non-discretionary increases for inflation on internal labour and benefits, contracts and materials, increases in operating activities, and new business drivers and safety requirements. In particular, incremental funding requests are driven by the five cost drivers discussed in Section 5.2:

- Labour inflation and benefits;
- Codes and regulations spending, reflecting our continued focus on maintaining the safety and reliability of our system summarized in Section 1.2.4.1 and 1.2.4.2;
- Customer and stakeholder expectations, reflecting the in-sourcing of key customer service functions and meter reading cost increases in 2013 (summarized in Section 1.2.1), and also the implementation of our long term resource planning initiative;
- Demographic challenges; and
- Service standards and reliability, driven in part by our Long Term Sustainment Plan requirements summarized in Section 1.2.4.3.

The O&M increases due to each of these cost drivers are described in detail on a department-by-department basis in Section 5.2.

Offsetting these incremental funding requests in 2012, the Companies are forecasting savings as compared to 2011 from the implementation of the Harmonized Sales Tax ("HST"). A discussion of the ongoing uncertainty around the HST is included in Section 5.6 Taxes.

3. Increases in Other Revenue

Overall, the Companies are forecasting a significant increase in other revenue in 2012 and a further modest increase in 2013. For all of the FortisBC Energy Utilities, other revenue includes revenue from service work (connection charges), late payment charges, and returned cheques. In addition, the Mainland utility receives revenue for wheeling charges (from Vancouver Island), third party revenue on its Southern Crossing Pipeline, and starting in 2012, revenue from natural gas for transportation service. The Vancouver Island utility also receives revenue from the Mainland for LNG mitigation.

Increases in this area are mainly from our CNG and LNG service revenue as summarized in Section 1.2.3 below.

4. Other Changes in Revenue Requirements

In this category includes:

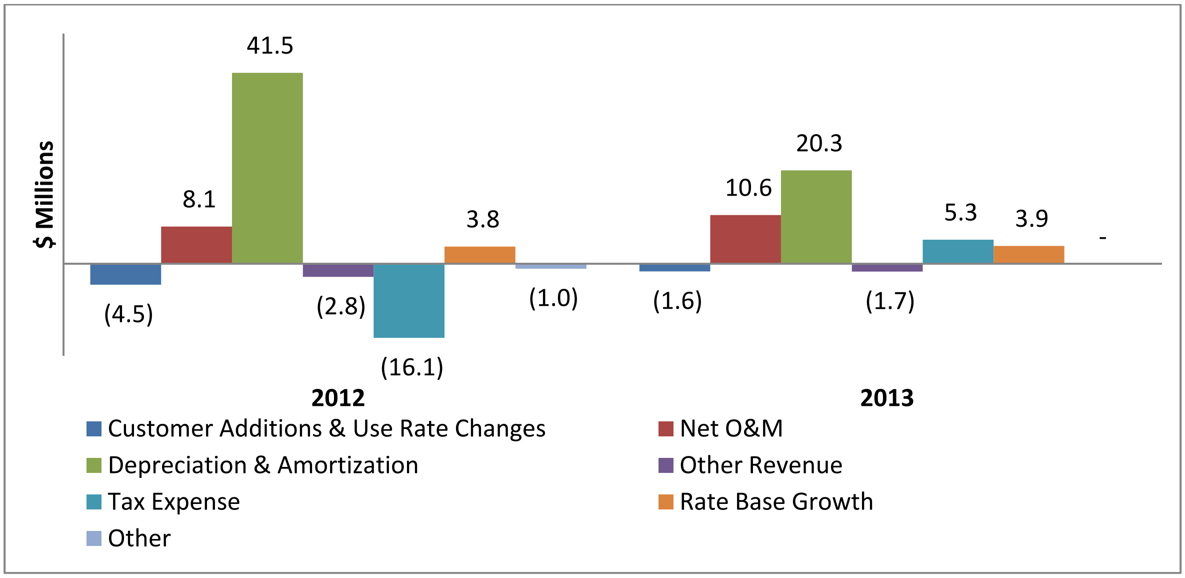
- Demand changes driven by customer growth and changes in use rates - all regions are forecast to experience a slight increase in consumption except Whistler, where consumption is forecast to decline by 1 percent from 2012 to 2013;
- Increases to depreciation and negative salvage rates related to removal costs - an update to the depreciation study has been conducted, resulting in increases in both depreciation expense and estimates of negative salvage;
- Increases in property tax. Property tax has a moderate impact on revenue requirements over the two year period; and
- Decreases in interest and income tax rates and changes to the tax treatment of certain items, such as removal costs. The income tax rate has declined from 26.5 percent in 2011 to 25 percent in 2012 and the forecast of short-term interest rates has declined from what was included in the 2011 rates.

The rates sought for each utility and the particular cost drivers affecting each utility are discussed in the following paragraphs. In addition to the delivery rate increases summarized below, with this Application FEI, Fort Nelson and FEW are also requesting changes to the Revenue Stabilization Adjustment Mechanism ("RSAM") Rider for 2012.

FORTISBC ENERGY INC.

Changes to the FEI revenue requirements result in revenue deficiencies of $29.0 million in 2012 and $36.8 million in 2013. These deficiencies are summarized in Figure 1.1-2 below.

Figure 1.1-2: Mainland Revenue Deficiency Components[4]



The primary drivers of the revenue deficiencies in FEI are rate base and depreciation growth resulting from the implementation of significant capital projects related to system integrity and reliability (including the Fraser and Kootenay River Crossings, the Tilbury Property Purchase and the capital related to the Long Term Sustainment Plan) and our customer care enhancement solution, as well as inflationary pressures on costs, a heightened focus on the safety and security of our gas systems, and our ongoing and growing compliance requirements related to codes and regulations. FEI has continued to manage its costs appropriately in the face of increasing cost pressures, and FEI believes that the costs reflected in the proposed rates are reasonable.

Based on these revenue deficiencies, FEI is seeking an increase in its rates for delivery service of 5.0 per cent in 2012, with an additional increase of 6.4 per cent in 2013 (cumulative increase of 11.4 per cent over two years). The delivery charge is only one component of a customer's total bill. For an average Lower Mainland residential customer, this delivery rate increase results in changes to the annual bill of 2.4 per cent or $24 in 2012 and an additional 3.0 per cent or $31 in 2013.[5] Including the removal of the Earnings Sharing Mechanism rider and an offsetting reduction to the RSAM rate rider, the FEI annual bill impact would be a larger increase, of 2.8 per cent or $28 in 2012.

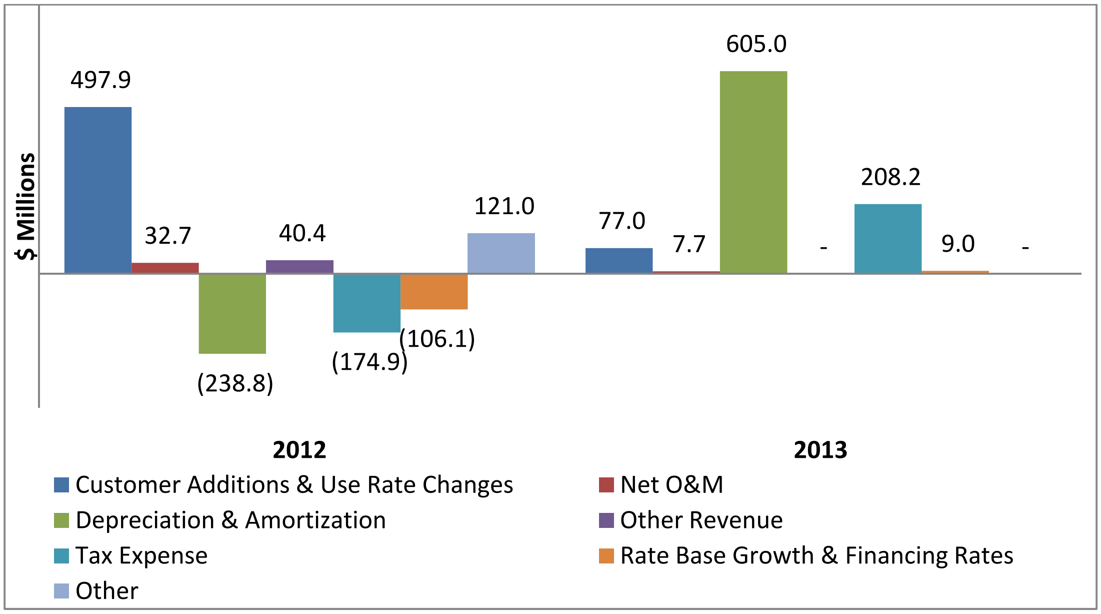
[4] Section 7.1, Schedule 1

[5] Based on a typical annual consumption of a Lower Mainland residential customer consuming 95 GJ. This is also based on current commodity and midstream charges effective April 1, 2011 and excludes the impacts of rate riders.

FORTISBC ENERGY WHISTLER INC.

Changes to the Whistler revenue requirements result in revenue deficiencies of $172 thousand in 2012 and $907 thousand in 2013. These deficiencies are summarized in Figure 1.1-3 below.

Figure 1.1-3: Whistler Revenue Deficiency Components[6]



In FEW, the primary driver of the revenue deficiencies is a reduction in the total demand forecast for 2012 and 2013, which is offset in large part in 2012 by the one year amortization of credit balances in deferral accounts.

Based on these revenue deficiencies, FEW is seeking an increase in its rates for delivery service of 2.2 per cent in 2012, with an additional increase of 11.9 per cent (cumulative increase of 14.1 per cent) in 2013. This results in an increase to the annual bill of an average Whistler residential customer of 1.5 per cent or $22 in 2012 and an additional 7.1 per cent or $115 in 2013.[7] Adding in the increase from the RSAM rate rider, the FEW annual bill impact would be an increase of 4.7 per cent or $69 in 2012.

---

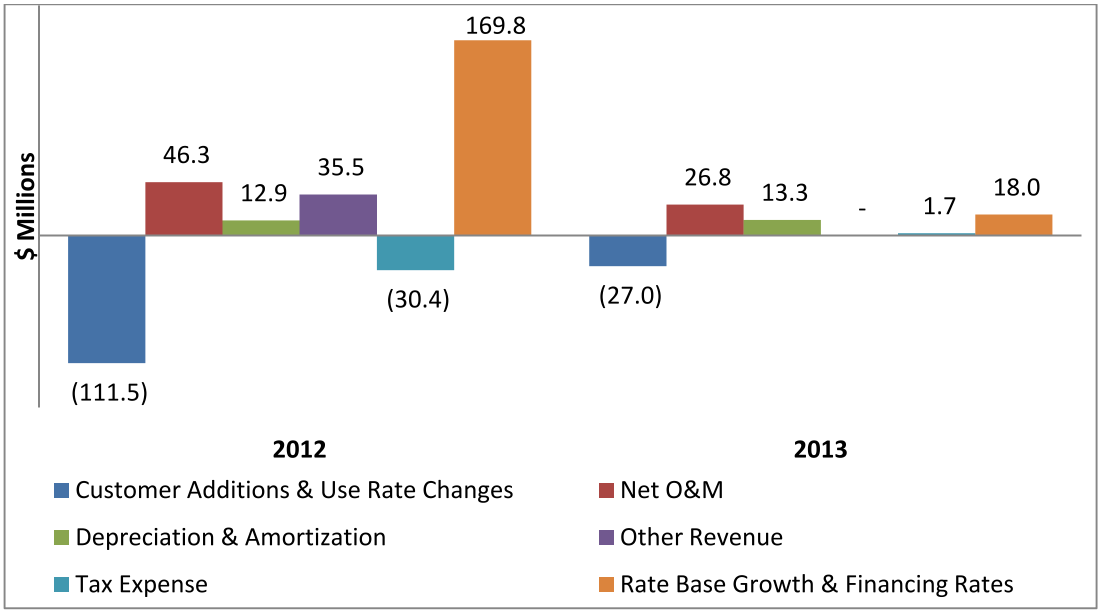
[6] Section 7.3, Schedule 1

[7] Based on a typical annual consumption of a Whistler residential customer consuming 90 GJ. This is also based on current commodity and midstream charges effective April 1, 2011 and excludes the impact of rate riders.

FORTISBC ENERGY INC. - FORT NELSON SERVICE AREA

Changes to the Fort Nelson revenue requirements result in revenue deficiencies of $122 thousand in 2012 and $33 thousand in 2013. These deficiencies are summarized in Figure 1.1-4 below.

Figure 1.1-4: Fort Nelson Revenue Deficiency Components[8]



The primary driver behind the revenue deficiencies in Fort Nelson is the necessary replacement of the Muskwa River Crossing that is expected to be complete late in 2011. The cost estimate and in service date for this project remains as approved in Commission Order No. G-27-11.

Based on these revenue deficiencies, Fort Nelson is seeking an increase in its rates for delivery service of 6.5 per cent in 2012, with an additional increase of 1.6 per cent (cumulative increase of 8.2 per cent) in 2013. This results in an increase to the annual bill of an average Fort Nelson residential customer of 2.3 per cent or $26 in 2012 and an additional 0.6 per cent or $7 in 2013.[9] Including a reduction to the RSAM rate rider, the Fort Nelson annual bill impact would be an increase of only 1.8 per cent or $20 in 2012.

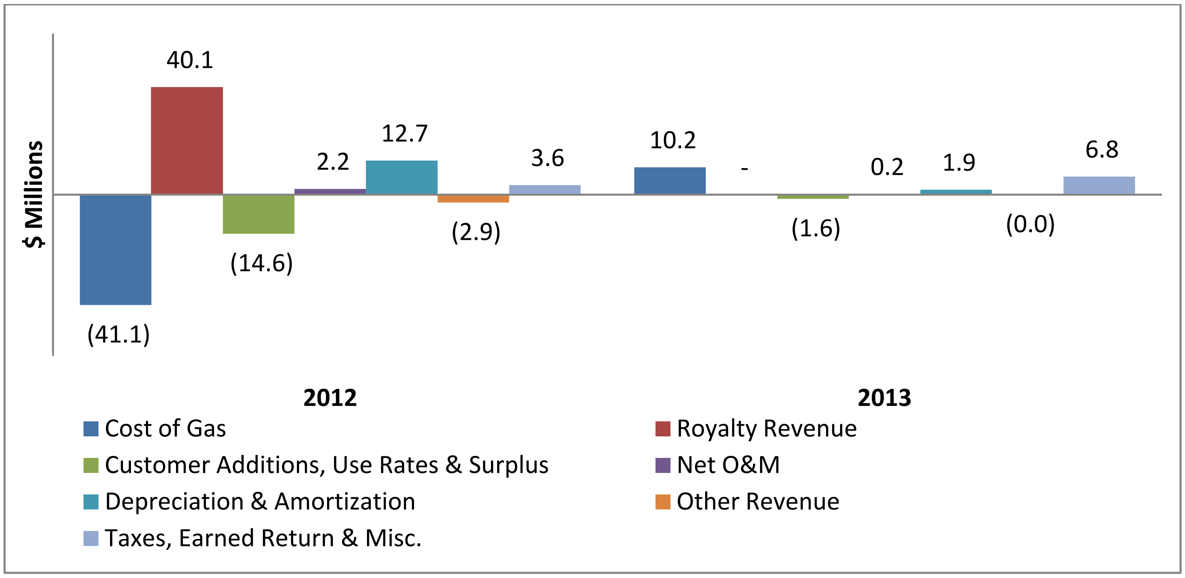
FORTISBC ENERGY VANCOUVER ISLAND INC.

A revenue deficiency is not forecast for 2012 for Vancouver Island; the $40.1 million deficiency that results from the loss of royalty revenues is offset by a $33 million reduction in the cost of gas and $8.1 million in amortization of the Gas Cost Variance Account ("GCVA"). The revenue

8 Section 7.4, Schedule 1
9 Based on a typical annual consumption of a Fort Nelson residential customer consuming 140 GJ. This is also based on current commodity charges effective April 1, 2011 and excludes the impact of rate riders.

deficiency in 2013 of $17.4 million is attributable to an increase in the cost of gas, the removal of the one-year amortization of the GCVA, and tax expense and earned return increases, as displayed in Figure 1.1-5.

Figure 1.1-5: Loss of Royalty Revenues Offset by Reduction in Cost of Gas in 2012[10]



FEVI is seeking to maintain current rates for all customers except those with specified rates in their transportation service agreements, for a two-year period commencing January 1, 2012. Consistent with the intended purpose of the RSDA, FEVI proposes to use part of the surplus to maintain rates at the 2011 level for 2013. The RSDA was approved as part of the last FEVI revenue requirements application, with the intention of using the accumulated balance to manage cost pressures unique to FEVI. The rate proposal in the present Application implements the previously developed strategy.

THE FORTISBC ENERGY UTILITIES - COMBINED COST OF SERVICE FOR 2013

Later this year, the FEU intend to seek the necessary approvals to amalgamate effective January 1, 2013 and to introduce harmonized rate structures effective on the same date. As the anticipated effective date of amalgamation and harmonized rates falls within this two year revenue requirements period, the orders sought in respect of 2013 rates for the individual entities have been expressed as being conditional upon amalgamation and harmonized rates not taking effect. And, in anticipation of the upcoming application to amalgamate and introduce harmonized rates, the FEU are collectively applying in the present Revenue Requirements Application for approval of the amalgamated utility cost of service for 2013. The FEU believe that this is the most efficient way to proceed and the order approving an amalgamated cost of

---

[10] Section 7.2, Schedule 1

service can be made without predetermining the merits of amalgamation and harmonized rates. Further information on the requested approval of an amalgamated cost of service, and the intended next steps to achieve harmonization of rates, is included in Section 1.2.5.

In addition to the revenue deficiency drivers described above, FEU has included in the Introduction Section (1.2) below, a review of important initiatives that the Companies are pursuing, such as enhanced Energy Efficiency and Conservation programs (Section 1.2.2), expanded service offerings for customers (Section 1.2.3) and the first step towards harmonization and an amalgamated rate structure (Section 1.2.5).

1.2 Introduction

The FEU collectively form the largest natural gas distribution utility in BC, providing sales and transportation services to approximately 950,000 customers in more than 140 communities throughout the Province. The Utilities have a proven record of offering a reliable supply of natural gas, delivered safely and efficiently at a reasonable cost.

The currently approved rates for the Mainland, and for FEVI, were determined through a Negotiated Settlement Process ("NSP") for 2010 and 2011. The 2010 and 2011 rates for FEW and the 2011 rates for the Fort Nelson division of FEI were determined through oral and written hearing processes, respectively. These recent rate setting processes and other more recent regulatory proceedings laid the foundation for the Utilities to deliver on several initiatives. These included:

1. The in-sourcing of key customer service functions;
2. Enhanced Energy Efficiency and Conservation programs;
3. Expanded service offerings for customers, including:
    1. A two year trial period for a biomethane service offering;
    2. A business model and rate design for Compressed Natural Gas ("CNG") and Liquefied Natural Gas ("LNG") fueling service filed December 1, 2010; and
    3. Approval to pursue Alternative Energy Services (which the Companies are now referring to by the more descriptive name "Thermal Energy Services") within the utility.
4. Increased focus on investments to maintain the safety and reliability of our system; and
5. The development of an interim rate mitigation strategy for our customers on Vancouver Island.

Each of these priorities and how they have been addressed in this RRA are discussed separately below.

1.2.1 IN-SOURCING OF KEY CUSTOMER SERVICE FUNCTIONS

In Commission Order No. C- 1-10, FEI received approval to in-source key components of customer care services and implement a new Customer Information System ("CIS") through the Customer Care Enhancement Project ("CCE Project"). The CCE Project is progressing on time with an implementation date of January 1, 2012, and the overall project spend remains on track with no variance to the approved spend of $115.5 million.

As a result of the implementation of the CCE Project, the Customer Service department has been created to manage the contact centres (located in Burnaby and Prince George), the revenue cycle and billing operations, customer relations, bad debt expenditures, and meter reading services. Overall, the 2012 forecast costs for the Customer Service department show a decline of approximately $1.9 million from the 2011 approved amount, as savings are recognized with the transition to the in-sourced service delivery model. In Section 5.3.7 of this Application, the ongoing services and operating expenses for the Customer Service Department are described in detail, as well as the Utilities' plan to maintain existing service quality measures for the two years of this RRA.

Also, in Section 6.3, a deferral account is requested to capture actual expenditures that differ from the forecast 2012 and 2013 O&M expenditure levels for many of the Customer Service functions. The types of uncertainties that the deferral account will address include fluctuations in call volumes, the rate of customer adoption of new communication channels and self serve options being offered, the stabilization of the new CIS and its impact on the end to end business processes, and any variances in the anticipated duration required for new staff to become skilled and proficient at their responsibilities. The variance account will also capture spending variances in meter reading costs primarily due to the timing of BC Hydro's Smart Metering Initiative and its impact on joint gas/electric meter reads in 2012 and the uncertainty of costs in 2013. These cost variances are largely beyond the control of the Companies and the use of deferrals will avoid the potential for windfall gains or losses to customers or the shareholder during the transition period.

1.2.2 ENHANCED ENERGY EFFICIENCY AND CONSERVATION PROGRAMS

As part of the 2010-2011 RRA, FEI and FEVI received approval to increase their investment in Energy Efficiency and Conservation ("EEC") to add programs for Interruptible Industrial customers and Innovative Technologies, to reallocate funding to Affordable Housing initiatives, and for additional funding to implement programs until the end of 2011, and an extension of the funding approved by the Commission in the EEC Decision of April 2009. This brought the total funding for EEC activities to $31.0 million in 2010 and $35.3 million in 2011. Of this approved expenditure, FEU spent $12.6 million in 2010 and is projecting to spend $25.7 million in 2011.

The 2010 Conservation Potential Review ("CPR") identified significant potential for EEC programs see Appendix K-2, and supports an expansion of EEC initiatives for the benefit of customers. In this Application the FEU are proposing an increase in the allowed funding envelope for 2012 and 2013 to $74.5 million in total for each year. This increase consists of increased budgets for previously-approved program areas (including "conventional" EEC programs and funding for Innovative Technologies), expansion of EEC programs to the Whistler service area, offering industrial programs to FEVI customers, as well as new initiatives such as the Furnace Scrap-It Program.

The amounts requested for 2012 and 2013 represent a significant increase in the funding envelope relative to 2011. However, the increased amount is supported by the CPR and all expenditures will continue to be evaluated according to Commission-approved mechanisms to ensure that they are beneficial. Also, the FEU are proposing a change in the methodology for recovery of EEC expenditures from customers such that only a base level of spending ($20 million per year) is included in rate base for 2012 and 2013. Expenditures incurred over and above the base level will be placed in a non rate base deferral account, attracting AFUDC, to capture the remaining portion of the EEC costs as incurred on an actual spend basis in 2012 and 2013, and to recover the balance over a ten year period beginning in 2014. The change in methodology is discussed in Section 6.3.2.1, and the details of all planned EEC expenditures are included in Appendix K-1. The FEU believe that the approach of increasing the overall funding envelope for cost-effective programs, while establishing the proposed financial treatment best ensures that FEU can maximize the benefits of EEC programs for customers in a manner that is fair to customers and the Companies.

FEU's ultimate intention is to obtain approval for a long term funding request. The FEU's long term EEC funding request for 2014 and beyond will be made in the FEU Long Term Resource Plan that will be filed with the Commission in 2013. The approvals sought in the present Application will provide the necessary continuity until that long-term request can be made.

1.2.3 EXPANDED SERVICE OFFERINGS FOR CUSTOMERS

The FortisBC Energy Utilities are providing expanded service offerings for customers in the areas of Biomethane, CNG and LNG Fueling, and Alternative Energy Services (now being referred to in this Application by the more descriptive term "Thermal Energy Services"). The costs and revenues associated with the Biomethane and Natural Gas for Transportation programs form part of FEI's natural gas business, and have been included in the forecasts included in this Application. In FEI's 2010-2011 Revenue Requirements Application, the necessary accounting structures were put in place to separate FEI's Thermal Energy Services line of business from the natural gas business. As a result of the approval of that application for FEI, the activities in the area of Thermal Energy Services are captured in a non-rate base deferral account attracting AFUDC, and do not form a part of the rate base or cost of service included in this Application. As a result, there is a reduction in the O&M included in the natural gas cost of service that is associated with the recovery of overheads from the Thermal Energy Services line of business. In the long-run, the more successful the Thermal Energy Services business becomes, the greater the potential benefit to natural gas customers in terms of a recovery of overheads. Each of the three service offerings is discussed below.

1.2.3.1 Biomethane Service Offering

In Commission Order No. G-194-10, FEI received approval to implement a two year pilot program for a Biomethane Service Offering. In that order, FEI was directed to include in this RRA the details of costs for the program.

The planned launch of the Biomethane Service Offering is June of 2011. FEI has included the costs and related revenues for the Biomethane program for 2012 and 2013 in the O&M (Section 5.3), capital expenditures (Section 6.2). The rate base deferral for the 2010-2011 Biomethane Program Costs (Section 6.3) is also included in the revenue requirement calculation. In addition, FEI has included a comprehensive report in Appendix J summarizing the costs incurred and deferred in 2010 and 2011 related to the program, and also providing a summary of the forecast program costs and revenues that are included in each of Sections 5.3, 6.2 and 6.3. Section 6.3 includes a description of the 2010-2011 Biomethane Program Costs deferral account, and Appendix G includes a description of the Biomethane Variance Account. In general the costs are as expected. The only change was a result of a redesign to the upgrader for the Columbia Shuswap Regional District biomethane supply project.

FEI will file a Biomethane Report in December 2012 to comply with the Order No. G-194-10 to initiate the review of the two year pilot program. Although this review will be commencing part way through the two-year test period for this RRA, FEI is of the view that it is reasonable to forecast costs through 2013 as any outcome from this review will not be resolved until sometime in 2013. Further, customers who elect to take up the Biomethane Service offering from FEI would expect this service to continue through 2013 and beyond given that they only signed up for the service beginning in June of 2011. FEI continues to believe the business model that has been approved by the Commission in Order No. G-194-10 is robust and comprehensive and can deliver this service offering to customers through the utility business.

1.2.3.2 Natural Gas Vehicles

On December 1, 2010 FEI submitted its Application for Approval of a Service Agreement for CNG Service and for Approval of General Terms and Conditions ("GT&Cs") for CNG and LNG Service (the "NGV Application") to the Commission. The NGV Application contemplates a model for FEI to own and operate refuelling stations for natural gas vehicle customers in a manner which ensures that all FEI customers benefit from the increased system throughput resulting from NGV volumes, while ensuring that the forecast incremental costs of FEI owning and operating these stations are recovered through a contract rate charged to these incremental customers. The proposed rate structures require firm "take-or-pay" (i.e. minimum contract demand) commitments, with rates set to recover from the particular customer over the term of the service agreement the cost of investing in and maintaining CNG/LNG facilities located on the customer's property to permit fueling. FEI is targeting commercial, return-to-base fleet of buses, heavy duty trucks, vocational trucks, and marine vessels. Under this business model the benefits to existing customers are potentially significant and this market represents one of the best opportunities to add throughput to FEI system.

On April 13, 2010, FEI submitted to the Commission and Interveners our Final Written Reply Submission, and at the time that this RRA was submitted the NGV Application was still before the Commission for approval. Given customer support[11] for the NGV Application and our belief that this is part of our core business, we have included in this RRA our project costs and revenue to undertake this business for 2012 and 2013. Thus these impacts have been integrated into our other revenue forecasts (Section 5.5), O&M (Section 5.3), capital expenditures (Section 6.2) and rate base deferral (Section 6.3) for the 2011 CNG and LNG Service Costs and Recoveries.

In the recent NGV Application, FEI requested approval for an ongoing rate base deferral account to capture incremental CNG and LNG fueling station recoveries received from fueling station volumes in excess of the minimum contract demand. Further, in this Application, FEI is seeking approval to expand this account to include variations from the revenue forecast pertaining to Rate Schedule 16 of $2.9 million in 2012 and $4.4 million in 2013. FEI has included a comprehensive report in Appendix I summarizing the costs incurred and deferred in 2010 and 2011 related to the program, and also providing a summary of the forecast program costs and revenues that are included in each of Sections 5.5, 5.3, 6.2, and 6.3.

The forecasts made in relation to NGVs and NGV fueling infrastructure in this Application and in Appendix I are premised on the assumption that the NGV Application will be approved as filed and all approvals sought will be granted. The forecasts are further premised on the assumption that the cost-effective EEC incentives for NGVs will continue during the test period of this RRA. These EEC incentives are being reviewed under a current proceeding as per Commission Order G-70-11, with the Information Request process beginning on May 4th, 2011. The growth of the NGV fueling business is inherently reliant upon the adoption of NGVs in our service territory and the Utilities believe that the adoption of NGVs in our service territory is inherently reliant upon the continued availability of these EEC incentives for NGV adoption during the term of the revenue requirement. The Utilities wish to make clear that the provision of cost-effective EEC incentives to fleet operators is not pre-conditioned on any requirement that the Utilities own and operate the NGV refuelling stations to supply the acquired vehicles. It does however require that it be allowed to make that option available to prospective fleet operators in order to see the NGV adoption required to provide meaningful and material benefit to our existing customers. Discontinuance of EEC incentives for NGV's will represent a significant barrier to achieving the objective of adding NGV throughput to the system for the benefit of all existing customers.

1.2.3.3 Thermal Energy Services

FEI and FEVI, in their respective 2010-2011 Revenue Requirements Applications, requested approval of tariff provisions to permit them to provide Alternative Energy Solutions ("AES"), which included Geo-exchange, Solar-thermal and District Energy Systems as those terms are described in the applications. The Companies are now using the more descriptive term "Thermal Energy Services" to encompass these same services. The Negotiated Settlement

[11] Final Submission Arguments from Registered Interveners BCSEA, BCOAPO, and CEC generally support the proposed NGV Application.

Agreement for FEI's 2010-2011 RRA, approved by BCUC Order No. G-141-09, acknowledged that FEI would be engaged in Thermal Energy Services (or AES). The Negotiated Settlement Agreement for FEVI's 2010-2011 RRA, approved by BCUC Order No. G-140-09, acknowledged the fact that FEVI withdrew its requests for relief in the RRA relating to AES and the Parties acknowledged that FEI will be pursuing AES projects within the FEVI service area and agreed that the costs incurred by FEI to provide AES will not be recovered in FEVI's natural gas service rates.

The Commission's approval of the FEI NSA resulted in an approved Rate Schedule for Thermal Energy Services, and implemented the necessary terms and certain conditions to establish Thermal Energy Services as a distinct line of business within FEI. Some of the conditions included in the approved NSA were as follows:

> *"Natural Gas service taken in combination with AES will be charged under TGI's natural gas rates.*
>
> *The Parties agree that the costs incurred by TGI to provide AES should not be recovered as part of natural gas service rates, and visa versa. The Parties agree that TGI's proposed New Energy Solutions Deferral Account, attracting AFUDC, is an appropriate mechanism to address allocation issues as between TGI's gas customers and TGI's AES customers. Therefore, the Parties agree that the new Energy Solutions Deferral Account will remain in effect pending a future rate design application at an unspecified future date after 2011 and will capture and record the following (plus AFUDC) to be recovered from AES customers:*
>
> > *(a) Direct costs associated with AES projects as outlined on pages 267-268 of the Application, including cost of design, equipment, etc. constructing and financing; and*
> >
> > *(b) Sales and marketing O&M and other development costs will be directly charged to the deferral account by time sheets or other direct charge (estimated at $1.0 million in 2010 and $1.5 million in 2011, representing a portion of the agreed upon Gross O&M reduction from gas customers of $4.0 million in 2010 and $5.5 million in 2011); and*
> >
> > *(c) An appropriate overhead allocation, which the parties have agreed will be $500,000 in each of 2010 and 2011 (representing a portion of the agreed upon Gross O&M reduction from gas customers of $4.0 million in 2010 and $5.5 million in 2011).*
>
> *Revenues received from customers for all AES projects, which are based on contracts approved by Commission will be recorded in the AES deferral account.*
>
> *The risk of non-recovery of amounts in the New Energy Solutions Deferral Account will not be borne by natural gas ratepayers. The Parties agree that any debit balance in the New Energy Solutions Deferral Account will not be recovered through natural gas rates and any credit balance will not be applied to reduce natural gas rates…"*

FEI is making progress towards developing the Thermal Energy Services line of business. It is expected that FEI will be bring forth individual projects with signed contracts for Commission approval during the Spring and Summer of 2011 that will also meet the terms of the NSA. Consistent with the approved framework, forecast costs for 2012 and 2013 relating to Thermal

Energy Services have been segregated and allocated to the Thermal Energy Services line of business. FEI activities in the area of Thermal Energy Services will continue to be captured in the approved non-rate base deferral account attracting AFUDC, and do not form a part of the rate base or cost of service included in this Application. There is also a reduction in the O&M included in the natural gas cost of service (i.e. a benefit to natural gas customers) that is associated with the recovery of overheads from the Thermal Energy Services line of business. This is discussed further in Appendix G.

The growing prevalence of thermal solutions such as solar, DES and geo exchange, regardless of the provider of those services, will have an increasingly significant impact on the natural gas requirements over time. Thus, from the perspective of natural gas customers it is important to understand the growth of these energy alternatives over time and how they may impact the natural gas throughput and utilization. FEU sees this as an important issue to address in future filings such as the Long Term Resource Plan and future Rate Design applications. The need for additional resources to examine these impacts as part of the long term integrated resource planning process is discussed further in Section 5.3.8.

1.2.4 INCREASED FOCUS ON INVESTMENTS TO MAINTAIN THE SAFETY AND RELIABILITY OF OUR SYSTEM

In our 2010-2011 RRAs, we requested increases to O&M and capital budgets to ensure ongoing compliance to existing codes and anticipated new or changed codes and to allow us to continue to invest in the safety, integrity and reliability of the energy delivery system. To address these requirements, we received approval for additional O&M in the amount of $5.3 million in 2010 and a further $2.1 million in 2011. This funding allowed us to enhance safety messaging for customers, begin the long-range asset planning and address the specific code changes that were required. How each of these three areas has evolved since then is discussed below. The FEU believes that continued funding in these areas is necessary to ensure safe and reliable natural gas service.

1.2.4.1 Codes & Regulations

In addition to the codes and regulations that were addressed in 2010 and 2011, the FEU have identified new codes and regulations, and changes to existing codes and regulations that need to be addressed. A further discussion of these specific codes and regulations and incremental funding of $1.8 million in 2012 and a further $0.9 million in 2013 to address these requirements is included in O&M Section 5.3.

Two other areas where the Utilities need funding to address safety and system integrity are:

- The BCOneCall project - a multi-stream two and a half year project that will automate a portion of the BCOneCall process and allow for the realization of significant benefits immediately upon completion of the project; and

- The Gas Assets Project - a four year project to move historic gas system asset compliance records into one system, with three distinct phases which will improve access to records, the integrity of compliance record information, the completeness of existing compliance records, the protection of compliance records, and the retention and disposal of compliance records no longer needed for operational, or other requirements.

Each of these two significant projects is discussed further in the Rate Base Deferrals Section 6.2.

1.2.4.2 Safety Messaging

In 2010 and 2011, the FEU spent approximately $1.0 million on safety awareness, primarily to increase the public's awareness of how to identify and respond to a gas leak. This initiative requires additional funding in 2012 and 2013 to fully implement our gas odour and action safety messaging, and also to increase public safety education around excavation diligence. The details regarding our plans to spend an additional $750 thousand in 2012 and a further $100 thousand in 2013 are included in O&M Section 5.3.8.5 Energy Solutions and External Relations.

1.2.4.3 Long Term Asset Planning

FEU recognized the need to develop a long term life cycle view of gas assets when planning its sustainment capital and related asset management programs a number of years ago and first described these requirements in their 2010-2011 Revenue Requirements Application and 2010 Resource Plan. A long term view of gas assets is required primarily because of risks related to aging infrastructure. Complicating this planning requirement is the continual need to also address environmental responsibility, increased public expectations and increased regulations to maintain the safety, reliability and integrity of the distribution and transmission system used to provide gas delivery service. Critical in this regard is the concept of a "Long Term Sustainment Plan", which serves as a key component of FEU's approach for managing this challenge. This approach to long term planning is also important in order to ensure that any transmission and distribution system changes are cost effective so that their impact on customers' rates is kept to a minimum.

Today, FEU is responsible for managing gas transmission and distribution assets with a book value of approximately $3.0 billion and an approximate replacement value of $6.8 billion. Nearly 25 percent of distribution mains and 35 percent of intermediate and transmission pressure pipelines have been in service for 40 to 55 years. These aging assets face an increasing rate of deterioration as they approach the end of their service life. FEU anticipates that over the next 40 years approximately two-thirds of current assets will need to be replaced.

To successfully manage this coming wave of asset replacements, FEU must also be cognizant of other interrelated factors. A long term view of asset management is therefore required due to a number of reasons:

- customers expect natural gas to be there when they need it. Tolerance for service disruption due to inadequate planning on the part of the utility is understood to be limited;
- codes and regulations are becoming increasingly stringent with the natural gas delivery system operator being held to higher standards of reliability, safety and environmental stewardship;
- the increased focus on public safety has recently been seen in the response to a pipeline rupture and subsequent fire in San Bruno, California which has resulted in the introduction of a number of initiatives to increase the onus on the operators to ensure public safety. Asset failure that impacts public safety is not acceptable;
- significant rate increases due to costs of repairs and unanticipated asset replacements passed on to customers would not be in the best interest of the customers, especially if they come in large spikes as significant assets fail and require immediate replacement;
- the wave of asset replacement poses the challenge of mobilizing additional O&M and capital resources. Additional O&M resources are required to enhance the asset management practices needed to manage aging infrastructure. Capital resources are needed to procure material, equipment, services, labour and contractors for the execution of asset replacement; and
- municipalities and utilities across North America are starting to come to grips with aging infrastructure and how to maintain services to their customers. This need, combined with baby boomers retiring, is resulting in resource shortages across the continent. Adequate lead time and visibility of asset replacement programs is required in order to engage contractors so that resources can be successfully mobilized when they are needed.

FEU expects system sustainment costs to continue rising in the future given the extent of its aging infrastructure and because of the complexity of the interrelated factors described above. To help manage these increasing costs, ensure system integrity, address risk to public safety and property and continue to reliably deliver service, FEU is developing a Long Term Sustainment Plan (“LTSP”).

The LTSP includes enhancements to our asset management and system integrity processes. The cost to establish these enhancements are included as a key component of the incremental O&M funding requested in Section 5.3 of this Application. Instead of identifying asset replacement requirements on a reactive basis and with a limited view beyond a three to five year horizon, and potentially overlooking major projects that address high risks, a higher level of resources is needed to complete the comprehensive reviews and analyses that are required to support long-term capital expenditure commitments of the amounts anticipated after 2013.

In Section 6.2, FEU describes sustainment capital spending for a total of $82.3 million in 2012 and $89.6 million in 2013 that it seeks approval for. These forecast amounts represent incremental spending, excluding CPCN projects, of $23.0 million and $30.2 million in 2012 and 2013 respectively over 2011 approved amounts for the same purpose. FEU believes that the forecast expenditures strike an appropriate balance between the risks to health, safety, system integrity, and property, with rate impacts and many other factors.

Over the longer term, FEU will continue to improve its asset management practices with the further development of a Long Term Sustainment Planning process. The LTSP will help us analyze a myriad of factors impacting asset replacement decisions and be used to prioritize spending where necessary and help to minimize the impact on rates by spreading costs out over time.

In summary, FEU must continue to address the critical issue of aging infrastructure and asset management in an evolving business environment. FEU believe the programs and expenditures included in this RRA are prudent and in the best interest of customers.

1.2.5 RATE MITIGATION STRATEGY FOR VANCOUVER ISLAND: AMALGAMATION AND HARMONIZED RATE STRUCTURE

In the 2010-2011 RRA for Vancouver Island, we developed and received approval for an interim rate mitigation strategy to help to offset the immediate rate pressure that would otherwise result from the loss of the forecast $40 million of revenues (“Royalty Revenues”) provided to FEVI by the Provincial Government that partially offset the cost of gas on Vancouver Island. This interim strategy resulted in a rate freeze for core market customers at a level that exceeded the cost of service and the creation of a Rate Stabilization Deferral Account, to capture the differences in 2010 and 2011 between the net revenues received and the actual cost of service, excluding O&M variances from forecast. The balance in the RSDA would then be used after 2011 to offset future rate increases. However, the balance in the RSDA is insufficient to offset the increased rate pressure for more than a short period of time. FEVI has long recognized that a permanent solution is required, and that the real solution will take the form of amalgamation of the Companies and the implementation of a harmonized rate structure. FEU’s intention is to file an application in the Fall of this year seeking approval to amalgamate the Companies effective January 1, 2013 and approval of a harmonized or “postage stamp” rate structure.

In this Application, we have presented the revenue requirement information for each of the FEU separately for 2012 and 2013, and are seeking approval of rates for each company separately. FEVI’s revenue requirement for 2013 reflects the utilization of part of the RSDA balance. However, as the intention is to amalgamate the entities half-way through the RRA period, the FEU have also taken the additional step in this Application of presenting an amalgamated cost of service based on the assumption that the three companies will be amalgamated effective January 1, 2013. The Companies are seeking approval of the amalgamated cost of service, which would only be employed if and when the FEU later obtain the necessary approvals to amalgamate and to implement harmonized rates. The amalgamated cost of service, once determined in this Application, will form the base for the cost of service used in developing a harmonized rate structure.

In this section, the FEU set out in greater detail our future plans for amalgamation and postage stamp rates, and how the approvals sought in the present Application fit within those plans. The FEU believe that it enhances regulatory efficiency to address the issues relating to the cost of service under an amalgamation scenario as part of the present Application, without predetermining the merits of amalgamation or a harmonized rate structure. This approach will ensure that the future rate design for an amalgamated entity can be assessed in a subsequent rate design application based on known 2013 costs.

The remainder of this section is organized as follows:

- Section 1.2.5.1 explains why the FEU intend to submit an application for approval to amalgamate, in conjunction with the adoption of postage stamp rate structures across the combined service area.
- Section 1.2.5.2 outlines our rationale for seeking approval as part of the present Application of an amalgamated cost of service for 2013, in addition to the rate approvals sought on a company by company basis for 2012 and 2013.
- Section 1.2.5.3 sets out, at a high level, our intention to implement postage stamp rates in two phases, the first of which (the "Phase "A" Rate Design Application") will be addressed in conjunction with amalgamation in Fall 2011 to determine rates effective on January 1, 2013 based on the approved amalgamated cost of service.

1.2.5.1 Rationale for Applying in Fall 2011 for Approval to Amalgamate and Postage Stamp Rates

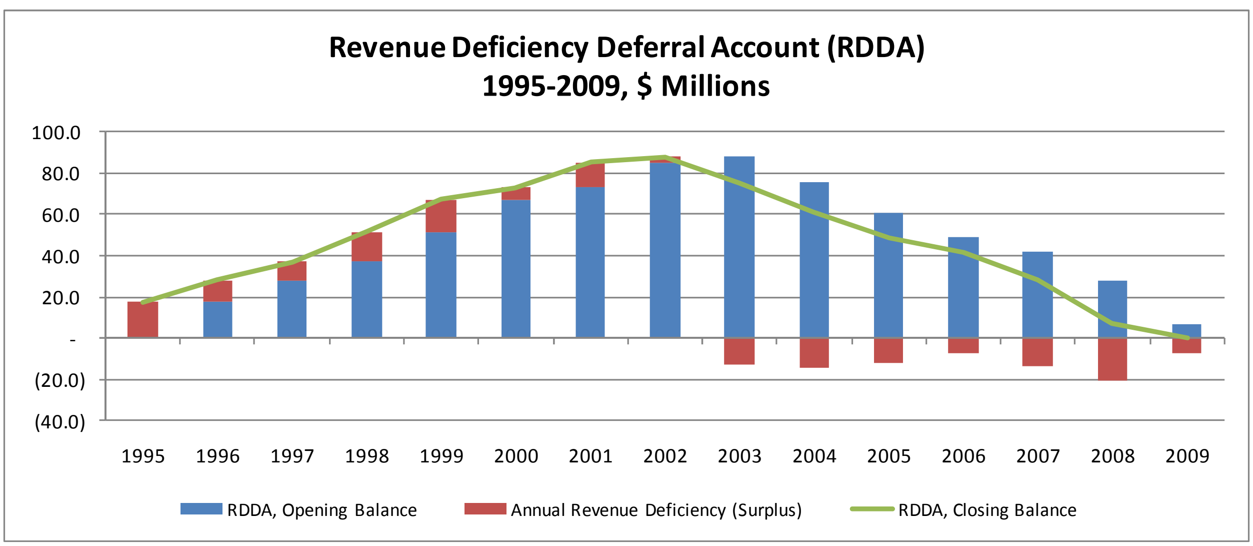
FEU discusses below the pressing challenge caused by the existing rate differential and future upward pressure on rates paid by customers on Vancouver Island, and how amalgamation of the three Utilities in conjunction with moving to postage stamp rates, presents a lasting solution to these issues. FEW also faces competitive challenges. The explanation provided below is intended to help explain why FEU has sought approval of an amalgamated cost of service for 2013 as part of this Application. FEU will be providing its full justification for amalgamation when it submits its Amalgamation and Rate Design Phase 'A' Application this Fall. FEU believes that detailed inquiries about the rationale for amalgamation should be made in the context of FEU's Amalgamation and Rate Design Phase 'A' Application and that the Commission's approval in the present Application of an amalgamated cost of service for 2013 can be made without prejudging the merits of amalgamation and postage stamp rates.

FEVI CUSTOMERS FACE SIGNIFICANT RATE INCREASES

From the outset of the utility on Vancouver Island, it was recognized that the relatively high cost structure and small customer base would present challenges to FEVI being able to compete with alternative energy sources. At that time, a series of agreements were put in place among the utilities (at that time, it was actually two distinct transmission and distribution utilities), and the Federal and Provincial governments, in conjunction with a new Vancouver Island Natural Gas Pipeline Agreement Special Direction ("Special Direction"). Those agreements and the Special Direction put in place mechanisms that would help to allow the utility to remain competitive. Rates were set below the cost of service, and the revenue deficiency was captured in the Revenue Deficiency Deferral Account ("RDDA"). The cost of gas was partially offset by Royalty Payments paid by the Provincial government. The Royalty Revenues, which have served to offset part of the cost of gas paid by customers, were a critical component in the development of a viable utility on Vancouver Island. However, these mechanisms had a limited horizon. Under the Special Direction, the RDDA was to be recovered over the shortest time reasonably possible taking into account FEVI's competitive circumstances. The Royalty Revenue payments are discontinued at the end 2011. The cessation of those payments will impact customers through higher rates unless something is done to address it. The current Vancouver Island rate differential for a Residential customer is approximately $6.00 per GJ or approximately 60 percent greater when compared to the effective rate of a Rate Schedule 1 customer in the Lower Mainland. This rate differential will continue to increase in the absence of rate mitigation on Vancouver Island.

The RDDA grew to a balance of $87.9 million in 2002. Beginning in 2003 FEVI paid down the balance in the RDDA, reducing it to zero in 2009.

Figure 1.2-1: RDDA Balances and Annual Repayments



Nevertheless, the pending end to the Royalty Revenue payments has loomed large for FEVI and its customers, as the cessation of those payments still presented the potential for significant and immediate rate increases in 2012, all else equal, of approximately 20 percent.[12] A rate increase of this magnitude would have compounded the competitive challenges facing FEVI. As a result, in its 2010-2011 RRA/RDA, FEVI proposed a rate freeze for 2010 and 2011. FEVI's proposal to freeze rates was accepted in the Negotiated Settlement Agreement, which was approved by the Commission.[13] The approved rates for 2010 and 2011 over-recovered the cost of service during the period (since they had been set in prior years to recover the RDDA, which had now been paid off), and the surplus revenue for 2010 and 2011 was placed into a deferral account, the RSDA. The intention was to use the revenue surplus to help mitigate any revenue requirement increase with the loss of the Royalty Revenues in 2012 and the repayment of the remaining Repayable Contributions.[14] Following the logic of the approved RSDA mechanism, in this Application FEU is proposing a rate freeze for FEVI sales customers, as well as FEW and BC Hydro[15] for 2012 and 2013 (please refer to Section 3.4.2 for a detailed discussion). The proposed rates for 2013 are insufficient to recover the full forecast cost of service in that year, and part of the surplus in the RSDA is used to make up the shortfall in each year.

While there is sufficient surplus in the RSDA to cover the forecast revenue shortfall resulting from the proposed rates in 2013, this mechanism provides only a temporary solution. Although somewhat mitigated by reductions in the forecast cost of gas, there is upward pressure on FEVI's cost of service post-2012 for the foreseeable future due to the cessation of the Royalty Revenue payments. Figure 1.2-2 provides a 5 year outlook of FEVI cost of service rates and shows an expected rate increase of 20 percent by 2016, as compared to existing 2011 rates. Two scenarios providing variations in gas costs are also shown in Figure 1.2-2 and demonstrate that in the event that high commodity costs are experienced, the expected rate increase doubles to 40 percent by 2016.[16]

---

12 All else equal, the impact to delivery rates would be the 2011 royalty credits of $40.091 million as approved in Commission Order No. G-140-09.

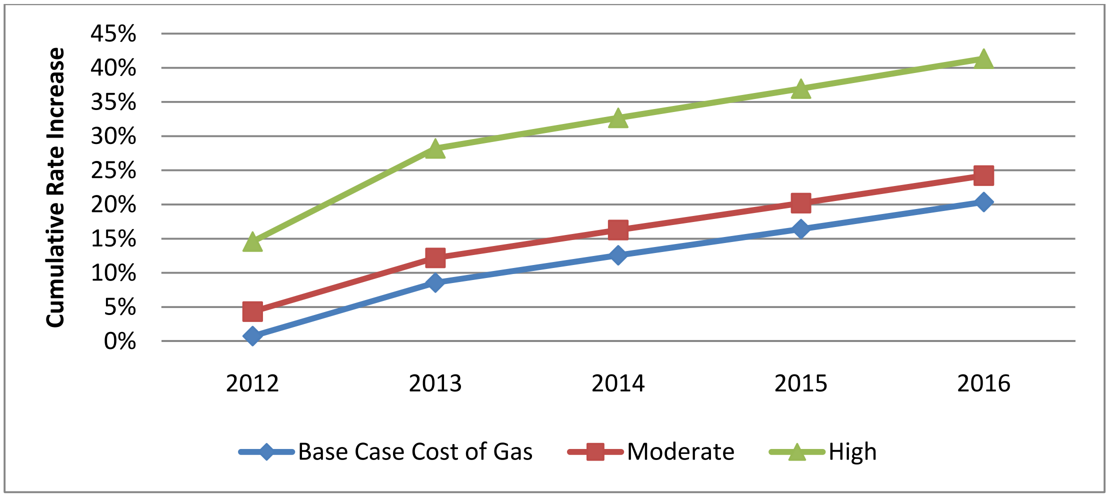
13 BCUC Order No. G-140-09 approving the Negotiated Settlement Agreement for FEVI pertaining to its 2010 and 2011 Revenue Requirement and Rate Design Application, Part II, Items 22-24.

14 As discussed in Part II of the FEVI 2010-2011 RRA/RDA, FEVI is obligated under the Pacific Coast Energy Pipeline Agreement ("PCEPA") to repay a total of $75 million to the Federal and Provincial Governments that had been provided to the Company under the terms of an earlier agreement that had been entered into to support the construction of the pipeline to Vancouver Island and the Sunshine Coast. The forecasted Repayable Contributions expected to be remaining at the end of 2012 is $29.1 million and $25.0 million at the end of 2013.

15 Other Transportation customers (VIJV and Squamish) are on contract rates.

16 Base Case Cost of Gas scenario has an approximate weighted average cost of gas of $6.30/GJ in 2012 and reflects the cost of gas embedded in this RRA, Moderate scenario has an approximate weighted average cost of gas of $6.91/GJ in 2012 and the High scenario has an approximate weighted average cost of gas of $8.61/GJ.

Figure 1.2-2: Significant FEVI Rate Increases are Expected with the Loss of Royalty Revenues and in the Absence of Amalgamation[17]



Assuming no rate mechanisms are in place (e.g., no use of RSDA to offset Royalty Revenue loss), increases of this magnitude over the next four years may impact FEVI's ability to increase its customer base and retain existing customers. FEVI has long recognized that a lasting solution is required, and FEU believes that amalgamation and rate harmonization is that solution.

AMALGAMATION AND HARMONIZED RATES REPRESENTS LASTING SOLUTION

In the pending Amalgamation and Rate Design Phase 'A' Application to be filed in Fall 2011, FEU will make the case that amalgamation of FEVI with the other FEU companies, coupled with rate harmonization / postage stamp rates for the amalgamated entity, is the lasting solution to mitigate the projected rate increases anticipated due to the cessation of the Royalty Revenues paid to FEVI. A brief overview of that rationale is provided below for context only.

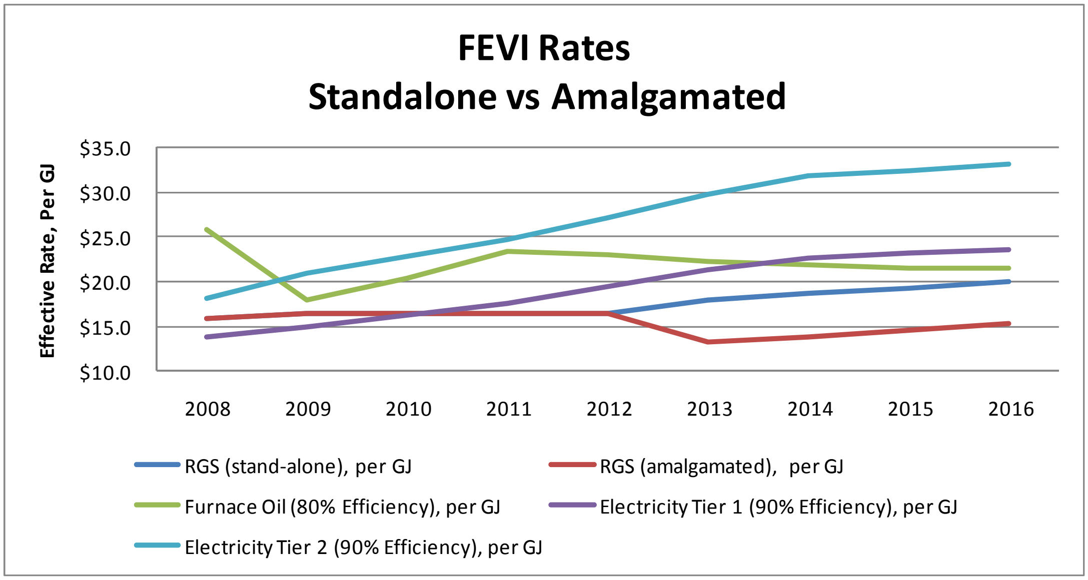
The basic reason why amalgamation and rate harmonization represents a lasting solution is that combining the FEVI rate base and customers with the other utilities in 2013, which will be the result of rate harmonization for the amalgamated utility, results in FEVI's higher fixed costs being spread over a larger customer base. FEVI's approximately $138 million in delivery costs[18], based on approximately $814 million of fixed assets[19], would be spread over approximately 1 million customers (i.e., the combined customer base of all three utilities) versus 100,000 customers. Further, FEVI's forecast $40 million increase in cost of service, as a result of the loss of Royalty Revenues, spread over approximately 1 million customers has less of an effect

17 This analysis excludes the impact of the allocation of the RSDA balance.
18 Section 7.2, Schedule 6
19 ibid

on rates than the same $40 million revenue shortfall spread over approximately the 100,000 customers of FEVI.

Figure 1.2-3 below displays the change in competitiveness expected in FEVI's service area if amalgamation is approved.

Figure 1.2-3: FEVI's Rates are More Competitive in an Amalgamated Entity than Standalone



Based on these figures it is evident that FEVI will be more competitive under an amalgamated scenario than left as a standalone utility.

Similarly, FEW customers would also benefit from moving into an amalgamated entity. FEW in many regards has similar challenges as FEVI with respect to remaining competitive from a 'price point' perspective vis-a-vis alternative energy options, e.g., electricity. FEW also has a small customer base over which to recover the costs of maintaining natural gas service. Therefore, it is also true in the case of FEW that combining the FEW rate base and customers with the other utilities will enable it to spread its cost structure over a larger customer base, thereby, mitigating against future potential rate increases. Indeed, it is expected that FEW customers will benefit through reduced rates upon Amalgamation. For example, a Residential FEW customer is expected to see an annual bill decrease of approximately 30-40 percent upon amalgamation.

FEU believe that enabling FEVI and FEW to remain competitive within an amalgamated entity can be achieved with impacts of approximately 9 percent to FEI's delivery rates, approximately $70 per year or 4 percent to the annual bill of a Lower Mainland Residential customer. FEI will make the case in the Fall Amalgamation and Phase "A" Rate Design Application that an increase in FEI rates to achieve harmonized rates is just and reasonable in light of the benefits that flow from adopting a rate structure where all customers in the combined FEU service territories have access to harmonized rates and services.

SUMMARY

In summary, the FEU's current rate structure is a result of FEU's growth via acquisition. The three service regions (FEI, FEVI and FEW) each retain the historic regulatory structures set by the predecessor company. FEU believes that bringing the gas utilities together as one company and adopting harmonized rate structures across all of the present service areas makes good sense for all of our customers and the communities we serve. By forming a single company with postage stamp rates, all natural gas customers will have access to affordable natural gas service.

1.2.5.2 Approval of Consolidated Cost of Service Is A Necessary First Step

A first step towards postage stamp rates for 2013 is to obtain Commission approval of an amalgamated cost of service, reflecting the combined costs of the three entities. The FEU believe, for the reasons set out below, that obtaining approval of an amalgamated cost of service as part of the present Application (rather than doing it as part of the Fall 2011 Amalgamation and Phase 'A' Rate Design Application) is most efficient:

- The approved consolidated cost of service will provide the platform for performing the cost of service analysis ("COSA") that will support a postage stamp rate design.
- There will be overlap in cost of service issues relating to the utility-specific and amalgamated views. For example, any items raised with respect to an individual entity's cost of service will flow through to the amalgamated cost of service; therefore, addressing these items in one application makes sense as opposed to having a 'secondary' review of the cost of service in the context of a future application that may lead to duplication of issues raised and addressed in this Application.
- The cost of service issues are conceptually distinct from the rate design issues that are to be the focus of the Fall 2011 Amalgamation and Phase 'A' Rate Design Application.
- The FEU believe that the Commission can make a determination on the amalgamated cost of service without prejudging the merits of amalgamation that will be addressed in the subsequent Amalgamation and Rate Design Phase 'A' application. The wording of the order sought, as set out in Section 8, reflects a conditional approval of the amalgamated cost of service "subject to" the subsequent approval of amalgamation and approval of harmonized rates. The rate design-related orders from the Phase "A" rate design will yield the harmonized 2013 rates.

For these reasons, the FEU believe that the review of the amalgamated cost of service is best undertaken in this Application. All issues relating to the merits of amalgamation, the rationale for moving to postage stamp rates, or the design of postage stamp rate structures should be deferred to the Fall 2011 Amalgamation and Rate Design Phase 'A' Application.

1.2.5.3 Two-Phase Process to Achieve Postage Stamp Rates

As mentioned above, it is the FEU's intention to file two further applications after the present Application, the first of which is the Amalgamation and Phase 'A' Rate Design Application slated to be filed this Fall for rates effective January 1, 2013. It will establish permanent harmonized rates for 2013 for the amalgamated entity. The second application (Rate Design Phase 'B' Application) will be filed following a decision on the Fall 2011 Phase 'A' Application. The Phase "B" Application will involve further Rate Design for the amalgamated entity effective for 2014. FEU describes below, at a high level, its expectation about what these two applications will entail.

FEU AMALGAMATION AND RATE DESIGN PHASE 'A' APPLICATION

The Amalgamation and Rate Design Phase "A" Application will seek approval under Section 53 of the UCA to amalgamate FEI, FEVI and FEW effective January 1, 2013. Under section 53, amalgamation requires the consent of the Lieutenant Governor in Council ("LGIC"). FEU will request in the application that the Commission submit a report to the LGIC finding that amalgamation would be beneficial in the public interest, as contemplated in the UCA.

The purpose of seeking amalgamation is to facilitate the implementation of postage stamp rate design for the combined service area, and FEU would not incur the cost to amalgamate in the absence of postage stamp rates. Thus, in a mutually dependent approval, FEU will seek as part of the application to move to a harmonized rate structure across its entire service area. In this initial phase, the combined entity will adopt the rate classes and structures of FEI. The outcome of the rate design will be a request for approval of 2013 permanent rates for the amalgamated entity, effective January 1, 2013.

RATE DESIGN PHASE 'B' APPLICATION FOR 2014

The Rate Design Phase "B" Application will build upon the prior application by considering further rate design items such as rate structure, changes to rate schedules and their terms and conditions and, if required, further rate rebalancing.

FEU anticipate filing this application in either the second or third quarter of 2012, dependent upon the timing of a decision on the Phase "A" application. If approved, the outcome of the rate design will be effective January 1, 2014.

1.2.5.4 Summary of Amalgamation and Harmonized Rate Structure

In light of the benefits that the FEU see with pursuing amalgamation and postage stamp rates across the combined service areas of the FEU, and our intention to apply for both later this year, we have sought a determination of the amalgamated cost of service as part of this RRA. FEU believe that it is most efficient to address the cost of service related issues at this time, rather than leaving them to be addressed in the Amalgamation and Rate Design Phase 'A' Application. The Commission can, and we respectfully submit should, determine the amalgamated cost of service without prejudging the benefits of amalgamation and postage stamp rates. The approval sought in respect of the amalgamated cost of service has been framed to make it clear that these issues remain to be determined in a future process.

1.3 Conclusion of Executive Summary and Introduction

In this RRA, the Utilities have included the costs and strategies to successfully deliver on existing commitments, with an increased focus on the safety and reliability of our system, and another step towards delivering a long term rate mitigation strategy for Vancouver Island and Whistler. If approved as forecast, the revenue requirements for 2012 and 2013 will set the stage for the future, enabling both customers and the Utilities to have a sustainable business model and more equitable rates across the service territories served by the FEU.

2 ORGANIZATION OF THE APPLICATION

This RRA is the first that has presented the revenue requirements for each of the four utilities in one comprehensive application, showing both individual utility costs and, wherever possible, an amalgamated view. The Application has been organized in this fashion to assist interested parties in gaining an understanding of differences and similarities between each of the utilities, and providing a high level view of the future under an amalgamated utility.

The sections of this Application are organized as follows:

1. Introduction and Executive Summary
2. Organization of the Application – current section
3. Revenue Requirements and Rates – An overview of the process and accounting policies used to determine revenue requirements, a summary of revenue requirements, and a summary of rate proposals.
4. Demand Forecast and Revenue at Existing Rates – A review of the forecasting methodology, the use rates and customer additions by utility and rate class, and the total demand and revenue forecast for each utility.
5. Cost of Service

    5.1 Introduction – An overview of the components of cost of service.

    5.2 Cost of Gas – A review of the cost of gas included in the cost of service forecasts.

    5.3 Operations and Maintenance ("O&M") Expense – A discussion of cost drivers for changes in O&M and full-time equivalent employees, followed by a department by department review of the gross O&M for 2010 through 2012, and a discussion of capitalized overheads and corporate and shared services.

    5.4 Depreciation and Amortization – A summary of the results of the recent depreciation study, the proposed treatment for negative salvage, and a review of the accumulated losses in FEI.

    5.5 Other Revenue – A summary of other revenue by utility.

    5.6 Taxes – A discussion of income taxes, property taxes, and other taxes and tax issues.

    5.7 Financing Costs and Return on Equity – Cost of debt and cost of equity calculations.

6. Rate Base – A summary of rate base for each utility, capital expenditures and rate base deferral accounts, and working capital.

7. Financial Schedules – Financial schedules for each utility.

8. Approvals Sought and Proposed Regulatory Process – A list of the various approvals sought, and the proposed regulatory process.

The following Appendices are included as part of the Application:

A. Glossary of Terms – Definitions of terms used throughout the Application.

B. Company and Regulatory Information – History of companies, legal and regulatory, discussion of the various service areas, and referenced previous decisions and concordance with directions.

C. Forecasting Data – Forecast assumptions, sources of Consumer Price Index information, sources of interest rate forecasts, and historical customer additions, use rates, weather, housing starts and energy demand.

D. Historic Data – Summary tables of Operating and Maintenance expense, FTEs, Utility Income and Earned Return, Income taxes, Return on Capital, Utility Rate Base, Capital Expenditure, and Customer Service Call Volume from 2006 onwards.

E. Depreciation – Gannett Fleming depreciation study, report on asset removal costs and asset retirement obligations, report on accumulated losses in FEI.

F. Tariffs – includes Tariff Continuity and Bill Impact Schedules for each utility as well as a discussion of the changes to the lock off and reconnection fees.

G. Non Rate Base Deferral Accounts – summary of non rate base deferral accounts by utility, including Thermal Energy Services (formerly Alternative Energy Services).

H. Organization Charts – Organization charts showing number of employees by department and reporting relationships.

I. Compressed Natural Gas and Liquefied Natural Gas Fueling Report

J. Biomethane Report

K. Energy Efficiency and Conservation Report

L. Financial Matters

M. Draft Form of Order

3 REVENUE REQUIREMENTS AND RATES

This section discusses:

1. How the Companies' management structure, compensation philosophy and O&M and capital budgeting and control processes contribute to effective management of the costs that are incorporated into these revenue requirements;
2. What accounting policies have been utilized in calculating the revenue requirements, and how the pending US GAAP Decision may impact the costs included in these revenue requirements;
3. The revenue requirements by utility and of the cost of service on an amalgamated basis, summarizing the forecasts included in Sections 4 through 6, and the financial schedules in Section 7; and
4. Rate proposals for each utility.

3.1 Management of Costs and Rate Determination

The FortisBC Energy Utilities remain focused and committed to providing cost-effective, high-quality service to our customers, while ensuring employee and public safety, and operating in an environmentally responsible manner. In advancing these objectives, the FEU employs an appropriate management structure, a variety of metrics to assess corporate performance, and a compensation program that is tied to the achievement of objectives. Each of these elements is discussed below.

3.1.1 MANAGEMENT STRUCTURE

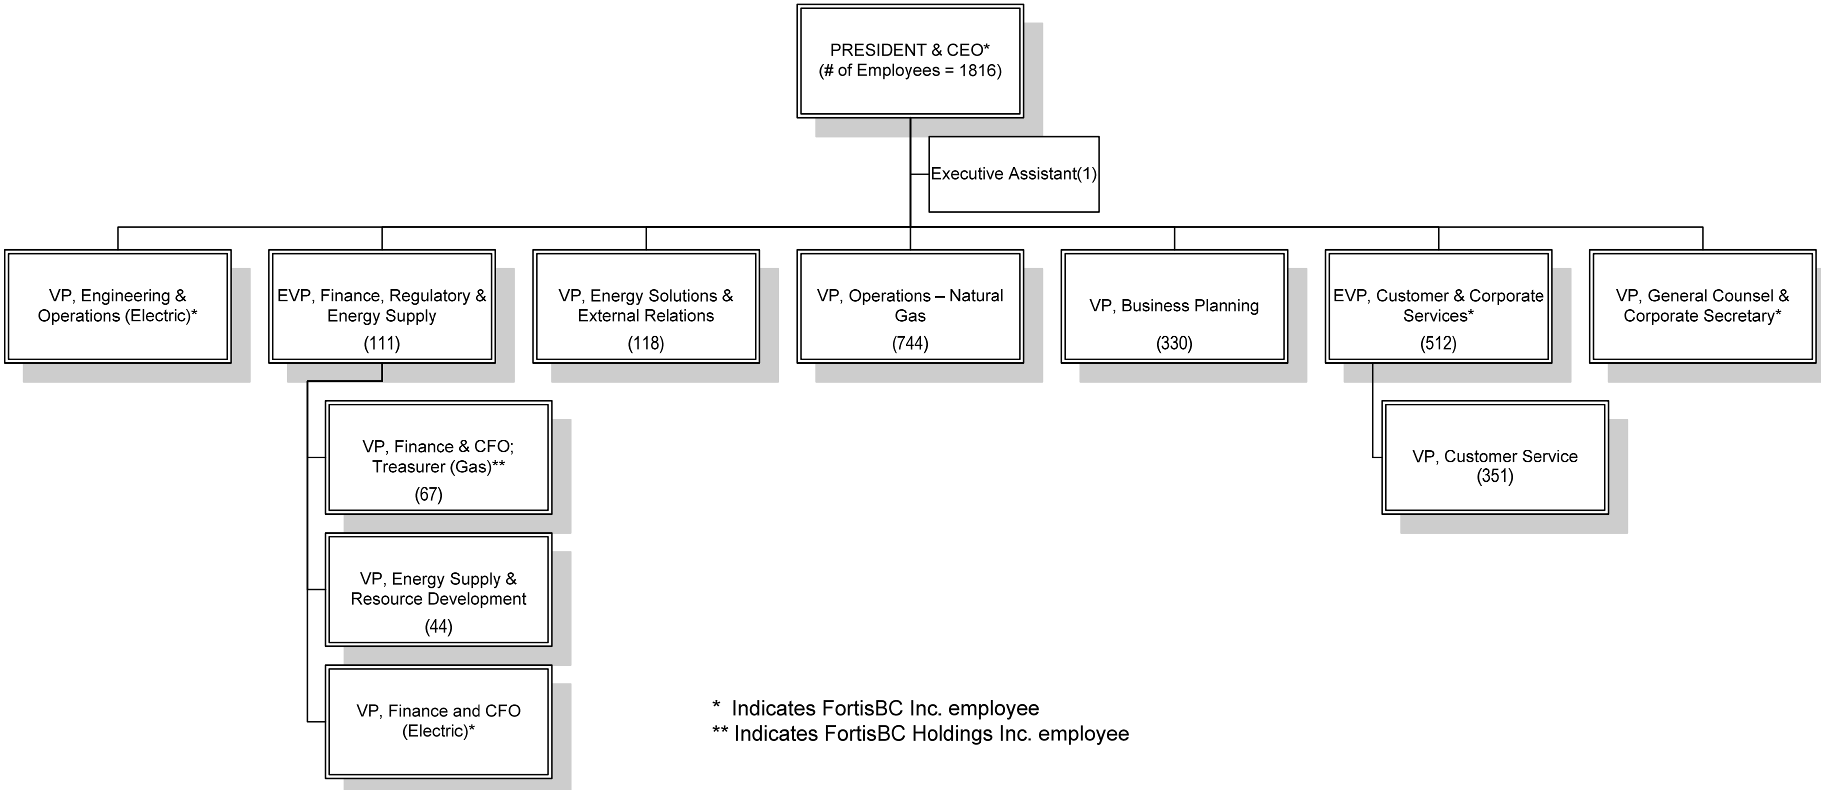
The Companies' ability to deliver on their commitment to customers to provide safe and reliable service in a cost effective manner is dependent on their management team and management structure. Below, the FEU describes the evolution of the management team and structure in response to changes in business requirements.

The Executive Leadership Team ("ELT"), comprised of the President and Vice Presidents, is responsible for providing overall leadership and strategic guidance. The ELT provides the strategic direction for the Companies and develops the business plan in support, including the setting of the performance targets. The ELT works closely with the Utilities Operating Committee ("UOC") to ensure that business goals and objectives are achieved, advancing the needs of customers, employees and the shareholder. The UOC is comprised of senior managers representing the different departments within the Companies and operates under the guidance of ELT. The UOC's mandate is to deliver on the targets as laid out in the Scorecard (discussed in the next section) while maintaining the Company's focus on providing safe, reliable and cost effective service.

In March 2010, Fortis Inc. announced a combined leadership structure for its two BC operations, FortisBC Inc. and the FortisBC Energy Utilities. The move to a common name and identity builds on a common leadership structure by aligning resources under one name and providing customers with one face through which to know the various energy offerings of Fortis including natural gas, electricity, and thermal energy. Although the names of the Terasen utilities changed to FortisBC, they will continue to operate as separate legal entities. It will be primarily business as usual. However, the move to a combined leadership structure is evident in the organizational structure of FEU at the leadership level. To varying degrees the leadership positions are shared between the FEU and the FortisBC electric utility, in which case employees of one entity will cross charge an appropriate share of their time to the other entity to achieve an appropriate allocation of cost. There are also leadership positions in FortisBC Holdings Inc., the parent company, in which case a share of their time is charged to the FEU through the corporate services fee. Details on the corporate services fee as well as shared services are addressed in Section 5.3.18.

Figure 3.1-1 below shows the organizational structure of FEU at the leadership level. Similar organizational charts, each portraying a forecast view as at December 31, 2011, are provided for each business area in the O&M 5ection 5.3 and typically drill down to a senior manager level. Each organizational chart will indicate the employees forecast as at December 31, 2011.

Figure 3.1-1: Organization Chart for Leadership Team



* Indicates FortisBC Inc. employee
** Indicates FortisBC Holdings Inc. employee

3.1.2 ORGANIZATION PERFORMANCE

The FortisBC Energy Utilities use a Balanced Scorecard approach to deliver on a number of key success measures critical to the business. This performance assessment is key for management in evaluating past performance and in determining the most cost effective service level for customers going forward.

FEU's Scorecard is comprised of four categories of measures with 10 measures in total that describe and guide the Companies' overall performance in meeting the targets that are set annually. The Scorecard serves as a valuable communication tool used to describe in clear and objective terms success measures for the FortisBC Energy Utilities. The four categories of measures include Financial, Customer, Key Processes and Employee and are described below.

FINANCIAL

Net earnings for FEU is used as the financial performance measure taking into account earnings from revenues, operating and maintenance expenses, depreciation, amortization, property taxes, interest expense and income taxes. It incorporates the approved costs and revenues that are utilized in determining customers' rates each year.

CUSTOMER

The three measures related to the category Customer include O&M per customer, Base Capital and Customer Satisfaction. The O&M and Base Capital amounts included in the Scorecard targets are the same O&M and Base Capital amounts that are incorporated into the determination of customers' rates. Effective management of costs is an important Scorecard measure. This includes managing O&M on a per customer basis and total capital expenditures (excluding CPCN projects). Success in meeting customer expectations is measured through the use of an index score calculated with information collected through surveys of customers' opinions, and includes residential, commercial, and builder/developer customer groups. Billing, corporate image and marketing communications are tracked as they are the three most important customer satisfaction drivers for residential customers.

KEY PROCESSES

Key processes consist of business processes that support Credit and Collections and control of bad debts and Execution against Regulatory Priorities. Credit and Collections is measured by FEU's ability to manage its residential and commercial customers' bad debt experience. Execution against Regulatory Priorities highlights the importance of achieving success on regulatory issues and agreements for the benefit of customers and the shareholder.

EMPLOYEE

Employee and public safety is fundamental. The Employee measure encompasses four components including Recordable Vehicle Accidents, Recordable Injuries, Wellness and Public Safety. Scorecard targets for vehicle accidents and employee injuries are set to encourage employee behaviours that all accidents are preventable and no accidents are acceptable. Wellness is measured as a composite of annual days lost per employee and is intended to promote attendance at work for employees. Achievement in Public Safety is measured by consideration of safety metrics in the utilities' service quality indicators.

FEU believe that the Scorecard is an effective tool for improving organizational alignment and helping to focus the Companies' activities on key measures. In the future, the Scorecard will remain an essential tool to measure the Companies' performance on key success measures important to customers, the regulator, and the shareholder.

SERVICE QUALITY INDICATORS (SQI'S)

For 2012 -2013 the FortisBC Energy Utilities will continue to report on Service Quality Indicators set out in the FEI 2010-2011 RRA Negotiated Settlement Agreement (Item 6). We will be reviewing these Service Quality Indicators when the CCE Project is fully implemented, and FEU will have greater control of the information and data in this area. The FEU are committed to enhancing the level of customer satisfaction and also meeting emerging challenges of the energy market into the future. To this end we feel the current SQI's and Scorecard help to measure our commitment to these goals.

FEU reports on SQIs that are comparable to the energy industry best practices and posts them quarterly on the website. The 10 Service Quality Indicators that the Companies measure and compare against on an annual basis are presented in Table 3.1-2.

Table 3.1-2: Service Quality Indicators

Customer Performance Indicator	Benchmark	2003 Actual	2004 Actual	2005 Actual	2006 Actual	2007 Actual	2008 Actual	2009 Actual	2010 Actual
Emergency Response Time – Time Dispatched to Site - Emergency – flowing Gas	≤21.1	22.00 minutes	21.36 minutes	21.42 minutes	21.30 minutes	20.36 minutes	20.42 minutes	22.41 minutes	22.30 minutes
Speed of Answer – Emergency (% of calls answered within 30 sec.)	≥95.0%	96.3%	97.9%	98.8%	98.6%	98.4%	98.3%	98.3%	99.2%
Speed of Answer – Non-Emergency (% of calls answered within 30 sec.)	≥75. 0%	76.4%	77.5%	76.9%	78.2%	76.9	73.8%	76.7%	77.2%
Transmission Reportable Incidents	≤2	3	3	3	1	1	2	0	0
Index of Customer Bills Not Meeting Criteria	≤5	2.63	1.93	1.97	0.77	2.30	7.53	3.75	2.40
Percent of Transportation Customer Bills Accurate	≥99.5%	99.8%	96.6%	99.9%	99.9%	99.5%	94.3%	96%	99.9%
Meter Exchange Appointment Activity	≥92.2%	92.6%	93.5%	94.3%	94.1%	93.5%	94.5%	94.7%	94.2%
Accuracy of Transportation Meter Measurement First Report	≥90.0%	97.4%	98.0%	99.5%	98.1%	98.9%	96.2%	98.7%	97.6%
Independent Customer Satisfaction Survey	Compared to prior years	73.9%	73.9%	77.2%	77.9%	79.3%	79.7%	80.1%	80.%
Number of Customer Complaints to BCUC	Compared to prior years	101	191	121	152	130	90	58	26
Number of Prior Period Adjustments	Compared to prior years	24	18	14	21	23	15	21	14
Directional indicators									
Leaks per Kilometer of Distribution System Mains	N/A	0.0040 134	0.0045 150	0.0034 120	0.0021 76	0.0024 87	0.0016 57	0.0031 60	0.0073 140
Number of Third Party Distribution System Incidents	N/A	1,459	1,492	1,457	1,508	1,545	1,574	1,322	1,246

FEU will continue measuring its operational performance using best practice Service Quality Indicators as we have done in the past.

3.1.3 COMPENSATION MANAGEMENT

For the purposes of compensation and benefits, our workforce is separated into three primary groups:

- Executives;
- M&E employees; and
- Unionized employees represented by the IBEW and COPE unions.

While the details of the compensation and benefits programs vary between these three groups, the Company applies the same philosophy and approach to compensation and benefits for all employees. This approach includes a total compensation package that rewards employees with competitive base salaries and wages, incentive compensation, benefits, and paid time-off. Below, the FEU set out the key objectives of the compensation and benefits program, and provide further information about each of the three employee groups. A well defined compensation management structure allows us to balance being able to attract and retain talented people for key positions, while effectively managing the labour and benefit costs that are included in this RRA.

KEY OBJECTIVES

The key objectives of the compensation and benefits program are to:

- Retain and motivate a qualified, diverse workforce by recognizing and rewarding achievement, contribution, and excellence;
- Attract a qualified, diverse workforce through a competitive compensation program;
- Reward by providing a consistently applied compensation program that meets the needs of a diverse workforce; and
- Promote continuous learning, leadership development and training while understanding that it is the responsibility of each employee to manage their own growth through development planning.

In order to achieve these objectives and to ensure the sustainability of employee benefit programs, FEU and their employees have adopted cost-shared pension and benefit arrangements. In addition, through ongoing review of our plans, we incorporate industry-determined best practices such as flexible work schedules and benefits, which enable employees to personalize the benefit plan to their own needs.

EXECUTIVE EMPLOYEES

The Company's executive compensation program is designed to provide competitive levels of compensation, a significant portion of which is dependent upon individual and corporate performance. The compensation package is designed to retain and attract qualified and experienced executives as well as align the compensation level of each executive to that executive's level of responsibility. The objectives of base salary are to recognize market pay, and acknowledge competencies and skills of individuals. The objectives of the annual incentive plan are to reward achievement of short-term financial and operating performance objectives and focus on key activities and achievements critical to the ongoing success of FEI. Long-term incentive plans focus executives on sustained shareholder value creation.

The Company's executive compensation program involves four main elements (base pay, short term and long term incentive pay and benefits), which comprise a Total Rewards package. All of these factors support the needs of the business and its customers, and each element contributes to finding the balance on delivering successfully on both short and longer term objectives.

As a general policy, FEU establish base and incentive compensation targets so as to compensate executives at a level generally equivalent to the median level of a broad reference group of approximately 200 Canadian commercial industrial companies.

With the exception of the pension plan, benefits provided to the executives are based on the benefit program for M&E employees. Prior to June 1, 2007, all executives participated in the pension plan for M&E employees, in either a defined benefit or a defined contribution program. Effective June 1 2007, all executives became members of a Group Registered Retirement Savings Plan ("RRSP"). The RRSP arrangement provides for equal contributions of 6 ½ per cent of salary by both the employee and employer up to the Canada Revenue Agency ("CRA") RRSP maximum limit. The Company makes notional contributions in excess of the RRSP maximum limit equal to 13 per cent of salary to a Supplemental Executive Retirement Plan ("SERP").

M&E EMPLOYEES

As a general policy, FEU establishes base and incentive compensation targets at a level approximately equal to the median level of a peer group of companies contained in the Hay Group's Paynet Database. The peer group is heavily influenced by the commercial/industrial subset with an emphasis on natural resources and utilities. By policy, the market rates are set to the 50th percentile of the peer group.

Pay increases and incentive opportunities for all employees are linked to individual and company performance which provides employees with an opportunity to increase their total compensation. Other factors, such as competitive market factors, current position in the salary range and budget guidelines may impact base pay.

FEU also offers an employee benefits program for M&E employees comprising pensions, health and welfare benefits, other work-related benefits and post-retirement benefits other than pensions. The employee benefits program is targeted to be competitive at the median level of an established group of comparator companies.

A key objective of FEU has been to provide a common benefits platform for all M&E employees. This strategy was adopted for several reasons, including simplified administration which reduces expenses and eases internal transfers. In addition, the rising cost of pensions and health care and other benefits is a concern for all Canadian businesses. We need to balance the needs of the business with those of our employees. Both are best served by a pension and benefits package that is sustainable in the future through employer and employee cost sharing, and which provides our employees with the flexibility to tailor benefits to meet their needs. The provision of a flexible benefits plan generates a greater understanding of the benefits available to the employee and the associated costs, and promotes prudent consumerism.

UNIONIZED EMPLOYEES

In 2006 and 2007, Terasen Gas reached five-year labour agreements with the IBEW and COPE respectively. These agreements introduced significantly greater flexibility in work management, and in implementing common flexible benefits and post-retirement benefits plans.

All IBEW and COPE employees belong to the FEI Pension Plan for IBEW and COPE Members. This plan is a jointly trusted and cost-shared defined benefit pension plan. As with M&E employees, FEU has made considerable progress in negotiating harmonized benefit plans for active and retired IBEW and COPE employees.

The labour and benefit inflation rates that are included in this RRA and that result from the compensation management structure outlined above are included in Section 5.3.2.2 of this Application.

3.1.4 CAPITAL AND OPERATING AND MAINTENANCE FORECASTING PROCESSES TO DETERMINE REVENUE REQUIREMENTS

The capital and O&M forecasts included in this Application result from adhering to the capital and O&M forecasting processes described below.

3.1.4.1 Capital Spending

Over the next five years, the FortisBC Energy Utilities expect to spend approximately $1 billion in Regular Capital expenditures to meet customers' needs and to maintain the integrity and reliability of the gas facilities. As in the past, the Companies manage the capital expenditures using defined capital approval policies and management processes. Capital funding requests are prioritized and approved taking into consideration safety and reliability requirements and ensuring that capital is put to its best use while minimizing the impact on customers' rates.

The FEU Capital Approval policy outlines an approval process with responsibilities and approval limits defined to ensure appropriate capital spending decisions are made. Annual capital budgets are reviewed and approved by the ELT and UOC. Subsequently, before capital spending occurs in the year, capital projects are reviewed to ensure appropriateness of budget estimates, priority and availability of staffing and resources to implement.

For information technology related projects, to ensure the effectiveness of prioritization of funding, all projects regardless of dollar value require review and approval by the UOC.

Customer driven capital consisting of new mains, meters and services are governed by the System Extension and Customer Connection polices which were approved by the Commission in Order No. G-152-07 in December 2007.

For large capital projects subject to CPCN requirements, senior management reviews the projects and obtains Board of Directors approval where necessary prior to filing the CPCN applications with the Commission.

The FEU believe that the forecast capital expenditures for 2012 and 2013 reflects the discipline imposed by these management structures. For a further description of the capital expenditure process, please see Section 6.2 Capital Expenditures.

3.1.4.2 Operating and Maintenance Spending

Similar to the management of capital spending, FEU manages its greater than $200 million of annual O&M expenditures using its defined approval policies and management processes. These policies and management processes are in place to ensure that O&M forecasts have been developed in support of the Companies' business priorities and objectives, ensuring that O&M funding is appropriate and prioritized to meet the current and longer-term needs of customers.

O&M budgets are developed annually by the UOC and reviewed and approved by the ELT. Existing department O&M budgets are reviewed to ensure their appropriateness and continued justification. Incremental O&M funding requests are prioritized and approved taking into consideration safety and reliability requirements and ensuring that funding is put to its best use while minimizing the impact on customers' rates. This holistic approach to O&M budgeting is more suited to achieving an optimal allocation of resources to realize the Companies' goals and objectives than that by following an exclusively incremental focus or being driven exclusively from the top down.

Monitoring and management of actual O&M expenditures during the year is primarily the responsibility of the UOC. The UOC tracks spending against budget targets. In addition, where the opportunity permits, available funding is reprioritized and allocated to fund more pressing or beneficial initiatives that arise. Through this regular review process, the Company is able to ensure O&M funds are put to their best use by responding to changing circumstances as appropriate. The FEU believe that the forecasted O&M for 2012 and 2013 reflects the discipline imposed by this management and monitoring framework.

3.2 Generally Accepted Accounting Principles ("GAAP") Used in Determining Revenue Requirements

This Application has been prepared using accounting policies and estimates assuming the continuation of the IFRS compliant policies that were approved in the setting of rates for 2011 for the Utilities. The accounting policy changes approved at that time are still allowed under IFRS, and are also allowed under US GAAP, except as noted below.

On February 9, 2011, the Fortis BC Utilities (FortisBC Inc. and the FEU) filed an application requesting approval for the use of US GAAP (the "US GAAP Application") in the determination of rates as of January 1, 2012. Specifically, the application sought approval for:

1. The use of US GAAP for the calculation of cost of service, revenue requirements, rate base, and the preparation of regulatory schedules and filings effective January 1, 2012; and
2. Recording the one-time conversion costs associated with the adoption of US GAAP in a rate base deferral account for each of the Companies, for recovery from its respective customers in 2012 and 2013.

The FEU filed the application for the adoption of US GAAP once it became apparent that IFRS would not allow the recognition of rate regulated assets and liabilities for external financial reporting. The Companies believe continued recognition of regulatory assets and liabilities best reflects the effect that regulatory activities have on the Companies' financial position and the economic realities of their businesses and the regulatory model they operate under. The only set of accounting standards that currently exists that would allow for regulatory assets and liabilities to continue to be recognized is US GAAP; therefore, US GAAP is the reasonable and prudent accounting standard for the Companies to report under.

The following two sections deal with the impacts on revenue requirements of either fully implementing IFRS but with deferral accounts, or adopting US GAAP. In addition, the FEU have included a summary of the current reconciling items between regulatory reporting and external financial statements as Appendix L-1, to provide some background around the level of reconciliation that is currently required.

3.2.1 IFRS WITH DEFERRAL ACCOUNTS FOR RATE SETTING PURPOSES

If the FEU continued with the adoption of IFRS for both rate setting purposes and external financial reporting, there would be many reconciling items between external financial reporting and regulatory reporting. This is because regulatory assets and liabilities would not be recognized for external financial reporting, creating a significant increase in the reconciliation process between regulatory reporting and financial reporting. Over the course of a number of years, this reconciliation would get more complicated as certain deferrals are recovered from customers while others would continue to build through time.

3.2.1.1 Changes to Fully Implement IFRS

Even under a scenario where IFRS with deferral accounts is adopted for rate setting purposes only, changes would be required to the current accounting treatment included in this RRA. On the adoption of IFRS, all regulated assets and liabilities would need to be de-recognized for external financial reporting as IFRS does not recognize the effect of rate regulated accounting. Once adopted, any impacts of rate regulation that are included or embedded in other assets or liabilities could not be recognized on a go forward basis. A key area of difference is the treatment of Pension and Other Pension and Employment Benefits, which is discussed in Section 3.2.1.2. The other areas where this is expected to impact the current RRA include:

1. The rate of overheads capitalized that would be allowed to be included in property plant and equipment would be limited to the rate that would be considered "directly attributable". The overheads study filed in conjunction with the 2010/2011 RRAs indicated that the rate would have been 8 percent for FEI and 5 percent for FEVI. The difference between this rate and the 14 percent overheads capitalized rate agreed to as part of the NSA would be captured in a deferral account for regulatory purposes rather than as part of property plant and equipment.
2. FEU would be unable to recognize AFUDC under IFRS. Similar to the treatment of overheads capitalized rate differences, differences between the AFUDC rate and an allowed interest during construction rate would need to be captured in a deferral account rather than as part of property plant and equipment.
3. On the adoption of IFRS, accumulated depreciation and amortization is required to be netted against the cost to effectively reset the cost of capital and intangible assets on transition. This re-setting would not be expected to affect the depreciation expense included in the revenue requirements calculation in this Application although the presentation of assets and depreciation rates would be impacted.

3.2.1.2 Pension and Other Post Employment Benefits

Consistent with the treatment included in this Application, on the adoption of IFRS, all unamortized pension actuarial gains and losses, past service cost and transitional obligations would require recognition as an opening adjustment to retained earnings for external financial reporting. For regulatory reporting purposes, these amounts have been captured in the IFRS Transitional Deferral account that was requested in the 2010/2011 RRA for FEI and FEVI. In the current application, FEI and FEVI have proposed to recover these amounts over the Expected Average Service Life ("EARSL") for each benefit plan. Additionally, the current method of recognizing actuarial gains and losses through pension expense is being re-examined by the IASB. If the current policy on the corridor method is removed from IFRS, the FEU may be required to recognize the effect of actuarial gains and losses in the current period rather than deferring the effects by the use of the corridor method.

3.2.1.3 Costs associated with the adoption of IFRS

In our US GAAP Application, the FEU outlined the expected costs of adopting both IFRS and US GAAP. The costs included in that GAAP Application include an increase in the one-time costs associated with adopting IFRS and an increase in the on-going costs of IFRS. Both types of costs have increased due to the fact that the effects of rate regulation would not be recognized in the external financial statements of the FEU. The FEU had estimated the incremental one-time costs at $1.4 million and incremental on-going costs at $0.9 million. These costs have not been included in this application as the Companies do not expect they will adopt IFRS for external financial reporting purposes.

3.2.2 ADOPTION OF US GAAP FOR RATE SETTING PURPOSES

The adoption of US GAAP for rate setting purposes has fewer adjustments than adopting IFRS and is closer to the existing reporting under Canadian GAAP. The FEU have committed to adopting US GAAP for external financial reporting and have also requested the adoption of US GAAP for rate setting purposes.

The following is a discussion of the differences between US GAAP and our existing regulatory policies and treatments that affect cost of service and rate base that have been identified to date.

3.2.2.1 Pension and Other Post Employment Benefits

ADOPTION DATE OF PENSION ACCOUNTING FOR US GAAP AND TRANSITIONAL OBLIGATION/BENEFIT

The Canadian Institute of Chartered Accountants adopted accrual accounting for pension and other post employment benefits ("OPEB") starting January 1, 2000. As a result of the adoption of accrual accounting, a transitional benefit/obligation was created which has been amortized to pension expense over the Expected Average Service Life ("EARSL"). The equivalent standard under US GAAP is FASB Statement 87 (FAS 87) which came into effect on January 1, 1989.

It would be virtually impossible for the FEU to obtain actuarial data prior to 2000 and as such, there is an accommodation available to foreign registrants who are adopting US GAAP. The accommodation essentially allows for the calculations of net benefit expense for pension and OPEBs to be calculated from 2000 onwards except for the transitional obligation/benefit created on adoption of Canadian GAAP. The transitional obligation that was created in 2000 when

Canadian GAAP adopted accrual accounting for pension benefit plans is moved back to 1989 and assumed to be amortized from the period onwards. Any transitional obligation remaining would be recognized in a deferral account.

As a result, under a US GAAP adoption scenario, the FEU would propose the creation of a rate base deferral account to capture any unamortized transitional benefit/obligation on the adoption of US GAAP (similar to the IFRS Transitional Deferral account). Under Canadian GAAP, these amounts are effectively part of the pension asset/liability which forms part of rate base today.

This is not expected to have a material effect on cost of service or rate base for any of the FEU. The amortization of the transitional obligation under Canadian GAAP is already included in the net benefit expense. By recognizing the transitional amounts in a rate base deferral account, the amortization could continue assuming the remaining EARSL is used.

Overall, the effect and amounts involved under the US GAAP scenario are materially lower than under transitioning to IFRS. The following table compares the projected pension and OPEB expense under existing Canadian GAAP, IFRS assuming an adoption date of January 1, 2010 and US GAAP. It also includes the effect of amortizing the regulatory asset created if the adoption of IFRS had taken place as of this date. The amortization period used is the EARSL by plan.

Table 3.2-1: Pension and OPEB Expense under US GAAP and IFRS

		2012				2013	
(in 000's)	**US GAAP**	**IFRS**	**Difference**		**US GAAP**	**IFRS**	**Difference**
FEI		**EARSL**				**EARLS**	
Legacy	1,904	(230)	2,134		1,162	(400)	1,562
Union	8,016	4,403	3,613		7,263	4,272	2,991
TI Plan	4,219	4,228	(9)		4,143	4,190	(47)
	14,139	8,401	5,738		12,568	8,062	4,506
Amortization		6,132	(6,132)			6,132	(6,132)
Net Pension	14,139	14,533	(394)		12,568	14,194	(1,626)
OPEB	4,779	4,134	645		4,917	4,367	550
Amortization		1,007	(1,007)			1,007	(1,007)
Net OPEB	4,779	5,141	(362)		4,917	5,374	(457)
Total - FEI	18,918	19,674	(756)		17,485	19,568	(2,083)
FEVI							
Legacy	1,487	846	641		1,302	767	535
TI Plan	237	232	5		237	237	-
	1,724	1,078	646		1,539	1,004	535
Amortization	-	621	(621)			621	(621)
Net Pension	1,724	1,699	25		1,539	1,625	(86)
OPEB	616	361	255		620	385	235
Amortization	-	306	(306)			306	(306)
Net OPEB	616	667	(51)		620	691	(71)
Total - FEVI	2,340	2,366	(26)		2,159	2,316	(157)

The net effect under each scenario presented above show that the effect of adopting US GAAP has a materially lower total cost compared to adopting IFRS.

RECOGNITION OF FUNDED STATUS ON THE BALANCE SHEET

US GAAP requires that the funded status of benefit plans – measured as the difference between the fair value of plan assets and the benefit obligation – be recognized on the balance sheet of the entity. For pension plans, the benefit obligation shall be the projected benefit obligation and for OPEB plans, the benefit obligation shall be the accumulated post-retirement benefit obligation. In companies not subject to rate regulation, the recognition of the funded status has a corresponding adjustment to other comprehensive income. The adjustment essentially recognizes any unamortized gains and losses due to the application of the corridor method, prior service costs (and credits), and any remaining unamortized transitional obligation/benefit. Through time, all of these components will be recognized through the net periodic benefit cost.

As a result, under a US GAAP adoption scenario, the FEU would propose the creation of a rate base deferral account to capture the difference between the carrying value otherwise determined and the funded status of the benefit plans. Similar to the transitional obligation discussed above, these amounts are effectively part of the pension asset/liability which forms part of rate base today.

This is not expected to have any effect on cost of service or rate base for any of the FEU. The recognition of the funded status is simply a re-classification between the pension/OPEB rate base amounts and a deferral account.

MEASUREMENT DATE

US GAAP, like IFRS, requires that benefit plans use a measurement date coinciding with the fiscal year end of the Company. FEI, FEVI and FEW all use a measurement date of December 31 so this is not expected to have any impact.

3.2.2.2 Uncertain Tax Positions

Financial Accounting Standards Board Interpretation No. 48 (FIN 48), Accounting for Uncertainty in Income Taxes, was implemented in 2006 and was intended to reduce uncertainty in accounting for income taxes. The standard requires a series of steps for the recognition, measurement, disclosure and presentation of uncertain tax positions. The accounting and reporting requirements of FIN 48 involve a two-step process that may result in a larger income tax liability due to the earlier recognition of income tax liabilities. The standard was implemented to reduce the uncertainty and diversity in practice that the FASB had observed which resulted in non-comparability across companies. No similar standard exists under either existing Canadian GAAP or IFRS.

FIN 48 requires the FEU to have documentation and support for each adjustment made to reconcile between accounting income and taxable income. The areas of documentation have included such items as the allowance for doubtful accounts, meals and entertainment expenses, unpaid compensation, inventory obsolescence, capitalized overheads, capital additions for tax purposes, dismantling costs and deferred charges. While there are many items to document and the FEU are still at the documentation stage, we do not expect to have any material adjustments as a result of this standard. The documentation is still subject to audit and the audit may result in adjustments to positions and ultimately to the recognition of amounts under this standard.

As a result, under a US GAAP adoption scenario, the FEU would propose the creation of a non rate base deferral account to capture any differences that arise from the implementation of FIN 48.

3.2.2.3 Other US GAAP Items

A number of other adjustments are contemplated on transition to US GAAP that should not affect cost of service or rate base. These potential adjustments include the application of pushdown accounting, adjusting for how FEI accounts for Lease In/Lease Out transactions for external financial reporting, and others. None of these transactions are expected to affect regulatory accounting or reporting and would not affect the revenue requirement.

3.2.2.4 Costs Associated with the Adoption of US GAAP

In their US GAAP Application, the FEU outlined the expected costs of adopting both IFRS and US GAAP. The costs of adopting US GAAP were estimated to be incremental one-time costs of $1.8 million and incremental on-going costs of $0.9 million. These one-time costs are generally as a result of audit fees on the adoption of US GAAP. The higher on-going costs are as a result of higher audit fees including work required under Sarbanes-Oxley. These costs have not been included in this application. Under a US GAAP adoption scenario, the FEU would include the recovery of these costs through an evidentiary update to this RRA.

3.2.3 SUMMARY OF STATUS OF GAAP

In summary, upon receipt of a decision in the US GAAP Application, the FEU will provide an evidentiary update.

If the US GAAP Application is approved as proposed, the FEU will update their Application to include:

1. A total decrease in cost of service from pension and OPEBs (decrease of $782 thousand in 2012 and $2.24 million in 2013 as shown in Table 3.2-1 above) plus any associated income tax impacts;
2. The changes to rate base resulting from the pension and OPEB deferrals discussed in Section 3.2.2.1,
3. A total increase in O&M of $0.9 million in each of 2012 and 2013 for the ongoing costs of US GAAP compliance; and
4. A non rate base deferral to capture the estimated $1.8 million in one-time US GAAP conversion costs.

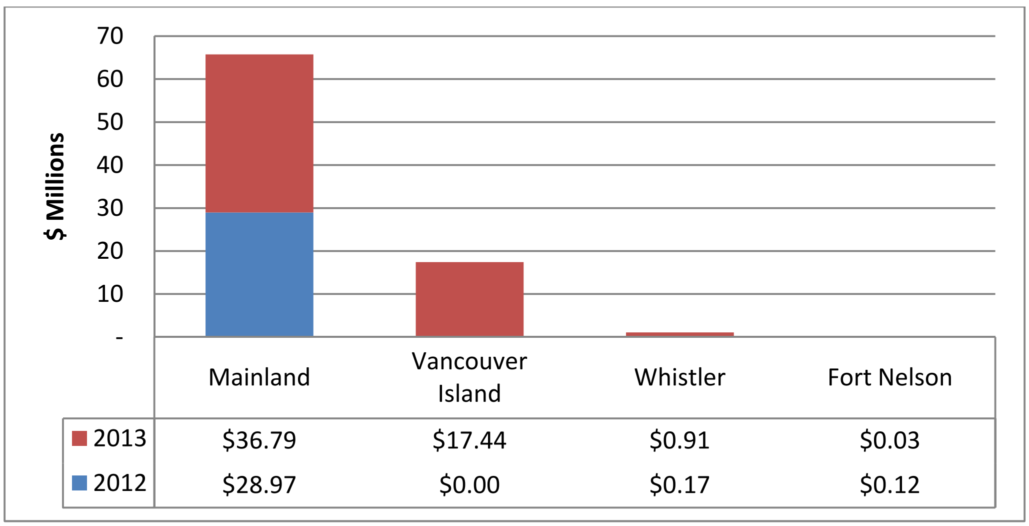
In the event that the FEU are ordered to implement accounting policies other than US GAAP, the FEU will update their Application to include the impacts of those changes.

3.3 Summary of Revenue Requirements for 2012 and 2013

The revenue requirements reflect all of the inputs in the financial schedules, and take into consideration all of the impacts described in this Application. The revenue requirement changes that the Companies are requesting are based on sound research and forecasting, using our knowledge and experience to determine what the Companies believe is the likely course of events over the upcoming forecast periods of 2012 and 2013.

The following figure provides the 2012 and 2013 revenue deficiencies for the FortisBC Energy Utilities. The revenue deficiency or surplus is determined by comparing the forecast cost of service to the forecast revenue at existing 2011 rates for each year.

Figure 3.3-1: Forecast 2012 and 2013 Revenue Deficiencies for the FortisBC Energy Utilities[20]



The revenue deficiencies result in 2012 and 2013 delivery rate changes for Mainland, Whistler and Fort Nelson as demonstrated in Table 3.3-1. The forecast revenue deficiency for Vancouver Island in 2013 is being offset by part of the projected December 31, 2012 surplus balance of $71.6 million (before tax) in the RSDA. In this Application, Vancouver Island is seeking approval for a rate freeze for 2012 (which equals the forecast cost of service) and 2013 and the continuation of the RSDA mechanism for 2012 and 2013.

20 Section 7.1 to 7.4, Schedule 2 and 3

Table 3.3-1: Revenue Deficiencies in Mainland, Whistler and Fort Nelson Result in Delivery Rate Increases[21],[22]

Utility/Region	2012	2013	Total
Mainland	5.04%	6.36%	11.40%
Whistler	2.23%	11.90%	14.12%
Fort Nelson	6.51%	1.64%	8.15%

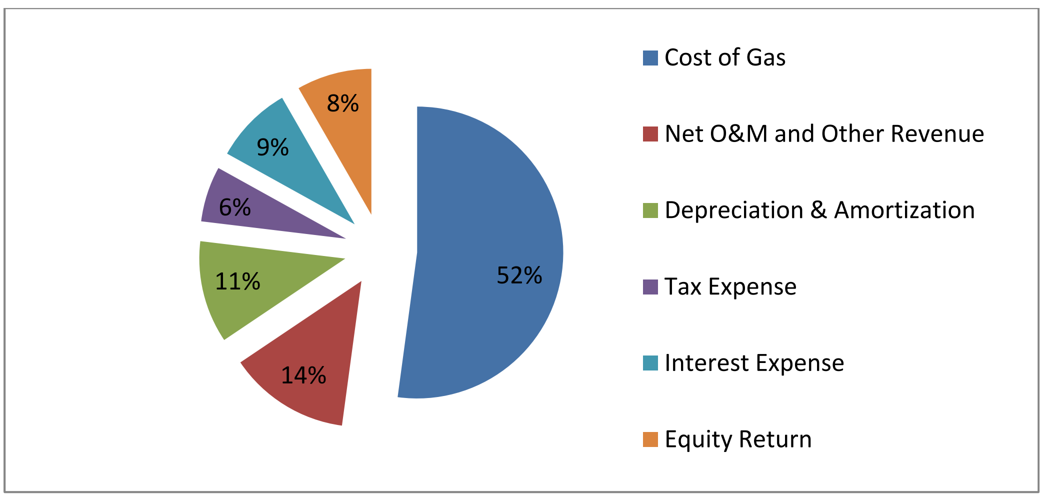
An explanation of the forecast 2012 and 2013 revenue deficiencies and rate proposals by Utility is provided in the following sections.

3.3.1 SUMMARY OF MAINLAND REVENUE REQUIREMENTS

The total revenue requirements of $1,245.1 million in 2012 and $1,282.8 million in 2013 have been calculated appropriately and reflect the reasonable costs required for FEI to continue to meet the needs of our customers and the communities in which we serve. The following sub-sections will discuss the total Mainland revenue requirement and revenue deficiencies for 2012 and for 2013.

Figure 3.3-2 provides a breakdown of the components of the Mainland total revenue requirement averaged for the two year period.

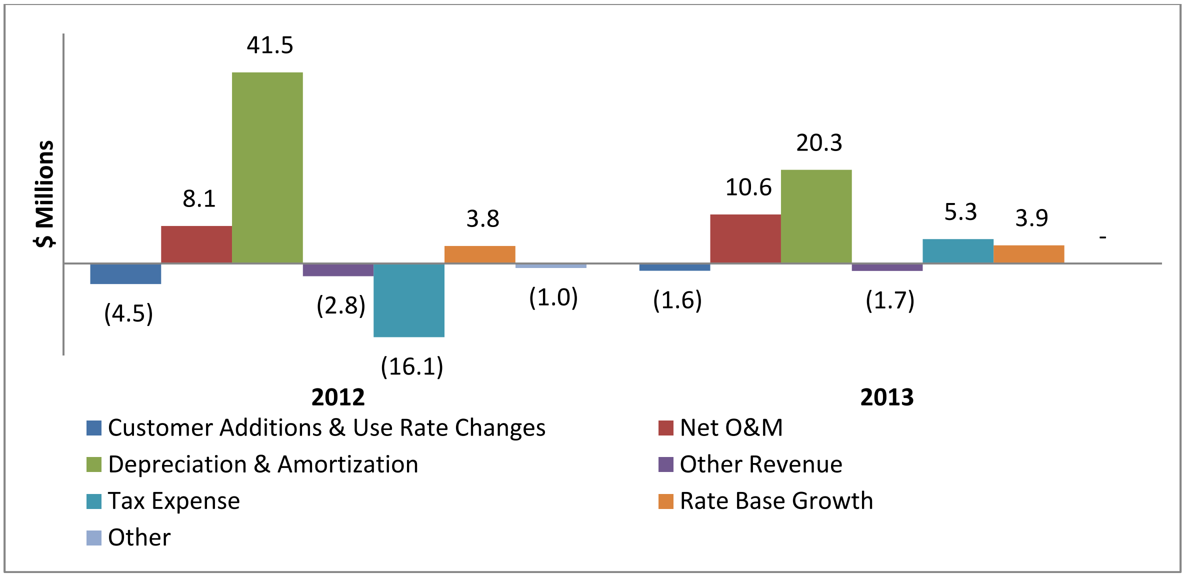
Figure 3.3-2: Average Composition of the 2012 and 2013 Mainland Revenue Requirement[23]



[21] Approximate delivery rate change percent is equal to the revenue deficiency divided by the forecast delivery margin revenue at existing 2011 delivery rates (i.e. excluding cost of gas).
[22] Section 7.1 to 7.4, Schedules 2 and 3
[23] Section 7.1, Schedule 5 and 6

Changes to the Mainland revenue requirements result in revenue deficiencies of $29.0 million in 2012 and $36.8 million in 2013. These deficiencies are summarized in Figure 3.3-3 below.

Figure 3.3-3: Mainland Revenue Deficiency Components[24]



3.3.1.1 Revenue at Existing Rates

The Demand Forecast discussed in Section 4 is a key component of the determination of the revenue surplus or deficiency. Existing approved rates are applied to the demand forecast to determine the variance (surplus or deficiency) between existing revenues and the revenue requirement for the year. The non-bypass customer demand determined in Section 4 is 1,850 TJs greater than the demand forecast embedded in 2011 delivery rates, with a further increase of approximately 214 TJs in 2013. This increase in demand is attributable to customer growth and reflects changes in use rates and results in a revenue surplus of approximately $4.5 million in 2012 and $1.6 million in 2013. The table below shows the changes in demand by customer group for 2012 and 2013.

24 Section 7.1, Schedule 1

Table 3.3-2: Increased Demand for 2012 and 2013[25]

Non-Bypass Volume Change, TJ	Forecast 2012	Forecast 2013
Residential	1,311	(74)
Commercial	(1,864)	(61)
Other	(835)	3
Total Sales	**(1,388)**	**(131)**
Rate 22 Firm	1,318	(127)
Rate 22 Interruptible	1,147	76
Rate 23	974	334
Rate 25	(403)	57
Rate 27	211	7
Total Transportation	**3,247**	**345**
Total Non-Bypass Volume Change	**1,859**	**214**

The Demand Forecast and Revenue at Existing Rates and have been properly incorporated in the calculation of the Company's revenue requirement.

3.3.1.2 Cost of Gas

As discussed in Section 5.2, the commodity cost recovery charge and the midstream cost recovery charge for the natural gas sales rate customers are subject to quarterly review by the Commission, and Mainland is not requesting approval of forecast gas costs with this Application. Forecast gas costs are required in the determination of working capital and correspondingly rate base and earned return. The cost of gas itself does not impact the determination of the revenue deficiency or surplus because the revenue at existing rates includes commodity and midstream revenue that fully offsets the forecast cost of gas.

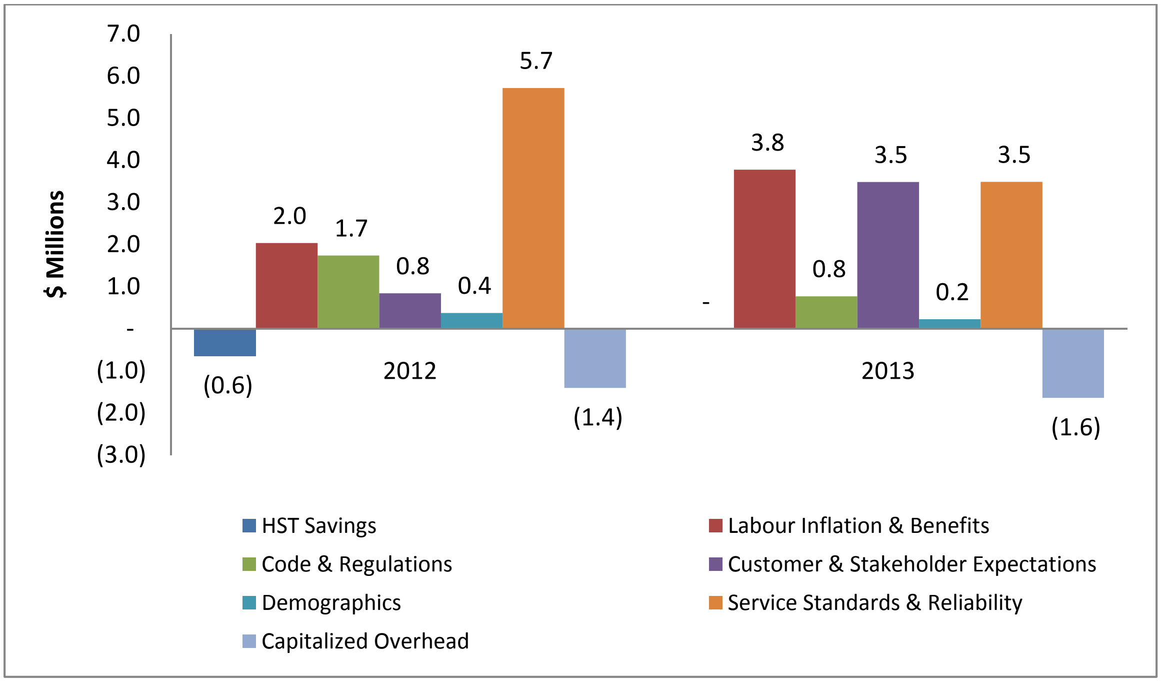
3.3.1.3 Operations and Maintenance Expenses

As discussed in Section 5.3, the 2012 and 2013 O&M expense forecasts have been developed in support of the Companies' business priorities and objectives, ensuring that O&M funding is appropriate and prioritized to meet the current and longer-term needs of customers. Key priorities and focus for the utilities in the near future include customer service repatriation; public and employee safety, customer satisfaction, financial management, environmental responsibility and system sustainment, and the demographic challenges we face with our aging workforce. The business drivers and their impacts on forecast O&M in 2012 and 2013 are summarized in

[25] Increase as compared to demand forecast embedded in 2011 rates, Section 7.1, Schedules 7 to 9

the figure below. As shown in Figure 3.3-4, the impact of changes in the O&M is an increase to the revenue requirements of $8.1 million in 2012 and $10.6 million in 2013, net of capitalized overhead.

Figure 3.3-4: O&M Funding Results in Increased Revenue Requirements[26]



The items in the figure above are discussed more fully in Section 5.3, and have been properly reflected in the calculation of the Company's revenue requirement.

3.3.1.4 Depreciation and Amortization Expense

As discussed in Section 5.4, an update to the depreciation study has resulted in an increase to depreciation expense of $4.6 million. Additions in 2012 and 2013 have resulted in higher depreciation expense of $12.9 million in 2012 and a further $5.5 million in 2013. Since the impacts on depreciation are not deductible for income tax purposes, the total impact on revenue requirements for these items needs to be grossed up. The revenue requirement impact of all depreciation changes is an increase of $23.3 million in 2012 and a further $7.3 million in 2013.

The removal cost provision has increased $4.9 million in 2012 and a further $0.5 million in 2013. Similar to depreciation expense, the removal cost provision is not deductible for income tax purposes; therefore, the total revenue requirement impact of the removal cost provision is $6.5 million in 2012 and a further $0.7 million in 2013.

---

[26] Please refer to Section 5.3, Table 5.3-6 and Table 5.3-7

In addition, amortization expense has increased $11.6 million in 2012 and a further increase of $12.3 million in 2013. Both of these amounts are after-tax, so the impact to revenue requirements is as stated. The four accounts listed in Table 3.3-3 are the key contributors to the increase in amortization expense in 2012 and are accounts that did not have amortization expense in 2011. The amortization expense in the IFRS Transitional account represents the amortization of the pension and OPEB transitional obligation as shown in Table 3.2-1.

Table 3.3-3: Accounting Impacts Drive Amortization Expense Increase in 2012[27]

($ millions) **Amortization Expense**	**2012**
IFRS Transitional Account	$ 7.1
Deferred Removal Costs	1.5
Gains and Losses on Asset Disposition	0.6
2010-2011 Customer Service O&M	2.9
	$ 12.1

The increase in 2013 amortization expense is largely driven by deferral accounts that had credit balances in 2011 and were fully amortized in 2012, such as the Property Tax Variance, Insurance Variance and Tax Variance accounts. The five accounts listed in Table 3.3-4 are the key contributors to the 2013 increase of $12.3 million in amortization expense.

Table 3.3-4: Change in Property Tax, Insurance and Tax Variance Accounts Drive Increase in 2013[28]

($ millions) **Amortization Expense**	**2012**	**2013**	**Change**
Property Tax Variance Account	$ (1.1)	$ (0.4)	$ 0.7
Insurance Variance Account	(1.2)	-	1.2
Tax Variance Account	(7.0)	-	7.0
Interest Variance Account	(2.5)	(1.7)	0.8
Energy Efficiency and Conservation	2.6	3.9	1.4
	$ (9.3)	**$ 1.9**	**$ 11.1**

The total impact on revenue requirement of changes in depreciation (including removal costs) and amortization is an increase of $41.5 million in 2012 and $20.3 million in 2013

27 Section 7.1, Schedules 68 to 71
28 Section 7.1, Schedules 28 and 29

3.3.1.5 Other Revenues

As discussed in Section 5.5, a significant increase in Other Revenue of $2.8 million in 2012 and a further increase of $1.7 million in 2013 is forecast. Increases in other revenue decrease the revenue requirement, offsetting the revenue deficiency. The increase in other revenue is largely attributable to revenue from natural gas for transportation service.

3.3.1.6 Taxes

As discussed in Section 5.6, forecast levels of property taxes and changes in income tax rates, new taxes, and changes to CCA rates all have an impact on the revenue requirement calculation. The property tax increases of $0.6 million in 2012 and a further $1.6 million in 2013 both serve to increase revenue requirements. Other changes to income tax rates and adjustments to taxable income result in a decrease in revenue requirements in 2012 of $8.0 million and an increase in 2013 of $5.7 million. As shown in Table 3.3-5, the increase in CCA deductions, along with the deduction of removal costs and the reduction in the tax rate are the key components of the decrease in tax expense in 2012. The increase in CCA deductions is driven by the CCE Project. Changes in amortization and earned return are the key contributors to the tax expense increase in 2013.

Table 3.3-5: Components of 2012 and 2013 Tax Expense Changes[29]

($ millions)	**2012**	**2013**	**Total**
Reduction in Tax Rate	$ (2.0)	$ (0.5)	$ (2.5)
Increase in CCA Deductions	(13.1)	-	(13.1)
Removal Cost Deduction	(4.5)	-	(4.5)
Pension and OPEB	(1.5)	-	(1.5)
Changes in Amortization Expense	4.0	-	4.0
Changes in Earned Return	1.5	0.7	2.2
Other	0.2	3.4	3.6
	$ (15.5)	**$ 3.7**	**$ (11.8)**

3.3.1.7 Earned Return – Return on Rate Base and Financing Costs

Mainland earns a return on rate base, so changes in the amount of rate base affect the amount of return included in the revenue requirement by approximately 3.8 per cent of that change. The rate base proposals contained in Section 6, Rate Base contribute $4.1 million to the 2012 revenue requirement and a further $2.0 million to the 2013 revenue requirement.

The final component of the revenue requirement calculation is financing costs. Financing costs are discussed in Section 5.7, Financing Costs and Return on Equity. The amount of financing

[29] Section 7.1 to 7.4, Schedules 30 to 35

required is determined by the rate base; the financing costs themselves are determined by a combination of the amount of financing and the forecast interest rates. The growth in rate base increases financing costs by $4.1 million in 2012 and $0.9 million in 2013. This is offset in 2012 by a reduction in interest rates, mitigating this impact by $4.4 million with an increase of $1.1 million in 2013, resulting in a net decrease associated with financing costs of $0.3 million in 2012 and an increase of $1.9 million in 2013.

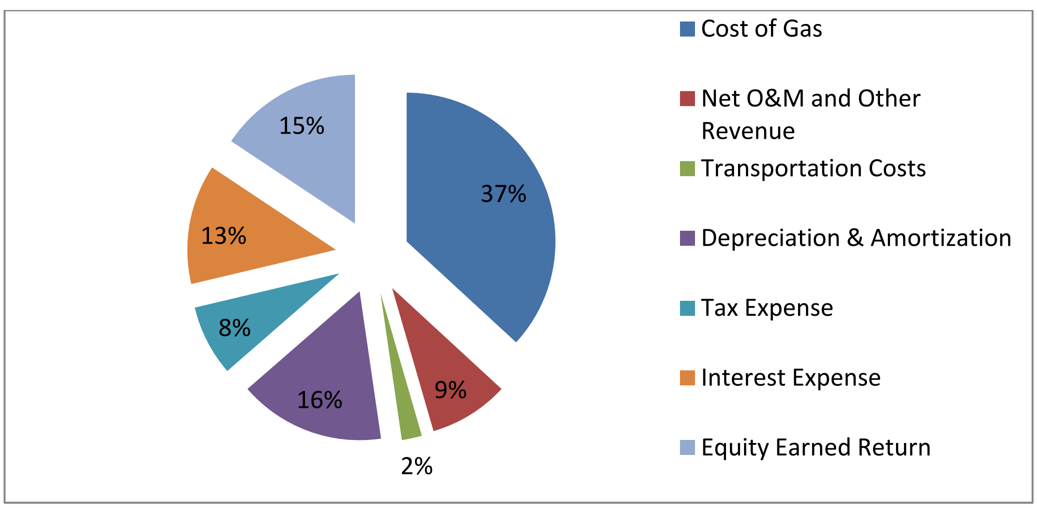
The revenue requirement changes discussed above are translated into customer delivery rate impacts by comparing the resulting revenue deficiency with the existing gross margin. The percentage change is applied to all existing non-bypass delivery rates.

3.3.2 SUMMARY OF VANCOUVER ISLAND REVENUE REQUIREMENTS

The FEU believe that the total revenue requirements of $195.1 million in 2012 and $214.1 million in 2013 have been calculated appropriately and reflect the reasonable costs required for FEVI to continue to meet the needs of our customers and the communities in which we serve. The following sub-sections will discuss the total Vancouver Island revenue requirement and revenue deficiency for 2013.

Figure 3.3-5 provides a breakdown of the components of the Vancouver Island total revenue requirement averaged for the two year period.

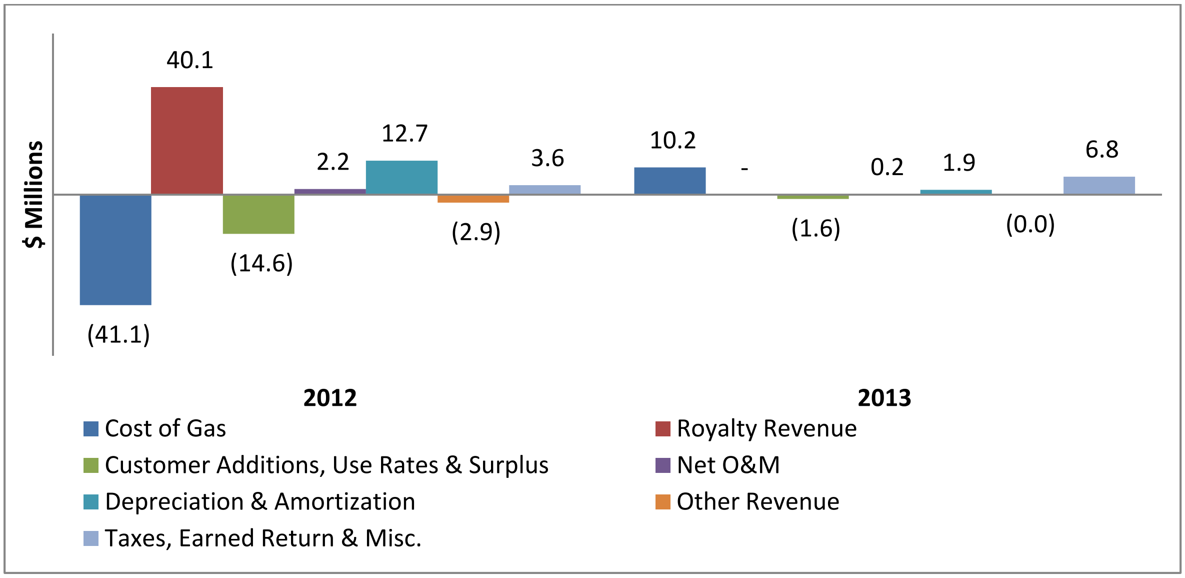
Figure 3.3-5: Average Composition of the 2012 and 2013 Vancouver Island Revenue Requirement[30]



[30] Section 7.2, Schedules 5 and 6

A revenue deficiency is not forecast for 2012; the $40.1 million deficiency that results from the loss of royalty revenues is offset by a $33 million reduction in the cost of gas and $8.1 million in amortization of the GCVA. The revenue deficiency in 2013 of $17.4 million is attributable to an increase in the cost of gas, the removal of the amortization of the GCVA, and tax expense and earned return increases, as displayed in Figure 3.3-6.

Figure 3.3-6: Loss of Royalty Revenues Offset by Reduction in Cost of Gas in 2012[31]



3.3.2.1 Revenue at Existing Rates

The Demand Forecast discussed in Section 4, is a key component of the determination of the revenue surplus or deficiency. Existing approved rates are applied to the demand forecast to determine the variance (surplus or deficiency) between existing revenues and the revenue requirement for the year. The sales customer demand determined in Section 4 is 659 TJs lower than the demand forecast embedded in 2011 rates, with an increase of approximately 86 TJs in 2013. This decrease in demand is attributable to a reduction in use rates that is not offset by customer growth and results in a revenue deficiency of approximately $7.8 million in 2012 and a surplus of $1.6 million in 2013. In addition to the impacts of customer additions and use rates, the existing rates for Vancouver Island have the 2011 approved revenue surplus of approximately $22.4 million embedded within them, providing a net surplus associated with revenues at existing rates of $14.6 million in 2012 and $1.6 million in 2013.

The demand forecast is discussed more fully in Section 4, Demand Forecast and Revenue at Existing Rates and has been properly reflected in the calculation of the Company's revenue requirement.

31 Section 7.2, Schedule 1

3.3.2.2 Cost of Gas

As discussed in Section 5.2, Vancouver Island's cost of gas reflects the costs related to commodity, transportation, and storage resources and the impacts of the hedging program. The Royalty Rebate arrangement under which Vancouver Island has received royalty revenues from the Province expires on December 31, 2011; therefore, the 2012 and 2013 forecast cost of gas does not include any royalty revenues. All else equal, the loss of the royalty revenues results in an approximate revenue deficiency of $40.1 million in 2012. As shown in Table 3.3-6, the revenue deficiency of $40.1 million associated with the loss of the royalty revenues is offset by a reduction in the cost of gas and the amortization of the GCVA, for a combined net reduction to the revenue requirement of approximately $1.0 million in 2012. With the GCVA fully amortized, the impact of cost of gas to the revenue requirement in 2013 is an increase of approximately $10.2 million.

Table 3.3-6: Reductions in Commodity Costs Offset the Deficiency Associated with Royalty Revenues in 2012[32]

($ thousands)

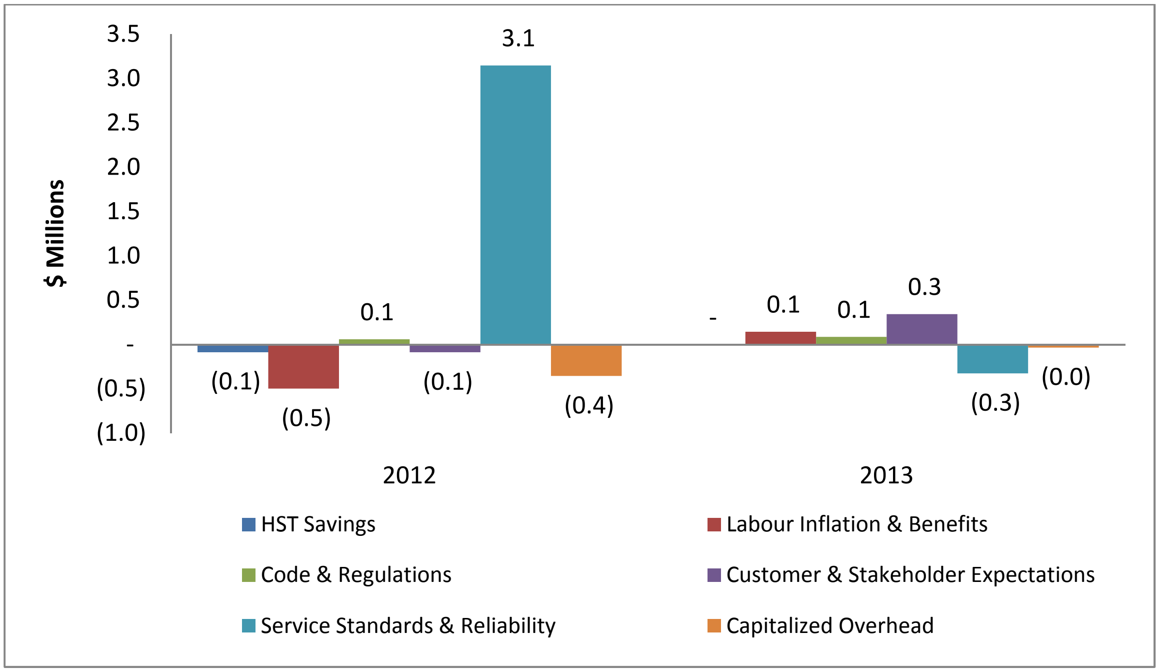
	2011 Approved	Increase (Decrease)	2012 Forecast	Increase (Decrease)	2013 Forecast
Cost of Gas	107,311	(32,974)	74,337	2,062	76,399
Royalty Revenues	(40,091)	40,091	-	-	-
Royalty Adjusted Cost of Gas	67,220	7,117	74,337	2,062	76,399
GCVA Amortization	-	(8,124)	(8,124)	8,124	-
Cost of Gas Revenue Requirement	67,220	(1,007)	66,213	10,186	76,399

3.3.2.3 Operations and Maintenance Expenses

The 2012 and 2013 O&M expense reflects the five key business drivers identified in Section 5.3. Forecast 2012 and 2013 revenue requirements changes associated with these O&M expenses are summarized in the figure below by these drivers, plus the impacts of HST in 2012. As shown in Figure 3.3-7, the impact of changes in the O&M is an increase to the revenue requirements of $2.2 million in 2012 and $0.2 million in 2013, net of capitaized overhead.

32 Section 7.2, Schedules 4-6 and Schedule 13

Figure 3.3-7: O&M Funding Results in Increased Revenue Requirements[33]



The items in the chart above are discussed more fully in Section 5.3, and have been reflected in the calculation of the Company's revenue requirement.

3.3.2.4 Transportation Costs

Vancouver Island transportation expenses are related to the Wheeling agreement between FEVI and FEI, the capacity right agreement between FEVI and BC Hydro, and motor fuel tax and social services tax on compressor and station fuel. A revenue requirement increase of approximately $360 thousand is forecast in 2012 with a further minor increase of $11 thousand in 2013, as shown in the table below.

Table 3.3-7: Transportation Cost Forecast for 2012 and 2013[34]

($ thousands) **Transportation Costs**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
FEI Wheeling Agreement	3,455	3,456	3,464
BC Hydro Capacity Right	375	244	244
Taxes on Compressor and Station Fuel	292	782	784
Total Transportation Expenses	**4,122**	**4,482**	**4,493**

[33] Please refer to Section 5.3, Table 5.3-8 and Table 5.3-9
[34] Section 7.2, Schedules 4 to 6

FEVI holds a Peaking Agreement with BC Hydro dated September 19, 2007 that provides FEVI limited access to a portion of BC Hydro's firm capacity under the Transportation Services Agreement during each winter period (November 1 to March 31). FEVI pays a Capacity Right Payment each month to BC Hydro whether or not it exercises its Capacity Right. The payment is comprised of a demand toll credit for the right to use peaking capacity and a carrying charge credit to BC Hydro to offset the carrying cost of the distillate required for fuel switching. For purposes of this submission, the forecast annual cost related to this capacity right is $244 thousand for 2012 and 2013.

3.3.2.5 Depreciation and Amortization Expense

As discussed in Section 5.4, an update to the depreciation study has resulted in a reduction to Vancouver Island depreciation expense of $0.3 million. Additions in 2012 and 2013 have resulted in higher depreciation expense of $3.9 million in 2012 and a further $1.1 million in 2013. Since the impacts on depreciation are not deductible for income tax purposes, the total impact on revenue requirements for these items needs to be grossed up. The revenue requirement impact of all depreciation changes is an increase of $4.8 million in 2012 and a further $1.5 million in 2013.

The removal cost provision has increased $3.6 million in 2012 and a further $0.1 million in 2013. Similar to depreciation expense, the removal cost provision is not deductible for income tax purposes; therefore, the total revenue requirement impact of the removal cost is $4.8 million in 2012 and a further $0.2 million in 2013.

In addition, excluding the GCVA, amortization expense has increased $2.9 million in 2012 and a further increase of $0.2 million in 2013. Both of these amounts are after-tax, so the impact to revenue requirements is as stated. In addition to the end of the amortization of the 2009 revenue surplus on December 31, 2011 which results in an increase of $1.5 million to amortization expense, several other accounts contribute to the remaining increase of $1.4 million in 2012. Table 3.3-8 reflects accounts that have a significant impact on 2012 amortization expense. The amortization expense in the IFRS Transitional account reflects the amortization of the pension and OPEB transitional obligation as shown in Table 3.2-1. The increase of $0.2 million in 2013 is attributable to an increase in amortization expense of the EEC deferral account.

Table 3.3-8: Accounting Impacts Increase Amortization Expense in 2012[35]

($ millions) **Amortization Expense**	**2012**
IFRS Transitional Account	$ 0.9
Deferred Removal Costs	0.2
Gains and Losses on Asset Disposition	0.1
2010-2011 Customer Service O&M	0.3
	1.5
2009 Revenue Surplus (fully amortized)	1.5
Increase to Amortization Expense	**$ 3.0**

The total impact on revenue requirement of changes in depreciation and amortization is an increase of $12.7 million in 2012 and $1.9 million in 2013

3.3.2.6 Other Revenues

As discussed in Section 5.5, a significant increase in Other Revenue of $2.9 million in 2012 is forecast with no further change forecast in 2013. Increases in other revenue decrease the revenue requirement and offset the revenue deficiency. The increase in other revenue is attributable to a full year of LNG mitigation revenues from the Mount Hayes LNG facility in 2012 as compared to nine months of LNG mitigation revenues included in the approved 2011 revenue requirement.

3.3.2.7 Taxes

As discussed in Section 5.6, forecast levels of property taxes and changes in income tax rates, new taxes, and changes to CCA rates all have an impact on the revenue requirement calculation. The property tax increases of $0.3 million and a further $0.4 million in 2013 both serve to increase revenue requirements. Other changes to income tax rates and timing differences result in a decrease in revenue requirements in 2012 of $2.2 million and an increase in 2013 of $3.1 million. As shown in Table 3.3-9, the increase in CCA deductions, along with the amortization expense are the key contributors to the increase in tax expense in 2012. The increase in CCA is primarily attributable to the CCE Project and amortization expense is primarily attributable to the GCVA. Tax expense associated with the earned return has increased in 2012 because of the growth in rate base due to the Mount Hayes LNG Facility and the CCE Project as well as the impact of the expiration of the VINGPA earnings reduction. Changes in amortization and earned return are the key contributors to the tax expense increase in 2013.

[35] Section 7.2, Schedules 66 to 71

Table 3.3-9: Components of 2012 and 2013 Tax Expense Changes[36]

($ millions)	2012	2013	Total
Reduction in Tax Rate	$ (0.3)	$ (0.3)	$ (0.6)
Increase in CCA Deductions	(1.1)	(0.2)	(1.3)
Removal Cost Deduction	(0.1)	(0.0)	(0.1)
Pension and OPEB	(0.8)	0.1	(0.6)
Changes in Amortization Expense	(2.4)	3.0	0.6
Changes in Earned Return	3.0	0.4	3.4
Other	(0.5)	0.2	(0.3)
	$ (2.2)	**$ 3.1**	**$ 1.0**

3.3.2.8 Earned Return – Return on Rate Base and Financing Costs

Vancouver Island earns a return on rate base, so changes in the amount of rate base affect the amount of return included in the revenue requirement by approximately 4.0 per cent of that change. The rate base proposals contained in Section 6, Rate Base contribute $2.4 million to the 2012 revenue requirement and a further $1.0 million to the 2013 revenue requirement.

The final component of the revenue requirement calculation is financing costs. Financing costs are discussed in Section 5.7, Financing Costs and ROE. The amount of financing required is determined by the rate base; the financing costs themselves are determined by a combination of the amount of financing and the forecast interest rates. Increases in financing, caused by higher rate base, result in $1.3 million of additional financing costs in 2012 and $0.4 million of additional financing costs in 2013. Changes in interest rates mitigate this impact in 2012 by $1.9 and then increase by $1.7 million in 2013, resulting in a net decrease associated with financing costs of $0.6 million in 2012 followed by an increase of $2.2 million in 2013.

Furthermore, the return on equity reduction associated with the VINGPA adjustment comes to an end on December 31, 2011 and results in an increase to revenue requirement of $1.9 million in 2012.[37]

Although a revenue deficiency of $17.4 million in 2013 is forecast, Vancouver Island is seeking approval for the continuation of existing rates for 2012 and 2013. This is because the forecast

---

[36] Section 7.2, Schedules 33 to 35

[37] OIC 1510 Special Direction:
3.1 (b) Adjustment to Cost of Service
For each year from January 1, 1996, to December 31, 2011, the return on the equity component of PCEC's rate base that would have been otherwise approved by the BCUC shall be reduced by the amount of $1,867,000. Such reduction shall not be recovered in whole or in part, directly or indirectly, through rates or tolls in any manner whatsoever.

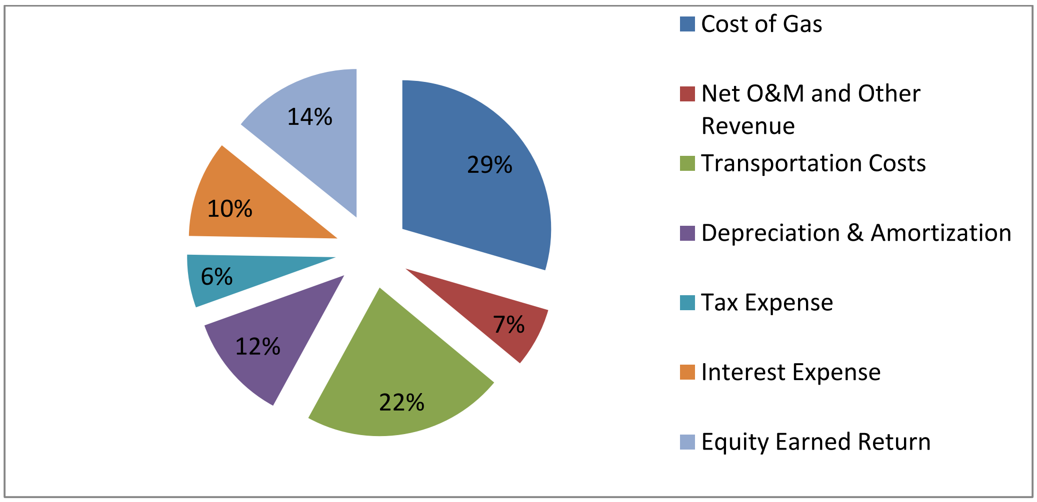
revenue deficiency described will be offset by part of the projected December 31, 2012 surplus balance of $71.6 million (before tax) in the RSDA. Section 3.4.2 provides a discussion on the RSDA and the 2012 and 2013 Vancouver Island rate proposals.

3.3.3 SUMMARY OF WHISTLER REVENUE REQUIREMENTS

The total revenue requirements of $11.4 million in 2012 and $12.2 million in 2013 have been calculated appropriately and reflect the reasonable costs required for FEW to continue to meet the needs of our customers in the Whistler area. The following sub-sections will discuss the total Whistler revenue requirement and revenue deficiencies for 2012 and for 2013.

Figure 3.3-8 provides a breakdown of the components of the Whistler total revenue requirement averaged for the two year period.

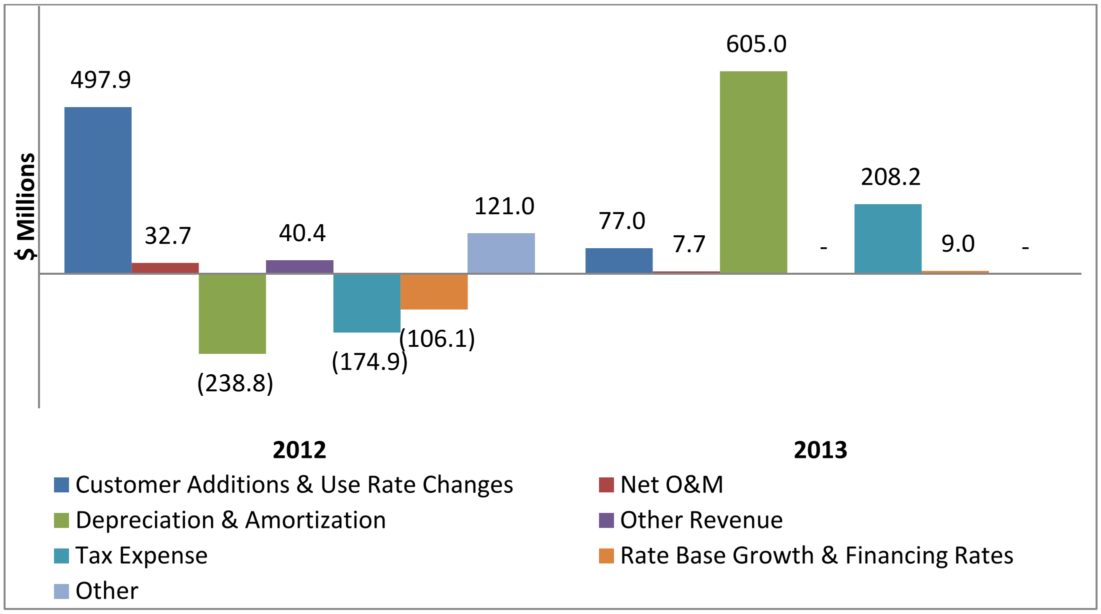
Figure 3.3-8: Average Composition of the 2012 and 2013 Whistler Revenue Requirement[38]



Changes to the Whistler revenue requirements result in revenue deficiencies of $172 thousand in 2012 and $907 thousand in 2013. These deficiencies are summarized in Figure 3.3-9 below.

[38] Section 7.3, Schedules 5 and 6

Figure 3.3-9: Whistler Revenue Deficiency Components[39]



3.3.3.1 Revenue at Existing Rates

The Demand Forecast discussed in Section 4 is a key component of the determination of the revenue surplus or deficiency. Existing approved rates are applied to the demand forecast to determine the variance (surplus or deficiency) between existing revenues and the revenue requirement for the year. The sales customer demand determined in Section 4 is 48 TJs lower than the demand forecast embedded in 2011 rates, with a further decrease of approximately 7 TJs in 2013.[40] This decrease in demand is attributable to the projection for the use rate on an ongoing basis being lower than originally anticipated, as Whistler customers have consumed less natural gas than they had historically consumed propane. This trend has not been offset by customer growth. This decrease in demand results in a significant revenue deficiency of approximately $498 thousand in 2012 and $77 thousand in 2013.

The demand forecast is discussed more fully in Section 4, Demand Forecast and Revenue at Existing Rates and have been properly reflected in the calculation of the Company's revenue requirement.

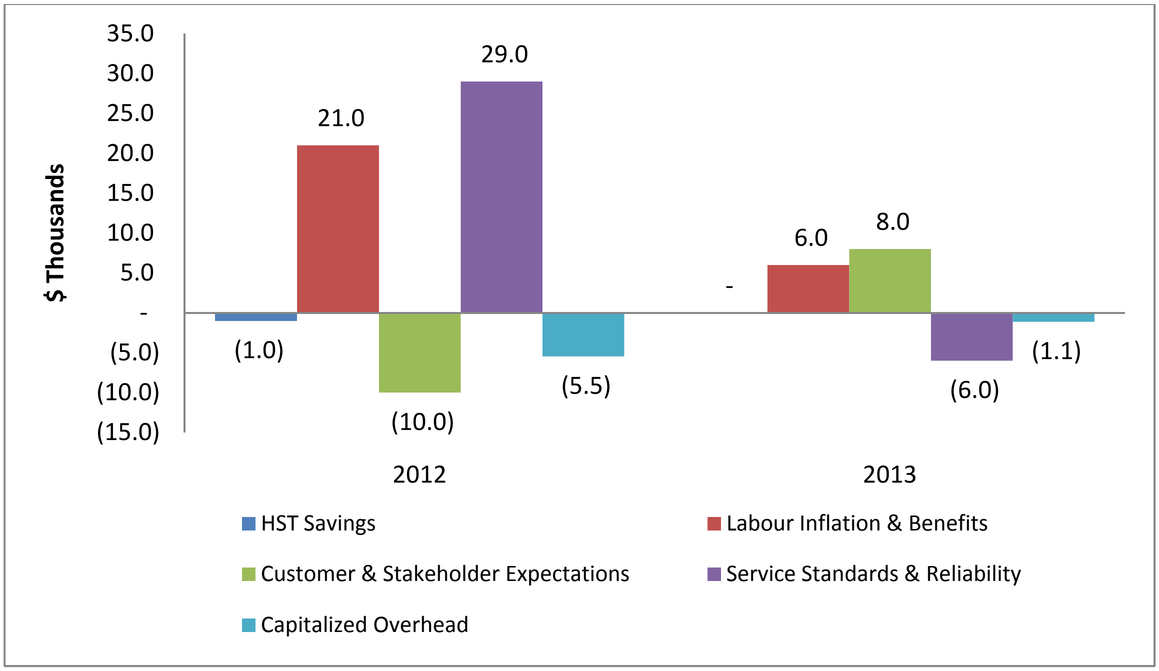
3.3.3.2 Operations and Maintenance Expenses

The 2012 and 2013 O&M expense reflects four of the key business drivers identified in Section 5.3. 2012 and 2013 revenue requirements are summarized in the figure below by these drivers, plus the impacts of HST in 2012. As shown in Figure 3.3-10, the impact of changes in the O&M

[39] Section 7.3, Schedule 1
[40] Section 7.3, Schedules 4 to 9

is an increase to the revenue requirement of $34 thousand in 2012 and $7 thousand in 2013, net of capitalized overhead.

Figure 3.3-10: O&M Funding Results in Increased Revenue Requirements[41]



The items in the chart above are discussed more fully in Section 5.3, and have been reflected in the calculation of the Company's revenue requirement.

3.3.3.3 Transportation Costs

Whistler transportation costs reflect the charge paid by Whistler to Vancouver Island for gas transportation service on the Whistler Pipeline. The transportation costs are forecast at approximately $2.6 million per year for 2012 and 2013, increasing the revenue requirement by $127 thousand in 2012.[42]

3.3.3.4 Depreciation and Amortization Expense

As discussed in Section 5.4, an update to the depreciation study has resulted in an increase to Whistler depreciation expense of $30 thousand. Additions in 2012 and 2013 have resulted in higher depreciation expense of $3 thousand in 2012 and a further $16 thousand in 2013. Since the impacts on depreciation are not deductible for income tax purposes, the total impact on revenue requirements for these items needs to be grossed up. The revenue requirement

41 Please refer to Section 5.3, Table 5.3-10 and Table 5.3-11
42 Section 7.3, Schedules 4 to 6

impact of all depreciation changes is an increase of $44 thousand in 2012 and a further $21 thousand in 2013.

The removal cost provision has increased $75 thousand in 2012 and a further $2 thousand in 2013. Similar to depreciation expense, the removal cost provision is not deductible for income tax purposes; therefore, the total revenue requirement impact of the removal cost is $100 thousand in 2012 and a further $3 thousand in 2013.

In addition, amortization expense has decreased $383 thousand in 2012 and increased $581 thousand in 2013. Both of these amounts are after-tax, so the impact to revenue requirements is as stated. The decrease in 2012 and corresponding increase is 2013, is largely attributable to the one year amortization of the credit balances in the Pipeline Cost Variance Account of $434 thousand and the Interest Variance account of $329 thousand. Please refer to Section 6.3 for a discussion of each of these accounts.

3.3.3.5 Other Revenues

As discussed in Section 5.5, a decrease in Other Revenue of $40 thousand in 2012 is forecast with no further change forecast in 2013. Decreases in other revenue increase the revenue requirement and the revenue deficiency. The decrease is attributable to a forecast reduction in Late Payment Charges; a downward trend consistent with the lower bad debt expense experienced by the Utilities.

3.3.3.6 Taxes

As discussed in Section 5.6, forecast levels of property taxes and changes in income tax rates, new taxes, and changes to CCA rates all have an impact on the revenue requirement calculation. The property tax reduction of $42 thousand in 2012 results in a decrease to the revenue requirement and is increased by $8 thousand in 2013. Other changes to income tax rates and timing differences result in a decrease in revenue requirements in 2012 of $133 thousand and an increase in 2013 of $200 thousand.

3.3.3.7 Earned Return

Whistler earns a return on rate base, so changes in the amount of rate base affect the amount of return included in the revenue requirement by approximately 4.0 per cent of that change. The rate base proposals contained in Section 6, contribute an $18 thousand reduction to the 2012 revenue requirement and a further reduction of $26 thousand to the 2013 revenue requirement as costs associated with the Whistler natural gas conversion continue to amortize.

The final component of the revenue requirement calculation is financing costs. Financing costs are discussed in 5.7, Financing Costs and ROE. The amount of financing required is determined by the rate base; the financing costs themselves are determined by a combination of the amount of financing and the forecast interest rates. Increases in financing, caused by higher rate base, and changes in interest rates result in a net decrease associated with financing costs of $88 thousand in 2012 followed by an increase of $35 thousand in 2013.

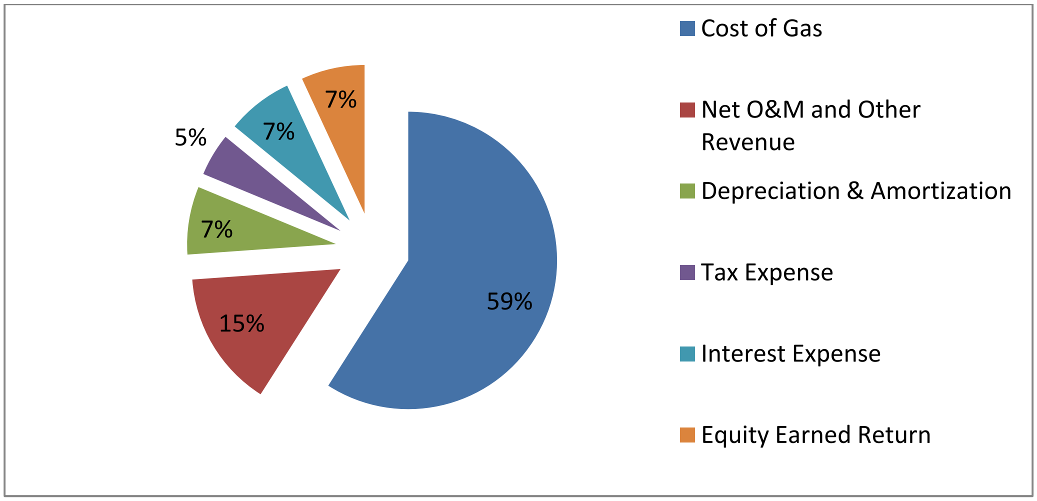
The revenue requirement changes discussed above are translated into customer delivery rate impacts by comparing the resulting revenue deficiency with the existing gross margin. The percentage change is applied to all existing delivery rates.

3.3.4 SUMMARY OF FORT NELSON REVENUE REQUIREMENTS

The total revenue requirements of $4.9 million in 2012 and $5.0 million in 2013 have been calculated appropriately and reflect the reasonable costs required for Fort Nelson to continue to meet the needs of our customers. The following sub-sections will discuss the total Fort Nelson revenue requirement and revenue deficiencies for 2012 and for 2013.

Figure 3.3-11 provides a breakdown of the components of the Fort Nelson total revenue requirement averaged for the two year period.

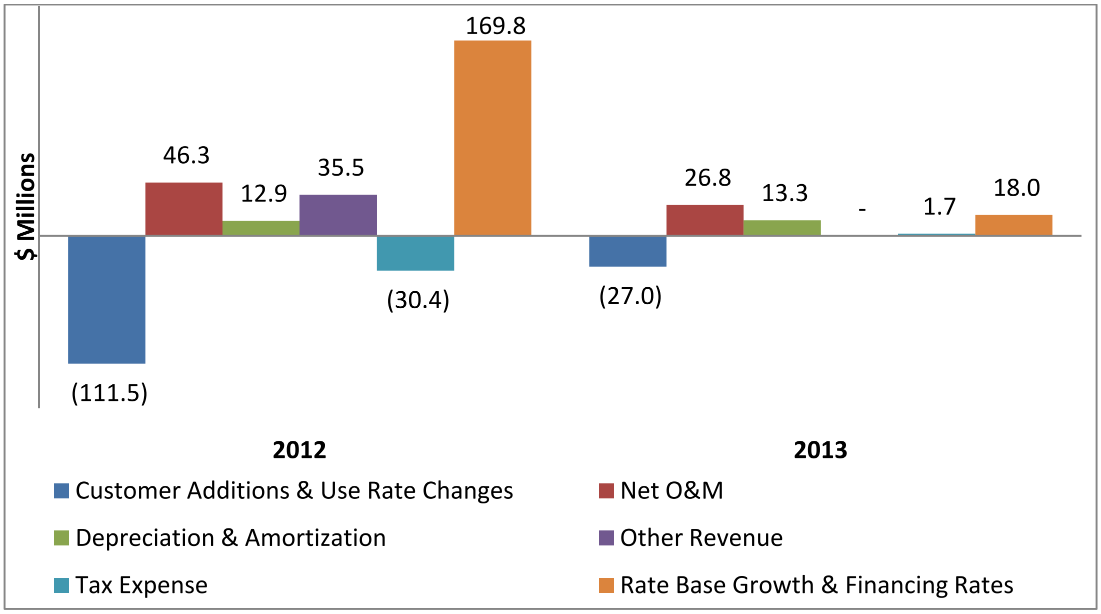
Figure 3.2-11: Average Composition of the 2012 and 2013 Fort Nelson Revenue Requirement[43]



Changes to the Fort Nelson revenue requirements result in revenue deficiencies of $122 thousand in 2012 and $33 thousand in 2013. These deficiencies are summarized in Figure 3.3-12 below.

[43] Section 7.4, Schedules 5 and 6

Figure 3.3-12: Fort Nelson Revenue Deficiency Components[44]



3.3.4.1 Revenue at Existing Rates

The Demand Forecast discussed in Section 4, is a key component of the determination of the revenue surplus or deficiency. Existing approved rates are applied to the demand forecast to determine the variance (surplus or deficiency) between existing revenues and the revenue requirement for the year. The sales customer demand determined in Section 4 is 34 TJs greater than the demand forecast embedded in 2011 rates, with an increase of approximately 9 TJs in 2013. This increase in demand is attributable to customer growth and changes in use rates and results in a revenue surplus of approximately $112 thousand in 2012 and $27 thousand in 2013.[45]

The demand forecast is discussed more fully in Section 4, Demand Forecast and Revenue at Existing Rates and has been properly reflected in the calculation of the Company's revenue requirement.

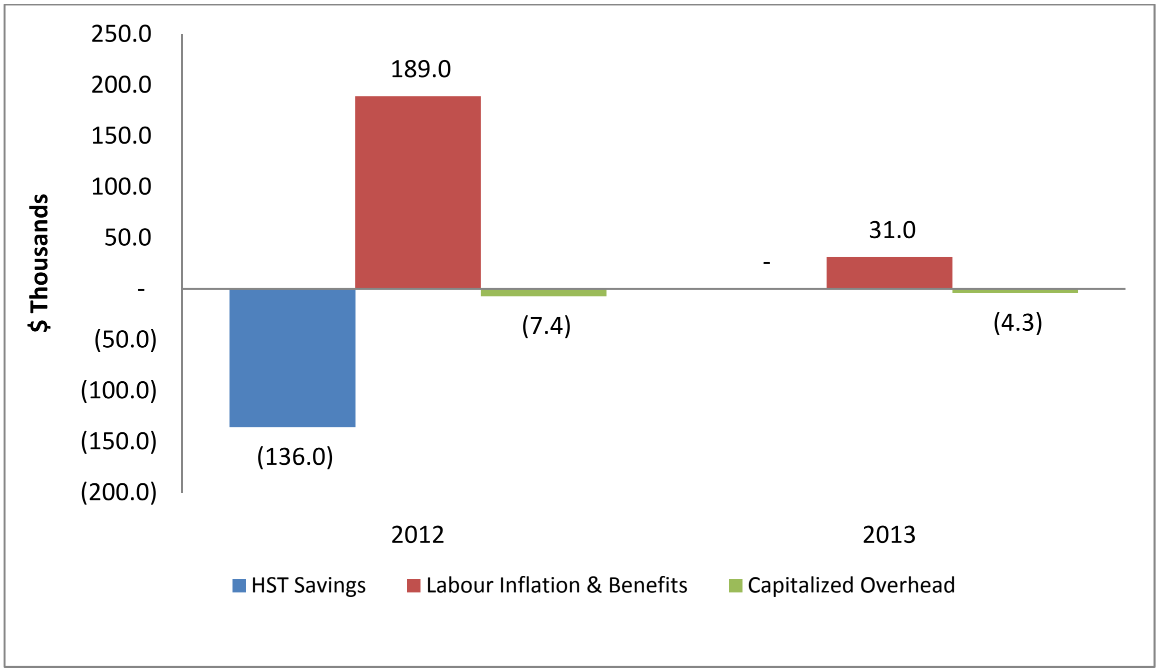
3.3.4.2 Operations and Maintenance Expenses

The 2012 and 2013 O&M expense reflects the two key business drivers identified in Section 5.3. 2012 and 2013 revenue requirements are summarized in the figure below by these drivers. As shown in Figure 3.3-13, the impact of changes in the O&M is an increase to the revenue requirement of $46 thousand in 2012 and $27 thousand in 2013, net of capitalized overhead.

---

44 Section 7.4, Schedule 1
45 Section 7.4, Schedules 4 to 9

Figure 3.3-13: O&M Funding Results in Increased Revenue Requirements[46]



The items in the chart above are discussed more fully in Section 5.3, and have been properly reflected in the calculation of the Company's revenue requirement.

3.3.4.3 Depreciation and Amortization Expense

A full year of depreciation associated with the Muskwa River Crossing Project, as well as additions in 2012 and 2013, have resulted in higher depreciation expense of $68 thousand in 2012 and a further $10 thousand in 2013. This increase is offset by the impacts of the changes in depreciation rates which reduce the expense by $30 thousand. Since the impacts on depreciation are not deductible for income tax purposes, the total impact on revenue requirements for these items needs to be grossed up. The revenue requirement impact of depreciation changes is an increase of $50 thousand in 2012 and a further $13 thousand in 2013.

In addition, amortization expense has decreased $37 thousand in 2012 with no further changes in 2013. This amount is after-tax, so the impact to revenue requirements is as stated.

[46] Please refer to Section 5.3, Table 5.3-12 and Table 5.3-13

3.3.4.4 Other Revenues

As discussed in Section 5.5, a decrease in Other Revenue of $36 thousand in 2012 is forecast with no further change forecast in 2013. Decreases in other revenue increase the revenue requirement and the revenue deficiency. The decrease is attributable to a forecast reduction in Late Payment Charges; a downward trend consistent with the lower bad debt expense experienced by the Utilities.

3.3.4.5 Taxes

As discussed in Section 5.6, forecast levels of property taxes and changes in income tax rates, new taxes, and changes to CCA rates all have an impact on the revenue requirement calculation. The property tax increase of $7 thousand in 2012 and a further increase of $6 thousand in 2013 result in increases to the revenue requirement. Other changes to income tax rates and timing differences result in a decrease in revenue requirements in 2012 of $37 thousand and a reduction in 2013 of $4 thousand.

3.3.4.6 Earned Return

Fort Nelson earns a return on rate base, so changes in the amount of rate base affect the amount of return included in the revenue requirement by approximately 3.8 per cent of that change. The rate base proposals contained in Section 6 increase revenue requirement by $78 thousand in 2012 and have a further increase of $9 thousand to the 2013 revenue requirement.

The final component of the revenue requirement calculation is financing costs. Financing costs are discussed in 5.7, Financing Costs and ROE. The amount of financing required is determined by the rate base; the financing costs themselves are determined by a combination of the amount of financing and the forecast interest rates. Increases in financing, caused by higher rate base, and changes in interest rates result in a net increase associated with financing costs of $92 thousand in 2012 followed by an increase of $8 thousand in 2013.

The revenue requirement changes discussed above are translated into customer delivery rate impacts by comparing the resulting revenue deficiency with the existing gross margin. The percentage change is applied to all existing delivery rates.

3.3.5 SUMMARY OF AMALGAMATED COST OF SERVICE

As discussed in Section 1.2.5, in addition to seeking approval of rates for each of the FEU, we are also seeking approval of the amalgamated cost of service for 2013. This will form the first step of the Companies' plans to amalgamate, and will be followed by an application in Fall 2011 requesting approval to amalgamate with a rate design based on the amalgamated cost of service. As the FEU are seeking approval for the amalgamated cost of service prior to the merits of amalgamation being considered by the Commission, the FEU have phrased the approval requested in this application to be conditional upon the amalgamation being approved and going forward. The efficiency rationale for proceeding in this fashion is also discussed in Section 1.2.5.

In Section 3.3.5.1, the FEU provide a summary of the amalgamated cost of service. The amalgamated cost of service represents the summation of the Mainland, Vancouver Island, Whistler and Fort Nelson cost of service as described above, as well as adjustments to account for cost of service line items that will eliminate or change upon amalgamation.

3.3.5.1 FEU Amalgamated Cost of Service

The FEU amalgamated cost of service of $1.509 billion ($779.9 million delivery margin) is determined as follows:

Table 3.3-10: Amalgamated 2013 Cost of Service

		2013		
($ thousands)	**Reference**	**Total**	**Cost of Gas**	**Cost of Service[1]**
Mainland	*Section 7, Tab 7.1, Schedule 6, Column 5*	$ 1,282,763	$ 658,568	$ 624,195
Vancouver Island	*Section 7, Tab 7.2, Schedule 6, Column 5*	214,087	76,399	137,688
Whistler	*Section 7, Tab 7.3, Schedule 6, Column 5*	12,173	3,455	8,718
Fort Nelson	*Section 7, Tab 7.4, Schedule 6, Column 5*	5,001	2,945	2,056
		1,514,024	741,367	772,657
Add (Deduct):				
FEI (LNG Mitigation fee to FEVI)		-	(12,000)	12,000
Unaccounted for Gas (FEVI Wheeling Charge)		-	(144)	144
Other Cost of Service & Rate Base		(1,864)	-	(1,864)
FEW Transportation Charge		(2,585)	-	(2,585)
Squamish Transportation Charge		(414)	-	(414)
Total Amalgamation Adjustments		(4,863)	(12,144)	7,281
Amalgamated FEU Cost of Service		**$ 1,509,161**	**$ 729,223**	**$ 779,938**

[1] *Cost of service excluding cost of gas*

AMALGAMATION ADJUSTMENTS

The cost of service must be adjusted to reflect intercompany items that will be eliminated upon amalgamation and rate harmonization. In the case of shared services and wheeling or transportation charges between the Regions, the amalgamation of the entities results in the inter-company agreements ceasing to be in effect, and the need to retain them for regulatory purposes disappears upon amalgamation. In the case of the three items below, an adjustment must be made to the cost of service.

- The LNG mitigation revenues are included in the Vancouver Island delivery cost of service with the offset cost residing in the Mainland midstream costs. For purposes of this analysis, FEU has taken the approach of showing this $12 million adjustment to the delivery cost of service and cost of gas; however, the allocation of the LNG mitigation revenues as between midstream and delivery will be reviewed in the Fall 2011 Amalgamation and Rate Design Phase 'A' Application and may result in changes from what has been presented in this RRA.

- The unaccounted for gas associated with the FEVI Wheeling Agreement with FEI resides in the delivery cost of service in FEI, but as a cost of gas in FEVI, and has been adjusted accordingly.
- Other cost of service impacts from changes in cash working capital and tax expense occur. The cash working capital for the amalgamated cost of service is determined using the FEI approved Lead and Lag days. The capitalized overhead rate for the determination of tax expense and UCC additions is assumed to be FEI's rate of 8 percent. The FEW and Squamish Transport charges are accounted for as a cost in one utility but as a revenue in another; therefore the delivery cost of service has been adjusted to remove these costs.

The Companies do not expect that there will be material cost savings as a result of the amalgamation, since the operations and management of the utilities are already fully integrated and the savings have been captured for the benefit of customers over the 2004 through 2011 period; however, some small annual savings will be realized. These savings would be limited to reporting efficiencies such as financial, legal and regulatory reporting and debt issuance requirements. There will also be costs incurred to effect a future legal amalgamation of the Companies, if approved. For the one year of amalgamated cost of service (2013) relevant to this RRA, the costs and savings are expected to offset each other, and therefore the FEU have not forecast a change to the cost of service for this item. The FEU will capture any variances from the forecast of zero in a deferral account for future recovery from/return to customers. Although the costs related to the legal amalgamation are one-time in nature, any efficiency savings, although not large, will be ongoing, and will be included in future RRAs.

3.4 Rate Proposals

3.4.1 DELIVERY RATES

The proposed delivery rates reflect the revenue requirements for each Utility as discussed in Section 3.3. Preliminary bill impacts and tariff continuity schedules for all customers are provided in Appendix F-2, showing the annual bill impacts below. The following summary for each Utility provides the delivery rate change required and a summary of the annual bill impact of the rate proposals for an average residential customer in Mainland, Whistler, and Fort Nelson.

3.4.1.1 Mainland

The Mainland proposed delivery rates reflect the 2012 and 2013 revenue requirements and result in an effective delivery rate increase of 5.0 per cent in 2012 and an additional effective base rate delivery increase of 6.4 per cent in 2013 (cumulative increase of 11.4 per cent).[47] These proposed increases result in changes to the annual bill of an average Lower Mainland residential customer with an approximate net increase of 2.4 per cent or $24 in 2012 and an additional 3.0 per cent or $31 in 2013.[48]

3.4.1.2 Whistler

The Whistler proposed delivery rates reflect the 2012 and 2013 revenue requirements and result in an effective delivery rate increase of 2.2 per cent in 2012 and an additional effective base rate delivery increase of 11.9 per cent in 2013 (cumulative increase of 14.1 per cent).[49] These proposed increases result in changes to the annual bill of an average Whistler residential customer with an approximate net increase of 1.5 per cent or $22 in 2012 and an additional 7.1 per cent or $115 in 2013.[50]

3.4.1.3 Fort Nelson

The Fort Nelson proposed delivery rates reflect the 2012 and 2013 revenue requirements and result in an effective delivery rate increase of 6.5 per cent in 2012 and an additional effective base rate delivery increase of 1.6 per cent in 2013 (cumulative increase of 8.1 per cent).[51] These proposed increases result in changes to the annual bill of an average Fort Nelson residential customer with an approximate net increase of 2.3 per cent or $26 in 2012 and an additional 0.6 per cent or $7 in 2013.[52]

3.4.2 VANCOUVER ISLAND EFFECTIVE RATES

FEVI has been operating under the Vancouver Island Natural Gas Pipeline Act Special Direction[53] (the "Special Direction") since 1995.[54] The Special Direction is appended to the Vancouver Island Natural Gas Pipeline Agreement ("VINGPA"), an agreement among the predecessor companies to FEVI, the Province, and (by assignment from Westcoast Energy Inc.) Fortis BC Holdings Inc. ("FHI"). The VINGPA contemplates the payment by the Provincial

[48] Appendix F-2, Tab 1.1.1 and Tab 1.2.1, Page 1
[49] Section 7.3, Schedules 2 and 3
[50] Appendix F-2, Tab 3.1 and Tab 3.2, Page 1
[51] Section 7.4, Schedules 2 and 3
[52] Appendix F-2, Tab 4.1.1 and Tab 4.2.1, Page 1
[53] OIC No. 1510 (Dec. 13, 1995).
[54] The Special Direction states that it shall cease to have any application after the latest of three conditions occurring: (a) the time when the balance of the RDDA has been reduced to zero; (b) the expiration/termination of the Joint Venture Transportation Service Agreement ("JV TSA"), but no later than January 1, 2011; or (c) the date of the termination of the Squamish Gas TSA. Although the RDDA has been reduced to zero and January 1, 2011 has passed, the Squamish Gas TSA continues to remain in effect thus keeping the Special Direction in effect.

Government of gas royalty revenues to FEVI through 2011, which are based on the wellhead price of gas until December 31, 2011, and have mitigated fluctuations in the cost of gas to the benefit of FEVI's Core Market customers. The Special Direction and the VINGPA contemplate the creation of the RDDA. The RDDA held Annual Revenue Deficiencies through 2002, and thereafter the Commission was directed by the Special Direction to set rates so as to permit the recovery of the Accumulated Revenue Deficiency in the RDDA over the shortest period reasonably possible, having regard to the competitive position of FEVI's rates relative to alternative energy sources and the desirability of reasonable rates for customers. The Core Market rates set by the Commission for FEVI under the Special Direction from 2003 to 2009 were based on the "Soft-Cap" mechanism and tied to electricity and fuel oil rates as competitive alternatives, appropriately recognizing the difficult competitive environment faced by FEVI. Although Core Market customer rates increased over time, the Soft-Cap ensured relative rate stability compared to competitive alternatives and volatile natural gas prices.

The 2010/11 RRA and RDA was FEVI's first rate application following the repayment of the RDDA. In that application, Vancouver Island developed and received approval for an interim rate mitigation strategy to offset the rate pressure resulting from the loss of the gas royalty revenues on December 31, 2011. This interim strategy resulted in a rate freeze for sales customers and the creation of a RSDA, to capture the differences in 2010 and 2011 between the net revenues received and the actual cost of service, excluding O&M variances from forecast. As demonstrated in Table 3.4-1, this was a successful strategy resulting in a projected after tax balance of $52.1 million at the end of 2011 to be used for future rate mitigation.

In this Application, Vancouver Island is seeking approval for a continuation of the existing rates for sales customers, Whistler and BC Hydro. The rates for VIJV and Squamish will remain in accordance with their respective Transportation Service Agreements. As discussed in Section 1.2.5, FEVI believes that a rate freeze is an appropriate rate mitigation strategy for the 2012 and 2013 forecast period in light of the continued long term significant upward pressure on rates for Vancouver Island customers, and continued pressure to remain competitive with other energy sources. FEU's plans to amalgamate via the forthcoming Amalgamation and Phase 'A' Rate Design Application in Fall 2011 which, if approved, will provide the long-term risk mitigation strategy for FEVI customers. A rate freeze for the next two year period will enable continued rate certainty for FEVI customer's until the longer term solution is in place. In the event that amalgamation is not approved, a two year rate freeze will enable natural gas on Vancouver Island to remain competitive with other energy sources for an additional 1-2 year period.

To achieve this rate freeze, the RSDA mechanism must remain in place for 2012 and 2013; FEVI is seeking approval for the continuation of the RSDA. The RSDA will continue to capture the differences in 2012 and 2013 between the net revenues received and the actual cost of service, excluding O&M variances from forecast. The existing surplus balance in the RSDA will be used to partly offset the forecast revenue deficiency in 2013 and results in forecast closing RSDA balances of $53.7 million, after tax in 2012 and $42.3 million, after tax in 2013.

Table 3.4-1: The RSDA Mitigates Rate Impacts Today and in the Future,

($ Thousands)	Actual 2010	Projected 2011	Forecast 2012	Forecast 2013
Opening RSDA Balance, net of tax	(3,300)	(35,618)	(52,066)	(53,668)
Annual (Surplus)/ Deficiency	(44,743)	(20,970)	4	17,436
Add: Interest on Balance	(457)	(1,408)	(2,140)	(2,338)
Less: Tax	12,882	5,930	534	(3,775)
Closing RSDA Balance, net of tax	**(35,618)**	**(52,066)**	**(53,668)**	**(42,344)**
Tax Rate	28.5%	26.5%	25.0%	25.0%
Closing RSDA Balance, before tax	**(49,816)**	**(70,838)**	**(71,557)**	**(56,459)**

As discussed in Section 1.2.5, using the existing low cost of gas as the base case, the future rate impacts expected for Vancouver Island are still in the range of a 20 percent increase over the next several years. This impact will be magnified, and may be doubled, should increases in the cost of gas occur. Therefore, FEVI believes that it is appropriate to maintain a rate freeze for 2012 and 2013 and preserve the RSDA mechanism to mitigate future rate increases for our customers.

3.4.3 DELIVERY RATE RIDERS

3.4.3.1 Mainland

The Mainland RSAM Rider reflects a projected balance of $8.4 million owing to customers at December 31, 2011. As noted in Section 6.3.1.3, RSAM account balances will continue to be recovered from or returned to customers through Delivery Rate Rider 5 over a three year period. This results in a credit rider of $0.032/GJ in 2012 applicable to Rate Schedules 1, 1B, 1U, 1X, 2, 2B, 2U, 2X, 3, 3B, 3U, 3X and 23; the 2013 Rider will be set as part of FEI's Fourth Quarter 2011 Gas Cost report.[55] The change in the RSAM rider results in a decrease to the annual bill of an average Lower Mainland residential customer of 0.1 percent or $1 in 2012.[56]

As shown in Appendix F-2, the expiry of the Mainland Earnings Sharing Mechanism credit rider will result in a nominal increase to the annual bills of Mainland non-bypass customers. The expiry of this riders results in changes to the annual bill of an average Lower Mainland residential customer with an approximate net increase of 0.5 per cent or $5 in 2012.[57]

---

55 Section 7.1, Schedule 85
56 Appendix F-2, Tab 1.1.1, Page 1
57 Ibid

3.4.3.2 Whistler

The Whistler RSAM Rider reflects a projected balance of $0.8 million recoverable from customers at December 31, 2011. As noted in Section 6.3.1.3, RSAM account balances are requested to be recovered from or returned to customers through Delivery Rate Rider 5 over a three year period. This results in a debit rider of $0.524/GJ in 2012 applicable to all Whistler customers; the 2013 Rider will be set as part of FEW's Fourth Quarter 2011 Gas Cost report.[58] The impact of the RSAM rider is significant and results in an increase to the annual bill of an average Residential Whistler customer of 3.2 per cent or $47 in 2012.[59]

3.4.3.3 Fort Nelson

The Fort Nelson RSAM Rider reflects a projected balance of $16.0 thousand owing to customers at December 31, 2011. As noted in Section 6.3.1.3, RSAM account balances will continue to be recovered from or returned to customers through Delivery Rate Rider 5 over a three year period. This results in a credit rider of $0.011/GJ in 2012 applicable to Rate Schedules 1, 2.1, 2.2 and 25; the 2013 Rider will be set as part of Fort Nelson's Fourth Quarter 2011 Gas Cost report.[60] The impact of the RSAM rider results in a decrease to the annual bill of a Residential Fort Nelson customer of 0.5 per cent or $6 in 2012.[61]

4 DEMAND FORECAST AND REVENUES AT EXISTING RATES

4.1 Introduction to Demand Forecast and Revenues at Existing Rates

This section provides a discussion of the demand for natural gas, comprised of natural gas sales and transportation volumes forecast for 2012 and 2013. The forecast of demand for natural gas is an important component of the RRA and is derived from the following two inputs:

- The forecast number of customers and customer additions; and
- The forecast average Use Per Customer ("UPC") by customer class.

The forecast number of customers and customer additions are key cost drivers for both operating and capital costs incurred serving our customers. Additionally, the forecast demand is a key input in the determination of the delivery rates needed to recover the revenue requirements for 2012 and 2013. Revenues and margin referred to in this section mean revenues and margin at existing rates for 2011.

All regions are forecast to experience a slight increase in consumption except Whistler, where consumption is forecast to decline by 1 percent from 2012 to 2013. The forecast increases in consumption drive delivery rates lower, all else equal. The forecast of demand for natural gas included in the RRA is based upon a methodology that is consistent with that used in prior years, and provides a reasonable estimate of future natural gas demand for the forecast period. The forecast of demand for natural gas included in this RRA fairly represents the expected customer additions and average UPC for 2012 and 2013, and is the most appropriate forecast of demand for natural gas to be used in the determination of rates for the 2012 and 2013 forecast period.

The remainder of this chapter is organized as follows:

- Section 4.2 - Overview of Total Energy Demand By Region
- Section 4.3 - Underlying Forecast Methodology
- Section 4.4 - Mainland (Demand Forecast and Revenues)
- Section 4.5 - Vancouver Island (Demand Forecast and Revenues)
- Section 4.6 - Whistler (Demand Forecast and Revenues)
- Section 4.7 - Fort Nelson (Demand Forecast and Revenues)

4.2 Overview of Total Demand Forecast by Region

Below, the Companies provide an overview of the demand forecast and its drivers in 2012 and 2013. The data is presented for the Companies individually and on a combined basis. The detailed explanations for the forecasts are provided in subsequent sections.

The following Table 4.2-1 shows the total energy demand for the Companies for the forecast period, and illustrates that all regions are forecast to experience a slight increase in consumption except Whistler, where consumption is forecast to decline by 1 percent from 2012 to 2013. It should be noted, that the forecast demand in this section for FEI does not include new customer additions or new energy demand for CNG and LNG service that is presented in Section 5.5.5 (Other Revenue – Mainland – Natural Gas for Transportation Service Revenue) and Appendix I (CNG and LNG Fueling Report). However, existing or historical natural gas for transportation customers under Rate Schedule 6 or Rate Schedule 25 have been included.

Table 4.2-1: The Companies – Forecast Total Energy Demand[62]

(In TJs)		2010 Actual	2011 Forecast	2012 Forecast	2013 Forecast
Mainland					
	Residential	70,041	70,003	69,890	69,817
	Commercial	46,643	46,790	47,059	47,332
	Industrial	51,538	51,226	51,547	51,559
	Mainland Total	**168,222**	**168,019**	**168,496**	**168,707**
Vancouver Island					
	Residential	4,698	4,630	4,576	4,528
	Commercial	7,051	7,066	7,198	7,333
	Industrial	19,526	22,295	22,295	22,295
	Vancouver Island Total	**31,275**	**33,991**	**34,069**	**34,156**
Whistler					
	Residential	224	230	237	244
	Commercial	541	500	480	465
	Whistler Total	**765**	**731**	**716**	**709**
Fort Nelson					
	Residential	271	273	273	274
	Commercial	288	296	304	312
	Industrial	55	55	55	55
	Fort Nelson Total	**615**	**624**	**633**	**642**
The Companies Total		**200,877**	**203,365**	**203,914**	**204,214**

For Mainland, an increase in commercial Rate Schedule 23 use per customer has resulted in increased demand for the commercial rate class, offsetting declining or relatively stable demand in residential rate class and other commercial rate schedules.

62 Sections 7.1 to 7.4, Schedule 7-9

For Vancouver Island, rising UPC in almost all Commercial Rate Schedules has helped offset the declining demand in the Residential Rate Schedule that is forecast to occur as a result of the continuing declining UPC. Following the recent volatility in both the housing market and UPC, Vancouver Island observed some returning stability in 2010. However in 2011, the industrial rate class, based on transportation contract demand, is projected to increase by 15 percent compared to 2010 actual resulting in an overall increase of 9 percent for Vancouver Island compared to 2010. For 2012 and 2013, total demand remains relativity flat for FEVI as a whole.

For Whistler, declining use per customer in the Commercial Large General Service Rate Schedules ("LGS-2" and "LGS-3") combined with reduced customer additions offset increases seen in the other commercial and residential Rate Schedules, resulting in overall reduced demand.

For Fort Nelson, an increasing UPC in commercial Rate Schedule 2.2 drove the increase in demand for this region.

As shown in the following Table 4.2-2, net customer additions for all Companies are expected to drop slightly in 2011 compared to 2010. For 2012 and 2013, net additions are forecast to rebound to and then exceed 2010 levels. Forecast additions are up significantly from the 8,144 customers added in 2009 but fall short of the 12,775 customers added in 2008.

Table 4.2-2: The Companies – Forecast Customer Additions

	2010 Actual	2011 Forecast	2012 Forecast	2013 Forecast
Mainland	6,913	6,317	6,656	6,923
Vancouver Island	2,432	2,422	2,557	2,658
Whistler	12	18	19	19
Fort Nelson	21	23	22	24
All Companies	**9,378**	**8,780**	**9,254**	**9,624**

The following Table 4.2-3 describes the existing Rate Schedules included in each of the three rate groups (Residential, Commercial, Industrial) for the four regions[63] discussed in this section.

[63] Note: The Mainland region presented in this section includes the Lower Mainland, Inland, Columbia and Revelstoke regions.

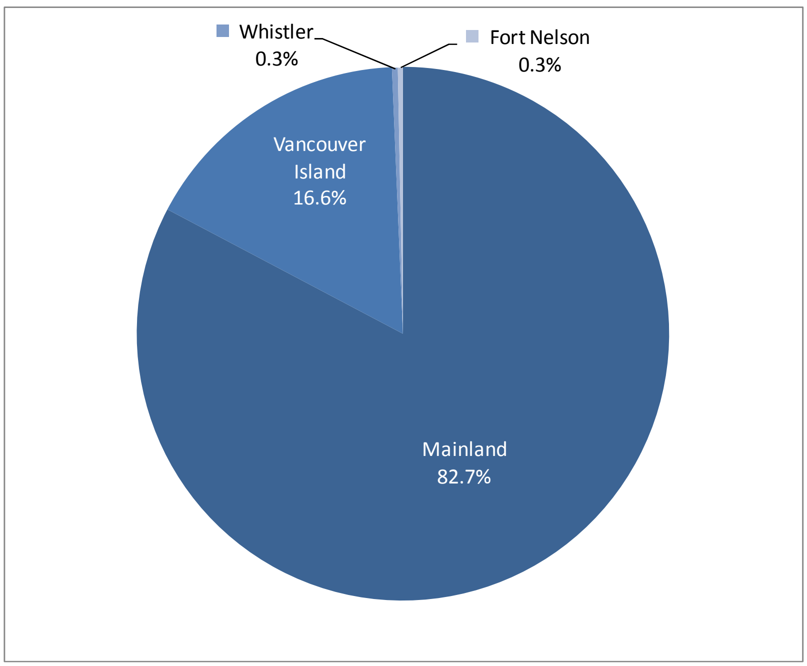
Table 4.2-3: The Companies – Rate Schedule Classification*

	Mainland	Vancouver Island	Whistler	Fort Nelson
Residential	1	RGS-1	SGS-1 Res	1
Commercial	2, 3, 23	AGS, SCS-1, SCS-2, LCS-1, LCS-2, LCS-3, HLF, ILF	SGS-1 Com, LGS-1, LGS-2, LGS-3	2.1, 2.2
Industrial	4 ,5, 6, 7, 22, 25, 27	TPT		25

* Note: Rate Schedule 16 has not been included because it is a supply offering for LNG and not a delivery service or transportation rate schedule like Rate Schedule 23 or Rate Schedule 25, for example.

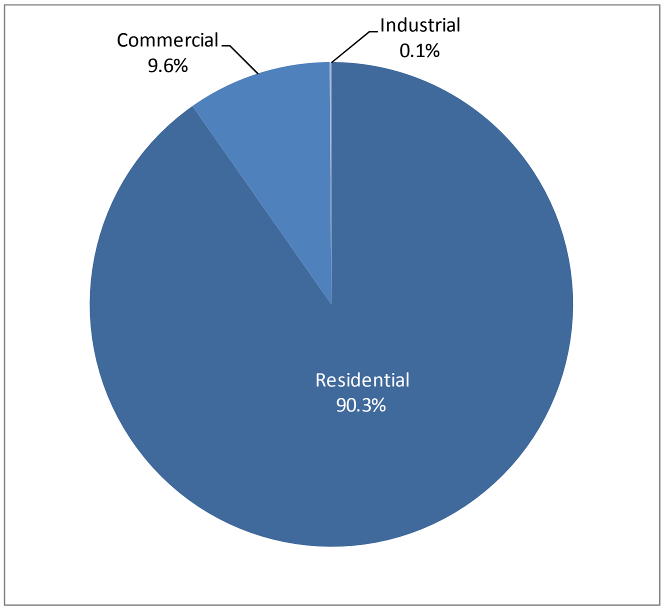
The forecast energy demand by company for 2012 is shown in the Figure 4.2-1 below. Whistler and Fort Nelson account for 0.6 percent of the total energy demand forecast for the Companies, with the Mainland making up about 83 percent of the total energy demand.

Figure 4.2-1: Total Demand Split between Companies



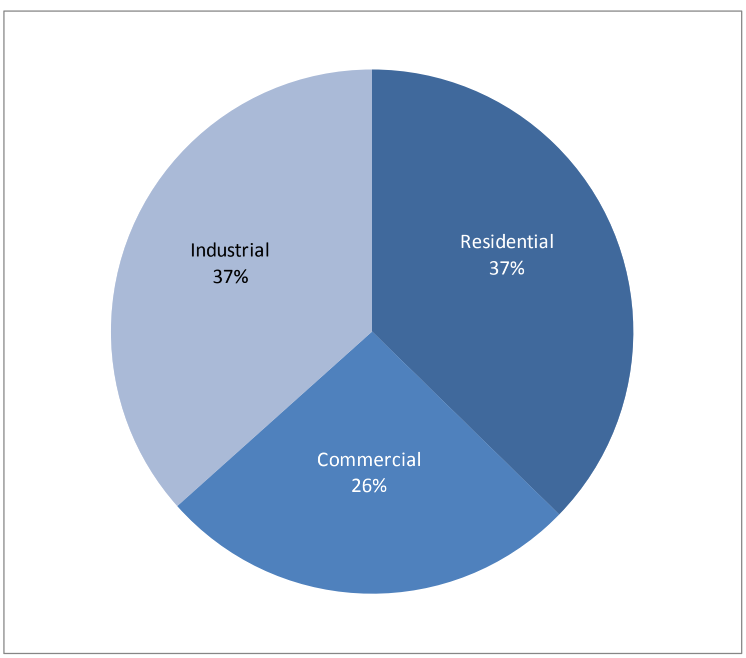
For 2012 just over 90 percent of the Companies' customers are forecast to be residential. 9.6 percent, or just over 93,000 customers, are in the Commercial Rate Schedules while 1,023 are in Industrial Rate Schedules. The split is shown in Figure 4.2-2 below:

Figure 4.2-2: Total Customer Split between Rate Groups, All Companies



The forecast energy demand by rate group for 2012 is shown in Figure 4.2-3 below. The split between Residential, Commercial and Industrial energy demand for all Companies forecast for 2012 remains consistent with prior years. The Residential and Industrial rate classes each account for 37 percent of the demand and the Commercial classes account for the remaining 26 percent.

Figure 4.2-3: Total Demand Split between Rate Groups, All Companies



The slight increase in total throughput across all regions, except for Whistler, has a positive impact in reducing delivery rates, all else equal, for 2012 and 2013. The Companies will provide an updated forecast if there are any material changes in the forecast inputs as the regulatory process unfolds through the summer and fall of 2011.

4.3 Underlying Forecast Methodology

The forecasts summarized above were prepared according to the methodology used in prior RRAs. It involves two major steps:

1. Forecast account additions, use rates and Industrial demand using methodologies that are consistent with past forecasts. These methodologies result in demand forecasts for each region and rate class. The aggregate energy forecast for each region and rate class is the summation of three separate demand forecasts as follows:
   - The forecast **Residential Energy Demand** is the product of the residential accounts (including account additions) and the normalized forecast Residential use rate.
   - The forecast **Commercial Energy Demand** is the product of the Commercial accounts (including account additions) and the normalized forecast Commercial use rate, for each Commercial rate schedule.
   - The forecast **Industrial Energy Demand** is the forecast demand reported through the Industrial Survey.
2. Compare the independently developed forecast with historical normalized data. Through this comparison the forecast for gas usage by our customers is verified. The tables and figures presented in Section 4, all show the historical values recorded by the Companies along with the forecast value for 2011, 2012 and 2013.

The following section discusses the methodology used to prepare the demand forecast. The methodology described in this section applies to all three Companies. The Companies believe it is reasonable to use the existing forecast methodology that has been reviewed and accepted internally, and has been reviewed and accepted by the BCUC and stakeholders in past regulatory proceedings, including the most recent RRA's for each of the Companies.

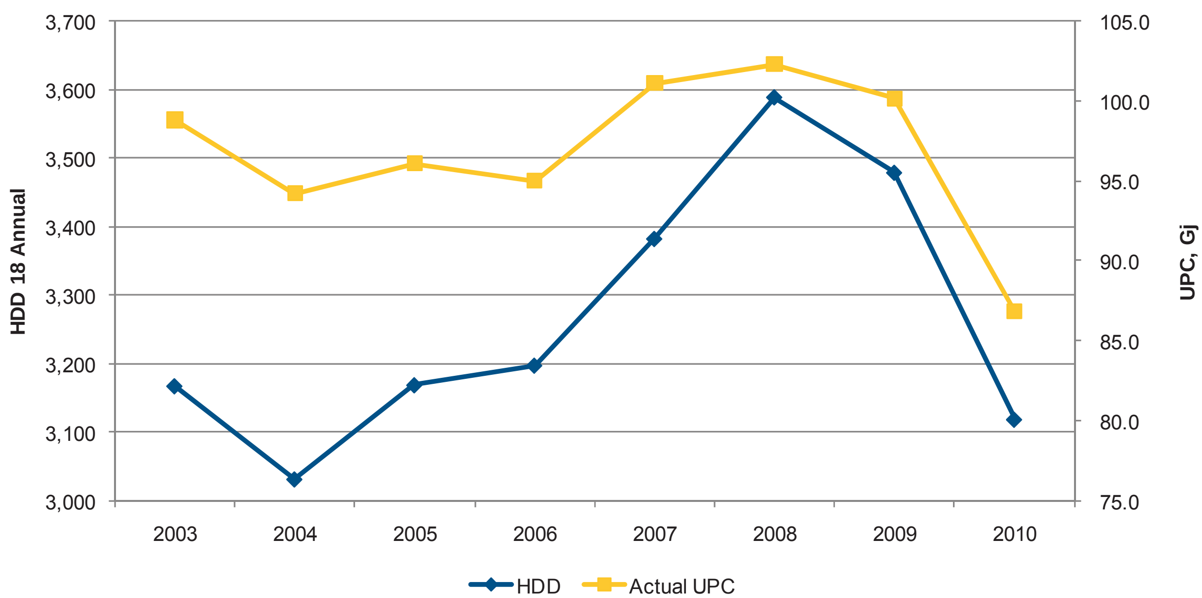
4.3.1 AVERAGE USE PER CUSTOMER FORECAST METHODOLOGY

The forecast UPC is one of two key inputs for both the residential and commercial demand forecast. The forecast UPC is multiplied by the total customer accounts in each region and rate schedule to determine the demand in those regions and rate schedules. The forecast of average usage per customer is based upon an analysis of weather normalized consumption data. Normalized UPC forecasts are developed for all Residential and Commercial rate classes.

Normalization is the process that allows us to compare use per customer in different years irrespective of the weather. Normalization essentially removes the weather as a factor from use per customer, allowing us to compare UPC rates from different years and between different regions and rates.

The following figure compares the actual residential demand with the annual heating degree days (HDD). Higher HDD totals indicate a colder year. As can be seen, the residential demand closely follows weather patterns.

Figure 4.3-1: Annual HDD Correlates Well to Actual Residential Demand

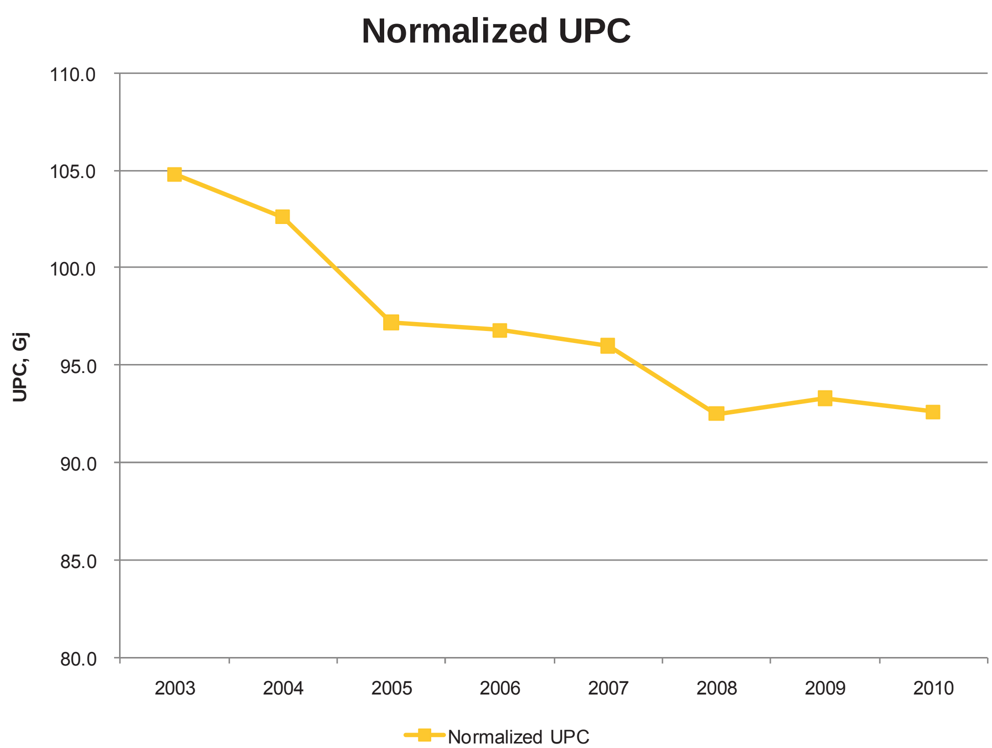


In colder years such as 2008, residential demand increases. In warmer years such as 2010, residential demand decreases.

Given the influence of the weather, it is not possible to make an accurate prediction about future demand based on the historical actual demand. We need to first normalize the demand by removing the weather effect. Once this is done, the normalized UPC may reveal other trends that are present in the data, such as reduced consumption resulting from improved appliance efficiency.

The following figure shows UPC resulting from the same annual demand on a weather normalized basis.

Figure 4.3-2: Normalized Use Rate Per Customer



From the figure above we can see that there is a clear and consistent downward trend in use per customer irrespective of annual weather. In rate schedules where a consistent trend is not identifiable a three year average UPC is used. Consistent with past practices and industry standards, and dating back to Mainland's 1992 Revenue Requirement Application, which was approved by Commission Order No. G-63-92 on August 5, 1992, the Companies use the previous 10 years of weather data for normalization.

The Companies believe that efficiency improvements are a key driver of the decline in Residential average UPC. These would include the retrofit of older, less efficient appliances with new high efficiency units, and also upgrades to insulation, window, doors, and, more generally speaking, building shells. Although efficiency improvements are driven by a number of factors such as technological advances, natural gas prices, public policies/programs and the state of the economy, they are also influenced by Mainland and Vancouver Island's EEC programs.[64] Since the Companies recently received approval for EEC programs that have significantly greater levels of funding, it is reasonable to assume that these will impact average UPC over the forecast period. In 2010 the impact was estimated to be a 0.12 Gigajoule ("GJ") decline in Residential average UPC. In 2011 the impact is forecast to be a 0.16 GJ decline in Residential

[64] EEC Programs have been established in Mainland and Vancouver Island regions.

average UPC. While EEC savings are not a direct input into the forecast model, their effect is implicit in the generally declining UPC trends.

4.3.2 RESIDENTIAL CUSTOMER ADDITIONS FORECAST METHODOLOGY

Residential customer additions and the existing residential customer totals are the second key input in the residential demand forecast. The customer count (including additions) is multiplied by the average use per customer to form the residential demand forecast.

The housing market is forecast by Canada Mortgage and Housing Corporation ("CMHC") to stabilize in 2011 and strengthen in 2012. The level of new home construction will trend higher during the next two years, resulting in housing starts reaching their ten-year average. According to CMHC housing starts are expected to reach 26,900 homes in 2011 and 29,000 homes in 2012.

In order to forecast customer additions, we continue to use the housing starts forecasts from the CMHC and the Conference Board of Canada ("CBOC"). The forecast provides separate single family and multi-family residential estimates.[65]

We have developed separate single and multi family dwelling forecasts for this filing. These two forecasts are based on our own internal customer mix for these dwellings as well as the CMHC and the CBOC forecast for growth in these two housing types. Once the separate forecasts are completed the accounts are combined for the two housing types and become the Rate Schedule 1 Residential accounts forecasts.

The following chart shows the relationship between the total housing starts and historical Rate Schedule 1 net customer additions for the period 2002 to 2010. The forecast starts and customer additions are shown for 2011-2013.

[65] Conference Board of Canada Long Term Housing Starts Singles Forecast dated January 13, 2011 and Conference Board of Canada Long Term Housing Starts Multiples Forecast dated January 13, 2011, refer to Appendices C-1 and C-2.

Figure 4.3-3: Customer Additions Correlate Well with Housing Starts for All Companies

	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011F	2012F	2013F
Housing Starts	17,234	21,625	26,174	32,925	34,667	36,443	39,195	34,321	16,077	26,479	26,900	29,000	30,491
Res Net Additions	6,554	10,180	9,061	14,798	14,214	13,439	15,801	11,318	7,723	9,198	8,517	8,996	9,366

The above figure demonstrates the continued strong correlation between housing starts and net Residential customer additions. The correlation statistic is over 90 percent. For this reason the CMHC and the CBOC housing starts forecast are an appropriate predictor of future customer additions for all the Companies.

The growth rates of provincial housing starts are used as proxies of the Companies' customer additions forecast. The preliminary forecast is then reviewed by internal staff who have more insights into regional housing markets. These reviews allow us to make adjustments to the forecast based on our detailed knowledge of regional trends.

4.3.3 GDP CORRELATION TO DEMAND

While historically, provincial GDP growth has provided a directional measure of the overall economy, it is not a discrete input into our forecasting model. The following figure shows normalized demand and provincial GDP. While the GDP has grown steadily since 2002, total demand has fallen from a peak of 218 Petajoules ("PJs") in 2003 to 201 PJs last year.

Figure 4.3-4: Provincial GDP Does Not Correlate to Normalized Demand

	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
Energy Demand	206	217	218	215	212	202	213	206	198	201
GDP	133,403	138,193	141,435	146,541	153,489	159,729	164,496	164,869	161,851	161,850

Further, forecasting natural gas prices and the impact to industrial demand is not a direct input into the forecast model, but are implicit in the survey responses received from the individual industrial customers.

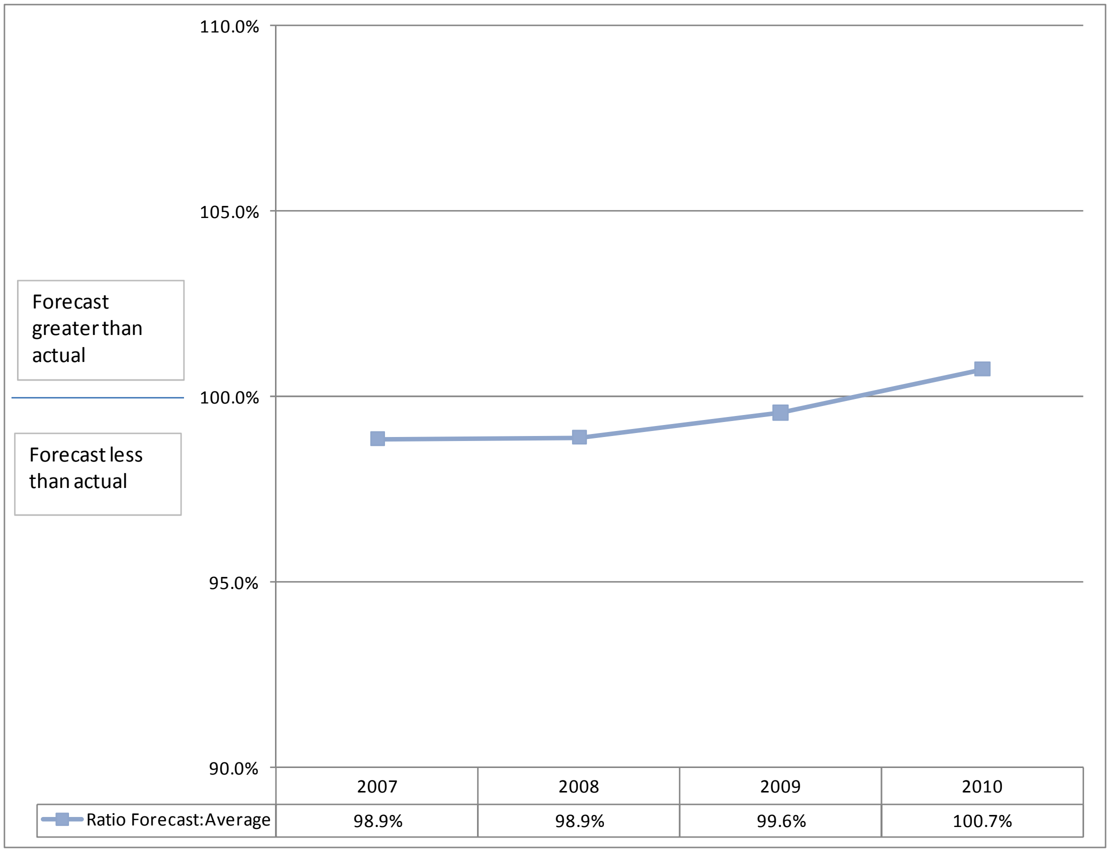
4.3.4 COMMERCIAL CUSTOMER ADDITIONS FORECAST METHODOLOGY

Commercial customer additions and the existing commercial customer totals are the second key input for the commercial demand forecast. The total customer count (including additions) is multiplied by the average use per customer to form the commercial demand forecast. Consistent with prior forecasts, and in the absence of independent third party commercial forecasts, the forecast of Commercial Customer Additions is based upon an analysis of recent trends in each region and Commercial rate class.

This method has provided accurate results in the past as shown in the following figure for Rate Schedules 2, 3 and 23 for the Mainland region. The figure compares the forecast and actual commercial customer totals for 2007, 2008, 2009 and 2010. The points in the figure are the ratio of actual year end commercial account totals compared to the forecast total for the same period. For the purpose of this section only the Mainland region is shown as it accounts for approximately 89 percent of all commercial accounts.

As seen below, the maximum error using this method was 1.1 percent in both 2007 and 2008. The average error for the four year period was 0.5 percent. Given this level of accuracy, trending based on our recent actual customer account data provides a reasonable forecast of customer additions.

Figure 4.3-5: Comparison of Forecast to Actual Commercial Customers, Mainland Region



4.3.5 COMPARISON OF WEATHER VS. CUSTOMER ADDITIONS AS DEMAND DRIVERS

In considering the demand forecast it is helpful to consider the relative weight and importance of the inputs. Our analysis reveals that on average total residential demand is more than five times more sensitive to weather fluctuations than it is to the demand from new customers. Weather, and its annual deviation from ten year normals, plays a substantially bigger role in the annual residential demand than do customer additions. The data and discussion in this section demonstrates the relative impacts of weather and residential account additions as drivers for total residential demand.

In this examination we will consider:

- Annual weather related residential demand variance, comparing actual demand to weather normalized demand for existing customers. This will establish the demand variance related to non-normal weather;

- Demand generated by the net customer additions; and
- A comparison of the demand from the above two sources.

4.3.5.1 Annual Weather Related Residential Demand Variance

Table 4.3-1 below compares normalized to actual total demand for the Residential Rate Schedule 1 for the Lower Mainland sub-region. The table shows that on average the actual demand can be expected to vary by 3.2 PJs per year compared to normalized demand. The 3.2 PJs is a result of non-normal weather. When the difference is close to 0 (i.e. 2005 and 2006) it indicates weather approaching the 10 year normal.

Table 4.3-1: Lower Mainland Actual and Normal Demand

	2003	2004	2005	2006	2007	2008	2009	2010	8-Yr Avg
Actual Demand (PJ)	50.7	48.4	51.1	51.3	56.2	58.8	53.2	48.7	52.3
Normalized Demand (PJ)	54.0	53.9	51.6	52.1	52.7	51.6	52.4	52.6	52.6
Difference (PJ)	-3.3	-5.5	-0.5	-0.8	3.5	7.2	0.8	-3.9	
Absolute value of Difference (PJ)	3.3	5.5	0.5	0.8	3.5	7.2	0.8	3.9	3.2

4.3.5.2 Demand from Net Customer Additions

We can compare the expected 3.2 PJs demand variance from non-normal weather to the demand generated from our net customer additions, as shown in the following tables.

The following table shows the year end accounts and net customer additions from 2003 through 2010.

Table 4.3-2: Lower Mainland Year End Accounts

	2003	2004	2005	2006	2007	2008	2009	2010	8-Yr Avg
Year End Accounts	486,954	494,756	502,589	508,748	516,801	521,437	524,620	529,194	
Account Additions	4,892	7,802	7,833	6,159	8,053	4,636	3,183	4,574	5,892

We can determine the actual UPC from the Actual Demand and the Year End Accounts.

Table 4.3-3: Lower Mainland Actual UPC

	2003	2004	2005	2006	2007	2008	2009	2010	8-Yr Avg
Actual UPC (GJ)	104.1	97.8	101.7	100.8	108.7	112.8	101.4	92.0	102.4

The Actual UPC[66] multiplied by the Account Additions provides the demand from the new customers from 2003 through 2010 as shown in the following table:

Table 4.3-4: Lower Mainland Demand from New Customers

	2003	2004	2005	2006	2007	2008	2009	2010	8-Yr Avg
Demand from new customers (PJ)	0.5	0.8	0.8	0.6	0.9	0.5	0.3	0.4	0.6

4.3.5.3 Comparison of Demand from Non-Normal Weather and Customer Additions

We can now compare the demand from new customers to the demand variance from non-normal weather as shown in the following table.

Table 4.3-5: Lower Mainland Weather Significance

	2003	2004	2005	2006	2007	2008	2009	2010	8-Yr Avg
Demand from new customers (PJ)	0.5	0.8	0.8	0.6	0.9	0.5	0.3	0.4	0.6
Absolute demand from non-normal weather (PJ)	3.3	5.5	0.5	0.8	3.5	7.2	0.8	3.9	3.2
Significance Factor (Weather:Customer Additions)	6.4	7.1	0.7	1.3	4.0	13.8	2.6	9.2	5.3

When the "Significance Factor" is 1.0, the demand from non-normal weather is equal to the demand from new customer additions. This is likely to happen in years where the weather is near normal and the customer additions are above average. An example is 2005.

In years where the weather is "normal" the Significance Factor will be 0.

In years where the weather is significantly different from normal the effect weather has on demand is much greater than the demand generated by customer additions. If the net customer additions are below average the effect is compounded. An example is 2008 where, due to weather much colder than normal, residential demand was 7.2 PJs greater than expected and 13.8 times greater than the demand from the 4,636 new customers added that year.

On average the demand variance from non-normal weather has been 5.3 times greater (530 percent) than the demand from new customers since 2003.

In conclusion total residential demand is more than five times more sensitive to weather fluctuations than it is to the demand from new customers. As a driver for residential demand, customer additions are important but, on average, are dwarfed by the impact of weather on the much larger existing customer base.

66 Annual UPC is used in this example for simplicity. The companies use monthly UPC to calculate demand.

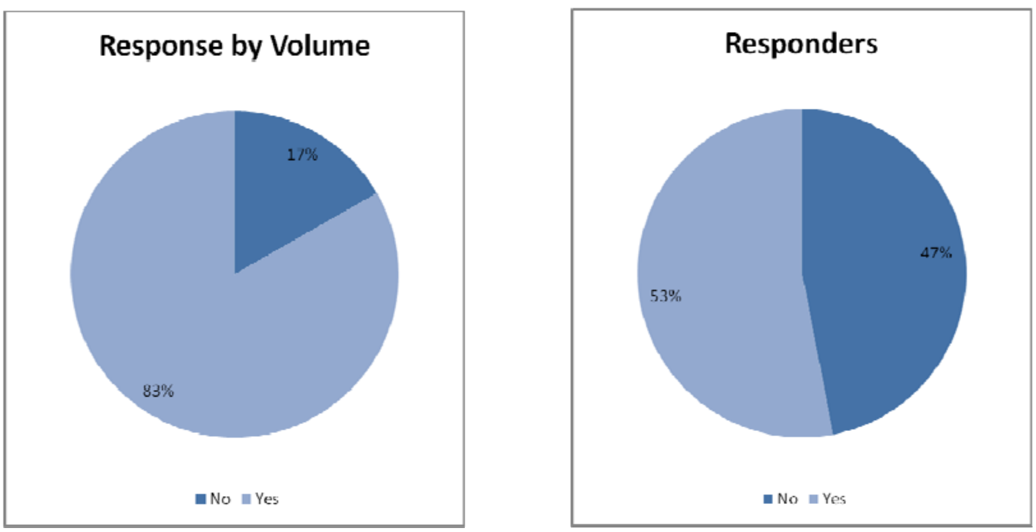
4.3.6 INDUSTRIAL DEMAND FORECAST METHODOLOGY

The forecast of **Industrial Energy Demand**, due to the smaller number of customers in each rate class, is based upon customer specific results from the annual Industrial Demand Survey.

The forecast for **Industrial Customer Additions** assumes no net change in the number of customers over the forecast period except where specific knowledge has been received by the Companies.

The survey asks each industrial customer for their short-term forecast monthly consumption and long-term annual consumption. This data is entered directly into the forecast to produce total demand for each industrial rate schedule. This year the Industrial Demand Survey was sent electronically. The survey was both easier to complete for our customers and easier to process for FEI staff than in the past. The participation rate in the survey increased this year and responses accounted for approximately 83 percent of the Industrial demand.

Figure 4.3-6: Response to 2010 Industrial Survey



We recognize that further improvements can be made to this process. In the future we will investigate the benefits of implementing the following changes:

Table 4.3-6: Potential Survey Improvements

Potential Survey Improvement	Expected Benefit
Internet Based Survey	• Higher participation rates in current Rate Schedules • Include additional Rate Schedules • Reduced staff time for processing results
Compare Forecast to Actual for each Customer	Allow us to make adjustments to specific customer forecasts where a clear trend of over- or under-forecasting has occurred.
Different survey for heat sensitive customers	Determine which Industrial customers are heat sensitive and provide them with a shorter, simpler survey. The survey would ask for process changes but not require the respondent to forecast total monthly consumption.

The table above is not intended as an exhaustive list. These and other changes may be investigated for potential impact, ease and cost of implementation, data security and possibly other factors. In the meantime, the Companies believe that the methodology of surveying industrial customers to forecast industrial demand continues to be reasonable.

4.3.7 REVIEW OF HISTORICAL DATA

Once the independently developed forecast is complete, it is compared with historic normalized data. Through this comparison, the forecast for gas usage by our customers is verified.

Using the forecast software system we are able to directly compare historic actual data alongside the forecast at many different levels (i.e. use per customer, accounts, energy demand etc). The graphical comparison is available at the region, sub-region and rate class level from 2003 through the forecast period. The graphical comparison allows us to establish the reasonableness of the forecast.

4.4 Mainland Demand Forecast and Revenues

4.4.1 INTRODUCTION

This section describes the forecast of average UPC, customer additions and total energy demand over the forecast period for the Mainland region.[67]

In order to forecast the Mainland total energy demand, FEI considers the following:

- Average Use rates by rate class;

[67] The Mainland region presented in this section includes the Lower Mainland, Inland, Columbia and Revelstoke regions.

- Customer Additions; and
- Industrial Demand.

These three inputs together form the basis for the forecast model. The total energy demand resulting from this model is forecast to be relatively stable over the forecast period.

Since 2003, the net increase in Residential customers is approximately 63,000. At the same time, more efficient home and appliance standards have been adopted, and we have experienced a continued shift towards more multi-family dwellings in the housing mix. Overall, the growth in Residential customers has not offset the decline in average Residential UPC, which has resulted in a decline in overall Residential energy demand.

However, increased UPC in selected Commercial and Industrial rate classes is expected to offset this decline in Residential demand resulting in the overall slight increase in total demand for 2012 and 2013.

This section is organized as follows:

- Revenue Stabilization and Adjustment Mechanism
    - Discusses the method by which delivery margins for residential and commercial customers are stabilized
- Residential and Commercial Use Rates
    - Discusses forecast of average use rates for each rate schedule
- Customer Additions
    - Discusses forecast of net residential and commercial customer additions
- Demand Forecast
    - Discusses total energy demand for all residential, commercial and industrial rate schedules
- Revenue and Margin Forecast
    - Monetization of demand

4.4.2 REVENUE STABILIZATION ADJUSTMENT MECHANISM

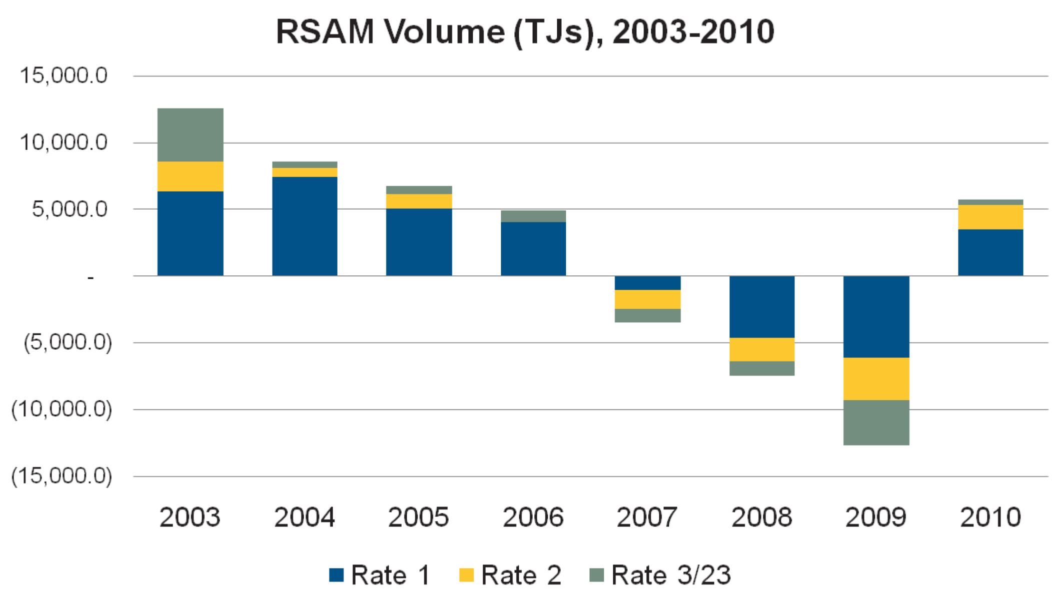
Mainland utilizes an RSAM which stabilizes the margins recovered from Mainland Residential and Commercial customers.[68]

The RSAM stabilizes delivery margin received from Residential and Commercial customer classes on a UPC basis. If customer use rates vary from the forecast levels used to set the rates, whether due to weather variances or other causes, Mainland records the delivery charge differences in the RSAM deferral account for refunding or charging through a rate rider to the RSAM rate classes over the ensuing three years.

Having an RSAM mechanism does not offer Mainland protection against forecasting errors due to variances between recorded and forecast number of customers nor does it mitigate any forecasting risks associated with the non-RSAM customer classes such as Industrial customers.

As shown in the following Figure 4.4-1, demand for Rate Schedules covered by RSAM in the Mainland region can vary by +/- 12 PJs in a particular year. Negative volumes indicate below normal temperatures.

Figure 4.4-1: RSAM Volumes Since 2003



The RSAM captures variances that occur in forecast to actual for factors such as weather that cannot be forecast with any degree of certainty.

---

68 Mainland Rate Schedules 1, 1U, 1X, 2, 2U, 2X, 3, 3U, 3X and 23

4.4.3 RESIDENTIAL AND COMMERCIAL USE RATES

Individual average UPC forecasts are developed for each service area and for each residential and commercial customer class. The analysis of historic normalized **residential** use rates indicates a continued downward trend, while normalized **commercial** average use rates are proving to be more stable.

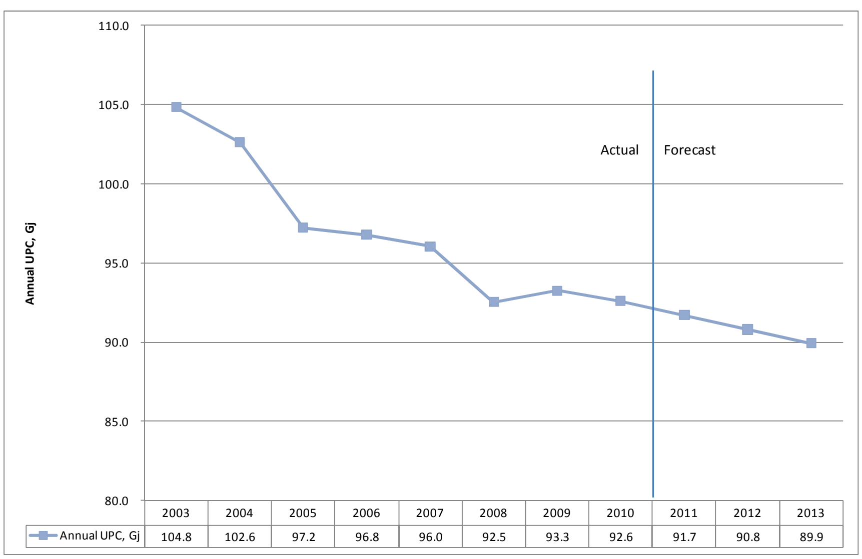
Customer migration, in the commercial customer classes, also affects the average UPC. Customers with annual consumption that falls outside the consumption range specified under their current rate class can skew the average UPC for the entire customer class. Consumption for this group of customers is reviewed annually to determine whether or not there will be an impact to average UPC, and if there is, to what extent.

For short term forecasts such as this one prepared for the RRA it is important to review historical consumption levels, as it is through this process that the Company is able to verify trends in the market, and more importantly, determine whether or not those trends are likely to continue into the future. Long term forecasts, such as those prepared for the Long Term Resource Plan, must consider these and other inputs because the recent history is not always an accurate or complete predictor of long term trends. Developing the inputs for the Long Term Resource Plan is substantially more difficult due to the number of factors that must be considered.

As can be seen from the figures in this section, the forecast of average UPC for Residential and Commercial rate classes is consistent with the trend of historical values.

As shown below, the Residential UPC is forecast to continue downward. For the Mainland region the decline is forecast to continue at approximately 0.9 GJ per year.

Figure 4.4-2: Mainland - Rate Schedule 1 UPC Declining Consistent with Prior Years



As seen below, the Rate Schedule 2 UPC in the Mainland region is forecast to decline slightly during the forecast period. The annual UPC reduction is forecast to be 1.6 GJ per year or approximately 0.5 percent.

Figure 4.4-3: Mainland - Rate Schedule 2 UPC Consistent with Prior Years

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Annual UPC, Gj	321.2	313.8	305.8	314.3	316.5	312.2	320.6	311.3	309.6	308.0	306.4

As seen below, the decline in Rate Schedule 3 UPC for the Mainland region has been consistent and this trend is forecast to continue. The annual decline in the Rate Schedule 3 UPC is forecast to be 17.4 GJ or approximately 0.5 percent.

Figure 4.4-4: Mainland - Rate Schedule 3 UPC Consistent with Prior Years

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Annual UPC, Gj	3,428	3,501	3,388	3,314	3,426	3,420	3,372	3,370	3,352	3,334	3,316

As seen below, the Mainland Rate Schedule 23 UPC is forecast to continue the slight recent upward trend.

Figure 4.4-5: Mainland - Rate Schedule 23 UPC Slight Recent Upward Trend

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Annual UPC, Gj	5,015	5,113	4,714	4,686	4,778	4,698	4,886	4,850	4,876	4,901	4,927

4.4.4 CUSTOMER ADDITIONS

The rate of growth seen in our customer base reached a high in 2007 of roughly 12,000 customers but declined in 2008 and 2009. In 2010 account additions rebounded and the Company added just over 6,900 customers in the Mainland region.

Figure 4.4-6: Mainland - Total Customer Growth for all Rate Classes Consistent with Prior Years

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
All Rate Classes	775,603	787,123	799,427	809,718	822,687	831,886	836,976	843,845	850,159	856,815	863,738

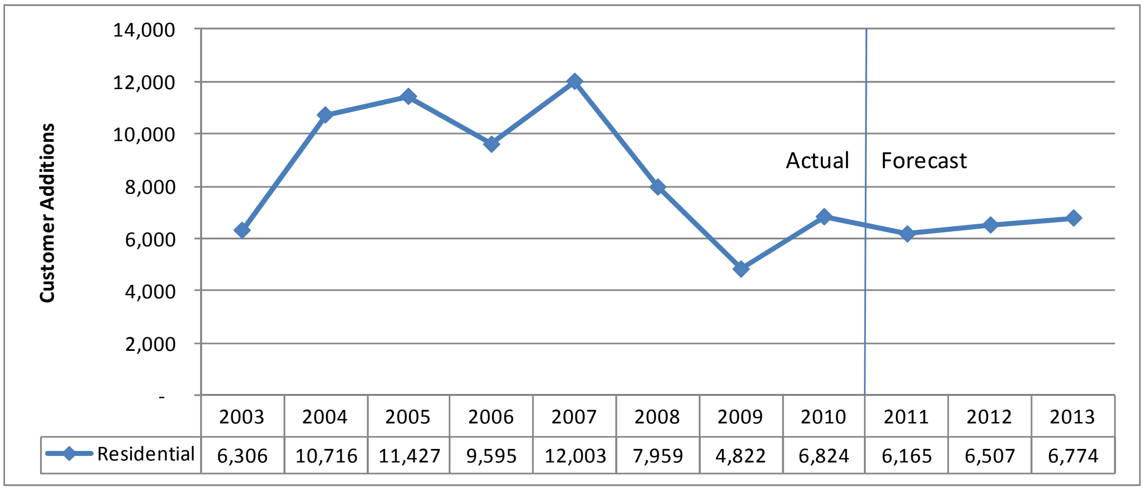
The forecast of customer additions is based on the CMHC's and the CBOC's Residential forecast, which is consistent with prior years. Customer additions are forecast for both Residential and Commercial customer classes.

The Residential forecast was reviewed for consistency with our historic customer additions and was then reviewed internally by the Residential and Commercial Energy Solutions group (part of the Energy Solutions and External Relations department). Residential and Commercial Energy Solutions staff made adjustments based on their in depth knowledge of their service areas.

No growth in customer additions was assumed for Industrial customers in Rate Schedules 5, 22, 25, and 27 as none were known of at the time of the forecast. It should be noted, that the forecast demand in Section 4.4 for FEI does not include new customer additions or energy demand for CNG and LNG service that is presented in Section 5.5.5 and Appendix I.

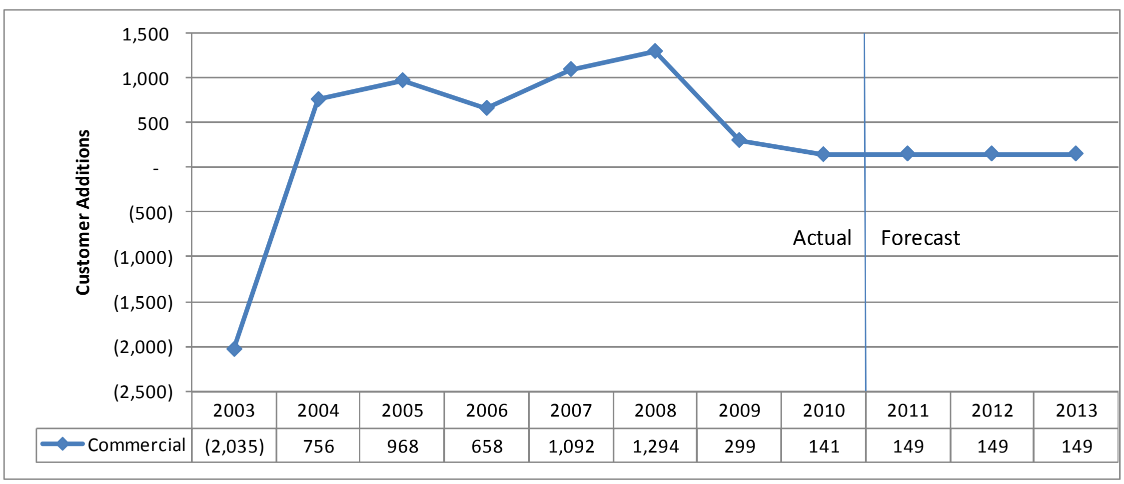
The following Figures (Figures 4.4-7 and 4.4-8) provide a summary of the Residential and Commercial net customer additions projected for 2011, and the forecast for the years 2012 and 2013.

Figure 4.4-7: Mainland - Residential Customer Additions



As shown in the preceding figure, Residential net additions rebounded in 2010 from the lows observed in 2009. Additions in 2011 are forecast to be slightly lower than 2010 and then will gradually increase in 2012 and 2013.

Figure 4.4-8: Mainland - Forecast Commercial Customers Additions



The net Commercial customer additions have historically been very volatile. Commercial net customer additions declined dramatically in 2009 and moderately in 2010. Based on the lack of a clear trend and through interviews with internal staff we are forecasting a modest 149 additions per year for the forecast period.

4.4.5 DEMAND FORECAST

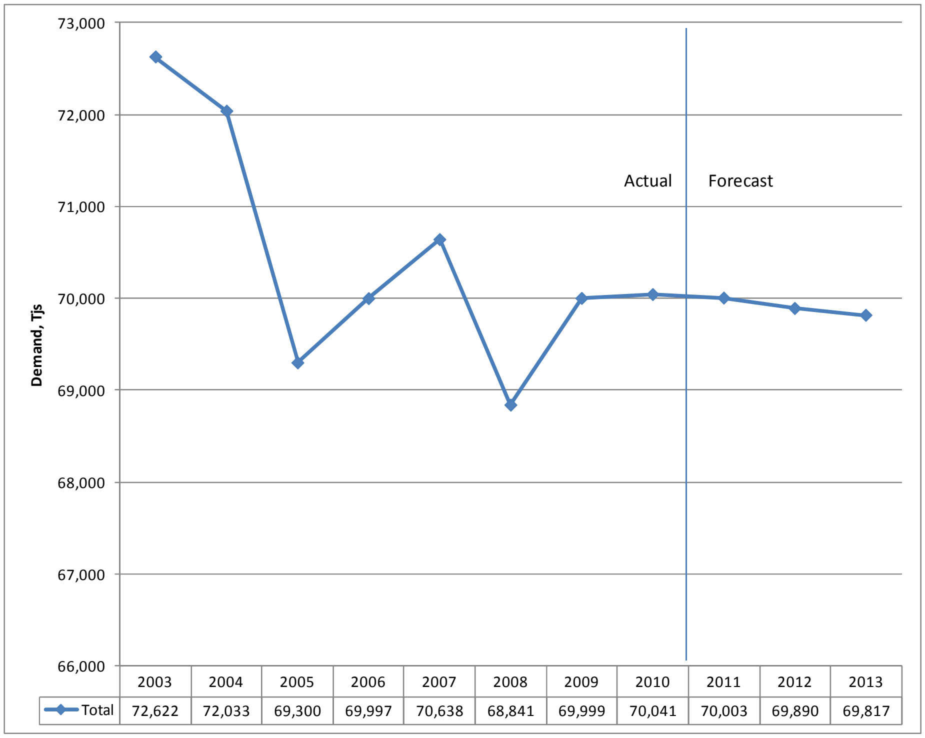
As seen below in Figure 4.4-9, the total normalized demand for the Mainland region is projected to be approximately 168 PJs in 2011, in line with 2010 actuals. For 2012 and 2013 the total normalized demand is forecast to be slightly higher as a result of increases in Commercial and Industrial rate classes.

Figure 4.4-9: Mainland - Total Normalized Energy Demand in TJs

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Total	184,134	180,817	176,431	172,410	176,160	170,007	165,607	168,222	168,019	168,496	168,707

As shown below in Figure 4.4-10, the growth in Residential customers has not offset the decline in average Residential UPC, which has resulted in an overall decline in Residential normalized energy demand.

Figure 4.4-10: Mainland - Normalized Residential Demand



As seen in the Figure 4.4-11 below, increased UPC in Rate Schedule 23 Commercial Transportation Service is expected to result in a slight increase in overall Commercial demand.

Figure 4.4-11: Mainland - Commercial Demand

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
RATE2	22,837	22,304	22,071	22,942	23,503	23,377	24,261	23,619	23,545	23,438	23,332
RATE3	18,732	18,295	16,671	15,637	16,078	16,291	16,455	16,394	16,423	16,469	16,515
RATE23	3,724	4,621	5,139	5,516	5,927	6,207	6,469	6,630	6,822	7,152	7,485

As seen below the demand from the Industrial rate classes is forecast to stabilize close to 2010 levels based on responses to the 2010 Annual Industrial Survey. In the forecast, demand for Industrial customers that did not participate in the annual survey was held constant at 2010 levels.

Figure 4.4-12: Mainland - Industrial Demand

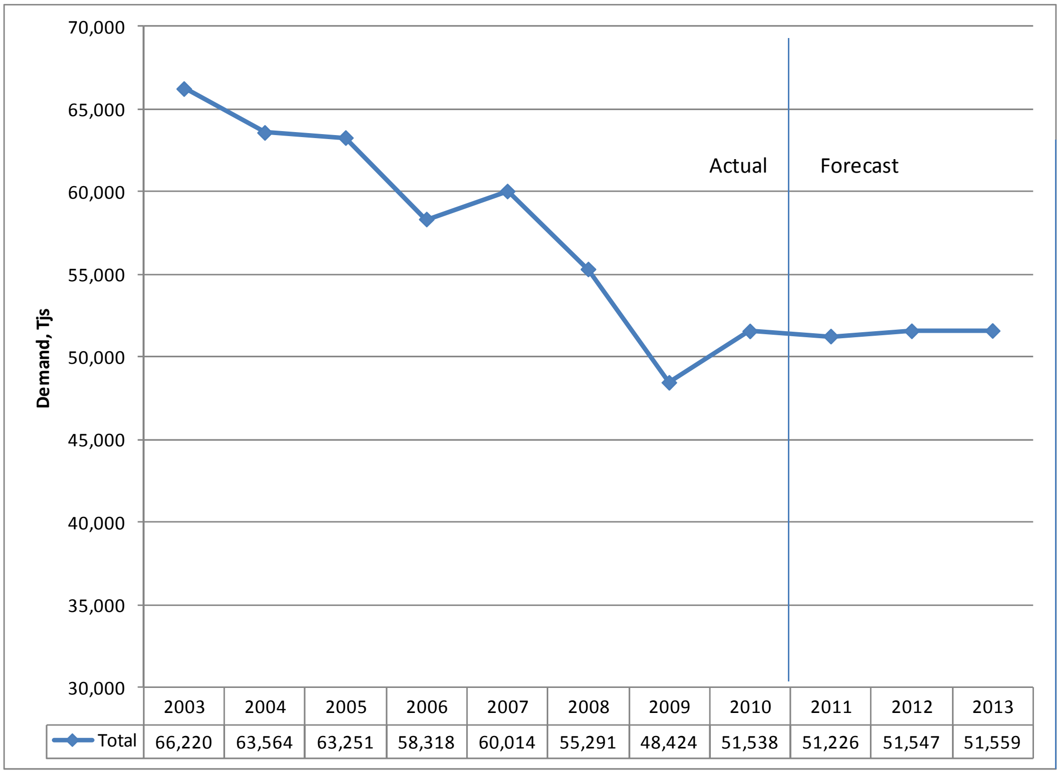


Table 4.4-1 outlines the total demand for Mainland by residential, commercial, and industrial sectors for 2012 and 2013.

Table 4.4-1: Mainland – Demand

Energy (Tjs)	2012	2013
Mainland		
Residential	69,890	69,817
Commercial	47,059	47,332
Industrial	51,547	51,559
Grand Total	**168,496**	**168,707**

4.4.6 MAINLAND REVENUE AND MARGIN FORECAST

A reasonable forecast of revenues and margins has been developed by considering the total energy forecast applied at existing 2011 approved rates.

4.4.6.1 Revenue

Revenues are a function of both energy consumption and the rate applicable at the time the energy is consumed. FEI has developed a reasonable forecast of revenues by applying the total energy forecast to the currently approved rates (as at January 1, 2011) for each customer class.

The revenue forecast presented in Table 4.4-3 does not include amounts for Vancouver Island Wheeling and B.C. Hydro for Burrard Thermal. The Burrard Thermal revenues are included in the financial schedule in Section 7.1, Schedules 11 and 12 of the Application. The Vancouver Island Wheeling revenues are included in the financial schedule in Section 7.2, Schedules 19 and 20 of the Application. Both revenues reflect existing contractual revenue and volume agreements.

Table 4.4-2 below summarizes the revenues projected for 2011 and forecast for 2012 and 2013, at 2011 rates.

Table 4.4-2: Forecast Sales Revenue for Mainland

Revenue ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Mainland			
Residential[1]	750.2	750.0	750.3
Commercial[2]	382.2	382.6	383.1
Industrial[3]	73.0	73.5	73.6
Grand Total	**1,205.3**	**1,206.1**	**1,207.0**

Notes:
1. Rate Schedule 1
2. Rate Schedules 2, 3, 23
3. Rate Schedules 4, 5, 6, 7, 22, 25, 27 (does not include Burrard Thermal or Vancouver Island Wheeling)

4.4.6.2 Margin

Margins are a function of both total revenues and the cost of natural gas being provided to customers. The Company has developed a reasonable forecast of margins by first developing the forecast of revenues at existing approved rates and then subtracting from that the cost of natural gas.

Table 4.4-3 below summarizes the margin projected for 2011 and forecast for 2012 and 2013, by customer segment, at 2011 approved rates

Table 4.4-3: Forecast Gross Margin for Mainland

Margin ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Mainland			
Residential[1]	336.4	336.9	337.6
Commercial[2]	150.5	151.4	152.2
Industrial[3]	58.0	58.9	59.0
Grand Total	**544.9**	**547.2**	**548.8**

Notes:
1. Rate Schedule 1
2. Rate Schedules 2, 3, 23
3. Rate Schedules 4, 5, 6, 7, 22, 25, 27 (does not include Burrard Thermal or Vancouver Island Wheeling)

Revenues are comprised of both fixed and variable charges, and the portion each contributes to the margin varies for each customer segment. The revenues for the Residential and Commercial customer segments have a smaller portion of fixed to variable charges (approximately 20 percent fixed, 80 percent variable) than do the firm sales and Industrial customer segments, where approximately 55 percent of revenues are fixed compared to 45 percent variable. This means that the margin collected for Residential and Commercial customers is more influenced by annual fluctuations in consumption patterns than it is for firm sales and Industrial customers. Similarly, margins collected from firm sales and Industrial customers, due to the nature of their contracts, are partially protected from yearly fluctuations in usage patterns.

4.4.7 SUMMARY

Through considering the factors influencing customer additions, average UPC and also Industrial volumes the Company has developed a forecast of demand for natural gas. The economic turmoil and dramatic decline seen recently has subsided and the housing starts are returning towards traditional levels. Customers continue to look for ways in which to improve efficiencies and as a result average UPC will also continue to decline over the forecast period. The Industrial survey analyses indicated that overall Industrial volumes will increase slightly in the near future. It is through considering these factors, applying a methodology consistent with prior years, and by using the latest and best information available that the Company believes it has developed a reasonable demand forecast that is the most appropriate to be used in the determination of rates for the 2012 and 2013 forecast period.

4.5 Vancouver Island Demand Forecast

4.5.1 INTRODUCTION

This section describes the forecast of average UPC, customer additions and total energy demand over the forecast period for the Vancouver Island region.

In order to forecast the Vancouver Island total energy demand FEVI considers the following:

- Average Use rates by rate class;
- Customer Additions;
- Industrial Demand;

These three inputs together form the basis for the forecast model. Following an increase in 2011 the total energy demand for Vancouver Island is forecast to stabilize for the remainder of the forecast period.

This section is organized as follows:

- Rate Stabilization Deferral Account
  - Discusses the method by which delivery margins for residential and commercial customers are stabilized
- Residential and Commercial Use Rates
  - Discusses forecast of average use rates for each rate schedule
- Customer Additions
  - Discusses forecast of net residential and commercial customer additions
- Demand Forecast
  - Discusses total energy demand for all residential, commercial and industrial rate schedules
- Revenue and Margin Forecast

4.5.2 RATE STABILIZATION DEFERRAL ACCOUNT

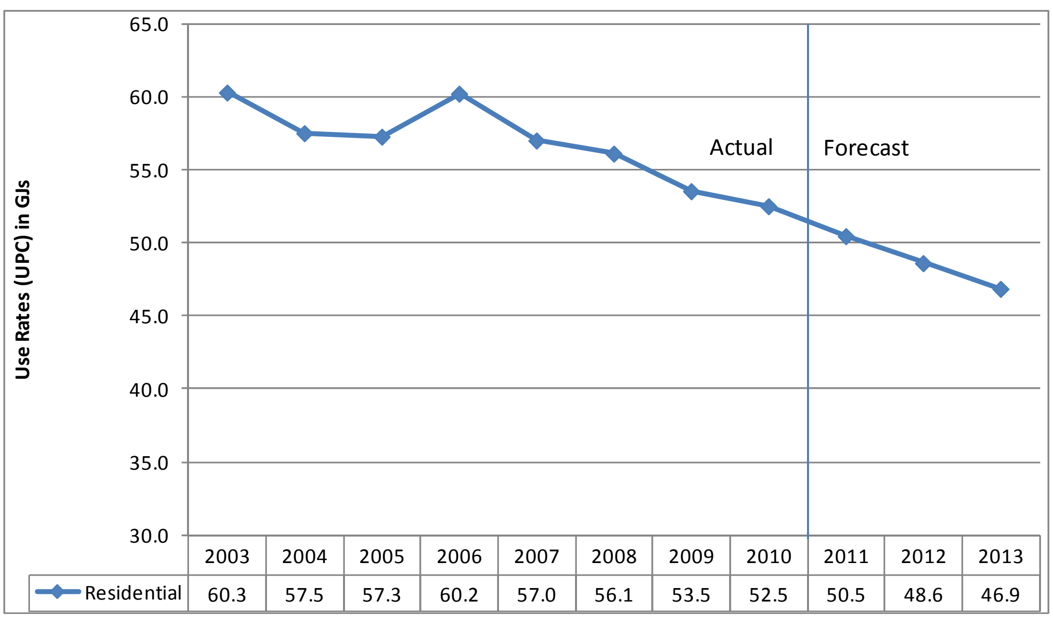
In the 2010-2011 RRA for Vancouver Island, we developed and received approval for an interim rate mitigation strategy, to offset the rate pressure resulting from the loss of the royalty revenues on Vancouver Island at the end of 2011. This interim strategy resulted in a rate freeze for core market customers and the creation of an RSDA, to capture the differences in 2010 and 2011 between the net revenues received and the actual cost of service, excluding O&M variances from forecast. The RSDA captures the volume variance due to the Vancouver Island's forecast volumes versus actual volumes and is similar to Mainland's RSAM in this respect.

4.5.3 RESIDENTIAL AND COMMERCIAL USE RATES

The average UPC forecast is the first component of determining the total demand for natural gas. Individual average UPC projections are developed for each of the core market (Residential and Commercial) customer classes.

Since 2006 the Residential General Service Rate No. 1 ("RGS-1") UPC has declined by almost 2 percent per year. This trend is forecast to continue for the duration of the forecast period. This is illustrated in Figure 4.5-1 below.

Figure 4.5-1: Vancouver Island – Residential General Service UPC Trend Continues to Decline



The FEVI believe that the factors influencing this decline in average UPC include the retrofit of appliances, the changing housing mix, and government policies and programs aimed at improving efficiencies. These factors are likely to continue to influence UPC in the coming years, consistent with the forecast decline for 2012 and 2013. It is also important to review historical consumption levels, as it is through this process that Vancouver Island is able to validate trends in the market, and more importantly, determine whether or not those trends are likely to continue into the future.

The average UPC for both the Small Commercial Service Rate No. 1 ("SCS-1") and Small Commercial Service Rate No. 2 ("SCS-2") rate classes are forecast to continue the upward trend observed since 2003. Despite the reduction in UPC in 2010 the SCS-1 rate class is forecast to be back to 110 GJ/yr in 2012 and then increase to 115 GJ/yr in 2013. The SCS-2 rate class is expected to increase by 8 GJ/yr through the forecast period. This is illustrated in Figure 4.5-2 below.

Figure 4.5-2: Vancouver Island – Small Commercial Service Rate No. 1 and Small Commercial Service Rate No. 2 UPC Trend is Consistent with Prior Years

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
SCS1	66	64	70	75	91	103	110	101	106	110	115
SCS2	296	285	303	314	310	313	325	330	339	347	355

The UPC in the Large Commercial Service Rate Schedule No. 1 ("LCS-1") and Large Commercial Service Rate Schedule No. 2 ("LCS-2") rate classes are expected to increase gradually for the duration of the forecast period. The Apartment General Service Rate ("AGS") rate class is expected to continue the gradual downward trend of approximately 2 percent per year observed since 2005. This is illustrated in Figure 4.5-3 below.

Figure 4.5-3: Vancouver Island – Large Commercial Service Rate Schedule No. 1, Large Commercial Service Rate Schedule 2 and Apartment General Service Rate UPC Trend Consistent with Prior Years

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
LCS1	898	883	926	903	943	952	980	997	1,023	1,049	1,075
LCS2	2,319	2,318	2,365	2,295	2,406	2,359	2,430	2,490	2,542	2,591	2,641
AGS	1,244	1,402	1,350	1,387	1,367	1,297	1,261	1,301	1,283	1,264	1,245

The LCS-3 rate class experienced two years of sharply declining use rates during the recent recession. The use rate rebounded in 2010. In the absence of a clear trend, the UPC for LCS-3 is forecast to remain constant for the duration of the forecast period. This is illustrated in Figure 4.5-4 below.

Figure 4.5-4: Vancouver Island – Large Commercial Service Rate Schedule No. 3 UPC Trend is Forecast to Remain Constant

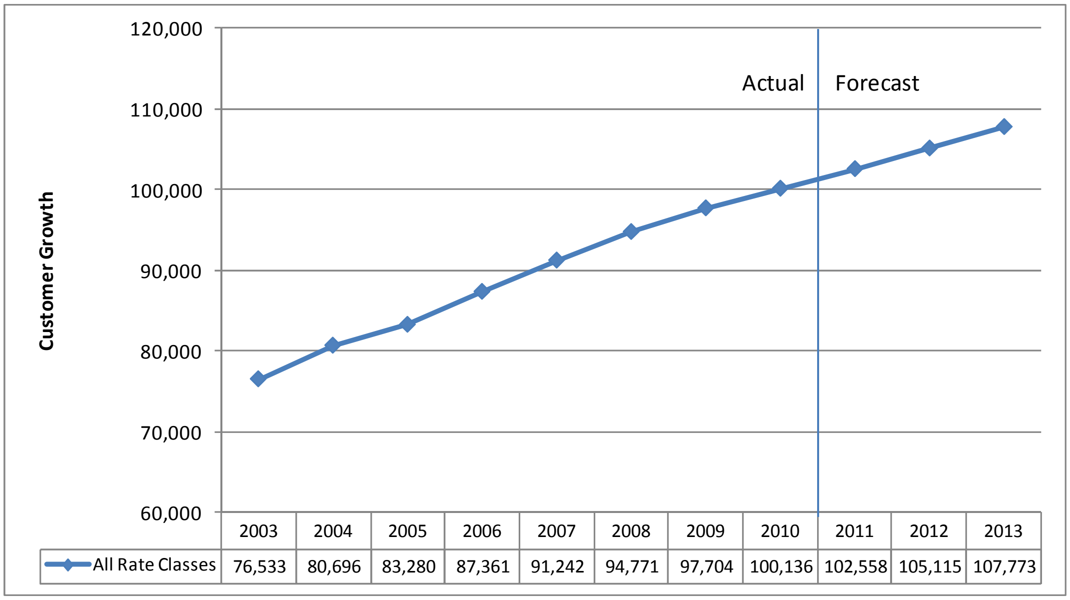
	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
LCS3	16,476	16,650	16,630	17,379	17,694	16,521	15,793	16,342	16,342	16,342	16,342

4.5.4 CUSTOMER ADDITIONS

The forecast of customer additions is the second component for determining the total energy demand. As in prior years, the forecast of customer additions is based upon the CMHC and the CBOC housing starts forecast, which is reasonable in light of the correlation between housing starts and customer additions.

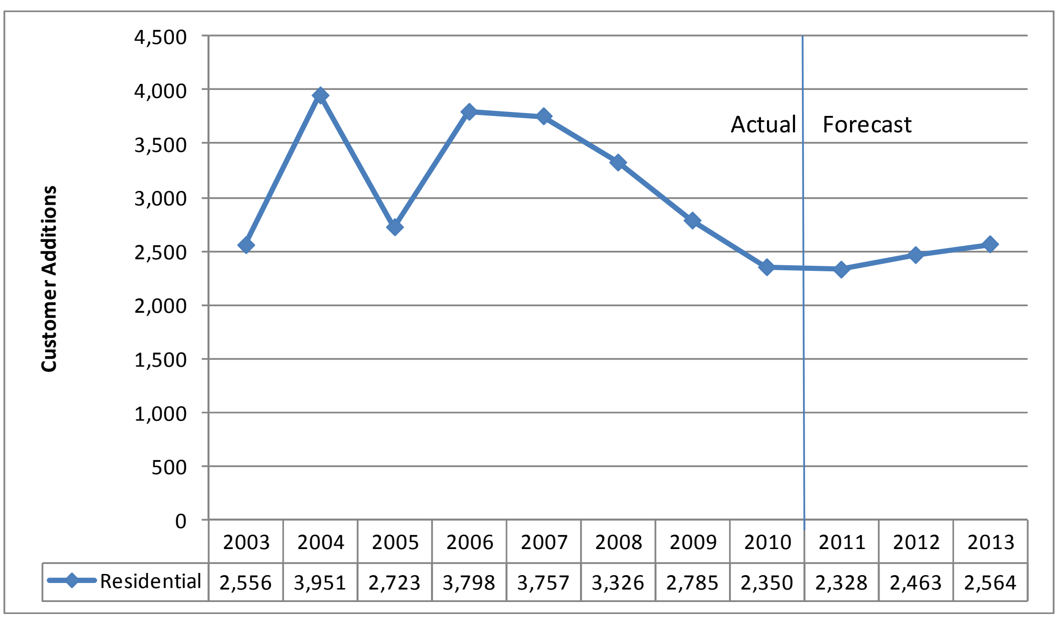
The total customer base on Vancouver Island has increased steadily from just over 76,500 customers in 2003 to in excess of 100,000 customers in 2010. As shown in the above figure the net additions each year are consistent and have averaged approximately 3,250 additions per year since 2004. Based on our account additions methodology FEVI is forecasting a net addition of approximately 2,600 customers per year in 2012 and 2013. This is illustrated in Figure 4.5-5 below.

Figure 4.5-5: Vancouver Island - Total Customer Growth for all Rate Classes Consistent with Prior Years



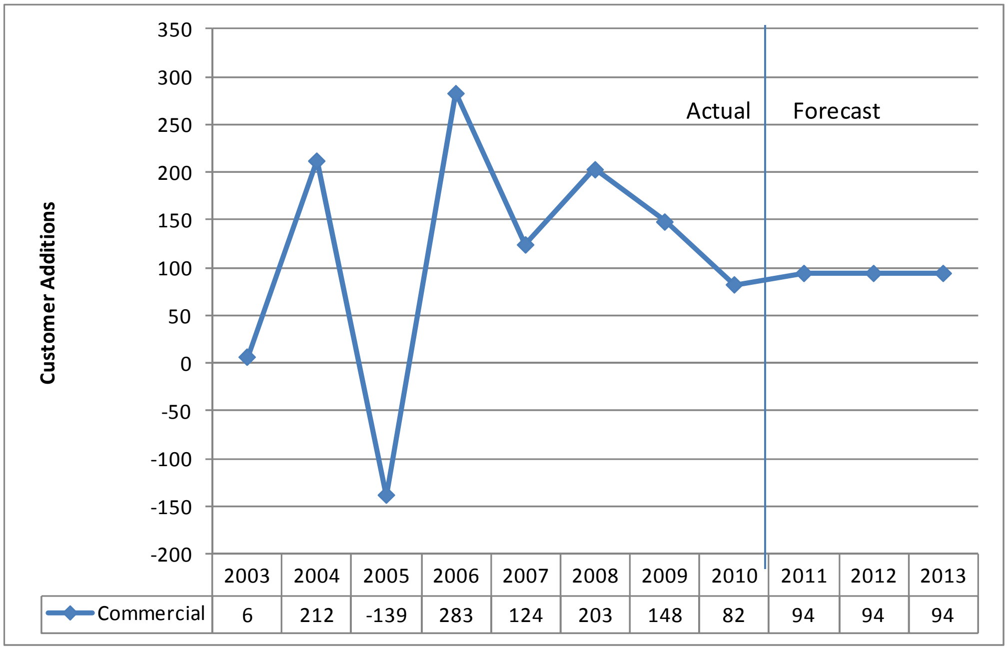
The rate of net Residential customer additions has declined in recent years due in large part to the recent recession. CMHC and CBOC are forecasting an increase in housing starts and this is reflected in our increased forecast of customer additions. This is illustrated in Figure 4.5-6 below.

Figure 4.5-6: Vancouver Island - Residential Customer Additions



The net Commercial customer additions have historically been very volatile. In 2009 and 2010 net Commercial customer additions declined but the rate of decline was not as pronounced as seen in prior years. Based on the lack of a clear trend and through internal interviews we are forecasting a modest 94 additions per year for the forecast period. This is illustrated in Figure 4.5-7 below.

Figure 4.5-7: Vancouver Island - Commercial Customer Additions

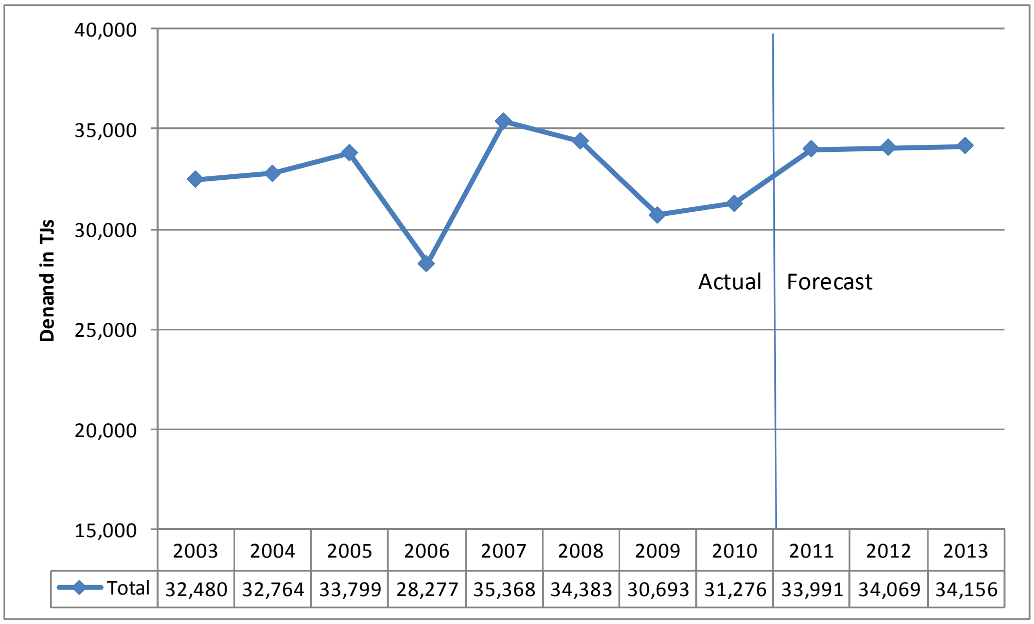


4.5.5 DEMAND FORECAST

As discussed previously, the energy demand forecast for Residential and Commercial customers is derived by applying the total forecast customers, including customer additions, to the average UPC forecast. Then, by adding the forecast energy demand for Transportation customers, based on contractual arrangements at the time of the forecast, the total energy forecast for all rate classes is developed. The total energy forecast is provided below.

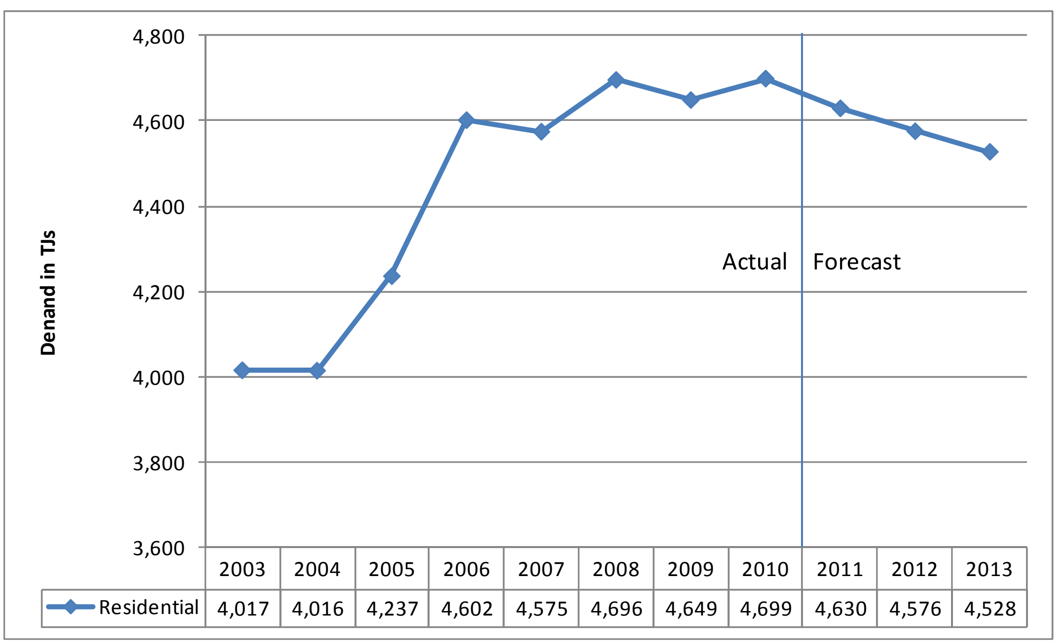
As discussed in the introduction to this section, actual 2010 Transportation demand was less than the 2011 confirmed Contract Demand volumes, resulting in the increase seen in Figure 4.5-8 below. This increase is not offset by the reduction in Residential and Commercial demand. For the forecast period the total energy demand for all customer classes is expected to remain relatively stable. The total energy forecast, for each customer class, is reasonable, based on a methodology that is consistent with prior years, and is appropriate for use in this RRA.

Figure 4.5-8: Vancouver Island – Total Energy Demand



The modest customer additions are not substantial enough to offset the declining UPC. As a result the forecast Residential demand is declining throughout the forecast period. The annual decline during the forecast period is approximately 1.2 percent per year as shown below in Figure 4.5-9.

Figure 4.5-9: Vancouver Island - Residential Demand– Customer Rate Class RGS



As shown in Figure 4.5-10 below, the Commercial demand is expected to increase as a result of the forecast increase in UPC in all Commercial rate classes except AGS.

Figure 4.5-10: Vancouver Island - Commercial Demand– All Rate Classes

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Commercial	7,294	7,212	7,416	7,341	7,491	7,345	7,175	7,051	7,066	7,198	7,333

The Transportation demand is forecast to be 22,295 TJs in 2011 and to then remain constant for the duration of the forecast period. Figure 4.5-11 below shows the actual and forecast volumes for 2003 through 2013 for the four transport customers. Two of the four customers have established demand contracts and consistent with past practices we have used their contract demand for 2011 through 2013 forecast. The forecast for British Columbia Hydro and Power Authority ("BC Hydro") is based on 45 TJ/Day for both 2012 and 2013.

Figure 4.5-11: Vancouver Island - Transportation Demand

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Transportation	21,169	21,536	22,146	16,334	23,302	22,342	18,869	19,526	22,295	22,295	22,295

4.5.6 VANCOUVER ISLAND REVENUE AND MARGIN FORECAST

4.5.6.1 Revenue

A reasonable forecast of revenues has been developed by applying the total energy forecast to the currently applicable rates for each customer class. Transportation revenues are based on the appropriate Transportation Service Agreement. Revenues are a function of both energy consumption and the rate applicable at the time the energy is consumed.

Table 4.5-1 below summarizes the revenues projected for 2011 and forecast for 2012 and 2013, based on the currently approved rates and Transportation Service Agreement's in place at the time of the forecast.

Table 4.5-1: Forecast Sales Revenue for Vancouver Island

Revenue ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Vancouver Island			
Residential[1]	77.5	77.0	76.7
Commercial[2]	95.4	97.3	99.3
Industrial[3]	20.7	20.7	20.7
Grand Total	**193.6**	**195.1**	**196.6**

Notes:
1. RGS
2. AGS, SCS-1, SCS-2, LCS-1, LCS-2, LCS-3, HLF, ILF
3. Transportation

4.5.6.2 Margin

Margins are a function of both total revenues and the cost of natural gas being provided to customers. The Company has developed a reasonable forecast of margins by first developing the forecast of revenues at existing approved rates and then subtracting from that the cost of natural gas.

Table 4.5-2 below summarizes the margin projected for 2011 and forecast for 2012 and 2013, by customer segment, at 2011 approved rates

Table 4.5-2: Forecast Gross Margin for FEVI

Margin ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Vancouver Island			
Residential[1]	51.1	48.1	47.5
Commercial[2]	55.1	51.9	52.0
Industrial[3]	20.7	20.7	20.7
Grand Total	**126.9**	**120.7**	**120.2**

Notes:

2. AGS, SCS-1, SCS-2, LCS-1, LCS-2, LCS-3, HLF, ILF
3. Transportation

4.5.7 SUMMARY

Through considering the factors influencing customer additions, average UPC, and Transportation volumes, the Company has developed a forecast of demand for natural gas. The economic turmoil and declines seen recently have subsided and housing starts are returning to traditional levels. During the forecast period an increase in Commercial demand for the forecast period is expected to offset a decline in Residential demand resulting in a slight increase of total demand. It is through considering those factors influencing natural gas consumption, applying a methodology consistent with prior years, and by using the latest and best information available that the Company believes it has developed a reasonable demand forecast that is the most appropriate to be used in this RRA.

4.6 Whistler Demand Forecast and Revenues

4.6.1 INTRODUCTION

This section describes the forecast of average UPC, customer additions and total energy demand over the forecast period for the Whistler region.

In order to forecast the Whistler total energy demand FEW considers the following:

- Average Use rates by rate class; and
- Customer Additions.

These two inputs together form the basis for the forecast model. A modest increase in customers coupled with a 2 GJ increase in Residential UPC is forecast to result in an increased Residential demand for Whistler. This increase is expected to be offset by a decrease in two of the large Commercial rate classes, resulting in an overall reduction in demand for Whistler.

This section is organized as follows:

- RSAM
    - Discusses the method by which delivery margins for residential and commercial customers are stabilized
- Residential and Commercial Use Rates
    - Discusses forecast of average use rates for each rate schedule
- Customer Additions
    - Discusses forecast of net residential and commercial customer additions
- Demand Forecast
    - Discusses total energy demand for all residential and commercial rate schedules

- Revenue and Margin Forecast

4.6.2 REVENUE STABILIZATION ADJUSTMENT MECHANISM

Whistler utilizes an RSAM which stabilizes the margins recovered from all Residential and Commercial customers.

The RSAM stabilizes delivery margin received from Residential and Commercial customer classes on a UPC basis. If customer use rates vary from the forecast levels used to set the rates, whether due to weather variances or other causes, the Company records the delivery charge differences in the RSAM deferral account for refunding or charging through a rate rider to the RSAM rate classes over the ensuing three years.

Having an RSAM mechanism does not offer Whistler protection against forecasting errors due to variances between recorded and forecast number of customers.

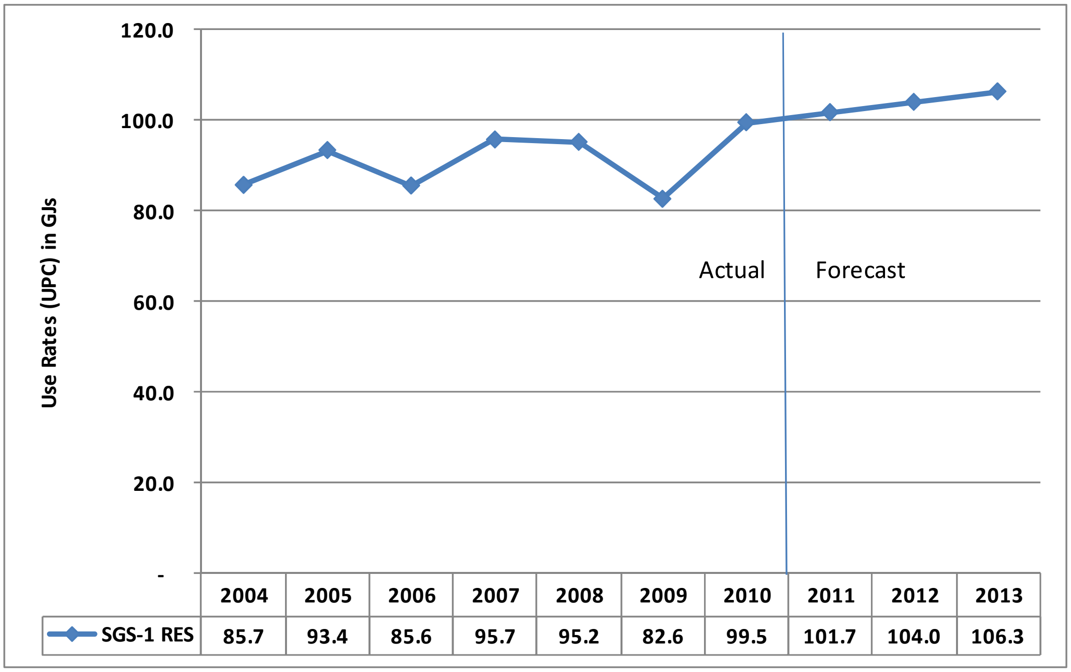
4.6.3 USE RATES

The average UPC forecast is the first component of determining the total energy demand. Individual average UPC projections are developed for each of the core market (Residential and Commercial) customer classes.

The forecast of average UPC has been developed by analyzing historical consumption. This is consistent with the approach taken in prior years, and forms an appropriate basis for the determination of total energy demand for this Application.

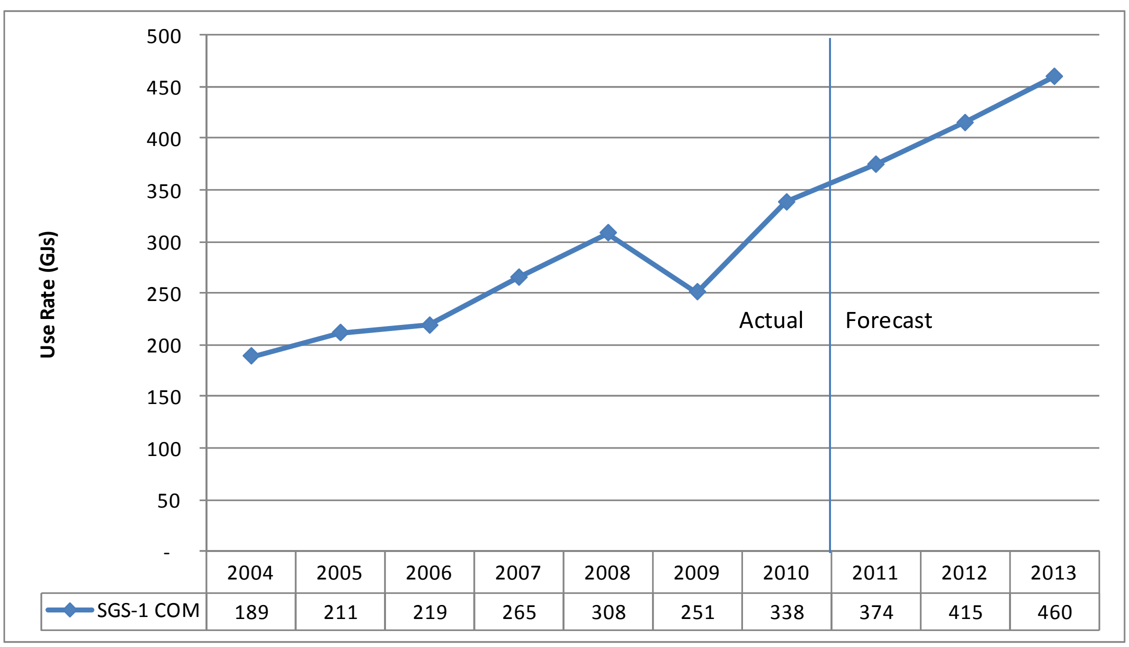
As shown below in Figure 4.6-1, Residential UPC is projected to increase approximately 2.3 percent annually during the forecast period.

Figure 4.6-1: Whistler - General Service Rate ("SGS-1") Residential UPC



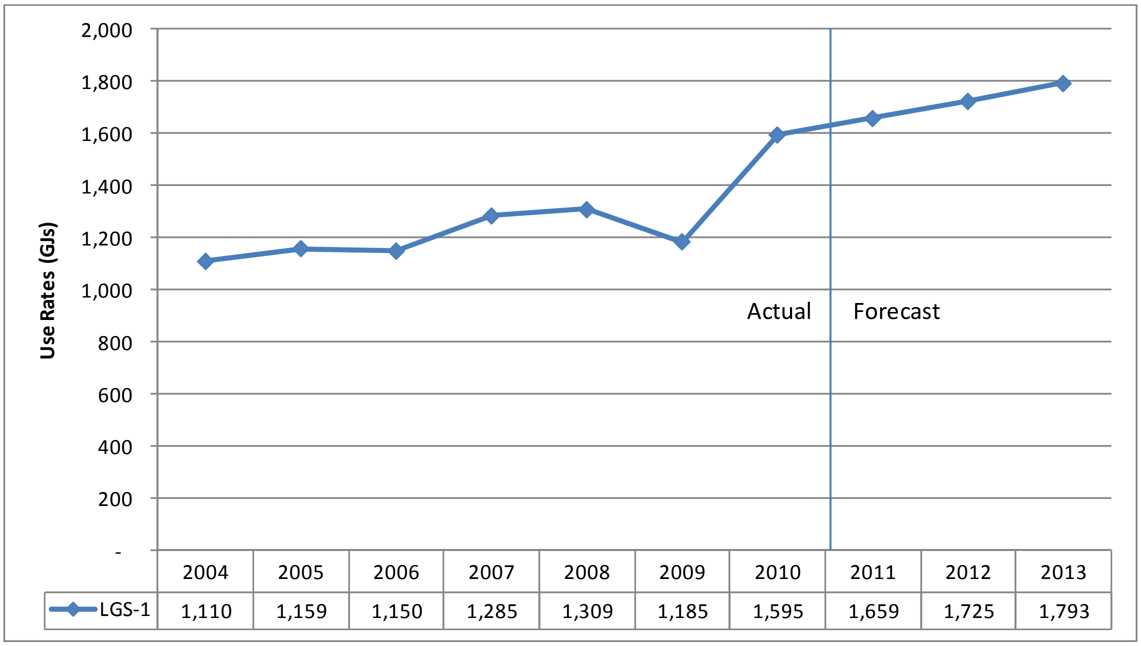
As shown in Figure 4.6-2 below, UPC for Rate Schedule SGS-1 is projected to increase by approximately 11 percent annually during the forecast period, consistent with our stated methodology and the trend observed in prior years.

Figure 4.6-2: Whistler - Rate SGS-1 Commercial UPC



As shown in Figure 4.6-3 below, UPC for the Large General Service Rate No. 1 ("LGS-1") rate class is projected to increase by approximately 4 percent annually during the forecast period consistent with prior years.

Figure 4.6-3: Whistler - Rate Large General Service Rate No. 1 Commercial UPC



As shown in Figure 4.6-4 below, UPC for the Large General Service Rate No. 2 ("LGS-2") rate class is projected to decrease by approximately 6 percent annually during the forecast period consistent with prior years.

Figure 4.6-4: Whistler - Rate Large General Service Rate No. 2 Commercial UPC

	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
LGS-2	3,126	3,430	3,204	3,214	2,874	2,454	2,803	2,647	2,500	2,362

As shown in Figure 4.6-5 below, UPC for the Large General Service Rate No. 3 ("LGS-3") rate class is projected to decrease by approximately 17 percent annually during the forecast period consistent with prior years.

Figure 4.6-5: Whistler - Rate Large General Service Rate No. 3 Commercial UPC

	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
LGS-3	13,456	12,889	13,093	11,853	10,972	9,175	8,872	7,409	6,187	5,167

The Resort Municipality of Whistler is actively working towards reducing its total emissions of greenhouse gases and although this is evidenced in the larger Commercial customer classes, the Residential and Small Commercial customer classes have moved into relatively stable ranges over the past few years.

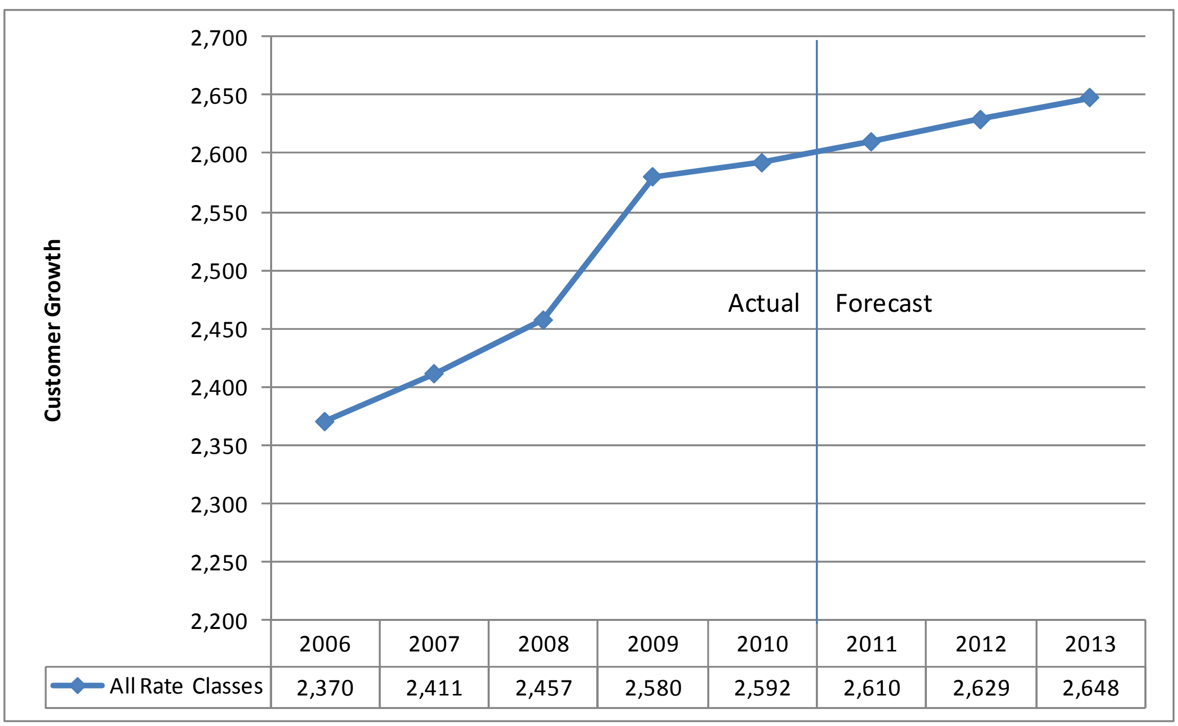
As described above, the forecast of average UPC has been developed by analyzing historical consumption and also considering other trends in the market. This is consistent with the approach taken in prior years, and forms an appropriate basis for the determination of total energy demand for this Application.

4.6.4 CUSTOMER ADDITIONS

The forecast of customer accounts is the second component of determining the total energy demand. There is a very strong correlation between the housing starts and the number of Whistler customer additions. The CMHC and the CBOC housing starts forecast provide a proxy for Whistler's customer additions. Market information, obtained through informal discussions with internal staff based in the region, is also incorporated when developing the forecast.

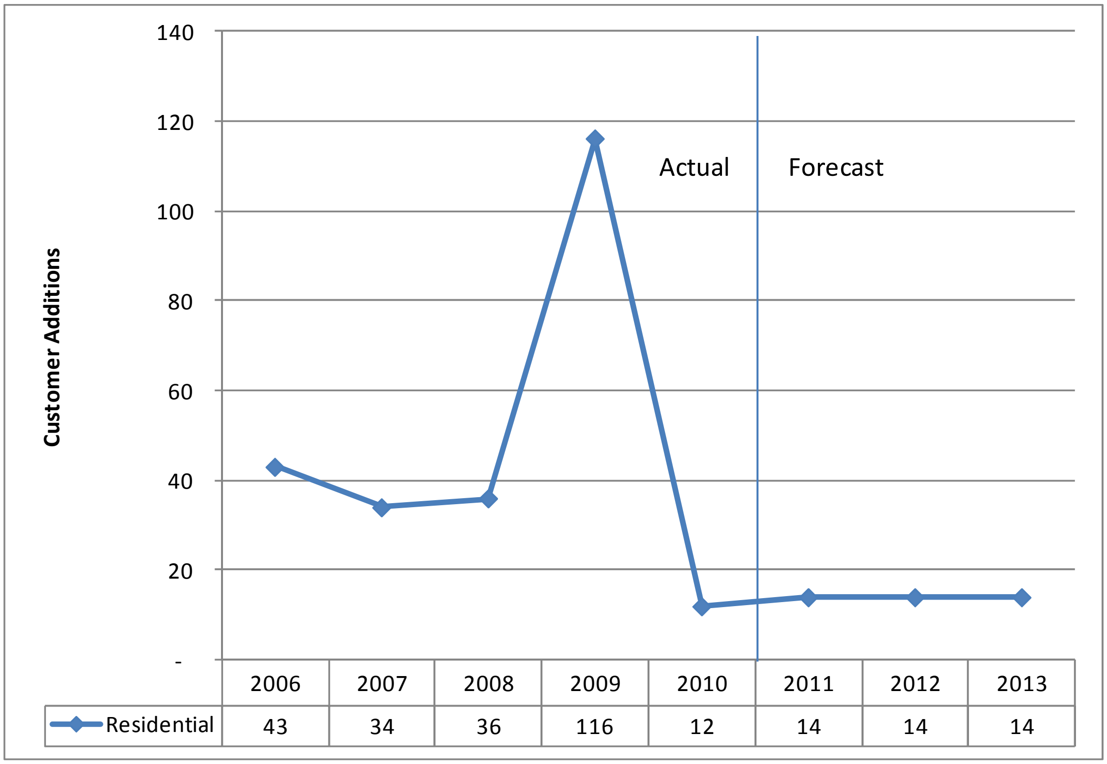
The total number of customers has continued to grow, with the majority of the growth being in the Residential segment as seen below in Figure 4.6-6. The level of growth experienced recently is forecast to continue, although at slightly lower levels.

Figure 4.6-6: Whistler - Total Customers



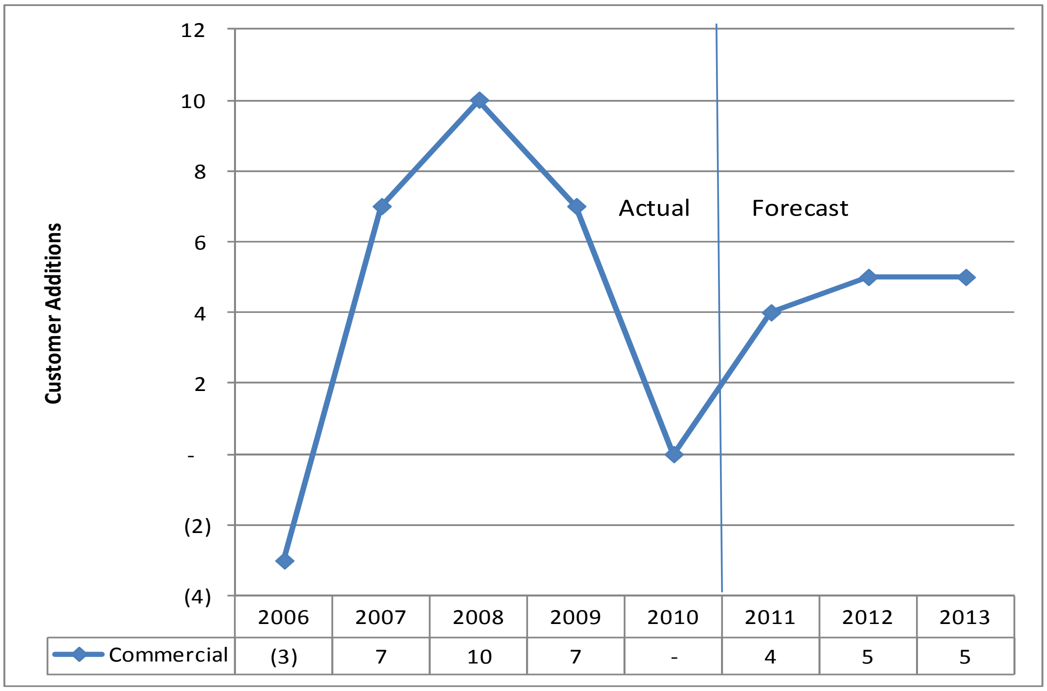
After a sharp increase prior to the 2010 Olympics Residential customers are expected to follow the CBOC trend and stabilize at 2010 level as illustrated in Figure 4.6-7 below.

Figure 4.6-7: Whistler - Residential Customer Additions



As shown in Figure 4.6-8 below, Commercial customer additions are continuing at a relatively modest pace, a result of the geographical constraints in the region and also the community's goal of managing growth in a sustainable manner.

Figure 4.6-8: Whistler - Commercial Customer Additions



The above forecast of customer additions and total number of customers incorporates the best available information, and is based on a methodology that is consistent with prior years.

4.6.5 DEMAND FORECAST

As discussed previously, the energy demand forecast for each rate classes is derived by applying the total forecast customers, including customer additions, to the average UPC forecast for each rate classes. The total forecast energy demand for Whistler is the sum of the energy demand for the rate classes.

The following Figure 4.6-9 illustrates the historical and forecast normalized energy demand over the period 2006 to 2013. In spite of an increase in Residential demand the downward trend in Large Commercial UPC results in a decrease in total demand,

Figure 4.6-9: Whistler - Total Demand

	2006	2007	2008	2009	2010	2011	2012	2013
Total Demand	734	742	711	632	765	731	716	709

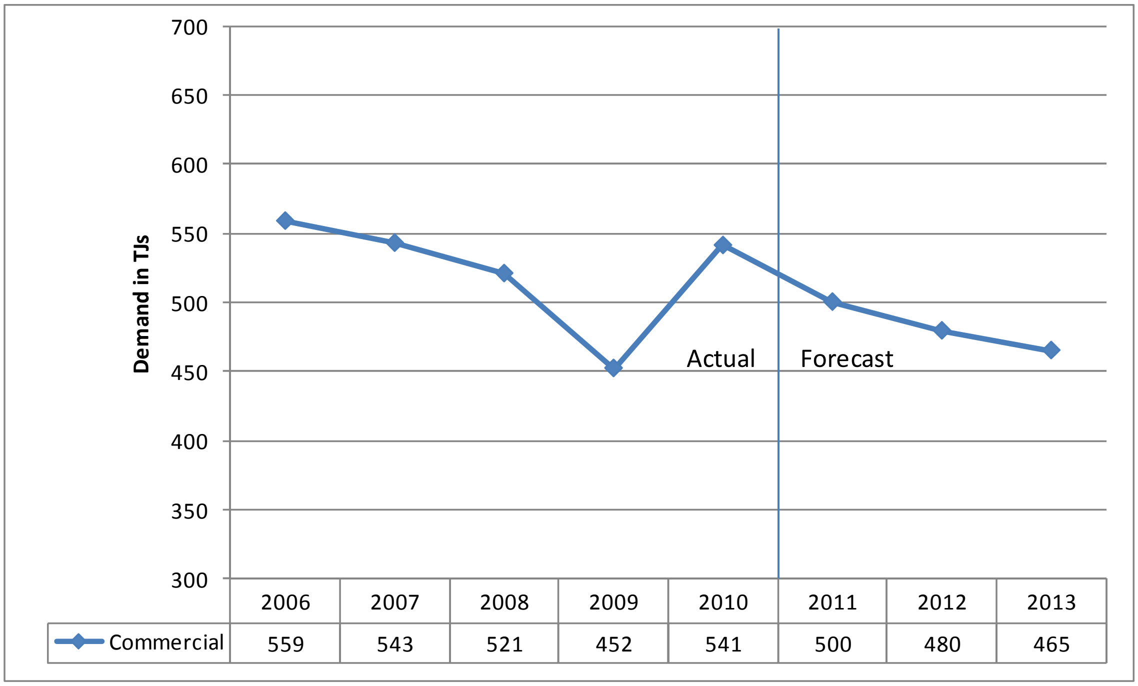
As seen in Figure 4.6-10 below, an increased UPC in SCS-1 Residential is expected to result in a slight increase in overall Residential demand.

Figure 4.6-10: Whistler - Residential Demand

	2006	2007	2008	2009	2010	2011	2012	2013
Residential	175	199	190	180	224	230	237	244

As seen in Figure 4.6-11, total Commercial demand is projected to decline at approximately 5 percent per year for the forecast period.

Figure 4.6-11: Whistler - Commercial Demand



4.6.6 REVENUE AND MARGIN FORECAST

4.6.6.1 Revenue

Revenues are a function of both energy consumption and the rate applicable at the time the energy is consumed. Whistler has developed its forecast of revenues by applying the total energy forecast to the currently approved rates for each customer segment.

Table 4.6-1 below summarizes the revenues projected for 2011 and forecast for 2012 and 2013, based on the currently approved rates in place at the time of the forecast.

Table 4.6-1: Forecast Sales Revenue for Whistler

Revenue ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Whistler			
Residential[1]	3.7	3.8	3.9
Commercial[2]	7.7	7.4	7.2
Grand Total	**11.4**	**11.2**	**11.1**

Notes:
1. SGS (Residential)
2. SGS (Commercial), LGS-1, LGS-2, LGS-3

4.6.6.2 Margin

Margins are a function of both total revenues and the cost of natural gas being provided to customers. The Company has developed a reasonable forecast of margins by first developing the forecast of revenues at existing approved rates and then subtracting from that the cost of natural gas.

Table 4.6-2 below summarizes the margin projected for 2011 and forecast for 2012 and 2013, by customer segment, at 2011 approved rates.

Table 4.6-2: Forecast Gross Margin for Whistler

Margin ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Whistler			
Residential[1]	2.6	2.7	2.8
Commercial[2]	5.3	5.0	4.9
Grand Total	**7.9**	**7.7**	**7.6**

Notes:
1. SGS (Residential)
2. SGS (Commercial), LGS-1, LGS-2, LGS-3

4.6.7 SUMMARY

Through considering the factors influencing customer additions, average UPC, and Transportation volumes, Whistler has developed a forecast of demand for natural gas. As a result, total forecast energy demand will remain relatively stable over the forecast period rather than experience the increase Whistler saw in 2010. It is through considering those factors influencing natural gas consumption, applying a methodology consistent with prior years, and by using the latest and best information available that Whistler believes it has developed a reasonable demand forecast that is the most appropriate to be used in this RRA.

4.7 Fort Nelson Demand Forecast and Revenues

4.7.1 INTRODUCTION

This section describes the forecast of average UPC, customer additions and total energy demand over the forecast period for the Fort Nelson region.

In order to forecast the Fort Nelson total energy demand Fort Nelson considers the following:

- Average Use rates by rate class;
- Customer Additions; and
- Industrial Demand.

These three inputs together form the basis for the forecast. A modest increase in Rate Schedule 2.2 UPC is forecast to offset the slight decline in Rate Schedule 1B Residential UPC, resulting in a small increase in overall demand. Industrial demand is forecast to remain flat.

This section is organized as follows:

- RSAM
    - Discusses the method by which delivery margins for residential and commercial customers are stabilized
- Residential and Commercial Use Rates
    - Discusses forecast of average use rates for each rate schedule
- Customer Additions
    - Discusses forecast of net residential and commercial customer additions
- Demand Forecast
    - Discusses total energy demand for all residential, commercial and industrial rate schedules
- Revenue and Margin Forecast

4.7.2 REVENUE STABILIZATION ADJUSTMENT MECHANISM

Fort Nelson utilizes an RSAM which stabilizes the margins recovered from Fort Nelson Residential and Commercial customers.[69]

The RSAM stabilizes delivery margin received from Residential and Commercial customer classes on a UPC basis. If customer use rates vary from the forecast levels used to set the rates, whether due to weather variances or other causes, the Company records the delivery charge differences in the RSAM deferral account for refunding or charging through a rate rider to the RSAM rate classes over the ensuing three years.

Having an RSAM mechanism does not offer Fort Nelson protection against forecasting errors due to variances between recorded and forecast number of customers nor does it mitigate any forecasting risks associated with the non-RSAM customer classes such as Industrial customers.

4.7.3 USE RATES

Individual UPC projections are developed for each rate class by considering the recent historical weather-normalized use per account.

The Rate Schedule 1 UPC is stable through the forecast period as seen in Figure 4.7-1 below.

Figure 4.7-1: Fort Nelson - Residential UPC for Rate Schedule 1B

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Rate 1	162.3	155.1	153.7	141.5	141.9	139.6	138.4	140.9	140.6	140.3	140.0

Rate Schedule 2.1 has stabilized in recent years as seen in Figure 4.7-2 below. This trend is expected to continue throughout the forecast period.

[69] Fort Nelson Rate Schedules 1, 2.1, 2.2 and 25

Figure 4.7-2: Fort Nelson - Commercial UPC for Rate Schedule 2.1

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Rate 2.1	563.6	537.3	502.1	486.5	472.0	448.9	464.0	468.1	467.2	466.2	465.2

Rate Schedule 2.2 is showing an increase in recent years as seen in Figure 4.7-3 below. The forecast for 2011 continues the trend which will result in moderate growth through the forecast period.

Figure 4.7-3: Fort Nelson - Commercial UPC for Rate Schedule 2.2

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Rate 2.2	3,404.2	3,814.7	3,634.5	3,302.8	3,083.7	3,137.1	3,370.7	3,387.5	3,496.7	3,609.4	3,725.7

4.7.4 CUSTOMER ADDITIONS

The forecast of customer accounts is the second component of determining the total energy demand. The CBOC housing starts forecast provide a proxy for Fort Nelson's customer additions. Market information, obtained through discussions with internal staff based in the region, is also incorporated when developing the forecast.

The total number of customers has continued to grow in both residential and commercial segments. The level of growth experienced recently is forecast to continue.

Figure 4.7-4: Fort Nelson - Total Customers

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
All Rate Classes	2,211	2,296	2,341	2,354	2,368	2,369	2,367	2,388	2,411	2,433	2,457

As shown in Figure 4.7-5 below the customer additions in the Fort Nelson region have been minimal since 2006. In 2010 there were 12 net additions and additions at this level are predicted for the forecast period.

Figure 4.7-5: Fort Nelson - Residential Customer Additions

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Rate 1	100	52	26	3	7	(3)	-	12	12	11	13

New construction for Small Commercial customers has been low and uncertain in Fort Nelson in recent years. There is the completion of construction of a new recreation centre in 2011, which will bring additional consumption near the latter part of 2011 and going forward into 2012. However, there are no other Small Commercial projects planned for construction in 2012 or 2013. Commercial customer additions are seen in Figure 4.7-6 below.

Figure 4.7-6: Fort Nelson - Commercial Customer Additions

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Rate 2.1	(7)	33	19	9	6	6	(2)	9	11	11	11
Rate 2.2	15	-	-	1	1	(2)	-	-	-	-	-

4.7.5 DEMAND FORECAST

As discussed previously, the energy demand forecast for each rate class is derived by applying the total forecast customers, including customer additions, to the average UPC forecast for each rate class. The total forecast energy demand for Fort Nelson is the sum of the energy for the individual rate classes. The following Figure 4.7-7 illustrates the historical and forecast normalized energy demand over the period 2003 to 2013. Fort Nelson is forecasting a slight increase in total energy demand for 2012 and 2013.

Figure 4.7-7: Fort Nelson - Total Energy Demand

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Total	973	974	951	905	816	751	621	615	624	633	642

As seen in the Figure 4.7-8 below, the modest increase in Rate Schedule 1B customers is expected to result in a slight increase in overall Residential demand.

Figure 4.7-8: Fort Nelson - Residential Energy Demand

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Rate 1	288	289	291	271	272	268	266	271	273	273	274

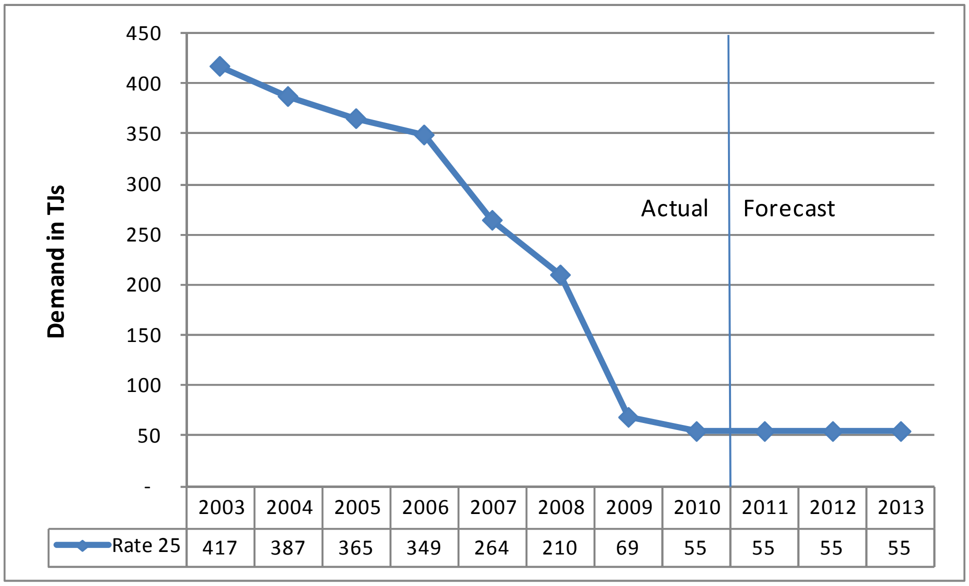
As seen in Figure 4.7-9 below, the modest increase in Rate Schedule 2.1 is the result of the increase in customers. On the other hand, the increase demand seen in Rate Schedule 2.2 is the result of a slight increase in the UPC for this rate class.

Figure 4.7-9: Fort Nelson - Commercial Energy Demand

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Rate 2.1	191	192	193	191	190	185	191	194	199	203	208
Rate 2.2	77	107	102	95	90	88	94	95	98	101	104

Canfor remains the only Industrial customer served under Rate Schedule 25 in the Fort Nelson region. The continuing downturn in the U.S. housing markets has caused difficulties within the forestry industry. The closure in 2008 of Canfor's two facilities in Fort Nelson resulted in these two plants maintaining only heat load consumption. Although there aren't any operating mills in Fort Nelson their heating load consumption can fluctuate from year to year. The Industrial Energy Demand is seen in Figure 4.7-10 below.

Figure 4.7-10: Fort Nelson - Industrial Energy Demand



4.7.6 FORT NELSON REVENUE AND MARGIN FORECAST

4.7.6.1 Revenue

Revenues are a function of both energy consumption and the rate applicable at the time the energy is consumed. Fort Nelson has developed its forecast of revenues by applying the total energy forecast to the currently approved rates for each customer segment.

Table 4.7-1 below summarizes the revenues projected for 2011 and forecast for 2012 and 2013, based on the currently approved rates in place at the time of the forecast.

Table 4.7-1: Forecast Sales Revenue for Fort Nelson

Revenue ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Fort Nelson			
Residential[1]	2.1	2.1	2.2
Commercial[2]	2.4	2.5	2.5
Industrial[3]	0.1	0.1	0.1
Grand Total	**4.7**	**4.8**	**4.8**

Notes:
1. Rate Schedule 1
2. Rate Schedules 2.1, 2.2
3. Rate Schedule 25

4.7.6.2 Margin

Margins are a function of both total revenues and the cost of natural gas being provided to customers. The Company has developed a reasonable forecast of margins by first developing the forecast of revenues at existing approved rates and then subtracting from that the cost of natural gas.

Table 4.7-2 below summarizes the margin projected for 2011 and forecast for 2012 and 2013, by customer segment, at 2011 approved rates

Table 4.7-2: Forecast Gross Margin for Fort Nelson

Margin ($ millions)	Projected 2011	Forecast 2012	Forecast 2013
Fort Nelson			
Residential[1]	0.8	0.8	0.8
Commercial[2]	0.9	1.0	1.0
Industrial[3]	0.1	0.1	0.1
Grand Total	**1.8**	**1.9**	**1.9**

Notes:
1. Rate Schedule 1
2. Rate Schedules 2.1, 2.2
3. Rate Schedule 25

4.7.7 SUMMARY

Fort Nelson developed the forecast demand for natural gas with reference to the factors influencing customer additions and average UPC. It is through considering factors influencing natural gas consumption, applying a methodology consistent with prior years, and by using the latest and best information available that Fort Nelson believes it has developed a reasonable demand forecast that is the most appropriate to be used in this RRA

4.8 Conclusion to Demand Forecast and Revenues

Through considering the factors influencing customer additions, average use per customer, and also industrial volumes the Company has developed a demand for natural gas.

- In the Mainland region the overall growth in Residential customers has not offset the decline in average Residential UPC, which has resulted in a decline in overall Residential energy demand. However, increased UPC in selected Commercial and Industrial rate classes is expected to offset this decline in Residential demand resulting in the overall slight increase in total demand for 2012 and 2013.

- On Vancouver Island in 2011 an increase in the confirmed contract demand compared to 2010 actuals will not be offset by the reduction in residential and commercial demand. For the remainder of the forecast period the total energy demand for all customer classes is expected to remain relatively stable.

- A modest increase in customers coupled with a 2 GJ increase in Residential UPC is forecast to result in an increased Residential demand for Whistler. This increase is expected to be offset by a decrease in two of the large Commercial rate classes, resulting in an overall reduction in demand for Whistler.

- A modest increase in Rate Schedule 2.2 UPC is forecast to offset the slight decline in Rate Schedule 1B Residential UPC, resulting in a small increase in overall demand. Industrial demand is forecast to remain flat in the Fort Nelson region.

The forecast of demand for natural gas included in the RRA is based upon a methodology that is consistent with that used in prior years and fairly represents the expected customer additions and average UPC for 2012 and 2013. This forecast of demand for natural gas is appropriate to be used in the determination of rates for the 2012 and 2013 forecast period.

5 COST OF SERVICE

5.1 Introduction to Cost of Service

FEU's revenue requirements are composed of the changes in revenue at existing rates (Section 4) and the cost of service.

Of these two components, changes in the cost of service have the biggest impact on the revenue requirement. Section 5 describes all of the components of the cost of service, and the changes in the forecast components for 2012 and 2013.

The cost of service is composed of:

1. Cost of gas (Section 5.2)
2. Operations and maintenance expenses (Section 5.3)
3. Depreciation and amortization expense (Section 5.4)
4. Other revenue (Section 5.5)
5. Taxes (Section 5.6)
6. Financing Costs and ROE (Section 5.7)

In turn, the depreciation and amortization and financing costs and ROE sections are dependent on the rate base forecasts included in Section 6.

Each of the following sections describes how the components have been calculated. The forecasts included in the following sections appropriately reflect the reasonable costs required for FEU to continue to meet the needs of our customers and the communities in which we serve.

5.2 Cost of Gas

5.2.1 INTRODUCTION TO COST OF GAS

This section of the Application describes the cost of gas, where the term "gas" refers to natural gas, propane, and biomethane, for the FEU. Biomethane makes up a very small component of the FEU gas supply portfolio and the biomethane costs are discussed in Appendix J. The total cost of gas is forecast to be approximately $740.1 million in 2012 and $741.4 million in 2013. Effectively managing these costs is essential to providing reliable and cost effective service to customers.

Table 5.2-1: Cost of Gas Forecasts[70]

($ thousands)

Utility/Region	Forecast 2012	Forecast 2013
Mainland	$659,338	$658,568
Vancouver Island	74,337	76,399
Whistler	3,493	3,455
Fort Nelson	2,900	2,945
Total	**$740,068**	**$741,367**

5.2.2 MANAGING GAS COSTS TO ENSURE RELIABLE, COST EFFECTIVE SUPPLY

The total cost of gas is comprised of the forecast natural gas and propane commodity costs, and the forecast costs for midstream components (storage and transportation). The gas costs for Mainland, Whistler, Fort Nelson, and Revelstoke sales rate customers are reviewed and approved in separate applications by the Commission and FEI (including Fort Nelson and Revelstoke) and FEW are not requesting approval of those forecast gas costs as part of this Application. These forecast gas costs are, however, required to determine a number of revenue requirement line items that form part of this Application.

Unlike FEI and FEW, FEVI is requesting approval of its forecast cost of gas, as described in Section 5.2.3.2, in order to determine the approved cost of gas, as variances between the approved and incurred cost of gas are recorded in the Gas Cost Variance Account, which is further described in Section 6.3. The FEVI forecast gas costs are also required to determine a number of revenue requirement line items that form part of this Application.

5.2.2.1 Gas Supply Management

Gas Supply is the area within the Energy Supply and Resource Planning department that manages the Companies' natural gas and propane supply functions. The department ensures that there are reliable, secure and cost effective supplies of natural gas and propane for Mainland, Vancouver Island, Whistler, Fort Nelson, and Revelstoke customers. The gas supply function encompasses most elements of the merchant role, providing supply to firm and interruptible customers. The cost to complete these management activities is included in Core Market Administration Expense ("CMAE") and forms part of the cost of gas. CMAE is discussed in more detail later in this section.

The key objectives relating to the management of natural gas and propane supply include:

- providing natural gas and propane supply to customers;

[70] Section 7.1 to 7.4, Schedule 13

- optimizing resources to minimize the overall supply portfolio costs for the benefit of customers;
- managing market price risk to reduce volatility on resulting rates for customers; and
- providing Energy Management Services to create value for customers through revenue generation.

The development and implementation of the Annual Contracting Plans and Price Risk Management Plans play a critical role in managing these objectives. Although separate applications are filed with the Commission for approval of these plans, it is helpful to understand their role in how gas costs are managed.

The Annual Contracting Plans outline the portfolio requirements to meet the needs of core customers[71] under design day conditions through contracting for an optimal and diversified mix of commodity, storage, and transportation resources. The plans outline procurement requirements in detail and address longer term gas supply and infrastructure issues, particularly those within the BC marketplace and the Pacific Northwest region.

The Price Risk Management Plans satisfy the primary objectives of reducing market price volatility and resultant rate volatility for customers. Price Risk Management Plans further serve to improve the likelihood of gas remaining competitive with other sources of energy in order to retain and attract customers.

Other key department functions include: providing intra-day balancing supply (required primarily due to weather changes) for core customers; facilitating all gas scheduling and nominations on the Companies owned and third party pipeline transmission systems; performing mitigation activity based on buying and selling around excess resources; and the management of relationships with financial and physical supply counterparties, storage operators and pipeline companies.

The Gas Supply department also provides Energy Management Services for other natural gas and propane utilities, currently this is done for Pacific Northern Gas Ltd. (“PNG”) and Northwest Natural Gas Company (“NWN”).

5.2.3 COST OF GAS BY SERVICE AREA

With the exception of the Vancouver Island service area, the gas cost recovery rates are subject to quarterly review and resetting, as necessary. The sections below provide details for the FEU service areas.

[71] Core customers are those for whom FEU is obligated to ensure the purchase, transportation, and uninterrupted delivery of natural gas to their premises.

5.2.3.1 Mainland and Whistler Cost of Gas

For the 2012 and 2013 forecast period, the total cost of gas sold is comprised of the commodity and the midstream components and it is determined by multiplying forecast sales volumes by the approved forecast unit gas cost recovery charges for each rate schedule. The commodity cost recovery charge for the natural gas sales rate customers is subject to quarterly review by the Commission, and FEI and FEW are not requesting approval of forecast gas costs with this Application; however, forecast gas costs are required in the determination of a number of revenue requirement line items.

The currently approved gas cost recovery charges were set with the 2011 First Quarter Gas Cost reports that were filed on March 3, 2011. The gas cost recovery rates for the Mainland and Whistler customers effective April 1, 2011 remained unchanged from the January 1, 2011 rates, as accepted by Commission Letters No. L-13-11 and No. L-12-11,respectively.

5.2.3.2 Vancouver Island Cost of Gas

The forecast gas costs included in the Application for the 2012 and 2013 test year periods are based on the NYMEX natural gas futures five-day average forward prices at February 15, 16, 17, 18, and 22, 2011 (the "February 22, 2011 Five-Day Average Forward Prices"). The February 22, 2011 Five-Day Average Forward Prices align with the commodity forward prices used in the FEVI 2011 First Quarter Report on the Gas Cost Variance Account and the Rate Stabilization Deferral Account, submitted to the Commission on March 4, 2011.

Vancouver Island's cost of gas reflects the costs related to commodity, transportation, and storage resources and the impacts of the hedging program. The cost of gas also includes unaccounted for gas, company use gas, carbon tax and CMAE costs as discussed within this section.

The Royalty Rebate arrangement under which Vancouver Island has received royalty revenues from the Province expires on December 31, 2011, therefore the 2012 and 2013 forecast cost of gas does not include any forecast royalty revenues. The projected cost of gas for 2011, excluding royalty revenues, and the forecast cost of gas for 2012 and 2013 are shown in Table 5.2-2 below.

Table 5.2-2: Vancouver Island 2011-2013 Cost of Gas Excluding Royalty Revenues and GCVA Impacts

	Amounts in $ Thousands		
	2011 Projected	**2012 Forecast**	**2013 Forecast**
Commodity	$ 38,841	$ 46,828	$ 51,919
Transportation Demand Charges	7,451	8,173	7,584
Storage Demand Charges	3,457	3,499	3,432
Hedging Cost / (Gain)	16,394	15,174	12,786
Gas Supply Management Costs	630	663	678
Total Cost of Gas	$ 66,773	$ 74,337	$ 76,399

With this Application, FEVI seeks approval of the 2012 and 2013 cost of gas. Variances between the actual incurred cost of gas and the approved forecast cost of gas for the two-year period of the 2012-2013 revenue requirements will be captured in the GCVA for amortization through future rates.

5.2.3.3 Fort Nelson Cost of Gas

For the 2012 and 2013 forecast period, the forecast cost of gas sold is determined by multiplying forecast sales volumes by the approved gas cost recovery charge for each rate schedule. The gas cost recovery charges for the sales rate customers are subject to quarterly review by the Commission, and Fort Nelson is not requesting approval of forecast gas costs with this Application. Forecast gas costs are, however, required in the determination of a number of revenue requirement line items.

The currently approved gas cost recovery charge was set with the 2011 First Quarter Gas Cost report that was filed on March 3, 2011. The gas cost recovery rates for Fort Nelson customers effective at April 1, 2011 remained unchanged from January 1, 2011 rates, as accepted by Commission Letter No. L-16-11.

5.2.3.4 Revelstoke Cost of Gas

For the 2012 and 2013 forecast period, the forecast cost of gas sold is determined by multiplying forecast sales volumes by the approved gas cost recovery charge for each rate schedule. The approved propane reference price, and corresponding gas cost recovery charges, for the sales rate customers are subject to quarterly review by the Commission, and Revelstoke is not requesting approval of forecast gas costs with this Application. Forecast gas costs are, however, required in the determination of a number of revenue requirement line items.

The currently approved gas cost recovery charge was set with the 2011 First Quarter Gas Cost report that was filed on March 3, 2011. The gas cost recovery rates for Revelstoke customers effective April 1, 2011 remained unchanged from January 1, 2011 rates, as accepted by Commission Letter No. L-15-11.

5.2.4 OTHER COMPONENTS OF THE COST OF GAS

Aside from the cost of the natural gas commodity and midstream resources, a number of other components are managed by FEU and form part of the cost of gas.

5.2.4.1 Unaccounted for Gas ("UAF")

UAF refers to gas that is not specifically accounted for in gas energy balance of receipts, deliveries, and operations use. UAF includes measurement variances and line loss of gas that is flowing in the transmission and distribution systems. Consistent with past practice, the UAF percentages are calculated based on the average historical recorded UAF percentages. The cost of UAF related to the Sales rate classes is included in the cost of gas and recovered from core customers via the gas cost rates; whereas the cost of UAF related to the Transportation Service rate classes is included in the determination of the delivery rates.

5.2.4.2 Company Use Gas ("Own Use Fuel")

FEU company gas use, or own use fuel, is required to deliver natural gas to customers in a safe and efficient manner and represents a significant cost for the Operations and Facilities business areas. Company use gas is consumed as distribution line heater fuel, transmission compressor fuel and LNG plant fuel, as well as gas used in the Companies' facilities and offices. In its letter to the Commission dated April 15, 2011, FEI has requested approval for the use of a hedge based on the Sumas price and the forecast volumes, and for continuation of the practice of accounting for volume variances within the MCRA, for Mainland company use gas for 2012 and 2013. This request is consistent with the treatment of own use gas in 2010 and 2011. At the time of preparing this Application, the Company has not yet received approval for the recommended hedging and treatment of volume variances sought. However, when approval is received, a hedge will be entered into based on the forecast volumes for 2012 and 2013.

The Vancouver Island system requires company use gas to fuel line heaters and compressors in order to move gas supply to customers. A higher proportion of company use gas is required for Vancouver Island compressors for its daily operations, as compared to the Mainland system, primarily due to its relatively higher pressure transmission system. Company use gas consumed by Vancouver Island is included in the cost of gas, consistent with past practice, except for company use gas that is used in facilities. This facilities cost is included in O&M.

5.2.4.3 Gas Control Services

The Vancouver Island cost of gas includes a charge related to services provided by the Gas Control group in the Energy Supply & Resource Development department for monitoring and operating the Vancouver Island transmission system. The costs are related to labour expenses and the SCADA system used to monitor the flows and conditions on the Vancouver Island transmission system. The forecast amounts for 2012 and 2013 are approximately $220 thousand per year, increased by an inflation factor over time. These costs are included in the cost of gas for Vancouver Island. For the Mainland, the cost of Gas Control is included in O&M. Differences in the treatment of some of the gas supply related costs between the various FEU entities are a result of the historical separate rate design processes for each entity, and is one of the items that will be included in the upcoming Rate Design Application.

5.2.4.4 Core Market Administration Expense

CMAE costs are a direct result of the management activities performed within the Gas Supply area to serve core market customers and are treated as a flow-through cost to core market customers as part of gas costs. Providing safe, reliable, and cost effective gas supply resources that are required to meet core customers' load demands is the central purpose of CMAE activities. These CMAE activities have been provided on the basis of a single administrative function since 2004 and are allocated between the gas supply portfolios for the Mainland, including Whistler, and Vancouver Island based on customer count. Further, the CMAE costs for the Mainland, including Whistler, are allocated between the CCRA and MCRA accounts based on the activities performed by employees in the Gas Supply area, with 30 percent allocated to the CCRA and 70 percent allocated to the MCRA.

CMAE BUDGET REQUIREMENTS

For the purposes of this Application, CMAE costs are presented on a consolidated basis. The CMAE forecast costs will continue to be allocated to the Mainland and Vancouver Island based on using customer count as the allocation methodology. For 2012 and 2013 this equates to 90 percent for the Mainland (including Whistler) and 10 percent to Vancouver Island, which is the same allocation used for 2010 and 2011. Historical and forecast consolidated CMAE annual expenditures are shown below (with the projection for 2011).

Table 5.2-3: CMAE Forecast

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 3,610	$ 3,309	$ 3,732	$ 3,732	$ 3,982	$ 4,112
Vancouver Island	$ 401	$ 368	$ 415	$ 415	$ 442	$ 457
Total	$ 4,011	$ 3,677	$ 4,147	$ 4,147	$ 4,424	$ 4,569

Expenditures in 2010 were $334 thousand lower than approved. The decrease in actual expenditures was caused by several vacant positions that were not filled until later in the year and because legal fees were lower than expected for work assisting with the intervention and review of third party pipeline transportation toll and tariff applications. The reductions in CMAE expenditures in 2010 are considered one-time savings only and flowed to customers as a direct savings as part of the cost of gas. Expenditures in 2011 reflect the amount approved in the RRA for 2010 and 2011 and are not projected to vary materially.

For 2012, expenditures are forecast to increase by $277 thousand and in 2013 by an additional $145 thousand. The increase in expenditures forecast for 2012 is caused by the need for an additional employee required to assist in the completion of Gas Supply activities, by labour and materials inflation, and the need to support several enhancements to the information systems used by Gas Supply. The increase in expenditures forecast for 2013 is caused by labour and materials inflation.

The following table shows the historical, projected, and forecast for 2012 and 2013 headcount (expressed as full time equivalents) required by Gas Supply to complete CMAE responsibilities.

Table 5.2-4: CMAE Historical and Forecast Employees

Total FTEs						
	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
CMAE	21	20	21	22	22	22

The total number of employees required to meet CMAE's responsibilities is not expected to change in 2012 or 2013 from the number projected for 2011. One employee is expected to be added in 2011 and is required to assist in the completion of Gas Supply activities.

5.2.5 CONCLUSION

The cost of gas includes the forecast natural gas and propane costs, the midstream related costs, and the costs associated with providing natural gas and propane supply services. Natural gas and propane resources are contracted by the Gas Supply department to meet the objectives of safe, reliable and cost effective supply for core customers.

Having effective natural gas and propane supply management is necessary to help ensure reliable, secure, and cost effective supplies of natural gas and propane to customers. The costs related to the Gas Supply function are reflected in the CMAE budget and included in the cost of gas flowed through to customers via rates. The Companies believe the costs presented in this Application are prudent and necessary to ensure safe and reliable gas service for customers.

5.3 Operations and Maintenance Expense

5.3.1 INTRODUCTION TO OPERATIONS AND MAINTENANCE EXPENSE

The FortisBC Energy Utilities' O&M expenditures are required to operate the system and provide administrative support to the business. The 2012 and 2013 O&M expense forecasts have been developed in support of the Companies' business priorities and objectives, ensuring that O&M funding is appropriate and prioritized to meet the current and longer-term needs of customers. Key priorities and focus for the utilities in the near future include customer service repatriation, public and employee safety, customer satisfaction, financial management, environmental responsibility and system sustainment, and the demographic challenges we face with our aging workforce.

To plan for allocation of financial resources, FEU reviews, updates and approves its O&M budgets annually, as described in Section 3.1.4. Forecast O&M expenditures by departments are developed on a trended and zero-based approach where appropriate. Departments review their existing O&M budgets and identify savings and/or incremental funding requests with supporting justification provided. Budgeting using this comprehensive approach helps to ensure an appropriate allocation of resources amongst the various departments.

For historical information for each of the Companies please refer to Appendix D.

O&M costs are budgeted for each of FEU's departments. These departments are:

- Operations (Distribution & Transmission) - manages the distribution and transmission assets and operates the gas system safely, reliably and in a cost effective manner.
- Energy Supply & Resource Development - manages the supply of natural gas and propane to customers, as well as managing energy resource planning, strategic project development, and major capacity initiatives.
- Customer Service – manages the interactions and relationships with customers.
- Energy Solutions & External Relations – manages external relations with communities, government bodies, and aboriginal and first nations groups, manages all internal and external communications including media and public relations, manages all support materials and publications, and plans and implements energy efficiency and conservation programs and new service offerings.
- Information Technology – manages all of the technology requirements in support of the business.
- Operations Engineering – manages the technical compliance with codes, standards and regulations.

- Operations Support – manages procurement, supply chain management, meter and measurement services, and communication and instrumentation systems.
- Facilities – manages all non-gas assets including buildings, property, security, space and furniture requirements as well as centralized office services.
- Human Resources – manages the overall workforce strategy, employee services, labour relations, compensation and benefits, recruiting, and employee development.
- Finance & Regulatory Affairs – manages the financial and regulatory reporting requirements.
- Corporate – provides overall management and leadership.

The table below shows the O&M (before capitalized overheads) for the years 2010 through 2013. O&M increases in the test period are 4.8 percent for each of 2012 and 2013.

Table 5.3-1: O&M Funding Reflects Our Continued Commitment to Safety and Integrity

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 206,464	$ 206,519	$ 214,680	$ 214,680	$ 224,119	$ 236,471
Vancouver Island	$ 31,229	$ 29,852	$ 32,702	$ 32,702	$ 35,236	$ 35,482
Whistler	$ 849	$ 773	$ 868	$ 868	$ 906	$ 915
Fort Nelson	$ 814	$ 794	$ 812	$ 812	$ 865	$ 897
Total	$ 239,356	$ 237,938	$ 249,063	$ 249,063	$ 261,127	$ 273,765

For 2012 and 2013, the O&M expenditure changes can be divided into five categories or cost drivers: labour inflation and benefits, codes and regulations, customer and stakeholder expectations, demographics, and a continued focus on service standards and reliability.

The following section will describe the five O&M cost drivers. Summary tables showing the incremental spending by cost driver for each of the departments for 2012 and 2013 is provided in Section 5.3.3. An overview of the changes in staffing levels is provided in Section 5.3.4. A description of changes on a department by department basis is provided in Sections 5.3.5 through 5.3.16. Capitalized overhead and corporate and shared services will also be discussed in Sections 5.3.17 and 5.3.18, respectively.

5.3.2 COST DRIVERS

5.3.2.1 Overview of Cost Drivers

O&M expenditures are influenced by a number of drivers with cost pressures coming from different sources including non-discretionary increases for inflation on internal labour and benefits, contracts and materials, increases in operating activities, and new business drivers and safety requirements. In particular, incremental funding requests are driven by five requirements – labour inflation and benefits, codes and regulations, customer and stakeholder expectations, demographics, and a continued focus on service standards and reliability. Each of these cost drivers is described in further detail in Sections 5.3.2.2 through 5.3.2.6 below.

Offsetting these incremental funding requests in 2012, the Companies are forecasting savings as compared to 2011 from the implementation of the HST and have included this reduction in O&M as a separate column in Tables 5.3-6, 5.3.8, 5.3.10 and 5.3.12 showing the changes from 2011 Approved to 2012 Forecast. This reduction amounts to $645 thousand[72] for the Mainland, $85 thousand for Vancouver Island, and $1 thousand for Whistler. A discussion of the ongoing uncertainty around the HST is included in Section 5.6 Taxes.

5.3.2.2 Labour Inflation and Benefits

Labour and benefit inflation are primarily non-discretionary costs required to fund expected wage and benefit increases for our employees. The total incremental funding in this category is summarized in the tables in Section 5.3.3. In all departments, the labour inflation and benefit loadings have been applied to the existing labour dollars from the prior year. Since this has been a consistent practice across all departments, the labour inflation category is not specifically addressed in each departmental discussion, but is instead included here as applicable to all departments.

In a labour market with increasing demographic challenges in certain areas, FEU must continually monitor and assess its Total Rewards[73] framework to ensure we remain competitive with respect to other employers, particularly utilities and others in the energy industry, that have a competing need for similar skill sets. The challenge is to find a balance where we are able to attract and retain talented people for key positions, while guarding against paying above market rates for other positions. FEU has defined a compensation philosophy of establishing our total

[72] The report "Terasen Utilities 2010-2011 Revenue Requirements – Impacts from Harmonized Sales Tax" showed $755 thousand for the Mainland area. The difference is $110 thousand related to the vehicle lease which is not included in O&M in this RRA.

[73] Total Rewards refers to all of the tools available to an employer that may be used to attract, motivate and retain employees. Total Rewards includes everything the employee perceives to be of value resulting from the employment relationship and may include:
Pay: Base Pay, Variable Pay, Long-term incentives;
Benefits: Health Care, Pension, Savings Plan, Time Off;
Learning & Development: Training, Career Development, Performance Management, Tuition Support;
Work Environment: Leadership, Values, Work/Life Balance, Organizational Climate, Community Involvement

cash compensation at the median of our defined peer group. Our total compensation core guiding principle is to deliver a total compensation program that includes employee understanding, administrative ease and cost controls that drive a perceived value which exceeds program costs. Paying competitive rates will allow FEU to attract the appropriate talent and help to retain employee knowledge in key areas of the Companies that are critical to the future success of the business. FEU needs to ensure that the Total Rewards cater to a diverse population and respond to the broad needs of a diverse workforce while retaining, attracting and motivating the talented individuals that FEU needs in order to continue to meet business goals and deliver service to our customers. The compensation philosophy of the FEU is discussed in Section 3.1.3.

The forecast O&M labour inflation and benefit increases for 2012 and 2013 are shown in the following table.

Table 5.3-2: O&M Labour and Benefit Increases for 2012 and 2013[74]

($ thousands)	2012			2013		
Utility/Region	**Labour Inflation**	**Benefits**	**Total for 2012**	**Labour Inflation**	**Benefits**	**Total for 2013**
Mainland *	2,160	(127)	2,033	2,507	1,266	3,774
Vancouver Island	152	(649)	(497)	140	4	144
Whistler	17	4	21	4	3	6
Total	**2,329**	**(772)**	**1,557**	**2,651**	**1,273**	**3,924**

* Fort Nelson - Labour Inflation and Benefits is included in Mainland and allocated and allocated to Fort Nelson

[redacted]

Redacted from Public Version

[74] The in-sourcing of the Customer Service department results in roughly 300 incremental employees. For this new employee group, 2012 is considered to be the base year, so that no incremental labour inflation or benefits are displayed for this department in that year in this table. Labour Inflation and benefit increases for the Customer Service group in the amount of $0.6 million is included in 2013.

Redacted from Public Version

BENEFITS

For budgeting purposes, employee benefit costs are calculated and expressed as a percentage of total available employee labour dollars for determination of labour charge-out rates. In this fashion, increases in labour and benefits are allocated between O&M and capital, based on the chargeable hours forecast against O&M and capital activities. Within the O&M tables in this section, only the O&M portion of labour and benefit increases has been captured. The capital portion of the increases are captured in the capital expenditures found in Section 6.2.

Employee benefits include workers' compensation, long term disability, extended health and dental benefits, group life, Medical Services Plan, Canada Pension Plan, Employment Insurance, employee savings plans, employee incentive plans, share purchase plans, pension and other post employment benefits. Other than pensions, the benefit costs remain relatively unchanged from prior years. Due to their impact on total benefit costs and the changes being experienced, pensions and OPEBs are discussed further below.

The costs of providing all benefit programs are under pressure due to increasing health care costs and reduced funding by all levels of governments, and with a new generation entering the workforce, the costs associated with current pension and benefit programs may prove onerous, particularly for those early in their careers who prefer cash flow. Flexibility must be taken into consideration for pension and benefit design in order to ensure sustainability while meeting the needs of a multi-generational workforce. With the assistance of benefits consultants (Mercer[75]), benefits pricing is reviewed on an annual basis to ensure that our usage experience, pricing and the market are taken into consideration when determining the next years pricing model. New benefits options and products are explored and considered to ensure that our pricing remains as low as possible given the pressures that we face each year. In 2010, the Companies and the

[75] Mercer is a human resource and related financial services consulting firm, headquartered in New York City. The firm operates internationally in more than 40 countries, with more than 19,000 employees, and is the world's largest human resource consulting firm.

Unions explored options which helped to mitigate the contribution rate increases, and we will continue to explore methods to mitigate these in the future.

Valuation of the IBEW and COPE defined benefit pension plan was recently completed while valuation of the M&E defined benefit pension plan is in progress with results expected in May, 2011. Due to the 2008 financial sector crisis, competitive plan benefits, increasing liabilities and lower than anticipated plan investment returns, contribution rate increases are occurring for both the Companies and plan members. Plan contribution rates for both the Companies and plan members are as follows:

- For non-union employees, 7.5 percent of pensionable earnings effective October 1, 2010;
- For COPE and IBEW, 12.95 percent of plan earnings effective April 1, 2011.

These plan contribution rates are expected to remain in effect for a period of up to three years as the most recent actuarial valuations of the above noted plans were completed in late 2010 and early 2011. Actuarial valuations are only required to be completed every three years and the recently completed valuations are expected to be valid until late 2013.

Pension and OPEB expenses are based upon actuarial estimates provided by the Company's actuaries, Towers Watson and Morneau Sobeco. Both firms have provided actuarial services to FEU for more than ten years and are very knowledgeable about FEU's pension plans and actuarial forecasting. For regulatory purposes, pension and OPEB expense forecasts for 2012 and 2013 have been prepared using the existing approved IFRS accounting methodologies assuming a transition date of January 1, 2010.

- For the Mainland, the actuarial estimates for pension and OPEB costs, excluding pension and OPEB for the incremental employees in the Customer Service department, are $12.1 million for 2012 and $12.0 million for 2013. A pro-rata share is allocated to Fort Nelson.
- Actuarial estimates of the pension and OPEB costs for the incremental employees in the Customer Service department are $0.4 million for 2012 and $0.4 million for 2013.
- For Vancouver Island, the actuarial estimates for pension and OPEB costs are $1.4 million for 2012 and $1.4 million for 2013 with a pro-rata share being allocated to Whistler.

These actuarial estimates do not translate directly into O&M expenses because a portion of the pension and OPEB expenses are capitalized. Pension and OPEB expenses are apportioned into two components, a current service component and a net benefit expense which includes the current service component not capitalized. The current service component is included in labour loadings and therefore in both O&M and capital expenditures, consistent with the treatment approved in the 2010-2011 RRA. The past service cost component is included in O&M only, as these costs have already vested.

- For FEI in 2012, the pension and OPEB costs are forecast to increase $1.1 million over 2011. This consists of an increase to the current service component of $3.9 million, offset by a reduction to the past service component of $2.8 million. After the allocation of the current service component to capital and deferrals, the net impact to O&M in 2012 is a reduction of $0.7 million. For FEI in 2013, the Pension and OPEB costs are forecast to decrease $0.1 million over 2012. This consists of an increase to the current service component of $0.4 million, offset by a reduction to the past service component of $0.5 million. After the allocation of the current service component to capital and deferrals, the net impact to O&M in 2013 is a reduction of $0.2 million.
- For FEVI in 2012, the pension and OPEB costs are forecast to decrease $0.4 million over 2011. This consists of an increase to the current service component of $0.2 million, offset by a reduction to the past service component of $0.7 million. After the allocation of the current service component to capital and deferrals, the net impact to O&M in 2012 is a reduction of $0.6 million. For FEVI in 2013, the pension and OPEB costs are forecast to decrease $0.1 million over 2012. This consists of a marginal increase to the current service component, offset by a marginal reduction to the past service component. The net impact to O&M in 2013 is a reduction of $0.1 million.

With respect to accounting treatment, we have prepared the O&M, capital and deferral estimates included in this RRA, including Pension and OPEB expenses, under the IFRS scenario in 2012 and 2013. This is consistent with FEU's calculation of pension and OPEB estimates for 2011, which was done as a result of the requirement to adopt IFRS by January 1, 2011 at the time of filing the 2010-2011 Revenue Requirements. (Prior to that date, we had calculated pension and OPEB estimates under Canadian GAAP.) The FEU have since applied for approval from the Commission to adopt US GAAP for regulatory purposes. In Section 3.2, the FEU discuss the impacts on this RRA of adopting US GAAP as compared to IFRS with deferral accounts, and included in that section are the estimated pension and OPEB costs under US GAAP.

5.3.2.3 Codes and Regulations

Codes and Regulations funding requirements are driven by the Companies' need to comply with existing codes and regulations as well as anticipated new or changed codes and regulations. The UCA, *Oil and Gas Commission Act*, *Workers' Compensation Act*, *Environmental Management Act*, *Safety Standards Act*, fire codes and safety standards, Provincial and Federal Emergency Acts, and Canada Standards Association Codes are some of the key codes and legislation with which the Company must be in compliance. These, along with other legislation, regulations, and bylaws, define FEU's level of reporting and compliance activities. These activities have a strong focus on public, employee, property, and environmental safety, and system reliability. A variety of external agencies oversees the Companies' response to these codes and regulations, to which FEU has a solid track record of compliance. Key applicable codes and regulations are outlined in Table 5.3-3 below.

Table 5.3-3: Codes and Regulations that Impact FEU Business

Code/Regulation/Standard	Governing Body
B.C. Environmental Management Act	B.C. Ministry of Environment
BC Safety Standards Act and Gas Safety Regulations	B.C. Safety Authority
Power Engineers and Boiler and Pressure Vessel Safety Act	B.C. Safety Authority: Pressure Vessels branch
B.C. Pipeline Act and Oil & Gas Commission Act (being replaced by Oil & Gas Activities act)	B.C. Oil & Gas Commission
CSA Z276: Liquid Natural Gas Production, Storage and Handling	Canadian Standards Association B.C. Oil & Gas Commission
CSA Z246: Security Management for Petroleum and Natural Gas Industry Systems (anticipated release October 2009)	Canadian Standards Association B.C. Oil & Gas Commission
CSA Z662 – Oil and Gas Pipeline Systems Including: • Clause 10.2 Safety & Loss Management System (annex A –framework) • Annex M: Gas distribution integrity management guidelines • Annex N: Guidelines for pipeline integrity management programs	Canadian Standards Association B.C. Oil & Gas Commission B.C. Safety Authority Workers' Compensation Board of BC
Electricity and Gas Inspection Act & Inspection regulations	Measurement Canada
WorkSafeBC Occupational Health & Safety Regulation • CSA Z1000 Safety Management System (framework)	Workers' Compensation Board of BC
Others including: • Provincial and Federal Emergency Acts; • Fire codes; • Building codes; • Emissions permits; and • Municipal and regional bylaws.	Various

For each of these codes and regulations, the Company has implemented management systems and/or operating practices to ensure compliance. The total incremental funding in this category is summarized in the tables in Section 5.3.3. Specific requirements to address compliance with Codes and Regulations are included later within each department's discussion, along with a reference to the specific code or regulation.

5.3.2.4 Customer and Stakeholder Expectations

O&M expenses in this category are primarily due to:

- recent BCUC decisions approving the in-sourcing of our Customer Service function;
- the Biomethane Program and the interim decision and ongoing review process for natural gas for CNG and LNG fueling infrastructure;
- funding support to meet increased regulatory requirements and customer expectations around long-term resource planning; and
- participant funding and BCUC direct costs for the regulatory process.

The total incremental funding in this category is summarized in the tables in Section 5.3.3. The incremental O&M increases in this category are addressed later on a department-by-department basis along with a reference to the relevant BCUC decision if applicable.

5.3.2.5 Demographics

The demographic challenges presented by the FortisBC Energy Utilities' aging workforce require increased efforts to proactively recruit, train and develop, transition, and manage overall changes to the composition of the workforce in the coming years. Shifting workforce demographics has been a well-known reality for some time and continues to be a major source of concern for governments and businesses alike. The initial wave of baby boomers has reached retirement age and the number of workers in British Columbia retiring each year is expected to swell from 56,000 to over 62,000 over the next decade[77]. As this scenario unfolds, the long predicted labour shortages, particularly within the skilled and professional trades, will begin to materialize. The combination of an aging population, declining birth rates, and continued economic growth will create significant pressure on businesses and available labour supply. As stated in the Ministry of Regional and Economic Skills Development British Columbia's Labour Market Strategy to 2020:

> *"As a result of economic growth, employment in British Columbia is expected to grow by an average of 1.8 percent each year through to 2019, creating a total of 450,000 new jobs. Approximately 676,000 additional jobs will become vacant due to retirements. In total, there will be an expected 1,126,000 job openings over the next decade. There are about 650,000 young people in our education system today which means that the growth in job openings is expected to outpace the number of workers."*[78]

Like many other organizations faced with an aging workforce and a shrinking labour market, FEU faces the challenge of having approximately half of its current workforce eligible to retire in

[77] Skills for Growth: British Columbia's Labour Market Strategy to 2020; Ministry of Regional and Economic Skills Development, Page 5

[78] Ibid

the next five years. In fact, between 2011 and 2016, a total of 663 FEU employees will become eligible to retire; 386 of those will be eligible to retire with an unreduced pension. This information is displayed in Table 5.3-4 below.

Transmission	16	17	22	24	29	32
Grand Total	**184**	**219**	**256**	**291**	**336**	**386**
* Note: Eligibility shown in the table is cumulative year over year						

The two groups facing the most significant retirement risk are Distribution and Transmission, where a total of 122 employees are eligible to retire with unreduced pensions in 2012, or 16 percent of their total combined workforce. This accounts for 56 percent of the 219 employees overall in all groups who will be eligible to retire in that year. Many of these employees are in highly technical or specialized field positions which require higher skill levels, are difficult to recruit and therefore demand longer training and knowledge transfer periods. In addition, more than 40 percent of Distribution managers are eligible to retire with reduced or unreduced pensions in 2012 which presents significant additional knowledge and experience loss. These workforce challenges are creating increased demand for field training as well as management and leadership development.

A few other departments such as Operations Engineering and Operations Support are also facing higher than average retirement risk, but the impact on their day-to-day operations is not of the same magnitude as the risk faced by Distribution and Transmission, and those departments should be able to manage the risk within their existing workforce plans.

The increased demand for training, employee development and knowledge transfer resulting from the large number of retirements, and related hiring of replacement employees, is having a direct impact on the Human Resources department which, as outlined in Section 5.3.13.4, will require additional O&M in 2012 in order to meet this challenge. Human Resources must continue to work closely with department managers to develop new plans and strategies to mitigate these risks, including:

- Developing effective workforce plans, recruiting and training strategies to manage the demographic risk;
- Providing effective and timely delivery of competency based peer training for large numbers of new hires (i.e. entry level Distribution Apprentices) accompanied by

thorough documentation of procedures and training materials to ensure compliance with code requirements;

- Continued evolution and sustainment of the competency management program beyond field employees;
- Providing management and leadership training to ensure there is sufficient, skilled management and leadership capacity in place to meet business needs; and
- Developing innovative and more efficient means for design and delivery of training, such as E-learning.

The total incremental funding in this category is summarized in the tables in Section 5.3.3. The incremental O&M increases in this category are addressed later on a department-by-department basis.

5.3.2.6 Service Standards and Reliability

The Service Standards and Reliability category includes any other required costs to support the ongoing integrity of our systems, and increases in non-labour costs including contractual funding increases for price escalation of existing contracts and service agreements. Please see Sections 1 and 6.2 for a detailed discussion of our system integrity focus through our Long-term Sustainment Plan and our commitment to ensure the safety and integrity of our delivery systems.

The total incremental funding in this category is summarized in the tables in Section 5.3.3. The incremental O&M increases in this category are addressed later on a department-by-department basis.

5.3.3 SUMMARY OF FORECAST 2012 & 2013 OPERATING COSTS (DEPARTMENTAL OVERVIEW)

The following tables reconcile the O&M incremental funding for 2012 and 2013 by category and by department. Many of the Mainland departments do not have direct O&M in Vancouver Island, Whistler and Fort Nelson. In these cases, the appropriate allocation of costs to those regions is included in the Corporate Department as a Shared Services fee. A discussion of both Shared Services and Corporate Services is included in Section 5.3.18.

** Following the in-sourcing of the customer service function in 2012, the 2011 approved Fort Nelson Customer Service O&M of $136 thousand was transferred to the Corporate department. This approach recognizes that customer service costs are captured in FEI and then allocated to Fort Nelson in a manner which is consistent with other FEI departments' allocated costs, in the Corporate department.*

5.3.4 EMPLOYEES

FEU will be increasing its staffing levels over the forecast period, driven primarily by the in-sourcing of Customer Service functions. Table 5.3-14 below provides the forecast employee levels for the 2012 and 2013 periods with the most recent years (2010 and 2011) included for comparison. Similar tables along with explanations for changes year over year are also provided for each department in their respective sections.

Not all the employees and their associated labour hours and dollars are for support of O&M activities. To provide clarity regarding the employee distribution, the employees have been allocated between O&M, Capital and Deferral activities (i.e. EEC programs).

Table 5.3-14: Growing Employees to Support In-Sourced Customer Service and Enhanced Reliability[79]

Dependant Contractors excluded	23	15	23	3	3	3

The requirements driving the overall employee numbers are described in each of the individual department discussions in Sections 5.3.5 through to 5.3.16.

The 2010 Approved and Actual, and the 2011 Approved employees listed in Table 5.3-14 above do not include any employees hired into the Customer Service Department as a result of the approval of the Customer Care Enhancements Certificate of Public Convenience and Necessity ("CPCN") Project (the "CCE Project"). The Customer Service department accounts for 331 of

79 Employees in this Section are the number of Full Time Equivalent employees as at December 31. Starting in 2011, dependant contractors have been mostly replaced by employees, reducing their numbers from 23 to 3 with an offsetting increase in Capital and O&M employees, as shown in the 2011 Projection. The dependant contractors are all IBEW; this change in status is more fully explained in the Operations O&M Section 5.3.5

the forecast increase in total employees included in the 2011 Projection; in 2011 their costs are included in the Deferral account for the CCE Project. For 2012 and 2013, the increased Customer Service department employees are primarily included in the O&M category. Further discussion of the Customer Service department employee requirements is included in the Customer Service O&M Section 5.3.7.

High-level departmental organization charts are included in each of the departmental overviews in Sections 5.3.5 through 5.3.15. Detailed company-wide organization charts are included in Appendix H.

5.3.5 OPERATIONS (DISTRIBUTION AND TRANSMISSION)

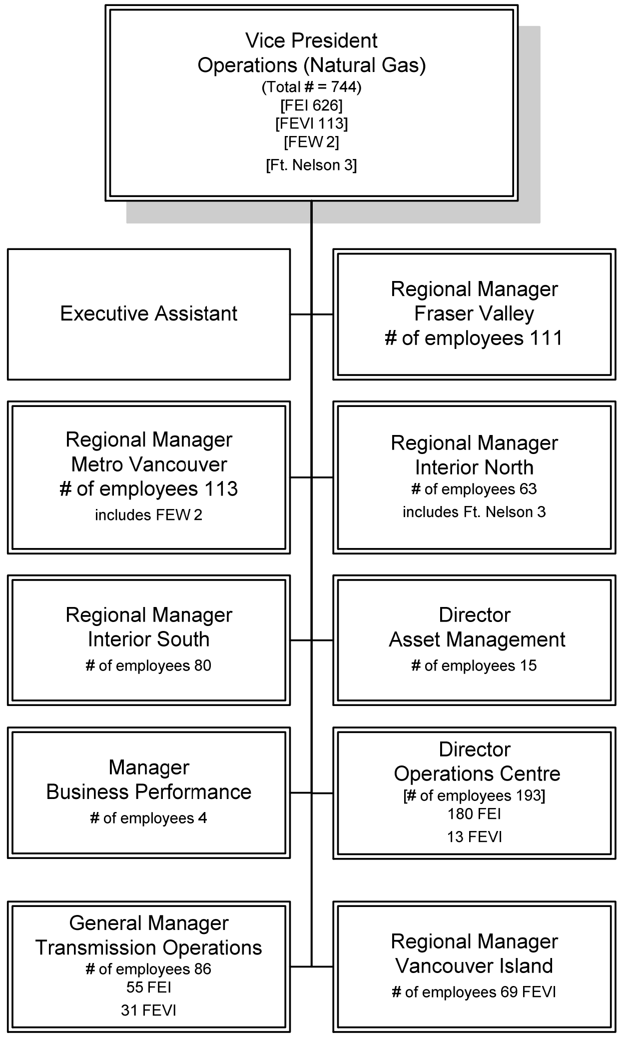
This section will provide a detailed review of the forecast O&M for the Operations Department (which include Distribution and Transmission). The section will proceed as follows:

- Departmental overview;
- Distribution O&M Expenditures and Employees;
- Distribution 2010 and 2011 Review;
- Distribution 2012 and 2013 Forecast;
- Transmission O&M Expenditures and Employees;
- Transmission 2010 and 2011 Review; and
- Transmission 2012 and 2013 Forecast.

5.3.5.1 Departmental Overview

In early 2011, the Distribution and Transmission groups were combined to create the Operations department which reports to the Vice President, Operations (Natural Gas). Operations is the largest department in terms of number of employees, budget and geographical footprint, and plays a major role in prudently managing O&M and capital expenditures. The Operations department is comprised of three main functional groups, Asset Management, Distribution, and Transmission. Each will be discussed below. The organization of the Operations Department is shown in the chart below.

Figure 5.3-1: Organization Chart for Operations



ASSET MANAGEMENT

The Asset Management group provides planning and management oversight of the installation, operation, and maintenance of the Company's distribution and transmission gas system assets. The group provides information gathering and analysis to achieve a holistic view of asset management, and is responsible for the development and continuous improvement of maintenance and capital programs that ensure ongoing safe, reliable, and cost effective service. In support of these responsibilities, the Asset Management group adopts and develops improved asset management practices that underpin its ability to maintain system reliability, safety, and regulatory compliance. Although Asset Management focuses largely on management of existing gas system assets, in the future it will increasingly need to manage new assets that are required to support such services as those offered through the natural gas vehicle ("NGV") and biomethane programs.

The need for effective system sustainment is a key asset management issue that is addressed in this Application. Improving the Company's asset management practices is becoming increasingly important so that the reliability and safety of the distribution and transmission system is sustained as it ages. This management is also important in order to ensure that any changes are cost effective and that their impact on customers' rates is kept to a minimum. The incremental O&M and Capital costs driven by system sustainment are reviewed in later sections of this Application.

In order to better support the Companies' ability to continue to improve asset management practices, a single Asset Management group for distribution and transmission assets was formed earlier this year as part of the organizational change. Previously, asset management focussed on a short, one to five year, planning horizon. A single management view of distribution and transmission assets will allow FEU to take a longer term view of system sustainment in order to more effectively address issues such as: the age of FEU's infrastructure; ongoing compliance to existing codes and anticipated new or changed codes; and customer, public and stakeholder expectations. Going forward, Asset Management will view the assets as a whole and will be better able to conduct system sustainment assessments, bring together local knowledge and experience, and improve formal asset health reports in order to identify areas of potential concern (i.e. single points of failure, lack of redundancy of supply). These areas must then be examined in more detail to determine whether operating and maintenance practices need to change or if additional capital expenditures are warranted. These initial assessments, which engage both internal and external expertise, are key to making appropriate long-term system sustainment decisions.

Incremental O&M funding is required to conduct system sustainment assessment as described below to enable the further development of the Company's asset management practices. Failure to adequately fund these assessments will limit the ability to develop the management systems needed to support a long term asset management view. Current resources are insufficient to complete the considerable reviews and analysis that are required to support future capital expenditure commitments in the amounts anticipated. If the budget requests are approved, Asset Management will secure the necessary resources needed to improve the management of asset renewal and refurbishment requirements, and to develop a more detailed, longer planning horizon.

DISTRIBUTION

The Distribution group is responsible for installing, operating and maintaining the gas distribution system, and providing safe, reliable and cost effective service directly to gas customers. Field personnel are trained and equipped with tools, equipment and vehicles to provide emergency response, operate and maintain the gas distribution system and to perform installations and renewals.

Distribution field and office activities are a combination of emergency response, operations and maintenance, and capital programs, and the group is organized to maximize synergies when completing the various installation, operational, and maintenance activities. The activities within Distribution are organized into four main functions or business processes - Emergency Management, Installation and Renewal, Operations and Maintenance, and Account Services. Additionally, Centralized Support Services, located in the Company's main operations centre in Surrey, is responsible for planning, resource management, dispatching and closing. These functional areas are described in greater detail below.

EMERGENCY MANAGEMENT

Emergency Management includes providing first and rapid response in order to ensure public, asset and employee safety. The activities include first response to system damage, gas odours, fire and carbon monoxide calls, emergency prevention through public education, and maintaining stand-by resources. Emergency response personnel and resources are mustered throughout FEU's service area to provide timely response to emergencies.

INSTALLATION AND RENEWAL

Installations include new mains, services, meters, stations and projects required to add customers and improve system reliability, integrity and capacity. Renewals are essentially replacements of the gas system components generally due to age, technology and obsolescence. Although employees routinely perform these activities, a significant portion of installation and renewal activity is performed by external contractors, particularly during periods of high customer additions activities.

OPERATIONS AND MAINTENANCE

Operations and Maintenance includes scheduled and unscheduled operating and maintenance activities dedicated to mitigating operating risks and ensuring the safety and reliability of the distribution system. Activities include system inspection, leak survey, preventive and corrective maintenance of equipment, valves, stations and meter sets. The level of activity required is influenced by code and standard requirements (i.e. Canadian Standards Association ("CSA")), regulatory requirements, operating and asset conditions.

ACCOUNT SERVICES

Account Services work performed by Distribution staff includes premise calls, meter lock-offs, unlocks and reactivations, meter exchanges/renewals and other customer inquiries requiring a field workforce response. An example of this is a high bill complaint initiated by a customer which results in a visit to the customer's premise to ensure the meter is functioning correctly.

CENTRALIZED SUPPORT SERVICES

In addition to Asset Management, there are two centralized Distribution support groups located primarily in Surrey: Process Support and the Operations Centre. The support groups provide the necessary expertise to assess work priorities, plan and design work to be completed, establish and maintain processes to be followed, and coordinate who, when and how the work gets completed. They also monitor costs and operational metrics to ensure commitments made to customers, regulators and other stakeholders are met.

TRANSMISSION

The Transmission group is responsible for ensuring the transmission system delivers natural gas from interconnecting pipelines, or Company owned liquefied natural gas ("LNG") facilities, to the distribution network and for operating and maintaining the mainline pipelines, compressor stations and LNG plants in a safe, reliable and cost effective manner.

Transmission operates and maintains a range of critical assets, falling into three main categories: pipelines, compressor stations, and LNG Plants. The assets operated by the group include the Interior Transmission system mainline, the Southern Crossing Pipeline, the Coastal Transmission system, the Island Transmission system, a number of transmission pressure lateral pipelines and marine loops, mainline compressor stations, and LNG plants at Tilbury and Mt. Hayes.

The Transmission group is organized based on specialized skills for three main types of assets. Field personnel are trained and equipped with tools, equipment and vehicles to provide emergency response, operate and maintain the transmission system and complete system improvements.

5.3.5.2 Distribution O&M Expenditures and Employees

To continue to meet the functions and objectives identified above, the Distribution group requires the forecast expenditures and headcount for the 2012 and 2013 test years as outlined in this RRA and shown in Tables 5.3-15 and 5.3-16 below. The Companies believe these forecast expenditures are reasonable and prudent, and consistent with expenditure levels observed in recent years.

Table 5.3-15: Distribution O&M Forecast to Meet Future Requirements

Amounts in $ Thousands

For a discussion of the Distribution capital expenditures, please refer to Section 6.2.

DISTRIBUTION EMPLOYEES

Distribution has 89 percent of the actual Operations employees in 2010, consisting of IBEW, COPE and M&E resources. These resources are required to manage, initiate, plan, schedule, dispatch, complete, and close field work. Distribution field personnel and resources are mustered throughout the service territory to provide timely response to emergencies and provide resources for routine utility activities. Regular O&M programs and activities are primarily completed by FEU employees, with approximately 7 percent of O&M programs completed by contractors/consultants. Approximately 35 percent of FEU employees are also utilized to complete capital work which is primarily a result of being able to utilize emergency response resources on smaller capital jobs at times when resources are available. FEU employees are also used on capital installations when unique skills unavailable in the open market are required or where the risk associated with the work requires it be done by experienced FEU personnel (i.e. System Operations Technicians commissioning a new station, crews completing large or complex pipeline tie-ins).

The 2010 actual employees are lower than the 2010 approved because of the large number of retirements. There were 33 IBEW retirements in 2010 which were at least partially triggered by changes to post retirement benefits effective January 1, 2011. The 2010 workload was managed by focusing FEU personnel on O&M activities and the installation contractor on capital activities.

In the 2011 projection for the Mainland, the principal reason for the increase in employee headcount has been the conversion of twenty long-time dependent IBEW contractor backhoe positions (not included in the employee numbers) to regular IBEW equipment operator positions (included in the employee numbers). This strategy was undertaken to increase the flexibility and efficiency of the crews. There were also ten additional planners and appointment setting employee positions added to the Operations Centre to support capital programs including third party alteration work, the hazard mitigation program and the inactive services program.

Due to the fact that certain positions in Distribution move between O&M and capital activities, the employee split between O&M and Capital is an estimate based on the following methodology. First, to arrive at the employee number for O&M, the wage/salary portion of the Distribution O&M was divided by the average Distribution salary to arrive at an estimated O&M related employee count. Second, the remaining headcount is categorized as Capital/Deferral. The methodology was applied consistently in the Distribution employee table for the 2010-2013 period.

DISTRIBUTION CONTRACTORS/CONSULTANTS

In addition to the FEU employees identified above, Distribution also utilizes contractors. The volume of capital and O&M work completed by contractors varies from year to year, depending on the overall capital workload, the level of regular operating and maintenance work, the number and size of emergencies and the number of vacancies in Distribution.

FEU periodically engages contractors and consultants for completion of Distribution O&M work activities. These resources are required to supplement the regular FEU employees in areas where in-house expertise is unavailable, the resource is a temporary requirement, and/or it makes economic sense to outsource. The most significant categories of contractor usage are in the areas of leak survey, flagging (i.e. to support emergency response, leak and valve repairs), vegetation clearing, paving and bridge crossing inspections and repairs. The most significant categories of consultant usage are in the areas of planning, seismic and customer satisfaction studies. In 2010 and 2011, the contractor/consultant employee equivalent embedded in Distribution O&M budgets is approximately 45 employees.

In addition to the FEU employees summarized in the tables and the contractor/consultants identified for O&M work activities above, there is a significant secondary workforce consisting primarily of two major installation contractors and a host of tertiary contractors (paving, flagging, project management, etc.). They provide a peak shaving resource for the capital workload which is more seasonal and unpredictable than regular O&M work and are an integral part of completing the capital work plans including new customer attachments (mains and services), system reliability and integrity projects and other major projects. In 2010, 82 percent of new mains work activity and 40 percent of new service work were completed by installation contractors. In addition, almost all larger project work such as system improvements are completed by contractors.

5.3.5.3 Distribution 2010 and 2011 Review - Mainland

2010 ACTUAL VERSUS 2010 ALLOWED

Distribution incurred O&M expenditures prudently to operate the gas distribution systems as outlined in the 2010-2011 RRA and met its program commitments. However, in doing so, it was $1.45 million or 3.6 percent over-budget in 2010. The principal reasons the 2010 actual varied from the 2010 allowed amount are as follows:

- System Damage Provisions ($400 thousand) – Several unusually large (>$100 thousand) third party damage repairs were incurred in 2010, and to date FEU has been unable to collect from the damagers for the repairs. FEU has made a provision for bad debt, but continues to negotiate with the damager and/or the damager's insurer. Partial recovery is expected in some future year, although legal costs to pursue recovery will negate much of the recovery. While we have limited experience with claims in excess of $100 thousand, the partial recovery is expected to be protracted (between one and five years if resolved through the courts). The size and frequency of significant third party damage events is at least partially attributable to the sizeable infrastructure projects undertaken by provincial and municipal governments in 2010 as they take advantage of funding available under the Federal Action Plan, the economic recovery plan put in place by the federal government to address the 2008 - 2009 economic downturn. FEU has increased its efforts to conduct damage prevention workshops in targeted municipalities with the support and assistance of WorkSafeBC and the BC Safety Authority in an effort to prevent these damages from occurring.

- S301HP Regulator Repairs ($400 thousand) – Distribution identified a significant unexpected performance issue in mid-2010 with a type of regulator (S301HP) used in gas service to commercial customers that required immediate resolution to ensure customer safety and reliability. The regulator performance issue, once identified, affected approximately 3,200 commercial class customers. This was a one-time unusual repair program requiring immediate resolution. FEU worked with manufacturer representatives in identifying a malfunctioning part in the S301HP regulator, obtaining replacement parts and developing a repair procedure. Replacement parts were supplied by the manufacturer; however, labour used to make the repairs was not covered by warranty.

- Leak Repairs ($375 thousand) – The number and magnitude of leak repairs is somewhat unpredictable from year to year with the unit cost varying from $1,000 to $100 thousand depending on the location, difficulty to locate, repair methodology and conditions, response effort, etc. 2010 was an atypical year in terms of overall spending levels for leak repairs. While activity levels remained consistent with prior years, average unit costs increased from $2,100 to $2,700 per repair. The average unit cost increase was due primarily to one significant leak repair (Como Lake Road-Coquitlam Intermediate Pressure line, $73 thousand) together with the impact of having new Distribution Apprentices on each of the repair crews.

- IBEW Training ($275 thousand) – In 2010, there were 53 new Distribution field hires and 132 field employees in new positions, which is considerably higher than previous years. This increase was driven by the high number of retirements (33) in 2010 which was influenced by changes to post retirement benefit packages beginning in 2011. The Distribution field workforce continues to face demographic challenges. Fifty four (or 14 percent of) IBEW field employees are eligible for retirement today and we have responded to this challenge through an apprentice program. While typically Distribution field employees are provided with 10 to 14 days of classroom training per year inclusive of travel to and from training sites, the Distribution Apprentice ("DA") program currently includes 45 days of classroom training during the first two years. The hiring of DAs (39 in 2010) created pressures on the training budgets. Furthermore, the significant number of retirements in the more highly technical field positions (System Operations Technicians, Customer Service Technicians, etc.) also generated significant training pressures as their replacements filled these roles.

- Operations Centre ($335 thousand) – The costs were incurred primarily for training Planners. In 2010, there were five new hires in the Install Coordinator (Planner) groups to go with an extensive new hire in 2009. These groups are responsible for new customer attachments and planning of system integrity and reliability projects. The new hires were the result of turnover in the group as well as retirements. The planning groups have some of the most complex and extensive training requirements in the Company and this placed unusual pressure on the group in order to ensure the newer employees were sufficiently trained to meet customer's expectations and service levels.

- Vegetation Management / Right of Way Clearing ($168 thousand) – Additional outstanding work was released to the contractor as the clearing season was extended due to favourable weather conditions late in the year in the eastern portion of the province.

- First Response Standby Reduction ($700 thousand savings) - Offsetting the principal 2010 cost pressures above was a reduction in first response standby. First response standby costs are generated when field resources are on standby and have no other work available to them, much like the fire department model. Typically, standby costs are more unavoidable in small towns where there is a requirement to have a service technician in town for emergency response and routine customer service calls; however, if the service technician does not have a full schedule of maintenance or capital work, standby costs are incurred. Having capital work (from the asset management and planning groups), customer service work, emergency work and routine operations and maintenance work activities available to crews and technicians in a timely manner in the right locations allows for the optimization of the resources and results in reductions to standby costs. The reductions to first response standby have been primarily due to being able to assign resource capacity to customer additions and capital hazard mitigation activities. Favourable weather, particularly in the Interior during the winter, also contributes to the reduction in standby as crews and technicians are able to complete more work without weather related restrictions.

2011 PROJECTION VERSUS 2011 ALLOWED

The 2011 Projected Distribution O&M of $43.2 million is expected to equal the allowed amount of $43.2 million under the 2010-2011 RRA as several of the items identified as contributing to the Distribution overage in 2010 were considered unusual expenditures unlikely to repeat in 2011.

5.3.5.4 Distribution 2010 and 2011 Review - Vancouver Island

2010 ACTUAL VERSUS 2010 ALLOWED

Distribution met its program commitments in 2010 to Vancouver Island customers as outlined in the 2010-2011 RRA, and, in doing so, was $0.4 million or 7 percent under-budget. The principal reason the 2010 actual varied from the 2010 allowed is:

- First Response Standby Reduction ($465 thousand savings) – As discussed in the Mainland section above, first response standby costs are generated when field resources are on standby and have no other work available to them, much like the fire department model. Reductions in first response standby on Vancouver Island were primarily due to available O&M and capital work (new customer additions activities) in areas where there was internal resource capacity and less need to use a contractor.

- The 2010 savings were partially offset by increased leak survey costs ($88 thousand). Leak survey is an activity that can be used to reduce the impacts of first response standby time; however, the FEVI field resources performing leak survey are typically higher cost than the leak survey contractor due to higher wages and benefits. FEVI technicians are required to be available to respond to emergencies such as hit lines, gas odour and fire calls, and the leak survey work is operations work that can easily be postponed temporarily and resumed after the emergency event is resolved.

2011 PROJECTION VERSUS 2011 ALLOWED

The 2011 Projected Distribution O&M of $5.4 million is expected to equal the Allowed amount under the 2010-2011 RRA (reduced by $350 thousand from 2010) which represents the permanent portion of the savings in first response standby costs achieved in 2010.

5.3.5.5 Distribution 2010 and 2011 Review - Whistler

2010 ACTUAL VERSUS 2010 ALLOWED

Distribution met its program commitments to Whistler customers as outlined in the 2010-2011 RRA, and, in doing so, was $63 thousand or 14 percent under-budget. The principal reasons the 2010 actual varied from the allowed were:

- Industrial Meter Set Preventive Maintenance ($20 thousand savings) – these meter sets were put in place in 2009 during the Whistler Conversion project (propane to natural gas) and little scheduled maintenance was required in their first year of operation.

- Distribution Manager Position ($20 thousand savings) – Subsequent to the Whistler Conversion project being completed, an appropriate system stabilization period and the 2010 Olympics, the Distribution Manager position located in Whistler was eliminated. The propane to natural gas conversion eliminated many of the activities and complexities of a satellite propane system, making the service territory manageable from Burnaby. Half of the manager's salary was included in the Whistler 2010 O&M budget and the change was made July 2010, resulting in a savings for half of the year. The Burnaby manager allocates 10 percent of his salary to Whistler under the new arrangement.

2011 PROJECTION VERSUS 2011 ALLOWED

The 2011 Projected Distribution O&M of $451 thousand is expected to equal the Allowed amount under the 2010-2011 RRA. The reduction in Distribution Manager costs is permanent; however, in 2011 these savings are expected to be offset by continued system stabilization repair work (gas odour calls, leak repairs, meter set maintenance). These activities have increased as Whistler conversion customers were encouraged to call in upon the detection of any gas odour to ensure the many fittings touched during the conversion were tightened and that the conversion had been completed safely and to the customers' satisfaction.

5.3.5.6 Distribution 2010 and 2011 Review - Fort Nelson

2010 ACTUAL VERSUS 2010 ALLOWED

The principal reasons the 2010 actuals varied from the allowed amount were due to reductions in vehicle and employee related expenses.

2011 PROJECTION VERSUS 2011 ALLOWED

The 2011 Projected Distribution Fort Nelson O&M of $347 thousand is expected to equal the allowed amount as part of the 2011 Fort Nelson RRA.

5.3.5.7 Distribution 2012 and 2013 Forecast – Mainland

The Mainland requires incremental O&M in 2012 and 2013 to ensure we continue to provide safe, reliable, cost-effective service to our customers. The requirements are presented under the following three cost driver categories and are summarized in Table 5.3-17 below:

1. Codes and Regulations;
2. Demographics; and
3. Service Standards and Reliability.

Table 5.3-17: Increases Required to Meet Mainland Regulatory Requirements and Service Expectations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	43,153	(54)	1,738	120	-	160	2,520	4,485	47,638
2013	47,638	-	1,307	600	-	270	1,243	3,420	51,058

The Mainland requests include incremental positions for Asset Management and the Distribution Centralized Support Services (Process Support and the Operations Centre). Further details and explanations are presented below.

CODES AND REGULATIONS

Incremental O&M is required to comply with codes and regulations. The Mainland's goal of providing safe, reliable, cost effective and environmentally responsible service is strongly aligned to code requirements. In 2012, $120 thousand is required for pipeline right-of-way signage which is related to a colour change in the standard from orange to yellow for natural gas markers. In 2013, $250 thousand is required for additional Asset Compliance Managers and $350 thousand is required for the standardization of locks and security devices at field facilities. Further details are provided below.

Pipeline right-of-way signage is required to meet CSA Z662 code and to identify the presence of pipelines in order to reduce the possibility of damage and interference. ANSI standard Z535.1 requires natural gas markers to be yellow, instead of orange. FEU has implemented this change for distribution pressure mains and it is necessary to extend this program to pipelines in order to achieve compliance.

Asset compliance management is a requirement under the Integrity Management Plan which has evolved to meet CSA Z662 code and safety and reliability objectives. Two Asset Compliance Managers were approved in the 2010-2011 RRA and subsequently hired in 2011 to develop processes and conduct quality audits to ensure field work meets code and internal standards. Three additional Asset Compliance Managers are requested in order to provide one manager per operational zone and facilitate effective monitoring of field work activities, particularly in light of the number of new employees, employees new in positions and contractors performing significant portions of new main and service installations. It is neither feasible nor practical to have two Asset Compliance Managers cover the entire five gas distribution service areas and the full scope of activities including new installations, routine operations and maintenance, emergencies, customer service work, design, and planning.

FEU must standardize locks and security devices at field facilities to meet code requirements and maintain adequate security measures (CSA Z662 and CSA Z246.1) to ensure only authorized personnel have the appropriate access to facilities and operating equipment. This is particularly important as the amalgamation of different companies and operating areas (the last one being Vancouver Island in 2006) has resulted in different keys and locks being used in different areas across the Province, limiting the ability to effectively move personnel and provide access to facilities as the work requires. FEU will implement a lock standardization program. The program plans to complete 50 percent of the lock upgrade and replacements in 2013 and complete the remainder of the program in 2014.

These additional costs are necessary to meet specific code and regulation requirements.

DEMOGRAPHICS

The Distribution group requires incremental O&M of $160 thousand in 2012 and $270 thousand in 2013 to address demographic challenges. Even with the relatively high number of retirements over the past five years, Distribution still has 90 employees eligible to retire. Distribution hired 53 new field employees in 2010 to fill a large number of vacancies created primarily by retirements (33). Distribution anticipates further retirements by the end of 2013 and is planning to hire new employees in 2012.

Distribution continues to be proactive by planning for inevitable replacements and ensuring new staff has progressed to ensure that a capable and competent workforce is maintained. Distribution has adopted a peer training model for the majority of field training which involves employees who currently work in the field also delivering training programs. An additional resource is required to manage and administer the peer training to ensure field resources are trained and skilled to meet regulatory and operating requirements. This new role will be required to work in conjunction with the Training group to coordinate the IBEW training (400+ field personnel) plus all the peer trainers (25+ field personnel) which are used by the Training group to provide the instruction. The Mainland requests approval of $90 thousand in 2012 to support this role, plus an additional $200 thousand in 2013 for the required training and development of field personnel.

In addition, Distribution has an aging management workforce resulting in significant attrition risk over the next five years. This risk has increased since the 2010-2011 RRA filing. More than 40 percent of current management employees become eligible to retire, with either a reduced or unreduced pension next year. Distribution will require $70 thousand in 2012 and a further $70 thousand in 2013 to develop new managers through the Manager-In-Training program and to ensure knowledge transfer and planning for replacement of management employees over the next few years.

SERVICE STANDARDS AND RELIABILITY

In order to continue to provide safe and reliable services, additional resources and investment are required to support the Operations Centre, Asset Management, field service delivery, IT system applications and system sustainment assessments. Further details are provided below.

OPERATIONS CENTRE

The Operations Centre, which is the Distribution centralized office group located primarily in Surrey and responsible for initiating, planning, scheduling, dispatching and closing the Capital and O&M field activities for the whole service territory, is facing an increasing workload from customer growth, customer expectations, process changes (enhancements to the estimating process) and changes in capital programs and requires additional resources in order to manage the workload. The increases in capital workload are primarily related to the hazard mitigation program, meterset upgrades, inactive meters and services programs and third party relocations such as the Gateway projects in the Lower Mainland. FEI requires $448 thousand of O&M in 2012 and $58 thousand of O&M in 2013 to hire the additional resources to manage the workload and maintain service standards in the Operations Centre group.

The Operations Centre will require six additional positions in 2012 and three additional positions in 2013 to address the increase in workload. In 2012, three Planners and three Operational Support Representatives ("OSRs") in the Closing and System Survey sub-group of the Distribution group are required. In 2013, three additional Planners, including a work-leader to supervise a large planning group, are required. The Planners, who typically meet on construction sites with homeowners, developers and municipalities to design and cost estimate gas system infrastructure, are required primarily for capital activities; however, they also engage in training, supervision and reviews of municipal project plans which are classified as O&M activities.

ASSET MANAGEMENT

The Asset Management group requires an analyst and assistant in 2012 ($160 thousand). Two assistants are required in 2013 ($140 thousand). These roles will support O&M, capital, sustainment planning and the NGV and biomethane programs. The existing and new assets require maintenance planning and administration to ensure ongoing safety, reliability and cost effectiveness. Asset Management must be adequately staffed with skilled personnel in order to manage the increased workload (new NGV and biomethane assets, internal reporting and data management to improve asset management) and meet customer and regulatory requirements. Asset Management requires adequate skilled resources to ensure capital investments are properly screened, prioritized and administered.

Distribution also requires a reporting analyst ($90 thousand) to manage steadily growing internal and external operational reporting requirements as well as reporting technology changes and individual and departmental performance management. Distribution also requires a process support analyst ($70 thousand) to manage the increase in system applications supported and number of users.

FIELD SERVICE DELIVERY

Field Service Delivery includes six primary work categories: Preventive Maintenance, Corrective Maintenance, Operations, Meter Exchange, Emergency Management and Meter to Cash. The Field Service Delivery budget is the largest component of the Distribution budget at $20.8 million. Incremental increases in O&M of $416 thousand in 2012 and $272 thousand in 2013 are required in the category of Service Standards and Reliability for field service delivery activities. The changes in budget requirements are caused by changes in activity levels and unit costs. Activity levels are impacted by system and customer growth and maintenance frequencies. Unit costs are impacted by labour/vehicle rates as well as the efficiency and experience of the employees and contractors performing the activities. 2012 and 2013 forecast unit costs primarily reflect the 2010 experience together with inflation.

A new area within the Preventive Maintenance category is the budget to operate and maintain NGV and biomethane assets.

Regular operation and maintenance of NGV assets, specifically CNG and/or LNG stations, are required to ensure public safety and reliability. Starting in 2012, the O&M costs will be forecast in Distribution, and as the number of NGV assets increases, the operation and maintenance requirements will increase. The Mainland requires $225 thousand in 2012 and an incremental $115 thousand in 2013 to operate and maintain the NGV assets. A summary of all NGV costs and revenues is included in Appendix I.

Biomethane service received a two-year Commission approval for inclusion in the regulated natural gas utility business. Regular operation and maintenance of biomethane assets, similar to pressure regulating stations, is required. Starting in 2012, the O&M costs will be forecast in Distribution, and as the number of biomethane assets increase, the operation and maintenance requirements will increase. The Mainland requires $23 thousand in 2012 and an incremental $68 thousand in 2013 to operate and maintain the biomethane assets. A summary of all biomethane costs and revenues is included in Appendix J.

Also included in the Field Service Delivery category, driven by changes in activity levels and inflation in unit costs or a combination thereof, are additional funds for:

- Battery upgrades for industrial meters ($160 thousand);
- Bridge crossing repairs ($110 thousand);
- Station transition repairs ($100 thousand);
- Leak repairs ($110 thousand);
- Line locates ($125 thousand);
- Valve inspections ($200 thousand);
- Gas odour calls ($200 thousand); and
- Meter to cash (lock-offs, etc.) ($1.13 million).

These additional requests are partially offset by the following savings:

- Operations – general (primarily line heater fuel) ($590 thousand);
- First response standby ($440 thousand); and
- Meter to cash recoveries ($1.12 million). The Companies plan to increase the reconnection/reactivation fee to $100 (regular hours) and $140 (after hours) as allowed

under their General Terms and Conditions. The proposed change reasonably reflects the cost of providing this service and is consistent with cost causation principles. The proposed fee change also mitigates negative impacts to other ratepayers and reduces the O&M cost per customer for all customers. For details on the planned fee increase, please refer to Appendix F-1.

IT SYSTEM APPLICATIONS

The Mobile Geographic Information System ("GIS") initiative was implemented in 2011 to provide field crews and technicians with remote access to service and main records. This initiative is demonstrating many benefits, particularly for emergency field personnel who now have visibility into up-to-date gas plant records information from their vehicles. An additional $200 thousand in 2012 is required to support the ongoing licensing costs and add a resource to provide technical system support.

SYSTEM SUSTAINMENT ASSESSMENTS

The requirement for a long term view of system sustainment was presented earlier in this section as part of Asset Management. This supports our prudent operational priorities by enabling a long term view of system sustainment to minimize the likelihood of unexpected asset failures in the future and reducing future cost and rate volatility due to reactive asset management. This also provides the assurance to stakeholders that related capital investments have been reviewed and planned in the best interest of both customers and the general public.

The O&M to support this initiative is forecast to be $1 million in 2012 and $500 thousand in 2013. Partially offsetting these increases are O&M reductions resulting from the elimination of similar studies that were completed in 2011 (seismic risk analysis for $145 thousand and single point of failure analysis for $200 thousand). Therefore, the net increase as compared to 2011 is $655 thousand in 2012 and $500 thousand in 2013.

In order to support the distribution system sustainment assessments, Asset Management will require the following additional resources: one engineer and two analysts in 2012 ($150 thousand), and one additional analyst in 2013 ($45 thousand). These resources are in addition to those identified to support Regular Operations and are required to ensure Asset Management has adequate skilled resources to ensure capital investments are appropriate, prioritized and administered effectively. In addition in 2012, the Operations Centre will require additional planners ($100 thousand) to manage increases in workload associated with the system sustainment assessments. The planners will work with engineers and analysts to plan, design and estimate changes such as new installations, alterations and abandonments to the gas distribution system. The Operations Centre requires adequate skilled resources to continue to plan, design and coordinate asset renewal projects and ensure capital investments are appropriately coordinated.

VEHICLE AND OTHER NON-LABOUR INFLATION

Also included in the Service Standards and Reliability category is $256 thousand in 2012 and $228 thousand in 2013 for vehicle and other non-labour inflation such as contracts and materials.

5.3.5.8 Distribution 2012 and 2013 Forecast - Vancouver Island

Vancouver Island requires incremental O&M in 2012 and 2013 to ensure we continue to provide safe, reliable, cost-effective service to our customers. The incremental O&M is shown in Table 5.3-18 below, broken down by cost driver.

Table 5.3-18: Increases Required to Meet Vancouver Island Regulatory Requirements and Service Expectations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	5,379	(31)	87	-	-	-	353	409	5,787
2013	5,787	-	139	40	-	-	402	582	6,369

CODES AND REGULATIONS

The incremental O&M in this category is Vancouver Island's allocation of costs to complete the lock standardization program planned starting in 2013. This program is described above in the Mainland section.

SERVICE STANDARDS AND RELIABILITY

Additional investment of $353 thousand is required in 2012 to support various field service delivery activities which are defined in the Mainland section above. In addition to minor changes in field service delivery activities in 2013, the significant item for 2013 is bridge crossing repairs for the Bay Street bridge in Victoria which is estimated at $330 thousand. The work includes repairing and recoating the two pipes (distribution pressure and intermediate pressure) which are supported by the bridge.

5.3.5.9 Distribution 2012 and 2013 Forecast - Whistler

The Whistler O&M requirement for 2012-2013 is shown in Table 5.3-19 below, broken down by cost driver.

Table 5.3-19: Efficiencies Realized in Meeting Whistler Service Expectations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	451	-	21	-	-	-	(42)	(21)	430
2013	430	-	6	-	-	-	(6)	(0)	430

SERVICE STANDARDS AND RELIABILITY

The costs for Whistler are forecast to decrease in the 2012-2013 period from 2011 due primarily to the reduction in management costs and declining system post-conversion repairs. Partially offsetting these reductions are annual inflation and scheduled commercial/industrial meter maintenance ($20 thousand) coming due in 2012 that is on a three year cycle.

5.3.5.10 Distribution 2012 and 2013 Forecast - Fort Nelson

Fort Nelson requires similar O&M levels in 2012 and 2013 as compared to 2011 to ensure we continue to provide safe, reliable, cost-effective service to our customers. Some minor inflationary wage pressures are offset by some minor expense and material savings which together are embedded in the Service Standards and Reliability category. The Fort Nelson operation consists of three employees and the annual expenditure requirement is a mix of direct costs and allocated costs from FEI.

Table 5.3-20: Changes in O&M to Meet Fort Nelson Service Expectations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	347	-	-	-	-	-	(4)	(4)	344
2013	344	-	-	-	-	-	7	7	350

5.3.5.11 Transmission O&M Expenditures and Employees

Code and regulations compliance forms the foundation of many of our operating programs and activities in the Transmission area. Code changes, asset age, asset base expansion, and inflation all drive the need for incremental O&M funding in the Transmission group to allow FEU to continue to provide natural gas service in a safe and reliable manner. Table 5.3-21 sets out approved, actual, projected, and forecast O&M costs for Transmission. These costs are reviewed later in this section.

Table 5.3-21: Transmission O&M Requirements to Meet Future Obligations

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 14,116	$ 13,871	$ 14,994	$ 14,994	$ 16,280	$ 17,499
Vancouver Island	$ 4,849	$ 4,542	$ 6,134	$ 6,134	$ 6,755	$ 7,064
Whistler	$ -	$ -	$ -	$ -	$ -	$ -
Fort Nelson						
Total	$ 18,965	$ 18,413	$ 21,128	$ 21,128	$ 23,036	$ 24,562

The cost of employees needed for the completion of Transmission work activities are included in the O&M costs that are set out in Table 5.3-21 above. Employees consist primarily of M&E, COPE, and IBEW resources required to manage, initiate, plan, schedule, dispatch, and complete field work. Table 5.3-22 below sets out approved, actual, projected, and forecast employees for Transmission.

Table 5.3-22: Transmission Employees Required to Meet Future Obligations

Two key requirements explain the increased need for employees by Transmission since 2010. First, the completion of the Mt. Hayes LNG facility in 2011 on Vancouver Island required 10 new operators to complete daily operating activities. Second, an additional four employees are required in 2012, followed by an addition of two more employees in 2013. The four employees in 2012 are comprised of management and field staff for the increased asset management activities that the Companies expects as it completes detailed assessments of aging assets to determine the scope and timing of future asset renewals. The role and importance of these asset management activities was discussed in Section 5.3.5.1. Of the two additional employees required in 2013, one will replace a contractor that is retiring in 2013 who operates the Company's V4 compressor, and the second is a pipeline technician required for the operation of the Vancouver Island transmission system.

In addition to the employees set out in the table above, the Companies engage contractors and consultants for completion of Transmission O&M work activities. These resources are required to supplement employees in areas where in-house expertise is unavailable, where the resource is a temporary requirement, or where it is economical to outsource. The most significant categories of contractor usage include pipeline line patrols, leak survey, and vegetation clearing.

An overview of the O&M changes for Transmission included in this Application is provided in Sections 5.3.5.12 through 5.3.5.15 below.

5.3.5.12 Transmission 2010 and 2011 Review – Mainland

2010 ACTUAL VERSUS 2010 ALLOWED

2010 actual Transmission O&M costs on the Mainland were $245 thousand lower than allowed in 2010. This variance is comprised of a number of changes from what was anticipated in preparing the 2010 forecasts. Key cost savings include:

- $147 thousand - warmer than normal weather resulted in lower electricity use;
- $123 thousand - lower than planned own use gas costs;
- $215 thousand - Transmission Pipeline Integrity Program ("TPIP") contractor bids more competitive than planned; and
- $282 thousand – several M&E and COPE positions remained unfilled until later than planned in the year.

Offsetting the above cost savings was the following key cost pressure:

- $522 thousand – higher than planned Transmission right of way activities, including unplanned land easement, fencing compensation, and city and owner court settlement costs.

All of these variances are expected to be one-time and are non-recurring in nature.

2011 PROJECTION VERSUS 2011 ALLOWED

No variance from the 2011 approved forecast is projected at the time of this Application.

5.3.5.13 Transmission 2010 and 2011 Review - Vancouver Island

2010 ACTUAL VERSUS 2010 ALLOWED

Actual Transmission O&M costs on Vancouver Island were $307 thousand lower than allowed in 2010. This variance is comprised of a number of changes from what was anticipated in the 2010 forecast. Key cost savings include:

- $154 thousand – ability to reduce the need to complete planned seismic activities;
- $81 thousand – ability to reduce the need to complete planned compressor station maintenance and carbon studies; and
- $110 thousand – higher than planned charge out to complete capital activities.

Offsetting the above cost savings was the following key cost pressure:

- $38 thousand – Mt. Hayes LNG operators hired earlier than planned.

All of these variances are expected to be one-time and are non-recurring in nature.

2011 PROJECTION VERSUS 2011 ALLOWED

No variance from the 2011 approved forecast is projected at the time of this Application.

5.3.5.14 Transmission 2012 and 2013 Forecast - Mainland

Transmission requires approximately $1.3 million in incremental O&M costs for 2012 and a further $1.2 million in incremental O&M costs for 2013 for Mainland operating and maintenance activities. A discussion of these cost increases by cost driver follows.

Table 5.3-23: Incremental Transmission O&M Requirements to Meet Future Obligations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	14,994	(57)	244	(130)	133	91	1,005	1,287	16,280
2013	16,280	-	185	(75)	106	(46)	1,048	1,218	17,499

CODES AND REGULATIONS

Underpinning the safety and reliability of the transmission system is the need to ensure compliance with a range of key codes and regulations. Legislation such as the UCA, *Oil and*

Gas Commission Act, *Workers' Compensation Act*, *Environmental Management Act*, *Safety Standards Act*, fire codes and safety standards, Provincial and Federal Emergency Acts, Canadian Standards Association ("CSA") codes, and other legislation, regulations and bylaws define compliance activities.

Transmission is forecasting a decrease in O&M to as it relates to the need to comply with codes and regulations in 2012. A number of activities needed and completed in 2011 are non-recurring and no longer required. These activities were all driven by the need to comply with Annex A of CSA Z662 and involved work to set up a safety and loss management system applicable to design, construction, operation, and maintenance activities that can affect the safety of people or the protection of property or the environment. The work to set up this safety and loss management system is now complete, which results in the ability to reduce O&M by $250 thousand in 2012. This savings is offset by a $120 thousand cost increase driven by the need to ensure that transmission pipeline signage meets CSA Z662 code to clearly identify the presence of pipelines in order to reduce the possibility of damage and interference.

In 2013, vegetation control costs are expected to decrease by $150 thousand because of competitive bids for vegetation control work which are lower than in previous years. This savings is offset by a cost increase of $75 thousand that is necessary for the recertification of pressure safety valves used in Transmission's compressors. This recertification requirement reoccurs on a three year cycle.

CUSTOMER AND STAKEHOLDER EXPECTATIONS

Increased O&M costs will be incurred to support the Companies' NGV program which is expected to start in 2011 subject to Commission approval of FEI's NGV Application. Increased liquefaction will be required to provide this service throughout 2012 and 2013 in order to replenish LNG tank levels. The additional O&M cost in 2012 is expected to be $133 thousand and followed by an additional $106 thousand in 2013 as the service ramps up. These incremental costs are expected to be offset in the revenue requirement by incremental revenue that should be earned from providing this service under Rate Schedule 16. A summary of all NGV costs and revenues is included in Appendix I.

DEMOGRAPHICS

Transmission requires three transitional field employees in order to manage a number of field workforce retirements that are expected in 2012 and 2013. The additional cost to manage these retirements is estimated to be $91 thousand in 2012 followed by a decrease of $46 thousand in 2013. Given the difficulty in recruiting and training these replacement employees, Transmission has assumed that each is required for a six month transition period, two in 2012 and an additional one in 2013. After this transition period ends, these costs will be offset by the three employees who are expected to retire. The initial savings in labour costs from the two employees anticipated to retire by the end of 2012 is reflected in the decrease that is expected for 2013.

SERVICE STANDARDS AND RELIABILITY

Transmission needs an additional $693 thousand in incremental O&M in 2012 and an additional $201 thousand in 2013 on Vancouver Island to meet its objectives related to Service Standards and Reliability. These amounts are comprised of standard inflation on materials for a total of $65 thousand in 2012 and an additional $66 thousand in 2013, and the need for additional Transmission pipeline employees for a total of $170 thousand in 2012 and an additional $95 thousand in 2013. An additional $166 thousand is required in 2012 for Mt. Hayes LNG plant operators who were able to capitalize a portion of their labour costs in 2011 while assisting with the construction of the LNG facility. The access road leading to the new Mt. Hayes LNG facility requires an additional $50 thousand in 2012 for ongoing annual maintenance. Additionally, Mt. Hayes will incur incremental electricity costs required for ongoing liquefaction and vaporization activities. In 2012 Mt. Hayes is forecast to incur additional electricity costs, net of a minor fuel gas savings, totalling $242 thousand. In 2013 electricity costs are expected to increase a further $40 thousand.

5.3.5.15 Transmission 2012 and 2013 Forecast - Vancouver Island

Transmission requires $621 thousand in incremental O&M funding in 2012 and a further $308 thousand in 2013 for Vancouver Island Transmission system operating and maintenance activities. A discussion of these increases by cost driver follows.

Table 5.3-24: Incremental Transmission O&M Requirements to Meet Future Obligations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	6,134	(41)	62	(92)	-	-	693	621	6,755
2013	6,755	-	63	45	-	-	201	308	7,064

CODES AND REGULATIONS

A number of non-recurring activities in 2011 that resulted from CSA Z662 are no longer required. In particular, aerial recoating, inline inspection activities, and seismic inspection activities required by CSA Z662 are complete for the 2012 and 2013 period, which results in an O&M reduction of $187 thousand in 2012. This savings is offset in 2012 by primarily two items: (1) a $20 thousand cost increase driven by the need to ensure that transmission pipeline signage meets CSA Z662 code to clearly identify the presence of pipelines in order to reduce the possibility of damage and interference and (2) an additional $75 thousand to manage the existing condition of vegetation growing on transmission rights of way on the Vancouver Island system.

In 2013, a cost increase of $45 thousand is forecast for the recertification of pressure safety valves used in Transmission's compressors. This recertification requirement reoccurs on a three year cycle.

SERVICE STANDARDS AND RELIABILITY

Transmission needs an additional $693 thousand in incremental O&M in 2012 and an additional $201 thousand in 2013 on Vancouver Island to meet its objectives related to Service Standards and Reliability. These amounts are comprised of standard inflation on materials for a total of $65 thousand in 2012 and an additional $66 thousand in 2013, and the need for additional Transmission pipeline employees for a total of $170 thousand in 2012 and an additional $170 thousand in 2013. An additional $166 thousand is required in 2012 for Mt. Hayes LNG plant operators who were able to capitalize a portion of their labour costs in 2011 while assisting with the construction of the LNG facility. The access road leading to the new Mt. Hayes LNG facility requires an additional $50 thousand in 2012 for ongoing annual maintenance.

5.3.5.16 Operations Summary

Outside of inflationary pressures, the main contributors to the increase in 2012 and 2013 forecast O&M expenditures for the Operations department relate to demographics, service standards and reliability, and code and regulations compliance.

Having effective asset, distribution and transmission system management is necessary to help ensure reliable, secure, and cost effective supplies of natural gas and propane to customers. The Operations department believes the costs it has presented are prudent and necessary to meet the above objectives and customer priorities.

5.3.6 ENERGY SUPPLY AND RESOURCE DEVELOPMENT

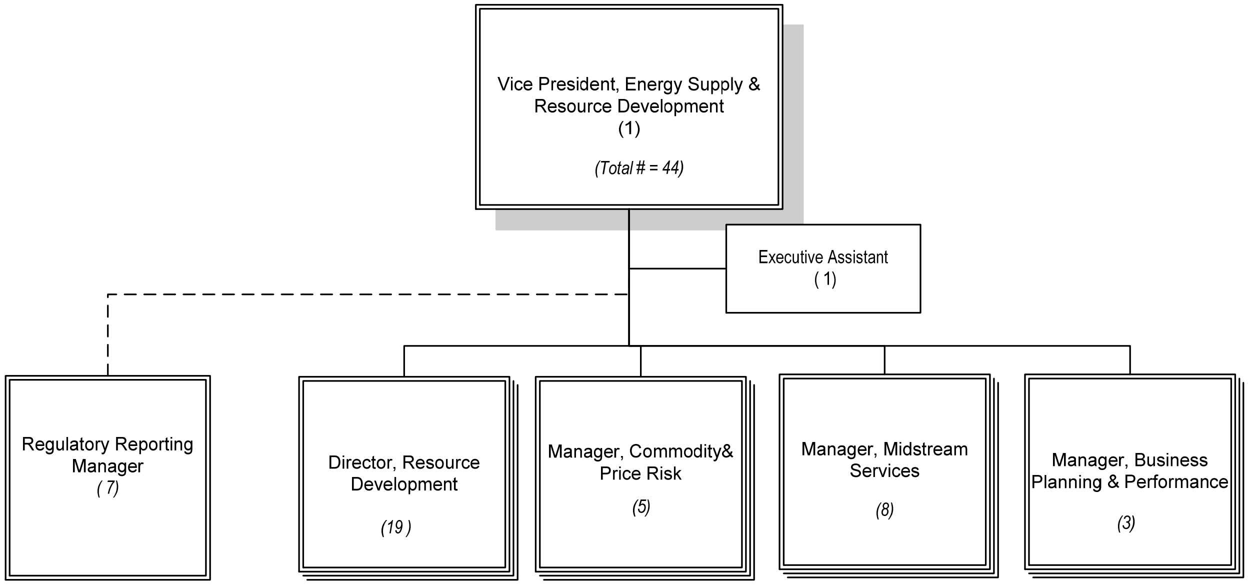
5.3.6.1 Departmental Overview

The Energy Supply and Resource Development department is responsible for two broad functional areas of activity – Energy Supply, and Resource Development. The purpose of each of these two functional areas and the scope of their activities are described in the following section.

ENERGY SUPPLY AND RESOURCE DEVELOPMENT ORGANIZATIONAL STRUCTURE

The organizational chart for the Energy Supply and Resource Development department is presented below.

Figure 5.3-2: Organization Chart for Energy Supply and Resource Development



ENERGY SUPPLY

The main activities for Energy Supply include completing gas commodity procurement, providing intra-day balancing supply (required primarily due to weather changes) for core customers, facilitating all gas scheduling and nominations on FEU and third party pipeline transmission systems, mitigation activity based on buying and selling around excess resources and the management of relationships with financial and physical supply counterparties, storage operators and pipeline companies to the benefit of customers. Also included is the management of the movement of gas supply provided by natural gas marketers to customers under the commodity unbundling program, which began in 2004.

The completion of these activities helps to ensure that there are reliable and secure supplies of natural gas and propane for all of the Company's customers. The key objectives of the Energy Supply department include:

- providing natural gas and propane supply for customers;
- optimizing resources to minimize the overall supply portfolio costs for the benefit of customers;
- managing market price risk to reduce rate volatility for customers;
- providing Energy Management Services to create value for customers through revenue generation; and
- managing commercial and industrial transport customers' requirements.

RESOURCE DEVELOPMENT

The Resource Development group provides the gas supply infrastructure planning and major capacity and sustainment initiatives management function. The group is responsible for identifying and developing new regional projects as well as system infrastructure projects within the Company's current service areas, including pipeline, compressor, and storage projects. Identifying the need for such major initiatives and projects is important in order to determine and plan infrastructure projects required for system reliability and to meet demand growth. Once these projects have been built and the assets commissioned they become the responsibility of the Asset Management group in Operations for ongoing management.

Long range planning for the Companies' gas system infrastructure is necessary given the long lead times for large infrastructure projects that typically face a range of extensive regulatory approvals, public consultation, conceptual design, detailed engineering, and construction schedules. This work forms a critical link in the Company's ability to provide safe, reliable, and cost effective service to customers. The Company will continue to place a high priority on the completion of these activities.

The organizational structure displayed in Figure 5.3-2 includes the Gas Control group reporting to Resource Development. The primary function of Gas Control is to dispatch and operate the gas transmission and distribution system, in a manner to meet the corporate obligation of safe, dependable and economical gas service to its customers. Gas Control is a 24/7 operation, and is responsible for the continuous monitoring and operation of the pipeline to meet its customers energy, pressure and gas quality requirements with maximum dependability. In addition, Gas Control performs the daily system load forecasts, as well as short-term 5-day forecasts for gas commodity purchasing

5.3.6.2 Energy Supply & Resource Development O&M Expenditures Overview and Employees

Energy Supply and Resource Development groups are funded from two sources - a CMAE budget and an O&M budget. CMAE costs are a direct result of the activities performed within the Energy Supply department to serve core market customers and are treated as a flow-through cost to core market customers as part of gas costs. These costs are not included in O&M in this RRA as the costs form part of commodity rates and not delivery rates. CMAE costs are reviewed in detail in the cost of gas Section 5.2 of this Application.

All other activities, including those completed by the Resource Development department, are required in support of all customers, not just for core customers, and are as a result funded from the O&M budget. Table 5.3-25 sets out approved, actual, projected, and forecast O&M costs for Energy Supply and Resource Development. These costs are reviewed later in this section.

Table 5.3-25: Energy Supply & Resource Development O&M Requirements to Meet Future Obligations

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 3,325	$ 3,251	$ 3,748	$ 3,748	$ 3,943	$ 4,196
Vancouver Island	$ -	$ -	$ 100	$ 100	$ 100	$ 100
Whistler			$ -	$ -	$ -	$ -
Fort Nelson						
Total	$ 3,325	$ 3,251	$ 3,848	$ 3,848	$ 4,043	$ 4,296

The cost of employees needed for the completion of Energy Supply and Resource Development work activities are included in the O&M costs that are set out in Table 5.3-25 above. Employees consist primarily of M&E and COPE resources required to manage, initiate, plan, schedule, and complete work activities. Table 5.3-26 that follows sets out approved, actual, projected, and forecast employees for Energy Supply and Resource Development.

Table 5.3-26: Energy Supply & Resource Development Employees Required to Meet Future Obligations

Mainland	42	40	42	45	46	47
Vancouver Island	0	0	0	0	0	0
Whistler	0	0	0	0	0	0
Fort Nelson	0	0	0	0	0	0
Total	42	40	42	45	46	47
Less: CMAE	(21)	(20)	(21)	(22)	(22)	(22)
Net O&M	21	20	21	23	24	25

Energy Supply and Resource Development is forecasting the addition of four employees after 2010. Two new employees were added in 2011 as business development specialists to help the Resource Development group with work identifying and developing new regional projects as well as system infrastructure projects. An additional two employees are expected to be required after 2011 for this group, one in 2012 and the second one in 2013. Both employees will also work as business development specialists that are required to assist the Resource Development group to meet its objectives.

In addition to the employees set out in the table above, the Company engages contractors and consultants for completion of Energy Supply and Resource Development O&M work activities.

These resources are required to supplement employees in areas where in-house expertise is unavailable, where the resource is a temporary requirement, or where it is economical to outsource.

Sections 5.3.6.3 through 5.3.6.5 below provide review of O&M expenses for Mainland and Vancouver Island.

5.3.6.3 Energy Supply & Resource Development 2010 and 2011 Review - Mainland

Energy Supply and Resource Development incurred O&M expenditures prudently in 2010 and 2011 to operate the Company's energy supply and gas control functions and to meet resource development objectives. Energy Supply and Resource Development met its program commitments, with O&M $75 thousand (2.2 percent) lower than approved in 2010.

No variance from the 2011 planned budget is projected at the time of this Application.

5.3.6.4 Energy Supply & Resource Development 2012 and 2013 Forecast - Mainland

Changes to the level of O&M costs from those approved for 2011 are identified in the table below, broken out by cost driver. These changes reflect both cost savings and cost increases, to ensure savings opportunities were reflected in the overall O&M impact.

Energy Supply and Resource Development requires approximately $195 thousand in incremental O&M cost for 2012 and a further $253 thousand in incremental O&M costs for 2013 that are required for Mainland Energy Supply and Resource Development activities. A discussion of these cost increases by cost driver follows.

Table 5.3-27: Mainland ES&RD O&M Requirements to Meet Future Obligations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	3,748	(14)	125	-	-	-	84	195	3,943
2013	3,943	-	99	-	-	-	154	253	4,196

SERVICE STANDARDS AND RELIABILITY

Energy Supply and Resource Development requires an additional $84 thousand in O&M funding in 2012 and an additional $154 thousand in 2013. As described earlier in the discussion on the level of employees required by this business area, Resource Development has identified the need to add one employee in 2012 and an additional employee in 2013. The costs included assume that each employee will be hired mid-year.

5.3.6.5 Energy Supply & Resource Development 2012 and 2013 Forecast - Vancouver Island

Energy Supply and Resource Development has not identified any incremental O&M funding needed in 2012 or in 2013 for Vancouver Island Energy Supply and Resource Development activities.

Table 5.3-28: Vancouver Island ES&RD O&M Requirements to Meet Future Obligations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	100	-	-	-	-	-	-	-	100
2013	100	-	-	-	-	-	-	-	100

5.3.6.6 Energy Supply & Resource Development Summary

In summary, outside of inflationary pressures, the main contributor to the increase in 2012 and 2013 forecast O&M expenditures for ES&RD relates to improving service standards and reliability.

5.3.7 CUSTOMER SERVICE

5.3.7.1 Departmental Overview

The Customer Service Department of FEU plays a vital role in providing service to customers, and consequently represents a core element of the business. It is the central point of interaction between customers and FEU in key aspects of its operations, and significant emphasis is placed in ensuring that service delivery meets customer needs.

The Customer Service department is responsible for providing accurate and timely billing for our customers, for ensuring that meters are read regularly and accurately, for providing effective and timely resolution of customer inquiries, and for providing customers with valuable energy consumption information. The majority of these activities are currently managed by the Customer Service department by way of a Business Process Outsourced[80] ("BPO") arrangement with CustomerWorks LP ("CWLP")[81]. The department also oversees mass market customer communications regarding accounts and billing, administers the Customer Choice program, performs market research and analysis, oversees mass market bad debt management, works to swiftly resolve customer issues raised to third parties including the BCUC, Better Business Bureau and Provincial MLAs, and provides contact centre services for

---

80 Business Process Outsourced Agreement is the contracting of a specific business task, including all responsibility for management of the business processes and underlying information technology system and applications.

81 The scope and terms of the BPO arrangement with CWLP was defined as a Client Services Agreement dated January 1, 2002.

customer construction requests including new service line installations, service alterations and abandonments through its Construction Services Contact Centre.

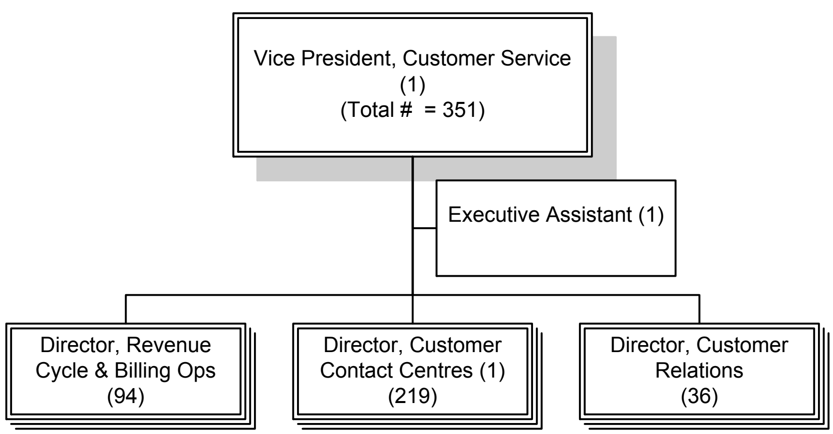
Prior to the second quarter of 2010, the Customer Service group was a division of the Energy Solutions and External Relations department (formerly known as the Marketing and Business Development department), and has since formed a separate department. This separation was in preparation for the in-sourcing of key customer service activities provided by the BPO Arrangement. The CCE Project[82] is well underway and the project team is preparing the Companies for the in-sourcing transition by way of implementing technologies, including a new Customer Information System technology platform integrated with new contact centre technologies for managing customer interactions; along with the development of new business processes to support the capability to deliver customer service excellence.

In 2012, the CCE Project will be complete and the Customer Service department will transition to a strategic sourced[83] framework with direct control over customer points of interaction. This new framework will enable FEU to better meet the current needs of its customers, with the ability to efficiently adapt to customers' needs as they change over time. Underpinning the new framework is a new internally administered technology platform which will enable the business processes necessary to meet our commitment to our customers.

5.3.7.2 Customer Service Organizational Chart and Employee Table

The organizational structure of the Customer Service department as it will exist on December 31st, 2011 is shown below:

Figure 5.3-3: Organization Chart for Customer Service



[82] CCE CPCN project was approved by Commission Order No. C-1-10

[83] Strategic sourced relates to the in-sourcing of key elements of the customer service function and the continuation of outsourcing transactions than can be exercised efficiently and cost effectively externally. For example- customer statement printing is an activity that will continue to be outsourced. For the purpose of simplicity, the term "in-sourced" will be used throughout this application to refer to this transition.

This organizational structure will support the new Customer Service delivery model. The majority of the new hires for the Contact Centres and Revenue Cycle and Billing Operations will be recruited and trained during the latter half of 2011 in preparation for the transition, as a CCE Project activity.

Total	29	31	29	31	310	296

Note: The difference of sixteen employees in 2011 between the organizational chart and the employee table shown above represents the Centralized Support Service resources required from IT and HR to support the in-sourced Customer Service framework.

The 331 increase in 2011 from the approved level of employees represents the resources required to support the transition to the in-sourced Customer Service delivery model. During the second and third quarters of 2011, hiring of the Contact Centre and Revenue Cycle and Billing Operations management team will be complete, and in the last two quarters of 2011, the bargaining unit staff will be recruited and trained. During 2011, these additional resources will be engaged in the CCE Project and hence are shown here under the Capital / Deferral section.

An increase in proficiency will result in the need for fewer resources over time. Through the period of 2011 to 2013, increased proficiency is expected to result in the reduction of 58 employees. Throughout 2012, FEU expects that staff in the Customer Service department will become more proficient at their duties, including handling calls, addressing complex billing issues, managing call volume volatility, as a result of refinement in the end to end business processes. In addition, FEU has anticipated a shift of some inbound call volumes to less labour intensive channels such as e-mail, online chat and self serve.

5.3.7.3 Customer Service O&M Expenditures

The table below summarizes the approved, actual, projected and forecast O&M levels for the Customer Service department for the 2010 to 2013 period.

Table 5.3-30: Customer Service O&M Required to Meet Future Obligations

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 56,951	$ 53,292	$ 56,935	$ 56,935	$ 55,388	$ 58,959
Vancouver Island	$ 5,281	$ 5,025	$ 5,459	$ 5,459	$ 5,257	$ 5,599
Whistler	$ 151	$ 125	$ 156	$ 156	$ 146	$ 154
Fort Nelson*	$ 138	$ 135	$ 136	$ 136	$ -	$ -
Total	$ 62,522	$ 58,577	$ 62,686	$ 62,686	$ 60,791	$ 64,712

** Following the in-sourcing of the customer service function in 2012, the 2011 approved Fort Nelson Customer Service O&M of $136 thousand was transferred to the Corporate department. This approach recognizes that customer service costs are captured in FEI and then allocated to Fort Nelson in a manner which is consistent with other FEI departments' allocated costs, in the Corporate department.*

The 2010 actual expenditure for the Customer Service department was $3.9 million below the approved level; this was primarily due to lower bad debt expense of $3.1 million and lower CWLP contract expense of $0.5 million. The lower bad debt expense was the result of low gas commodity rates and warmer winter weather which translates into reduced gas throughput, while the lower CWLP contract expenditure was due to lower actual CPI and fewer customer additions than budgeted. The 2010 CWLP contract inflation estimate included a CPI forecast of 2.3 percent, whereas the actual CPI rate amounted to 0.3 percent. At the time of this Application, no variance to budget for cost items, including bad debt expense, is anticipated for the 2011 projected expenditure. Since bad debt expenditure is driven by a number of factors including economic conditions, it is too early in the year to ascertain the likelihood of a variance to budget for 2011 such as that experienced in 2010.

The 2012 forecast shows a decline of approximately $1.9 million from the 2011 approved amount, as savings are recognized with the transition to the in-sourced service delivery model. The move to the new CIS and contact centre technologies will provide efficiencies that are not achievable with the current outsourced arrangement. While FEU continues to recognize efficiencies with the in-sourced model in 2013, these efficiencies are offset by the disappearance of cost savings from the joint gas/electric manual meter reads in our shared service area with BC Hydro, as BC Hydro pursues its Smart Metering Initiative ("SMI"). As discussed below (under Meter Reading Services), FEU is seeking deferral account treatment due to the uncertainties with respect to this cost component.

FUNCTIONAL GROUPS AND KEY RESPONSIBILITIES

The forecast O&M levels required for the Customer Service department have been delineated into the functions of the department.

Table 5.3-31: Customer Service O&M Functional Areas to Support a New In-Sourced Framework

($ thousands)

Customer Service	2012 Forecast	2013 Forecast
Contact Centres (Burnaby and Prince George)	12,349	11,837
Revenue Cycle & Billing Operations	15,256	15,026
Customer Relations	4,297	4,420
Bad Debt Expense	4,541	4,547
Meter Reading Services	17,750	22,000
Administration	634	649
Total Customer Service	**54,828**	**58,479**
Centralized Support Services	**5,963**	**6,233**
Grand Total	**60,791**	**64,712**

The Customer Service department will receive Centralized Support Services from Information Technology ("IT"), Human Resources ("HR") and Facilities. The expenditures for these services will be incurred in the respective departments, but for this RRA, they have been included within the Customer Service department to illustrate the total impact of the new in-sourced customer service delivery framework.

CONTACT CENTRES

Critical to the in-sourcing of Customer Service activities is the set up of two new Contact Centre facilities, one located in Burnaby and the other in Prince George. The two facilities will be equipped and staffed to ensure all customer inquiries are handled by skilled and knowledgeable staff and in a timely manner. The Contact Centre group will also be responsible for customer interactions initiated through the new communications channels including enhanced telephony capabilities, online chat and integrated e-mail. The new customer service framework will enable the ability to support industry changes including the education of customers related to the new biomethane service offering and the integration of this energy alternative and potential new offerings in the future into our contact centre operations.

FEU will also offer enhanced customer communication self-serve options as part of its multi-channel strategy, including web self serve and Interactive Voice Response ("IVR") capabilities. These transactional capabilities will be available to customers upon implementation on January 1, 2012, although customer adoption rates are largely unknown at this time. FEU will promote the use of these alternatives to customers and monitor customer response and satisfaction related to their use in order to more accurately forecast future impacts. As alternate communication channels of engagement are introduced, it is anticipated that these will have an impact on existing communication channels, however, the extent to which this occurs is uncertain at this time.

FEU has used 2009 call volumes (1,012,568 calls) as the basis for its estimate for 2012 and 2013 staffing levels, as these were most representative of a three year call volume average for the period 2008 to 2010. A schedule showing call volume history has been provided in Appendix D-7. The model to support staffing levels assumes sufficient flexibility to support daily, monthly and seasonal volatility. This will be managed through a mix of full time, part time and auxiliary employees. The contact centre staff will be recruited in 2011, and will undergo a comprehensive training program to ensure they have the skills and knowledge to navigate the complex business processes of an energy utility. The majority of these new hires will be covered by the Customer Service Collective Agreement negotiated with COPE. The Customer Service Collective Agreement is distinct from the conventional COPE Collective agreement that has been established for the COPE employees in the rest of the organization, as it has been specifically designed to support the unique needs of staffing requirements in a contact centre and billing operations environment. These unique needs include flexible scheduling to support timely response across multiple communication channels including 24/7 support for critical calls.

Although FEU believes that the 2009 call volumes are a good indicator of call volumes for 2012 and 2013, there are uncontrollable events that can significantly increase the number of calls into the contact centre. For example, significantly colder weather and variability in gas commodity costs would increase the number of calls, as customers seek clarification on their energy usage or statement balance. The fluctuations in call volumes will be managed to the best of the ability of the contact centre management and staff within the 2012 and 2013 forecast O&M expenditure levels.

While the CCE Project is on track according to its planned schedule, the project team is still in the process of implementing the new CIS and therefore the detailed steps of the end to end processes have not yet been fully developed and tested. Furthermore, there will be new staff hired and trained to perform these new processes. The project team is undertaking a tremendous amount of effort in developing comprehensive recruiting and training programs but has limited insight into the pool of eligible applicants it will receive, and consequently how fast these new staff members will grasp their new duties, responsibilities and perform the new business processes.

In order to enhance productivity, measure and monitor the quality of service provided to customers, improve performance and build employee loyalty, both the Contact Centres and the Revenue Cycle and Billing groups will be supported by an integrated telephony platform that includes Quality Monitoring and Workforce Planning capabilities. A supporting Learning and Knowledge team will provide the capabilities for ongoing training and communication as well as maintaining a knowledge base application providing ready access to information and instructions for all key business processes.

The Learning and Knowledge group will manage the design, development and delivery of fundamental customer service skills, processes, policies and procedures. The Quality Assurance team will provide ongoing coaching and development programs to improve all contact centre service delivery and will play a significant role in monitoring contact centre performance along with creating a culture that prides itself on delivering customer service excellence. The Learning and Knowledge team will also be responsible for developing effective training materials and facilitator guides as one of the Project deliverables. These documents will then form the foundation from which to structure all ongoing training and knowledge transfer. This group will continue to build on this foundation as they seek to monitor effectiveness of training delivery programs and retention of material, and will continuously amend and adjust in order to ensure service excellence. The Workforce Planning group will be responsible for managing the scheduling and availability of appropriately skilled staff.

The 2012 forecast amount for the Contact Centre operations is $12.3 million, with a decline of $512 thousand in 2013 to $11.8 million. The 2012 estimate includes temporary resources that will not be required in 2013, as FEU anticipates its contact centre agents will become increasingly proficient at their roles as they gain "on-the-job" experience throughout 2012.

REVENUE CYCLE AND BILLING OPERATIONS

The Revenue Cycle and Billing team will be responsible for billing and payments, collections, management of third party contracts including meter reading, and will be located at the Burnaby Facility. They will provide support to the Contact Centre staff in resolving complex billing issues and escalations. Furthermore, they will be responsible for proactively identifying potential billing issues and contacting customers to rectify issues before they are escalated.

The billing function includes establishing and maintaining accurate customer rates and pricing, determining tax applicability, calculating usage based on specific equipment and installation characteristics, calculating charges and taxes based on usage, applying special charges and payments and formatting, and printing statements for delivery to customers. This group will be responsible for receiving and processing customer payment. While a large number of customers continue to send payment by mail, a growing number use electronic means, such as direct deposit or online payment through their financial institution's website. Collections activities by this group will include managing activities to secure payment of arrears balances on active accounts, including specific and timely messaging, notification and disconnection of services related to active customers. The collections function also includes the placement, reporting and recovery processes related to terminated account balances.

In addition, this group will be responsible for contract management, including managing the agreements specifically negotiated to support industrial and transportation customers; together with contracts in support of marketers providing commodity service to customers under the commercial and residential customer choice programs. Facilitated by the new CIS, this group will also have the ability to implement new rate structures as needed, including for example expanded support for new natural gas refuelling services for fleet vehicles. Another specific area of focus supported through the CCE Project is billing and reporting support for the biomethane service offering.

Resource estimates for the back office functions were compiled by utilizing information from the following sources:

- Historical call volume information;
- Volume of work undertaken in the back office over the last few years at the outsourced provider;
- Preliminary process information indicating how SAP processes may differ from existing processes; and
- Comparison of these estimates to several other utilities through informal discussions as a reasonableness check.

The following assumptions were used to arrive at these estimates:

- The historical call and work volumes were tracked accurately by the outsourced provider and that these volumes will not change significantly in 2012 or 2013; and
- The final SAP processes will not change significantly from the draft processes currently documented.

The use of a daily mechanism for administration of the basic charge was approved by the Commission as per Order No. G-2-11. This Order approved a change from a monthly to a daily administration and has no impact on the basic charge rate. The Order directed FEU to identify any cost savings associated with the change in administration. The continuation of the monthly administration would have increased development and implementation efforts for the new system. As such, while the daily mechanism has required little system development and configuration there are no material O&M savings that can be identified as a result of this change.

The 2012 forecast amount for this group is $15.3 million, with a decline of $230 thousand in 2013 to $15 million.

CUSTOMER RELATIONS

The role of the Customer Relations group is to manage customer relationships by identifying the needs and expectations of customers and ensuring operations and processes across all departments within the organization serve to optimize these customer expectations. The group will maintain customer relations as its primary focus and will play a key integration role between the Customer Service department and the rest of the organization in sharing the learnings and insights the department attains from the increased direct interaction with customers.

Areas of accountability and responsibility will include:

- Customer Service and communications management regarding rates and tariffs, customer accounts and billing. Investigation of customer issues presented to the BCUC, Better Business Bureau, Provincial MLAs and Company executives with a focus on achieving timely resolution for customers;
- Ensuring effective integration of processes between Customer Service and multiple departments across the organization;
- Customer Choice program management to oversee all operational aspects of the Customer Choice program, gas marketer relations and annual filings with the BCUC;
- Customer Research management to oversee and conduct research such as annual customer satisfaction and commitment studies and periodic customer end use studies, among others. This team will manage activities to secure customer feedback regarding their expectations for existing and potential new products and services to ensure service delivery and new product and service activities meet the expectations of our customers;
- Administering customer construction service requests by means of the Construction Services Contact Centre. These service requests include new service installations, service alterations and service abandonments (removals);
- Conducting root cause analysis to address cross-functional issues and service or process improvement opportunities. Leading cross-functional teams to complete situational analysis, develop business cases and deliver improvements for customers and internal operations; and
- Oversee the development of performance measures and ensure that Service Quality Indicators (SQIs) and Corporate Scorecard metrics are accurately measured and that

quality and productivity targets are met or exceeded. Please see discussion on Service Quality Measures below.

The 2012 forecast estimate for this group is $4.3 million and $4.4 million in 2013, with the $123 thousand increase year over year to account for labour inflation.

BAD DEBT EXPENDITURE

The bad debt expenditure will be managed by the Revenue Cycle and Billing group. The forecast estimate of $4.5 million for 2012 and 2013 is based on analyzing actual historical bad debt expenditure to arrive at a reasonable experience rate of 0.30 percent for FEU for both 2012 and 2013. This experience rate was then multiplied by the forecast revenue to arrive at the 2012 and 2013 forecast levels. FEU believes the historical bad debt expense is a good indicator of the expected level for 2012 and 2013.

METER READING SERVICES

FEU's intention has been to continue with joint gas/electric manual meter reading that combines meter reading for FEU and BC Hydro in order to take advantage of the benefits associated with the joint meter read for as long as that option is available. BC Hydro's commitment to move forward with its SMI deployment combined with the termination of the Client Services Agreement with CustomerWorks LP, which includes joint manual meter reading with BC Hydro conducted by Accenture, instigated the requirement for FEU to explore alternative meter reading solutions for 2012 and beyond and to develop an independent meter reading strategy. After exploring various options, FEU has reached agreements with both Accenture and BC Hydro directly, for the provision of manual meter reading services and supporting infrastructure for the 2012 calendar year which amounts to a total forecast amount of $17.8 million for 2012. Accenture will manage and deliver meter reading services as they have since 2002, and BC Hydro will provide the meter reading infrastructure which has supported FEU's meter reading over this same period.

The 2012 meter reading agreements with both Accenture and BC Hydro have a two-tiered pricing structure based on dual reads (gas and electric) and single (gas only) reads which take into consideration the anticipated deployment of smart meters under BC Hydro's SMI program. The 2012 forecast amount was determined under the assumption that BC Hydro would have its smart meters deployed and activated by the end of 2012, consistent with its current plans. In the event that deployment and activation proceeds on a slower timeline, the actual meter reading costs incurred by FEU would be lower than the forecast amount. If the SMI did not proceed in 2012, then FEU expects that the meter reading costs incurred in 2012 will be approximately $12 million. FEU believes any savings in its meter reading costs from forecast should flow back to customers and the converse should also hold true.

These meter reading agreements are in the best interests of our customers and FEU as they enable FEU to maintain the benefits of joint gas/ electric manual meter reads in the majority of FEU's service areas; moreover they mitigate the risk of designing, developing, testing and commissioning new meter reading processes and interfaces while the CCE Project is being executed. Meter reading services were extraneous to the decision to in-source strategic customer service activities and as such did not factor into the project's cost-benefit analysis. FEU will continue to explore options beyond 2012 as BC Hydro is scheduled to have completed full deployment of its smart meters by the end of 2012, and is not expected to require large scale manual meter reading services beyond that time. As such, FEU has estimated gas only manual meter reads for 2013 in the amount of $22 million, at a unit rate consistent with the amounts included in the agreements with Accenture and BC Hydro for 2012. FEU is finalizing its strategy as to best meet its meter reading requirements for 2013 and beyond.

In 2012 and 2013, FEU will be faced with business uncertainties with respect to meter reading as discussed above and it is both reasonable and in the interests of our customers, that FEU include variances in meter reading expenditures between the forecast and actual 2012 and 2013 levels in a deferral account, discussed further below in Section 5.3.7.4. FEU is seeking deferral account treatment for actual meter reading expenditure that falls either above or below the forecast spend of $17.8 in 2012 and $22 million in 2013.

CENTRALIZED SUPPORT SERVICES

Centralized support services will be provided primarily by three departments - HR, IT and Facilities, and details of these services are provided below. The forecast expenditure for these services, of $6 million in 2012 and $6.2 million in 2013, have been shown here, rather than in their respective departments, in order to illustrate the total impact of the new in-sourced customer service delivery framework.

Human Resources

HR will provide general HR and labour relations advisory services along with payroll and time administration for the Customer Service Department. This HR support currently exists during the project phase and these services will evolve after the January 1st, 2012 go-live date. The additional resources in HR to provide this support will be $444 thousand in 2012 and $378 thousand in 2013 and are described further in the following paragraph.

In 2012, $230 thousand will account for two HR Advisor positions, to support staff at the Prince George and Burnaby locations. These resources are required to ensure effective administration and management of employee relations, including labour relations compliance with employment laws and standards, interpretation and application of the collective agreement, recruiting, and performance management. In addition, $214 thousand will account for three positions required to ensure all employee data including pay, time, compensation and related provisions in the collective agreement are effectively administered and managed. In 2013, FEU anticipates efficiencies with the implementation of automated time entry in SAP, would enable the elimination of one position and reduce the 2013 O&M forecast by $66 thousand.

Information Technology

IT will support and manage the new CIS technology platform, by providing system applications support, on-going sustainment services, and management of the overall integrity of the data. These services amount to a total of $3 million in 2012, and $3.4 million in 2013. Further details of these services are provided below:

Software Maintenance and Support

IT's contractual obligations in support of the new Customer Service department are forecast to be $1.024 million in 2012 and an incremental $82 thousand in 2013. There are two specific costs drivers in this category that are generally attributable to annual licensing fees associated with software and for agreements with third parties for the support and maintenance of the Companies applications. First, licensing and annual maintenance for the CIS will drive an annual fee of $638 thousand in 2012 and an additional $73 thousand in 2013, factoring in fees related to customer growth projections. Third party consulting and support services enabling the CIS and Customer Contact Centre technology will drive $386 thousand in 2012 and $9 thousand in 2013.

Infrastructure

With the advent of Customer Contact Centre and Revenue Cycle and Billing Operations in 2012, the Customer Service department is expected to be highly reliant on information technology to deliver a stable and scalable operation, to drive efficiencies in its business operations and to continue service improvements for its customers. Information technology infrastructure will play a key role in achieving this mandate with the required infrastructure being delivered through the CCE Project in 2011. As such, in 2012 when the Project is completed and the delivered infrastructure becomes fully operational, IT forecasts an incremental $994 thousand to the existing operations support model for fees associated with the maintenance and support of this new infrastructure. In 2013, there is a reduction of $13 thousand to reflect the decommissioning of the equipment used by the Project office and the redeployment of the equipment into inventory for future usage or retirement as some of the equipment will have reached the end of its useful life.

Labour

As a centralized service organization charged with technological enablement of the new Customer Service department, IT must maintain an effective staffing level commensurate with the expectation of this new organization, core applications and business processes. This will better enable IT to respond to departmental and ultimately customer demands and to meet ongoing service delivery expectations. As such, IT forecasts incremental headcount for the Enterprise, Application and Infrastructure support teams to support the Customer Service department's business processes and supporting technologies. Specifically, the IT department requires additional headcount to bolster the key functions in customer self-serve, billing operations and technical support for IT infrastructure and software applications in production. In order to facilitate these functions, IT forecasts the addition of ten employees for a total of $988 thousand in 2012 with continued support to the Customer Choice program estimated at a combined resource of one employee. It is important to note that labour costs in 2012 represent three quarters of the year (April – December 2012) as the project stabilization period (January – March 2012) remains a charge to the CCE Project. As such, an incremental $310 thousand is required in 2013 to account for the full year.

Facilities

Facilities will be responsible for providing services ranging from building asset operation and maintenance, physical security, space planning, office furniture and equipment, mailroom and reception services for both the Burnaby and the Prince George facilities.

The 2012 funding request of $2.5 million is comprised of the following:

- Lease Contract expense of approximately $2 million for the Burnaby facility lease and parking;
- Service contracts and building maintenance are estimated at $225 thousand, and includes janitorial, landscaping, snow removal, carpet cleaning, security, HVAC maintenance, generator and UPS maintenance, pest control, electrical and fire extinguisher maintenance;
- Utility costs estimated at $185 thousand for electrical, natural gas and water; and
- Administration costs of $160 thousand for stationery, courier, postage, office equipment maintenance and first aid supplies.

For 2013, a $19 thousand increase is required to support inflationary increase in rent and electricity.

5.3.7.4 Deferral Account Summary for the Ongoing Operating Costs of the In-sourced Service Model

This section provides a summary of the ongoing operating costs of the in-sourced activities, with a comparison of the 2012 and 2013 forecasts to the preliminary O&M estimates supplied with the CCE CPCN application. As explained below, a deferral account is sought for variances from these forecasts due to the unique uncertainties related to the first years of operating under the new service model and technology platform.

Table 5.3-32: 2012 and 2013 Ongoing Operating Costs of the In-Sourced Service Model

($ thousands)

Ongoing Operating Costs of In-sourced Activities	2012 Forecast	2013 Forecast
Contact Centres (Burnaby and Prince George)	12,349	11,837
Revenue Cycle & Billing Operations	15,256	15,026
Customer Relations[a]	997	1,032
Total Customer Service	**28,602**	**27,895**
Centralized Support Services	5,963	6,233
Grand Total	**34,565**	**34,128**
Estimate supplied with CPCN Application[b]	**35,282**	**35,660**
Savings	**(717)**	**(1,532)**

[a] These services were identified in the CCE CPCN application as necessary to support the in-sourced activities

[b] These estimates correspond to the 2012 and 2013 O&M forecasts of $46.2 million and $47.5 million submitted with the CCE CPCN application before inclusion of manual meter reading costs.

Since the estimate was provided in the CCE CPCN Application, the forecast for ongoing operating costs of the in-sourced activities has been refined by drawing on the detailed functional design of the new CIS and the most current information from the CCE Project. The revised estimates are $0.7 million lower for 2012 and $1.5 million lower for 2013 than the estimates supplied at the time of the CCE CPCN application. The $0.7 million savings for 2012 is due to lower forecast centralized support costs and an additional $0.8 million savings in 2013 is primarily due to lower staffing requirements in the Contact Centres and Revenue Cycle and Billing Operations than was anticipated at the time of filing of the CCE CPCN application.

The operating cost estimates for 2012 and 2013, however, are subject to a number of uncertainties related to the first years of operating under the new service model and technology platform. The types of uncertainties include fluctuations in call volumes, the rate of customer adoption of new communication channels and self serve options being offered, the stabilization of the new CIS and its impact on the end to end business processes, along with a potentially longer than anticipated duration required for new staff to become skilled and proficient at their responsibilities.

As discussed above, although FEU believes that the 2009 call volumes are a good indicator of call volumes for 2012 and 2013, there are uncontrollable events that can significantly increase the number of calls into the contact centre. For example, significantly colder weather and significant variability in gas commodity costs would increase the number of calls, as customers seek clarification on their energy usage or statement balance.

As also stated above, the CCE project team is still in the process of implementing the new CIS and therefore the detailed steps of the end to end processes have not yet been fully developed and tested. Once the operating experience with the CIS and related processes is gained, FEU should be able to more accurately forecast operating expenditures.

In addition, there will be new staff hired and trained to perform these new processes utilizing the new CIS. The project team is developing comprehensive recruiting and training programs but has limited insight into the pool of eligible applicants it will receive, and consequently how fast these new staff members will grasp their new duties, responsibilities and perform the new business processes. Thus, while FEU anticipates that that there will be a reduction in the need for resources in 2013 as staff become more proficient at their roles with front-line experience, the extent of this reduction is difficult to estimate with accuracy.

Given these uncertainties, the Companies are requesting a deferral account to capture actual expenditures that differ from the 2012 ($28.6 million) and 2013 ($27.9 million) forecast O&M expenditure levels for the ongoing operating costs of the in-sourced activities. The FEU believe that any savings associated with the ongoing operations of the in-sourced activities should flow back to customers and the converse should also hold true.

In addition to the expenses shown above, this same deferral account will also capture variances in meter reading expenditures between the forecast and actual 2012 and 2013 levels as discussed in Section 5.3.7.3.

5.3.7.5 Service Quality Measures

The transition to an enhanced customer service delivery framework will enable FEU to exercise greater control over the processes and technologies that facilitate the Companies' ability to adapt to changes in the business environment and in customer expectations to ensure service quality is maintained and enhanced. FEU understands that service quality measures need to be revisited and refreshed to reflect customers' evolving needs, and the implications of technology changes which will support business process improvements. For these reasons FEU will be evaluating performance measures during the first year of operations, and will be assessing the appropriateness of the existing service metrics to ensure they are reflective of the business process changes along with overall customer expectations. Some of these metrics will be for internal review, as they will seek to monitor the efficiency of discrete business processes; while others will be more visible and measure the direct impact on customer service delivery. As such, FEU will continue to measure service quality through the existing Service Quality Indicators for 2012 and 2013, as described in Section 3.1.2.

5.3.7.6 O&M Expenditures for each Utility

The forecasts for each utility, presented below, have been derived by forecasting the direct costs for each utility, or identifying those costs that pertain to all utilities and allocating to the

Mainland, Vancouver Island and Whistler utilizing customer count as the allocation base. The use of customer count as an allocation base is consistent with the methodology that has been in use with the existing BPO arrangement. All changes in O&M expenditures for the Customer Service department (other than labour and benefit inflation on existing O&M employees) has been classified under the cost driver Customer and Stakeholder Expectations.

The O&M forecast changes from 2011 to 2012 are primarily the result of efficiencies achieved in transitioning Customer Service activities from a BPO arrangement to a in-sourced framework, as described above. The increase in 2013 is driven primarily by an increase in manual meter reading service costs as the benefits of joint gas/electric meter reads with BC Hydro disappear.

MAINLAND

The table below shows the Mainland's O&M expenditure changes from 2011 to 2013.

Table 5.3-33: Mainland Customer Service O&M requirements

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	56,935	(15)	120	-	(1,653)	-	-	(1,548)	55,388
2013	55,388	-	553	-	3,018	-	-	3,571	58,959

VANCOUVER ISLAND

The table below shows Vancouver Island's O&M expenditure changes from 2011 to 2013.

Table 5.3-34: Vancouver Island Customer Service O&M requirements

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	5,459	(3)	-	-	(198)	-	-	(201)	5,257
2013	5,257	-	-	-	342	-	-	342	5,599

WHISTLER

The table below shows Whistler's O&M expenditure changes from 2011 to 2013.

Table 5.3-35: Whistler Customer Service O&M Requirements

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	156	-	-	-	(10)	-	-	(10)	146
2013	146	-	-	-	8	-	-	8	154

FORT NELSON

The table below shows Whistler's O&M expenditure changes from 2011 to 2013.

Table 5.3-36: Fort Nelson Customer Service O&M Required

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012*	136	-	-	-	(136)	-	-	(136)	-
2013	-	-	-	-	-	-	-	-	-

** Following the in-sourcing of the customer service function in 2012, the 2011 approved Fort Nelson Customer Service O&M of $136 thousand was transferred to the Corporate department. This approach recognizes that customer service costs are captured in FEI and then allocated to Fort Nelson in a manner which is consistent with other FEI departments' allocated costs, in the Corporate department.*

5.3.7.7 Customer Service Summary

In 2012, FEU sees an evolution in the Customer Service delivery model, as it transitions to an in-sourced framework with direct control over customer points of interaction that will enable the Companies to better meet the expectations of its customers. The estimates prepared for 2012 and 2013, have drawn upon both historical data together with the most current functional design of the new CIS. However, the Customer Service department will be faced with business uncertainties that can only be identified, evaluated, and effectively managed once the in-sourced services are operational and the Customer Service staff have had "on the job" experience; and therefore it is reasonable, prudent and in the interests of our customers, that FEU request a deferral account to capture both actual expenditures that differ from the forecast 2012 and 2013 O&M expenditure levels for the ongoing operations of the in-sourced activities, and variances in the 2012 and 2013 meter reading costs.

5.3.8 ENERGY SOLUTIONS AND EXTERNAL RELATIONS

5.3.8.1 ES&ER Departmental Overview

FEU's Energy Solutions and External Relations ("ES&ER") Department has evolved during 2010 and 2011 from the Marketing and Business Development Department that existed at the time of the 2010-2011 RRA. The implementation of a new Customer Information System and in-sourcing of Customer Service activities[84] resulted in the creation of a new Customer Service department, which caused business activities between the two groups (ES&ER and Customer Service) to be realigned. Customer service and customer research activities were moved to the new Customer Service department, while customer information, education, energy solutions and business facilitation activities remain with the ES&ER department. For more information about the Customer Service department, please see the preceding Section 5.3.7.

[84] CIS implementation and in-sourcing of customer service activities was approved in February of 2010 by Commission Order No. C-1-10.

Functional groups within ES&ER are Market Development, Resource Planning and Market Assessment, Community, Aboriginal and Government Relations, Communications and Energy Solutions[85]. Included in the responsibilities of these groups are:

- Planning and implementing energy efficiency and conservation ("EEC") programs;
- managing customer energy solutions and key customer accounts;
- developing new initiatives and service offerings to meet customer needs;
- energy demand and customer forecasting and integrated resource planning;
- developing and executing customer, public and employee communication; and
- liaising with communities, First Nations, government and other stakeholders.

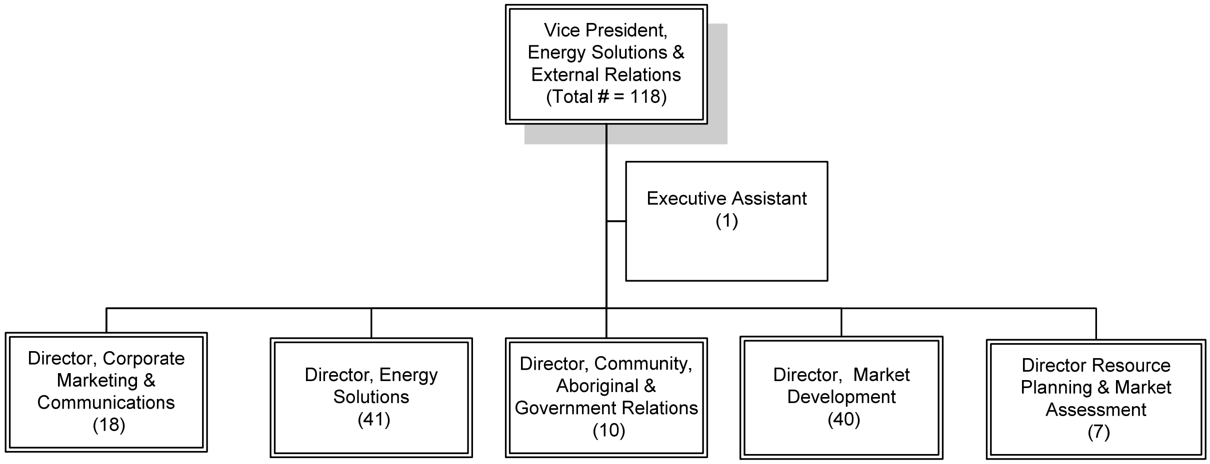
ES&ER ORGANIZATION CHART

Figure 5.3-4 shows the five major areas of responsibility within the Energy Solutions and External Relations department as discussed above. The numbers of employee positions shown within each group are projections to the end of 2011. Additional description of the activities of these groups follows. A number of 2010 and 2011 achievements for the ES&ER department are presented in Section 5.3.8.3.

[85] Thermal Energy Services is also a workgroup within the ES&ER department: however, all costs for this group are tracked in a separate deferral account and not recovered from natural gas customers for 2012 and 2013. The activities and cost for the Thermal Energy Services Group are discussed in Appendix G, but are not shown in Figure 5.3-5.

Figure 5.3-4: Organization Chart for ES&ER

Structured to Meet the Needs of Customers and Other Stakeholders



Note: The Market Development Group in this organization chart includes 17 employees whose costs reside in the Energy Efficiency and Conservation deferral account and are therefore not part of the O&M for ES&ER. This deferral account is discussed in more detail in Section 6.3.

CORPORATE MARKETING AND COMMUNICATIONS

This group is responsible for both internal and external communications strategies and standards as well as media relations. Initiatives undertaken by this group include the development and implementation of customer communications, safety education messaging, social media activity, traditional media plans, corporate awareness messaging and events.

ENERGY SOLUTIONS

Staff in this group manage customer relations and key customer accounts, develop and implement activities to add new customers and load, identify and help develop service enhancements and initiatives for existing customers, communicate directly with customers regarding service options and new service initiatives including EEC program opportunities.

COMMUNITY, ABORIGINAL AND GOVERNMENT RELATIONS

This group maintains ongoing relationships with communities and municipalities, First Nations and their support organizations, business associations and key government ministries and organizations that regulate the energy industry, health and safety, and the environment.

MARKET DEVELOPMENT

The Market Development group identifies and develops new energy service products and initiatives such as FEI's biomethane and NGV fueling service initiatives. This group also includes the Energy Efficiency and Conservation function which develops, implements and tracks progress on FEU's efficiency and conservation programs. Supporting activities in this group include monitoring and assessing technology developments, investigating new service initiative opportunities, developing project and tariff applications for submission to the BCUC, and monitoring energy policy and other utility activities within and outside of BC.

RESOURCE PLANNING AND MARKET ASSESSMENT

This group is responsible for energy demand and customer forecasting as well as the development of FEU's Long Term Resource Plan. Currently this group relies on resources from other parts of the Company to provide and analyse research and monitor the energy planning and operating environment in order to complete its tasks. For example, the implications of new legislation or efficiency codes and standards on customer demand for natural gas are an input into the demand forecast, while impacts of a growing marketplace for renewable thermal energy solutions have implications for FEU's long term planning strategies. The Energy Supply and Resource Development Department (see Section 5.3.6) also provides key inputs into the Long Term Resource Plan by continuously monitoring natural gas and propane supply issues and constraints, and assessing alternative solutions.

5.3.8.2 ES&ER O&M Expenditures Overview and Employees

Meeting customer and stakeholder expectations forms the foundation of many of the Companies' operating programs and activities. Table 5.3-37 sets out approved, actual, projected, and forecast O&M costs for ES&ER. These costs are reviewed later in this section.

Table 5.3-37: ES&ER Department Effectively Managing Continued Increased Expectations From Customers and Stakeholders

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 13,599	$ 14,280	$ 14,370	$ 14,370	$ 17,423	$ 18,439
Vancouver Island	$ 1,410	$ 1,329	$ 1,464	$ 1,464	$ 1,657	$ 1,694
Whistler	$ -	$ -	$ -	$ -	$ -	$ -
Fort Nelson						
Total	$ 15,009	$ 15,609	$ 15,834	$ 15,834	$ 19,080	$ 20,132

While 2010 Actuals have exceeded 2010 Approved amounts, FEU projects year-end expenditures to equal the approved amount for 2011, as discussed further in Section 5.3.8.3 and 5.3.8.4. Incremental funding requirements for 2012 and 2013 are explained in Sections 5.3.8.5 and 5.3.8.6.

ES&ER has M&E and COPE employees. The cost of those employees needed to support the activities of ES&ER is included in the O&M costs set out in Table 5.3-37 above. Table 5.3-37 does not include deferral account budgets for EEC and Thermal Energy Services, which are also part of ES&ER. Details of projected spending and requested funding for these deferrals are included in Appendix K along with supporting information for EEC spending and Appendix G for Thermal Energy Services. Table 5.3-38 sets out approved, actual, projected, and forecast employees for ES&ER.

Table 5.3-38: Modest Increases in ES&ER Staff to Continue Meeting Our Commitments to Customers and Stakeholders

Total Employees

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	91	105	95	110	117	117
Vancouver Island	7	6	8	8	8	8
Whistler	0	0	0	0	0	0

Mainland	81	90	85	93	100	100
Vancouver Island	7	6	7	7	7	7
Whistler	0	0	0	0	0	0
Fort Nelson	0	0	0	0	0	0
Total	88	96	92	100	107	107

Note: For the Capital / Deferral employee portion of the table, the heading “Approved” refers to the information presented in the 2010-2011 RRA as approved by the Commission, and does not refer to the 2008 EEC Program Application approval. The number of employees added to the EEC deferral account may vary as programs expand and customer activity increases. As discussed in Appendix K, the number of staff working on EEC initiatives will be managed within guidelines established as part of the 2008 EEC Program Application.

By the end of 2011, ES&ER expects to have increased its employees by 15 over that approved as part of the 2010-2011 RRA. Seven of these fifteen are related to Energy Efficiency and

Conservation activities as programs are developed and launched. These costs are captured in the EEC deferral account, and the associated employees are therefore not included in the O&M portion of the table. Three of the fifteen are included in the Customer Service Department in '2011 approved', but are moved into the ES&ER department in '2011 projection', therefore representing a transfer and not an actual increase in headcount within the company. Four new positions in the Energy Solutions group were created through a reallocation of approved budget spending to ensure the group continued to meet its commitments to customers. Finally, one position was created to manage the new biomethane service offering and was approved by Commission Order G-194-10 as part of a separate biomethane application discussed in Section 5.3.8.5 below. Other minor variances are caused by the accumulated impact of hiring for some new positions later than expected.

5.3.8.3 ES&ER 2010 and 2011 Review - Mainland

As discussed in our 2010-2011 RRA, government policies and regulations, along with public perception and changing energy price pressures, are all contributing to changes to the way that customers are using energy. Customer groups and other stakeholders told FEU that they wanted more service alternatives and energy solutions to help reduce emissions and manage energy cost pressures. As a result, the ES&ER department needed to increase its annual budget in order to undertake a range of new activities to meet evolving customer needs and a dynamic business environment. This increased spending was approved by the Commission and a number of new initiatives were implemented by FEU following the approval. Some of the accomplishments that this increased spending allowed include:

- New and expanded energy efficiency programs for 2010 and 2011 that will result in cumulative energy savings of over 700,000 GJs and associated GHG reductions;
- Bringing carbon neutral biomethane produced using local agricultural waste into the gas distribution system and developing a complete biomethane service offering for customers;
- Critical work toward the successful completion of negotiations for service agreements with a number of Vancouver Island municipalities;
- The development of new natural gas fueling service for fleet vehicles that will benefit all natural gas customers through increasing year-round loads on the gas distribution system; and
- The ongoing development of an integrated thermal energy service offering and project initiatives that will help customers reduce carbon emissions and manage energy costs over the long term, and for which utility spending has been segregated.

In 2010, the department had to manage more business activities than expected. Examples include greater than expected media coverage and public education about FEU's biomethane service offering, greater than expected social media activity, commodity rates education messaging, communications on natural gas solutions for transportation, and expanded event activity such as municipal conferences, industry events and builder association awards support. A communications and public affairs plan was also made a priority for funding reallocation and continues to be implemented. As a result, there was an increase in spending of $680 thousand in 2010.

Some offsetting spending reductions also occurred. These resulted from higher than expected cross-charging of staff time into the deferral account for thermal energy services development, and a longer than expected delay in hiring some of the new staff positions, until part way through 2010.

The 2011 Mainland O&M budget is also shown in Table 5.3-37. 2011 Mainland O&M costs for the ES&ER department are projected to remain at the approved level.

5.3.8.4 ES&ER 2010 and 2011 Review - Vancouver Island

On Vancouver Island, actual spending was lower than approved in 2010 due to cross charges made into the Thermal Energy Services deferral account as well as lower than expected costs for completing municipal operating agreements with a number of Vancouver Island municipalities. The 2011 projection remains consistent with the approved budget.

5.3.8.5 ES&ER 2012 and 2013 Forecast - Mainland

For 2012 and 2013, most of the activities that ES&ER will be undertaking, such as those described in Section 5.3.8.3 above, are the same as those undertaken in 2010 and 2011 based on the 2010-2011 RRA settlement agreement. For these activities, incremental spending in 2012 and 2013 is limited to inflationary pressures. Three important initiatives, however, do require additional incremental resources beyond inflation. One of these initiatives is the public safety education initiative which received some incremental funding for the 2010-2011 period, but requires additional funding to further implement our plan. The second initiative is a range of new activities stemming from the Commission's recent decision on the Companies' 2010 Long Term Resource Plan. The third is the approved ES&ER costs related to the Biomethane Service Offering for 2012 and 2013.

A fourth initiative, fueling service for NGV, is discussed in Appendix I. Budget details related to this initiative are presented in anticipation of a Commission decision on our Application for General Terms and Conditions for Compressed Natural Gas and Liquefied Natural Gas Service.

Table 5.3-39 summarizes the additional funding requirements for the Mainland ES&ER activities. Incremental spending is being driven by a range of cost drivers as explained in the following discussion.

Table 5.3-39: Incremental Mainland ES&ER Funding in 2012 - 2013

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	14,370	(4)	606	750	1,616	-	85	3,054	17,423
2013	17,423	-	489	100	299	-	128	1,015	18,439

CODES AND REGULATIONS

FEU has a responsibility to educate the public about the risks associated with its natural gas and propane products. Thus, FEU has developed safety education programming that is a critical part of the Mainland natural gas Safety Management Plan to meet the requirement of the CSA Oil and Gas Systems Standard Z662-07. Section 10.2 of the Standard indicates that operating companies must "develop, implement and maintain a documented safety and loss management system for the pipeline system that provides for the protection of people, the environment, and property".[86] FEU views public safety education as a key part of our safety and loss management system, and has thus developed a measuring and monitoring system to review the effectiveness of safety education activities.

Further, Annexes M and N of Z662-07 guide the development and implementation of integrity management systems for gas distribution and pipeline systems. Public safety education programs can reduce risk to the public, the environment and property by improving safety awareness, and can improve system integrity by reducing potential hazards caused by third party damage. Therefore, public safety education is also an integral part of FEU's integrity management system.

In 2010, the Companies added a single staff member and increased spending on public safety education, with one of the main objectives being to support safe, secure and healthy communities by increasing public awareness of gas safety risks and the steps that can be taken to minimize the potential for accidents and harm. While this increase in spending has shown positive results, research and statistics indicate that more needs to be done.

An additional $850 thousand annually is needed in the Mainland service area to build on and enhance the success of the public safety education programming established in 2010. This additional spending is necessary for two purposes: 1) to increase the public's understanding of safety issues and appropriate actions pertaining to natural gas odour; and 2) to improve excavation diligence and reduce third party damages to the natural gas system. Due to the timing required for ramp-up of safety messaging activities, Mainland estimates that the incremental cost in 2012 will be slightly less than the annual amount being requested for 2013. The 2012 incremental funding requested for public safety education is $750 thousand, with a

[86] Canadian Standards Association Standard Z662-07 Oil and Gas Pipeline Systems, June 2007, Section 10.2, page 177.

further $100 thousand requested in 2013. This funding will become part of the communications budget within the ES&ER department.

Approximately two thirds of the incremental funding requested for public safety education is expected to be spent on gas odour and action awareness in 2012 and 2013 in addition to current activities. In the 2010-2011 RRA, FEU requested and received approval for $1.0 million in safety awareness spending, primarily to increase the public's awareness of how to identify and respond to a gas leak. Vital to public safety preparedness is ensuring the public knows the proper order of steps to take when dealing with a gas leak. The 2010 campaign has been successful in raising the awareness of how to recognize a gas leak (via its odour) and some of the actions that need to be taken in a gas odour emergency. Research indicates that public awareness of some individual messages increased by between ten and fifteen percent. Recalling all of the messages and the order in which to take appropriate action in the event of a gas leak is much more complex.

The effectiveness of the complete FEU gas odour and action safety messaging (knowing the signs of a possible gas leak and the correct order of actions to take) is measured using a Safety Preparedness Index. This index showed a 5 percent improvement over pre-2010 conditions to a full awareness level of 15 percent. With a target awareness level of at least 50 percent, more funding is required to build on the success to date. Since message clarity, frequency and repetition are all important factors in raising issue awareness, both the increased spending and more time over which to run the education programming are required to reach more satisfactory awareness levels.

The remaining third of the incremental funding for increased public safety education is for excavation diligence (call before you dig). Table 5.3-40 shows that the number of third party damage incidents in each the past 5 years decreased from 2007 to 2009 and then seems to have levelled off. Each incident represents a potential risk to public safety.

Table 5.3-40: Third Party Damage Incidents Decrease and then Level Off

Year	2006	2007	2008	2009	2010
Number of Incidents (all service regions)	1751	1881	1661	1435	1448

The public education programming will work with other safety and system integrity initiatives such as the damage prevention workshops that target excavation contractors as discussed in Section 5.3.5.3. Our education programming will also complement the BCOneCall public awareness campaign, which, on its own, has been insufficient to adequately reduce third party damage incidents. Approximately 30 percent of the requested funding increase will be used for excavation diligence education. A small portion of the budget (approximately 5 percent) will be used to bolster our current gas appliance safety, winter preparedness and gas meter safety messaging.

The additional funding of $750 thousand in 2012 and $850 thousand in 2013 will bring FEU's annual safety education spending during the test period closer to $2 million, or approximately $2 per customer, annually.

CUSTOMER AND STAKEHOLDER EXPECTATIONS

ES&ER will require $1.616 million in 2012 and a further $299 thousand in 2013 in support of the forecasting, research and integrated resource planning activities and the Biomethane service offering.

FORECASTING, RESEARCH AND INTEGRATED RESOURCE PLANNING

FEU's stakeholders[87] are seeking a much greater depth of research and analysis in our long range planning efforts than we currently have the capacity to provide. Feedback from these stakeholders during the regulatory process for the 2010 Long Term Resource Plan ("LTRP") highlights the growing need for new analyses and a broader examination of potential future outcomes. In consideration of these needs, the Commission's decision on the 2010 LTRP together with Commission Order No. G-14-11 requires FEU to comply with a number of related directives. Currently, our integrated resource planning function has very few resources[88] that can be dedicated to these activities. Therefore, In order to comply with these directives and to implement additional initiatives that will improve FEU's integrated resource planning, we are requesting an annual budget increase of $1.5 million, including an additional 7 employees.

Anticipating a ramp-up period in early 2012 for hiring staff and initiating the needed research and analytical activities, the 2012 funding request is $1.2 million, with an incremental $300 thousand in 2013 for a total annual funding of $1.5 million. Table 5.3-41 provides an explanation of the requested incremental funding in relation to the Commission's directives and new FEU initiatives related to our long range planning activities.

---

87 Stakeholders include municipal and provincial governments, First Nations, customer and environmental advocacy groups, energy industry participants, other utilities and the Commission.

88 Currently, 1 full time employee and one shared analyst position are dedicated to the preparation of the Long Term Resource Plan.

Table 5.3-41: Additional Resources are Required to Comply with Stakeholder Expectations and Commission Directives Related to Long Range Planning

<table>
<tr><th>Commission Directive / FEU Initiative</th><th>Incremental Budget Item and Description</th></tr>
<tr><td>20 year vision
- Macro-economic analysis and scenario development / review
- Market transformation scenarios
- Contribution to GHG reductions
- New technology forecasting
- Impact on BC Energy Objectives
- Drivers for non-EEC/infrastructure resource requirements</td><td>- Staffing for increased economic research, analysis and reporting
- Staffing for increased technology research, analysis and reporting
- Staffing for increased energy use and GHG modelling, analysis and reporting
- Funding for economic studies and reports, access to economic forums
- Funding to support market access and transformation studies, reports and analysis
- Staffing and activities associated with investigating non-EEC/infrastructure resource requirements</td></tr>
<tr><td>New Stakeholder Consultation Initiatives
- Resource Planning Advisory Group, Community Consultation Activities and other new consultation activities</td><td>- Staffing for planning, preparing for and executing increased stakeholder activities
- Funding to carry out increased stakeholder activities
- Staffing and funding to respond (within reason) to stakeholder requests and feedback during the long range planning process</td></tr>
<tr><td>EEC Planning and Impacts of New Initiatives
- GHG impact modelling and analysis
- Improved analysis of long term EEC planning and scenarios
- Impact of new service initiatives on EEC scenarios, resource requirements, demand and emissions</td><td>- Staffing for increased energy use and GHG modelling, analysis and reporting
- Staffing for increased analysis of long term impacts of EEC scenarios on other resource requirements
- Staffing to examine potential new service initiatives and analyze impacts
- Funding for increased research into and review of technology advancements affecting energy use</td></tr>
<tr><td>Planning Environment and Demand Forecasting
- Develop end-use forecasting methodology
- Compare with traditional methodology and prove out new methodology pros and cons
- Broader consideration of economic inputs to and impacts of planning scenarios
- Incorporate potential legislative, regulatory or market transformational changes into forecast and resource assessment
- Rigorous analysis of scenarios that consider the impact of new service initiatives on resource needs, energy demand and GHG emissions
- Consideration of other variables that could impact scenarios and results
- Regional / provincial thermal energy demand investigations
- Regional / provincial transportation energy demand investigations</td><td>- Staffing to develop new end-use forecasting methods, prepare and report on new forecasts
- Staffing to compare new and traditional forecasting methods and processes
- Staffing for increased consideration of economic variables in developing future scenarios and considering impacts on energy use and resource needs
- Staffing to examine alternative legislative, regulatory and market future scenarios in regard to energy demand, EEC, new initiatives and other resources
- Staffing to investigate thermal and transportation energy demand on a regional and provincial scale
- Funding to support additional staffing and forecasting initiatives</td></tr>
<tr><td>New report and document preparation requirements</td><td>- Staffing and funding support for communicating issues and analysis results and for including the increased long-range analysis and scenario considerations within the LTRP</td></tr>
</table>

FEU intends to ramp up its research, analytical, planning and consultation capabilities in response to these expectations as soon as approved funding is available. This should facilitate an anticipated LTRP filing in the first half of 2013. Any changes made to this level of funding will reduce the extent to which FEU is able to meet these Commission directives and expectations from customers.

BIOMETHANE SERVICE OFFERING

On December 14, 2010, the Commission issued Order No. G-194-10 in FEI's Application for Approval of a Biomethane Service Offering and Supporting Business Model (the "Biomethane Application"). The program was approved on the basis of a two year pilot period, which requires FEI to provide a comprehensive report on the program at the conclusion of the pilot. FEI is planning to launch the program in June of 2011.

In Order No. G-194-10, the Commission directed FEI to "Include in its next Revenue Requirements Application, in accordance with this Order and the Decision, details of costs for all deferral accounts created by this Order". The requested details are provided in Appendix J, which describes the pending launch of the Biomethane Service Offering and the actual, projected and forecast costs.

The Biomethane Application proposed to allocate and recover the costs of making the program available to customers, such as program administration and customer education, to all non-bypass customers, and that the costs for 2010 and 2011 would be collected into a deferral account but that, starting in 2012, these costs would be included in delivery rates. The proposed treatment was approved.

The incremental costs included in this RRA equal what was identified on page 3 of Appendix G in the Biomethane Application, with a total of $416,384 in 2012. Of these costs, $10,000 is a one-time cost and the remaining $406,384 was increased by a 2 percent inflation factor to determine a requirement of $414,512 for 2013. These costs include items such as customer education, program management and small improvements to the new CIS software. These costs are broken down in detail in Appendix J.

SERVICE STANDARDS AND RELIABILITY

The costs for service standards and reliability shown in Table 5.3-39 relate to non-labour inflation costs. These include inflation on items such as employee expenses, service and outsourcing contracts with third parties, sponsorships and memberships.

5.3.8.6 ES&ER 2012 and 2013 Forecast - Vancouver Island

Table 5.3-42 summarizes the additional funding requirements for the Vancouver Island ES&ER department. Incremental spending is mainly related to the Codes and Regulations driver as discussed below.

Table 5.3-42: Codes and Regulations Drive Most of the Incremental Funding Requirements for ES&ER Needs on Vancouver Island

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	1,464	(1)	37	150	-	-	7	193	1,657
2013	1,657	-	30	-	-	-	7	37	1,694

CODES AND REGULATIONS

Section 5.3.8.5 describes FEU's public safety education initiative and required incremental funding in relation to CSA Standard Z662-07. Our statistics show that the awareness level of how to recognize gas odour is somewhat lower on Vancouver Island than in the Mainland service area. Since recognizing gas odour is the first step in identifying and acting on potential natural gas hazards, it provides an important foundation for the entire gas odour and action education initiative. For this reason, an incremental annual funding amount of $150 thousand is requested specifically for public safety education programming on Vancouver Island.

5.3.8.7 ES&ER Summary

Incremental funding in the ES&ER department for 2012 and 2013 is set against important safety code requirements, and Commission directives and stakeholder expectations. Without these increases, FEU will not be able to meet its public safety education and long range planning obligations. Continued concerns with the state of the public's knowledge of natural gas safety and the implications for the well being of customers, the public and the environment warrant additional attention to public safety awareness education. As well, the changing planning environment and evolving customer needs require additional staffing and funding resources to examine a much broader scope of future long range planning scenarios and uncertainties.

5.3.9 INFORMATION TECHNOLOGY

5.3.9.1 IT Departmental Overview

The IT department is a centralized service group that is responsible for identifying, designing, operating, and maintaining technology solutions to improve the delivery of service. The services encompass three core functions: IT Infrastructure Management, Applications Management and IT Project Portfolio Planning and Execution.

INFRASTRUCTURE MANAGEMENT ("ITI")

ITI manages the overall technology environment and infrastructure architecture for FEU. This team is responsible for the plan, forecast and design of future infrastructure capacity requirements that will ultimately support the development and direction of implementation of new technology services at FEU. This team also ensures the availability, integrity and security of FEU's critical enterprise infrastructure including hardware and networks.

APPLICATION MANAGEMENT SERVICES ("AMS")

AMS manages the overall data and application architecture for FEU and provides application integration design and delivery services. AMS also is charged with supporting and managing existing applications and on-going sustainment. This team provides application architecture and technology advisory services and ensures application projects are developed according to our technology standards.

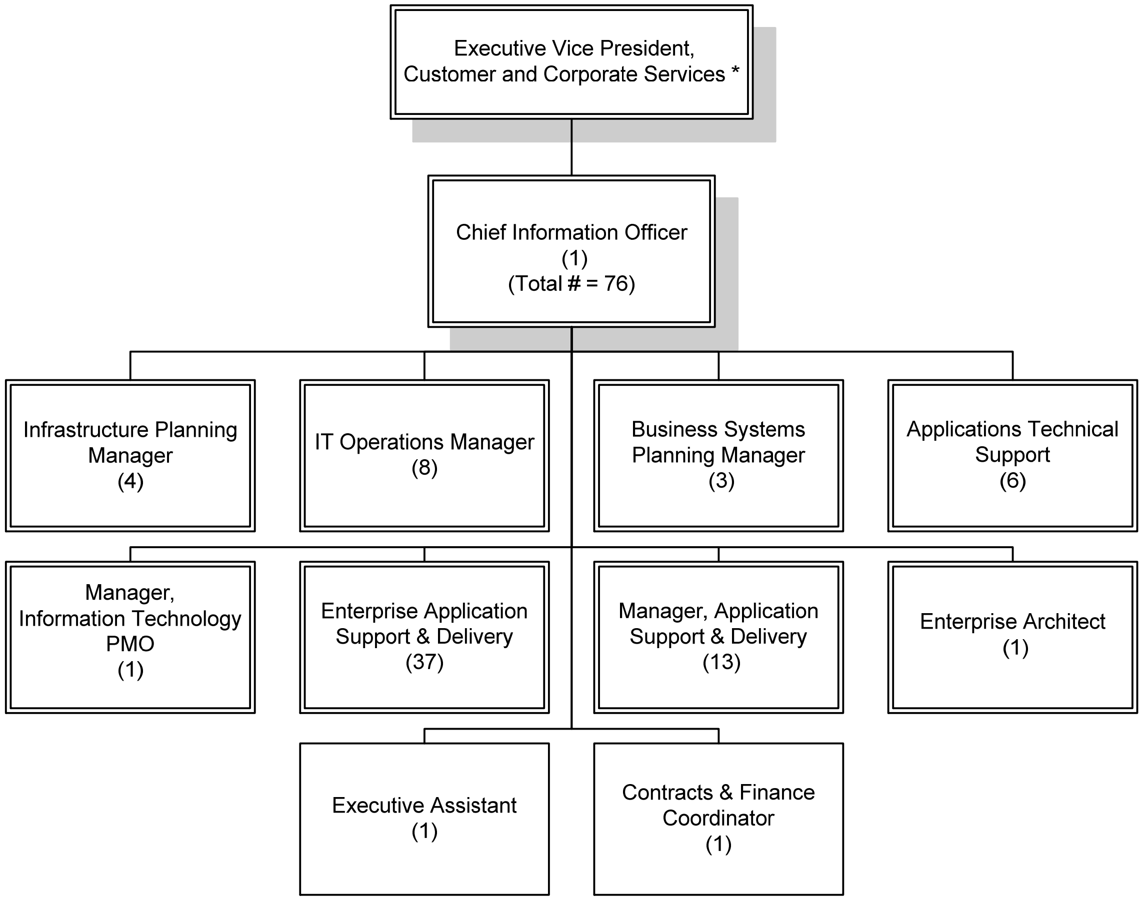
THE IT PROJECT PORTFOLIO PLANNING AND EXECUTION

The IT Project Portfolio Planning and Execution team supports the establishment and facilitates the implementation of the IT Project Portfolio that encompasses all of the capital project work undertaken by IT each year. This Portfolio is comprised of all project requests stemming from IT and many other FEU departments and it is established and executed under a governance process called IT Project Portfolio Management that is further examined in Section 6.2.

INFORMATION TECHNOLOGY ORGANIZATION CHART

The organization chart for the IT department is presented below.

Figure 5.3-5: Organization Chart for Information Technology



5.3.9.2 IT O&M Expenditures and Employees

To continue to identify, operate and maintain technology solutions in support of the FEU Companies, IT forecasts incremental O&M funding and employees in 2012 and 2013 primarily in the Service Standards and Reliability category. Some of the key drivers of this increase are contractual obligations, corporate growth, incremental O&M related to IT capital expenditures, and incremental labour costs related to the continuation of our in-sourcing of key IT sustainment functions. Table 5.3-43 sets out approved, actual, projected, and forecast O&M costs for the IT department. These costs are reviewed later in this section.

Table 5.3-43: IT Department O&M Increases to Maintain Service Standards and Reliability

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 18,353	$ 17,012	$ 20,095	$ 20,095	$ 21,505	$ 22,270
Vancouver Island	$ 423	$ 387	$ 421	$ 421	$ 422	$ 426
Whistler	$ -	$ -	$ -	$ -	$ -	$ -
Fort Nelson	$ -	$ -	$ -	$ -	$ -	$ -
Total	$ 18,776	$ 17,400	$ 20,516	$ 20,516	$ 21,927	$ 22,696

The costs of IT employees (M&E and COPE) are included in the O&M costs that are set out in Table 5.3-43 above, as well as being included in IT capital projects. Table 5.3-44 that follows sets out approved, actual, projected, and forecast employees for IT.

As a centralized service organization charged with IT enablement for FEU, IT must maintain an effective staffing level commensurate with the broader organization. This will better enable IT to respond to other FEU departmental demands and to meet ongoing service delivery expectations.

The IT operating model for FEU is a hybrid model of internal resources and third party service providers. The balance between what functions are managed internally vs. provided by external resources is a complex combination of factors including:

- Skills;
- Labour market conditions – both for the ability to attract qualified employees as well as the evolving business models of third-party service providers;
- The evolution of IT capabilities planned for the enterprise which in turn drives support requirements and new or different skills – both required and in some cases, no longer required; and
- Succession planning requirements.

It is part of our ongoing management role to review these factors and determine the appropriate balance of internal vs. external resources. IT will continue to change the mix of in-sourced vs. outsourced staff to ensure value for the customer and FEU.

For 2012 to 2013, a number of strategic, high-value IT development and support functions currently conducted by vendor partners or external consultants are being brought back in house in areas where it offers value for the customer. This reinvestment in IT's internal capabilities will reduce the loss of core knowledge and expertise and likewise will lead to increased scalability and versatility of the internal team. Through strategically sourcing services, IT is able to balance service levels, skills, internal knowledge and costs, and as market conditions change, adjust the support offerings accordingly. This will have the effect of increasing output against the fixed budgets due to the lower cost of labour taking on this work. Furthermore, IT will be able to leverage the continued offset of future consulting dollars coupled with resource capitalization rates and offsetting O&M related to capital projects to allow for a reestablishment of key functions like Business Analysts, Geographical Information System (GIS) Support Analysts, Project Manager and Infrastructure Support primes without a significant cost to the organization. In fact, the addition of 9 employees in 2012 and the 1 employee in 2013, as shown in Table 5.3-44 above, will result in an incremental cost of $89 thousand in 2012 and an incremental cost of only $40 thousand in 2013.

5.3.9.3 IT 2010 and 2011 Review - Mainland

Throughout 2010, the IT department realized approximately $1.3 million lower O&M than approved. This variance was seen in the areas of labour, consulting costs, and software.

IT experienced approximately $630 thousand less O&M attributable to labour and associated expenses. Across the team, several planned employee positions were hired later than initially forecast in the 2010 plan and there was higher than anticipated turnover of employees with some roles taking a long time to refill. In addition, due to project commitments in 2010, specifically the addition of the CCE Project, which was approved subsequent to finalization of the IT department O&M, much of the team was focused on delivery and did not fully utilize the dedicated expenses budget, which is inclusive of training. IT believes that maintenance and improvement of team members' core skills is vital to the department's continued success. As such, IT will place continued emphasis on the investment in employee training while limiting any impact on the commitment to delivery.

In 2010, IT experienced approximately $283 thousand less O&M attributable to its consulting costs. First, IT sought to put a greater emphasis on in-sourcing a number of previously outsourced high-value sustainment functions, thereby reinvesting in internal capabilities and reducing the loss of core knowledge and expertise. This in-sourcing initiative allowed IT to hire or retrain staff to support these critical functions but at a cost less than the contract, and it also allowed for a greater degree of flexibility. These permanent savings have been redeployed within IT Operations in order to minimize the incremental growth requirements in 2011 and to offset any further pressures that may arise in 2011. Second, IT was also able to forgo planned security testing expenditures in 2010 since this was already conducted as a part of the 2010 Olympic preparation. However, this cost is expected to be incurred in 2011 with planned security testing. Third, several planned maintenance costs were not required in 2010 based on IT taking the decision to pre-buy several extensions in maintenance arrangements, thereby reducing risk to the organization in the longer term. Finally, an minor increase in SAP consulting costs offset the above variances.

There were some very specific one-time opportunities related to software in 2010 that drove lower O&M of approximately $360 thousand. These included the elimination of PST mid-year (returned to customers through the Income Tax Variance deferral account), savings related to the US dollar conversion and inflationary savings on several contracts with software companies, and finally the pre-buying of software licenses and maintenance plans for infrastructure administration and security software.

The IT department anticipates that its 2011 spending will be in line with approved.

5.3.9.4 IT 2010 and 2011 Review - Vancouver Island

IT O&M costs in 2010 were slightly below approved. The IT department anticipates that its 2011 spending will be in line with approved.

5.3.9.5 IT 2012 and 2013 Forecast - Mainland

In order to continue to identify, operate and maintain technology solutions in support of the FEU Companies in 2012 and 2013, IT forecasts incremental O&M funding for Service Standards and Reliability. Some of the key drivers of this increase are contractual obligations, corporate growth, incremental O&M related to IT capital expenditures, and incremental labour costs related to the continuation of the strategic in-sourcing initiative.

As shown in Table 5.3-45 below, O&M expenses increase for the Mainland area by approximately $1.4 million in 2012 and by $765 thousand in 2013 primarily in the Service Standards and Reliability category.

Table 5.3-45: Mainland O&M Increases to Maintain Service Standards and Reliability

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	20,095	(185)	233	4	-	-	1,358	1,410	21,505
2013	21,505	-	290	-	-	-	475	765	22,270

SERVICE STANDARDS AND RELIABILITY

Incremental O&M related to Service Standards and Reliability totals approximately $1.4 million in 2012 and a further $475 thousand in 2013. These increases are driven by IT contractual obligations, growth in staffing levels, and business-driven initiatives for IT projects.

IT contractual obligation increases are driving an increase of $213 thousand in 2012 and $104 thousand in 2013. There are three areas that are generally attributable to annual licensing fees associated with software and for agreements with third parties for the support and maintenance of the Company's applications. First, changes in the SAP software licensing model are driving an increase of $17 thousand in 2012 and $40 thousand in 2013. Specifically, SAP has changed its licensing costs to 22 percent from 17 percent but introduced a graduated annual licensing increase for licenses that were already owned by customers. This graduated scale should reach the full 22 percent by the end of 2015. Second, contract and other inflation accounts for a $48 thousand increase in 2012 and $61 thousand in 2013. This includes TELUS contract inflation along with other software vendors such as Oracle and GE Smallworld. Finally, $148 thousand in 2012 and $3 thousand in 2013 is to purchase software under multi-year support contracts.

As a centralized service department, IT is required to support the projected growth and maturation of the FEU. As such, $92 thousand in 2012 and $12 thousand in 2013 is required to support increased Company-wide headcount, increases in infrastructure to support the new applications, upgrades to capacity for existing infrastructure as well as the ever increasing costs of security. Furthermore, as detailed in the discussion on IT Department employees in Section 5.3.9.2, the addition of 9 employees in 2012 and 1 employee in 2013 as shown in Table 5.3-44, will result in an incremental cost of $89 thousand in 2012 and an incremental cost of $40 thousand in 2013.

In 2010, FEU implemented accounting changes that altered the IT project capitalization policy. Certain costs that had been traditionally capitalized were required to be expensed. These included any costs incurred in the development of feasibility studies, business cases, training, training material, change management and general administration costs. At the time the accounting change was implemented, there were no costs captured specifically in these categories to provide quantitative evidence of this cost for forecast purposes, so it was estimated that these costs would amount to approximately 5 percent of the capital spend, with the assumption re-evaluated after the accounting changes were implemented in 2010 and 2011. Based on an analysis of 2010 actuals and considering the 2011 IT Project Portfolio, IT has calculated that 10.5 percent is required to effectively execute the planned capital spend. As such, IT is forecasting O&M related to capital projects at $2.1 million in each of 2012 and 2013 (10.5 percent of the planned $20 million of IT capital). This is an increase in 2012 of $920 thousand from the 2011 approved of $1.18 million.

Furthermore, the speed and complexity with which the IT industry moves offers a constant challenge to the IT department to maintain pace with industry changes, customer and internal expectations while ensuring prudent expenditures and business value. There are ever increasing security threats and increasing requirements for department support services. As such, $44 thousand in 2012 and $225 thousand in 2013 is required to support the incremental operating expense associated with new IT capital initiatives to address these requirements. These initiatives will include continued support to the Infrastructure Evergreen programs, ensuring sufficient and scalable data protection and storage, combined with the planned replacement of employee IT equipment. Additionally, IT will be seeking to consolidate and upgrade the Enterprise Messaging[89] and telephony infrastructures, specifically Microsoft Exchange and Communication Server upgrades, and the consolidation of email and voice mail through Unified Communication[90] technology. Some expenditures are required to support upgrades in network security infrastructure, replacement of aging network equipment and to enable the increased use of wireless networking. Finally, the biannual validation of the Disaster Recovery environment ensuring stability, performance and effective functioning will commence in 2013 driving an expected cost of $94 thousand.

5.3.9.6 IT 2012 and 2013 Forecast - Vancouver Island

As shown in Table 5.3-46 below, Vancouver Island O&M expense forecasts for 2012 and 2013 are consistent with 2011 projections.

---

[89] Enterprise Messaging is our system that enables program-to-program messaging between applications and systems throughout the enterprise. It is a software interface that enables data (messages) to be sent by one program and stored in a message queue until the receiving program is able to process it.

[90] Unified Communications is a combined software package that includes voice mail, email, Voice over IP and other software communication enablers.

Table 5.3-46: Vancouver Island IT O&M Stable in the Forecast Period

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	421	(0)	1	-	-	-	-	1	422
2013	422	-	4	-	-	-	-	4	426

5.3.9.7 IT Summary

IT is constantly examining all of the above impacts and business requirements to find the appropriate balance of cost, risk mitigation and service. The forecast incremental IT expenditures are required in order to prudently manage, maintain, and support the IT infrastructure of the Companies to meet the goal of servicing the customer.

5.3.10 OPERATIONS ENGINEERING

5.3.10.1 Operations Engineering Departmental Overview

The primary focus of the Operations Engineering department is on technical compliance, achieved through the following areas.

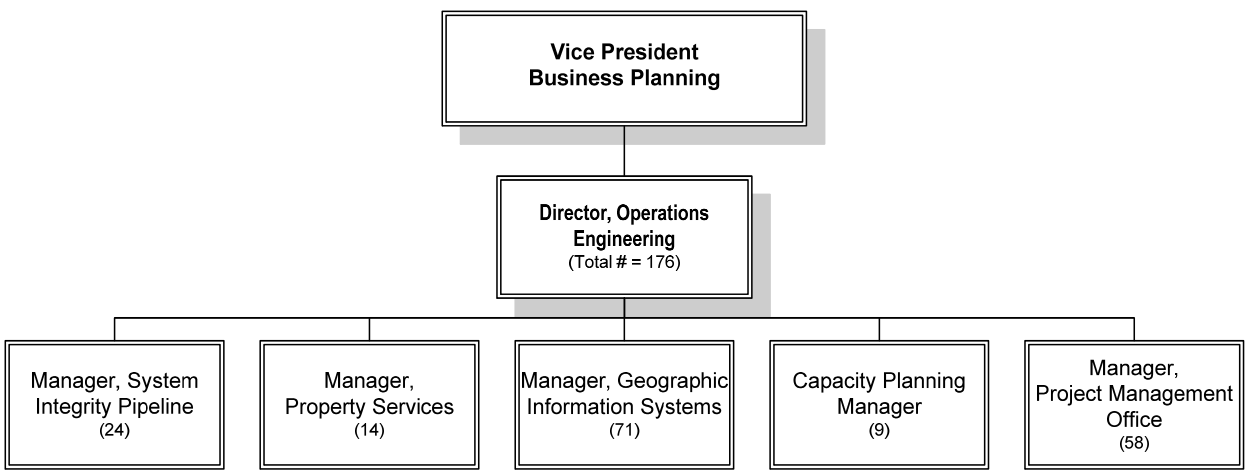
- The Project Management Office is responsible for the complete delivery of all capital projects related to pipelines and above ground facilities to meet the business needs of the transmission and distribution assets. The group provides project management, design services and drafting services to the FEU;
- The GIS area is responsible for completing new mains and service construction drawings and as-built mapping. It is also responsible for developing and maintaining the GIS base mapping system and maintaining the majority of the records for distribution and transmission facilities;
- System Integrity provides risk-based integrity management services related to operating plant and surrounding natural hazards, principally focused on material defect, corrosion, geotechnical and hydro-technical risks, and manages the TPIP on behalf of the Transmission group;
- The Corrosion group operates and maintains the systems providing cathodic protection ("CP") to operating plant;
- Property Services is responsible for managing all land rights and land tenure issues including property taxation, acquisition and disposal, leases, right of way ("ROW") agreements, and for supporting environmental reviews and First Nations negotiations;

- System Planning is responsible for the planning of the lowest cost system improvements for the gas distribution and transmission systems based on system hydraulics and for providing hydraulic scenario analysis for operational enquiries and project development;
- Location Records provides asset information for underground facilities, as requested through BCOneCall; and
- The Gas Lab provides gas measurement and analysis to ensure appropriate levels of odorization of the natural gas that is delivered to customers.

OPERATIONS ENGINEERING ORGANIZATION CHART

The Operations Engineering organization chart is presented below.

Figure 5.3-6: Organization Chart for Operations Engineering



5.3.10.2 Operations Engineering O&M Expenditures and Employees

Codes and regulations compliance and maintenance of service standards forms the foundation of many of the Operations Engineering departmental activities. Table 5.3-47 sets out approved, actual, projected, and forecast O&M costs for Operations Engineering. These costs are reviewed later in this section.

Table 5.3-47: Operations Engineering O&M

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 12,355	$ 12,355	$ 13,288	$ 13,288	$ 14,076	$ 14,633
Vancouver Island	$ 683	$ 983	$ 679	$ 679	$ 677	$ 677
Whistler	$ -	$ -	$ -	$ -	$ -	$ -
Fort Nelson	$ -	$ -	$ -	$ -	$ -	$ -
Total	$ 13,038	$ 13,338	$ 13,967	$ 13,967	$ 14,753	$ 15,310

Operations Engineering has historically met its O&M targets and is forecasting prudent and reasonable increases in its 2012 and 2013 funding requirements going forward. For the Mainland region, Operations Engineering was on budget in 2010 and is projecting to be on target again in 2011 as detailed in Section 5.3.10.3. For the Vancouver Island region, Operations Engineering was allocated $300 thousand of internal funding in 2010 for the Vancouver Island Conflation Project. This was a one-time project for the Vancouver Island region where we updated our outdated municipal GIS landbase and shifted our gas infrastructure representation in GIS to align with the new and current municipal GIS landbase. Further information on this project is included in Section 6.3. For future years, Vancouver Island's forecast funding requirements return to their previous levels. For the forecast period, the additional funding requirements for the Mainland region are detailed in Section 5.3.10.4 below.

Table 5.3-48: Employee Profile Reflects Need to Sustain and to Meet Growing Regulatory and Strategic Requirements

Total Employees

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	164	160	172	176	191	191
Vancouver Island	2	1	2	2	2	2
Whistler	0	0	0	0	0	0
Fort Nelson						
Total	166	160	174	178	193	193

Capital/Deferral Employees

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	47	52	48	56	64	64
Vancouver Island	0	0	0	0	0	0
Whistler	0	0	0	0	0	0
Fort Nelson						
Total	47	52	48	56	64	64

O&M Employees

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	117	108	124	120	127	127
Vancouver Island	2	1	2	2	2	2
Whistler	0	0	0	0	0	0
Fort Nelson	0	0	0	0	0	0
Total	119	109	126	122	129	128

On a total and O&M employee basis, the values for 2010 in the above table show significantly lower actual employees than the approved values because of the use of "seasonal staff". While these "seasonal staff" are approved and reflected in the Operations Engineering budget, they are filled from the temporary pool of staff whose employee count resides in Human Resources. (Refer to Section 5.3.13.3 for a more detailed discussion on this matter).

Other than this anomaly, Operations Engineering has consistently met its employee targets. For future years, Operations Engineering is forecasting a necessary increase in employees to address new and existing compliance requirements as detailed in Section 5.3.10.4 and to respond to anticipated capital program increases related to the LTSP. The employee increases related to proposed increases in capital spending will predominantly occur within the Project

Management Office and will be managed to ensure appropriate resource response to capital project levels and timelines.

5.3.10.3 Operations Engineering 2010 and 2011 Review – Mainland and Vancouver Island

Operations Engineering requested funding for compliance and employee related matters in the 2010-2011 RRA. We believe that we are continuing to successfully deliver against all of those established targets and regulatory initiatives. Our specific delivery on our funding requests are as follows:

- We applied additional funding to the processing of BCOneCall tickets and consistently met the 2 day turnaround requirement of the BCSA for the ticket volumes of 2010 and 2011;
- The funds approved for compliance with the requirements of CSA Z662 Clauses 10.2.1 and Clause 10.2.2 have been applied accordingly and we are now in compliance with these code requirements;
- We spent funds approved through the 2010-2011 RRA on implementing a formal training and competency model for technical staff performing elements of our Asset Integrity Management Programs;
- With respect to gas system asset records and their management, we migrated critical cathodic protection data from our contractor into our systems and we added half of a full time support staff to coordinate the management of our gas system asset records;
- The Corrosion group completed a one-time additional CP survey. As such, the affected cathodic protection records are now located in our Corrosion Data Management System;
- We continue to be able to operate our rectifiers for the cathodic protection of the steel assets because of the funding provided;
- We met our increased vegetation management cost, ROW fees and public awareness program cost;
- We continued to be able to fund our odorant requirements;
- The funds approved for demographics allowed and continues to allow us to successfully and proactively transfer knowledge and skill from our retiring workforce; and
- We successfully funded the Front End Engineering and Design (“FEED”) of many capital projects from the money that was reclassified to O&M due to accounting changes.

5.3.10.4 Operations Engineering 2012 and 2013 Forecast - Mainland

The pipeline regulatory landscape is constantly evolving based on new information, external events, and objectives and directives of the BCUC, the OGC and others having jurisdiction. Operations Engineering will require additional funding in 2012 and 2013 to continue to maintain regulatory compliance and to address recent and anticipated changes in regulatory requirements. Table 5.3-49 sets out approved, actual, projected, and forecast O&M costs for Operations Engineering. These costs are reviewed below.

Table 5.3-49: Prudent and Reasonable Increase to Meet Compliance Challenges

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	13,288	(122)	326	533	-	(190)	242	788	14,076
2013	14,076	-	378	44	-	-	135	557	14,633

CODES AND REGULATIONS

Operations Engineering requires funding to maintain regulatory compliance and also to comply with new regulatory requirements. Each of these requirements is discussed in detail below, with reference to the applicable regulation.

ONGOING REGULATORY COMPLIANCE REQUIREMENTS

On-going regulatory compliance is a key cost driver for the Operations Engineering group. We require additional funding of $208 thousand in 2012 and $94 thousand in 2013 to maintain regulatory compliance related to increased BCOneCall ticket handling costs, increased gas sampling requirements, changes to cathodic protection testing required pursuant to Asset Integrity Management Plan ("AIMP") CSA Z662 Annex N and system capacity network planning requirements.

NEW COMPLIANCE - CSA S250

The soon to be published CSA S250 Mapping Standard for Underground Utilities is the first new driver of funding requirements. This new standard "will specify the mapping requirements for the recording and depiction of underground utility infrastructure, and related appurtenances at or near grade and will apply to proposed existing, abandoned in-place, retired, or reserved for future use, underground utility infrastructure"[91]. FEI participated in the second and final reading of the new standard and will require incremental funding to be able to comply with the standard when it is published (anticipated to be some time in 2011). We need an incremental $222 thousand in 2012 to fully fund a GIS Drafter Leader and required land base mapping, drafting

[91] CSA S250 Standard Mapping of Underground Utility Infrastructure http://www.ogra.org/lib/db2file.asp?fileid=24694

interface and drawing management activities in compliance with this new standard. Subsequently, we will reduce the 2013 budget by $50 thousand that is associated with a one time consultant related ask in 2012. The publication of CSA S250 is imminent and we need funding to bring our GIS system in compliance.

NEW COMPLIANCE - OIL AND GAS ACTIVITIES ACT

The new B.C. Oil and Gas Activities Act ("OGAA") that replaced the B.C. Pipeline Act and became law in October 2010 is the second new driver of funding requirements. As stated on the Oil and Gas Commission website, "Regulations were added and strengthened in areas of compliance, consultation, reclamation, reviews and conservation."[92] New regulations made under OGAA require pipeline companies to perform extensive consultations with communities, landowners, First Nations, environmental groups and industry, reflecting the needs of the people, environment, industry and government. In response to the new and expanded requirements of the OGAA, we need an additional $103 thousand in 2012 to be maintained in 2013 to fully fund an employee for the OGAA Project Coordinator position. Approval of this funding request will allow us to be in compliance with this new requirement of OGAA.

DEMOGRAPHICS

Operations Engineering successfully addressed the demographic challenges faced during the 2010 and 2011 period. The $190 thousand reduction for demographics in Table 5.3-49 above represents the reduction of transitional headcount that was in the budget to address our 2011 demographic challenge.

SERVICE STANDARDS AND RELIABILITY

Operations Engineering needs to increase its resource capacity in order to deliver on the sustainment plan described in Section 6.2. We need an additional $242 thousand in 2012 and $135 thousand in 2013 to provide the required administrative and support resources for the LTSP and programs identified in the plan. Failure to approve this funding request will hinder our ability to execute the sustainment plan and to support the strategic direction of the FEU.

5.3.10.5 Operations Engineering 2012 and 2013 Forecast - Vancouver Island

The Operations Engineering O&M on Vancouver Island consists primarily of property services, corrosion inspections and engineering support services. There are no forecast changes in 2012 or 2013, other than the HST savings for 2012 as allocated to the Operations Engineering group. The 2012 and 2013 Operations Engineering O&M for Vancouver Island is shown in Table 5.3-50 below.

---

92 Oil & Gas Activities Act – Regulating Change, Community www.bcogc.ca/OGAA/

Table 5.3-50: Vancouver Island Operations Engineering O&M Stable for the Forecast Period

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	679	(2)	-	-	-	-	-	(2)	677
2013	677	-	-	-	-	-	-	-	677

5.3.10.6 Operations Engineering Summary

Operations Engineering has implemented and maintained compliance in the areas of Project Management, Geographic Information Systems, System Integrity, Corrosion, Property Services, System Planning, the Gas Lab, and Location Records, and will continue to manage and execute all requirements in 2012 and 2013.

5.3.11 OPERATIONS SUPPORT

5.3.11.1 Operations Support Departmental Overview

Distributed among several communities within British Columbia including Burnaby, Surrey and Penticton, Operations Support is comprised of Measurement Services, Instrument Control Systems and Data Acquisition, Supply Chain Management and Mechanical Services, and Procurement. These groups are staffed with highly skilled analysts, trades people and employees trained to offer meter asset management, technical analysis, field support and supply chain services as described below.

MEASUREMENT SERVICES

METER FLEET MANAGEMENT

Meter Fleet Management encompasses all activities related to maintaining the "health" of the meter fleet in a manner that is cost effective, reliable, and compliant with all federal regulations and public policy. It also includes meter services to third parties.

INSTRUMENT CONTROL SYSTEMS AND DATA ACQUISITION

INSTRUMENTATION AND DATA ACQUISITION

Instrumentation and Data Acquisition involves the maintenance of instrumentation, control and data acquisition systems throughout the Companies' pipeline network. Included are activities associated with daily data validation, editing and estimation on behalf of the commercial and industrial customers who purchase their natural gas through a commodity broker.

RADIO NETWORK MANAGEMENT

Radio Network Management refers to the management of all aspects of the mobile radio network deployed throughout British Columbia. Included are all activities relating to ownership of repeater towers which provide an additional source of third party revenue.

SUPPLY CHAIN MANAGEMENT AND MECHANICAL SERVICES

MECHANICAL SERVICES

Mechanical Services refers to the manufacture and repair of equipment and tools as required by the Operations Department.

SUPPLY CHAIN MANAGEMENT

Supply Chain Management involves all activities related to managing the flow of inventory materials, tools and equipment used throughout the Companies.

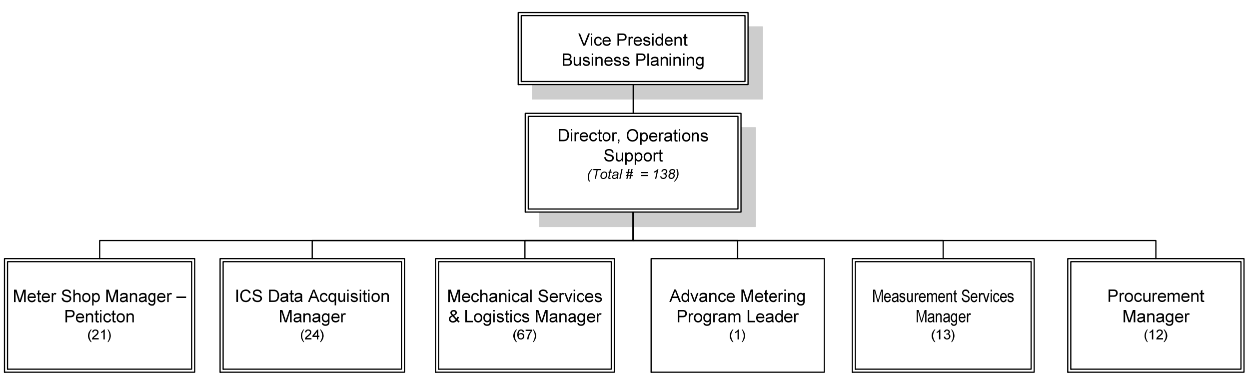
PROCUREMENT

The Procurement group is responsible for assisting departments across the Companies in acquiring a variety of materials and services. Procurement ensures the appropriate processes are followed and agreements are in place in acquiring materials and services. Procurement also assists with market research, risk management, tender evaluations and vendor management.

OPERATIONS SUPPORT ORGANIZATION CHART

The organizational chart for the Operations Support department is presented below.

Figure 5.3-7: Organization Chart for Operations Support



5.3.11.2 Operations Support O&M Expenditures and Employees

Codes and regulations combined with system reliability requirements form the foundation of many of Operations Support department expenditures. Table 5.3-51 sets out approved, actual, projected, and forecast O&M costs for Operations Support. These costs are reviewed later in this section.

Table 5.3-51: Operation Support O&M Requires Significant Increases in the Forecast Period

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 9,486	$ 9,715	$ 9,847	$ 9,847	$ 11,238	$ 11,802
Vancouver Island	$ -	$ -	$ -	$ -	$ -	$ -
Whistler	$ -	$ -	$ -	$ -	$ -	$ -
Fort Nelson	$ -	$ -	$ -	$ -	$ -	$ -
Total	$ 9,486	$ 9,715	$ 9,847	$ 9,847	$ 11,238	$ 11,802

The cost of employees needed for the completion of Operations Support work activities are included in the O&M costs presented in Table 5.3-51. Note that in addition to the completion of O&M activities, Operations Support employees contribute to the delivery of capital projects as required. Employees consist of a combination of M&E, COPE, and IBEW resources. Table 5.3-52 provided below presents the approved, actual, projected, and forecast employees for Operations Support.

Table 5.3-52: Operations Support Shows Stable Staffing Levels

An overview of the O&M and employee changes is provided in Sections 5.3.11.3 and 5.3.11.4 below.

For a discussion of capital expenditures please refer to Section 6.2.

5.3.11.3 Operations Support 2010 and 2011 Review - Mainland

2010 was a challenging year for Operations Support because of the large amount of infrastructure and maintenance work occurring throughout the Province creating increased demand for materials and services while at the same time we experienced an elevated rate of employee turnover resulting in an unsustainable number of vacancies.

Despite implementing a number of cost saving measures to defer spending where reasonable to do so, Operations Support still exceeded its O&M budget by $229 thousand or 2.4 percent. This additional spending on materials and services was required to ensure safety, asset reliability and compliance with public policy was maintained. Some of the drivers of this additional spending include both ongoing and one time spending as listed below.

- Increases in maintenance activities incurred more spending on related materials and replacement parts;
- Increases beyond the inflation rate in the price of these replacement parts;
- Additional inventory of maintenance materials to outfit new field employees with standard quantities; and
- Increase in transportation costs so materials were provided at the required time and location throughout the Province.

Also throughout 2010, Operations Support experienced a large number of employee retirements plus a significant number of employees that transferred to positions within other departments resulting in a considerable recruiting effort within the department. This higher than normal level of employee movement, combined with the unique skill sets required to fill the positions left vacant, resulted in an average of 10 O&M vacancies as shown in Table 5.3-52.

In 2011, Operations Support's activity level is projected to increase slightly, while both the one time expenditures and the rate of employee turnover is expected to decline. Operations Support anticipates meeting the approved 2011 O&M budget. In addition, Operations Support will continue to actively recruit for vacancies and expects to fill them throughout 2011 and early 2012 in order to ensure all O&M activities are completed and the Company's capital program is adequately supported.

5.3.11.4 Operations Support 2012 and 2013 Forecast - Mainland

Operations Support's O&M costs are driven by several critical activities conducted in support of the Companies' operating activities. These activities include management of the Companies' meter fleet, maintenance of instrumentation and communication equipment, and supply chain and procurement services. Therefore, as demand for these services is projected to increase due to growth within the business and changes in public policy, a corresponding increase in Operations Support O&M funding is required to continue providing these services in a safe, reliable and cost effective manner.

Table 5.3-53 below shows the increase in Operations Support's O&M budget for 2012 and 2013. Each of the main drivers is described further below.

Table 5.3-53: Increased Funding Driven by Support Activities for Operations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	9,847	(91)	675	352	67	-	387	1,391	11,238
2013	11,238	-	252	65	10	-	237	564	11,802

CODES AND REGULATIONS

Operations Support has three incremental funding requirements for 2012. These are in the areas of communication systems, gas detectors, and maintenance on emergency response equipment. Each of these items is discussed below.

Operations Support requires $170 thousand in O&M funds in 2012 to mitigate the risk of losing the use of the Company's communication systems that are critical to a coordinated emergency response. The FEU owns and operates a series of radio towers located throughout the Province. These towers are used by voice and data communication systems that are critical to the daily and emergency operations of the FEU. In the summer of 2009, one of the Company's radio towers was at risk of being damaged from a nearby forest fire. A subsequent review of the various radio tower sites showed that these assets require a program of vegetation management in the surrounding area to protect these sites from potential damage. In addition, structural inspections and maintenance are now required because of the age of our towers. Inspections are mandated by regulation CSA-S37-2006 and will ensure the radio towers are operated in a safe and reliable manner.

Operations Support requires an additional $105 thousand in O&M funds in 2012 to maintain our fleet of gas detectors due to the introduction of new units that are capable of monitoring methane and other dangerous gases. This funding requirement is critical to the ongoing maintenance of these units as they are the first line of defence for our customers and employees working in an environment where dangerous gases can be present. The need for these gas detectors is mandated in Worksafe BC's Occupational Health and Safety Regulation Section 5.48 and in CSA Z662 10.3.7.1

Operations Support requires $77 thousand in O&M funds in 2012 to maintain critical emergency response equipment. This equipment has reached the age that manufacturers recommend to start performing preventative maintenance functions. The availability of emergency equipment is stipulated in CSA Z662 10.3.2.5. FEI will be at risk of its critical emergency equipment not being available or failing when it is most needed if this maintenance is not performed as recommended by the manufacturer.

In 2014, Measurement Canada, the federal agency that regulates FEU's meter fleet, is legislating sampling plan SS06 which is a more rigorous standard on meter sampling, testing and accuracy tolerances than the existing standard. In particular, SS06 will result in a 50 percent increase in the number of meter samples. As such, in 2013 Operations Support requires $65 thousand to meet Measurement Canada's requirements for testing and reporting of meters in order to avoid potentially costly fines. To ensure FEU's meter fleet meets these requirements and avoids costly fines two additional labour resources will be required in the second half of 2013. These resources will be trained on measurement operations and be involved with additional meter handling and testing so our meter fleet will be in compliance with Measurement Canada's regulations by January 1, 2014.

CUSTOMER AND STAKEHOLDER EXPECTATIONS

FEI offers automated meter reading ("AMR") service to its existing 2,700 commercial and industrial customers that fall within rate schedules 5, 7, 22, 23, 25, and 27. The most recent AMR units use cellular networks as the communication medium instead of the previously used landlines, and FEI has negotiated an agreement with a network provider for wireless services to support these units. Given the success of this technology it is prudent to continue deploying this wireless AMR technology to customers in these rate classes. Funding of $40 thousand in 2012 and additional $20 thousand in 2013 will allow FEI to meet its obligation of providing daily customer consumption information to the respective gas marketers who require this information to optimize their daily gas purchasing decisions.

One additional head count is required part way through 2012 at an incremental cost of $52 thousand to support growth in the business, including new biomethane and NGV programs. The biomethane program is described in Appendix J and NGV program is described in Appendix I.

Offsetting these pressures, Operations Support is expecting an increase in third party revenue activities by $25 thousand in 2012 and an additional $10 thousand in 2013.

SERVICE STANDARDS AND RELIABILITY

Beginning in 2011, FEU began recalling electronic meters installed in vertical subdivisions to be tested for accuracy in accordance with Measurement Canada regulations. At the same time, these meters are scheduled to have their batteries replaced to ensure reliable operation after redeployment to the field. This level of maintenance will continue through 2012 and 2013 and beyond as the next group of installed electronic meters become due for recall. Also in 2010 one of the vendors supplying rotary meters currently deployed in FEU's fleet began offering lithium battery packs to energize the associated micro-correctors in place of the alkaline batteries previously used. This change has resulted in an incremental cost for each meter maintained in the meter shop. The total increase in O&M funding to support the battery replacements in 2012 is $181 thousand and in 2013 an additional $71 thousand. Secondly, FEI will be purchasing additional parts for meter sets to continue delivering gas safely to customers at an additional cost of $149 thousand in 2012. Funding for these materials will allow the Company to extend the life of these assets deferring the cost of replacement.

To cover inflation related to parts and materials required to support Operations Support's responsibilities, $57 thousand is requested in 2012 and an additional $59 thousand is requested in 2013.

Finally, one additional headcount will be required in 2013 to support the LTSP projects at an incremental cost of $107 thousand.

5.3.11.5 Operations Support Summary

Operations Support provides critical asset management, emergency response and system maintenance service to FEU operations. The O&M required to provide these services is increasing because of the increase in activities and the rising cost of parts, and is required in order to continue to provide the level of service required to ensure the safe, reliable and cost effective operations.

5.3.12 FACILITIES

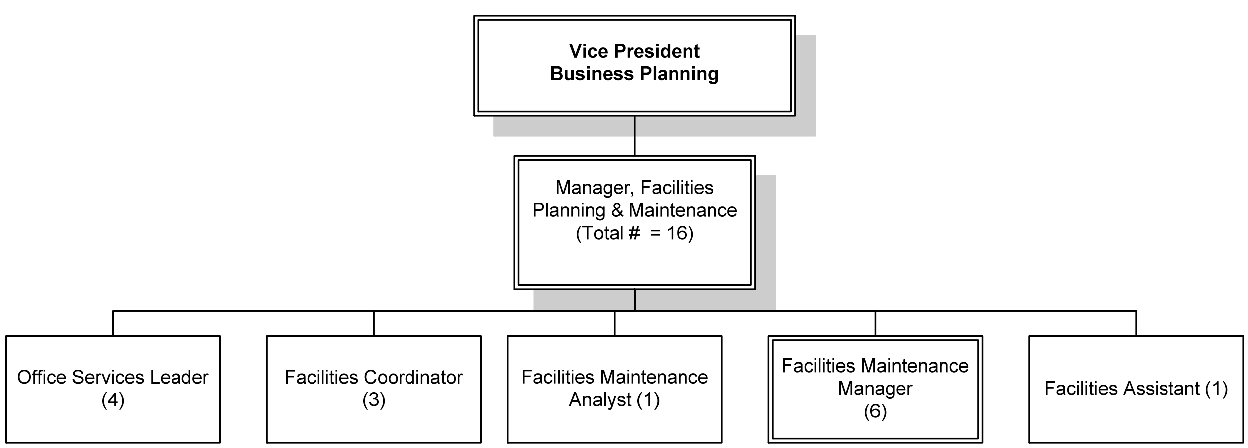
5.3.12.1 Facilities Departmental Overview

The Facilities department is a centralized service group that is responsible for operating and maintaining all non-gas facilities. The services range from building asset operation and maintenance, physical security, space planning, office furniture and equipment, mailroom and reception services. The department ensures that the FEU Companies and their employees have a suitable work environment with safe and efficient buildings and workspaces.

FACILITIES ORGANIZATION CHART

The organization chart for the Facilities department is presented below.

Figure 5.3-8: Organization Chart for Facilities



5.3.12.2 Facilities O&M Expenditures and Employees

Facilities is responsible for a wide range of services, including:

- Cyclical maintenance - This is preventative maintenance service to keep facility assets in good condition, improving equipment utilization and reliability, and ensuring the health, safety and welfare of our employees. As this maintenance is cyclical, the spending pattern associated with these tasks varies based on manufacturer recommendations, best practices and code compliance. Maintenance levels will fluctuate over multiple years, with a corresponding impact on the forecast expenditures;
- Lease Contracts – The FEU Companies hold leases for 26 of their locations. Lease contracts have stepped rate increases, renewals and expiries that affect the required operating costs for the various facilities. Lease contracts demand market rates for the specific lease area;
- Lease Revenue – Facilities acts as the Landlord to tenants at 8 facilities. Lease revenue, similar to lease contracts, have stepped rate increases, renewals and expiries that affect the required operating costs for the various facilities;
- Service Contracts – Contracts for various services are competitively tendered and negotiated over a fixed term. Contract increases can be stepped within the contract term or require renegotiation;
- Operating Costs for utility services – electricity rates are periodically reset; and
- Administrative General – These costs vary with changes to headcount at our facilities, and requirements for consulting costs to ensure subject matter expertise on specific facilities-related concerns. Headcount increases stress the available space and force increases to off-site record storage requirements, additional stationary and janitorial supplies and increases in electricity requirements.

Table 5.3-54 sets out approved, actual, projected, and forecast O&M costs for Facilities. These costs are reviewed later in this section.

Table 5.3-54: Facilities O&M Required to Meet Cyclical Maintenance and Contractual Inflation

Amounts in $ Thousands

Fort Nelson						
Total	17	14	16	17	18	18

An overview of the O&M and employee changes is provided in Sections 5.3.12.3 through 5.3.12.6 below.

5.3.12.3 Facilities 2010 and 2011 Review - Mainland

The Facilities group continues to provide efficient and effective asset management practices and support services to all FEU Companies. In 2010 and 2011, Facilities operated and maintained buildings to ensure equipment utilization and reliability and provided a suitable and safe workplace for our employees. In 2010, Facilities was challenged with unplanned work which has been necessary to complete.

In 2010, Facilities actual costs were $264 thousand above the approved budget. The reason for the increase in expenditure is as follows:

- Flooding occurred at two of our facilities as a result of heavy rainfall which caused water damage to the interior of the Cranbrook and Trail Regional offices. Costs of repairs were $65 thousand.
- Our buildings are increasing in age and increased maintenance and repairs are required to the roofs to prevent roof leaks and extend the life cycle of the assets. As a result of roof condition assessments, Facilities expensed an additional $81 thousand for roof repairs.
- The majority of regional facilities and operations centres have no available workstations. Increased headcount above what had been forecast and incorporated into the Facilities budget resulted in additional reconfiguration, densification and restacking of the facilities. The additional cost to Facilities was $115 thousand.

Facilities employee headcount for 2010 was not attained as a result of competency review and job description re-writes for the Maintenance roles which required a delay in hiring. During the year, vacancies were back filled by contractor services to ensure operations and maintenance were not impacted. Posting of the revised job descriptions was completed in 2010 and the positions are expected to be filled in 2011. In addition, Facilities carries one IBEW employee to cover vacation relief. The vacation relief was filled by contractor services in 2010 as the Company could not release qualified resources from other areas of the organization. In 2011, an additional headcount will be added in the 4th quarter to begin the extensive training requirements to ensure the individual is performing at 100 percent by 2012. As this position is funded 50 percent capital and 50 percent O&M it will have a minimal impact on the 2011 budget.

The decrease from 2010 to 2011 approved is due to the cyclical nature of some of the reconfiguration and maintenance work completed in 2010.

5.3.12.4 Facilities 2010 and 2011 Review - Vancouver Island

Vancouver Island was favourable to budget by $61 thousand in 2010. This was a result of reduced electrical and natural gas charges from lower consumption, and consulting costs. As these variances are not expected to carry forward into this year, Facilities projects it will be on budget for 2011.

5.3.12.5 Facilities 2012 and 2013 Forecast - Mainland

Changes in expenditures in Facilities in 2012 and 2013 are to meet Service Standards and Reliability, as Facilities ensures delivery of a suitable work environment with safe and efficient buildings and workspaces.

As shown in Table 5.3-56 below, Facilities expenses increase for the Mainland area by $228 thousand in 2012, followed by a decrease of $77 thousand in 2013.

Table 5.3-56: Changes in Mainland Facilities Costs Driven by Service Standards and Reliability

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	6,201	(57)	24	-	-	-	262	228	6,430
2013	6,430	-	62	-	-	-	(139)	(77)	6,353

SERVICE STANDARDS AND RELIABILITY

The 2012 Service Standards and Reliability increases are driven by the following:

- Cyclical Building Maintenance increase of $205 thousand to complete projects including electrical vault inspections and interior painting at our Burnaby Stores and Shops location;
- Service Contract increases of $130 thousand for HVAC, janitorial, snow removal and security contracts;
- Labour increase of $87 thousand for addition of 1 M&E headcount as a result of continual increase in workload due to more buildings that are aging and have greater maintenance requirements and more employees who require space and services;
- Operating Cost increase of $81 thousand as a result of higher electricity rates;
- Lease Contract increases of $60 thousand;
- Consulting Fee increase of $56 thousand to complete an energy study for one facility which will provide recommended improvements to reduce energy consumption and GHG emissions, and a building envelope condition assessment for one site which provides condition of building envelope, and addresses any areas of concern with options and recommendations and expected remaining life;
- Remaining increases of $68 thousand for off-site record storage, office supplies, and other miscellaneous costs; offset by
- Lease revenue increases of $425 thousand including tenant contract stepped rate increase at the Kelowna Regional Office, tenant expiry and removal of one lease at the Kamloops Regional Office, and a new tenant contract at the Tilbury location.

For 2013, the Services Standards and Reliability category is expected to decrease by $139 thousand as a result of a reduction in cyclical building maintenance and expiry of the FortisBC Holdings Centre head lease, partly offset by continuing energy cost increases.

5.3.12.6 Facilities 2012 and 2013 Forecast - Vancouver Island

Vancouver Island Facilities expenses are forecast to decrease by $155 thousand in 2012 and a further $924 thousand in 2013, mainly due to the expiry of the Langford Muster and Garbally leases, and the resulting relocation of the Victoria Regional Operations Centre to an owned facility, as approved by Commission Order No. C-6-11. These changes are shown in Table 5.3-57 below.

Table 5.3-57: Facilities O&M Savings as a Result of New Victoria Regional Operations Centre

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	1,618	(5)	-	-	-	-	(150)	(155)	1,463
2013	1,463	-	-	-	-	-	(924)	(924)	539

5.3.12.7 Facilities Summary

The forecast changes in costs continue to be driven by contractual inflation and required service levels for operating and maintaining building assets. The changes are required to ensure Facilities can continue to deliver a suitable work environment with safe and efficient building and workspaces.

5.3.13 HUMAN RESOURCES

5.3.13.1 Human Resources Departmental Overview

The overall goal of the Human Resources function is to ensure that FEU's workforce, now and into the future, has the level of skill and capacity to achieve the Companies' business goals and objectives. The Human Resources department performs and provides different services to support management of FEU's workforce to ensure effective and efficient alignment with FEU's business plans. The following sections provide an overview of the activities and responsibilities within each of the four functional areas in the Human Resources department.

CORPORATE HUMAN RESOURCES

Ensures HR direction and people practices are aligned with departmental and corporate goals and objectives. Areas of responsibility include HR business planning, HR policy development and review, HR governance and reporting, regulatory requirements and corporate HR initiatives.

EMPLOYEE SERVICES

Oversees the design and delivery of the Total Rewards framework that supports the needs of the business by ensuring FEU is able to attract, retain and motivate the type of employees needed to reinforce the desired corporate culture and leadership style. Areas of responsibility include compensation, payroll and time administration, HR Information Systems and master data, and HR metrics, surveys and reporting.

EMPLOYEE RELATIONS

Provides direction and delivery of labour relations and advisory services in an effort to maintain and foster a productive and cooperative employee relations climate. Areas of responsibility include employee and labour relations, HR advisory services, disability and attendance management, collective agreement administration and collective bargaining and contract negotiations.

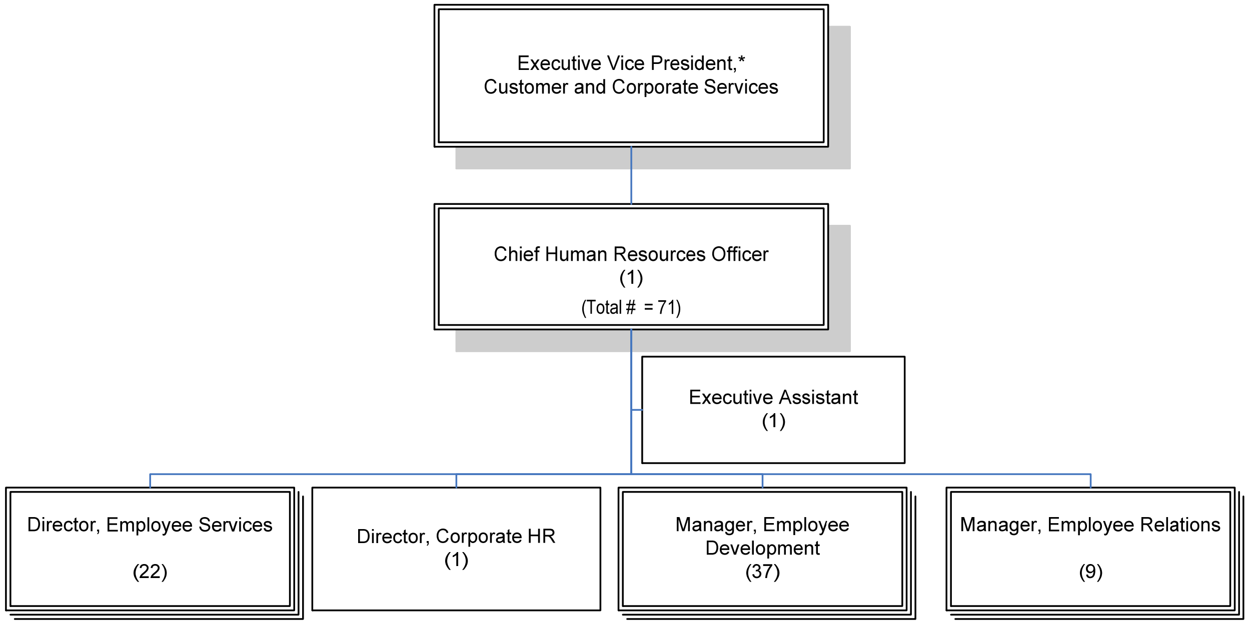
RECRUITING AND EMPLOYEE DEVELOPMENT

Ensures recruiting and selection processes meet business needs and operational requirements. Partners with the business to design and deliver employee training, including management and leadership development programs. Areas of responsibility include recruiting and relief services, development and delivery of trades training and in-house apprenticeship programs, learning content management, management training and leadership development, competency management and administration and training records.

HUMAN RESOURCES ORGANIZATION CHART

The organizational chart for the Human Resources department is presented below.

Figure 5.3-9: Organization Chart for Human Resources Department



The structure of the Human Resources department allows the Companies to efficiently respond to evolving workforce needs required to support achievement of the Companies' objectives and business plans. FEU will continue to place a high priority on all Human Resources activities and talent management needs in order to meet our objectives of retaining, attracting and motivating employees in order to meet customer needs and achieve desired business results.

5.3.13.2 Human Resources O&M Expenditures and Employees

Table 5.3-58 sets out approved, actual, projected, and forecast O&M costs for Human Resources. These costs are reviewed later in this section.

Table 5.3-58: HR O&M Increasing in Response to Evolving Needs

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast

Fort Nelson						
Total	71	116	72	70	71	72

An overview of the O&M and employee changes is provided in Sections 5.3.13.3 and 5.3.13.4 below.

5.3.13.3 Human Resources 2010 and 2011 Review - Mainland

In 2010, FEU experienced a 130 percent increase in the number of employees hired over 2009. This pace is expected to continue in 2011 in addition to the more than 300 new hires which will be required for Customer Service and the new Customer Contact Centres in Burnaby and Prince George. Some departments, particularly the Distribution and Transmission groups within Operations, will experience higher than normal hiring activity in order to replace retiring employees. As the Companies address staffing needs, there will be additional challenges to meet the demand for leadership development and competency based training.

Table 5.3-58 above shows that in 2010, HR exceeded its approved budget by $283 thousand. These funds were used to support the design and delivery of a Leadership Development program to raise awareness and understanding of the core leadership competencies across the Companies.

Table 5.3-59 above reflects an increase of 1 employee between 2010 and 2011 approved, which is the Instructional Designer to support the increased demand for new training. The apparent spike in 2010 Actual employees is due to the fact that the actual employee counts include approximately 45 temporary Relief Services personnel who are hired and managed by the Human Resources Department (and included in HR’s Actual employees), but whose services are charged out to various operating departments that require temporary relief to fill vacant positions. HR does not budget or forecast requirements for Relief Services personnel as the need is determined by operational requirements within the various departments. The reduction of 2 employees approved vs. projected for 2011 results from the reallocation of full-time instructor resources to peer trainers. The instructor headcount has been reduced, but the costs are still incurred in the HR department as peer trainers charge their labour and expenses to the Training Department.

The current demographic profile presents new challenges with respect to training and employee development. These challenges relate not only to the anticipated increased volume of hiring activity, but also the changing skill-sets and competencies required for existing employees as they move into new positions. A total of 270 IBEW employees have been hired since 2007 (new hires, re-hires, and changes in affiliation), each requiring various levels of training. Of those, 108 were hired between Jan. 1, 2010 and Feb. 28, 2011. Structured, competency based training was formally implemented for specific field employees in 2010 to ensure that the Companies were able to demonstrate compliance with new regulatory requirements. In 2011, projected training delivery costs required to support the increased volume of training for field employees is forecast to exceed budget. This pressure will be offset in 2011 by prioritizing formal training based on available funding; however, this is not a sustainable solution in the longer term. The Companies have also moved to a combination of Peer Trainers and full-time Instructors. The use of Peer Trainers allows employees to be trained closer to their work locations reducing travel time and associated expenses.

5.3.13.4 Human Resources 2012 and 2013 Forecast - Mainland

In order to be able to continue to ensure that FEU's workforce has the level of skill and capacity to achieve the Companies' business goals and objectives, Human Resources requires approximately $687 thousand in incremental O&M cost for 2012 and a further $416 thousand in incremental O&M costs for 2013. A discussion of these cost increases by cost driver follows.

Table 5.3-60: Incremental Human Resources O&M Requirements

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	8,280	(14)	265	59	-	313	65	687	8,966
2013	8,966	-	265	-	-	-	151	416	9,382

CODES AND REGULATIONS

Additional funding in the amount of $59 thousand is required in 2012 to satisfy all of the current requirements set out in CSA Z662 Annex "N" and ensure that the management of competencies is consistent, efficient and sustainable. This additional funding will ensure that governance functions required in the Competency Management Program are met and that data entry and reporting are completed in a timely manner. The Competency Management Program supports employees across the Company and is one of the fundamental building blocks for our talent management processes.

DEMOGRAPHICS

As discussed above, the current demographic profile presents new challenges with respect to training and employee development. Additional O&M in the amount of $225 thousand is required in 2012 to accommodate increased levels of training and related expenses in order to meet the demands of the business. To be more efficient and effective in training delivery, FEU is pursuing a blended model for learning that consists of instructor-led learning, computer based learning (e-learning) and informal learning (i.e. coaching, mentoring, self study, peer training, on the job training), supported by a competency management framework that ensures requirements are defined, and training is delivered when required. E-learning is a cost effective method of providing training to large groups of employees across the Province. The demand for e-learning is continuing to grow, and on-going development and delivery of e-learning requires dedicated technical support to sustain these learning assets.

In 2010, $100 thousand was approved for the development of e-learning. A further $59 thousand is required in 2012 to ensure that the deployment of e-learning courses is consistent, efficient and sustainable. This funding will also ensure that employees engaged in e-learning are supported when they encounter system or technical difficulties. To ensure the continued acceptance of this technology, the Training Department requires specialized support to ensure reliable access for e-learning across the Companies.

Managers across the companies are looking for better tools to assist them in analyzing, planning and managing their workforce. The Human Resources Information System (“HRIS”) roadmap (see Service Standards and Reliability below) includes plans to leverage additional functionality to support workforce planning that will attract additional O&M of $29 thousand in 2012

This funding will provide a stable base level of resources to develop and sustain training delivery and provide related tools for workforce planning.

SERVICE STANDARDS AND RELIABILITY

Beginning in 2010, HR began defining technical requirements for the department which were documented in an HRIS roadmap representing a coordinated, long term HR IT strategy that includes enhancements to existing systems. The following HRIS initiatives have been identified as highest priority and require additional O&M funding for IT support and sustainment in the forecast period. These initiatives will help streamline key business processes, provide for more efficient use of resources and give managers direct access to critical employee information they need to manage day-to-day operational requirements as well as develop short and long-term workforce plans.

First, is the purchase of additional SAP licenses, servers and related maintenance at a cost of $29 thousand in 2012. This is needed to support enhancements to HRIS that will improve the administration of processes related to annual salary planning and review as well as incentive pay calculations.

Second, one additional resource in the IT HR group in 2013 to support the implementation and sustainment of Employee Self Serve and Manager Self Serve ("ESS/MSS") at a cost of $109 thousand in 2013. ESS/MSS allows the automation of time entry, salary administration and compensation management, and workforce planning, all in SAP.

The remaining amounts of $36 thousand in 2012 and $42 thousand in 2013 are included to cover all non-labour inflation.

The immediate driver for automated time entry is the addition of approximately 300 employees in the Customer Care organization. Work is currently underway to have automated time entry available for the Customer Care organization at go-live in January 2012, followed by implementation across the remainder of the FEU in 2012 and 2013.

Once ESS/MSS has been fully operationalized across the organization (estimated in early 2014) operational efficiencies will be realized that will result in reduced requirements for resources in salary and time administration and reporting.

5.3.13.5 Human Resources Summary

The overall goal of the Human Resources function is to ensure that FEU's workforce, now and into the future, is of a quality and quantity to enable the achievement of FEU's business goals and objectives. FEU is entering a critical stage in a labour market that is challenged on two fronts, by an aging workforce, and a limited supply of younger, skilled workers graduating from trades and technology programs. In order to remain competitive and continue to grow its business, FEU needs to strengthen the foundation of its end to end talent management systems and processes. This need lies at the heart of the long-term Human Resources vision to "Retain, attract, develop and motivate the right people to achieve desired business results".

5.3.14 ENVIRONMENT, HEALTH & SAFETY

5.3.14.1 EH&S Departmental Overview

The Environmental, Health and Safety ("EH&S") group is made up of the following areas:

- Environmental Affairs, which manages environmental risks associated with operational activities and the fulfilment of compliance requirements with all applicable environmental regulation;
- Occupational Health and Safety, which manages employee safety risk as aligned with the maintenance of compliance with WorkSafeBC regulation;

- Public Safety Awareness, which involves the development of plans and strategies around the education of customers, first responders, and the general public around the properties of natural gas, about the steps to be taken in emergent situations, and about the processes to be followed prior to conducting any ground disturbance or excavation. Research conducted in the department tracks the overall efficacy of the safety communications plan, and allows for targeted messaging throughout the Province that can be adjusted based on customer responses to the annual survey or to the more frequent ad tracking that is conducted. The budget for the execution of the safety awareness communications plan is in the ES&ER group where the communication strategies are implemented;

- Emergency Preparedness, which involves the management of emergency response system compliance with all applicable legislation. An exercise program is conducted in concert with provincial emergency program inputs, in order to maintain operational readiness;

- Business Continuity Planning, a key component of the FEU Corporate Emergency Plan, which is comprised of inter-departmental processes that will serve to ensure timely operational response to our customers and the resumption of core business function if the current operational platforms are unavailable for use; and

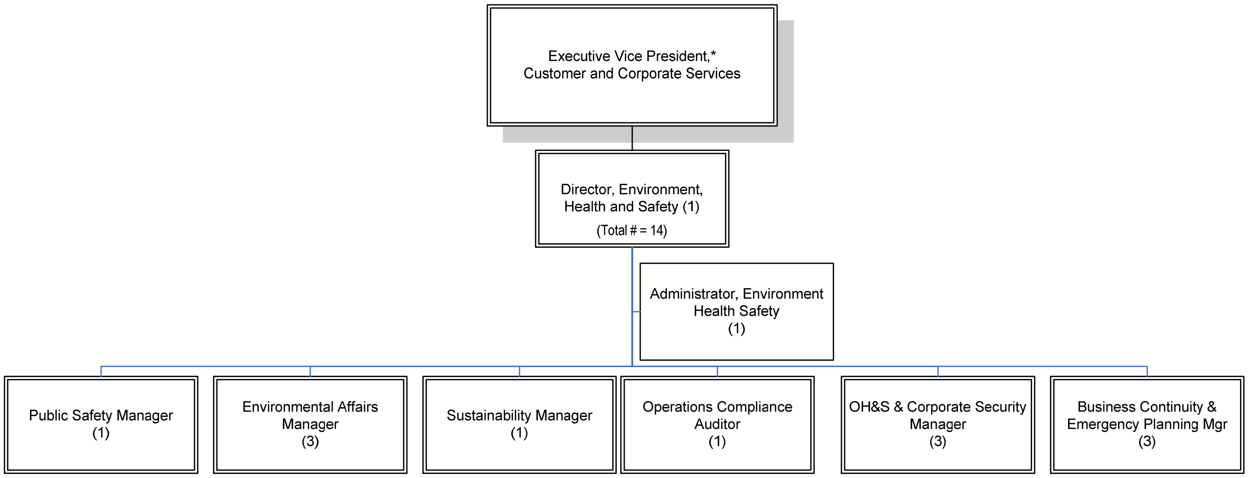
- Corporate Security, which manages corporate security risks.

The programs and activities noted strengthen the management systems that support each of these areas, so as to fulfill regulatory requirements and to provide a suitable working environment for our employees, customers, and the general public. The FEU place a high priority on safe work practice, and on minimizing the operational impact of works conducted on the natural environment.

EH&S ORGANIZATION CHART

The organizational structure for the EH&S Department is presented below.

Figure 5.3-10: Organization Chart for Environment, Health & Safety



5.3.14.2 EH&S O&M Expenditures and Employees

Table 5.3-61 sets out approved, actual, projected, and forecast O&M costs for EH&S. These costs are reviewed later in this section.

Table 5.3-61: EH&S Funding to Meet Changing Regulations and Governance Requirements

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 2,482	$ 2,583	$ 2,615	$ 2,615	$ 2,893	$ 3,057
Vancouver Island	$ -	$ -	$ -	$ -	$ -	$ -
Whistler	$ -	$ -	$ -	$ -	$ -	$ -
Fort Nelson						
Total	$ 2,482	$ 2,583	$ 2,615	$ 2,615	$ 2,893	$ 3,057

The cost of M&E and COPE employees needed for the EH&S department are included in the O&M costs that are set out in Table 5.3-61 above. Table 5.3-62 that follows sets out approved, actual, projected, and forecast employees for EH&S.

Table 5.3-62: EH&S Staffing Levels Stable Through the Forecast Period

Total Employees

Mainland	12	12	14	14	14	14
Vancouver Island	0	0	0	0	0	0
Whistler	0	0	0	0	0	0
Fort Nelson						
Total	12	12	14	14	14	14

An overview of the O&M and employee changes is provided in Sections 5.3.14.3 and 5.3.14.4 below.

5.3.14.3 EH&S 2010 and 2011 Review - Mainland

Additional expenses in 2010 above the approved level occurred as a result of enhanced regulatory tracking and review as related to emerging greenhouse gas regulation. Also, additional public safety messaging was conducted in the key areas of appliance maintenance, excavation diligence, meter safety, and gas odour awareness. These increases were offset by delays in the hiring of new employees. These positions, the Business Continuity Manager and Public Safety Manager positions as described in the 2010-2011 RRA, have now been filled, and there will be an additional manager brought in during 2011 to support the new Greenhouse Gas ("GHG") regulatory reporting activities which will be finalized this year, as well as a headcount to support safety and/or emergency preparedness.

B.C. GHG reporting regulation was further defined for operators in the Province, for both the new Provincial requirements and for the 'One Window' Federal reporting. The different levels of government have strived to avoid duplicating the regulatory reporting burden on industry, with the result that FEI and FEVI will each be able to submit provincial and federal GHG reporting requirements in a single report (FEW does not meet the reporting threshold). The GHG reporting regulation sets out requirements for the reporting of GHG emissions from B.C. facilities emitting 10,000 tonnes or more of CO2e per year beginning on January 1, 2010. Those facilities with emissions of 25,000 tonnes or more are required to have emissions reports verified by a third party.

5.3.14.4 EH&S 2012 and 2013 Forecast - Mainland

EH&S requires $278 thousand in incremental O&M cost for 2012 and a further $164 thousand in incremental O&M costs for 2013. A discussion of these cost increases by cost driver follows.

Table 5.3-63: EH&S O&M Increases to Meet Standards and Expectations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	2,615	(5)	76	50	36	-	121	278	2,893
2013	2,893	-	52	35	50	-	27	164	3,057

CODES AND REGULATIONS

To maintain compliance with Annex A of the CSA Z662 Pipeline Standard, an incremental $50 thousand is required starting in 2012 for the delivery of compliance related environmental training for Operations employees. Operations employees have been hired in a larger group, and will continue to be hired, requiring continued environmental training.

The Companies maintain an Environmental Management System ("EMS") that is compliant with the ISO 14001 EMS standard. The EMS provides guidance to the Company, its employees, and its contractors on compliance requirements as related to all applicable environmental laws, Company policies and industry codes of practice. As part of the ongoing review and development of the EMS, FEI will be implementing an enhanced waste management tracking system in 2013 at a cost of $35 thousand, such that hazardous wastes logged throughout the Company are archived in a central repository. Hazardous wastes will be managed throughout their entire lifecycle, that is, during generation, characterization, treatment, storage, transportation, and disposal. FEI must comply with facility-specific permits and registration requirements per the provincial Environmental Management Act ("EMA"), the Federal Canadian Environmental Protection Act ("CEPA") and the Transportation of Dangerous Goods Act ("TDGA") and their associated regulations.

CUSTOMER AND STAKEHOLDER EXPECTATIONS

In terms of business continuity, additional contingencies are required to ensure the maintenance of key business processes if an event was to occur that would significantly impact the Surrey Operations site and require the activation of the Disaster Recovery ("DR") site. FEI recognizes that improvements must be made if the Company is to be fully prepared to respond to business interruption, regardless of the event. Loss of access to applications and data for an extended period of time is a significant exposure of the organization that needs to be addressed. The majority of companies in the energy and utility industry maintain formal IT / disaster recovery plans; prudent alignment of emergency planning, business continuity and disaster recovery planning has been an industry focus. FEI will attain an expanded DR capacity as well as an alternate location (to Surrey) for first response employees to work from in the event of an impacting event. In 2012 and 2013, $36 thousand is required, in order to purchase licenses, wiring, and other equipment related to telephony; in 2013, a further $50 thousand is required for similar materials that will enable the data access expansion to the DR site. Alternate physical work locations in existing FEI offices in the Lower Mainland will be equipped to manage daily operational requirements outside of the Surrey Operations site. Phone applications will also be expanded to alternate locations, such that post incident system restoration efforts can proceed without significant delay.

SERVICE STANDARDS AND RELIABILITY

The majority of incremental costs in this category relate to contracted increases in licensing fees for IT systems that support the business requirements of the EH&S group.

5.3.14.5 EH&S Summary

The strong corporate governance structure at the FEU, in addition to well defined policies and procedures that are monitored for performance, continue to be important in continually achieving business priorities. The recent 'COR' certification ('Certificate of Recognition') by WorkSafeBC, involving an external audit of the Company's safety management system, is reflective of the commitment to the continued improvement of the FEI safety management system. Three of the current corporate scorecard measures continue to measure workplace health and safety - Recordable Injuries, Recordable Vehicle Accidents and Wellness. The FEU continue to strengthen and fortify all existing management systems, such that risks are prudently managed in accordance with all applicable regulatory requirements

The assurance of operational readiness continues. Joint awareness initiatives with the Provincial Emergency Program, municipal/community representatives, and First Responders continue as related to coordinated response strategies. FEU continues to educate the public about the risks associated with its natural gas and propane products.

5.3.15 FINANCE AND REGULATORY AFFAIRS

5.3.15.1 Finance and Regulatory Affairs Departmental Overview

The Finance and Regulatory Affairs departments are responsible for providing a range of financial and regulatory services to various departments throughout the Companies as described below.

FINANCE

The range of services provided by the Finance department include: maintenance, reporting and analysis of the financial results; financial forecasting and budgeting; administering accounts payable and accounts receivable functions; managerial reporting and other functions.

REGULATORY AFFAIRS

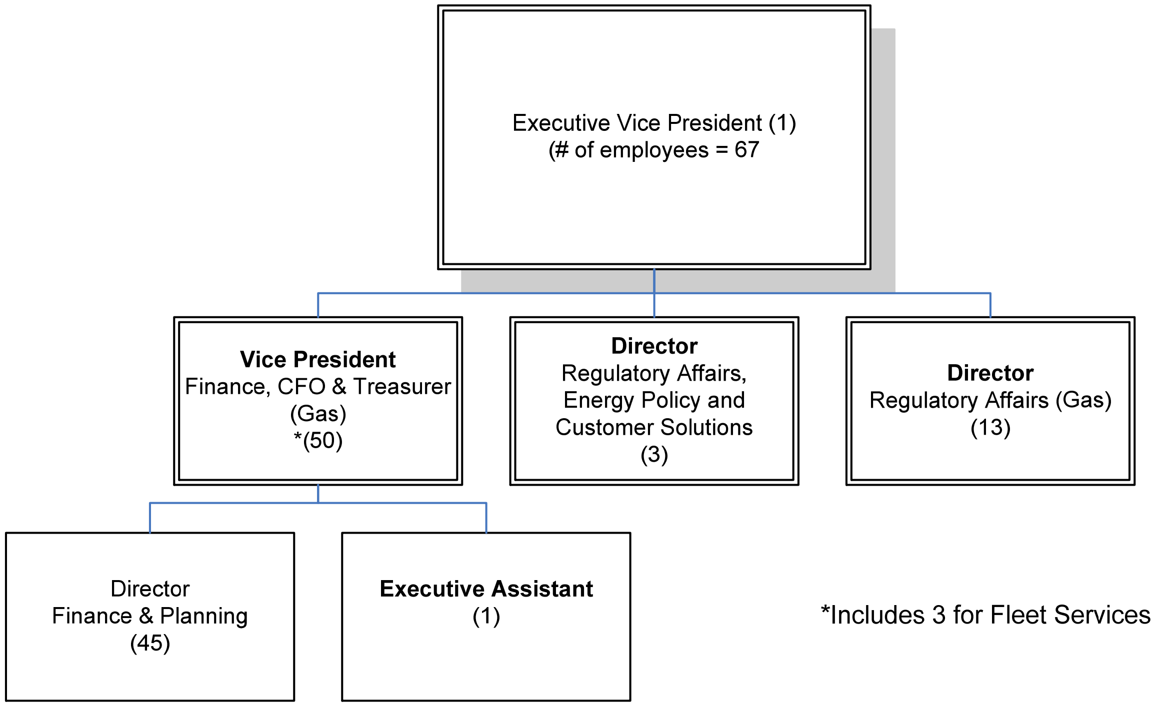
The Regulatory Affairs Department assists the operating groups, business units and Senior Management to achieve their goals in accordance with the UCA and requirements of the Commission.

The Regulatory Affairs Department provides support to the FortisBC Energy utilities by:

- Developing pro-active regulatory plans in support of current and prospective regulatory initiatives and issues;
- Assisting the operating groups with the regulatory process, regulatory and industry research, and analytical support for projects and initiatives;
- Developing rate design (rate pricing) structures that are in alignment with cost structures;
- Managing each utility gas tariff related to applications for changes and new initiatives and ensuring implementation of rate changes;
- Managing regulatory relationships with the Commission and stakeholders on behalf of the gas utility companies; and
- Managing the gas utility companies' compliance with Regulations, Orders, Directives and Decisions.

FINANCE AND REGULATORY AFFAIRS ORGANIZATION CHART

Figure 5.3-11: Organization Chart for Finance and Regulatory



5.3.15.2 Finance and Regulatory Affairs O&M Expenditures and Employees

In order to continue to successfully meet the requirements of our various stakeholders, the Finance and Regulatory Affairs department requires the forecast expenditures and headcount for the 2012 and 2013 test years as shown in Tables 5.3-64 and 5.3-65 below. The Companies believe these forecast expenditures are reasonable, and consistent with expenditure levels observed in recent years.

Table 5.3-64: Finance and Regulatory O&M Forecast to Meet Future Requirements

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 9,616	$ 9,343	$ 9,953	$ 9,953	$ 11,071	$ 11,399
Vancouver Island	$ 380	$ 381	$ 383	$ 383	$ 493	$ 493
Whistler	$ -	$ -	$ -	$ -	$ -	$ -
Fort Nelson						
Total	$ 9,997	$ 9,724	$ 10,336	$ 10,336	$ 11,564	$ 11,892

Table 5.3-65: Finance and Regulatory Employees to Meet Future Requirements

Total Employees						
Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	69	68	69	69	69	69
Vancouver Island	0	0	0	0	0	0
Whistler	0	0	0	0	0	0
Fort Nelson						
Total	69	68	69	69	69	69

The number of employees is expected to remain unchanged during the forecast period. An overview of the O&M changes is provided in Sections 5.3.15.3 through 5.3.15.5 below.

5.3.15.3 Finance and Regulatory Affairs 2010 and 2011 Review – Mainland

During 2010 the Finance and Regulatory Affairs department spending was below the 2010 approved budget. Labour savings resulting from staff turnover and vacancies contributed to the lower spending for the FEU as per Table 5.3-65 above.

In 2011, as vacancies have been filled and the staffing levels in Finance and Regulatory Affairs normalize, the department is expected to meet its budget.

The 2010 Actuals and 2011 Projection O&M are in line with the approved amounts, with the exception of the labour challenges discussed above. The Finance and Regulatory department remains committed to providing the necessary support to the various departments within the FEU in order to achieve our overall organizational commitments.

5.3.15.4 Finance and Regulatory Affairs 2012 and 2013 Forecast – Mainland

Finance and Regulatory Affairs will require the forecast incremental expenditures for 2012 and 2013, described further below, to continue to provide the expected level of service.

The total forecast O&M for the Mainland Finance and Regulatory Affairs departments in 2012 of $11.1 million is comprised of the following:

- $7.44 million of compensation and related costs for the 69 COPE and M&E staff. The employee group is a mix of professionals (Chartered Accountants, Certified General Accountants, Certified Management Accountants and MBA graduates) holding management and senior analyst positions, and other non professional staff providing clerical and administrative services;

- $3.35 million of fees (including BCUC quarterly assessments, audit and filing fees, bank charges, contractor fees and other); and
- $0.28 million for employee training costs, travel expenses, miscellaneous administrative costs, materials and supplies, and professional membership dues.

The table below shows the incremental change in the Mainland Finance and Regulatory Affairs department O&M for 2012 and 2013.

Table 5.3-66: Increased O&M is Required to Stakeholder Needs and Expectations

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	9,953	(1)	417	-	640	-	62	1,118	11,071
2013	11,071	-	328	-	-	-	-	328	11,399

CUSTOMER & STAKEHOLDER EXPECTATIONS

In 2012, the $640 thousand increase in this category includes the following: $300 thousand to reflect recent experience of higher BCUC quarterly assessments (in 2010 the actual BCUC fees were $300 thousand greater than the approved amount), $250 thousand for expected higher levels of accounting audit fees due to the IFRS implementation which does not allow the use of rate regulated accounting, and $90 thousand due to the new requirements around emission reporting as described in Section 5.3.14.3 (starting 2011 the *Greenhouse Gas Emissions Act* requires external verification/audit of greenhouse gas emissions reporting).

SERVICE STANDARDS & RELIABILITY

In 2012, the $62 thousand increase in this category is due to non-labour inflation.

5.3.15.5 Finance and Regulatory Affairs 2012 and 2013 Forecast - Vancouver Island

Finance and Regulatory Affairs O&M in Vancouver Island consists of BCUC Quarterly Assessments, audit fees and bank charges. The table below shows the incremental change in the Finance and Regulatory Affairs department O&M for 2012 and 2013.

Table 5.3-67: Finance & Regulatory Incremental O&M on Vancouver Island

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	383	(0)	-	-	110	-	-	110	493
2013	493	-	-	-	-	-	-	-	493

CUSTOMER & STAKEHOLDER EXPECTATIONS

The 2012 forecast increase of $110 thousand in this category includes the following: $50 thousand increase in BCUC quarterly assessments; $50 thousand increase in accounting audit fees; and $10 thousand increase driven by the government policy around emission reporting. The rationale for seeking these increases is discussed in Section 5.3.15.4, above.

In 2013, the total Vancouver Island O&M forecast for the Finance and Regulatory Affairs is expected to remain unchanged from the 2012 level.

5.3.15.6 Finance and Regulatory Affairs Summary

The increases in Finance and Regulatory Affairs O&M sought in this Application are primarily driven by inflation and changes in Stakeholder Expectations. They represent the resources needed to meet compliance standards and the requirements of regulatory stakeholders.

5.3.16 CORPORATE

5.3.16.1 Corporate Departmental Overview

The Corporate department provides overall management and leadership for the FortisBC Energy Utilities.

The Corporate department centralizes certain corporate wide cost items including: external legal fees, company insurance premiums, the retiree portions of the pension expense and the OPEB costs, FortisBC Holdings Inc. (“FHI”) corporate services fees, industry association fees (i.e. Canadian Gas Association, Western Energy Institute), shared service charges and recoveries between affiliated utilities and shared service recoveries from CMAE, and recoveries from non-regulated businesses.

5.3.16.2 Corporate O&M Expenditures and Employees

The overall O&M and employee labour requirements for the Corporate department for the four regions are outlined in Tables 5.3-68 and 5.3-69 below. These forecast expenditures reflect the allocation of common costs to the various Companies as discussed further in Section 5.3.18.

Table 5.3-68: Corporate O&M for the Forecast Period

Amounts in $ Thousands

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	$ 11,274	$ 13,915	$ 11,201	$ 11,201	$ 7,266	$ 7,424
Vancouver Island	$ 11,057	$ 10,506	$ 11,065	$ 11,065	$ 12,625	$ 12,522
Whistler	$ 251	$ 264	$ 261	$ 261	$ 330	$ 331
Fort Nelson*	$ 317	$ 321	$ 329	$ 329	$ 522	$ 547
Total	$ 22,898	$ 25,007	$ 22,856	$ 22,856	$ 20,743	$ 20,824

** Following the in-sourcing of the customer service function in 2012, the 2011 approved Fort Nelson Customer Service O&M of $136 thousand was transferred to the Corporate department. This approach recognizes that customer service costs are captured in FEI and then allocated to Fort Nelson in a manner which is consistent with other FEI departments' allocated costs, in the Corporate department.*

Table 5.3-69: Staffing in the Corporate Department

Total Employees

Utility/Region	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Mainland	2	1	2	1	1	1
Vancouver Island	0	0	0	0	0	0
Whistler	0	0	0	0	0	0
Fort Nelson						
Total	2	1	2	1	1	1

There are several cost drivers for the Corporate operating costs. Corporate legal fees are influenced by the level of external legal support required by the different departments in the FortisBC Energy Utilities. The Companies' insurance premiums are affected by a number of factors such as the insurance company's insured losses, coverage levels and investment income.

In addition, included under the Corporate department are the shared services costs/recoveries between regulated affiliates as well as the corporate services management fee from FHI. The amounts of inter-company charges are based on the level of activities performed and are governed by the Shared Services Agreements and the Corporate Services Agreement. These agreements benefits the organizations involved as they enable the FEU to harvest the benefits of economies of scale by having a single corporate management and support structure while avoiding duplication of work, and allowing customers to benefit from the efficiencies realized.

For 2010 and 2011 in the Whistler and Fort Nelson regions, O&M tracked very close to the approved amounts. In 2010, the $2.59 million higher cost for the Mainland region is primarily driven by executive retirements and the $550 thousand favourable variance on Vancouver Island was due to lower support costs including employee incentive plan related costs.

With the retirement of FEU's past president in 2010, the number of employees became one and is expected to remain unchanged during the forecast period.

The changes in Corporate O&M for the forecast periods are described in Section 5.3.16.3 thorough 5.3.16.6 below.

5.3.16.3 Corporate 2012 and 2013 Forecast - Mainland

The total Mainland O&M forecast for the Corporate department in 2012 of $7.27 million is comprised of the following: $10.72 million for the FHI corporate services fee, $4.4 million for insurance premiums, $1.29 million for retiree portions of employee pension and OPEB expenses, $1.4 million for supporting costs, $623 thousand for corporate legal expenses, and $467 thousand in cross charges from FortisBC Inc.; offset by a $11.02 million credit for shared services recoveries from Vancouver Island, Whistler, Fort Nelson, Thermal Energy Services, and CMAE.

In addition, included in the $7.27 million is a one-time $616 thousand credit for a shared services true-up. In its 2010 – 2011 Revenue Requirement Application, FEI proposed to include in its 2012 O&M forecast a two year cumulative shared services true-up of actual costs between FEI and FEVI and FEW. Consistent with this approach, included in the 2012 Corporate O&M forecast is a $616 thousand one time true-up of the shared services recoveries ($600 thousand from FEVI and $16 thousand from FEW.) These estimates are based on the observed 2010 actual levels of shared services between FEI and other FEU Companies. In 2010, shared Services provided to FEVI were $300 thousand higher than approved, whereas the shared Services provided to FEW were $8 thousand higher than the approved. The Companies have forecast the 2011 level of Shared Services to mirror the observed 2010 actual levels, so the true-up for each year is the same amount.

Table 5.3-70 below shows the year over year changes broken down by the five cost drivers.

Table 5.3-70: Mainland Corporate Incremental O&M

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	11,201	(27)	(2,817)	-	-	-	(1,091)	(3,935)	7,266
2013	7,266	-	(485)	-	-	-	643	158	7,424

LABOUR INFLATION AND BENEFITS

The decreases in this category in 2012 and 2013 are due to the decreases in the past service cost component of pensions and OPEBs as described in Section 5.3.2.2.

SERVICE STANDARDS AND RELIABILITY

In 2012, the $1.09 million net decrease in this category includes the following items:

- A decrease in costs resulting from an increase in shared services fee recoveries from Vancouver Island, Fort Nelson and Whistler of $1.67 million and the one-time $616 thousand credit for 2010 and 2011 shared services fee recoveries from FEVI and FEW as described above; offset by
- A $1.07 million increase in the corporate cervices fee from FHI and a $125 thousand increase which is the net result of an increase in executive cross changes from FortisBC Inc. and removing the salary of FEU's past president, and an inflationary increase in supporting costs.

In 2013, the $643 thousand net increase in this category is primarily due to:

- a $616 thousand increase due to the removal of the one-time shared services true-up discussed above;
- a $311 thousand increase in the corporate services fee from FHI;
- $220 thousand in higher insurance premiums representing a 5 percent increase over the 2012 estimate;
- a $46 thousand increase in supporting costs; offset by
- $550 thousand higher shared services recoveries from Vancouver Island, Whistler and CMAE.

Please see Section 5.3.18 for a thorough discussion of Shared Services and Corporate Services.

5.3.16.4 Corporate 2012 and 2013 Forecast - Vancouver Island

The total Vancouver Island O&M forecast for the Corporate department in 2012 of $12.62 million is comprised of the $9.04 million shared service fee allocated from the Mainland, the $600 thousand one-time Shared Service true-up discussed above, $1.14 million corporate service fee allocated from FHI, $174 thousand for retiree portions of employee OPEB and pension expenses, $1.04 million for insurance premiums and $630 thousand of supporting costs.

Please refer to the Table 5.3-71 below for the year over year changes broken down by the five cost drivers.

Table 5.3-71: Vancouver Island Corporate Incremental O&M

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	11,065	(1)	(684)	-	-	-	2,245	1,560	12,625
2013	12,625	-	(92)	-	-	-	(11)	(103)	12,522

LABOUR INFLATION AND BENEFITS

The decreases in this category in 2012 and 2013 are due to the decreases in the past service cost component of pensions and OPEBs as described in Section 5.3.2.2.

SERVICE STANDARDS AND RELIABILITY

In 2012, the $2.25 million increase in this category is primarily due to a $1.5 million increase in the shared service fee from the Mainland, the $600 thousand one-time true up discussed above, $110 thousand increase in insurance premiums and a $35 thousand increase in supporting costs.

The increase in the shared service fee is reflective of the increase in O&M for the Mainland business areas which provide operational support but do not charge their cost directly to Vancouver Island.

In 2013, the $11 thousand decrease is primarily due to a removal of the $600 thousand one-time shared service true-up, offset by a $500 thousand increase in the shared service fee from the Mainland, $39 thousand increase in the FHI corporate services fee and $50 thousand increase in the insurance premium.

5.3.16.5 Corporate 2012 and 2013 Forecast - Whistler

The total Whistler O&M forecast for the Corporate Services department in 2012 of $330 thousand is comprised of $251 thousand in shared service fees allocated from the Mainland, $48 thousand of corporate services fees from FHI, a $16 thousand one-time true-up of shared services discussed above and $15 thousand of supporting costs.

Table 5.3-72: Whistler Corporate Incremental O&M

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012	261	(1)	-	-	-	-	70	69	330
2013	330	-	-	-	-	-	1	1	331

SERVICE STANDARDS AND RELIABILITY

In 2012 the $70 thousand increase in this category is driven by a $39 thousand increase in the shared service fee from the Mainland, a $16 thousand one-time true up discussed above, and a $15 thousand increase in insurance premiums.

In 2013, the $1 thousand increase is due to a $17 thousand increase in the shared service fee from Mainland offset by the removal of $16 thousand one-time true-up included in 2012 and discussed above.

5.3.16.6 Corporate 2012 and 2013 Forecast - Fort Nelson

For financial reporting purposes, the O&M costs for Fort Nelson are included in the overall operating and maintenance expense of Mainland. For regulatory reporting purposes, an allocation from Mainland Corporate O&M is made, recognizing the functional support provided to Fort Nelson. This approach is consistent with the past practice and was approved by Commission Order No. G-27-08.

The increase in Corporate O&M is driven by an increase in the Mainland O&M which is used as an allocation base for Fort Nelson and the 2012 reclassification of Customer Service costs. Following the in-sourcing of the customer service function in 2012, customer service related costs are no longer being captured under the Customer Service department. Instead these costs are included as part of Corporate costs and calculated based on the methodology describe above.

Table 5.3-73: Fort Nelson Corporate Incremental O&M

Year (in $'000's)	Prior Year	2011 HST Savings	Labour Inflation and Benefits	Code and Regulations	Customer & Stakeholder Expectations	Demographics	Service Standards & Reliability	Total Incremental	Total Forecast
2012*	329	-	-	-	-	-	193	193	522
2013	522	-	-	-	-	-	25	25	547

** Following the in-sourcing of the customer service function in 2012, the 2011 approved Fort Nelson Customer Service O&M of $136 thousand was transferred to the Corporate department. This approach recognizes that customer service costs are captured in FEI and then allocated to Fort Nelson in a manner which is consistent with other FEI departments' allocated costs, in the Corporate department.*

5.3.16.7 Corporate Summary

For 2010 and 2011, FEU and stakeholders agreed that the requested level of Corporate O&M was appropriate to provide the required leadership to the Companies in an effective and efficient manner. The Corporate department requires the above levels of forecast expenditures for 2012 and 2013 and believes the forecast expenditures are reasonable and appropriate.

5.3.17 CAPITALIZED OVERHEADS

As part of the 2010-2011 RRA, the Utilities had undertaken a study of their overhead capitalized activities. The results of that study indicated an appropriate overhead capitalization rate as applied to gross O&M of 8 percent for Mainland and Fort Nelson, and 5 percent for Vancouver Island and Whistler.

As part of the 2010-2011 NSA for the Mainland, the Parties agreed to a change in the overheads capitalized rate to 14 percent of Gross O&M for 2010 and 2011 which reflected the approximate actual overheads capitalized rate for 2009. This rate of 14 percent was subsequently approved for the Vancouver Island, Whistler, and Fort Nelson service areas.

FEU is of the opinion that there has been no material change in utility operations since that time that would necessitate a further review of the overheads capitalized rate. Therefore, at this time FEU are proposing that the overheads capitalization rate remain at 14 percent of Gross O&M for all utilities during the 2012 and 2013 test years.

5.3.18 CORPORATE AND SHARED SERVICES

5.3.18.1 Corporate Services

The corporate services function consists of certain specialized functions that reside in FHI and Fortis Inc. and that provide expertise to the FEU. These services are shared, providing economies of scale to the FEU. The costs are allocates to each of FEI, FEVI and FEW.

Since the Corporate Services costs and allocations were last determined in 2009, there has been a limited amount of change. The increase is attributable primarily to inflation and the loss of sundry income from the rental of poles at Fortis Inc. The sundry income had previously helped alleviate costs in the FEU but this source of revenue is expected to cease in 2011. Additionally, costs are higher due to higher headcount in functions like Internal Audit and Taxation where certain consulting services have been brought in-house to increase in-house capabilities. Previously, some of these services would have been provided by external resources. The benefit to the customer of this approach is an increased knowledge base today and in the future in order to maintain reasonable costs. In this application, FHI is proposing to continue with the allocation of the same types of costs that were allocated in 2010 and 2011, reflecting FHI’s current ownership structure which has not changed since 2009.

Today, as in 2010 and 2011, the Corporate Services are contracted to FEU through FHI. These costs are consistent with those include in the 2010/2011 RRA as reviewed by KPMG. The report of KPMG was filed with the 2010-2011 RRA in 2009.

FORTIS INC. CORPORATE SERVICES COSTS

The services to be performed by Fortis Inc. are consistent with the services provided by Fortis Inc. to FHI in 2009, which were approved by the Commission. At the Fortis Inc. level, these services are strategic in nature and consist of the following functions:

- Executive (CEO and CFO) - provide strategic direction, leadership and management for Fortis Inc., manage the organizational structure, financial planning, maintaining controls and internal systems, employee relations, external communication, board relations, regulatory compliance, provision of legal services, maintain internal and external audit activities, and corporate financing and budgeting.
- Treasury and Taxation - performs Fortis Inc. Treasury services and provides oversight to subsidiary companies for debt and equity financings, maintaining the capital structure, corporate cash management and forecasting, management of hedging activities, preparation of corporate tax returns, tax planning, coordinating corporate tax audits, rating agency process, and corporate credit facilities.
- Investor Relations - manage analyst, investor and shareholder communications, coordinate Fortis Inc. annual general meeting, preparation of quarterly investor relations reports, manage public and media relations, maintain Fortis Inc. website, manage dividend reinvestment and share purchase plans, and oversight over the Annual Report preparation process.
- Financial Reporting - preparation of monthly, quarterly and annual consolidated and non-consolidated Fortis Inc. financial statements, coordination with external auditors, analysis of financial information, preparation of the Annual Information Form for Fortis Inc., Annual Report for Fortis Inc., quarterly and annual Management Discussion and Analysis for Fortis Inc. and other continuous disclosure documents for Fortis Inc., coordinate consistent accounting policy treatment across the Fortis group, oversight and coordination of conversion to International Financial Reporting Standards, preparation of the company-wide quarterly forecast consolidated earnings for Fortis Inc. and EPS and maintaining internal controls over financial reporting for Fortis Inc.
- Internal Audit - performs Fortis Inc. internal audit activities, provides oversight over the internal audit function at the Fortis subsidiary companies, administers and monitors reports of allegations of suspected improper conduct or wrong doing, development of a company-wide Enterprise Risk Management program approach.
- Corporate Secretary and Board of Directors - annual strategic planning and risk management activities, selecting and evaluating the CEO, appoint officers, review and approve all material transactions, evaluate Fortis Inc.'s internal controls relating to financial and management information systems, establish and maintain policies regarding communication and disclosure with stakeholders, develop and maintain governance procedures.

The eligible costs for allocations to FHI and other Fortis Inc. owned entities are summarized in the following table. The FHI allocation has been included in the totals in Table 5.3-75 below.

Table 5.3-74: Eligible Cost Allocations to FHI and other Fortis Inc. Owned Entities

Estimated 2012 Estimated Costs Services (in 000s)	FHI 44.31%	Other ~~1~~ 55.69%	Total 100%
Executive	1,682	2,114	3,796
Treasury	220	276	496
Investor Relations	702	883	1,585
Financial Reporting	801	1,007	1,808
Internal Audit	73	91	164
Board of Directors	788	991	1,779
Other	1,309	1,646	2,955
Subtotal	5,575	7,008	12,583
Less: Fortis Properties Management Fee Revenue	(665)	(835)	(1,500)
Total	4,910	6,173	11,083

The forecast costs for 2013 includes a three percent increase in overall costs multiplied by the same allocation percentage of 44.31%. The allocation percentage represents the total assets of FHI compared to the total assets of Fortis Inc. Fortis Inc. has consistently allocated costs across its regulated holdings but using the percentage of assets as its allocation factor.

FORTISBC HOLDINGS INC. CORPORATE SERVICES COSTS

The corporate services group at FHI are responsible for providing key corporate function directly to each of the FEU, and consists of the following functions:

- Board of Directors - ensure all continuous disclosure and governance activities required by external regulators and stakeholders and third parties are appropriately carried out, manage the relationship and corporate activities of the FHI Board of Directors, and develop and maintain governance procedures and policies. The Board of Directors is a joint Board that is shared with FortisBC Inc. All costs incurred for compensation and other Board expenses have been shared between FHI and FBC based on an expanded Massachusetts method which incorporates the assets, payroll and net tangible assets. The costs reflected in this Application are the costs less any amounts recoverable from FortisBC Inc.
- Corporate Development, Treasury and Cash Management – execute short and long term financings, cash management and forecasting, arrange operating credit facilities, and negotiate bank-service fees for all FEU entities; responsible for treasury related controls and compliance, compliance reporting, hedging of interest rate and foreign exchange risks, managing the rating agencies, maintaining bank and debt investor relationships, investor and shareholder communication, preparation of annual/quarterly disclosure documents, preparation of the annual report, preparing regulatory submissions in support of ROE, capital structure and financing related matters, providing credit and counter-party credit risk management and assistance in negotiating physical

and derivative commodity contracts to the Energy Supply and Resource Development department for both the gas and electric, assessment and monitoring of physical and financial counterparties, developing appropriate derivative and counterparty policies.

- External Reporting – preparation of monthly, quarterly and annual consolidated and non-consolidated financial statements (for FHI, FEI, FEVI and FEW), coordination with external auditors, analysis of financial information, assisting in the preparation of the Annual Information Form, quarterly and annual Management Discussion and Analysis and other continuous disclosure documents, coordinating consistent accounting policy treatment across the FEU, preparing for and implementing GAAP changes, preparing quarterly forecasts of consolidated earnings and maintaining internal controls over financial reporting.
- Taxation Services – provides a full range of services in income and commodity taxes including financial reporting for taxes (year-end and quarterly tax provisions for current and future income taxes), tax compliance (filing of tax returns, coordination of tax audits), regulatory tax accounting (tax calculations for rate cases and annual reports), tax planning including guidance and support for significant transactions, and tax dispute management and resolution.
- Internal Audit – developing, planning and conducting audits/reviews, conducting annual risk assessment processes, monitoring and evaluating the effectiveness and efficiency of internal controls.
- Risk Management and Insurance Services – ensuring compliance with the TSX requirements on risk management, arranging for coverage based on assessed potential risk, and ensuring an appropriate and prudent insurance program.
- Legal – provides all legal services and counsel to various departments on issues including regulatory, environmental, business development, employment, securities, financing and intellectual property, and manages legal matters that have been outsourced to outside legal counsel.
- Human Resources Compensation and Planning – consults with management on the maintenance, development and governance of employees and retirees, provides assistance on annual wage and salary increases, ensure that employment practices are in compliance with applicable regulations and legislation.

TOTAL POOL OF COSTS FOR ALLOCATION TO FEU

The costs discussed above that are incurred by Fortis Inc. on behalf of the FEU are allocated to FHI. These costs and other corporate costs incurred by FHI on behalf of the FEU form the pool of costs that are eligible to be allocated to each of FEI, FEVI and FEW.

Of the pool of costs, certain costs incurred in support of the utilities are eligible for inclusion in customer rates and are passed on to the utilities in the form of a corporate services fee. Other costs are unique to the holding company and have been excluded from the calculation of the FHI corporate services fee. These excluded costs are:

- All identifiable corporate development and capital management (shareholder related) costs;
- Legal fees incurred for non-regulated entities;
- Pension costs related to executive bonuses;
- All fees associated with FHI's International operations; and
- Ineligible components of the Fortis Inc. management fee including Defined Benefit Pension, Defined Contribution Supplemental Employee Retirement Plan on executive bonuses and stock option costs which were not already excluded by Fortis Inc.

The following table is a summary of the actual total corporate services costs (net of the exclusions noted above) that form the total pool of costs that is allocated to the FEU and shows the costs incurred in 2010, a forecast of 2011 costs and forecast costs for 2012 and 2013.

Table 5.3-75: Corporate Services Costs 2010 through 2013

Services (in 000)	2010 Actual	2011 Projected	2012 Forecast	2013 Forecast
Board of Directors (12 Directors)	772	672	666	686
External Financial Reporting and Consolidation	1,151	970	966	995
Human Resources Compensation & Planning	370	229	285	294
Internal Audit	480	599	623	642
Legal	1,151	1,220	1,160	1,195
Risk Management and Insurance	268	284	301	310
Taxation	607	708	731	753
Treasury and Cash Management	725	800	824	849
Facilities and Support	942	912	949	977
Other Compension and Benefits	1,388	1,488	1,437	1,480
Fortis Inc Management Fee	3,801	4,210	4,910	5,057
	11,655	12,092	12,852	13,238

ALLOCATION OF CORPORATE SERVICES COSTS

The costs from Fortis Inc. are allocated to FHI using the assets by subsidiary driver which is a valid cost driver given the organizational structure of Fortis Inc. The methodology selected by FHI to allocate the corporate services costs charged to FEI, FEVI and FEW incorporates the

Massachusetts formula,[93] which is the same allocation methodology previously approved by the Commission for 2010 and 2011.

The results of the review indicate that the annual Corporate Services to be allocated from FHI to FEI, FEVI and FEW are as shown in the following table.

Table 5.3-76: Annual Corporate Services to be Allocated from FHI

	2010 Actual	2011 Projected	2012 Forecast	2013 Forecast
FEI	9,557	9,652	10,719	11,031
FEVI	1,087	1,097	1,140	1,196
FEW	48	49	48	50
Other	963	1,294	945	961
	11,655	12,092	12,852	13,238

The overall structure of FHI has remained relatively constant since 2009. FHI has reviewed the Corporate Services approach as part of this RRA. The same approach and methodologies, which were reviewed and validated by KPMG for the 2010/2011 RRA, have been used by management. FEI considers the results to be reasonable and representative of the activities and their value provided by FHI to FEI, FEVI and FEW. The increase in the fee is generally due to higher headcount in certain functions to support the businesses plus higher costs due to inflation. The higher headcount is in Internal Audit and Taxation. The other functional areas are generally higher due to inflation increasing the costs for 2012 and 2013. Additionally, the management fee from Fortis Inc. to FHI is higher due to the loss of rental pole revenue which lowered the fees charged from Fortis to its subsidiaries, reducing the previous management fee charged by Fortis. Amending agreements between FHI, FEI, FEVI and FEW are included in Appendix L-2.

5.3.18.2 Shared Services

Sharing of resources amongst the FEU under Shared Services arrangements enables the Companies to maintain the benefits of economies of scale by having a single management and support structure while avoiding duplication of work and allowing customers to benefit from the efficiencies realized.

FEI completed a review of the Shared Services agreement and cost allocation approach as part of the 2010-2011 RRA with validation by KPMG. No changes in methodology have occurred

93 The Massachusetts Formula is in extensive use in industry and is composed of the arithmetical average of (1) operating revenue, (2) payroll, and (3) average net book value of tangible capital assets plus inventories. The use of these factors represents the total activity of all business segments as a means to allocate costs that cannot be directly assigned.

since the time of the 2009 review that would warrant making any change to the Shared Service Agreement currently in place.

Common services delivered on a Shared Services basis include:

- Corporate;
- Finance and Regulatory Affairs;
- Customer Service;
- Human Resources;
- Environmental & Safety
- Energy Supply and Resource Development;
- Information Technology;
- Facilities;
- Operations Support;
- Operations Engineering;
- Transmission;
- Distribution; and
- Energy Solutions & External Relations.

SUMMARY OF RESULTS

The following table provides the comparative amounts of Total Shared Services Costs for FEU.

Table 5.3-77: Total Shared Services Costs

('000's)	Approved		Forecast					
	2010	2011	Incremental 2012 vs 2011	% Allocation	2012	Incremental 2013 vs 2012	% Allocation	2013
Total Costs included in Shared Services Pool	70,313	73,338	14,202	100.00%	87,540	4,710	100.00%	92,250
Allocated to FEVI	7,239	7,541	1,499	10.6%	9,040	498	10.6%	9,538
Allocated to FEW	202	212	39	0.3%	251	13	0.3%	264
Allocated to FEI	62,872	65,585	12,664	89.2%	78,249	4,199	89.2%	82,448

FEI AND FEVI SHARED SERVICES

The Shared Services agreement between FEVI and FEI including the method of allocation is unchanged from that filed in Appendix H-4-a of the 2010-2011 RRA[94]. The results of the Shared Service agreement indicate that the amount of annual Shared Services to be allocated from FEI to FEVI is estimated to be $9.0 million in 2012 and $9.5 million in 2013 as illustrated in Table 5.3-77.

The current allocation in comparison to the 2011 projection is higher with increased levels and scope of work driving the increase. The increases in the 2012 Forecast recoveries compared to the 2011 projection total $1.5 million with incremental recoveries by business area as follows:

- Customer Services - $650 thousand for Centralized Support Services that the Customer Service department will receive from Information Technology, Human Resources and Facilities. Since the Centralized Support Services costs will be incurred in the respective departments rather than in Customer Service department, it is appropriate that these costs are allocated to FEVI through Shared Services. In the past, under the ABSU agreement, these costs would have been directly billed to FEVI.
- Distribution, Transmission and Information Technology - $430 thousand for Service Standards and Reliability costs to support ongoing integrity and asset management activities related to system sustainment and improvements to the long term asset management plan. The majority of these costs are incurred by Distribution, Transmission and IT departments. For a detailed explanation of the Service Standards and Reliability increase, please refer to Section 5.3.5 for Distribution and Transmission, and Section 5.3.9 for IT.
- Labour inflation - $230 thousand allocated for Shared Services from FEI to FEVI.

94 Costs are generally allocated on the basis of customers, employees, and, management estimates of time.

- Human Resources - $50 thousand due to increased requirements resulting from retirement and related hiring activity. Please refer to a discussion of demographics in Human Resources in Section 5.3.13.
- Energy Solutions & External Relations and Finance & Regulatory - $140 thousand due to stakeholder requests to improve resource planning, forecasting, and energy analysis and planning activities. Please refer to Section 5.3.6 for a thorough discussion of the Customer and Stakeholder Expectation cost driver in ES&ER.

In 2013, Shared Services are expected to increase by a further $0.5 million with approximately half of the increase due to system sustainment, service standards and reliability, and the remaining half for labour inflation.

Despite the higher costs, FEI and FEVI believe that by providing common services through a Shared Services approach, the costs are being optimized between the two organizations for the benefit of all customers. To properly reflect the value of activities provided by FEI to FEVI, the Company requests that the Commission approve the allocation of costs for Shared Services between FEI and FEVI for the years 2012 and 2013.

FEI AND FEW SHARED SERVICES

The Shared Service agreement between FEW and FEI including the method of allocation is unchanged from that filed in Appendix H-4-b of the 2010-2011 RRA. The amount of annual Shared Services to be allocated from FEI to FEW is estimated to be approximately $0.3 million in 2012 and 2013. The drivers of these changes are as explained above for FEVI.

To properly reflect the value of activities provided by FEI to FEW, the Company requests that the Commission approve the allocation of costs for Shared Services between FEI and FEW for the years 2012 and 2013.

PROVISION OF SERVICES TO THERMAL ENERGY SERVICES

In Commission Order No. G-141-09, FEI agreed to charge Thermal Energy Services customers $0.5 million for 2010 and $0.5 million for 2011 for services provided by the gas utility. In this Application, FEI has undertaken a review of which services should be included in this administrative charge and what the charge should be for 2012 and 2013. Administrative services include those services not directly charged or chargeable and include the following categories:

- Executive: time to review current status of projects, monitor status of projects and reviewing and approving potential projects.
- Finance: management and financial reporting and accounts payable.

- Regulatory affairs: reviewing cost of service models, tariffs and project management.
- Human Resources: recruiting and compensation and benefits.
- Information technology: IT support to existing employees charging time directly to the AES deferral.
- Facilities: allocation of facilities costs for employees charging directly into the AES deferral account. The facilities include space in the Surrey Operations Centre, Garbally/Langford and the Burnaby facility.

Based on the review, FEI has estimated that a charge of approximately $0.5 million for both 2012 and 2013 be included as a recovery of overheads for the benefit of FEI and its ratepayers. This charge represents the expected administrative costs of supporting the AES business.

SHARING OF SERVICES WITH FORTISBC INC.

In the summer of 2010, FEU and FortisBC Inc. ("FBC") began having a common, shared Executive Management team. The shared responsibilities between the entities facilitates the FEU and FBC cross charging each other for the time each Executive expects to spend with their new responsibilities. FEU are charging FBC for those Executives who are FEU employees and have responsibilities in FBC, and receiving charges for FBC Executives who have responsibilities at FEU. Additionally, in a limited a number of circumstances, a number of FEI employees perform work for FBC, and vice versa for certain employees in FBC providing services to FEI. Currently, the cross charge includes a fully loaded wage with benefits and concessions plus an overhead charge of 10 percent and a one hundred dollars per day facility fee.

In order to simplify this process between similar regulated entities, FEI is proposing to simplify the cross charges between FEU and FBC. In this Application, the FEU are requesting to allow for charges between these regulated entities to be based on a fully loaded benefits and concessions charge but to not include overheads or a facilities fee. The current policy requires that charges between FEI and FBC include the overhead and facilities fee. The Shared Services Agreement between FEI and FBC is included in Appendix L-3.

5.3.18.3 Transfer Pricing Policy and Code of Conduct Review

Since they were originally established in 1997 and approved by the Commission in Letter L-64-1997, the Code of Conduct ("COC") and Transfer Pricing Policy ("TPP") have served to govern the relationships between FEU and Non-Regulated Businesses ("NRB") regarding the provision of utility resources for activities including sharing of utility resources, the treatment of customer, utility or confidential information and the nature of the relationship between FEU and NRBs. These policies were reviewed as part of the 2010 and 2011 Revenue Requirements Application where the Company did not propose any changes. As part of this application, FEU has reviewed the COC and TPP to assess their appropriateness and whether amendments are required.

FEU propose no changes to the existing COC and TPP. Both policies are expected to continue to provide appropriate direction and rules to govern the interaction of FEU and NRBs during the period of the current Application. Further, FEU believe that the processes in place and the independent compliance reviews conducted annually by FEU's Internal Audit provide a sufficient level of assurance to ratepayers, stakeholders and the Commission.

COMPLIANCE WITH CODE OF CONDUCT AND TRANSFER PRICING POLICIES

The FEU comply with the COC and the TPP for provision of Company resources and services by having their employees charge out their time to NRBs. Employees currently keep track of the time they spend on NRB activities. Their salary costs, loaded for benefits and concessions, and an overhead charge for the use of facilities and other resources, and in some cases, an availability and supervisory surcharge are charged to the NRB. This process is managed through the continuing services contracts between the Company, and NRBs. The following is a list of entities which are managed through this process:

- FortisBC Holdings Inc.
- FortisBC Alternative Energy Services Inc (formerly Terasen Energy Services Inc.).
- Inland Energy Corp.
- FortisBC Huntingdon Inc.

Non-utility activities performed on behalf of FHI and other NRBs are charged 100 per cent to FHI and to the NRBs respectively. This is managed through monthly timesheets and appropriate charge codes for each NRB. For 2012 and 2013, it is expected that the FEU will charge FHI and other NRBs and reduce the cost of service through the recovery of overheads for the benefit of FEI and its customers. The overhead recoveries are included in Other Revenues in Section 5.5.

To ensure that FEU's practices and processes comply with the policies, FEU's Internal Audit group completes a review of compliance with the COC and TPP annually with a report provided summarizing the results of the review. This practice has worked very well over the years with very few issues or exceptions. Those few that were identified were promptly addressed by management and appropriately remedied.

In summary, FEU has reviewed the existing TPP and COC and is requesting that the existing policy changes to accommodate charges between two affiliated regulated utilities, FEU and

FBC. The change being requested should simplify the charges between the two entities as both move towards a more shared management structure. Additionally, FEU has reviewed the overhead charge between the gas customers and the AES customers and has proposed a fee based on the expected utilization of services by the AES customers. Other than these proposed changes, the current transfer pricing policies are appropriate for the period of this Application.

5.3.18.4 Summary of Corporate and Shared Services

In summary, this section has described the corporate services provided by Fortis Inc. and FHI to the FEU and how the FEU share costs amongst each other and with FBC. The relationship between the FEU, FHI and Fortis Inc. is generally unchanged from the time of filing of the 2010/2011 RRA. Certain organizational changes as a result of a shared executive team have changed the relationship between the FEU and FBC. The shared executive team has resulted in cross charges between FEU and FBC for the portion of executive time spent on each others business. Shared services across the FEU is similar to what was filed in the 2010/2011 RRA. While the costs are different, the drivers of those costs are as filed in the 2010/2011 RRA.

5.3.19 SUMMARY OF OPERATIONS AND MAINTENANCE EXPENSE

The Companies' 2012 and 2013 O&M forecasts reflect the changes in operating requirements that are anticipated over the forecast period. In particular, incremental funding requests are driven by five requirements – labour inflation and benefits, codes and regulations, customer and stakeholder expectations, demographics, and a continued focus on service standards and reliability. In total, these drivers serve to increase O&M by 4.8 percent in each of the forecast years. The FEU believe that the O&M levels that have been forecast prudently reflect the known and expected impacts of their operating environment, and required increases related to safety and regulatory requirements.

5.4 Depreciation and Amortization

5.4.1 INTRODUCTION TO DEPRECIATION AND AMORTIZATION

The FortisBC Energy Utilities received approval to update their depreciation rates, excluding any amount for recovery of negative salvage, effective January 1, 2010. Excerpts from the relevant Commission Orders follow.

Appendix A to Order G-141-09 approving the Negotiated Settlement Agreement in the 2010-2011 FEI (then Terasen Gas Inc.) Revenue Requirement Application states:

"22. Depreciation Study

The Parties agree that the depreciation rates specified in the Gannett Fleming study included the Application under Appendix H-2 for Parts I-III, and in the Supplemental filing dated July 8, 2009 for Parts IV and V, will be implemented effective January 1, 2010…

The Parties agree that TGI will undertake an updated depreciation study to be included as part of TGI's next Revenue Requirements Application. This study will address the methodology and rates for net negative salvage to be included in cost of service for future periods. TGI will work with Commission staff and a depreciation rate specialist in determining the requirements of the study.

23. Negative Salvage Values

On an annual basis, TGI includes a provision for estimated net negative salvage value (removal costs less proceeds) in its depreciation rates. This treatment recognizes that net negative salvage value is a cost of providing service using the asset and should be recovered from customers over the useful life of the asset. An alternative treatment is to recover the net negative salvage values at the time they are incurred resulting in future customers paying for the removal costs, which TGI views as inappropriate. The inclusion of a provision for estimated net negative salvage value in depreciation rates is a practice that has been followed by TGI historically, and with this RRA TGI had proposed continuation of this treatment. This treatment is consistent with the BCUC Uniform System of Accounts and is generally followed by other investor-owned utilities in British Columbia and across Canada.

The Parties agree that for the purposes of the two year period covered by this Agreement, the provision for net negative salvage (net removal costs) will be removed from the depreciation estimates. Instead, an estimate of the amount of net removal costs to be incurred in each of the years 2010 and 2011 ($8.038 million and $11.29 million) will be included in the cost of service and recovered from customers in each of those years. Any variances between the actual amount of net removal costs realized and the estimated amounts included in cost of service will be recorded in a new deferral account created for this purpose that will be called the "Removal Cost Deferral Account". The amount accumulated in the Removal Cost Deferral Account over the two year period of this Agreement will be recovered from (or returned to) customers in 2012.

TGI continues to be of the position that removal costs should be recovered over the service life of the asset and not at the time the removal costs are actually incurred. TGI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the removal costs and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.

24. Unrecovered Losses

> *Issue No. 7 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:*
>
> *"Unrealized losses in rate base – should some of these losses be to the shareholder? Parties should present a separate settlement package."*
>
> *Unrealized (unrecovered) losses relate to Unrecovered Depreciation on assets used 100 percent for the provision of utility service to ratepayers (as discussed in the response to BCUC IR 2.131.1.4). The Parties agree that the treatment for unrecovered losses as proposed in the Application is acceptable for the 2010 and 2011 period covered by this agreement. TGI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the unrecovered losses and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application."*

Appendix A to Order G-140-09, approving the Negotiated Settlement Agreement in the 2010-2011 FEVI (then Terasen Gas (Vancouver Island) Inc.) Revenue Requirement Application states:

> *"16. Depreciation Study*
>
> *The Parties agree that the depreciation rates specified in the Gannett Fleming study included the Application under Appendix H-2 for Parts I-III, and in the Supplemental filing dated July 8, 2009 for Parts IV and V, will be implemented effective January 1, 2010…The Parties agree that TGVI will undertake an updated depreciation study to be included as part of TGVI's next Revenue Requirements Application. This study will address the methodology and rates for net negative salvage to be included in cost of service for future periods. TGVI will work with Commission staff and a depreciation rate specialist in determining the requirements of the study.*
>
> *17. Negative Salvage Values*
>
> *On an annual basis, TGVI includes a provision for estimated net negative salvage value (removal costs less proceeds) in its depreciation rates. This treatment, which was approved as recently as 2004, along with an estimate of the salvage amount to be included in depreciation rates recognizes that net negative salvage value is a cost of providing service using the asset and should be recovered from customers over the useful life of the asset. An alternative treatment is to recover the net negative salvage values at the time they are incurred resulting in future customers paying for the removal costs, which TGVI views as inappropriate. The inclusion of a provision for estimated net negative salvage value in depreciation rates is a practice that has been followed by TGVI historically, and with this RRA TGVI had proposed continuation of this treatment. This treatment is consistent with the BCUC Uniform System of Accounts and is generally followed by other investor-owned utilities in British Columbia and across Canada.*

The Parties agree that for the purposes of the two year period covered by this Agreement, the provision for net negative salvage (net removal costs) will be removed from the depreciation estimates. Instead, an estimate of the amount of net removal costs to be incurred in each of the years 2010 and 2011 ($0.343 million and $0.344 million) will be included in the cost of service and recovered from customers in each of those years. Any variances between the actual amount of net removal costs realized and the estimated amounts included in cost of service will be recorded in a new deferral account created for this purpose that will be called the "Removal Cost Deferral Account". The amount accumulated in the Removal Cost Deferral Account over the two year period of this Agreement will be recovered from (or returned to) customers in 2012.

TGVI continues to be of the position that removal costs should be recovered over the service life of the asset and not at the time the removal costs are actually incurred. TGVI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the removal costs and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.

18. Unrecovered Losses

Issue No. 7 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

"Unrealized losses in rate base – should some of these losses be to the shareholder? Parties should present a separate settlement package."

Unrealized (unrecovered) losses relate to Unrecovered Depreciation on assets used 100 percent for the provision of utility service to ratepayers (BCUC IR 1.112.1). The Parties agree that the treatment for unrecovered losses as proposed in the Application is acceptable for the 2010 and 2011 period covered by this Agreement. TGVI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the unrecovered losses and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application."

Appendix A to Order G-138-10 and Reasons for Decision in the FEW (then Terasen Gas (Whistler) Inc.) 2010-2011 Revenue Requirements and Rates Application states:

"2.7.3 Depreciation Expense

The Commission Panel takes note of the depreciation methods and policies adopted for TGI and TGVI as part of their respective Negotiated Settlement Agreements for 2010 and 2011. As noted in previous sections above, the Commission Panel generally agrees that it is beneficial to align TGW's policies and methodologies with those of TGI and

> *TGVI where appropriate. Accordingly, the Commission Panel approves the depreciation policies and practices requested by TGW, for the forecast years 2010 and 2011, subject to the removal of the negative salvage provision from the composite depreciation rate as discussed above.*
>
> *Notwithstanding the foregoing approval, the Commission Panel is not convinced that the elimination of the negative salvage provision in the determination of the composite depreciation rate is appropriate on an ongoing basis. TGW is directed to include evidence with respect to negative salvage in future revenue requirement applications. The Commission Panel also suggests that consistent with the above comments concerning the alignment of TGW's policies and methodologies with those of TGI and TGVI, those utilities also include evidence with respect to negative salvage in their future revenue requirement applications."*

Appendix A to Order G-27-11 and Reasons for Decision in the FEI Fort Nelson (then Terasen Gas Inc. – Fort Nelson Service Area) 2011 Revenue Requirements Application:

> *"3.6.2 Changes in Depreciation*
>
> *The Commission approves the requested depreciation increases for implementation effective January 1, 2010 to align with the approved depreciation rates of TGI which are the most recent estimates of the useful life of the Utility's assets."*

This section of the Application discusses the information that the FEU committed to provide as part of the above excerpts.

First, the Companies summarize the results of their updated Depreciation Study in Section 5.4.2 and Appendix E-1. This study addresses the methodology and rates for net negative salvage to be included in cost of service for future periods. The Companies have involved Commission staff and a depreciation rate specialist in determining the requirements of the study.

Second, the Companies summarize the historical and proposed treatment of negative salvage in Section 5.4.3 and provide a report on Asset Retirement Obligations in Appendix E-2. The Companies have involved Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the removal costs and have included the documentation to support the rates in the Depreciation Study.

Finally, the Companies summarize the asset retirement and accounting processes at the utilities and how the processes lead to the financial gains/losses recorded, and provide explanations and reasons for the losses recorded for each of the asset categories noted. This information is included in Section 5.4.4 and an Asset Loss Report provided in Appendix E-3.

5.4.2 DEPRECIATION STUDY AND RATES

Overall, the current Depreciation Study's results are consistent with the previous study's results which were approved for use effective January 1, 2010. Similar to the previous study, Gannett Fleming Valuation and Rate Consultants Inc. ("Gannett Fleming"), a leading Depreciation, Valuation and Ratemaking consulting firm in North America, was contracted to perform the review of the FEU depreciation rates. The current study which is included in Appendix E-1, has been prepared based on gas plant-in-service as of December 31, 2009 for FEU's assets. FEU considers that the current study's recommendations are applicable for the 2012 and 2013 forecast period as Gannett Fleming recommends that complete studies be performed every three to five years to re-evaluate depreciation rates.

As in the prior study, Gannett Fleming has estimated the depreciation rates using various statistical methods, operational interviews with FEU staff and informed judgement based on their experience in the natural gas industry. Straight-line depreciation is developed for the assets in a particular class beginning with the original cost, the estimated average and remaining service life characteristics and then accounting for the accumulated depreciation already booked in that class. In addition, the current study has been prepared in conformance with International Financial Reporting Standards and US GAAP reporting requirements.

Implementation of the recommended rates, which are set out in the following Tables 5.4-1 to 5.4-3, that were developed using the Average Service Life ("ASL") depreciation methodology would change the average composite rate for FEI, FEVI and FEW from 3.0 percent, 2.6 percent and 2.2 percent to 3.1 percent, 2.6 percent and 2.4 percent respectively. Total depreciation expense for FEI, FEVI and FEW would change approximately +$4.6 million, -$0.3 million and +0.03 million due to changes in the depreciation rates. This excludes the effects on depreciation expense of additions and retirements to PP&E. Rates noted with an asterisk in the tables below are rates that are not included in the Depreciation Study since they have been set through separate regulatory applications (i.e. Biogas, Natural Gas for Transport, etc.) or specific rates set by the FEU (i.e. lease structures/buildings based on lease terms, etc).

Table 5.4-1: FEI - Impact of Implementing Recommended Depreciation Rates[95]

Line #	Class	Description	Existing 2011 Rate	Recommended 2012 Rate	Depreciation Based on 2011 Rate	Depreciation Based on 2012 Rate	Increase + / Decrease -

	* Numbers above are in actual dollars with depreciation calculated using the January 1, 2012 gross asset values.						

The asset categories that account for the majority of the forecast change in depreciation expense are Meters and Transmission Plant. Refer to page II-25 to II-31 of the Gannett Fleming study included in Appendix E-1 for further discussion.

For Meters, Gannett Fleming recommends a 20 year life, a decrease from the 25 years meter life recommended in the previous study. Implementation of more stringent metering testing guidelines introduced by Measurement Canada in 2010 will result in residential meters being retired by 20 years of age. Interviews with FEU Measurement staff and indications from metering experts across Canada confirm that residential meters will no longer be tested when they reach 15 to 20 years of age. The recommended shorter meter life results in an increase of approximately 2 percent in the depreciation rate for the Meter category.

For the 465-00 Transmission Plant – Pipeline category, in its previous study, Gannett Fleming recommended a 60 year life. A recent review of retirements, additions and other plant transactions for the period 1957 to 2009 suggests that an average service life of 65 years is more reflective of the historic retirement activity and consistent with the typical range of lives used for transmission mains in the gas industry. The recommended lengthening of the service life by 5 years leads to a slight decrease of approximately 0.2 percent in the depreciation rate.

Included in the current study also is a recommended change in how the asset category Distribution Systems Meters/Regulator Installations are accounted for and depreciated. Instead of relying on individual retirement of assets in this category which are wide and disparate, a simpler and still representative approach would be to follow an amortization approach, similar to the general plant categories outlined on page II-49 of the Gannett Fleming study included in Appendix E-1. Amortization accounting is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset to which it applies.

Under the revised approach, new plant additions to Distribution Systems Meters/Regulator Installations category would be recorded in a separate account (474.02) with depreciation expense calculated using a whole life rate. Gannett Fleming has recommended an initial whole life rate of 4.5 percent based on an expected life of 22 years. The existing meter install costs would remain in the current account (474.00) and continue depreciating at the recommended depreciation rate, which includes a factor for recovery of existing retirement losses. More details and information explaining the rationale for the proposed change is included in the Analysis of Asset Retirement Losses report contained in Appendix E-3.

The FEU believe the adoption of the depreciation rates as outlined in the current Depreciation Study is necessary in order to properly reflect the assets' useful lives and a fair allocation and recovery of depreciation expense between current and future ratepayers.

5.4.3 NEGATIVE SALVAGE

The Companies believe that estimates of negative salvage (removal costs less salvage proceeds) should be recovered over the service life of the asset and not at the time the removal costs are actually incurred. This treatment recognizes that negative salvage is a cost of providing service and should be recovered from customers over the useful life of the asset. The inclusion of a provision for estimated negative salvage value in depreciation rates is consistent with the BCUC Uniform System of Accounts and is generally followed by other utilities across Canada. The BCUC Uniform System of Accounts states:

> *"There shall be charged monthly to account No. 303, "Depreciation", or other appropriate accounts with concurrent credits to the accounts for accumulated depreciation amounts which will allocate the service value for the plant over its estimated service life in a systematic and rational manner. The service value of the assets, for depreciation purposes, shall be their cost less their estimated net salvage value. Net salvage value means the salvage value less removal costs. The charges for depreciation shall be computed in conformity with the group system under the straight line method at rates approved by the Commission."*

In accordance with the direction provided in the Commission Orders referenced in Section 5.4.1, the FEU have included a report (included in Appendix E-2) that includes information on the following topics:

1. Treatment of negative salvage in generally accepted accounting principles;
2. Treatment of negative salvage in rate making in British Columbia, Canada, including by the National Energy Board, and the United States;
3. Options for collection of removal costs; and
4. Summary and recommendation.

As outlined in the report, the regulatory treatment that the FEU recommend is to follow the traditional approach[96] for regulatory assets that require significant removal costs, with funds segregated by asset classes in a separate liability account. In addition, the utilities will continue to review their regulatory assets to determine if any Asset Retirement Obligations ("AROs") are required to be recorded under GAAP. If AROs are required to be recorded for specific assets, the utilities propose to use the ARO methodology for regulatory purposes as well. At this time, no AROs have been identified for the Utilities.

The report demonstrates that the recommended treatment provides the best balance in achieving regulatory goals, in that it distributes costs to ratepayers equitably over time, improves utility accountability for removal costs collected from ratepayers through tracking funds separately by asset class, and ensures that funds for asset removal are available at the time they are needed, while achieving an appropriate balance with respect to administrative costs relating to implementation, maintenance and tracking.

For these reasons, the Companies have prepared their financial schedules incorporating this approach, recovering negative salvage over the lives of the applicable asset classes. The asset classes where negative salvage is included are shown in Table 5.4-4 below.

[96] Under this method, the negative salvage percentages are a component of depreciation rates, and are calculated as the expected cost to remove the asset today divided by the cost to install that asset originally.

Table 5.4-4: Negative Salvage Rates Recover Costs Over the Useful Lives of Assets

FortisBC Energy Utilities				
Estimates of Negative Salvage by Asset Class				
		FEI	FEVI	FEW
442.00	LNG Gas - Structures	-10%	-10%	n/a
443.00	LNG Gas - Equipment	-20%	-20%	n/a
449.00	LNG Gas - Other Equipment	-10%	-10%	n/a
462.00	Trans. Plant - Compressor Structures	-5%	-5%	n/a
463.00	Trans. Plant - Meas. & Reg. Structures	-5%	-5%	n/a
464.00	Trans. Plant - Other Structures	-5%	-5%	n/a
465.00	Trans. Plant - Trans. Pipeline	-10%	-10%	n/a
466.00	Trans. Plant - Compressor Equipment	-10%	-10%	n/a
467.10	Trans. Plant - Meas. & Reg. Equipment	-5%	-5%	n/a
468.00	Trans. Plant - Communications Equipment	-5%	-5%	n/a
472.00	Dist. Systems - Structures	-5%	-5%	-5%
473.00	Dist. Systems - Services	-50%	-50%	-50%
473.01	LILO - Dist. Systems - Services	-50%	n/a	n/a
474.00	House Regulators and Meter Installations	-10%	-10%	-10%
475.00	Dist. Systems - Mains	-20%	-20%	-20%
475.01	LILO - Dist. Systems - Mains	-20%	n/a	n/a
476.00	Dist. Systems - NGV Fuel Equipment	-20%	n/a	n/a
477.30	Dist. Systems - Meas. & Reg. Equipment	-5%	n/a	n/a
478.10	Dist. Systems - Meters	-5%	-5%	-5%

These negative salvage rates, the existing asset balances, and the calculations performed and described in the Depreciation Study result in the provisions for negative salvage as shown Sections 7.1 to 7.4 Schedule 61 and 62. The continuity of the negative salvage provision is discussed in detail in Section 6.1.5.4.

5.4.4 LOSSES ON DISPOSAL

Historically, the FEU have followed recognized regulatory group accounting procedures in accounting for their property plant and equipment. The FEU also adhere to the BCUC Uniform System of Accounts, unless modified by Commission order. Under both of these procedures, on retirement of depreciable gas plant, Accumulated Depreciation is charged with the ledger value of the gas plant retired and the cost of removal less amounts recovered for salvage and insurance. It is only in rare cases where the forces of retirement are outside of the forces that were contemplated in determining depreciation rates that gains and losses on depreciable plant would be recognized in income. Therefore, under historical practice, all normal course gains and losses on retirement of assets are included in accumulated depreciation.

This treatment is appropriate since group depreciation rates are set to recover the asset values over the average service life of the asset group, so that we expect some assets to be retired before their net book value reaches zero; others would be retired after their net book value reaches zero; and overall the gain/loss amount included in accumulated depreciation will have an immaterial value, with any material amounts recovered through changes to future depreciation rates. When depreciation rates are not adjusted to reflect the shorter service lives of assets, or retirements occur in a different pattern than was expected in the last accepted depreciation study, then the loss amount can build in accumulated depreciation.

An excerpt from the BCUC Uniform System of Accounts explains this more fully:

> *"The group system contemplates that some part of the investment in a group of assets probably will be recovered through salvage realizations and that probably there will be variations in the service lives of the assets constituting the group, even among assets of the same class. The depreciation provision determined for the group is a weighted average of the various individual provisions reflecting the individual expectancies of life and salvage for the respective assets in the group. It is not the intention of this classification to require the company to keep records of the accumulated depreciation of each unit of plant. For purposes of analysis, however, each company shall maintain subsidiary records in which accumulated depreciation is subdivided according to the utility department to which applicable, or to each group of gas plant accounts. When the retirement or disposal of any individual asset in a group occurs under circumstances reasonably provided for through accumulated depreciation, it may be assumed such provision has been made. Thus, whether the period of service is less or greater than average, accumulated depreciation attributable to an asset at the time of retirement under such circumstances, is equal to the cost, except for that portion reasonably assumed recoverable through salvage realization."*

As indicated in the excerpts from the Negotiated Settlement Agreement for the Mainland and Vancouver Island included above, the size of the accumulated losses at December 31, 2009 ($149 million for the Mainland and $39 million for Vancouver Island) was of concern to the Commission Panel. Further analysis of these balances demonstrated that:

For FEI, four asset classes – 474 Regulators and Meter Installations, 478 Meters, 473 Services and 475 Mains account for $138 million or over 90 percent of the total accumulated loss of $149 million. Included in the $138 million is $54 million of actual removal costs incurred, leaving $84 million of actual losses. In accordance with the agreement reached in the 2010-2011 NSA, the analysis of the accumulated losses provided in Appendix E-3 has focused on these four asset classes.

For FEVI, further analysis determined that over 92 percent of the accumulated loss balance of $39 million was as a result of "disaggregation entries". These disaggregation entries resulted from an accounting system adjustment made on the purchase of Vancouver Island in 2003. At that time, the accumulated depreciation balances were transferred to the SAP accounting system as one amount for each asset class. Then, a program was run that calculated what the accumulated depreciation should have been given the current depreciation rates in the system and the age of the assets, and an entry was created to split the accumulated depreciation into two components – one to reflect the current remaining life of the existing assets, and the balance to the accumulated loss component. This calculation was done because historically Vancouver Island had never calculated losses on retirement and it was decided an estimation of the accumulated losses was required. As we have no ability to determine in hindsight the accuracy of this allocation, there is no further analysis that can be completed. Excluding these disaggregation entries and incurred removal costs of approximately $1.4 million, the accumulated loss balance at the end of 2009 would only be in the order of $1.6 million.

As demonstrated in the report included in Appendix E-3, the accumulated losses represent investments in utility plant required to continue providing service to customers, and have resulted from a number of factors, reflecting the environment that a natural gas utility operates in. In addition, and although not specifically addressed in the report included in Appendix E-3, a portion of the accumulated losses also results from inadequate recovery of depreciation from past customers. Adjustments to depreciation rates are required on a regular basis to reflect changes in the expected lives of assets. The past practice of deferring depreciation rate increases has contributed to losses being accumulated. Although the approval of previously recommended increases in depreciation rates would not have resulted in a material reduction in the balance of accumulated losses that existed at the end of 2009, they were designed to address the recovery of those losses over the expected lives of the assets.

Consistent with past practice, the depreciation rates included in the Depreciation Study filed with this Application include a portion related to the recovery of the unrecognized loss balances that were accumulated prior to 2010.

Net losses realized subsequent to 2009 have been recorded in a deferral account instead of in accumulated depreciation, as agreed to in the 2010-2011 Negotiated Settlement. As discussed in Section 6.3, the FEU propose to maintain this treatment for 2012 and 2013, and have proposed a 20 year amortization period for the deferral account that is aligned with the average service life of the asset categories that are contributing to the losses. This treatment will achieve the same result for ratepayers as the historical treatment followed by the Utilities and provided for in the BCUC Uniform System of Accounts.

5.4.5 AMORTIZATION OF CONTRIBUTIONS IN AID OF CONSTRUCTION ("CICA")

For FEI, the amortization rate of 2.89 percent for Distribution CIAC has been determined based on the average depreciation rate for the relevant distribution asset classes, namely, 473 Services, 474/478 Meters, and 475 Mains. The depreciation rate of 1.68 percent for Transmission CIAC has been determined based on the average depreciation rate for the relevant transmission asset classes, namely, 465 Pipe, 466 Compressor Equipment, and 467 Measuring, Regulating and Telemetry Equipment.

For FEVI, the average amortization rate for Distribution CIAC is 1.93 percent and for Transmission CIAC it is 1.79 percent, both of which have been determined based on the individual asset classes that the CIAC relate to. The Contribution for the Whistler pipeline is being amortized over 50 years.

For FEW, the average amortization rate is 1.67 percent.

5.4.6 SUMMARY OF DEPRECIATION AND AMORTIZATION

The FortisBC Energy Utilities have updated their recommendations for depreciation and amortization rates to reflect both their historical experience and their expectations for the service lives of their assets. The FEU have completed an analysis of the historical accumulation of losses in accumulated depreciation, and provided recommendations for the continued recovery of these losses through depreciation and amortization. The FEU have recommended a return to a traditional method of recovery of negative salvage, along with changes to the tracking and reporting of those amounts to allow for increased transparency. Overall, the FEU believe that the recommendations put forward are the most appropriate to allocate the recovery of prudent investment in capital from customers.

5.5 Other Revenue

5.5.1 INTRODUCTION TO OTHER REVENUE

Overall, as shown in Table 5.5-1 below, the Companies are forecasting a significant increase in other revenue in 2012 when compared to 2011 Approved, and a further modest increase in 2013.

Table 5.5-1: Forecast Other Revenue for 2012 and 2013[97]

($thousands) **Utility/Region**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
Mainland	$ 24,394	$ 27,203	$ 28,883
Vancouver Island	9,752	12,651	12,662
Whistler	56	16	16
Fort Nelson	60	24	24
Total	**$ 34,262**	**$ 39,894**	**$ 41,585**

[97] Section 7.1 to 7.4, Schedule 19 & 20

For all of the FortisBC Energy Utilities, other revenue includes revenue from service work (connection charges), late payment charges, and returned cheques. In addition, the Mainland utility receives revenue for wheeling charges (from Vancouver Island), third party revenue on its Southern Crossing Pipeline, and starting in 2012, revenue from natural gas vehicles service and biomethane recoveries. The Vancouver Island utility also receives revenue from the Mainland for LNG mitigation. Each of these categories is discussed below.

5.5.2 SERVICE WORK, LATE PAYMENT CHARGES AND RETURNED CHEQUES

For all of the Utilities, other revenue includes revenue for service work, late payment charges and returned cheques. Revenue from service work is $25 for customer additions and account transfers. Late Payment Charges are charged at a rate of 1.5 percent per month, and are estimated annually based on the prior year's experience. The 2012 and 2013 forecast Late Payment Charges have decreased in comparison to 2011 approved; this downward trend is consistent with the lower bad debt expense experienced by the Utilities. Annual returned cheque revenues are estimated at approximately 0.5 percent of the beginning of the year's account base, at a rate of $20 per cheque.

Mainland Other Recoveries of approximately $122 thousand in 2012 and $126 thousand in 2013 are from Non-Regulated Businesses related to recoveries of overhead under the Transfer Pricing policy (see Section 5.3.18).

The follow tables provide the 2012 and 2013 forecasts for each utility.

Table 5.5-2: Lower Late Payment Charges Forecast for Mainland

($thousands) **Mainland**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
Late Payment Charges	$ 3,020	$ 2,333	$ 2,333
Connection Charges	2,907	2,662	2,685
NSF Returned Cheque Charges	82	79	79
Other Recoveries	76	122	126
Total	**$ 6,085**	**$ 5,196**	**$ 5,223**

Table 5.5-3: Lower Late Payment Charges Forecast for Vancouver Island

($thousands) **Vancouver Island**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**

Connection Charges	20	11	11
NSF Returned Cheque Charges	-	-	-
Other Recoveries	2	-	-
Total	**$ 60**	**$ 24**	**$ 24**

5.5.3 MAINLAND – VANCOUVER ISLAND WHEELING CHARGES

The Vancouver Island Wheeling Agreement, as approved by Commission Order No. G-149-07, is up for renewal at July 27, 2011. Under section 17.2 of the Wheeling Agreement, FEVI has the option to extend the term for 20 years with the demand rate for the first year of the renewal period determined in reference to the payment in the final year of the initial agreement.

FEVI will exercise its option to extend the agreement and there will be no changes to the determination of Wheeling Charges. Therefore, for the purposes of determining the 2012 and 2013 revenue requirements, FEI has calculated the Vancouver Island Wheeling Charge using the approved 2011 demand rate and has updated the other components of the charge in accordance with the initial agreement. 2011 revenue from FEVI wheeling charges was approximately $3.5 million and remains the same for the 2012 and 2013 forecast period.

5.5.4 MAINLAND - SOUTHERN CROSSING PIPELINE ("SCP") THIRD PARTY REVENUES

Similar to 2010 and 2011, SCP third party revenues are forecast at approximately $14.8 million for both 2012 and 2013. Table 5.5-6 below illustrates the SCP revenue forecast through 2013.

Table 5.5-6: Southern Crossing Pipeline Revenues Remain Consistent

($thousands) **SCP Revenue Component**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
Northwest Natural Gas Co.	$ 8,849	$ 5,573	$ 5,573
MCRA	3,600	3,600	3,600
Motor Fuel Tax	(50)	(50)	(50)
Net Mitigation (T-South Enhanced Service)	2,400	5,703	5,703
Total SCP Revenues	**$ 14,799**	**$ 14,826**	**$ 14,826**

Historically, the SCP third party revenues have been allocated to customers through the MCRA and the delivery margin. The allocation methodology is intended to reflect the principle that customers paying for SCP in the delivery margin should share in the mitigation revenue associated with the SCP transportation resources. Recent changes in agreements necessitated a review and a change in this allocation, discussed further below. The net impact to SCP revenues of this change is zero because the allocation of additional costs associated with the Northwest Natural Gas Co. component is offset by the allocation of additional net mitigation revenues associated with the T-South Enhanced Service.

NORTHWEST NATURAL GAS CO.

The Company has a firm service contract with NWN, approved in Order No. G-98-05, for 46.5 MMcfd of SCP capacity over the period November 2004 through October 2020. Effective November 2010 the NWN payments increased from $7.3 million per year to about $9.0 million per year and PG&E Termination fees decreased from $825,000 per year to $145,000 per year.

The Company provides this firm transportation service to NWN from Yahk to Sumas via SCP capacity and Spectra Energy Kingsvale South Transportation. Currently, the cost of the 46.5 MMcfd Spectra Energy Kingsvale South capacity resides in the MCRA. The Company is proposing that the cost of the 46.5 MMcfd of Spectra Energy Kingsvale South capacity be offset against the NWN revenues which are credited to the Delivery Margin. The $3.3 million cost of holding Spectra Energy Kingsvale South capacity would be netted against the NWN revenues as the capacity is required in conjunction with the SCP capacity to facilitate deliveries to NWN, and the capacity is not available for use by the midstream to manage the Core load. Incorporating this change, the forecast NWN net revenues shown in Table 5.5-6 above for the 2012 and 2013 years are calculated as follows:

Table 5.5-7: 2012-2013 Calculation of Northwest Natural Gas Co. Revenue

	($thousands)
NWN Revenue	$ 8,994.0
PG&E Termination Fee	(145.0)
Spectra Transportation Tolls	(3,275.7)*
Net NWN Revenue	$ 5,573.3

* Forecast cost of Spectra Kingsvale South capacity.

FEI is proposing that the Spectra Energy Kingsvale South capacity charge be included in the Delivery Margin effective November 2011. The net NWN revenues in the 2011 year will then include the cost of the Spectra Transportation tolls for the two months of November and December and MCRA costs will be correspondingly reduced.

MCRA

The revenue of $3.6 million per year is related to the inclusion of SCP capacity in the MCRA portfolio.

Through Order No. G-141-09, the Commission approved the continuation of the debiting of the MCRA and crediting of the delivery margin revenue in the amount of $3.6 million per year for the 2010 and 2011 settlement period. The Company continues to believe that this treatment of costs and revenues is fair and appropriate given that SCP capacity is an essential part of its midstream portfolio, meeting the objectives of safe, reliable and cost-effective resources, and continues to provide optimal benefits to customers. In this Application, the Company seeks approval for the continuation of the debiting of the MCRA and crediting of the delivery margin revenue in the amount of $3.6 million per year for the 2012 and 2013 forecast period. Consistent with the approach discussed above, the MCRA will continue to pay for the cost of their portion of the Spectra Energy Kingsvale South capacity.

NET MITIGATION REVENUE (T-SOUTH ENHANCED SERVICE)

In the SCP Revenue, the Company has included revenue associated with the T-South Enhanced Service which is forecast to be $5.7 million per year from 2011 through 2013.

The T-South Enhanced Service is an initiative between Spectra Energy and the Company that adds value to Spectra Energy's T-South service by providing shippers the option to access the Kingsgate market through the Company's interior transmission system and SCP. As a result of this initiative with Spectra Energy, the Company's customers will benefit from increased liquidity in the BC marketplace, decreased T-South tolls and incremental SCP mitigation revenue.

The initial term of the T-South Enhanced Service was May 1, 2010 to April 30, 2012. As a result of the success of this service, Spectra Energy and the Company executed an extension of the Service to October 31 2014 which was approved by the Commission in Order No. G-69-11 dated April 14, 2011.

Any variance from the forecast net mitigation revenues of $5.7 million will be recorded in the SCP Mitigation Revenues Variance Account and returned to or recovered from customers over a five year period. Please refer to Section 6.3 for a discussion on this deferral account.

As discussed above, FEI is seeking approval in this Application for a change in the allocation between the delivery margin and midstream of the SCP costs and revenues, and of the Spectra Energy Kingsvale South charges related to the NWN capacity. As shown in Table 5.5-6 above, the net impact to the forecast annual SCP revenues for 2012 and 2013 of this change, as compared to the approved 2011 SCP revenues, is zero because the allocation of additional costs associated with NWN related Spectra Energy Kingsvale South capacity component is offset by the allocation of an additional $3.3 million in net mitigation revenues associated with the T-South Enhanced Service.

5.5.5 MAINLAND - NATURAL GAS FOR TRANSPORTATION SERVICE REVENUE

Natural Gas for Transportation Service is the compression and dispensing service for CNG fueling and transportation, delivery, fuel storage and dispensing service for LNG fueling. On December 1, 2010 FEI submitted its Application for Approval of a Service Agreement for CNG Service and for Approval of General Terms and Conditions for CNG and LNG Service (the “NGV Application”) to the Commission. On April 13, 2011, FEI submitted to the Commission and Interveners our Final Written Reply Submission. The forecasts made in relation to NGVs and NGV fueling infrastructure in the 2012-2013 RRA are premised on the assumption that the NGV Application will be approved as filed. Further, it is also based on the premise that the EEC incentives for NGV will continue. After the Commission’s Decision on the NGV Application has been issued, FEI will file an evidentiary update to this Application to the extent required to reflect the Commission’s determinations on these matters.

The other revenue forecast of $3.7 million in 2012 and $5.4 million in 2013 includes two components related to the NGV Application:

4. Fueling station revenue
5. Incremental delivery margin revenue

Table 5.5-8 outlines the components of other revenue associated with CNG and LNG Service included in the determination of the revenue requirements for 2012 and 2013.

Table 5.5-8: CNG and LNG Service Provide Benefits to All Customers in the Forecast Period

($thousands)	**2012**	**2013**
CNG Service Fueling Station Revenue	$ 699	$ 1,114
LNG Service Fueling Station Revenue	1,411	1,995
Total Fueling Station Revenue	2,110	3,109
CNG Service Delivery Margin Revenue	110	173
LNG Service Delivery Margin Revenue	1,527	2,122
Total Delivery Margin Revenue	1,636	2,295
Total CNG Service Revenue	809	1,287
Total LNG Service Revenue	2,937	4,116
Total CNG and LNG Service Revenue	**$ 3,746**	**$ 5,403**

The fueling station revenue is the recovery of the costs associated with the CNG and LNG fueling stations and reflects existing approved stations as well as expected additions of CNG and LNG Service fueling stations in 2012 and 2013.[98] We have forecast CNG Service fueling station revenue of $0.7 million in 2012 (from 5 stations) and $1.1 million in 2013 (from 8 stations). We have also forecast LNG Service fueling station revenue of $1.4 million in 2012 (from 2 stations) and $2.0 million in 2013 (from 3 stations). This results in a total fueling station revenue forecast of $2.1 million in 2012 and $3.1 million in 2013.

The incremental delivery margin revenue reflects the forecast volume on the delivery system that the CNG and LNG Service fueling stations are expected to provide (incremental volume from a total of 7 stations in 2012 and 11 stations in 2013). The volume is determined by Rate Schedules 6, 23, 25 and 16 and is forecast to provide incremental throughput on the delivery system of 517 TJs in 2012 and 742 TJs in 2013 (Table 5.5-9). The volume by rate schedule is multiplied by the existing delivery rate[99] to determine the forecast incremental delivery revenue of $1.6 million in 2012 and $2.3 million in 2013 that will benefit all existing non-bypass customers.

[98] The costs associated with all CNG and LNG contracts are embedded in the O&M and capital forecasts for 2012 and 2013. A comprehensive report on the Natural Gas for Transportation Service can be found in Appendix I.

[99] Corresponding existing delivery rate per Rate Schedule

Table 5.5-9: Forecast CNG and LNG Fueling Station Volume

Forecast Fueling Station Volume, TJ	2012	2013
CNG Service Volume	131	206
LNG Service Volume	386	536
Total CNG and LNG Service Volume	**517**	**742**

Additional information on the NGV Application, including the calculations behind the revenue forecasts, can be found in Appendix I.

5.5.6 MAINLAND BIOMETHANE RECOVERIES

The other revenue amounts of $62 thousand in 2012 and $29 thousand in 2013 represent the transfer of applicable biomethane costs from the delivery margin to the Biomethane Variance Account ("BVA"). This is the forecast cost of service each year associated with the upgrader plant. These costs are to be excluded from delivery rates and included in the Biomethane Energy Recovery Charge in accordance with Commission Order No. G-194-10. Please refer to the discussion on the BVA in Section 6.3, Rate Base Deferral Accounts, as well as the comprehensive Biomethane Report in Appendix J.

5.5.7 VANCOUVER ISLAND LNG MITIGATION REVENUES

LNG Mitigation Revenues commence in 2011 as a result of the Mt. Hayes LNG Facility becoming operational. These revenues reflect a storage and delivery agreement between the Vancouver Island and Mainland utilities for monthly demand charges of $1.0 million, or $12.0 million per year. The storage and delivery agreement was approved by Commission Order No. C-9-07.

5.5.8 SUMMARY OF OTHER REVENUE

The FortisBC Energy Utilities believe that the forecast amounts of other revenue for the years 2012 and 2013 reflect all applicable contracts and fixed revenues and are based on our best knowledge of the factors that drive the variable components.

5.6 Taxes

In carrying out its mandate as a gas service provider, the FortisBC Energy Utilities incur taxes that are imposed by different government bodies. The Companies manage these expenditures through the tax audit process and various tax planning strategies, as well as ongoing compliance activities. The tax expenses included in this RRA reflect the current substantively enacted tax legislation and have been properly calculated and applied in calculating the revenue requirement for each Company.

5.6.1 INCOME TAX

The FortisBC Energy Utilities are subject to corporate income taxes imposed by the Federal and BC governments, and as such appropriately include these costs in calculating the Companies' revenue requirements. Current income taxes have been calculated using the flow-through (taxes payable) method, consistent with Commission approved past practice, at the corporate tax rate of 25.0 percent for 2012 and 2013. The corporate tax rates used in this RRA are based on the Canada Income Tax Act and the BC Income Tax Act substantively enacted legislation.

As approved by Commission Order No. G-53-94, deferred charges, to the extent they are tax deductible, and deferred credits, to the extent they are taxable, are treated on a net-of-tax basis. Under the net-of-tax method, the gross addition to a deferral account is offset by the tax savings or tax cost (as the case may be) calculated at the prevailing income tax rate for the current year.

5.6.2 PROPERTY TAX

Property tax for 2012 and 2013 uses Company forecasts of assessed values of taxable assets, municipal mill rates, and taxes from revenues earned from natural gas consumed within the Municipalities. Property tax also includes the annual fee charged by the Oil & Gas Commission ("OGC"). The following table provides the forecast property tax expense for 2012 and 2013 for purposes of determining revenue requirement and rates for each of the FortisBC Energy Utilities.

Table 5.6-1: Property Tax Expense by Utility/Region[100]

($ thousands) **Utility / Region**	**Approved 2011**	**Projected 2011**	**Forecast 2012**	**Forecast 2013**
Mainland	$ 49,556.5	$ 48,858.0	$ 49,656.5	$ 51,239.0
Vancouver Island	9,751.6	9,292.1	9,895.0	10,262.5
Whistler	264.6	269.3	236.2	244.2
Fort Nelson	167.7	165.8	172.4	178.0
Total Property Taxes	**$ 59,740.4**	**$ 58,585.2**	**$ 59,960.0**	**$ 61,923.7**

The Mainland, Whistler and Fort Nelson regions maintain Commission approved deferral account mechanisms to track variances between forecast and actual property tax expense. Please refer to Section 6.2 for a discussion of the Property Tax Variance Accounts. For Vancouver Island, the variances flow through the RSDA.

The following subsections provide details on the property tax forecasts for each Utility.

[100] Section 7.1 to 7.4, Schedule 25 & 26

5.6.2.1 Mainland Property Tax Expense

Table 5.6-2 below provides the property tax forecast for the Mainland.

Table 5.6-2: Forecast Mainland Property Tax Expense

($ thousands) Asset Type	Approved 2011	Projected 2011	Forecast 2012	Forecast 2013
Distribution Assets	$ 17,459.5	$ 16,539.6	$ 17,889.3	$ 18,842.8
Transmission Assets	13,300.3	13,309.6	14,035.3	14,485.9
Gas Storage Assets	848.4	942.0	987.5	1,033.9
Manufactured Gas Assets	27.1	25.8	27.0	28.3
General Assets	2,791.4	2,681.9	2,804.4	2,935.3
Revenue and Other Taxes	15,129.8	15,359.1	13,912.8	13,912.8
Total Property Taxes	**$ 49,556.5**	**$ 48,858.0**	**$ 49,656.5**	**$ 51,239.0**

Mainland property taxes are forecast to be $698.5 thousand (1.4 percent) lower than originally approved for 2011. 2012 property taxes are forecast to increase by $798.5 thousand (1.6 percent) compared to projected 2011 and 2013 property taxes are forecast to increase by $1.58 million (3.2 percent) compared to forecast 2012 based on the following:

1. Distribution Assets

   2011: 2011 Taxes are projected to be lower than 2011 Approved due to lower forecast tax rates.

   2012: Comparing the 2012 Forecast to 2011 projected property taxes, additions are expected to add $400 thousand in taxes, with the remaining $950 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

   2013: In 2013, additions are expected to add $400 thousand in taxes, with the remaining $554 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

2. Transmission, Gas Storage, Manufactured Gas and General Assets

   For 2011 to 2013 taxes on transmission, gas storage, manufactured gas and general assets are forecast to increase as a result of inflationary pressures from materials and labour on legislated pipeline rates, in addition to increases in general and other tax rates.

3. Revenue and other taxes

   A portion of a utility company's property taxes payable within a municipality on certain improvements are calculated based on revenues earned within that municipality. For all municipalities except the City of Vancouver, FEI pays a tax of 1 percent of revenues earned in the second preceding year. For example, taxes payable in 2012 will reflect revenues earned in 2010. For the City of Vancouver, FEI pays 1.25 percent of revenues earned in the preceding year. For example, taxes payable to the City of Vancouver in 2012 will reflect revenues earned in 2011.

   2011 and 2012 taxes payable are based on actual reporting. 2012 taxes payable are forecast to decline by an average of 11.7 percent, while 2013 taxes are forecast to remain unchanged from 2012 levels.

5.6.2.2 Vancouver Island Property Tax Forecast

Table 5.6-3 below provides the property tax forecast for Vancouver Island.

Table 5.6-3: Forecast Vancouver Island Property Tax Expense

($ thousands) **Asset Type**	**Approved 2011**	**Projected 2011**	**Forecast 2012**	**Forecast 2013**
Distribution Assets	$ 4,750.6	$ 4,426.7	$ 4,715.6	$ 4,968.1
Transmission Assets	2,513.6	2,472.8	2,601.9	2,686.7
Gas Storage Assets	483.6	507.6	620.6	634.7
General Assets	215.6	152.4	359.1	375.1
Revenue and Other Taxes	1,788.2	1,732.6	1,597.9	1,597.9
Total Property Taxes	**$ 9,751.6**	**$ 9,292.1**	**$ 9,895.0**	**$ 10,262.5**

Vancouver Island property taxes are forecast to be $459.5 thousand (4.7 percent) lower than approved for 2011. 2012 property taxes are forecast to increase by $602.9 thousand (6.5 percent) compared to projected 2011 and 2013 property taxes are forecast to increase by $367.5 thousand (3.7 percent) compared to forecast 2012 based on the following:

1. Distribution Assets

   2011: 2011 Taxes are expected to be lower than 2011 Approved due to lower forecast tax rates.

   2012: Comparing 2012 Forecast to 2011 projected property taxes, additions are expected to add $103 thousand in taxes, with the remaining $185.7 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

2013: In 2013, additions are expected to add $105.2 thousand in taxes, with the remaining $147.3 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

2. Transmission

2011 projected taxes are expected to be lower than originally forecast because of lower expected tax rates. For 2012 to 2013, taxes on transmission assets are forecast to increase as a result of inflationary pressures from materials and labour on legislated pipeline rates, in addition to increases in general and other tax rates.

3. Gas Storage

The projected 2011 taxes are expected to be higher than 2011 Approved due to tax rates.

In 2012, completion of the Mt. Hayes LNG facility in 2011 will result in full taxation of this facility adding $99.3 thousand in taxes. Increases in tax rates results in an additional $13.7 thousand in taxes.

In 2013, taxes are expected to increase by $14.1 thousand due to general inflation on assessment values and tax rates.

4. General Assets

General assets are mainly comprised of office buildings. In 2011, taxes for general assets are projected to be lower than originally forecast as it was originally expected the Langford regional operations centre would become taxable to FEVI in 2011, however, the purchase is not expected to complete until April 2011.

For 2012, this property is forecast to be fully taxable resulting in increased property taxes of $182.6 thousand. General forecast property value increases and higher tax rates result in an additional $24.1 thousand in property taxes.

In 2013, taxes are forecast to increase by $16.0 thousand due to overall property value inflation and higher general and other tax rates.

5. Revenue and other taxes

A portion of a utility company's property taxes payable within a municipality on certain improvements are calculated based on revenues earned within that municipality. For all municipalities FEVI pays 1 percent of revenues earned in the second preceding year. For example, taxes payable in 2012 will reflect revenues earned in 2010.

2011 taxes payable are based on actual reporting. 2012 taxes payable used preliminary estimates of actual data, which indicated an average decrease of 7.8 percent in reported revenues. 2013 taxes are based on a zero increase on 2010 revenues.

5.6.2.3 Whistler Property Tax Forecast

Table 5.6-4 below provides the property tax forecast for Whistler.

Table 5.6-4: Forecast Whistler Property Tax Expense

($ thousands) **Asset Type**	**Approved 2011**	**Projected 2011**	**Forecast 2012**	**Forecast 2013**
Distribution Assets	$ 117.8	$ 108.8	$ 115.9	$ 123.8
Transmission Assets	-	-	-	-
Gas Storage Assets	-	-	-	-
Manufactured Gas Assets	-	-	-	-
General Assets	-	-	-	-
Revenue and Other Taxes	146.9	160.5	120.3	120.3
Total Property Taxes	**$ 264.6**	**$ 269.3**	**$ 236.2**	**$ 244.2**

Whistler property taxes are forecast to be $4.7 thousand (1.8 percent) higher than originally approved for 2011. 2012 property taxes are forecast to decrease by $33.1 thousand (12.3 percent) when compared to projected 2011 and 2013 property taxes are forecast to increase by $8.0 thousand (3.4 percent) compared to forecast 2012 based on the following:

1. Distribution Assets

   2011: 2011 Taxes are expected to be lower than 2011 Approved due a successful appeal in 2011 resulting in lower assessment values.

   2012: Comparing 2012 Forecast to 2011 projected property taxes, additions are expected to add $2.5 thousand in taxes, with the remaining $4.6 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

   2013: In 2013, additions are expected to add $2.6 thousand in taxes, with the remaining $5.3 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

2. Revenue and Other taxes

   A portion of a utility company's property taxes payable within a municipality on certain improvements are calculated based on revenues earned within that municipality. Whistler revenues are calculated based on 1 percent of revenues earned in the second preceding year. For example, taxes payable in 2012 will reflect revenues earned in 2010.

   2011 and 2012 taxes payable are based on actual reporting. 2013 taxes are based on a zero increase to 2010 revenues.

5.6.2.4 Fort Nelson Property Tax Forecast

Table 5.6-5 below provides the property tax forecast for Fort Nelson.

Table 5.6-5: Forecast Fort Nelson Property Tax Expense

($ thousands) **Asset Type**	**Approved 2011**	**Projected 2011**	**Forecast 2012**	**Forecast 2013**
Distribution Assets	$ 94.9	$ 92.1	$ 99.5	$ 104.4
Transmission Assets	0.3	0.3	1.3	1.3
Gas Storage Assets	-	-	-	-
Manufactured Gas Assets	-	-	-	-
General Assets	12.5	13.5	14.2	14.9
Revenue and Other Taxes	60.0	60.0	57.4	57.4
Total Property Taxes	**$ 167.7**	**$ 165.8**	**$ 172.4**	**$ 178.0**

Fort Nelson property taxes are forecast to be $1.9 thousand (1.1 percent) lower than originally approved for 2011. 2012 property taxes are forecast to increase by $6.5 thousand (3.9 percent) when compared to projected 2011 and 2013 property taxes are forecast to increase by $5.6 thousand (3.2 percent) when compared to forecast 2012 based on the following:

1. Distribution Assets

   2011: 2011 Taxes are expected to be lower than 2011 Approved due lower forecast tax rates.

   2012: Comparing 2012 Forecast to 2011 projected property taxes, additions are expected to add $2.5 thousand in taxes, with the remaining $4.9 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

2013: In 2013, additions are expected to add $2.5 thousand in taxes, with the remaining $2.4 thousand resulting from inflation on distribution pipeline rates, as well as increases in general and other tax rates.

2. Transmission Assets

   The Muskwa River Crossing Project is forecast to add $1.0 thousand in 2012.

3. General Assets

   General assets are mainly comprised of the Fort Nelson office, taxes on which are forecast to increase by general inflation.

4. Revenue and Other Taxes

   A portion of a utility company's property taxes payable within a municipality on certain improvements are calculated based on revenues earned within that municipality. Fort Nelson revenues are calculated based on 1 percent of revenues earned in the second preceding year. For example, taxes payable in 2012 will reflect revenues earned in 2010.

   Revenues from gas consumed within Fort Nelson (Northern Rockies Regional Municipality[101]) are expected to decrease by 4.5 percent in 2012 based on actual reported 2010 revenues. For 2013, revenues are forecast to remain unchanged.

5.6.3 CARBON TAX

The Carbon Tax represents a cost to the Companies on their own consumption of fuel to operate compressors, line heaters, motor vehicles and space heating. The Carbon Tax rate applicable to natural gas effective July 1, 2011 is $1.24 per GJ, and will rise to $1.49 per GJ on July 1, 2012. There are no further announced increases beyond this date. The estimated costs to the FortisBC Energy Utilities with respect to Carbon Tax on own-use fuel are embedded in O&M and capital. If the Carbon Tax rate is adjusted during the period of the RRA from what is currently enacted, the impact will be assessed and reflected in the Tax Variance Deferral Accounts.

[101] Northern Rockies Regional Municipality was created with the amalgamation of The Town of Fort Nelson and the Northern Rockies Regional District on February 6, 2009

5.6.4 HARMONIZED SALES TAX

In July of 2009, the Governments of Canada and British Columbia announced that the Harmonized Sales Tax ("HST") would be implemented in British Columbia effective July 1, 2010, replacing the BC Social Service Tax ("SST") and the Goods and Services Tax ("GST"). The B.C. HST is a federally administered commodity tax eligible on goods and services at a rate of 12 percent, representing a federal component of 5 percent and a BC provincial component of 7 percent. Businesses are entitled to claim Input Tax Credits ("ITCs") on HST paid. However, large businesses will have their ITCs restricted during the first 8 years of HST implementation. Accordingly, ITCs for the provincial portion of HST (7 percent) are restricted for most telecommunication expenses, passenger vehicles, heat and electricity, and meals and entertainment expenses. The Companies are entitled to recover the HST paid on taxable purchases of goods and services, therefore, other than the above noted restricted ITCs, the tax does not represent a net cost to the Companies.

In an Application filed with the BCUC on September 27, 2010, the FortisBC Energy Utilities proposed that the 2010 and 2011 revenue requirement impacts of the implementation of HST be recorded in the applicable Tax Variance Deferral Accounts and returned to customers as part of the 2012 Revenue Requirements filings. Please see Section 6.2 Deferred Charges for a discussion on the additions to the Tax Variance Deferral Account and the corresponding amounts returned to customers through this Application.

A referendum on the continuation of the HST will be held in British Columbia on June 24, 2011. Although the referendum is non-binding, the BC government has pledged that if a simple majority of 50 percent vote against the HST, the tax will be repealed. The RRA assumes continuation of the HST; should the HST be repealed or an alternate tax introduced, the impact on revenue requirements, including any associated implementation costs, will be assessed and reflected in the Tax Variance Deferral Accounts.

5.6.5 MOTOR FUEL TAX ("MFT") AND INNOVATIVE CLEAN ENERGY ("ICE") LEVY

The Province levies other taxes on various goods and services. These taxes include the MFT, which applies at a rate of 1.9 cents per 810.32 litres of natural gas used in compressors. The ICE levy of 0.4 percent on purchases of energy including electricity and natural gas was eliminated effective July 1, 2010. The MFT is not recoverable and therefore represents a net cost to the Companies.

5.6.6 TAX ISSUES

5.6.6.1 Risk of Changes in Tax Laws or Accepted Assessing Practices

At any time, the Companies can face changes in tax laws or accepted assessing practices in respect of Federal income tax, Provincial income tax, Federal or Provincial sales taxes or any other tax that may be imposed. As discussed in Section 6.2, the Mainland, Whistler and Fort Nelson utilities will continue the approved deferral account treatment to capture the impact of changes in tax laws or accepted assessing practices, audit reassessments in respect of any tax year, and impacts on taxes of changes in accounting policies, at Federal, Provincial, Municipal or any other level of jurisdiction. In particular and for greater certainty, should the Companies' tax treatment of removal costs (see Section 5.6.6.2 below) be challenged by the Canada Revenue Agency, the tax variance deferral account will capture such reassessments.

5.6.6.2 Tax Benefits Relating to Prior Periods – Removal Costs

During 2010, the Companies conducted a review of the tax treatment of removal costs to determine whether all or a component of these costs could be deducted for tax purposes in the year incurred. The Companies have determined that it is reasonable to deduct these costs in the year incurred for income tax purposes because of the nature of the costs classified as 'removal costs' for accounting purposes. Historically, including for the determination of rates in 2010 and 2011, the Companies have added these costs to Undepreciated Capital Cost ("UCC") for tax purposes. Beginning with the year ended December 31, 2010, the Companies have deducted removal costs for tax return filing purposes. The Companies have deferred the tax benefits relating to the 2010 tax deduction and will do the same for 2011. The analysis to support the deduction of these benefits was not completed in time to include them in rates for 2010 and 2011. A discussion of the amount of the benefits, and other items captured in the Tax Variance deferral accounts is included in Section 6.3. In the 2012 and 2013 Utility tax calculations, removal costs have been deducted in determining income tax expense.

5.6.7 CONCLUSION

The FortisBC Energy Utilities will continue to incur income taxes, property taxes and other taxes that are imposed by different government bodies. The Companies manage these expenditures through the tax audit process and various tax planning strategies, as well as ongoing compliance activities. The tax expenses included in this RRA reflect the current substantively enacted tax legislation and have been properly calculated and applied in calculating the revenue requirement for each Company.

5.7 Financing Costs and Return on Equity

The cost of service includes both financing costs and a return on equity. The Utilities' financing costs are determined by the percentage of debt included in the capital structure, and the cost of that debt. The total percentage of debt is determined by the Commission, and the allocation between long-term and short-term debt is managed by the Utilities. The Utilities' return on equity is determined by the amount of equity included in the capital structure (the equity percentage) and the allowed return on equity, both determined by the Commission.

In this section, we will explain what the allowed debt and equity percentages are for each of the utilities, and the anticipated debt issuances and expected interest rates that the Companies have included in the forecasts for 2012 and 2013. The impacts of these forecasts have been appropriately included in the Companies' revenue requirements.

This section (see Section 5.7.2) also explains why the Companies are seeking Commission's permission to defer the filing of evidence with respect to FEVI and FEW's equity component as directed in Directive No. 7 of Commission Order G-158-09. As discussed in this section, given FEU's plans to file an application in Fall 2011 to Amalgamate the Companies, FEU believes that it is more efficient to defer the filing of the evidence until that time.

5.7.1 FINANCING COSTS

Financing costs included in this RRA reflect the anticipated debt issuances and retirements over the forecast period, as well as the interest expense that has been calculated based on existing interest rates for existing debt, and external forecasts of interest rates for new debt issues. Debt consists of both Long-term Debt and Short-term (Unfunded) Debt.

5.7.1.1 Short-term Debt

FEI obtains short term funding primarily through the issuance of commercial paper to Canadian institutional investors. FEI backstops the issuance of commercial paper by maintaining a $500 million committed credit facility, which matures August 2013. FEVI obtains its short term funding through advances made available on its $300 million committed credit facility. The credit facilities provide the Companies with crucial liquidity should there be constraints in the capital markets that make obtaining cost-effective financing for working capital and debt issuance requirements temporarily unavailable. FEW obtains its financing from FHI.

5.7.1.2 Long-term Debt

FEI is a public issuer and issues long-term debt by way of a shelf prospectus. FEVI has issued long-term debt by way of private placement in the past. FEW's long-term debt consists of an intercompany loan from its parent FHI. Fort Nelson receives an allocation of FEI's long-term debt.

FEI does not have any long-term debt due for redemption in 2012 or 2013, but expects to issue $100 million in medium term note debentures in July of 2011 and has reflected this issue in its long term debt projection.

In 2013 FEVI has forecast a $15.5 million retirement of the Pacific Coast Energy Pipeline Agreement ("PCEPA") revolving credit facility, which matures in January 2013. The PCEPA facility is available solely for the purpose of funding prepayments of the Government of Canada and Government of BC contributions. The non-interest bearing contributions from the Federal and Provincial governments were in connection with the construction and operation of the Vancouver Island natural gas pipeline, of which $49.1 million is forecast to be outstanding at year-end 2011, drawn down to $25.0 million by year-end 2013.[102] These contributions are shown as CICA. Any annual prepayments of the Government contributions are funded with debt and equity in the same proportion as the capital structure of Vancouver Island. The repayment of the PCEPA facility and also the refinancing of the 2013 contributions will be financed through short-term debt as the amounts come due, with a long-term debt issue planned for after 2013.

FEW has not forecast any long-term debt issuances or redemptions in 2012 or 2013.

5.7.1.3 Forecast of Interest Rates for 2012 and 2013

The Companies use interest rate forecasts to estimate future interest expense. Forecasts of Prime rate and benchmark Government of Canada Bond interest rates are used in determining the overall interest rates for short-term debt and for new issues of long-term debt. The forecasts are averages of projections made by leading economists at four Canadian Chartered banks. Credit spreads on new long-term debt are based on current indicative rates.

Short-term rates (i.e. Prime bank lending rate) are projected to increase in the coming months. Surveys of leading economists expect the Prime bank lending rate to remain on average at 3.63 percent for 2011, and then increase to 5.56 percent by 2013.[103] The Companies' short-term borrowing rate forecast for 2012 and 2013 is based on the historical short-term borrowing differential between the Prime bank lending rate and the rate issued under the commercial paper program at that time. The short-term interest rate forecasts for all Companies are shown in Table 5.7-1 and Table 5.7-2 below.

[102] Section 7.2, Schedule 84
[103] Economist reports are included in Appendix C-1

Table 5.7-1: Determination of Short-Term Interest Rates for 2012

2012 Interest Rate Forecast %				
	Mainland	**Vancouver Island**	**Whistler**	**Fort Nelson**
Prime Rate	4.57%	4.57%	4.57%	4.57%
Short-Term Debt Rate Spread	-1.82%	-0.32%	-0.82%	-1.82%
Short-Term Debt Rate	2.75%	4.25%	3.75%	2.75%

Table 5.7-2: Determination of Short-Term Interest Rates for 2013

2013 Interest Rate Forecast %				
	Mainland	**Vancouver Island**	**Whistler**	**Fort Nelson**
Prime Rate	5.56%	5.56%	5.56%	5.56%
Short-Term Debt Rate Spread	-1.81%	-0.31%	-0.81%	-1.81%
Short-Term Debt Rate	3.75%	5.25%	4.75%	3.75%

Due to the uncertainty associated with forecasting interest rates, the Mainland, Whistler and Fort Nelson utilities have an Interest Rate Variance deferral account that captures the impact on interest expense of interest rate variances and variances in the timing of long-term debt issues, as compared to forecast.

5.7.1.4 Interest Expense Forecast

The interest expense forecast reflects the Utilities' existing and projected borrowing costs on long term debt and projected short-term debt.

The calculation for short-term interest expense is determined by applying the short-term debt rate to the short-term debt balance. Long-term debt interest expense is determined using the effective interest method. For each long-term debt issue, the effective rate (forecast effective rate if it is a new issue) is multiplied by the average balance of that long-term debt for the year. The long-term debt schedules for each company can be found in Sections 7.1 to 7.4, Schedule 82 to 84.

The following tables highlight long-term and short-term interest expense for 2012 and 2013.

Table 5.7-3: Forecast 2012 Interest Expense[104]

2012 Forecast					
($ thousands) **Interest Expense**	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
Short Term	1,644	4,556	198	7	6,405

Total Interest Expense	**108,192**	**25,559**	**1,220**	**350**	**135,321**

Table 5.7-4: Forecast 2013 Interest Expense[105]

2013 Forecast					
($ thousands) **Interest Expense**	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
Short Term	3,393	7,268	233	13	10,907
Long Term	106,730	20,473	1,022	346	128,571
Total Interest Expense	**110,123**	**27,741**	**1,255**	**359**	**139,478**

5.7.2 ALLOWED CAPITAL STRUCTURE AND RETURN ON EQUITY

On December 16, 2009, the Commission released Order No. G-158-09 and its accompanying decision on "*Terasen Gas Inc., Terasen Gas (Vancouver Island) Inc., and Terasen Gas (Whistler) Inc. Return on Equity and Capital Structure Application".* The decision established the deemed capital structure for each utility, discontinued the use of the automatic adjustment mechanism, and fixed an allowed return on equity for all three utilities. For purposes of determining the revenue requirements for 2012 and 2013, the 2012 and 2013 capital structure and return on equity for each of the Companies will remain as currently approved through BCUC Order No. G-158-09. Below, the Companies have set out the deemed capital structure and allowed ROE used in the calculation of the 2012 and 2013 revenue requirements, and explain their rationale for deferring a request for filing evidence on the equity component of capital structure for FEVI and FEW.

5.7.2.1 Background

The capital structure and return on common equity ("ROE") for FEU is established by the Commission for use in the calculation of rates. For many years, the Commission annually set the ROE for utilities in British Columbia based on the Benchmark ROE for FEI using a formula that ties the utilities' rates of return on equity to the forecast yield on long-term Canada (30

[104] Section 7.1 to 7.4, Schedule 80
[105] Section 7.1 to 7.4, Schedule 81

years) bonds for the forthcoming year. This formula is commonly referred to as the Automatic Adjustment Mechanism ("AAM").

On May 15, 2009 FortisBC Energy Utilities applied to the BCUC to request:

1. that the Commission eliminate the use of AAM in the determination of the ROE;
2. a review and adjustment to the Benchmark ROE and FEI's equity thickness for rate-setting purposes and that the so determined ROE for FEI be used in establishing the ROE of FEVI and FEW used for rate setting.

By Order No. G-158-9 dated December 16, 2009, the Commission agreed that the appropriate equity ratio for FEI is 40 percent and approved an ROE for FEI of 9.50 percent for rate setting purposes. The Commission decision also set the FEI ROE as the Benchmark in establishing the return on equity and set FEW and FEVI's allowed return on equity with reference to the Benchmark ROE by adding a utility specific risk premium of 50 basis points for both utilities.

Table 5.7-5 provides the current deemed capital structure and return on equity applicable to each utility:

Table 5.7-5: Capital Structure and Return on Equity

Utility/Region	Debt	Common Equity	Return on Equity
Mainland	60%	40%	9.50%
Vancouver Island			10.00%
Whistler			10.00%
Fort Nelson			9.50%

The currently approved deemed capital structures and return on equity for each utility is used in the determination of the revenue requirements for 2012 and 2013, as well as the combined cost of service for 2013.

5.7.2.2 FEVI and FEW Capital Structures

As neither FEVI nor FEW applied for a change in their respective capital structures in 2009, the Commission confirmed their existing capital structures and directed them to file evidence as to what equity component best reflects their respective long term risks in their next Revenue Requirement Application.[106]:

[106] BCUC Order No. G-158-09, Directive 7.

> *"TGVI and TGW are to file in their respective next revenue requirement applications evidence on the equity component that best reflects their respective long-term business risks."*

In consideration of FEU's intention to file an application later this year seeking amalgamation of FEVI, FEW and FEI, the Companies believe that it is not appropriate to address the issue at this time. The Companies are requesting, for the purposes of regulatory efficiency, leave to defer filing evidence for the capital structures of FEVI and FEW until the Amalgamation and Rate Design Phase 'A' Application to be filed in Fall 2011. The following discussion addresses the mentioned Commission directive and reasons for this request.

As outlined in Section 1.2.5, it is the Companies' intention to file an application in the Fall 2011 seeking approval to amalgamate FEI, FEVI and FEW, and move to a harmonized rate structure. If amalgamation and rate harmonization is approved, FEVI and FEW will cease to exist; if amalgamation and rate harmonization is not granted, FEVI and FEW will continue as separate stand alone utilities. As the Fall application will determine the future of FEVI and FEW, the Companies believe that it is appropriate for regulatory efficiency purposes to defer submission of evidence relating to their respective stand-alone equity components at this time.

Under the Companies' proposal, in the Fall application the Companies would provide:

- Evidence with respect to the equity ratio for FEVI and FEW on stand-alone basis. (The evidence would be provided to meet the Commission's directive. It is currently expected that the Companies still would not seek at that time any change for the stand-alone FEVI and FEW capital structures, as that would be based on the assumption that amalgamation will not proceed. In the event that Amalgamation is not approved, FEVI and FEW will apply for changes to their equity component in their next respective revenue requirement based on the evidence filed.)
- Evidence on the impact of amalgamation on appropriate capital structure and ROE for the amalgamated utility, all else being equal. (Note that this would take the form of a change *relative to* the existing benchmark, and not a change *to* the benchmark itself. The current benchmark, based on the pre-amalgamation FEI as the benchmark low risk utility, can remain in place until the next comprehensive cost of capital proceeding.)

This approach is efficient for two reasons.

First, the capital structure of a regulated utility is a function of the business risks facing the entity. There is overlap with respect to the long term business risks for both the amalgamated entity and FEVI / FEW, and addressing that evidence at the same time will eliminate the potential for redundant inquiries. In the 2009 *Return on Equity and Capital Structure*

Application, FEI explained the business risks faced by FEI in detail and recognized the following key drivers for the risk associated with operating earnings[107]:

- Provincial climate change and energy policies has increased the risk inherent to FEIs core natural gas business;
- Natural gas' competitive position relative to electricity has weakened;
- FEI is capturing a smaller percentage of new constructions;
- Electricity is increasingly the choice of high-density housing;
- Alternative energy sources further weaken FEI's competitive position,
- Fuel switching has also diminished demand for natural gas.

These same risks also face FEVI and FEW, and will impact their appropriate capital structure and return on equity. In addition to the reasons outlined above, FEVI and FEW face additional risks arising from, but not limited to, their price disadvantage, smaller size, lower market penetration rates and higher supply disruption risk[108]. In light of what is involved in assessing business risk, there is considerable potential for redundancy if business risk is addressed both in this proceeding and in the Fall 2011 proceeding.

Second, a determination on a change (if the evidence supports a change) to the equity component of FEVI and / or FEW is only required in the event that the amalgamation is not approved. If the issue is deferred until the Fall Amalgamation and Rate Design Phase 'A' Application, depending on the Commission's determination about amalgamation, it may be unnecessary for the Commission to ever determine the appropriate capital structure for the stand alone FEVI and FEW. Therefore, undertaking a full review of FEVI / FEW at this time is in the Companies' view inefficient.

In sum, the Companies seek permission to defer filing evidence of FEVI and FEW's capital structure to the Amalgamation and Rate Design Phase 'A' Application in Fall 2011. For the purposes of determining the revenue requirements, the 2012 and 2013 capital structure and return on equity for each of the companies has been calculated as currently approved through BCUC Order No. G-158-09.

5.7.3 FINANCING COSTS AND RETURN ON EQUITY CONCLUSION

The FortisBC Energy Utilities continue to prudently manage their capital structure and address financing requirements. The Companies maintain adequate credit facilities to provide sufficient

[107] FEU (formerly Terasen Utilities) 2009 ROE and Capital Structure Application, Section 4, page 24.
[108] FEU (formerly the Terasen Utilities) 2009 ROE and Capital Structure Application Panel IR 1.6 Response.

liquidity to meet their ongoing working capital requirements and address any concerns that may result from tighter credit markets. The Companies are active participants in the debt capital markets and have fostered strong relationships with its lenders. We have taken a reasoned approach to funding our long term debt requirements. With this Application, the Utilities are not seeking a change to either their capital structure or ROE.

6 RATE BASE

The determination of rate base is a significant step in the calculation of the revenue requirement; it forms the basis for the earned return component of the cost of service. The rate base is comprised of:

- mid-year net plant in-service (gross plant in service, less contribution in aid of construction, less accumulated depreciation relating to both, and negative salvage), adjusted for the timing of completion of major capital projects;
- work-in-progress not attracting allowance for funds used during construction;
- the mid-year balance of unamortized deferral accounts (regulatory assets and liabilities);
- the thirteen-month average of cash working capital and other working capital;
- mid-year future income tax asset and offsetting liability; and
- in the case of the Mainland, the LILO benefit arising from LILO agreements with several Interior municipalities.

The following subsections will discuss in detail the various components of rate base, beginning with an overview of rate base and a summary by utility/region (Section 6.1) that is followed by discussions on capital expenditures (Section 6.2) and rate base deferral accounts (Section 6.3).

6.1 Rate Base Overview and Summary by Utility/Region

The 2012 and 2013 rate base amounts, as determined in Sections 7.1 to 7.4, Schedules 40 and 41 of this RRA, represent the average investment by the Companies in utility assets necessary to provide service to our customers. The table below sets out the forecast rate base for 2012 and 2013, for each FortisBC Energy Utility.

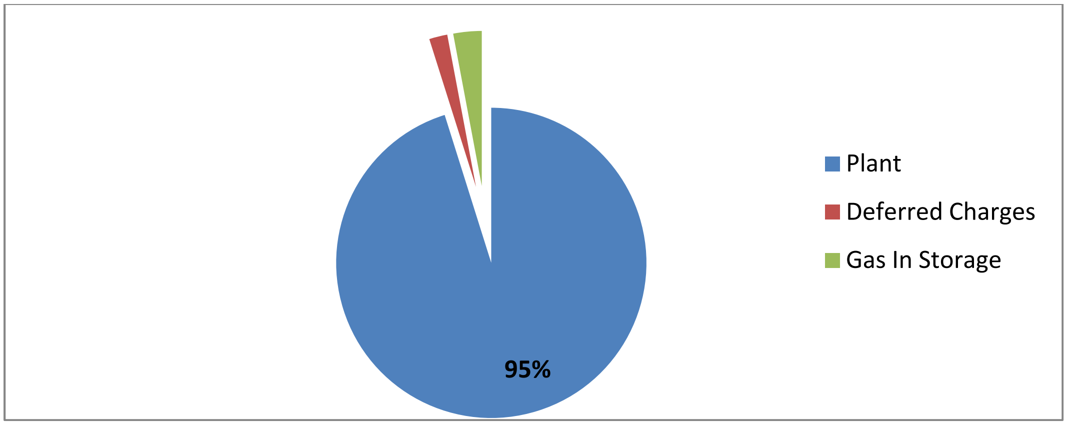
Table 6.1-1: Rate Base in 2012 and 2013 is Growing[109]

($ thousands) **Utility/Region**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
Mainland	$ 2,629,185	$ 2,736,507	$ 2,788,327
Vancouver Island	728,993	787,864	814,078
Whistler	42,594	42,139	41,502
Fort Nelson	6,839	8,889	9,127
	$ 3,407,611	**$ 3,575,399**	**$ 3,653,034**

[109] Section 7.1 to 7.4, Schedules 40 and 41

The total FEU rate base of $3.6 billion is comprised largely of net gas plant in service as shown in Figure 6.1-2:

Figure 6.1-1: FEU Rate Base is Primarily Net Gas Plant in Service



The following subsections provide a discussion on the various components of rate base for each Utility.

6.1.1 MAINLAND RATE BASE SUMMARY

The table below sets out the Mainland rate base for 2012 and 2013, for purposes of determining rates and revenue requirements.

Table 6.1-2: Mainland Rate Base 2011 through 2013[110]

($ thousands) **Mainland**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
Mid Year Net Plant In Service	$ 2,494,713	$ 2,555,445	$ 2,634,300
Adjustment to 13-month average	-	40,567	-
Work in progress, no AFUDC	15,627	17,110	17,110
	2,510,340	2,613,122	2,651,410
Deferred Charges	6,770	27,407	38,574
Cash Working Capital	(6,534)	(3,445)	(1,963)
Gas In Storage Working Capital	114,804	97,294	97,242
Other Working Capital	5,287	3,611	4,380
Other	(1,482)	(1,482)	(1,316)
Utility Rate Base	**$ 2,629,185**	**$ 2,736,507**	**$ 2,788,327**

110 Section 7.1, Schedules 40 and 41

The growth in rate base for the forecast period is largely attributable to investments in system sustainment and reliability and the addition of assets (both capital and deferral) related to the CCE Project being in service starting in 2012. Offsetting these increases are reductions in Gas In Storage due primarily to lower commodity rates. Driving the increase in the 2013 deferred charges is the growth in the balance of the EEC deferral account and the full amortization of credit balances in several of the Non-Controllable deferral accounts in 2012. Please refer to Section 6.3 for a discussion on the forecast deferred charges balances.

6.1.2 VANCOUVER ISLAND RATE BASE SUMMARY

The table below sets out the Vancouver Island rate base for 2012 and 2013, for purposes of determining rates and revenue requirements.

Table 6.1-3: Increase in Vancouver Island Rate Base is Driven by Mount Hayes LNG[111]

($ thousands) **Vancouver Island**	**Approved 2011**	**Forecast 2012**	**Forecast 2013**
Mid Year Net Plant In Service	$ 651,454	$ 774,128	$ 796,990
Adjustment to 13-month average	56,712	1,210	-
Work in progress, no AFUDC	3,608	2,285	2,285
	711,774	777,623	799,275
Deferred Charges	4,908	(1,096)	3,891
Cash Working Capital	134	295	476
Gas In Storage Working Capital	11,146	10,605	10,605
Other Working Capital	1,031	437	(169)
Other	-	-	-
Utility Rate Base	**$ 728,993**	**$ 787,864**	**$ 814,078**

The growth in the 2012 rate base is generally attributable to the full year impact of the Mount Hayes LNG Facility. Balances in the GCVA and EEC deferral accounts are the significant contributors to changes in the mid-year balance of deferred charges included in rate base. Please refer to Section 6.3 for a discussion on the forecast deferred charges balances.

6.1.3 WHISTLER RATE BASE SUMMARY

The table below sets out the Whistler rate base for 2012 and 2013, for purposes of determining rates and revenue requirements.

[111] Section 7.2, Schedules 40 and 41

Table 6.1-4: Amortization of the Pipeline Contribution Decreases Whistler's Rate Base[112]

($ thousands) Whistler	Approved 2011	Forecast 2012	Forecast 2013
Mid Year Net Plant In Service	$ 12,643	$ 13,746	$ 14,080
Adjustment to 13-month average	-	111	-
Work in progress, no AFUDC	63	23	23
	12,706	13,880	14,103
Deferred Charges	29,176	27,584	26,703
Cash Working Capital	31	42	61
Gas In Storage Working Capital	655	628	625
Other Working Capital	26	5	10
Other	-	-	-
Utility Rate Base	**$ 42,594**	**$ 42,139**	**$ 41,502**

The annual amortization of the Whistler Pipeline Contribution results in a slight decline to the Whistler rate base each year. As discussed in Section 6.3, the Whistler Pipeline Contribution has been decreased by approximately $2.5 million reflecting a reduction in the estimate of the final Pipeline costs; however, this reduction is offset by additions in 2012 and 2013 related to the CCE Project as well as other plant additions.

6.1.4 FORT NELSON RATE BASE SUMMARY

The table below sets out the Fort Nelson rate base for 2012 and 2013, for purposes of determining rates and revenue requirements.

[112] Section 7.3, Schedules 40 and 41

Table 6.1-5: Increases in Fort Nelson Rate Base Due to Muskwa River Crossing[113]

($ thousands) Fort Nelson	Approved 2011	Forecast 2012	Forecast 2013
Mid Year Net Plant In Service	$ 7,256	$ 8,823	$ 9,028
Adjustment to 13-month average	(666)	-	-
Work in progress, no AFUDC	38	-	-
	6,628	8,823	9,028
Deferred Charges	154	54	83
Cash Working Capital	54	8	12
Gas In Storage Working Capital	-	-	-
Other Working Capital	3	4	4
Other	-	-	-
Utility Rate Base	**$ 6,839**	**$ 8,889**	**$ 9,127**

The growth in the 2012 rate base is attributable to the full year impact of the Muskwa River Crossing Project. The projected in-service date of the assets related to the Project is November 1, 2011 with total project costs currently estimated at $3.0 million (excluding AFUDC), unchanged from the amount approved by Commission Order No. G-27-11.

6.1.5 NET PLANT IN SERVICE ("NPIS")

The mid-year NPIS balances reflect the necessary additions to ensure that the Utilities are able to meet the needs of our customers. The mid-year NPIS is the largest component of rate base and is the sum of the averages of the gross plant in-service (including intangible plant), CIAC, accumulated depreciation, and negative salvage.

6.1.5.1 Gross Plant in Service ("GPIS")

The ending GPIS balances are made up of opening GPIS plus plant additions, both regular and CPCNs, less retirements. Plant additions are comprised of capital expenditures plus overheads capitalized, plus AFUDC, and adjusted for opening and closing work-in-progress ("WIP"). Details of capital expenditures are discussed in Section 6.2. Retirements are forecast as a percentage of additions each year. The percentage used is based on a five year historical average for all classes except those subject to amortization accounting. For asset classes subject to amortization accounting, retirements are forecast based on the year that the asset becomes fully amortized.

The mid-year gross plant in service is as follows:

[113] Section 7.4, Schedules 40 and 41

Table 6.1-6: Approved and Forecast Gross Plant in Service Balances

($ thousands) Utility/Region	Approved 2011	Forecast 2012	Forecast 2013
Mainland	$ 3,495,886	$ 3,656,234	$ 3,837,558
Vancouver Island	1,155,525	1,290,340	1,330,943
Whistler	16,225	16,710	17,420
Fort Nelson	10,458	12,162	12,722
Total	**$ 4,678,093**	**$ 4,975,445**	**$ 5,198,643**

The forecast gross plant in service additions for the Utilities for 2012 and 2013 are as follows:

Table 6.1-7: Mainland Gross Plant in Service Additions[114]

Mainland, $ thousands	Forecast 2012	Forecast 2013
Regular Capital Expenditures	$ 133,971	$ 130,811
Overhead Capitalized	31,375	33,106
AFUDC and WIP Adjustments	5,128	4,629
Subtotal: Regular Capital Additions	170,473	168,546
Special Projects & CPCN Additions	82,393	-
Total Plant Additions	$ 252,867	$ 168,546

Table 6.1-8: Vancouver Island Gross Plant in Service Additions[115]

Vancouver Island, $ thousands	Forecast 2012	Forecast 2013
Regular Capital Expenditures	$ 29,950	$ 29,079
Overhead Capitalized	4,933	4,967
AFUDC and WIP Adjustments	139	147
Subtotal: Regular Capital Additions	35,022	34,193
Special Projects & CPCN Additions	21,973	-
Total Plant Additions	$ 56,996	$ 34,193

[114] Section 7.1, Schedule 42
[115] Section 7.2, Schedule 42

Table 6.1-9: Whistler Gross Plant in Service Additions[116]

AFUDC and WIP Adjustments	-	-
Subtotal: Regular Capital Additions	729	400
Special Projects & CPCN Additions	-	-
Total Plant Additions	$ 729	$ 400

ALLOWANCE FOR FUNDS USED DURING CONSTRUCTION (AFUDC)

The AFUDC rate applied to work in progress is based on the Company's after tax weighted average cost of capital ("WACC").[118] The WACC for each Company is based on its current approved capital structure and is determined as follows:

Figure 6.1-2: After Tax Weighted Average Cost of Capital Formula

(ROE x Equity Thickness) + [(Long Term Debt Rate x Long Term Debt Thickness) + (Short Term Debt Rate x Short Term Debt Thickness)] x (1- Tax Rate)

The approved AFUDC Rates for 2011 and the forecast AFUDC rates for 2012 and 2013 are shown in Table 6.1-11.

[116] Section 7.3, Schedule 42
[117] Section 7.4, Schedule 42
[118] The AFUDC rate also applies to non-rate base deferral accounts

Table 6.1-11: Forecast AFUDC Rates for 2012 and 2013

Utility/Region	Approved 2011	Forecast 2012	Forecast 2013
Mainland	6.83%	6.77%	6.76%
Vancouver Island	6.63%	6.44%	6.56%
Whistler	6.26%	6.17%	6.27%

The AFUDC charged to work in progress is calculated by multiplying the project costs by the company's AFUDC rate. Table 6.1-12 below shows the 2011 approved and 2012 and 2013 forecast AFUDC by utility.

Table 6.1-12: Approved and Forecast AFUDC

($ thousands) Utility/Region	Approved 2011	Forecast 2012	Forecast 2013
Mainland	$ 5,051	$ -	$ -
Vancouver Island	3,703	604	-
Whistler	-	-	-
Fort Nelson	-	-	-
	$ 8,754	**$ 604**	**$ -**

6.1.5.2 Contributions in Aid of Construction (CIAC)

Gross CIAC is composed of opening contributions, plus additions, and less the retirements throughout the year. The year-end CIAC amounts reflect forecast contributions associated with main extensions, excess service line charges, billable alterations, hazard mitigation work chargeable to customers, and system damage. The Utilities do not forecast retirements for CIAC, except for software tax savings which are retired based on the year that they become fully amortized and in the case of Vancouver Island, retirements related to the government loans. The CIAC in the Vancouver Island rate base includes government loan retirements of $20 million in 2012 and $4.1 million in 2013, bringing the outstanding balance of the government loans to $29.1 million at the end of 2012 and $25.0 million at the end of 2013. The closing balance of CIAC in Vancouver Island also includes the contribution from Whistler to Vancouver Island for the Whistler pipeline of $14.6 million. Forecast additions to CIAC are discussed in Section 6.2.6.

The year-end CIAC amounts are forecast as follows:

Table 6.1-13: The Year End Balance of CIAC Decreases Rate Base[119]

($ thousands) Utility/Region	Approved 2011	Forecast 2012	Forecast 2013
Mainland	$ (194,753)	$ (183,107)	$ (189,803)
Vancouver Island	(276,176)	(254,306)	(250,614)
Whistler	(96)	(186)	(186)
Fort Nelson	(1,271)	(1,287)	(1,287)
Total	**$ (472,296)**	**$ (438,886)**	**$ (441,890)**

6.1.5.3 Accumulated Depreciation

The rate base of the Utilities includes both the accumulated depreciation of plant in service, and accumulated amortization of CIAC. Both are increased through depreciation and amortization expense, and decreased through retirements. A discussion on the depreciation policies for the Utilities is included in Section 5.4. In addition, the accumulated depreciation balances reflect depreciation expense calculated using the depreciation rates as recommended by the updated Depreciation Study and the opening 2012 accumulated depreciation balances have been adjusted to reflect the transfer of estimated negative salvage opening balances to the negative salvage provision.

The mid-year accumulated depreciation is as follows:

Table 6.1-14: Forecast Accumulated Depreciation Reflects Updated Depreciation Study and Negative Salvage Transfers[120]

($ thousands) Utility/Region	Approved 2011	Forecast 2012	Forecast 2013
Mainland	$ (860,508)	$ (966,678)	$ (1,059,824)
Vancouver Island	(285,125)	(302,515)	(332,731)
Whistler	(3,496)	(2,761)	(3,067)
Fort Nelson	(2,486)	(2,542)	(2,897)
Total	**$ (1,151,615)**	**$ (1,274,495)**	**$ (1,398,518)**

6.1.5.4 Negative Salvage

As discussed in Section 5.4.3, the rate base of the Utilities includes both an opening and closing balance for negative salvage. The continuity of negative salvage (see Sections 7.1 to 7.4, Schedule 61 and 62) is described further below.

119 Section 7.1 to 7.4, Schedules 63-65
120 Section 7.1 to 7.4, Schedules 54-60

OPENING BALANCE

The opening balance is transferred from accumulated depreciation and determined by calculating the December 31, 2009 negative salvage provision as follows:

1. Increases in provision equal to the negative salvage component of depreciation rates multiplied by the applicable year's opening gross plant balance for those asset classes and years this treatment was approved (asset classes 474 and 478 in FEI starting in 2004; asset classes 462, 463, 465, 466, 467, 472, 473, 474, 475, 477, 478, 482, 484, 485 in FEVI starting in 2003);
2. Decreases in provision equal to the actual removal costs less salvage incurred in each of those years.

ADDITIONS

Additions represent the provisions for negative salvage as calculated using the estimated negative salvage rates provided in Table 5.4-4 and determined through the Depreciation Study included as Appendix E-1. The provision is included as a line item on the cost of service schedule and is added back for purposes of calculating income tax expense (Sections 7.1 to 7.4, Schedules 33 to 35).

COSTS INCURRED

These are the estimates of actual costs to be incurred for removal. These are the costs deducted in calculating income tax expense.[121]

Retirement costs are incurred in all major gas asset categories including mains, services, meters and stations. The following table summarizes historical and forecast expenditures required to support ongoing recurring retirement work in these gas asset categories.

Table 6.1-15: Approved, Actual and Forecast Retirement Expenditures

Utility/Region, ($ thousands)	Approved 2011	Forecast 2012	Forecast 2013
Mainland	$ 11,290	$ 12,609	$ 12,932
Vancouver Island	344	632	648
Whistler	5	6	6
Fort Nelson	-	-	-
	$ 11,639	$ 13,247	$ 13,586

The types of retirement activities that occur are described separately below:

[121] Section 7.1 to 7.4, Schedules 33 to 35

- Retired or abandoned main is generally company driven and is the removal or deactivation of an existing main from plant at the direction of the asset owner due to age, redundancy, leaking beyond economical repair or insufficient capacity.
- Retired services can be removed for the same reasons and also consist of both customer driven and company driven programs. Customer driven service retirements or removals are initiated by homeowners and developers as older homes are demolished, existing property lots are subdivided and new properties and potential homes are created. A developer typically purchases an older group of homes, requests cut-off or removal of the gas services, demolishes the homes, and rebuilds more single family or multi-family units with multiple additional service lines or service header main with multiple meters.
- Company driven service retirements or removals are driven by our inactive services program. An inactive service to a premise is a live gas service with no meter with no existing customer; these assets continue to attract regular maintenance but are not used for gas delivery. Inactive services are often forgotten by the property owner and represent a significant risk of third party damage if not removed.
- Inactive service stubs are another segment of service retirements. These are stubs installed at the time of main installation and or service lines cut-off at the property line for a variety of reasons. Their existence increases the probability of third party damage as they are difficult to locate using electronic instruments and project outside the mechanical no-dig zone of the main to which they are attached (i.e. the mechanical no-dig zone is one metre on each side of the main). If there is no future use expected for these stubs after a period of time our policy is to cut-off the service at the main to eliminate potential for third party damage.
- Retired meters (and meter removals) expenditures are for the removal and retirement of an existing meter from a premise due to age, malfunction, obsolescence or inactivity. The level of activity is driven primarily by the residential meter exchange activity as residential meters are typically removed from service once they have reached the end of their useful life in contrast to larger meter sets which may undergo some meter shop maintenance and are re-circulated for service. Inactive meters are typically those pulled from service due to customer inactivity after an appropriate time period.
- Miscellaneous retirements would include all other gas asset categories but are generally expenditures related to retiring or removing stations.

The forecast expenditures for 2012-2013 for miscellaneous and mains retirements are generally project specific whereas the forecast for meters and services is generally recurring annual work that is expected to remain fairly consistent from 2010 actuals.

CLOSING BALANCE

Calculated as the opening balance plus additions less costs incurred. The closing balance is deducted from rate base on Sections 7.1 to 7.4, Schedules 40 and 41.

As discussed in Section 5.4, the FortisBC Energy Utilities believe that the proposed treatment is in the best long-term interests of customers and is the most appropriate for rate making purposes.

The mid-year negative salvage included in rate base for 2012 and 2013 is as follows:

Table 6.1-16: Mid-Year Balance of Negative Salvage[122]

($ thousands) Utility/Region	Forecast 2012	Forecast 2013
Mainland	$ (6,200)	$ (9,900)
Vancouver Island	(10,835)	(14,175)
Whistler	(37)	(112)
Fort Nelson	-	-
Total	**$ (17,071)**	**$ (24,187)**

6.1.6 13-MONTH ADJUSTMENT

Since the NPIS is calculated on a mid-year basis (beginning plus ending divided by two), for large capital projects, the rate base is adjusted to reflect the timing of when these projects actually go into rate base. In 2012, a 13-month adjustment has been applied to Mainland, Vancouver Island and Whistler to include the assets associated with the CCE Project as of January, 2012. For the Mainland, the 13-month adjustment also accounts for the Tilbury Land purchase which enters rate base January 1, 2012. For Vancouver Island, the 13-month adjustment also accounts for the Victoria Regional Office CPCN in-service as of October 2012. The Companies have not forecast any 13-month adjustments in 2013.

6.1.7 WORK IN PROGRESS INCLUDED IN RATE BASE

Consistent with past practice, Work in Progress included in rate base represents construction work in progress for projects that are shorter than three months in duration and less than $50 thousand. Projects over this threshold attract AFUDC, and are not included in rate base until they are available for use, at which time AFUDC is no longer charged to the capital project. The Work in Progress (not attracting AFUDC) included in Rate Base has been forecast at the ending 2010 balance for both 2012 and 2013.

[122] Section 7.1 to 7.4, Schedules 61 and 62

6.1.8 RATE BASE DEFERRAL ACCOUNTS

The forecast mid-year balance of deferral accounts has been included in rate base. Individual rate base deferral accounts are discussed in Section 6.3.

6.1.9 WORKING CAPITAL

The working capital component of rate base is comprised of cash working capital and other working capital. Cash working capital is defined as the average amount of capital provided by investors in the Companies to bridge the gap between the time expenditures are required to provide service and the time collections are received for that service. Other working capital includes Gas-In Storage, transmission line pack, inventory and construction advances.

6.1.9.1 Cash Working Capital

The cash working capital requirements that have been included in this RRA appropriately reflect the most recent Lead Lag Study results and represent the amounts required to compensate the Utilities for the timing differences between when expenditures are required to provide service and when collections are received for that service.

As a result of the implementation of HST, the Utilities have removed the GST and PST lead days from the cash working capital calculation and updated them to show an HST lead day and a Residential Energy Credit lead day as shown in Table 6.1-17 below. The modification of the lead days to reflect HST does not materially impact the cash working capital or the cost of service for each utility and results in a minor decrease to the cash working capital because of the higher input tax credit associated with gas purchases and non-labour O&M.

Table 6.1-17: The Implementation of HST Results in a Minor Change to Cash Working Capital

	Approved GST Lead Days	Proposed HST Lead Days	Residential Energy Credit Adjustment	Proposed REC Lead Days
Mainland	38.8	38.8	(5.0)	33.8
Vancouver Island	39.8	39.8	(5.0)	34.8
Whistler	39.8	39.8	(5.0)	34.8
Fort Nelson	38.8	38.8	(5.0)	33.8

Consistent with the treatment of GST, HST is remitted to the Government of Canada at the end of the subsequent month. Therefore, the current lead day associated with GST is applicable when determining the working capital implications of the HST. HST of 12 percent is collected from non-residential customers while residential customers receive the Residential Energy Credit ("REC"). The REC is typically received from the Province five days before the HST is remitted to The Government of Canada.

As discussed in Section 5.6, the implementation of the HST replaced the GST, PST and also eliminated the ICE Levy. The impact of the ICE Levy was embedded in the lead day determined for PST. Therefore, the GST and PST lead days are no longer applicable to the determination of cash working capital and must be removed.

The Utilities request approval to modify their approved Lead Lag days with the removal of the GST and PST lead days and the insertion of the proposed HST and REC lead days, as set out in Table 6.3-17.

6.1.9.2 Gas-in-Storage and Other Working Capital

The main component of other working capital is gas-in-storage inventory, which is determined on a 13-month average basis. The forecast amount of Gas in Storage is subject to significant risk, both in terms of forecasting volumes that will be held in storage, and in terms of forecasting future commodity prices. For purposes of this RRA, the forecast volumes and prices are consistent with the assumptions used in forecasting the gas costs and the balances of the gas cost deferral accounts.

The forecast balances of the gas-in-storage component of working capital are provided in the table below:

Table 6.1-18: Gas in Storage Balances Reflect Current Commodity Forecasts[123]

($ thousands) Utility/Region	Approved 2011	Forecast 2012	Forecast 2013
Mainland	$ 114,804	$ 97,294	$ 97,242
Vancouver Island	11,146	10,605	10,605
Whistler	655	628	625
Fort Nelson	-	-	-
Total	**$ 126,605**	**$ 108,527**	**$ 108,472**

6.1.10 SUMMARY

Mainland, Vancouver Island, Whistler and Fort Nelson must be accorded the opportunity to earn a return on their investments in rate base. The rate base amounts that have been forecast for 2012 and 2013 incorporate required expenditures to meet the expectations of our growing customer base, support the repatriated customer service function and to make improvements related to system integrity and reliability.

[123] Section 7.1 to 7.4, Schedules 72 to 74

6.2 Capital Expenditures

6.2.1 INTRODUCTION

The Companies' capital expenditures involve small and large projects of many types that are required to meet increasing regulatory requirements and public expectations to maintain the safety, reliability and integrity of the distribution and transmission facilities used to provide service to existing and new customers, respond to the information needs and inquiries of customers, and to provide the information and systems necessary to support the business.

The FortisBC Energy Utilities forecast 2012 and 2013 capital expenditures (excluding Allowance for Funds Used During Construction ("AFUDC") and CPCN projects) are as outlined in the tables below. A summary of the Companies' capital expenditures for the 2010/2011 period with a comparison to the Approved amounts over the same period is also provided below. To better reflect and describe the nature of the capital expenditures, the categories of expenditures have been redefined from Category A, B and C used in past applications to Sustainment Capital, Growth Capital, and Other.

- Sustainment Capital – Includes expenditures for meter recall or meter exchange programs (previously Category A – Replacement Meters); system reinforcements to the distribution and transmission systems to maintain capacity to meet existing and forecast load, and replacements and upgrades to the distribution and transmission systems to ensure safety, integrity and reliability (previously Category B – Transmission and Distribution); and expenditures for mains and service renewals and alterations (previously Category C – Non IT Distribution)
- Growth Capital – Includes expenditures for the installation of new mains, services and meters (previously Category A – New Mains, Services and Meters) and NGV and biomethane equipment
- Other Capital – Includes expenditures for Facilities, Equipment and IT (previously Category C – IT and Non IT Facilities/Equipment)

This categorization has been used in the tables that follow, showing the total capital expenditures for each of the Mainland, Vancouver Island, Whistler and Fort Nelson utilities.

A discussion of each of the Sustainment Capital, Growth Capital, Equipment and Facilities, IT, and CIAC categories follows. The FEU have also provided a discussion of both current and forecast CPCN projects that are not included in the table above, but that enter rate base in the year that they go into service.

For historical information for each of the Companies please refer to Appendix D.

6.2.2 SUSTAINMENT CAPITAL EXPENDITURES

6.2.2.1 Overview of Sustainment Capital

The expenditures within sustainment capital include gas system improvements to ensure adequate capacity to the transmission and distribution system in order to meet forecast load and to ensure the safety, reliability and integrity of the system. These expenditures mitigate the risk of loss from system outages and business interruptions.

[127] Section 7.4, Schedule 42

Before discussing the 2012 and 2013 forecast expenditures, the following will provide background on the planning for transmission and distribution system reinforcements and for safety, reliability and integrity of the systems.

SYSTEM REINFORCEMENT PLANNING

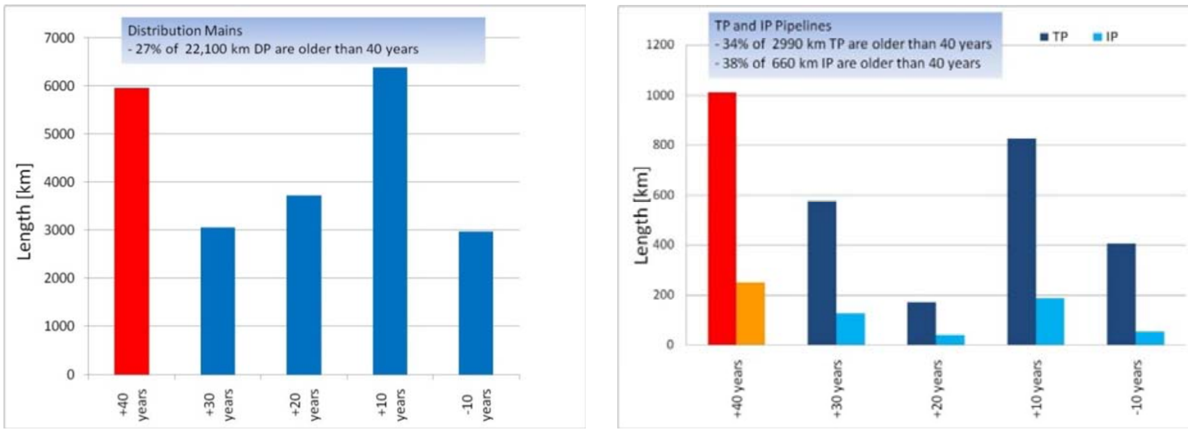
The requirements for transmission system capacity reinforcements are identified and evaluated annually through system hydraulic and financial analyses with the best overall alternative selected in a long term system capacity plan (typically for a 20 year planning period). The analyses are based on long term demand forecasts, accounting for the hourly demand variations of heat sensitive load, the amount of line pack available within the transmission system, and any midstream gas supply benefits. Long range planning for the transmission system is necessary to account for the long lead times for typical large infrastructure projects (i.e. regulatory approvals, public consultation, conceptual design, detailed engineering, and construction schedules). The plan optimizes the transmission capacity additions to meet the forecast demand from core market (residential, commercial, small industrial) customers under design temperature conditions and firm transportation from industrial customers.

Similarly, for distribution, the key tool used to determine the capital requirements necessary for these facilities is the Companies' five-year infrastructure plan. This plan is developed using a detailed network analysis process that incorporates the needs of each community with different weather patterns, growth rates, geographic location, and specific customer attributes, and is updated annually. The planning cycle starts with gathering pressure information from hundreds of points throughout the system, which are then adjusted for weather differences. This data is then used to validate and adjust the hydraulic modeling application, ensuring that the model continues to accurately reflect the operating conditions of the natural gas delivery system, Computer programs are used to analyze the flows on gas distribution grids and the transmission system to model growth and to develop a plan that minimizes the long-term costs of meeting customer needs while meeting appropriate codes and standards. As well, other components of the system (such as gate stations, odorant facilities, metering, etc.) are reviewed and analyzed to ensure the design delivery requirements will continue to be met. Once the network analysis of the distribution system is complete, specific projects to meet the load growth are determined, evaluated and prioritized. The evaluation is centered on ensuring that undue risk is not taken with regard to meeting peak day obligations or compromising system integrity. Where possible, procedures such as active monitoring and manual intervention are examined as a way to analyze the impacts of deferring the requirement for projects without risking the security of supply to the customers. The final output of the review is the five-year capacity upgrade plan which is then used to create a portion of the five-year budget.

AGING INFRASTRUCTURE AND ASSET RISKS

Most Utilities in North America, including FEU, are facing the challenge of aging infrastructure. Today, FEU is responsible for gas transmission and distribution assets with a book value of approximately $3.0 billion, and an approximate replacement value of $6.8 billion. Nearly 25 percent of distribution mains and 35 percent of intermediate and transmission pressure pipelines (Figure 6.2-1) have been in service for 40 to 55 years. These aging assets will be facing an increasing rate of deterioration and be approaching the end of their service life leading to the need for replacement starting within the next 10 years.

Figure 6.2-1: Proportions of Transmission and Distribution Approaching Retirement

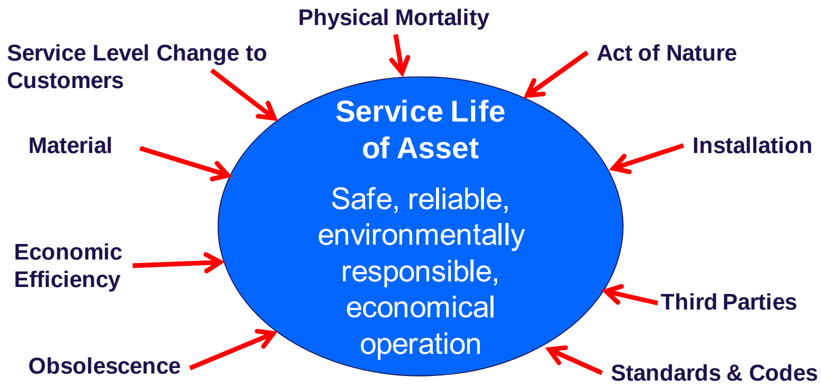


Distribution Main Age **Transmission and Intermediate Pressure Pipe Age**

(+10 years means more than / -10 years means less than)

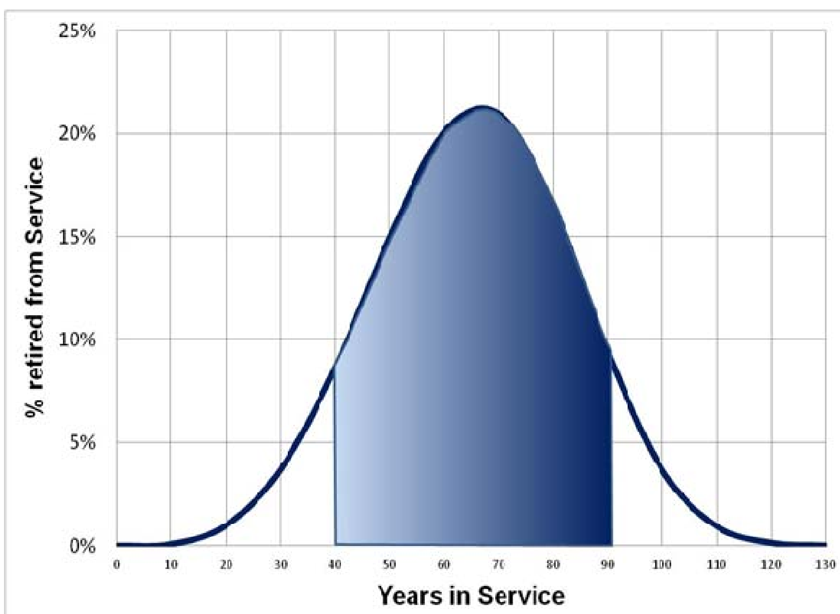
To understand the challenge posed by a wave of aging assets, it is necessary to understand the service life of each asset group. Examples of asset groups include pipelines, mains, services, meters, compression equipment, measuring and regulators. The concern is that a large population of the asset group would typically be retired from service near the average service life of the asset group, causing a spike in costs for asset replacement. The factors such as normal wear and tear, plus other external factors such as obsolescence, changes in codes and standards, economic efficiency, changes in service requirements, acts of nature, and third party damages, can all impact specific assets (Figure 6.2-2) and all need to be considered. These factors may result in early asset retirement in some cases, while an effective asset management program can also identify opportunities to optimize the service life of assets in the group.

Figure 6.2-2: Many Factors Impact the Service Life of an Individual Asset



Based on the estimates of the service life of our assets, over the next 40 years, approximately two-thirds of the current assets are expected to need replacement. As an example, Figure 6.2-3 illustrates the anticipated wave of asset replacement for FEU's pipe assets by showing their projected service life.

Figure 6.2-3: Projection of Gas Pipe Asset Renewal



CHANGING REGULATIONS AND EXPECTATIONS

The Oil and Gas Commission ("OGC") through regulation uses the CSA standard Z662 Oil and Gas Pipeline Systems to establish the minimum technical standards for the design, construction, operation, and maintenance of pipeline systems within B.C. In the 2007 Edition of the standard the concepts and specifications for asset Integrity Management and Safety and

Loss Management Systems were introduced. The Province also replaced the 40-year-old Pipeline Act with the Oil and Gas Activities Act, thus implementing a regulatory framework for managing risks to the environment and public safety due to all natural gas activities. The new Act addresses safety, transparency and consideration of "quality of life" impacts when working within prescribed distances of dwellings. As a result of these changes FEU has had to enhance its asset management systems and programs which will likely drive increased asset replacement.

Another example of increased regulation is the adoption by the OGC of CSA standard Z246.1 Security management for petroleum and natural gas industry systems that specifies requirements for security management planning and threat response. As a result FEU must continually review and update its security risk assessments and Security Management Program.

A number of high profile natural gas accidents have occurred across North America in recent years, heightening public concern for the safety of natural gas infrastructure. These heightened expectations are impacting asset management requirements, regulations and processes for utilities.

In November, 2000 an El Paso Natural Gas pipeline ruptured and caused a fire near Carlsbad, New Mexico. The incident led to the creation of the US Federal Pipeline Safety Improvement Act in 2002 to strengthen pipeline safety programs, oversight of pipeline operators, and public education on pipeline safety.

A more recent example is the September 2010 Pacific Gas and Electric gas pipeline failure and fire in San Bruno, California. A 30-inch diameter natural gas pipeline ruptured in a residential area. The accident killed eight people, injured many more, and caused substantial property damage. Approximately 47.6 million standard cubic feet of natural gas was released.[128] This accident has significantly increased public and regulator expectations on the safety of pipeline systems. For example, the incident has led to the introduction of a new Feinstein-Boxer safety bill to strengthen the Pipeline Safety and Enforcement Act of 2011, to mandate additional safety inspections and equipment installations, increase the number of safety inspectors, and increase the penalties for violation of regulations. These increases in prescriptive regulations in the US reflect public concerns regarding pipeline safety, and will very likely have implications for the entire industry in both the US and Canada.

Customers continue to expect reliable gas delivery and are increasingly less tolerant of an extended loss of service. The loss of gas supply can impact quality of life and comfort, and disrupt business. Regulatory authority investigations into long duration outages are expanding and requiring additional utility resources.

---

[128] NTSB releases preliminary report on its investigation of pipeline rupture accident in California, http://www.ntsb.gov/pressrel/2010/101013.html

Given the need to manage and control the risks from aging assets, while balancing asset performance and cost effectiveness and meeting the challenges from increasing regulation and evolving stakeholder expectations, FEU must adopt a proactive approach and a long term view to manage its gas assets. This is the reason that FEU is applying and enhancing its asset management practices, particular in the planning of safety, reliability and integrity related sustainment capital, as explained below.

SUSTAINMENT CAPITAL AND ASSET MANAGEMENT

Given the challenge of the approaching wave of asset replacement and increasing regulation, an asset management approach and methodology is required which includes an analysis of the long term requirements of resources, as well as the ongoing asset management enhancement efforts. This will result in an optimized and levelized portfolio of capital investments matching available resources and minimizing rate impacts to our customers while continuing to ensure safe, secure natural gas delivery. As described below, FEU has made enhancements to its sustainment capital planning and asset management methodology that aim to reach this goal.

The methodologies to develop sustainment capital plans are linked to Asset Management. The Canadian Gas Association ("CGA") released a Guiding Document on Asset Management in 2009 that provides a basic framework for enhanced Asset Management practices. The CGA defines asset management as:

> *"A strategic management system used to optimally manage assets over the life cycle by balancing performance, risk, and expenditures to achieve corporate strategic objectives",*

and CGA further clarifies that asset management:

> *"…refers to a comprehensive and strategic application of a set of concepts, techniques, and tools that, when adopted and used effectively, can enhance a company's current management of its assets."*

The document goes on to describe the evolution of asset management practices:

> *"asset intensive industries such as aerospace, defence, oil and gas refineries, roads, bridges, railway works… have been developing this asset management discipline since the late 1970...* ***In more recent years, asset management has been gaining attention among North American transportation/municipal infrastructure managers and electric and gas utilities*** *(emphasis added)."*

In response to the need for a longer term and systematic sustainment capital planning and asset management strategy as described above, in 2010, FEU began developing a Long-Term Sustainment Plan (the "LTSP") for sustainment capital for transmission and distribution asset safety, integrity, reliability and capacity reinforcement. The LTSP is an enhancement to existing processes used for development of sustainment capital budgets. The primary enhancement is a life cycle view of asset health and management instead of the traditional one to five year view of assets. The LTSP is a longer term, more comprehensive and systematic process enhancement to the existing base capital planning on existing assets.

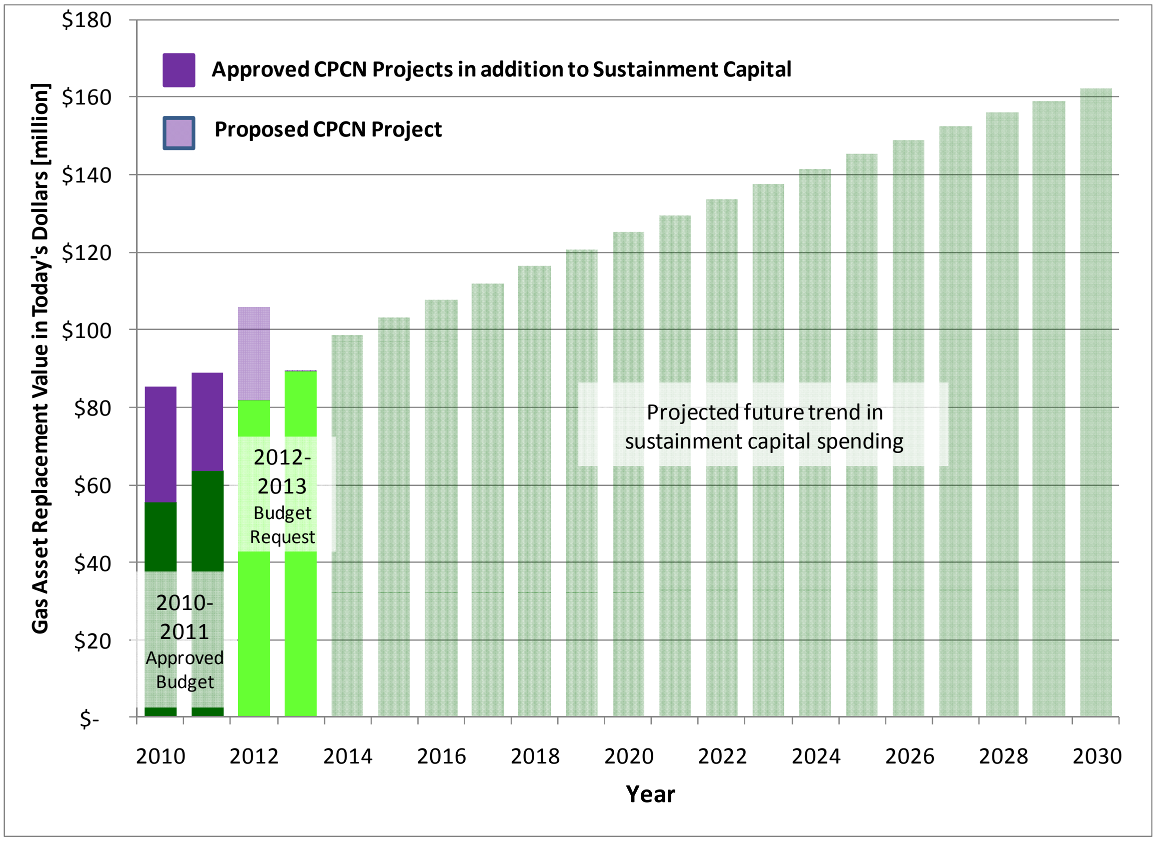
The enhanced sustainment planning process can be summarized into five elements.

- The Asset Registry links asset management modules, such as financial, geographic, maintenance and control systems, and establishes a clear and systematic hierarchy of assets and their inter-relationships so the overall system effectiveness can be measured;
- The Business Values defined for asset management purposes translate the corporate objectives of safe, reliable, environmentally responsible and cost effective energy service delivery into a set of metrics (quantitative and qualitative) that can be assessed against the impact of service failure;
- An Asset Health Review enables a more systematic view of risk, and includes a framework for asset failure prediction to ensure the correct data is collected and measurements are conducted to examine asset performance against expected service levels. A risk assessment is then conducted to quantify the impact on the Utilities' business values of both the consequence and probability of asset failure;
- The identification of defined levels of risk exposure triggers the preparation of a Business Case in which the problem is defined, feasible options are identified and evaluated, a preferred solution is selected, cost and resource requirements are determined and a project schedule is presented; and finally
- The various business cases for system sustainment projects are prioritized by the business value benefits to cost ratio.

The LTSP consists of two major groups of plans: System Reinforcement Plans and Integrated System Sustainment Plans. The sustainment capital falls within these two plans. This LTSP would coordinate with the accompanying O&M Plans to ensure appropriate operating strategies and maintenance efforts are applied to the assets. The cycle of conducting the asset management steps will be ongoing and continuously improving.

While it will take some time to fully implement the asset management enhancements, we have made important organizational, process and system advancements for the collection and assessment of data and to establish the technical and process foundations for improved trending of asset performance and service life prediction for all of FEU's assets. By knowing the age of our assets, using the service life curves (also known as Iowa Curves) generated based on the retirement history of our assets, and estimating the replacement costs of our assets in today's dollars, FEU is able to develop a projected trend of sustainment capital expenditure for all gas assets, as is shown in Figure 6.2-4. The wave of aging asset replacements is reflected by the rising trend of capital expenditure.

Figure 6.2-4: Projected Trend in Sustainment Capital



The 2012-2013 budgets have been more closely examined than long-term cost trending and are based on project specific estimates. As shown in the graph above, however, the 2012-2013 budget requests are consistent with our long-term view of the system from an asset health perspective.

For this Application, sustainment capital spending budgets have been developed using existing sustaining capital and some enhanced asset management practices. It should be noted that FEU is also addressing hazards and risks that the Company believes require immediate attention. Over the longer term, FEU will continue to improve its asset management practices with the further development of a Long Term Sustainment Planning process. Asset replacement costs are expected to continue to rise in the future because the cost of new assets will be higher than that of the original equipment. The LTSP will help us analyze a myriad of factors impacting asset replacement decisions and be used to prioritize spending where necessary and help to minimize the impact on rates by spreading costs out over time.

The approved, actual, projected, and forecast sustainment capital expenditures for transmission and distribution systems for all of the FortisBC Energy Utilities (FEU) are summarized in Table

6.2-5 below. The forecast for 2012 and 2013 is based on identifiable projects and represents a prudent and reasonable level of spending to provide reliable service.

Table 6.2-5: Approved, Actual and Forecast Sustainment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Sustainment Capital						
Meter Recalls/Exchanges	19,700	20,307	20,580	20,755	21,925	22,566
Transmission System Reinforcements / Integrity and Reliabililty	14,591	13,607	16,531	16,531	28,448	30,714
Distribution System Reinforcements / Integrity and Reliabililty	10,159	6,559	11,276	11,726	10,195	8,705
Distribution Mains and Service Renewals and Alterations	11,212	12,542	10,957	12,853	21,757	27,605
	55,662	**53,015**	**59,344**	**61,865**	**82,324**	**89,590**

In this Application, FEU is seeking approval for 2012 and 2013 sustainment capital budgets for distribution and transmission assets. FEU has forecast $82.3 million in 2012 and $89.6 million in 2013 for Sustainment Capital expenditures. This represents incremental spending of $23.0 million and $30.2 million in 2012 and 2013 respectively over 2011 approved amounts for the same purposes. The project descriptions for the 2012 and 2013 projects are provided in the sections that follow. This two year sustainment spending includes:

- Expenditures for meter recalls and meter exchange programs;
- System reinforcements to the distribution and transmission systems to maintain capacity to meet existing customer demand and forecast load;
- Replacements and upgrades to the distribution and transmission systems to ensure safety, integrity and reliability; and
- Expenditures for main and service alterations and renewals.

The following sections describe the Sustainment Capital expenditures for each of the four utilities – Mainland, Vancouver Island, Whistler, and Fort Nelson.

6.2.2.2 Mainland Sustainment Capital Overview

The 2010 through 2013 Mainland Sustainment Capital is shown in the following table. Overall, Sustainment Capital in the Mainland utility is forecast to grow to $65.5 million in 2012 (increase of $21.7 million or almost 50 percent from 2011 Approved). The 2013 forecast is $75.1 million (an increase of $9.6 million or 15 percent from 2012 Forecast).

Table 6.2-6: Approved, Actual and Forecast Mainland Sustainment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Sustainment Capital						
Meter Recalls/Exchanges	18,178	19,126	19,055	19,525	20,668	21,272
Transmission System Reinforcements / Integrity and Reliabililty	9,546	9,771	8,663	8,663	20,350	24,386
Distribution System Reinforcements / Integrity and Reliabililty	7,900	5,198	6,250	6,750	7,170	7,610
Distribution Mains and Service Renewals and Alterations	10,060	11,342	9,810	11,370	17,330	21,845
	45,684	**45,437**	**43,778**	**46,308**	**65,517**	**75,114**

Each of the four categories is discussed further below.

6.2.2.3 Meter Recalls and Exchanges – Mainland

This section contains a discussion of all meter capital, including both the recalls and exchanges included in Sustainment Capital, and the new meters included in Growth Capital. Similarly, the discussion of meter expenditures for Vancouver Island, Whistler and Fort Nelson below also includes both sustainment and growth meter expenditures.

The three main considerations in understanding the forecast meter expenditure level are:

1. the level of activity (meters purchased and installed or exchanged);
2. the unit cost to purchase, fabricate and install the meter (dollars per meter); and
3. other miscellaneous meter and regulator programs.

A summary of 2011 Meters (New and Replacement) projections as well as 2012-2013 forecast activities, unit costs, and expenditures follows in Table 6.2-7 below. The level of activities combined with the unit cost form the basis for the total expenditures.

Table 6.2-7: Approved, Actual and Forecast Mainland Meters Activities, Unit Costs & Expenditures

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Activities						
Meters - Exchange	60,255	61,540	60,175	61,853	62,350	62,300
Meters - New	5,952	6,949	6,166	6,361	6,656	6,923
Unit Costs ($/meter)						
Meters	$ 267	$ 274	$ 280	$ 280	$ 295	$ 304
Expenditures ($000's)						
Meters - Exchange	$ 16,079	$ 16,873	$ 16,861	$ 17,331	$ 18,408	$ 18,945
Meters - Other	$ 2,099	$ 2,253	$ 2,194	$ 2,194	$ 2,260	$ 2,328
Total Sustainment	$ 18,178	$ 19,126	$ 19,055	$ 19,525	$ 20,668	$ 21,272
Meters - New	$1,588	$ 1,905	$1,728	$ 1,782	$ 1,965	$ 2,105

METERS ACTIVITY LEVELS

The forecast level of meter activity is derived from the sum of the customer additions and the meter exchange forecasts. The meter forecast for new customers is derived directly from the forecast of customer additions using a one to one ratio. The forecast level of meter exchange activity to service existing customers is driven by life expectancy of meters and the total size of the meter population.

In the past few years, there were two specific drivers that significantly influenced the meter recall schedule. Prior to 2006, we managed the residential meter fleet to a 28 year life span enabled by one maintenance and recondition operation at the midpoint of this 28 year life. This resulted in a meter recall frequency of 14 years. Communications with vendors, ongoing discussions within the Canadian Gas Association Measurement Committee and the Company's own internal analysis, provided us with the confidence to target a 20 year life span for the residential meter fleet without a mid-life recondition operation. This allowed the Mainland to temporarily reduce the number of meter recalls from between 40,000 to 50,000 meter recalls annually to a range between 25,000 to 35,000 recalls annually over the period 2006 - 2008. The reduction in the number of recalls brought the demographics of the meter fleet in line with a 20 year life expectancy, which provide customers with the cost benefits of previous investments in the fleet.

Forecast meter exchanges for 2012 and 2013 of approximately 62,000 per year are consistent with recent activity levels observed. Of the 62,000 forecast per year, approximately 58,000 are for the residential meter recalls program as well as unscheduled residential meter exchanges. The remaining units (approximately 4,300) are identified for the industrial meter exchange program (seven year exchange frequency) as well as unscheduled industrial meter exchanges.

We believe the established meter recall frequencies reflect the long term objectives of the fleet management program and will ensure our customers will continue to receive service that is both cost effective and reliable.

METERS UNIT COSTS

Aggregate or blended meter unit cost, which is the second consideration in establishing the forecast expenditure requirement for meters, is influenced by the type, size, and design of the meter, installation, fabrication and exchange conditions and the timing of bulk meter purchases and meter/regulator upgrade activity. A blended unit cost of all customer types is used for meter exchanges and installs. Meter unit costs typically range from $75 to $10,000 depending on customer requirements. In 2010, the blended meter unit cost consists of 35 percent labour and 65 percent material costs. Unit costs for meters for 2012 and 2013 are based on 2010 actuals and 2011 forecast inflation on labour and materials of 3 percent per annum. Also included in the 2012 unit cost increase is an incremental $6 per meter to reflect additional funding required for customer meter set upgrades and alterations. These upgrades are primarily on industrial/commercial meters to address obsolescent components and to facilitate field maintenance (i.e. the installation of a by-pass mechanism to eliminate a customer shutdown during routine meter maintenance).

METERS EXPENDITURES

In Table 6.2-7 above, the Exchange Meters expenditures forecast for 2012 and 2013 is $18.4 and $18.9 million respectively. Meters expenditures are variable and rise and fall with meter exchange activity levels. The regulators required for replacement activities are included in the “Meters-Other” category. In 2012 and 2013, $2.3 million is required for a continuation of the annual regulator ever-greening requirement. This is a program started in 2003 in Mainland to replace regulators at the same time as meters were replaced at the customer premise. The forecast in meter exchange activity levels together with the regulator replacement program is reflected in the aggregate expenditure requested.

6.2.2.4 Transmission System Reinforcement, Integrity & Reliability Capital – Mainland

These Transmission-related capital expenditures include system capacity improvements to meet existing customer demand and forecast load, and expenditures related to ensuring safety, reliability and integrity of the transmission system, as well as to minimize impact to the environment.

As shown in Table 6.2-6 above, the 2010 approved expenditure for the Mainland was approximately $9.6 million while the actual expenditure was approximately $9.8 million, a difference of 2 percent. It is expected that 2011 expenditures will be very close to the approved amount of approximately $8.7 million. The forecasts for Mainland Transmission expenditures in

2012 and 2013 are $20.4 and $24.4 million, respectively. The primary reason for the higher forecasts is the implementation of the LTSP.

2012 and 2013 projects that are forecast to cost greater than $1 million and significant multi-year programs are discussed below:

COMPRESSOR STATION CONTROL UPGRADE PROGRAM

In 2007, the manufacturer of the electronic control equipment commonly used in all 9 compressor stations served a 24 month notice of inactivation – i.e. the equipment will no longer be manufactured and there will be no guarantee of inventory or spare parts. To address this equipment obsolescence, a replacement program, which began in 2009, will require $1.3 million between 2012 and 2013 to update the electronic control technology. The program will continue until its completion in 2016.

INTERIOR TRANSMISSION SYSTEM VALVE REPLACEMENT PROGRAM

Over 40 percent of 1,515 km of pipeline in the Interior Transmission System are 40 years and older. There are over 90 valve assemblies on the older portion of the pipeline system that are exhibiting deterioration in operational performance such as high operating torque, and stem and seal leaks that are difficult to repair due to the below ground installations. A program was initiated in 2008 to systematically replace the aging valve assemblies with above ground designs on a priority basis based on operational criticality, proximity to people and potential third party activity, and accessibility for emergency response, etc. The program will continue to 2016 with planned expenditures of $2.4 million and $2.2 million in 2012 and 2013, respectively.

MAJOR INSPECTION OF PIPELINES

Major expenditures for on-going inline inspection of the major transmission pipelines will cost $1.5 million and $1.3 million, respectively in 2012 and 2013. These spending levels are similar to that experienced in 2010 and 2011.

PHYSICAL SECURITY IMPROVEMENT

With the anticipated adoption by the Oil and Gas Commission of CSA Z246.1-09, *Security management for petroleum and natural gas industry systems*, security upgrades are planned for the critical and vulnerable assets on the transmission systems. These upgrades will occur on an on-going basis in response to regular security criticality, threat and vulnerability assessments. For 2012 and 2013, physical security improvement such as access control, vehicular barricade, active video monitoring and alarms, and improved fencing, etc. in the amount of $1.6 million and $1.2 million, in 2012 and 2013 respectively, will be added to several critical transmission facilities.

COASTAL TRANSMISSION SYSTEM VALVE REMOTE AUTOMATION PROGRAM

The Coastal Transmission System, located in an urban and seismically-sensitive area, has a relatively high probability of damage from third-party activities and natural ground movement. The consequence of a pipeline rupture, in the form of property damage or personal injury or fatality, is also correspondingly greater in the Lower Mainland due to the higher population density. The ability to remotely close valves will allow operations personnel to address such emergency situations quickly and safely. The ability to close valves in a more timely manner will mitigate the potential consequences of a transmission pipeline rupture by the reducing the amount of vented gas, reducing the possibility of fire damage, and reducing physical exposure to danger for operations personnel, emergency responders and the public. This program will automate 49 mainline and crossover valves in 17 valve assembly sites, spanning 4 years from 2012 to 2015, with an expenditure of $2 million per year in each of 2012 and 2013.

PIPELINE IN-LINE INSPECTION IMPROVEMENT

The major transmission pipelines are subject to in-line inspection (“ILI”) for monitoring of corrosion and other conditions affecting pipeline integrity. The inspection provides a proactive approach to preventing pipeline failure. However, there are several small pipe segments where the ILI launchers/receivers for the inspection tools are not yet installed, thus not allowing ILI for these pipe segments.

Since installation in 1989, the 610 mm OD pipeline from Noons Creek to Eagle Mountain, interconnecting the Coastal Transmission System to the Vancouver Island Transmission System, could not be shut down for ILI launcher/receiver installation as it is the single feed to Vancouver Island. However, with the completion by the end of 2011 of the Mt. Hayes LNG Facility near Ladysmith to provide an alternate source of gas supply to Vancouver Island this single feed line can finally be temporarily isolated. The ILI launcher/receiver installation for the Noons Creek to Eagle Mountain Pipeline is planned to take place in 2012 at a budgetary cost estimate of $1.5 million.

SEISMIC UPGRADES

The transmission and distribution systems in the Lower Mainland operate in a zone of high potential seismic activity. An updated Regional Seismic Risk Assessment (last performed in 1994) was completed in late 2010 with seven high priority pipeline segment sites identified. Site specific geotechnical assessments are underway for these sites to be followed by assessments of the actual pipelines at each site and, where necessary, further work to finalized the scope and cost of both geotechnical and pipeline remediation to mitigate the threats posed by potential seismic events.

Based on preliminary geotechnical and pipeline assessments, the pipelines connecting the Tilbury Transmission Valve Assembly to the Tilbury LNG Facility have been identified as requiring remediation in the period 2012 to 2013. The two pipelines cross an area with significant potential for seismically induced soil liquefaction and lateral ground spreading, putting both lines at risk of failure. A preliminary estimate for geotechnical remediation in the form of Ground Improvement ("GI") barriers is $1.0 million and the remediation work is currently scheduled to be completed in 2012

DEPTH OF COVER RESTORATION ON AGING PIPELINES

Sufficient depth of cover of a pipeline is an important mitigation strategy for reducing the risk of third party damage and providing safe, efficient and reliable operations. A contractor has been retained to perform depth of cover surveys along portions of the Interior Transmission System. So far, these surveys have recorded a number of low depth of cover locations as well as a few instances of pipeline exposure. These sites are predominantly on older pipelines. Such locations in combination with areas of cultivation activity raise the risk of third party damage to the pipeline that could lead to failure and prevent safe and reliable gas delivery.

Remedial action is proposed to lower the risk of third party pipeline damage. The most effective means of risk reduction while maintaining cost, schedule and resource efficiency is to perform a series of restoration projects at the highest risk segments within a 5 year plan. The initial 5 year plan calls for restoring the depth of cover over approximately 7.5 kms of pipeline at high risk locations of the Interior Transmission System. Further surveys and analysis will be perfomed during these 5 years to determine the risk levels of other areas of significant loss of cover to develop future mitigation plans.

To ensure resource allocation and avoid scheduling difficulties, the 5 year plan will be divided into yearly projects commencing in 2012. During 2012 we will restore depth of cover over approximately 0.5kms of pipeline at a cost of $1.0 million and during 2013, over approximately 2.5kms of pipeline at a cost of $5.0 million.

6.2.2.5 Distribution System Reinforcement, Integrity & Reliability Capital – Mainland

These Distribution expenditures primarily focus on improvements to flow and pressure regulating stations and installation of pipe to increase the capacity of the distribution systems. Also included are upgrades to the transmission pressure laterals which are not part of the Interior Transmission System, and the associated cathodic protection installations.

As shown in Table 6.2-6 above, the 2010 approved expenditures for the Mainland was $7.9 million. The actual expenditure was approximately $5.2 million. The decrease was primarily due to:

- A relocation of the Highland Valley Lateral was approximately half the estimate submitted for budgeting due to the requestor providing their own resources at their own cost. This reduced expenditures by approximately $1 million.

- A relocation of the PG#2 Lateral was delayed until 2011 in conjunction with municipal road construction which deferred expenditure of approximately $200 thousand.
- Deferral of system improvement installations in accordance with recent reduced customer growth forecasts resulted in a deferral of $600 thousand to later years.
- Completion of an upgrade to the Coquitlam Gate Station was deferred until 2011 so a more thorough assessment could be completed in order to clearly understand the necessary scope of work. Materials were obtained later in the year; however the field work was not undertaken resulting in a deferral of approximately $350 thousand to 2011.

During 2012 and 2013 there are no programs or projects being undertaken that are greater than $1 million.

6.2.2.6 Distribution Mains, Service Renewals and Alterations Capital – Mainland

These expenditures primarily consist of replacement of intermediate pressure and distribution pressure mains and services either to address integrity concerns identified by the Company or to address location concerns raised by others. On occasion this category also includes upgrades to the Revelstoke Propane Plant and the installation of new pressure regulating stations.

As shown in Table 6.2-6, 2010 Actual and 2011, projected expenditures are higher than Approved. Drivers for this include an increase in federal, provincial and municipal infrastructure improvement projects that necessitate alterations to existing mains and services, and the Company taking advantage of opportunities to replace mains and services that have integrity concerns when others have already disturbed the ground surface. This avoids pavement replacement costs and costs associated with unplanned work to respond to pipe leaks. This trend is expected to increase over time as municipalities implement programs to upgrade their infrastructure and we undertake similar actions at the same time.

The forecast expenditure in this category for 2012 and 2013 is $17.3 million and $21.8 million respectively. The amount expended over recent years has not varied significantly; however, the initiation of the LTSP has resulted in the identification of a variety of integrity concerns with respect to steel mains and services and a resulting increase in the forecasts for 2012 and 2013. The Company has been able to determine the extent of these concerns in many cases and as a result, proposes the implementation of the following programs to address these concerns in a timely manner. Projects discussed below are anticipated to exceed $1 million in the forecast 2012-2013 periods.

UNPROTECTED DP MAINS AND SERVICES – LOWER MAINLAND

This program consists of replacing 18,340 metres of unprotected steel distribution pressure main and the approximately 2,000 associated services in the Lower Mainland over an 8 year period.

Approximately 103 sections of main have been identified in the Lower Mainland that cannot be protected by cathodic protection due to very poor coating and insufficient cathodic protection current. CSA Standard Z662, Oil and gas pipeline systems, requires that steel pipe be protected from corrosion. Replacing the steel pipe, in most cases being very old, with new polyethylene pipe will prevent leaks and the higher costs associated with unplanned repairs.

The program will have significant impact on municipal infrastructure, such as roads, and extensive coordination with municipal projects is planned.

The proposed expenditure is $1.2 million and $4.5 million in 2012 and 2013 respectively.

LOUGHEED HWY MAIN REPLACEMENT PROJECT

The Lougheed Highway Main Replacement project consists of replacing approximately 4.5km of existing 168mm steel main with polyethylene pipe along the existing route or along another, as the existing steel main has had periods of significant leaks and unusual failures.

As it is very likely there will be future leaks or pipe failures, the installation of new pipe will reduce the probability of a significant interruption to the operation of Skytrain[129] and interference with the primary highway thoroughfare. Other sections have been replaced in the past.

It will be necessary to undertake design and community relations activities in 2012 with construction to occur in the following 2 years.

The proposed expenditure is $375 thousand and $1.5 million in 2012 and 2013 respectively with project completion in 2014.

DP MAINS MAINLAND RENEWAL PROGRAM

This program involves the replacement of aging steel mains and services with polyethylene mains and services based on internal priority and in conjunction with municipal infrastructure upgrade projects.

Buried pipe assets are aging and many are approaching the established useful life of approximately 65 years. Within Mainland and Vancouver Island, 113km (17 percent) of Intermediate Pressure and 3,500km (16 percent) of Distribution Pressure buried pipe are over

[129] A recent leak caused the shutdown of the Skytrain.

50 years old. As the pipe ages, is it likely that it will need to be replaced due to integrity concerns, lack of capacity or third party activity such as municipal infrastructure upgrades. Replacing the steel pipe with polyethylene pipe or with steel having better coating results in a safer, more reliable system with less concern regarding maintaining integrity or having to undertake emergency repairs.

This type of work is currently undertaken to a limited extent. We are forecasting an increase of $2.5 million starting in 2012 to address additional projects in coordination with third parties, such as municipalities. Various municipalities have announced that they intend to ramp up their spending to upgrade their infrastructure and thus excavate roads and work around our pipe.

The proposed expenditure is $2.5 million in each of 2012 and 2013 respectively.

6.2.2.7 Vancouver Island Sustainment Capital Overview

The 2010 through 2013 Vancouver Island Sustainment Capital is shown in the following table. Overall, Sustainment Capital in the Vancouver Island utility is forecast to grow to $16.3 million in 2012 (increase of $3.6 million or almost 30 percent from 2011 Approved). The 2013 forecast is $14.2 million (a decrease of $2.1 million or 13 percent from 2012 Forecast).

Table 6.2-8: Approved, Actual and Forecast Vancouver Island Sustainment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Sustaining Capital						
Meter Recalls/Exchanges	1,492	1,134	1,496	1,188	1,215	1,250
Transmission System Reinforcements/Integrity & Reliabililty	5,045	3,836	7,868	7,868	8,098	6,328
Distribution System Reinforcements/Integrity & Reliabililty	1,520	991	2,315	2,315	2,685	935
Distribution Mains, Service Renewals and Alterations	1,000	1,156	1,000	1,326	4,276	5,646
	9,057	**7,117**	**12,679**	**12,697**	**16,274**	**14,159**

Each of the four categories is discussed further below.

6.2.2.8 Meter Recalls and Exchanges – Vancouver Island

This section contains a discussion of all meter capital, including both the recalls and exchanges included in Sustainment Capital, and the new meters included in Growth Capital.

The three main considerations in understanding the forecast meter expenditure level are:

1. the level of activity (meters purchased and installed or exchanged);
2. the unit cost to purchase, fabricate and install the meter (dollars per meter); and
3. other miscellaneous meter and regulator programs.

A summary of 2011 Meters (New and Replacement) projections as well as 2012-2013 forecast activities, unit costs, and expenditures follows in Table 6.2-9 below. The level of activities combined with the unit cost form the basis for the total expenditures.

Table 6.2-9: Approved, Actual and Forecast Vancouver Island Meters Activities, Unit Costs & Expenditures

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Activities						
Meters - Exchange	6,410	6,155	6,250	6,250	6,210	6,210
Meters - New	2,320	2,432	2,430	2,415	2,557	2,656
Unit Costs ($/meter)						
Meters	$ 233	$ 177	$ 239	$ 182	$ 188	$ 193
Expenditures ($000's)						
Meters - Exchange	$ 1,492	$ 1,134	$ 1,496	$ 1,188	$ 1,215	$ 1,250
Meters - New	$ 540	$ 430	$ 582	$ 440	$ 480	$ 513

METERS ACTIVITY LEVELS

As with the Mainland, the forecast level of meter activity for Vancouver Island is derived from the sum of the customer additions and the meter exchange forecasts. The meter forecast for new customers is derived directly from the forecast of customer additions using a one to one ratio. The forecast level of meter exchange activity to service existing customers is driven by life expectancy of meters and the total size of the meter population.

The meter exchange program on Vancouver Island is managed centrally through the Mainland Measurement department. Prior to being centralized, the meter exchange program was a "just in time" program where meter exchange levels were established based on original install dates and estimated life expectancy. Consistent with the program established for the Mainland, Vancouver Island will be exchanging the meter fleet in line with 20 year life expectancy on residential meters. Communications with vendors, ongoing discussions within the Canadian Gas Association Measurement Committee and the Company's own internal analysis, has provided confidence to target a 20 year life span for the residential meter fleet without a mid-life recondition operation. The 20 year life span is the financially optimal target, balancing the risk (cost) of unscheduled failure with the replacement cost. An unscheduled failure is generally disruptive to the customer and more costly to execute in the field as compared to a scheduled replacement which can be completed at both the customer's and Company's convenience.

The early 1990s was a period of high customer (meter) growth for Vancouver Island and meters installed during this period are coming due for exchange. It is no longer viable to maintain lower exchange levels as the result of an aging meter fleet and anticipated early failures for some batches of meters purchased. In the 1990s, certain batches of meters were comprised of components constructed with less durable materials and, although the vendor has since re-designed the meter to address this concern, it is prudent to proactively remove these meters from the fleet to prevent unscheduled failures. This meter recall frequency reflects the long term objectives of the fleet management program and will ensure customers will continue to receive service that is both cost effective and reliable.

METERS UNIT COSTS

Meter unit cost, which is the second consideration in establishing the forecast expenditure requirement for meters, is influenced by the type, size, and design of the meter, installation, fabrication and exchange conditions and the timing of bulk meter purchases. A blended unit cost of all customer types is used for meter exchanges and installs. Meter unit purchase costs can range from $75 to $10,000 each depending on the customer requirements. Including installation costs, the meter unit cost consists of approximately 35 percent labour and 65 percent material costs.

Unit costs for meters for 2012 and 2013 are based on 2011 projections adjusted for, labour and material inflation at 3 percent.

METERS EXPENDITURES

In Table 6.2-9 above, the Exchange Meters expenditures forecast for 2012 and 2013 is $1.2 and $1.3 million respectively. Meters expenditures are variable and rise and fall with meter exchange activity levels.

6.2.2.9 Transmission System Reinforcement, Integrity & Reliability Capital – Vancouver Island

These transmission-related capital expenditures include system capacity improvements to meet existing customer demand and forecast load, and expenditures related to ensuring safety and reliability of the transmission system, as well as to minimize the impact to the environment.

As shown in Table 6.2-8 above, the 2010 approved expenditures for Vancouver Island Transmission was $5.1 million. The actual expenditure was approximately $3.8 million. The decrease was primarily due to planned projects not materializing in the year.

The forecasts for transmission expenditures in 2012 and 2013 are $8.1 and $6.3 million, respectively as shown in Table 6.2-8 above.

6.2.2.10 Distribution System Reinforcement, Integrity & Reliability Capital – Vancouver Island

As shown in Table 6.2-8 above, the 2010 approved expenditure for Vancouver Island was $1.5 million. The actual expenditure was approximately $1.0 million. The lower amount incurred was primarily due to the deferral of distribution pressure system improvements due to revised lower growth forecasts ($250 thousand), delayed system improvement projects due to the routes not being ready ($452 thousand) and approved projects that were not completed by year end ($200 thousand).

The forecasts for distribution expenditures in 2012 and 2013 are $2.7 and $0.9 million, respectively as shown in Table 6.2-8 above. The primary difference between the years is due to the expenditures for system improvements to address customer growth, which are projected to be $2.1 million in 2012 and $0.3 million in 2013. Station upgrades including telemetry, required by customer growth and changes to facility requirements, generally, make up the balance of the expenditures in 2012 and 2013.

In 2012 and 2013, only one project is forecast to cost greater than $1 million, and is discussed below.

To address growth on the Saanich peninsula a 1.5km long loop of the existing intermediate pressure system is necessary. As an example of the customer growth, the expanded regional hospital lies within the area to be served by the proposed project. The preliminary design recommends that the pipe be 323mm OD and the preliminary cost estimate is $1.5 million, the majority of which is to be incurred in 2012. Design is to be undertaken in 2011.

6.2.2.11 Distribution Mains, Service Renewals and Alterations Capital – Vancouver Island

These expenditures on Vancouver Island primarily consist of replacement of intermediate pressure and distribution pressure mains and services either to address integrity concerns identified by the Company or to address concerns about the location of our pipes raised by others, such as municipalities and developers. On occasion this category also includes the installation of new pressure regulating stations. A summary of the proposed expenditures is contained in Table 6.2-8 above.

The amount expended over recent years has not varied significantly; however the initiation of the LTSP has resulted in the identification of a variety of integrity concerns with respect to steel mains and services that will result in increased expenditures in 2012 and 2013. The Company has been able to determine the extent of the concern in many cases and as a result we are implementing the following programs to address the concerns in a timely manner.

The projects discussed below are anticipated to exceed over $1 million in the forecast 2012-2013 periods.

REPLACE ISOLATED STEEL MAINS AND SERVICES – CAPITAL REGIONAL DISTRICT

Of a total of 50 segments of isolated steel main, Corrosion Control has identified 28 as being high priority for replacement due to difficulties associated with maintaining adequate cathodic protection current levels to prevent corrosion. 17 of the 28 segments are less than 200m long.

Replacing the existing steel main and the associated services with polyethylene pipe will eliminate the need for special monitoring of the 50 sections of main and thus reduce O&M costs from current levels. Replacement will also avoid increased O&M costs over time as the pipe ages and anodes must be replaced on an increasing frequency. Some agencies have expressed concerns regarding the environmental impact of sacrificial magnesium anodes. Replacement with polyethylene pipe will avoid dealing with any resistance there may be to granting permission to install replacement or additional anodes.

The higher priority sites are to be address over the 2012 – 2013 periods with the forecast expenditure being $1.3 million and $2.7 million in 2012 and 2013 respectively. The project will be continuing in the future as the remaining sites are re-evaluated and prioritized.

DP MAINS ISLAND RENEWAL PROGRAM

This program, identical to the DP Mains Mainland Renewal Program discussed above, consists of the replacement of steel mains and services with polyethylene mains and services based on internal priority and in conjunction with municipal infrastructure upgrade projects.

An increase in expenditure is expected to be needed as municipalities ramp up their spending to upgrade their infrastructure and thus excavate roads and work around our pipe.

The forecast expenditure is $1.5 million in each of 2012 and 2013 respectively.

6.2.2.12 Whistler Sustainment Capital Overview

The 2010 through 2013 Whistler Sustainment Capital is shown in the following table. Overall, Sustainment Capital in Whistler is forecast to grow to remain relatively stable over the forecast period.

Table 6.2-10: Approved, Actual and Forecast Whistler Sustainment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Sustainment Capital						
Meter Recalls/Exchanges	27	44	27	41	41	42
Transmission System Reinforcements / Integrity and Reliabililty	-	-	-	-	-	-
Distribution System Reinforcements / Integrity and Reliabililty	10	45	-	-	-	-
Distribution Mains and Service Renewals and Alterations	82	27	84	94	88	81
	120	**116**	**111**	**134**	**129**	**123**

6.2.2.13 Meter Recalls and Exchanges - Whistler

Meter activity levels are based on meters required to service new customers as well as meters exchanged for existing customers. The meters related to new customers are driven by the number of customer additions and the meters required for exchange activities are driven by Measurement Canada standards and the in-house program established to meet these standards. Meter unit cost is a blended amount of residential, commercial and industrial meters and forecast amounts for 2012 and 2013 reflect the most recent actual experience of 2010 with natural gas meters. Forecast meter expenditures for 2012-2013 are similar to 2010 actuals. The majority of these meter costs are related to the number of meter exchanges which are unchanged from previous years.

6.2.2.14 Distribution System Reinforcement, Integrity & Reliability Capital – Whistler

Whistler has limited facilities that fall within the scope of this category and thus on occasion there will not be a need for capital expenditure. This is the case for the 2011 through 2013 period.

The 2010 approved expenditure in Whistler was $10 thousand while the actual expenditure was $45 thousand. The expenditure was to address the replacement of valves at the Whistler District Station as they were found to leak gas when they were closed

6.2.2.15 Distribution Mains, Service Renewals and Alterations Capital – Whistler

In 2010 the actual expenditure was $55 thousand less than expected due to an anticipated main relocation within the village not materializing. There is no unusual activity anticipated within the Whistler system during 2012 or 2013. The forecast expenditures are required to address concerns regarding relocations of mains and services and hazards as they are found.

6.2.2.16 Fort Nelson Sustainment Capital Overview

The 2010 through 2013 Fort Nelson Sustainment Capital is shown in the following table. Overall, Sustainment Capital in Fort Nelson is forecast to return to normal levels after the completion of the Muskwa River crossing project in 2011.

Table 6.2-11: Approved, Actual and Forecast Fort Nelson Sustainment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Sustainment Capital						
Meter Recalls/Exchanges	3	3	2	2	2	2
Transmission System Reinforcements / Integrity and Reliabililty	-	-	-	-	-	-
Distribution System Reinforcements / Integrity and Reliabililty	729	325	2,711	2,661	340	160
Distribution Mains and Service Renewals and Alterations	69	17	63	63	63	33
	801	**345**	**2,776**	**2,726**	**405**	**195**

6.2.2.17 Meter Recalls and Exchanges – Fort Nelson

Forecast meter expenditures are required for new and replacement activities. There is minimal activity expected in 2011, and 2012 and 2013 forecasts are based on 2011 projections.

6.2.2.18 Distribution System Reinforcement, Integrity & Reliability Capital – Fort Nelson

Natural Gas service to the Fort Nelson area is provided by a single 114mm transmission pressure pipeline that crosses the Muskwa River on the southeast side of the town. This pipeline has become exposed and is now at risk of damage from river action. Expenditures are required to replace the pipeline crossing. As approved by the Commission in Order No. G-27-11, a river crossing replacement utilizing the adjacent highway bridge is projected to be the most cost-effective strategy. Total project costs for this option are currently estimated at $3.0 million (excluding AFUDC), unchanged from the approved amount. Of this total, approximately $2.9 million will be added to rate base in late 2011, with the remainder being added in 2012.

Capital expenditures in 2012 and 2013 are much lower than that of 2011 due to a return to more a typical capital expenditure period once the Muskwa River concern is addressed. However they are higher than the years prior to 2010 and 2011. The increase is primarily due to expenditures required for the replacement of existing equipment due to obsolescence and to address anticipated customer growth.

6.2.2.19 Distribution Mains, Service Renewals and Alterations Capital – Fort Nelson

These expenditures primarily consist of replacement of intermediate or distribution pressure mains and services either to address integrity and reliability concerns identified by the Company or to address location concerns raised by others.

In 2010 the actual expenditures were $17 thousand compared to a budget of $69 thousand. The lower expenditure was due to a decision by the City of Fort Nelson to convert its pump station heating system to electricity rather than continue to use natural gas. This cancelled a planned $20 thousand upgrade to the local station. As well, we were not able to implement a $30 thousand program to remove culverts and valves that are no longer needed and pose a public safety risk due to structural deterioration. We anticipate that we will be able to address these in 2011. There is no unusual planned activity anticipated within the Fort Nelson system during 2012 or 2013. The funds required are to address concerns regarding relocations of mains and services and hazards as they are required.

6.2.2.20 System Sustainment Capital Summary

The proposed level of Sustainment Capital expenditure is considered prudent and reasonable, particularly when considered in terms of the nature and age of the transmission and distribution systems. Much of the infrastructure is over 40 years old and requires a significantly higher level of capital expenditure to ensure that FortisBC Energy Utilities meets its commitments to public safety, code requirements, environmental performance and its obligation to provide dependable, reliable service.

6.2.3 GROWTH CAPITAL EXPENDITURES

Growth Capital expenditures include the installation of new mains, services, meters and regulators. Also, new to Growth Capital in 2011 are expenditures for biomethane and NGV projects. The primary drivers for Growth Capital expenditures are the number and type of new services and mains. These in turn are driven by customer additions, which are dependent on new housing, development activity and market capture. The descriptions that follow for new mains, services, meters and regulators are applicable across all four utilities.

Main expenditures consist of new main extensions with a number of different attributes including location, size of pipe, and length of extension, pressure and type of material. Proposed main extension projects are evaluated through a main extension economic test ("MX Test") which analyzes cost estimates for installing the main, projections in numbers of customers attached as well as forecast customer gas usage. Uneconomic results require contributions from customers in order for the planned extensions to proceed.

Service expenditures consist of a variety of service types for new customers. These include new and conversion, distribution and intermediate pressure services to single and multi-family dwellings, gas stub service from the main, services installed from the stub, vertical header subdivisions (a vertical service line system within a building such as a high-rise) and distribution and intermediate new or conversion service header mains, and distribution and intermediate service header laterals. Service header mains are distribution mains installed on private property (i.e. multi-family strata owned complexes). Stubs are service extensions off of the main installed with the main in new subdivisions to eliminate road cuts and pavement repairs at a future date. There are two basic considerations in understanding the forecast service expenditures level. These are level of activity (number of services installed, number of service header mains installed) and aggregate unit cost to install the service (dollars per service) and/or service header main (dollars per meter).

Meter and regulator expenditures consist of new meters and regulators to serve new customers. The two main considerations in understanding the forecast meter expenditure level are: (1) the level of activity (meters purchased and installed); and (2) the unit cost to purchase, fabricate and install the meter (dollars per meter). Growth meter expenditures have been discussed above in the sustainment capital section.

Biomethane and NGV expenditures are a new category of products offered by FEU and discussed in more detail in Appendix J and Appendix I respectively.

Below in Table 6.2-12 is a summary of the approved, actual, projected, and forecast Growth Capital expenditures for the combined FortisBC Energy Utilities.

Table 6.2-12: Approved, Actual and Forecast Growth Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Growth Capital						
New Customer Mains	11,595	6,616	12,318	8,521	9,116	9,657
New Customer Services	20,781	19,337	22,480	15,787	17,069	18,279
New Customer Meters	2,147	2,348	2,323	2,232	2,455	2,629
Biomethane/NGV	-	-	-	7,004	7,078	7,378
	34,523	**28,301**	**37,122**	**33,544**	**35,717**	**37,943**

The following sections describe the Growth Capital expenditures for each of the four utilities – Mainland, Vancouver Island, Whistler, and Fort Nelson.

6.2.3.1 Mainland Growth Capital Overview

Anticipated Growth Capital expenditures for 2012-2013 together with 2010 and 2011 data for the Mainland are summarized in Table 6.2-13 below.

Table 6.2-13: Approved, Actual and Forecast Mainland Growth Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Growth Capital						
New Customer Mains	8,807	4,538	9,306	5,738	6,124	6,497
New Customer Services	14,722	13,874	15,940	11,175	12,044	12,903
New Customer Meters	1,588	1,905	1,728	1,782	1,965	2,105
Biomethane/NGV				7,004	7,078	7,378
	25,117	**20,317**	**26,974**	**25,699**	**27,211**	**28,883**

6.2.3.2 Mains - Mainland

The drivers of the mains capital additions - forecast mains activity and unit costs - are summarized in Table 6.2-14 below.

Table 6.2-14: Approved, Actual and Forecast Mainland Mains Activities, Unit Costs & Expenditures

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Activities (meters)	112,136	81,259	116,166	100,724	105,395	109,623
Unit Costs ($/meter)	$ 79	$ 56	$ 80	$ 57	$ 58	$ 59
Expenditures ($000's)	$ 8,807	$ 4,538	$ 9,306	$ 5,738	$ 6,124	$ 6,497

Forecast mains activity levels, forecast mains unit costs and capital expenditure forecasts for mains are each described in the following sections.

MAINS ACTIVITY LEVELS

The forecast level of mains activity is derived indirectly from the customer additions forecast. Customer additions determine the forecast quantity of Service additions based on a three year (2008-2010) historical ratio of 0.72 Services per Gross (new) customer addition. In turn, the forecast mains activity level is determined by using a three year (2008-2010) historical ratio of 13.7 metres of new Main per new Service addition. A three year historical ratio is used to smooth out the annual fluctuations in the ratio as well as to recognize any trends materializing in the past three years of actual data.

The actual mains activity levels in 2010 were considerably lower than the approved levels largely due to the downturn in the economy in late 2008, a buildup of new mains infrastructure in 2005-2008, the beginning of a period of lower new subdivision activity in 2009 and decreases in housing starts in 2009. Typically, a new main takes up to five years to be fully utilized with service attachments prior to additional main extensions being required. Mains activity levels peaked in 2008 at 200,167 metres which equated to 19 metres of new main per service installed. The comparative ratio in 2010 was approximately 9 metres of new main per service installed reflecting the absence of developers seeking main extensions for new housing developments.

Projected new mains activity levels for 2011 are 100,724 metres based on the 2011 forecast new customer additions and the forecasting methodology described above. Using the same methodology, in 2012 and 2013, new mains activity has been forecast at 105,395 and 109,623 metres, respectively.

MAINS UNIT COSTS

The forecast unit costs for 2012 and 2013 reflect the unit cost experience of 2010 inflated by 2 percent annually. The mains work has seen a slight shift back to install contractors. We maintain workforce levels sufficient to respond to emergencies. Consequently, our company workforce mains unit costs are historically higher than contractors due to having to periodically interrupt projects to respond to emergencies. The percent of mains activity completed by contractors in 2010 was 81 percent versus 2009 at 70 percent. 2010 unit costs ($56/metre) have dropped significantly from 2009 actuals ($72/metre) primarily due to the elimination of a secondary contractor in the Lower Mainland (with the highest pricing), regular reviews of contract pricing, a shift of work to contractor from FEU crews, change in geographical mix of work, and strengthening of the main extension estimating process. Offsetting these unit cost reducing factors have been several cost pressure factors including managing the demographic challenge (recruiting, training and outfitting apprentices to replace retiring workers), the rising cost of managing construction with a multitude of municipalities, inflationary increases in wages, vehicles, contracts and materials. Other variables impacting overall unit costs during this period are geographical location of main extension, travel times, pavement and traffic control requirements. Forecast unit costs reflect the shift of this type of work activity to the current two install contractor companies. 2012 and 2013 forecast unit costs are based on 2010 actuals and 2011 projection and reflect inflationary increases for the contractor workforces. The inflationary increase used for both 2012 and 2013 is 2 percent.

MAINS EXPENDITURES

The 2010 actuals and 2011 projected expenditures are considerably lower than the 2010-2011 approved amounts due to a combination of lower activity levels and lower unit costs driven by the factors cited in the respective sections above.

The new mains expenditures forecasts for 2012 and 2013 are $6.1 and $6.5 million respectively. Total new mains expenditures are largely variable and rise and fall with activity levels. The forecast activity levels of 105,395 meters in 2012 and 109,623 meters in 2013 are reflected in the aggregate expenditure requested. Experience with unit costs in 2010 with the two remaining install contractors who completed 81 percent of the work forms the basis for the forecast unit costs. The forecast unit costs when applied to the forecast activity level drive the overall new mains expenditure requirement. We believe these expenditures are prudent and reasonable in providing for distribution main extensions to serve new customers.

6.2.3.3 Services - Mainland

Forecast services activities, together with unit costs and capital expenditure levels are summarized in Table 6.2-15 and discussed in the sections that follow.

Table 6.2-15: Approved, Actual and Forecast Mainland Services Activities, Unit Costs & Expenditures

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Net Customer Additions	5,952	6,629	6,166	6,361	6,656	6,923
Gross Customer Additions	9,336	12,770	9,672	10,194	10,667	11,095
Ratio of Service Additions to Gross Customer Additions	0.78	0.73	0.78	0.72	0.72	0.72
Activities (risers or services)	7,303	9,382	7,566	7,337	7,677	7,985
Unit Costs ($ per service - riser)	2,016	$ 1,479	2,107	$ 1,523	$ 1,569	$ 1,616
Expenditures ($000's)	$ 14,722	$ 13,874	$ 15,940	$ 11,175	$ 12,044	$ 12,903

SERVICES ACTIVITY LEVELS

The 2012 and 2013 forecast level of services activity is derived directly from the gross customer additions forecast, as discussed in Section 4. Using the three year historical average (2008-2010), the ratio of Service Additions to Gross Customer Additions is 0.72. A three year historical average ratio is used to smooth out the annual fluctuations in the ratio as well as to recognize any trends materializing in the past three years of actual data.

Projected service additions activity levels for 2011 are 7,337 services and are based on the 2011 forecast new customer additions and the forecasting methodology described above. Using the same methodology, in 2012 and 2013, new service activity has been forecast at 7,677 and 7,985 services, respectively.

SERVICES UNIT COSTS

Aggregate (blended) service unit cost, which is the second consideration in establishing the forecast expenditure requirement for new services, is calculated by taking all services costs (including service header main) and dividing by the number of risers (services) installed.

The 2010 actual and 2011 projected blended service unit cost was lower than the approved unit costs in the 2010-2011 RRA which were based on 2009 year-end projections of $2,000 per service which in turn were based on Jan-May 2009 actuals which reflected a significant downturn in the economy and shifting of services work from contractors to the company workforce. The 2009 end of year actual unit cost of $1,769 reflected a recovery in activities in the latter half of 2009 and an improvement in unit costs.

The forecast unit costs for 2012 and 2013 reflect the most recent actual aggregate unit cost experience of 2010 and the 2011 forecast. Activity levels have risen from the lows of 2008 and 2009 and aggregate unit costs are at the lowest levels seen since 2006. The 2010 unit cost of $1,479 was lower than the average 2008-2009 services unit cost of $1,709. Unit costs in 2010 were driven down by changes in the workforce (utility versus contractors), optimal crew sizing, increased activity levels, strengthening of the estimation process, elimination of higher priced secondary contractor, change in the mix of services, changes in the geographical mix of the services and exclusion of training costs in the labour rates. In 2010, contractors completed 36 percent of this work versus 32 percent in 2009. The 2008-2009 unit costs reflected the addition of apprentices to crews to train for replacement of retiring employees, the downturn in the economy in late 2008, lower services activities in 2009, changes in the geographical mix of these services and changes in the mix of these service products. Forecast unit costs are based on 2011 projections and reflect inflationary increases for both Mainland and Contractor workforces and equipment. The inflationary increases projected are 3 percent for 2012 and 3 percent for 2013.

SERVICES EXPENDITURES

The 2010 actuals and 2011 projected expenditures are lower than the 2010-2011 approved amounts due primarily to considerably lower unit costs driven by the factors cited in the Services Unit Costs section above. The lower services expenditures related to unit cost reductions were partially offset by increased service expenditures due to the higher number of services installed over approved levels.

Service expenditures for 2012 and 2013 are forecast at $12.0 and $12.9 million, respectively. Total services expenditures are largely variable and rise and fall with activity levels. The forecast activity levels, together with unit cost history adjusted for inflation form the basis for the aggregate expenditure requested. We believe these expenditures are prudent and reasonable in providing service products including service header mains to service new customers.

6.2.3.4 New Meters – Mainland

The discussion of new meter expenditures is included in Section 6.2.2.3.

In Table 6.2-15 above, the New Meters expenditures forecast for 2012 and 2013 is $2.0 million and $2.1 million respectively. Meters expenditures are variable and rise and fall with customer additions activity levels.

6.2.3.5 Biomethane/NGV - Mainland

BIOMETHANE

Capital invested in interconnection facilities and upgrader equipment for Biomethane projects during the test period is forecast to be $3.1 million and $3.6 million in 2012 and 2013 respectively. Further detail on this capital investment is provided in Appendix J.

NGV

Capital invested in NGV fueling assets, subject to approval of the NGV Application presently before the Commission, is forecast to be $4 million in 2012 and $4.8 million in 2013. These projects will be accompanied by contracts that provide for their forecast incremental costs of service to be recovered through dedicated take-or-pay incremental revenues from the incremental NGV fueling customers. Further detail on this capital investment is provided in Appendix I.

6.2.3.6 Vancouver Island Growth Capital Overview

Anticipated Growth Capital expenditures for 2012-2013 together with 2010 and 2011 data for Vancouver Island are summarized in Table 6.2-16 below.

Table 6.2-16: Approved, Actual and Forecast Vancouver Island Growth Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Growth Capital						
New Customer Mains	2,725	1,836	2,966	2,553	2,757	2,922
New Customer Services	5,940	5,309	6,459	4,517	4,926	5,270
New Customer Meters	540	430	582	440	480	513
	9,206	**7,575**	**10,006**	**7,510**	**8,163**	**8,705**

6.2.3.7 Mains – Vancouver Island

Forecast new mains activity, together with unit costs and capital expenditure levels are summarized in Table 6.2-17 below.

Table 6.2-17: Approved, Actual and Forecast Vancouver Island Mains Activities, Unit Costs & Expenditures

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Activities (meters)	30,116	18,282	31,610	24,927	26,393	27,415
Unit Costs ($/meter)	$ 90	$ 100	$ 94	$ 102	$ 104	$ 107
Expenditures ($000's)	$ 2,725	$ 1,836	$ 2,966	$ 2,553	$ 2,757	$ 2,922

Forecast mains activity levels, forecast mains unit costs and capital expenditure forecasts for mains are described in the following three sections.

MAINS ACTIVITY LEVELS

The forecast level of mains activity is derived indirectly from the customer additions forecast. Customer additions determine the forecast quantity of Service additions based on a three year

(2008-2010) historical ratio of 0.81 Services per Gross (new) customer addition. In turn, the forecast mains activity level is determined by using a three year (2008-2010) historical ratio of 12 metres of new main per new Service addition. A three year historical ratio is used to smooth out the annual fluctuations in the ratio as well as to recognize any trends materializing in the past three years of actual data.

Projected new mains activity levels for 2011 are 24,927 metres based on the 2011 forecast new customer additions and the forecasting methodology described above. Using the same methodology, in 2012 and 2013, new mains activity has been forecast at 26,393 and 27,415 metres, respectively.

MAINS UNIT COSTS

The forecast unit costs for 2012 and 2013 reflect the unit cost experience of 2010 inflated by 2 percent annually. The 2010 activity levels declined 26 percent from 2009 levels which contributed to economy of scale unit cost pressures when compared to 2010 approved activity levels and unit cost. Due to the declining service activity levels, on a percentage basis, the Vancouver Island mains work has seen a slight shift back to the company workforce from the install contractors although the total amount of new mains work installed by the company's own workforce has remained unchanged in 2010 from 2009. The percent of mains activity completed by contractors in 2010 was 80 percent versus 87 percent in 2009 and 97 percent in 2008. Vancouver Island maintains company workforce levels sufficient to respond to emergencies and consequently, Vancouver Island own workforce unit costs are historically higher than contractors due to having to periodically interrupt projects to respond to emergencies. 2010 unit costs ($100/metre) have dropped from 2009 actuals ($105/metre) due to changes in contract pricing, exclusion of training costs in company labour rates and strengthening of the main extension estimating process. Other variables impacting overall unit costs are geographical location of main extension and the corresponding municipal, pavement, and traffic control requirements.

Forecast unit costs reflect a significant component of new mains work activity being assigned to the install contractor as our crews typically have sufficient levels of emergencies, new and conversion service activity to limit assignments to the lengthier more complex main jobs. 2012 and 2013 forecast unit costs are based on 2010 actuals and 2011 projection and reflect inflationary increases for the contractor workforces. The inflationary increase used for both 2012 and 2013 is 2 percent.

MAINS EXPENDITURES

The 2010 actuals and 2011 projected expenditures are lower than the 2010-2011 approved amounts due primarily to lower activity levels. Higher actual unit costs in 2010 versus approved unit costs driven by the factors cited above partially offset the reduction in expenditures due to lower activities.

The new mains expenditures forecasts for 2012 and 2013 are $2.8 million and $2.9 million respectively. Total new mains expenditures are largely variable and rise and fall with activity levels. The forecast activity levels of 26,393 meters in 2012 and 27,415 meters in 2013 are reflected in the aggregate expenditure requested. Experience with unit costs in 2010 with the current install contractor who completed 80 percent of this work, form the basis for the forecast unit costs. The forecast unit costs when applied to the forecast activity level drive the overall new mains expenditure requirement. We believe these expenditures are prudent and reasonable in providing for distribution main extensions to serve new customers.

6.2.3.8 Services – Vancouver Island

Forecast services together with unit costs and capital expenditure levels are summarized in Table 6.2-18 and discussed in the sections that follow.

Table 6.2-18: Approved, Actual and Forecast Vancouver Island Services Activities, Unit Costs & Expenditures

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Net Customer Additions	2320	2,725	2430	2,415	2,557	2,656
Gross Customer Additions	2460	2,940	2582	2,564	2,714	2,820
Ratio of Service Additions to Gross Customer Additions	0.78	0.85	0.78	0.81	0.81	0.81
Activities (risers or services)	1,922	2,501	2,017	2,066	2,187	2,272
Unit Costs ($ per service - riser)	$ 3,091	$ 2,123	$ 3,202	$ 2,186	$ 2,252	$ 2,320
Expenditures ($000's)	$ 5,940	$ 5,309	$ 6,459	$ 4,517	$ 4,926	$ 5,270

SERVICES ACTIVITY LEVELS

The 2012 and 2013 forecast level of services activity is derived directly from the gross customer additions forecast, as discussed in Section 4. Using the current three year historical average (2008-2010), the ratio of Service Additions to Gross Customer Additions calculated is 0.81. A three year historical ratio is used to smooth out the annual fluctuations in the ratio as well as to recognize any trends materializing in the past three years of actual data.

Projected service additions activity levels for 2011 are 2,066 services and are based on the 2011 forecast new customer additions and the forecasting methodology described above. Using the same methodology, in 2012 and 2013, new service activity has been forecast at 2,187 and 2,272 services, respectively.

SERVICES UNIT COSTS

Aggregate (blended) service unit cost, which is the second consideration in establishing the forecast expenditure requirement for new services, is calculated by taking all services costs (including service header main) and dividing by the number of risers (services) installed.

The 2010 actual and 2011 projected blended service unit cost are lower than the approved unit costs in the 2010-2011 RRA primarily due to refinements made to the estimating process for exception type service jobs such as conversion services. The 2010-2011 RRA unit cost amounts were based on 2009 year-end projections which in turn were based on Jan-May 2009 actuals which reflected a standard cost estimating practice for conversion services, a significant downturn in the economy and shifting of services work from contractors to the company workforce. The 2009 end of year actual unit cost of $2,424 reflected a recovery in activities in the latter half of 2009 and an improvement in unit costs at least partially due to the elimination of services that previously met the economic test under the standard geo-code estimating methodology. One of the refinements made to the estimating process was to introduce job specific estimating for conversion services as these types of installations typically attract irregular costs being located in well-developed established areas.

The forecast unit costs for 2012 and 2013 reflect the most recent actual aggregate unit cost experience of 2010 and the 2011 forecast. Forecast unit costs are based on 2011 projections and reflect inflationary increases for both Vancouver Island and Contractor workforces and equipment. The inflationary increases projected are 3 percent for 2012 and 3 percent for 2013.

SERVICES EXPENDITURES

The 2010 actuals and 2011 projected expenditures are lower than the 2010-2011 approved amounts due primarily to considerably lower unit costs driven by the factors cited in the Services Unit Costs section above. The lower services expenditures related to unit cost reductions were partially offset by increased service expenditures due to the higher number of services installed compared to approved levels.

Service expenditures for 2012 and 2013 are forecast at $4.9 million and $5.3 million respectively. Total services expenditures are largely variable and rise and fall with activity levels. The forecast activity levels, together with recent unit cost history adjusted for inflation form the basis for the aggregate expenditure requested. We believe these expenditures are prudent and reasonable in providing services and service header mains to service new customers.

6.2.3.9 New Meters –Vancouver Island

The discussion of new meter expenditures is included in Section 6.2.2.8.

In Table 6.2-16 above, the New Meters expenditures forecast for 2012 and 2013 is $0.5 million. Meters expenditures are variable and rise and fall with customer additions activity levels.

6.2.3.10 Whistler Growth Capital

Anticipated Growth Capital expenditures for 2012-2013 together with 2010 and 2011 data for Whistler are summarized in Table 6.2-19 below.

Table 6.2-19: Approved, Actual and Forecast Whistler Growth Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Growth Capital						
New Customer Mains	51	219	35	218	223	227
New Customer Services	97	122	68	48	52	53
New Customer Meters	14	3	9	4	5	5
	163	**344**	**112**	**270**	**279**	**285**

Forecast mains activity levels, unit costs and resulting capital expenditure are difficult to forecast in Whistler due to the small volumes and wide year over year fluctuations. For 2009 and 2010 the average metres of main installed was 1,800 metres and we have assumed a similar level of activity for 2012-2013. Unit costs are generally higher in Whistler than in the Mainland and Vancouver Island as the install contractor completing mains and services work is located outside the Whistler service territory and includes a crew mobilization/travel charge in rates. Depending on the volume of activity the mobilization charge can be spread across one job or many. Install conditions are generally more difficult in Whistler than the average provincial conditions due to the rockier landscape. For 2012-2013, we have assumed a unit cost of 2010 actuals inflated by 2 percent per annum to reflect expected contractor pricing changes.

Service activity levels are derived from the forecast for gross customer additions and are generally quite low compared to other service areas. The 2010 ratio of service additions to gross customer additions is .90 and this ratio was applied to the 2011 projection as well as the 2012 and 2013 forecasts to establish activity levels. Service unit costs are generally higher in Whistler than both Vancouver Island and Mainland due to rockier conditions and higher install contractor pricing which includes a contractor crew mobilization charge being applied across a few service jobs. Generally speaking, contractor charges for services in Whistler are approximately $2,600 with conditions, length of service and number of service jobs completed during the same crew mobilization week being primary factors in determining costs. The 2012 and 2013 forecast unit costs are based on 2011 projected unit costs inflated 3 percent per annum. Whistler contract pricing is reviewed regularly and expectations are that increased fuel prices will drive above normal contractor inflation for services work.

Meter activity levels are based on meters required to service new customers and are driven by the number of customer additions. Meter unit cost is a blended amount of residential, commercial and industrial meters and forecast amounts for 2012 and 2013 reflect the most recent actual experience of 2010 with natural gas meters.

6.2.3.11 Fort Nelson Growth Capital

Anticipated Growth Capital expenditures for 2012-2013 together with 2010 and 2011 data for Whistler are summarized in Table 6.2-20 below.

Table 6.2-20: Approved, Actual and Forecast Fort Nelson Growth Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Growth Capital						
New Customer Mains	11	23	11	11	12	12
New Customer Services	22	32	13	48	47	53
New Customer Meters	4	10	5	6	6	6
	37	**65**	**29**	**65**	**65**	**71**

Mains activity levels in Fort Nelson, are generally low and fluctuate widely from year to year depending on the local economy. Unit costs are difficult to forecast due to the small volume of activity. No major extensions are foreseen at this time. As with the other Utilities, all proposed main extensions are scrutinized through the main extension review test to determine if they are economic. For forecasting purposes the 2012 and 2013 expenditure was based on the 2011 projection inflated.

Service activity levels are driven by the forecast for gross customer additions which is projected to increase from 2010. For the 2011 projection, the ratio of service additions to gross customer additions is projected to be 1.0 and this ratio was applied to the 2012 and 2013 forecasts to establish activity levels. For every forecast gross customer addition, one service addition has been forecast.

Service unit costs (inclusive of service header mains) are reflective of services installed by the local crew. The 2010 unit cost experience ($1,257 per service), although based on very few services, is typical of expected unit costs and is the basis for the 2011 projection. The 2012 and 2013 forecast unit costs are based on 2011 projected unit costs inflated at 3 percent per annum. Forecast services expenditures are simply the forecast service activity volumes multiplied by the forecast unit costs.

Forecast meter expenditures are required for new activities. There is minimal activity expected in 2011, and 2012 and 2013 forecasts are based on 2011 projections. The 2010 actuals included one upgrade/alteration on a larger set for $5 thousand which is not expected in 2011.

We believe the 2012-2013 forecast Growth Capital expenditures for Fort Nelson are reasonable. They are similar to the 2010 actual expenditure level and local circumstances have not materially changed.

6.2.3.12 Growth Capital Summary

The forecasts for Growth Capital expenditures for 2012-13 have been developed in a manner consistent with past practice and based on recent historical data, utilizing projected customer additions and current unit costs escalated by inflation. The forecast of $35.7 million for 2012 and

$37.9 million for 2013 represent the level of this type of investment required to provide safe, reliable and efficient service to new and existing customers of the FortisBC Energy Utilities.

6.2.4 FACILITIES AND EQUIPMENT CAPITAL

Facilities and Equipment Capital expenditures include the acquisition or leasing of land, station buildings, facilities equipment, telecommunications infrastructure, specialized tools and equipment, and radio system upgrades. Technological improvements tend to drive changes in tools, equipment, radios and furniture.

6.2.4.1 Facilities and Equipment Capital – Mainland

The approved, actual, projected, and forecast capital expenditures for the Mainland Facilities and Equipment are summarized in Table 6.2-21 below.

Table 6.2-21: Approved, Actual and Forecast Mainland Facilities & Equipment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Other						
Equipment	2,973	3,434	2,634	2,664	3,310	2,930
Facilities	3,737	4,177	4,212	4,138	8,424	4,124
	6,710	**7,611**	**6,845**	**6,802**	**11,734**	**7,054**

EQUIPMENT

The forecast expenditures of $3.3 million and $2.9 million in 2012 and 2013 are generally consistent with historical spending, although higher than normal spending was experienced in 2010, when expenditures were $461 thousand higher than approved. This was due to a conversion of some Company vehicles to natural gas, and to the acquisition of CNG refuelling equipment located on FEI's sites in Burnaby and Surrey, which provide fueling service to the Company's fleet.

An increase of $150 thousand in equipment expenditure is required in 2012 for the integration of the radio network system. In an emergency situation, it is critical that the utilities can broadcast "one too many" radio communications to ensure the initial response and the subsequent continuation of service is done in a manner that is timely, cost effective, and above all, preserves the safety of both the public and employees. As such, the Company continues to operate a private radio network throughout its coastal and interior service territories.

The remaining increase in 2012 is primarily due to cyclical spending on tools and equipment replacement, additional requirements for in-ditch inspection equipment, and a one-time purchase of inspection kits.

FACILITIES

Facilities ensures business requests are suitable for the business and built to meet company standards, building code and regulations and provides a long term view of the facilities.

In 2010, Facilities expenditures were $440 thousand higher than approved as a result of the project to create additional surface parking at Surrey Operations being delayed from 2009, non forecast Salmon Arm Muster renovations and a storage addition for the Langley Compressor station that was originally budgeted under Transmission Sustainment Capital.

The increased pressure to the Surrey site, both parking and office space, will continue in 2012 as forecast employees and project consultants at this location continues to rise. Facilities is planning on increasing the densification of the Surrey Operations site and increasing the workstation count. This densification will require the purchase of new additional furniture systems to build out new workstations and alter existing workstations. The furniture costs are estimated at $1.5 million. Densification will eliminate the requirement for additional O&M of over $1.7 million per year for a leased facility and will maintain the business groups at one facility to support efficiency and collaboration within the groups.

In 2012, Facilities also proposes to purchase land for the North Vancouver Muster for an estimated $2 million. This estimate is based on the requirement of approximately .5 acre at the current market rate of $85 square foot. The muster is currently leased and, due to an expansion for the Landlord, we will be forced out and not able to operate from this site. This site is a critical for the Operations department as it provides operational support for the North and West Vancouver areas and is on the north side of the Burrard Inlet to ensure resources are always available for this area in the event of an emergency. The Landlord has provided reasonable timelines for their expansion and Facilities has been exploring alternatives for two years with no success due to the limited industrial real estate market.

Other projects within the 2012 and 2013 budget year are smaller projects that range from storage improvements, building additions, HVAC upgrades, security upgrades and office furniture and equipment purchases. In particular, there is an increase of approximately $1.4 million in 2012 due to the Penticton Meter Shop modification and Langley Compressor Station Muster addition. Modifications are required to the Penticton Meter Shop as a result of a regulatory requirement change to the standards for meter sampling. The change will result in an increased sample base and product movement through the Penticton Meter Shop. The Langley Compressor Muster Station addition will provide a mustering facility for Operations at this station which will allow personnel to have access to tools and equipment to perform maintenance and inventory. The existing Langley muster cannot accommodate all personnel.

6.2.4.2 Facilities and Equipment Capital – Vancouver Island

The approved, actual, projected, and forecast capital expenditures for Vancouver Island Facilities and Equipment are summarized in Table 6.2-22 below.

Table 6.2-22: Approved, Actual and Forecast Vancouver Island Facilities & Equipment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Other						
Equipment	1,615	1,181	1,500	1,391	3,073	3,591
Facilities	291	400	141	343	439	616
	1,906	**1,581**	**1,642**	**1,734**	**3,512**	**4,207**

The projected expenditures for Facilities and Equipment for 2012 and 2013 are $3.5 million and $4.2 million respectively.

These expenditures include purchases for tools and equipment, office furniture and equipment and facilities. The increase in expenditure for tools and equipment in 2012 and 2013 is due to the expansion of the Companies' radio system to the Vancouver Island region. Maintaining the emergency response capability has required the Companies to expand their current private radio communications network. Currently, Vancouver Island attempts to address this need through the use of an independent third party solution. This network is limited in that the service coverage is inadequate and the network is isolated from the remainder of the Companies' service areas. Therefore, parts of this region carry a much greater risk of not having adequate emergency communications capability compared to the remainder of the our service areas and will have limited ability to receive or offer support with other regions in the event of a major emergency. Compounding this concern is the fact that this service is provided over a public network which can become overly congested during major emergencies, preventing a safe and timely response within the impacted area. As such, in order for Vancouver Island to ensure effective emergency communications within the region, FEU's private network will need to be expanded to include the Vancouver Island service territory. Expansion of FEU's existing private radio network will allow the Company to address the limitations described above while leveraging the experienced operating group already in place. Expenditures for the radio system replacement is anticipated to be $1.8 million in 2012 and $2.2 million in 2013.

The projected expenditures for the improvement or replacement of structures, office furniture and equipment replacement in 2012 and 2013 are $436 thousand and $490 thousand respectively.

6.2.4.3 Facilities and Equipment Capital – Whistler

The approved, actual, projected, and forecast capital expenditures for Whistler Facilities and Equipment are summarized in Table 6.2-23 below.

Table 6.2-23: Approved, Actual and Forecast Whistler Facilities & Equipment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Other						
Equipment	18	5	17	17	20	60
Facilities	53	15	25	25	290	13
	71	**20**	**42**	**42**	**310**	**73**

Expenditures for Equipment are anticipated to be $20 thousand and $60 thousand in 2012 and 2013, respectively. $50 thousand is required in 2013 to replace an existing Bobcat vehicle in Whistler. These vehicles typically need to be replaced every four to five years; therefore, funding is only required on a cyclical basis.

With the planned disposition of the propane plant sites, Facilities reduced spending in 2010 by $40 thousand while a site assessment was completed for the remaining facilities. As the remaining sites have no storage, a new storage shed is proposed for 2012 to provide secure and dry covered storage for tools and equipment used to support the local operations to deliver natural gas. The 2012 forecast for this item is $290 thousand.

6.2.4.4 Facilities and Equipment Capital – Fort Nelson

The approved, actual, projected, and forecast capital expenditures for Fort Nelson Facilities and Equipment are summarized in Table 6.2-24 below.

Table 6.2-24: Approved, Actual and Forecast Fort Nelson Facilities & Equipment Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Other						
Equipment	-	-	8	8	10	10
Facilities	-	-	-	-	129	-
	-	**-**	**8**	**8**	**139**	**10**

Facilities require $129 thousand for expenditures for the Fort Nelson area in 2012 to provide water and sewer connection for our office to the municipality's systems. The municipality of Fort

Nelson is currently developing the area around our office which will bring the water and sewer services to our facility. It is beneficial for the Company to connect to these services and not rely on a septic field and well water as it reduces future replacement costs of the existing septic system and well water and minimizes risk around potential water contamination. In addition, there will be fencing changes and a concrete apron addition will be added to one of the storage buildings to improve accessibility. The Company believes these costs are prudent and valuable for the future.

6.2.4.5 Summary of Facilities and Equipment Capital

Facilities and Equipment Capital has been forecast based on known and anticipated projects. These expenditures are required to meet the ongoing business requirements of the Utilities.

6.2.5 IT EXPENDITURES

The approved, actual, projected, and forecast capital expenditures for the FortisBC Energy Utilities' Category C IT capital are summarized in Table 6.2-25 below.

Table 6.2-25: Approved, Actual and Forecast IT Capital Expenditures

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
IT Capital - Mainland	16,000	12,418	16,000	16,000	18,000	18,000
IT Capital - Vancouver Island	1,500	1,473	1,500	1,500	2,000	2,000
IT Capital - Total	17,500	13,891	17,500	17,500	20,000	20,000

The 2010 actual amount of $13.9 million for both Vancouver Island and the Mainland in 2010 against the budget of $17.5 was primarily due to the approval of the Customer Care Enhancement (CCE) CPCN which refocused key IT and business resources that otherwise would have been allocated to other initiatives. At the time of budget planning, this CPCN was not yet approved therefore the budget was created assuming access to all required resources. Additionally, several key projects had their planned spend profile deferred between fiscal year 2010 and 2011 due to unplanned competing demands on scarce business resources and prolonged vendor negotiations. 2011 spend is projected to be $17.5 million based on the rebaselined plan factoring in CCE and maximizing the available resources.

In 2012 and 2013, IT expenditures are forecast to be $20 million annually, which will allow for the replacement, acquisition, and implementation of IT hardware, software, and related infrastructure.

The following will describe how IT expenditures are allocated to Vancouver Island, the key drivers of IT expenditures, how the IT project portfolio is developed and the basis for the 2012-2013 forecast amounts.

ALLOCATION TO VANCOUVER ISLAND

As detailed in the previous Application, IT development and support has been centralized within the Mainland utility. The vast majority of capital expenditures are made in support of all of the FortisBC Energy Utilities regulated operating entities. It remains the case in this application that the costs of these initiatives will continue to be initially captured within the Mainland utility and then allocated to Vancouver Island where Vancouver Island utilizes those technology investments. The allocations are predicated on the nature of the expenditure. If the capital expenditure is to support a new business process or enhance an existing one that is followed by both utilities, then the allocation is based on employee distribution. This results in Vancouver Island being allocated ten percent of the overall capital costs. This allocation is also true for any initiatives that are driven by productivity improvements of investments made to shared infrastructure such as security, server upgrades, e-mail services, etc. In cases where the capital expenditure is specifically in support of Vancouver Island, these are direct costs with no allocation. This is the case with desktop and printer refresh initiatives. In cases where Vancouver Island is not a beneficiary of the outcome of the expenditure, there is no allocation. This was the case with the residential and commercial unbundling programs implemented in the Mainland utility.

KEY DRIVERS

The requirements for IT expenditures are categorized into three areas:

- Introducing or enhancing new capabilities in individual business units or the enterprise;
- Technology sustainment and upgrading; and
- Security / risk mitigation.

A key driver of IT capital expenditures is changing business process needs. The operating departments within the Company continually seek to identify more efficient or effective processes as well as to permit the Company to preserve efficiencies that have been attained. As a result, investments in information technologies are required. In addition, IT capital expenditures are made to enable the operating departments to comply with changing regulations and external requirements that demand compliance.

A second requirement for IT expenditures is the need to sustain and upgrade hardware and software. Keeping up with evolving technologies is a challenge for all companies as the frequent introduction of new infrastructure and new application versions have become commonplace throughout the IT industry. On occasion, the turnaround from new to discontinued application versions can be as short as 18 months. Larger application vendors (i.e. GE Smallworld and SAP) have scheduled version updates that incorporate new changes and additional functionality to the application, incorporate correction patches into the core system and take advantage of improvements in infrastructure. Many software and hardware vendors typically abandon older versions and withdraw support as their new version becomes available. Consequently, continuous sustainment investments must be made to replace these older applications and technologies. This sustainment cycle also requires the upgrading and replacement of desktop computer technologies in order to operate more advanced versions of the software applications. The establishment of an "Evergreening" program has enabled us to follow a consistent and predictable approach to ensuring core infrastructure and applications are reasonably current in today's ever changing version landscape, optimizing the usage the existing assets and then replacing them before they start to break down which would result in costly maintenance repairs and lost productivity.

The focus on IT security has increased steadily. A dramatic shift in security threats began early in 2001. This is primarily due to the increased use of Internet e-mail functionality and the escalating threat of external hackers. These security threats have grown to exploit weaknesses in all areas of network and software applications. The increased use of the Internet to support business processes requires additional investment in the protection of those processes and associated data. IT security must continue to be implemented with a depth model that uses many layers of differing protection but still offers the capability to support business requirements. With the disaster recovery site operational, IT is better equipped to support the breadth of the Disaster Recovery Plan required for business continuity; however continued investment must be made to ensure the relevancy of the information slated for disaster recovery considering the constant change in the Company's applications and systems.

The demand for IT capital investment pursuant to the categories above is significant. It is the IT department's experience that this demand continues to outpace the Company's capacity to execute. It is also the Company's experience that not all projects that are implemented by the end of any year are identified during the prior year's budgeting process. The capability of the business units to invest resources required to successfully implement new solutions must be balanced against operational demands.

IT PROJECT PORTFOLIO DEVELOPMENT

In order to mitigate the issues above, the Company implemented in 2010 a well established methodology known as IT Project Portfolio Management (PPM). This methodology is a recognized discipline for managing IT Project portfolios that facilitates the evaluation, prioritization and coordination of the requirements of the various operating business units and technology, thus enabling more effective capital investment decisions.

The Company's PPM provides a standard framework to evaluate projects allowing for the comparison and selection of competing IT investment options. Projects must be aligned to one or more of the Company's strategic goals, and each project is required to demonstrate how it supports the achievement of organizational goals and priorities. PPM compares and prioritizes potential IT project investments based on the project's value contribution to the organization's goals, irrespective of where the initiative originated. Those projects with the greatest contribution and alignment will receive highest priority. The priority of each project guides the financial and resource allocation for the portfolio. Prioritization ideally assures projects with the greatest value to the Company will be considered first when allocating finite resources. PPM ultimately drives the establishment of the IT Project Portfolio which must be reviewed and accepted by the Utility Operating Committee Capital Management group consisting of the key representatives from IT, Finance, Regulatory, Distribution, Transmission, Marketing, and Engineering Services. This activity takes place annually following the corporate budgeting process and in advance of initiation of the targeted fiscal year. Prior to execution, all approved IT Project Portfolio projects must still acquire formal authorization for capital investment through written justification (business casing) which reconfirms the business value of undertaking the project and validates the assumptions made in the initial establishment of the IT Project Portfolio.

2012 AND 2013 FORECASTS

The Company is forecasting an increase of $2.0 million for the Mainland and $500 thousand for Vancouver Island for 2012 from the 2011 total of $16.0 million and $1.5 million respectively, with 2013 held at that level. This increase is based on enabling several robust technology roadmaps created in 2010 and 2011 in addition to satisfying pent-up demand from restrictions on the execution of several IT projects other than the CCE CPCN. Effective execution of this increased forecast will be managed through the employment of PPM, management of inter-project dependencies and risk mitigation within the IT Project Portfolio and the optimal usage of IT and business resources freed up from the cessation of the CCE CPCN. For projects that require significant business involvement, the business must prioritize between IT project commitments and other business imperatives. Over the years, the Company has invested time and effort on technology that enables operational efficiencies and the integration of business processes spanning multiple business units. Consequently, the IT Project Portfolio management team must work to ensure that all affected groups are coordinated and have the same ability to commit resources to projects that impact them all.

The capital request for IT investment is forecast at an amount in 2012 and 2013 that FEU believes is the appropriate amount that can prudently be executed while meeting the top priorities of the business. The incremental $2.0 million from 2011 to a total of $18 million for the in each of 2012 and 2013 reflects the costs anticipated to ensure a balanced IT Project Portfolio that will address the requirements of technology sustainment, security and risk mitigation and meet the priority demands of the Company's further IT enablement.

6.2.6 CONTRIBUTIONS IN AID OF CONSTRUCTION

6.2.6.1 CIAC - Mainland

The table below summarizes Mainland's anticipated CIAC recoveries for 2012-2013.

Table 6.2-26: Approved, Actual and Forecast Mainland Contributions in Aid of Construction

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Growth Capital	936	512	(763)	(1,261)	(1,319)	(1,372)
Sustainment Capital	(4,700)	(4,350)	(2,900)	(4,966)	(3,750)	(3,750)
CPCN	-	(84)	-	-	-	-
Retirements					(271)	(277)
Total	**(3,764)**	**(3,922)**	**(3,663)**	**(6,227)**	**(5,341)**	**(5,399)**

CIAC for 2012 and 2013 are based on recoveries for the forecast customer additions and anticipated receivable work.

In total, CIAC are forecast at $5.3 million in 2012 and $5.4 million in 2013.

For Growth Capital, the 2010 Approved and Actual includes the transfer of the $1.443 million balance in the Deferred Service Line Installation Fee account to CIAC on January 1, 2010, as approved by Commission Order No. G-141-09.

CIAC for Sustainment Capital are anticipated to be $3.7 million in 2012 and 2013. The recoveries in this category were budgeted based on the anticipated receivable work for third party alterations and historical levels of receivable work for Transmission crossing replacements and identified recoverable projects. Higher CIAC is anticipated for 2012 and 2013 due to an increase in receivable work on third party alterations, expected especially as a result of announcements by municipalities to increase infrastructure renewal, for the forecast periods.

6.2.6.2 CIAC - Vancouver Island

The table below summarizes Vancouver Island's anticipated CIAC recoveries for 2012-2013.

Table 6.2-27: Approved, Actual and Forecast Vancouver Island Contributions in Aid of Construction

($ thousands)

	2010 Approved	2010 Actual	2011 Approved	2011 Projection	2012 Forecast	2013 Forecast
Growth Capital	(117)	(140)	(123)	(122)	(130)	(135)
Sustainment Capital	(310)	(218)	(310)	(350)	(281)	(281)
CPCN	-	-	-	-	-	-
Retirements					(15)	(15)
Total	**(427)**	**(358)**	**(433)**	**(472)**	**(426)**	**(431)**

CIAC for 2012 and 2013 are based on recoveries for the projected customer additions and anticipated receivable work.

CIAC of $426 thousand and $431 thousand for 2012 and 2013 respectively are consistent with average contributions over the 2010 – 2011 period.

6.2.6.3 CIAC - Whistler

Whistler does not anticipate any contributions for the 2012-2013 forecast period.

6.2.6.4 CIAC - Fort Nelson

Fort Nelson does not anticipate any contributions for 2012-2013 forecast period.

6.2.7 CPCNs

Section 45(1) of the UCA requires that a person must not begin the construction or operation of a public utility plant or system, or an extension of either, without first obtaining from the Commission a CPCN approving the construction or operation. Section 46(1) of the UCA requires an application for a CPCN be filed with Commission.

As agreed to in the 2010-2011 RRAs for the Mainland and Vancouver Island, large capital expenditures over $5 million (excluding AFUDC) qualify for the CPCN application process. This threshold has been in place since 2003. The 2010 Certificates of Public Convenience and Necessity Application Guidelines, issued March 18, 2010, provide general guidance regarding the Commission's expectations of the information that should be included in a CPCN Application.

As CPCNs are approved through a separate process, we have not included in this RRA the capital expenditures related to CPCNs that are anticipated but have not yet been approved. CPCNs that have been approved and are forecast to go into service during the test years are included in rate base in this RRA.

The sections below discuss both approved and anticipated CPCNs for the Mainland and Vancouver Island. The section on anticipated CPCNs is provided for information only, as these projects do not affect the forecasts included in this RRA.

6.2.7.1 Mainland CPCNs – Approved Projects

FRASER RIVER CROSSING PROJECT

In November of 2008, FEI filed an application for a CPCN for the Fraser River South Arm Crossing Upgrade Project as part of the Coastal Transmission System, consisting of a new crossing using horizontal directional drill technology to replace the 24 inch and the 20 inch since there is a risk of a major seismic event. On March 12, 2009, the Commission granted a CPCN for the Project by Order No. C-2-09. Current pipeline in-service dates are estimated at the third quarter of 2011, approximately 20 months later than originally planned. At this time the estimated cost at completion for the Project is $36.3 million including AFUDC based on completion of the associated restoration work in 2011 and excludes a settlement between the contractor and FEI in the event that the contractor submits any extra-ordinary claims. The project has been included in rate base in October of 2011 based on the current timeline to completion.

CUSTOMER CARE ENHANCEMENT PROJECT

In June of 2009, FEI filed an application for a CPCN for the CCE Project and on February 26, 2010, the Commission granted approval by way of Order No. C-1-10. This approval was subject to a cost sharing formula, wherein if the final cost of the Project is greater than 10 percent above or greater than 10 percent below $115.5 million including AFUDC, the additional costs or savings outside that +/- 10 percent band will be shared equally between the Company and its ratepayers.

The CCE Project is well underway and the forecast cost of the project including AFUDC remains at the approved level of $115.5 million including AFUDC (of which $74.7 million corresponds to capital spend and $40.8 million to deferred O&M). The scheduled date that the FEU expects to go live with the new system continues to be January 1st, 2012. Overall good progress has been made to date, with the completion of the detailed system design for the SAP CIS platform. Currently the Project team is engaged in the configuration and development of the reports and interfaces, unit testing and integration testing of the new system together with documentation of the business process designs. In addition, development of recruitment plans, training plans, training materials and end user documentation is ongoing to ensure the Contact Centres and back office operations are staffed with knowledgeable and skilled employees. Furthermore, two new facilities, one in Burnaby and the other in Prince George, are currently being prepared to house the new operations.

TILBURY LAND PROPERTY PURCHASE

In October of 2009, FEI filed a CPCN application for the acquisition of the Tilbury Property, immediately adjacent to the Tilbury LNG Facility, at a cost close to $16 million. On April 27, 2010, the Commission granted a CPCN for the Property by Order No C-2-10, with a condition that generally results in the amount of land to be added to rate base January 1, 2012 being reduced by that portion of the Property to be subdivided and sold. As a result, of the total Property purchase price, $14.2 million will be added to rate base January 1, 2012.

KOOTENAY RIVER CROSSING (SHOREACRES) PROJECT

In July of 2010, FEI field an application for a CPCN to replace the aerial pipeline crossing of the Kootenay River located near the community of Shoreacres with a new crossing by means of a horizontal directional drill as part of the Interior Transmission System. On November 10, 2010, the Commission granted a CPCN for the Project by Order No. C-9-10 for an estimated $8.3 million including AFUDC and with a projected in service date of October, 2011. Current estimates remain at the CPCN estimates for both project costs and in service date.

6.2.7.2 Mainland CPCNs - Anticipated Projects

HUNTINGDON STATION BYPASS

FEI's Huntingdon Control Station, located on the Canada/US border south of Abbotsford, controls the supply of natural gas to the majority of customers in the Lower Mainland and all of the customers in Whistler, Squamish, the Sunshine Coast, and Vancouver Island. In total, approximately 660,000 customers depend on Huntingdon for their gas supply. The Huntingdon Control Station, originally commissioned in 1956 has been continually operated, upgraded and maintained to ensure the station remains fit for service. Through operational experience and risk assessments, FEI identified the station as a potential "single point of failure," meaning that the failure of the station would cause the complete outage of the entire gas system. This failure event could be caused by equipment failures, natural hazards, vandalism, or failures of adjacent interconnected midstream pipelines and facilities. The risk of a failure event due to such an incident is amplified by a lack of redundancy within certain parts of the station.

In order to ensure reliable gas supply to the approximately 660,000 FEI customers who depend on Huntingdon, FEI proposes constructing a bypass pipeline around Huntingdon Station and the associated interconnection facilities that will provide redundancy to the overall system and mitigate the impact of a major incident at Huntingdon from any of the failure scenarios listed above. The Company plans to submit a CPCN application in the second quarter of 2011 for the installation of the station bypass, to be completed before the 2012/13 winter season. The current project cost is estimated at $25 - $30 million.

OKANAGAN REINFORCEMENT PROJECT

Based on the 2011 core market demand forecast, the Interior Transmission System is anticipated to face system capacity shortfall by 2017. Currently, three resource options are being considered: phased pipeline looping from Penticton towards Kelowna in conjunction with increased compression at Kitchener-B Compressor Station at a budgetary estimate of $42 million and $20 million respectively; Phased pipeline looping from Savona at a budgetary estimate of $30 million; or LNG peaking storage facility in North Okanagan at a budgetary estimate of $131 million. Depending on the option yet to be chosen, the CPCN application will be filed with the Commission as early as 2014.

6.2.7.3 Vancouver Island - Approved Projects

MOUNT HAYES LNG STORAGE FACILITY PROJECT

In June of 2007, FEVI filed an application for a CPCN for the Mt. Hayes LNG Storage Facility Project, including construction and ownership of an LNG peak-shaving storage facility at Mt. Hayes near Ladysmith, and various associated facilities to connect the LNG Storage Facility to Vancouver Island's natural gas transmission system. On November 15, 2007, the Commission granted a CPCN for the project by Order No. C-9-07. Total capital costs were approved for $193.3 million (excluding AFUDC). On-site construction is complete and commissioning is currently underway with planned completion and turn-over to FEVI in May 2011, and the Facility is expected to begin-service for the winter of 2011/12. The Project is on time and on budget; costs of $213.0 million including AFUDC have been included in FEVI's rate base in May 2011.

VICTORIA REGIONAL OPERATIONS CENTRE PROJECT

In October of 2010, FEVI filed an application for a CPCN seeking approval to acquire property and construct a new regional operations centre, replacing its existing leased facility. In January 2011, the Commission issued Order No. C-1-11 granting conditional approval for the acquisition of the property and deferred approval for construction until completion and review of a staffing report. FEVI filed the required report on February 28, 2011. On March 23, 2011 the Commission issued Order No. C-6-11 granting approval to construct the Victoria Regional Operations Centre. The total project capital cost is estimated at $13.8 million including AFUDC. Purchase of the property has completed with construction starting in late fall of 2011. Completion of the project is expected in October 2012.

6.2.8 CONCLUSION

The proposed 2012 - 2013 capital forecast reflects the appropriate level of capital expenditures needed to ensure the safety and reliability of the gas distribution system and provide service to new and existing customers. The FortisBC Energy Utilities' believe the forecast capital costs are prudent and required to meet the evolving needs of our customers and shareholder.

6.3 Rate Base Deferral Accounts

The Utilities have considered the following factors with respect to continuing existing deferral accounts and seeking deferral account treatment in different matters:

- Maintain those previously approved accounts that continue to provide benefits as appropriate to customers and the utilities in 2012 and 2013[130];
- Create new mechanisms to address uncontrollable or non-recurring matters appropriately;
- Discontinue the use of certain deferral accounts that are no longer required.

The Utilities have organized their deferral accounts into the six categories described in Table 6.3-1.

Table 6.3-1: Deferral Accounts Providing Benefits to Customers and the Utilities

Deferral Account Category	General Purpose & Description
Margin Related	• Decrease the volatility in rates caused both by such factors as fluctuations in gas prices and the significant impacts of weather and other changes on use rates. • Deferring the cost and delivery margin impacts arising from un-forecast variations in these types of factors and recovering the impacts from, or refunding the impacts to customers over a longer period of time is an effective method of reducing rate volatility.
Energy Policy	• Capturing costs associated with changing energy policies that focus on energy efficiency, conservation and the environment. • Deferring and amortizing these costs matches the costs of the programs with the period of time that the benefits are expected to be realized by customers.
Non-Controllable Items	• Items which are either outside of the Company's control or where the Company has limited ability to influence the costs. • Deferring the variances from the forecast level of costs for these activities reduces the exposure for both the Utility and customers due to significant variances in these amounts, and serves to avoid windfall gains or losses to the Company or to customers.
Deferred Costs of BCUC Applications	• Costs incurred consist of legal fees, costs for expert witnesses and consultants, costs related to independent validation of study results, intervener and participant funding costs, Commission costs, required public notifications, and miscellaneous facilities, stationery and supplies costs.
Other	• Various accounts that provide benefits to customers and the Company, often for items that are non-recurring in nature.

[130] As per the Decision attached to Commission Order No. G-7-03 in referencing the approval of individual deferral accounts, the Commission wrote: "The Commission believes that its Orders supporting these requests continue in force until a change is approved by the Commission. For greater certainty, the Commission approves the continuation of amortization rates as previously ordered." Consistent with that Decision, the Utilities have continued to employ deferral accounts previously approved by the Commission.

Deferral Account Category	General Purpose & Description
Residual	• Deferral accounts which are no longer required and the Company is proposing to discontinue the use of the account. • Typically the proposal is to fully amortize any remaining balances.

The forecast mid-year balance of unamortized deferred charges in rate base for the FEUs is approximately $53.9 million in 2012 and $69.3 million in 2013 and is driven largely by the balances in the Whistler Pipeline and Energy Efficiency and Conservation accounts. Figure 6.3-1 provides the mid-year deferral account balances summarized by deferral account category.

Figure 6.3-1: FEU Forecast Mid-Year Balances of Deferral Accounts by Category

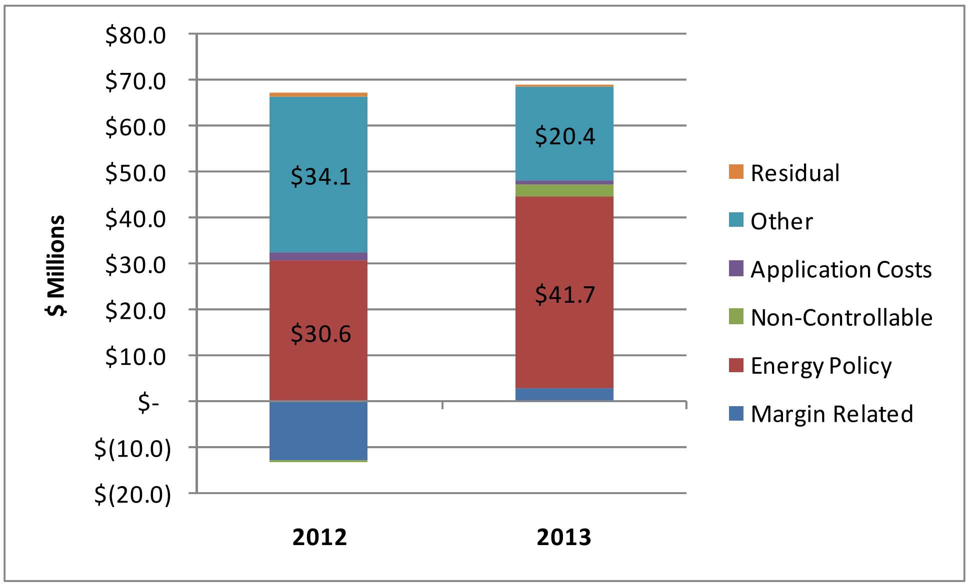


Table 6.3-2 provides the forecast mid-year balances of the deferral account by Category and by Utility and the following sections describe each rate base deferral account in detail, grouped by the six categories. For a discussion on non-rate base deferral accounts, including the Thermal Energy Services Deferral Account (formerly the New Energy Solutions Deferral Account), please refer to Appendix G.

Table 6.3-2: Forecast Mid-Year Balances of Deferral Accounts by Category[131]

2012 Forecast, Mid Year Balance, ($ thousands)					
	Mainland	Vancouver Island	Whistler	Fort Nelson	Total
Margin Related	$ (9,371)	$ (4,062)	$ 703	$ (41)	$ (12,770)

6.3.1.1 Commodity Cost Reconciliation Account (CCRA)

The CCRA applies to Mainland and Whistler and was approved by Commission Order No. G-25-04 for Mainland and Commission Order No. G-138-10 for Whistler. The CCRA captures the costs incurred by Mainland and Whistler to purchase its portion of the baseload commodity supply under the Essential Services Model and the commodity recovery revenues received from sales customers choosing to remain on the utility standard rate offering. Commodity price-related variances collected in the CCRA are taken into account when determining future commodity rate changes. The commodity rate is reviewed on a quarterly basis, and typically reset when the commodity recovery-to-cost ratio, on a 12-month prospective basis, falls outside the 0.95 to 1.05 threshold. Based on the recommendations within the FEI Report on the CCRA and MCRA Deferral Accounts and Rate Setting Mechanisms (the "CCRA / MCRA Review Report"), dated March 10, 2011, a secondary parameter of a minimum rate change threshold value of $0.50/GJ would be added to the existing rate change trigger mechanism to avoid minor changes to the commodity rate which can occur in low commodity price environments when using only a percentage-based threshold. Generally, when the commodity rate is reset, the new rate is designed to recover, or refund, over the next 12 months any existing CCRA balance,

[132] Section 7.1 to 7.4, Schedule 68 and 70

along with any under or over recovery of commodity costs forecast to occur over the next 12-month period. Consistent with past practice, any variances that arise in 2012 and 2013 between the forecast CCRA balances and the actual amounts realized will be subject to deferred interest treatment

6.3.1.2 Midstream Cost Reconciliation Account (MCRA)

The MCRA captures the costs the Mainland and Whistler incur in performing the midstream function and the revenues collected through midstream rates. Gas Supply, in its midstream role, uses the pipeline and storage resources, spot and peaking purchases, and sale activities as approved in the Annual Contracting Plans to manage load variability. The MCRA accumulates any resultant cost variances, including any volume-related variances due to differences between the forecast and actual consumption. The resulting variances are taken into account when determining future midstream rates. Midstream rates are reviewed on a quarterly basis and, under normal circumstances, midstream rates are adjusted on an annual basis with a January 1 effective date. Based on the recommendations within the CCRA / MCRA Review Report, when midstream rates are reset for the upcoming calendar year, the new rates will be designed to amortize 1/3 of the cumulative MCRA deferral balance at the end of each year into the next year's midstream rates; effectively lengthening the amortization period related to the yearend MCRA balance to help reduce year-to-year rate volatility. Consistent with past practice, any variances that arise in 2012 and 2013 between the forecast MCRA balances and the actual amounts realized will be subject to deferred interest treatment.

6.3.1.3 Revenue Stabilization Adjustment Mechanism (RSAM)

The RSAM, originally approved by Commission Order No. G-59-94, and subsequently approved for Fort Nelson through Commission Order No. G-17-04 and Whistler through Commission Order No. G-138-10, is a mechanism that stabilizes the Company's delivery margin revenue from the Residential and Commercial customer classes in Mainland and all customers in Whistler and Fort Nelson. The RSAM enables the Companies to record delivery margin revenue for these customer classes based on the forecast use per customer for each rate class that was used in establishing rates. If weather or other factors result in the customer use varying from forecast, an entry is made to the RSAM account that adjusts revenue collected from customer rates from actual use to what customers would have paid based on forecast use. If actual use is less than forecast, the RSAM deferral account is charged for the variance in use times the delivery rate and the RSAM revenue is credited. Conversely, if actual use is greater than forecast, the RSAM deferral account is credited and the RSAM revenue is decreased. Consistent with past practice, any variances that arise in 2012 and 2013 between the forecast RSAM balances and the actual amounts realized will be subject to deferred interest treatment.

The 2012 account balance variances and the associated deferred interest will be returned to or recovered from customers through an adjustment to Rate Rider 5 from 2013 to 2015; the 2013 account balance variances and the associated deferred interest will be returned to or recovered from customers through an adjustment to Rate Rider 5 from 2014 to 2016.

MAINLAND

RSAM account balances will continue to be recovered from or returned to customers (Rates 1, 1B, 1U, 1X, 2, 2B, 2U, 2X, 3, 3B, 3U, 3X and 23) through Delivery Rate Rider 5 over a three year period. The determination of Mainland Delivery Rate Rider 5 is discussed in Section 3.3.1, and Section 7.1, Schedule 85.

WHISTLER

In this Application, Whistler is seeking approval to transfer the residual balance in the Whistler Sales Margin Differential account to the RSAM account effective January 1, 2012, as the balances in both of these accounts arise primarily from changes in use rates as compared to forecast. As approved by Commission Order No. G-138-10, Whistler discontinued the use of the Sales Margin Differential account upon the adoption of the RSAM in 2010. In addition, Whistler is seeking approval to recover from or return to all customers the combined RSAM account balances through a Delivery Rate Rider, amortized over a three year period. Consistent with the Mainland and Fort Nelson, Whistler will use the same Delivery Rate Rider 5. The determination of Whistler Delivery Rate Rider 5 is discussed in Section 3.3.3 and Section 7.3, Schedule 85.

FORT NELSON

RSAM account balances will continue to be recovered from or returned to all customers through Delivery Rate Rider 5 over a three year period.[133] The determination of Fort Nelson Delivery Rate Rider 5 is discussed in Section 3.3.4 and Section 7.4, Schedule 85.

6.3.1.4 Interest on CCRA, MCRA, RSAM and Gas in Storage

Consistent with past practice, and as approved by Commission Order No. G-7-03, variances from the forecast CCRA, MCRA, and RSAM balances attract interest at the Company's short-term borrowing rate. The booking of interest on variances reduces the likelihood of large carrying cost benefits or losses accruing to either the Company or to customers. Balances in these accounts and variances from the forecast amounts will be recovered from or returned to customers using the same methodology as outlined above for the associated CCRA, MCRA and RSAM accounts.

---

[133] RSAM recovery or refund is embedded within the bundled step rates for those customers that do not have an unbundled gas cost recovery rate

Pursuant to Commission Order No. G-141-09, Mainland received approval for deferred interest treatment on variations between the forecast balance of gas in storage inventory included in rate base, and the actual balance in the account through the year. In this Application, Mainland is seeking approval for an amortization period of three years for the Gas in Storage Interest account.

6.3.1.5 Revelstoke Propane Cost Deferral Account

The Revelstoke Propane Cost Deferral Account, approved by BCUC Order No. G-72-90, captures the difference between the actual cost of propane and the amount recovered in rates, based on the approved reference price of propane. The propane reference price is reviewed on a quarterly basis, and typically reset when the propane recovery-to-cost ratio, on a 12-month prospective basis, falls outside the 0.95 to 1.05 threshold. It is expected the secondary parameter of a minimum commodity rate change threshold value of $0.50/GJ, as recommended in the CCRA / MCRA Review Report, would apply to other gas utilities regulated by the Commission and would therefore be applicable to Revelstoke. In general, when the propane reference price is reset, the new reference price is designed to recover, or refund, over the next 12 months any existing deferral account balance, along with any under or over recovery of propane costs forecast to occur over the next 12-month period.

6.3.1.6 Gas Cost Variance Account (GCVA)

Approved by Commission Order No. G-2-03, the Vancouver Island GCVA was established effective January 1, 2003 to accumulate the variances between the actual and the forecast gas costs on a royalty adjusted basis, for amortization and recovery from, or refund to, sales customers in future rates. The Royalty Rebate arrangement under which Vancouver Island has received royalty revenues from the Province expires on December 31, 2011; the GCVA will continue to collect the variances between the actual and forecast gas costs during 2012 and 2013.

Although the Vancouver Island forecast gas costs and GCVA balances have continued to be reported on a quarterly basis, the Vancouver Island sales rates were not subject to resetting for flow through of gas costs during the 2010-2011 revenue requirements settlement period. The GCVA is projected to have a surplus balance at December 31, 2011 of approximately $11.1 million ($8.1 million after tax), which will be amortized in 2012.

For purposes of this Application, the GCVA balances at the end of 2012 and 2013 are forecast to be zero; however, differences between the actual and forecast gas costs will occur. Vancouver Island proposes that these variances continue to be accumulated in the GCVA for the two-year period, and that the December 31, 2013 balance be amortized through future rates. Further, as the Vancouver Island 2012 and 2013 sales rates sought within this Application will not be subject to resetting for flow through of gas costs during the 2012-2013 revenue requirements period, FEVI is proposing to discontinue the quarterly reporting of the Vancouver Island forecast gas costs and GCVA balances.

6.3.1.7 Fort Nelson Gas Cost Reconciliation Account (GCRA)

The GCRA accumulates the actual costs incurred by Fort Nelson to purchase gas, and the amounts recovered through the gas cost component of rates. The Fort Nelson gas cost recovery rates are reviewed on a quarterly basis, and typically reset when the gas cost recovery-to-cost ratio, on a 12-month prospective basis, falls outside the 0.95 to 1.05 threshold. It is expected the use of a secondary parameter of a minimum commodity rate change threshold value of $0.50/GJ, as recommended in the CCRA / MCRA Review Report, would apply to Fort Nelson, as well as other gas utilities regulated by the Commission. Generally, when Fort Nelson gas cost recovery rates are reset, the new rates are designed to recover, or refund, over the next 12 months any existing GCRA balance, along with any under or over recovery of gas costs forecast to occur over the next 12-month period.

6.3.1.8 SCP Mitigation Revenues Variance Account

The SCP Mitigation Revenues Variance Account, approved by Commission Orders No. G-124-00, No. G-123-01, No. G-7-03 and No. G-141-09, relates to the use of SCP transportation capacity that has not been utilized by the firm transportation agreement customers and is sold to others, and the third party back-haul movements from Kingsvale to Yahk which relate to transportation service in a West to East direction through the system. As discussed in Section 5.5, Other Revenue, FEI has increased the forecast SCP mitigation revenues for 2012 and 2013 to $5.7 million as a result of the T-South Enhanced Service initiative between Spectra Energy and FEI. Any variation from this $5.7 million and actual revenues received will be captured in the SCP Mitigation Revenues Variance Account and returned to or recovered from customers over a three year period through delivery rates.

6.3.2 ENERGY POLICY DEFERRAL ACCOUNTS

The Utilities have included the following previously approved, modified and new deferrals related to changing energy policy in rate base for 2012 and 2013:

Table 6.3-4: Mid-Year Balances of Energy Policy Deferrals[134]

2012 Forecast, Mid Year Balance, ($ thousands)					
Energy Policy Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
Energy Efficiency & Conservation (EEC)	$ 26,571	$ 3,147	$ 75	$ -	$ 29,793
NGV Conversion Grants	101	17	-	-	118
Emissions Regulations	-	-	-	-	-
2010-2011 Biomethane Program Costs	748	-	-	-	748
2011 CNG and LNG Service Costs and Recoveries	(24)	-	-	-	(24)
CNG and LNG Service Recoveries	-	-	-	-	-
Total Mid Year Balance, Energy Policy Deferrals	**$ 27,396**	**$ 3,163**	**$ 75**	**$ -**	**$ 30,635**

2013 Forecast, Mid Year Balance, ($ thousands)					
Energy Policy Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
Energy Efficiency & Conservation (EEC)	$ 36,665	$ 4,290	$ 218	$ -	$ 41,173
NGV Conversion Grants	119	26	-	-	145
Emissions Regulations	-	-	-	-	-
2010-2011 Biomethane Program Costs	449	-	-	-	449
2011 CNG and LNG Service Costs and Recoveries	(36)	-	-	-	(36)
CNG and LNG Service Recoveries	-	-	-	-	-
Total Mid Year Balance, Energy Policy Deferrals	**$ 37,198**	**$ 4,316**	**$ 218**	**$ -**	**$ 41,731**

6.3.2.1 Energy Efficiency and Conservation (EEC)

Pursuant to Commission Order No. G-36-09, the Commission approved the use of a deferral account for EEC expenditures for Mainland and Vancouver Island. The decision also approved the inclusion of the forecast deferral account balances in rate base on a net-of-tax basis and to amortize these balances in rates over a ten year period. The Companies propose that the deferral account mechanism be modified to address variances in the level of customer participation as well as to address the expansion of the EEC program to Whistler.

In this Application the Companies are seeking the following approvals related to EEC:

1. An increase of $35.3 million to the approved EEC funding envelope in 2011 to a total of $74.5 million in 2012 and remaining at that level in 2013 for Mainland, Vancouver Island and Whistler combined;
2. Combined EEC rate base deferral account additions of $20.0 million in 2012 and $20.0 million in 2013, included on a net-of-tax basis and amortized in rates over a ten year period;
3. The allocation of the 2012 and 2013 EEC rate base deferral account additions amongst Mainland, Vancouver Island and Whistler on an average customer basis which is

[134] Section 7.1 to 7.4, Schedule 68 and 70

approximately 89 percent to Mainland, 10 percent to Vancouver Island and 1 percent to Whistler;

4. The creation of the EEC Incentive non-rate base deferral account, attracting AFUDC, to capture the remaining portion of the EEC costs as incurred on an actual spend basis in 2012 and 2013, and to recover the balance over a ten year period beginning in 2014.

All costs incurred by the Companies continue to be subject to the guidelines of the EEC Application, as approved by Commission Order No. G-36-09. The four requests are discussed in further detail below.

INCREASE TO EEC FUNDING

In this Application, the Companies are seeking approval of an increase to the EEC funding envelope from the 2011 approved amount of $35.3 million to $74.5 million for 2012 and 2013.

Table 6.3-5 below summarizes the various areas of activity to be funded by the proposed EEC expenditure.

Table 6.3-5: Proposed EEC Funding by Activity for 2012 and 2013

	2012 Proposed Funding ($000's)	2013 Proposed Funding ($000's)
	Total	**Total**
Previously Approved EEC Activity		
Conventional EEC Activity		
Residential	9,500	9,500
High Carbon Fuel Switching	2,000	2,000
Low Income	5,000	5,000
Commercial	14,500	14,500
Conservation Education and Outreach	5,000	5,000
Industrial	2,000	2,000
Subtotal - Conventional EEC Activity	***38,000***	***38,000***
Subtotal - Innovative Technologies inc. NGT	***11,500***	***11,500***
Subtotal - Previously Approved EEC Activity	***49,500***	***49,500***
New Initiatives		
Furnace Scrap-It program	**10,000**	**10,000**
Solar Thermal	**4,000**	**4,000**
TES for Schools	**11,000**	**11,000**
Subtotal - New Initiatives	***25,000***	***25,000***
Total Funding	**74,500**	**74,500**

This level of funding is necessary to build on the significant progress that has been made toward building a strong foundation for future growth in EEC activity, to support new EEC programs and to make EEC programs available to customers in Whistler[135] in addition to customers on the Mainland and Vancouver Island and to include Industrial customers of FEVI in eligibility for EEC program participation. Further, in this RRA, the Utilities have requested $10 million in 2012 and $10 million in 2013 to fund its natural gas for Transportation initiatives within the Innovative Technologies Program Area. Further, the FEU have put forth new programs such as Furnace Scrap-It program, Solar Thermal and TES for Schools. Appendix K provides a review of the proposed EEC activity for 2012 and 2013, and the EEC-related approvals sought along with supporting information.

The table below provides a summary of the 2010 through 2013 EEC activity:

Table 6.3-6: A Significant Increase in EEC Funding is Proposed

($ millions)	2010		2011		2012	2013
Utility/Region	*Approved*	*Actual*	*Approved*	*Projected*	*Forecast*	*Forecast*
FEI	25.8	11.1	29.6	20.0	74.5	74.5
FEVI	5.2	1.5	5.7	5.7		
FEW	-	-	-	-		
Total	**31.0**	**12.6**	**35.3**	**25.7**	**74.5**	**74.5**

EEC FORECAST INCLUDED IN RATE BASE

The Companies are seeking approval to include $20 million per year in the EEC rate base deferral account, slightly less than 30 percent of the total forecast, to recognize the variability in customer participation that may occur in the forecast period. As discussed below, the remaining $54.5 million per year of the forecast EEC costs will be accumulated, on an actual as-spent basis, in a non-rate base deferral account, attracting AFUDC. This approach helps to protect customers from paying for EEC expenditures in 2012 and 2013 until program results are known.

The Companies believe that $20 million per year is an appropriate forecast to include in the rate base deferral account for 2012 and 2013 because of the following:

1. $20 million is in line with the total projected EEC costs for 2011.
2. As demonstrated in the 2010 EEC Annual Report, FEI's recent experience of the ratio between non-incentive costs to incentive costs is approximately 35 percent.[136]

[135] In Appendix A (page 7), Reasons for Decision accompanying Commission Order No. G-138-10, Whistler was directed to develop plans for EEC programs consistent with British Columbia's energy objectives in its next revenue requirement application

[136] Appendix K; Non incentive costs of $6.283 million compared to total costs of $17.701 million as shown on Page 6

3. $20 million reflects the approximate level of non-incentive costs like labour, customer education and general administrative expenses required to deliver an EEC program of $74.5 million.

ALLOCATION OF EEC FORECAST IN RATE BASE

The Companies are seeking approval to allocate the forecast costs included in the rate base deferral account on an average customer basis amongst Mainland, Vancouver Island and Whistler. This results in rate base deferral account additions as follows:

Table 6.3-7: EEC Additions Allocated Based on Average Customers

($ millions) **Utility/Region**	**EEC Rate Base Additions**		
	Allocation	**2012**	**2013**
FEI	89%	17.8	17.8
FEVI	10%	2.0	2.0
FEW	1%	0.2	0.2
Total	100%	20.0	20.0

The allocation of the forecast costs in rate base on an average customer basis is appropriate because the programs will be available to customers in all regions.

EEC INCENTIVE NON-RATE BASE DEFERRAL ACCOUNT

The Companies are seeking approval of a non-rate base deferral account, attracting AFUDC, to capture the remaining portion of EEC costs as incurred on an actual basis, to a maximum of $54.5 million each year amongst the Companies. The non-rate base account reduces the risk of variability in EEC costs of customer participation in program costs that are embedded in delivery rates. That is, costs incurred over and above the forecast EEC rate base account additions of $20.0 million in 2012 and 2013 will be captured in the EEC Incentive non-rate base account. The additions to the non-rate base account will be tracked on a Company basis for Mainland, Vancouver Island and Whistler.

Consistent with the rate base deferral accounts, the balance in the non-rate base account will be recovered over a ten year period. The recovery of the balance will commence in 2014, with the method of recovery to be determined as a part of the next Revenue Requirement.

6.3.2.2 NGV Conversion Grants

Mainland and Vancouver Island maintain a NGV Conversion Grant Program, as approved by Commission Order No. G-98-99 for FEI and Commission Order No. G-140-09 for FEVI. The NGV Conversion Grant program is not a part of the EEC Program maintained by FEI and FEVI.

The Companies record the actual amount of grants in the NGV Conversion Grants deferral account, and amortize them in rates over five years. Any variances between the forecast level of expenditures and actual expenditure levels will be amortized in rates beginning in 2014.

6.3.2.3 Compliance with Emissions Regulations

The growing number of regulations around emissions trading may result in incremental compliance costs and recoveries during the forecast period. These compliance costs and recoveries are difficult to forecast because of uncertainty around the final form and applicability of emissions trading regulations. Currently, the Emissions Trading Regulation and the Renewable and Low Carbon Fuel Requirements Regulation ("RLCFRR") are two regulatory mechanisms aimed to reduce GHG emissions in BC. These two regulations, as discussed further below, impact us in two ways: 1) we are required to reduce our own operating emissions, and 2) we can sell our credits from renewable energy to other firms or use them to offset excess emissions in other parts of our operations. However, given the uncertainty with these regulations at this point, the Utilities request approval for the rate base Compliance to Emissions Regulations Deferral Account to capture potential compliance costs and revenues collected from credits.

The Emissions Trading Regulation ("Cap and Trade" regulation), currently in the process of being discussed with partners in the Western Climate Initiative, is proposed to start in 2012, but is yet to be legislated. The past year has raised doubts in terms of global negotiations over climate change and carbon markets, including emission trading schemes. The U.S. has failed to move forward its plans for cap and trade at the federal level for the foreseeable future. California is planning to launch its own state program in 2012 and other Canadian and U.S. jurisdictions were planning to follow. However, a recent California judge ruled that California did not adequately consider alternatives to its plan to create a cap-and-trade market for carbon emissions, a setback for the most aggressive effort by a state to combat climate change. This ruling placed California's global warming and climate change program on hold and brings into question whether the California cap-and-trade system will start on time in January 2012. Furthermore, our Province's approach to emissions trading is still questionable, especially given the recent changes in our political landscape. BC has reportedly stated that, although the legislative framework is in place to be ready for 2012 implementation of cap and trade, the timing remains subject to provincial government decision. BC's new Environment Minister, Terry Lake, recently announced that Premier Christy Clark needs to re-evaluate the cap-and-trade proposal to ensure it wouldn't undermine the province's competitiveness.

The cap-and-trade regulations may apply to the Utilities' operating emissions, requiring the Utilities to comply with the requirements. There are financial impacts associated with complying with cap-and-trade regulation, including purchasing allowances and offsets, or making internal reductions to meet targets. The Utilities have processes and controls in place for capturing, measuring, and reporting GHG emissions and have worked towards a carbon management strategy, including steps to reduce operating emissions, which will help achieve compliance with the potential cap-and-trade regulation. However, there is uncertainty regarding the final form of the cap-and-trade regulation that is well suited to a deferral account mechanism. Some of the key concerns and uncertainties associated with cap and trade are as follows:

- Baseline and emissions targets;
- Treatments of fugitives and vented emissions (including third party damages);
- Approach to distribution of allowances;
- Limitation on use of offsets – potential that no more than 49 percent of emission reductions may come from offsets; and
- Carbon price - potential of $30 per tonne.

The Province of BC has also legislated the RLCFRR, which addresses the transportation sector's contribution to GHG emissions in BC. Starting in 2011, Part 3 fuel suppliers will have to meet annual targets, or pay a penalty. Natural gas, propane, electricity and hydrogen are Part 3 fuels if they are sold for use in transportation. *"A Part 2 or Part 3 fuel supplier who manufactures fuel in British Columbia for the first time or imports fuel into British Columbia for the first time, or uses it for the first time, is responsible for compliance unless there is a written agreement stating otherwise."*

Since we sell natural gas for transportation under various rate classes, we have the opportunity to claim first sale as a 'Part 3' fuel supplier in the Province. This regulation allows for emissions credits and obligations based on required carbon intensity baseline. Those suppliers who are not in compliance with the mandated reductions in carbon will have to purchase credits from others or pay a penalty of $200/tonne for deficiencies. As we add more CNG and LNG sales, our credits will continue to increase as it is measured against the conventional fuel intensity baseline, which creates a potential revenue stream for us, benefiting our customers.

As a result of the above-mentioned concerns and uncertainties, it is difficult to forecast associated costs and revenues with cap and trade and RLCFRR regulations, and we request a deferral account to capture both compliance costs, and revenues collected associated with these regulations. For purposes of the 2012 and 2013 revenue requirement, additions to this account have not been forecast and the amortization of any balance that accumulates in this account will be addressed in a future revenue requirement application.

6.3.2.4 2010-2011 Biomethane Program Costs

In accordance with Commission Order No. G-194-10, FEI has created a non-rate base deferral account attracting AFUDC to capture the biomethane costs applicable to all customers incurred prior to January 1, 2012. Commencing January 1, 2012, this account is transferred to rate base and is amortized through delivery rates over a three year period. The 2010 and 2011 costs captured in the deferral account include:

1. The 2010 and 2011 cost of service value related to the assets that are being transferred to Rate Base in 2012 – i.e. Earned Return, Depreciation Provision, and Income Tax; and
2. O&M expenditures (net of tax), consisting of the costs of upgrading the CWLP system to allow the launch of the Green Gas program and the ongoing costs of updating that tariff information, the costs of CWLP answering informational calls regarding the Green Gas program and other planned Customer Education costs and the cost of one FTE to administer the Green Gas program. Additionally, FEI has included the BCUC application costs incurred in support of the Biomethane Application filed on June 8, 2010.

Any variances between the forecast level of 2011 expenditures and actual expenditure levels will be amortized in rates beginning in 2014. Delivery system-related Capital and O&M costs incurred after December 31, 2011 have been forecast as part of this Application and will not be included in this deferral account.

Please refer to Appendix J for a comprehensive report on the biomethane program and details regarding the balance of all deferral accounts associated with biomethane.

6.3.2.5 2011 CNG and LNG Service Costs and Recoveries

In the recent CNG and LNG Service Application, FEI requested approval for a non-rate base deferral account attracting AFUDC to capture the O&M costs and cost of service associated with the capital additions to the delivery system incurred and the CNG and LNG Service recoveries received prior to January 1, 2012, and to recover or refund the balance to all non-bypass customers by amortizing the balance through delivery rates commencing January 1, 2012 over a three year period. FEI has captured the forecast costs and revenues associated with the Waste Management Fueling Station agreement, as well as two additional fueling station agreements which are anticipated to be in-service in 2011, in this non-rate base deferral account, and has transferred the projected balance to rate base January 1, 2012 with three year amortization. Any variances between the forecast level of 2011 expenditures and revenues and actual expenditure and revenue levels will be amortized in rates beginning in 2014. CNG and LNG Service costs and recoveries incurred after December 31, 2011 are embedded in this Application and used in the determination of the revenue requirements for 2012 and 2013.

The forecasts made in relation NGV refuelling infrastructure in the 2012-2013 RRA are premised on the assumption that the CNG and LNG Service Application will be approved as filed. Further, it is also based on the premise that the EEC incentives for natural gas for Transportation will continue. If necessary, FEI will file an evidentiary update to this application to take into account the Commission's Decision on the CNG and LNG Service Application once it is available.

Please refer to Appendix I for a comprehensive report on the CNG and LNG Fueling Program and details regarding the balance of all deferral accounts associated with the program.

6.3.2.6 CNG and LNG Service Costs and Recoveries

In its recent CNG and LNG Service Application dated December 1, 2010, FEI requested approval for an ongoing rate base deferral account to capture incremental CNG and LNG fueling station recoveries received from fueling station volumes in excess of the minimum contract demand. In this Application, FEI is seeking approval to expand this account to include variations from the revenue forecast pertaining to Rate Schedule 16 of $2.9 million in 2012 and $4.4 million in 2013. FEI believes that a deferral account is appropriate because Rate Schedule 16 is a relatively new rate schedule and at the time of this filing we have no customers using this service. It is expected that Vedder Transportation will be the first customers to use this Rate Schedule beginning in the second half of 2011. While FEI believes its CNG and LNG forecasts to be reasonable, FEI believes that both the customer and the shareholder should be kept whole with respect to Rate Schedule 16 and fuelling station recoveries for CNG and LNG Service and that a deferral account mechanism is appropriate, at least for the 2012 and 2013 forecast period.

Additions to this account over the forecast period will be recovered from or refunded to all non-bypass customers beginning in 2014. Please refer to Appendix I for a comprehensive report on the CNG and LNG Fueling Program.

6.3.3 NON-CONTROLLABLE DEFERRAL ACCOUNT ITEMS

The Utilities have included the following previously approved and new Non-Controllable Items deferrals in rate base for 2012 and 2013 as shown in Table 6.3-8. As discussed in Section 3, Vancouver Island is seeking approval for the continuation of the RSDA for the 2012 and 2013 forecast period. In the absence of the RSDA, Vancouver Island would seek approval of Non-Controllable Item deferral accounts similar to those employed in Mainland, Whistler and Fort Nelson.

Table 6.3-8: Non-Controllable Item Deferral Accounts[137]

2012 Forecast, Mid Year Balance, ($ thousands)					
Non-Controllable Items Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
Property Tax Deferral	$ (1,339)	$ -	$ 80	$ (2)	$ (1,262)

Tax Variance Account	-	-	-	-	-
Vancouver Island HST Implementation	-	-	-	-	-
Olympic Security Costs	94	22	(2)	-	114
IFRS Conversion Costs	128	13	2	-	143
Customer Service Variance Account	-	-	-	-	-
Vancouver Island Joint Venture Litigation Costs	-	-	-	-	-
Total Mid Year Balance, Non-Controllable Items Deferrals	**$ 2,259**	**$ 35**	**$ 50**	**$ (2)**	**$ 2,342**

6.3.3.1 Property Tax Deferral

The Company has limited ability to influence property taxes, which are imposed by municipalities and other levels of government, and are influenced by assessed property values, mill rates, and shortfalls in other areas within a municipal boundary. A significant portion of property taxes is tied to the amount of revenues collected within municipalities ("1 percent in lieu" tax), and fluctuates with commodity-related variations in revenues. Mainland, Whistler and Fort Nelson will continue to defer the variance between actual and forecast property taxes, as most recently approved by Commission Order No. G–51-03 for FEI, Commission Order No. G-35-09 for Whistler and Commission Order No. G-27-11 for Fort Nelson. Any variances in amounts forecast will be amortized in rates starting in 2014.

---

[137] Section 7.1 to 7.4, Schedule 68 and 70

With this Application, Whistler is requesting to include the balance of its existing Propane Plant Property Tax Deferral account (forecast December 31, 2011 balance of $101 thousand) into its Property Tax Deferral account. Also, for consistency with the approved amortization period for the Mainland, both Whistler and Fort Nelson request approval to amortize their deferral account balances in rates over a three year period, rather than the currently approved amortization period of one year.

6.3.3.2 Insurance Variance

Insurance costs may differ significantly from the levels forecast, due to changes in economic factors and natural disasters outside of the control of the Companies. The impact of these types of events cannot be incorporated in insurance premium forecasts. A deferral account for these variances with amortization over a one year period was approved by Commission Order No. G-51-03 for Mainland and Commission Order No. G-2-03 for Vancouver Island. The Companies have continued with this account and treatment. Any variances from amounts forecast will be amortized in rates in 2014.

6.3.3.3 Pension and OPEB Variance

A deferral account for pension and OPEB variances was approved by Commission Order No. G-51-03 and No. G-141-09 for Mainland and Commission Order No. G-2-03 for Vancouver Island. Volatility in the accounting expense related to both pension and OPEB costs is likely to continue. It is therefore critical that variations from forecast are captured in a deferral account, both to avoid large fluctuations in recovered amounts from year to year, and to allow for the uncontrollable nature of these costs. The Utilities will continue this deferral account treatment for pensions and OPEB costs, with amortization over a three year period. Any variances from amounts forecast will be amortized in rates starting in 2014.

The significant additions to this account in 2011 are due to the deferral of the adoption date to IFRS. At the time that delivery rates were approved for 2011, the IFRS adoption date was January 1, 2011, and therefore pension and OPEB expenses were forecast under IFRS for 2011. With the adoption date deferred to January 1, 2012, the Companies continued to record their pension and OPEB expense in 2011 under Canadian GAAP. As a result, the difference between the approved IFRS expense and the actual Canadian GAAP expense for 2011 was captured in the Pension and OPEB Variance account.

6.3.3.4 BCUC Levies Variance

Variations in BCUC levies from those recovered in rates were approved for deferral account treatment by Commission Order No. G-112-04 for Mainland and Commission Order No. G-140-09 for Vancouver Island, with amortization in the following year. The account recognizes that the amount of funding that the Commission requires is dependent on a number of factors that are outside the control of the Utilities. Any variances from amounts forecast will be amortized in rates in 2014.

6.3.3.5 Interest Variance

The Interest Variance deferral account allows the Mainland, Whistler and Fort Nelson to avoid potential gains or losses on forecasting of interest rates. This account captures the impact on interest expense of interest rates variances and variances in the timing of long-term debt issues, as compared to forecast. In Fort Nelson, this account captures the Fort Nelson portion of the Mainland deferred interest account. This deferral was previously approved by Commission Order No. G-7-03 for Mainland with amortization in rates over three years and by Commission Order No. G-35-09 for Whistler and Commission Order No. G-147-09 for Fort Nelson, with amortization over one year in both utilities.

In this Application, Whistler and Fort Nelson are seeking approval to change the amortization period from one year to three years for consistency with Mainland. Any variances from amounts forecast will be accumulated and amortized in rates starting in 2014.

6.3.3.6 Tax Variance Account

At any time, the Companies can face changes in tax laws or accepted assessing practices in respect of Federal income tax, Provincial income tax, Provincial sales taxes or any other tax that may be imposed. As such, Mainland and Whistler will continue to capture the impact of changes in tax laws or accepted assessing practices, audit reassessments in respect of any tax year, and impacts on taxes of changes in accounting policies at Federal, Provincial, Municipal or any other level of jurisdiction. This deferral was previously approved by Commission Order No. G-141-09 for Mainland, with amortization over one year. In Whistler, this account was approved by Commission Order No. G-138-10; however, an amortization period was not determined. Whistler believes that an amortization period consistent with Mainland is appropriate for this account and is seeking approval in this Application for amortization over a one year period.

For purposes of the 2012 and 2013 revenue requirement, additions to this account have not been forecast and any variances will be accumulated and amortized in rates starting in 2014. Additions to the Tax Variance Account in 2010 and 2011 were as a result of a change in the tax treatment of removal costs, the impact of the transition to HST and costs incurred in Mainland associated with the LILO reassessment. These additions are described further below.

2010 AND 2011 REMOVAL COST BENEFITS

As discussed in Section 5.6.6.2, during 2010, the Companies determined that it is reasonable to deduct removal costs in the year incurred for income tax purposes. Mainland and Whistler have deferred the tax benefits, as shown in Table 6.3-8, relating to the 2010 tax deduction and will do the same for 2011. The analysis to support the deduction of these benefits was not completed in time to include them in rates for 2010 and 2011. The Vancouver Island removal cost benefits in 2010 and 2011 are captured in the Vancouver Island RSDA.

Table 6.3-9: Removal Cost Tax Benefits Returned Through the Tax Variance Account and RSDA

($ thousands) **Utility/Region**	**Actual 2010**	**Forecast 2011**
Mainland	$ 2,291	$ 2,992
Vancouver Island	98	98
Whistler	1	1
Total	**$ 2,390**	**$ 3,091**

2010 AND 2011 HST TRANSITION IMPACT

In an Application filed with the BCUC on September 27, 2010, the FEU proposed that the 2010 and 2011 revenue requirement impacts of the implementation of HST be recorded in the applicable Tax Variance Deferral Accounts and returned to customers as part of the 2012 Revenue Requirements filings. The addition to the Mainland deferral account over the two year period is a net benefit to customers of $1.3 million (net of tax). The net impact to Whistler is nil because the benefit of the Social Services Tax savings of $2 thousand is fully offset by HST implementation costs of $2 thousand.

MAINLAND LILO REASSESSMENT

FEI received approval through Commission Order No. G-141-09 for a non-rate base deferral account to record potential payments to CRA and legal costs associated with a LILO agreement tax reassessment. This matter was successfully resolved in favour of customers in early 2011 and as a result, FEI incurred legal costs of $52 thousand in 2010. Due to the nature of the costs and their size, FEI is seeking approval to discontinue the LILO Reassessment non-rate base account and to include the LILO reassessment costs in the Tax Variance Account instead.

6.3.3.7 Vancouver Island HST Implementation

In accordance with the proposed treatment of the impact of the HST transition and as indicated in the letter filed with the Commission on September 27, 2010, Vancouver Island has captured the revenue requirement impact of the HST transition in 2010 and 2011, net of implementation costs in an HST Implementation deferral account. The December 31, 2011 closing balance in this account is $133 thousand, net of tax. In this Application, Vancouver Island is seeking approval for this account and to refund the forecast December 31, 2011 closing balance to customers in rates over a one year period.

6.3.3.8 Olympic Security Costs

The security costs related to the 2010 Olympic and Paralympic games, approved for deferral treatment by Commission Order No. G-191-08, with an allocation to Vancouver Island and

Whistler based on average customers, have been amortized over three years commencing in 2011. This account is forecast to be fully amortized by December 31, 2013.

6.3.3.9 IFRS Implementation Costs

The costs associated with the conversion to IFRS, approved for deferral treatment by Commission Order No. G-191-08, with an allocation to Vancouver Island and Whistler based on average customers, have been amortized over three years commencing in 2011. The account is expected to be fully amortized by December 31, 2013. The FEU believe that these costs should be recovered from customers as previously approved, despite the planned adoption of US GAAP by the Utilities. While these costs were incurred as part of the planned transition to IFRS, there has been a great deal of value obtained from the knowledge gained and the system changes implemented as a result that will continue to provide value despite the fact that IFRS conversion will not be completed. Some of the costs incurred to date have resulted from the FEU involvement in industry initiatives aimed at achieving IFRS changes that would have allowed for the recognition of regulated assets and liabilities, and in doing so would have eliminated the current necessity to adopt US GAAP as opposed to IFRS. The costs already incurred for IFRS have also assisted in establishing fact patterns and identifying accounting differences, and may be used to address future accounting changes. Many of these costs also support the adoption of US GAAP and any convergence that will likely continue to occur between US GAAP and IFRS.

6.3.3.10 Customer Service Variance Account

In 2012 and 2013, the Customer Service department will be faced with business uncertainties as discussed in detail in Section 5.3.7 and the Companies are requesting a deferral account to capture actual expenditures that differ from the forecast 2012 and 2013 O&M expenditure levels for the ongoing operating costs of the in-sourced activities, as outlined in Table 5.3-32. The types of uncertainties that the deferral account will address include fluctuations in call volumes, the rate of customer adoption of new communication channels and self serve options being offered, the stabilization of the new CIS and its impact on the end to end business processes, and any variances in the anticipated duration required for new staff to become skilled and proficient at their responsibilities.

The variance account will also capture spending variances in meter reading costs primarily due to the timing of BC Hydro's Smart Metering Initiative and its impact on joint gas/electric meter reads in 2012 and the uncertainty of costs in 2013, as an outsourced provider has yet to be confirmed since BCH will not require large scale manual meter reading service at that time. For purposes of the 2012 and 2013 revenue requirement, additions to this account have not been forecast and the disposition of any balance that accumulates in this account will be addressed in a future revenue requirement application.

6.3.3.11 Vancouver Island Joint Venture Litigation Costs Account

In this Application, Vancouver Island is seeking approval for a deferral account to capture the legal costs of $130 thousand incurred defending a lawsuit filed by the Vancouver Island Gas Joint Venture (VIGJV). This lawsuit was dismissed in January 2010. The basis of this lawsuit was alleged overpayment of past tolls and declarations for reduction of future tolls. Had the VIJV been successful in their claim, it would have likely resulted in additional costs and a reallocation of cost of service for all other customers. Vancouver Island is seeking approval to amortize this account through delivery rates in 2012.

6.3.4 DEFERRED COSTS OF APPLICATIONS

The Utilities have included the following previously approved and new deferrals related to costs of filing regulatory applications in rate base for 2012 and 2013:

Table 6.3-10: Approved and Forecast Application Cost Accounts[138]

2012 Forecast, Mid Year Balance, ($ thousands)					
Application Costs Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
2009 ROE & Cost of Capital Application	$ 582	$ 34	$ 4	$ -	$ 621
2010-2011 Revenue Requirement Application	(82)	-	132	-	50
2012-2013 Revenue Requirement Application	654	70	7	3	734
CCE CPCN Application	178	17	2	-	197
NGV for Transportation Application	123	-	-	-	123
Victoria Regional Office CPCN	-	35	-	-	35
Long Term Resource Plan Application	144	16	2	-	162
Total Mid Year Balance, Application Costs Deferrals	**$ 1,600**	**$ 172**	**$ 147**	**$ 3**	**$ 1,921**

2013 Forecast, Mid Year Balance, ($ thousands)					
Application Costs Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
2009 ROE & Cost of Capital Application	$ 414	$ 20	$ 3	$ -	$ 437
2010-2011 Revenue Requirement Application	-	-	-	-	-
2012-2013 Revenue Requirement Application	218	23	2	1	245
CCE CPCN Application	122	11	1	-	134
NGV for Transportation Application	74	-	-	-	74
Victoria Regional Office CPCN	-	-	-	-	-
Long Term Resource Plan Application	159	18	3	-	180
Total Mid Year Balance, Application Costs Deferrals	**$ 986**	**$ 72**	**$ 9**	**$ 1**	**$ 1,068**

6.3.4.1 Revenue Requirements and Long Term Resource Plan

FEI will incur costs in 2011 and 2012 to prepare various recurring applications such as the current Revenue Requirement Application and the Long Term Resource Plans. Costs incurred

[138] Section 7.1 to 7.4, Schedule 69 and 71

consist of legal fees, costs for expert witnesses and consultants, costs related to independent validation of study results, intervener and participant funding costs, Commission costs, required public notifications, and miscellaneous facilities, stationery and supplies costs. FEI is proposing to allocate 10 percent of these costs to Vancouver Island and 1 percent of these costs to Whistler, based on number of customers. Consistent with past practice, FEI proposes to defer the costs incurred in 2011 for recovery over 2012 and 2013 for the Revenue Requirement Application, and over two years beginning in 2013 for the Long Term Resource Plan application costs. Any variances between the forecast account balances and the actual incurred costs will be amortization in rates starting in 2014.

The application cost deferral accounts pertaining to the 2010 and 2011 Revenue Requirements, the 2009 ROE and Cost of Capital and the CCE CPCN were approved by Commission Order No. G-141-09 for Mainland, Commission Order No. G-140-09 for Vancouver Island and Commission Order No.138-10 for Whistler and Commission Order No. G-27-11 for Fort Nelson. The 2010 and 2011 revenue requirement application costs are expected to be fully amortized by December 31, 2012 for Mainland, Vancouver Island and Whistler. The 2009 ROE and Cost of Capital and CCE CPCN costs have been amortized over five years in all of the Utilities and are expected to be fully amortized by December 31, 2014.

6.3.4.2 NGV for Transportation Application

In the NGV Application filed on December 1, 2010, FEI requested approval for a non-rate base deferral account attracting AFUDC to capture the NGV Fueling Service Application costs incurred in 2010 and 2011 and to recover these costs from all non-bypass customers by transferring the account to rate base and amortizing the balance through delivery rates commencing January 1, 2012 over a three year period. For purposes of determining its 2012 and 2013 revenue requirements, FEI has included this account and its amortization. Any variances between the forecast account balances and the actual incurred costs will be amortization in rates starting in 2014.

6.3.4.3 Victoria Regional Centre CPCN

In accordance with Commission Order No. C-6-11, FEVI has captured application costs associated with the Victoria Regional Office Facility CPCN incurred in 2010 and 2011, in a deferral account. In this Application, FEVI is seeking approval to amortize the balance through rates in 2012. Any variances between the forecast account balances and the actual incurred costs will be amortization in rates starting in 2014.

6.3.5 OTHER DEFERRAL ACCOUNTS

The Utilities have included the following previously approved and new deferrals in rate base for 2012 and 2013:

Table 6.3-11: Balance in Other Deferrals Largely Due to Whistler Conversion[139]

2012 Forecast, Mid Year Balance, ($ thousands)					
Other Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**

6.3.5.1 Whistler Pipeline and Conversion Costs

Pursuant to Commission Order No. G-53-06, Commission Order No. G-35-09 and Commission Order No. G-138-10, Whistler maintains four deferral accounts related to pipeline and conversion costs that began amortizing in delivery rates effective January 1, 2010, over a 20 year period. No further additions will occur to these accounts.

For presentation purposes[140], Whistler has summarized the pipeline and conversion cost accounts into one account as shown in Table 6.3-12.

[139] Section 7.1 to 7.4, Schedule 69 and 71
[140] Whistler will continue to maintain the five deferral accounts related to pipeline and conversion costs separately

Table 6.3-12: Whistler Pipeline and Conversion Cost Accounts Summarized

Deferral Account, ($ thousands)	2012 Mid Year Balance	Annual Amortization	Amortization Years	Account Description
Natural Gas Pipeline Development Costs	$ 1,651	$ (94)	20	Project development costs
Decommissioning of Propane Assets	4,068	(232)	20	NBV of the propane assets (net of the land sold)
Capital Gain on Sale of Propane Land	(466)	27	20	Gain on the sale of the land
Direct Customer Appliance Conversion Costs	7,665	(441)	20	Appliance conversion costs
Whistler Pipeline and Conversion Costs	$ 12,918	$ (740)		

6.3.5.2 Whistler Capital Contribution to Vancouver Island

To the extent that FEW toll revenues are less than the marginal cost of service of the Whistler Pipeline, FEW is required to make a Capital Contribution to FEVI to leave the existing FEVI customers unaffected by the construction of the Whistler Pipeline. As per Commission Orders No. G-53-06, G-76-06, G-35-09 and G-138-10, the contribution amount is to be determined upon the completion of the Whistler Pipeline and the determination of final pipeline costs. The contribution is amortized in Whistler delivery rates over 50 years, commencing January 1, 2010. In accordance with Commission Order No. G-138-10, amortization based on a forecast capital contribution of $17.0 million was included in the interim 2010 and 2011 Whistler delivery rates.

As of the filing date of this Application, the determination of final pipeline costs remains outstanding. In this Application, FEW has estimated the final amount of the contribution at $14.6 million and has adjusted the January 1, 2012 opening balance in the deferral account accordingly. The impact of the approximate $2.5 million variance between the contribution of $14.6 million and the contribution of $17.0 million included in the 2010 and 2011 delivery rates is captured in the Pipeline Contribution Costs Variance Account discussed below.

6.3.5.3 Pipeline Contribution Costs Variance Account

On April 14th, 2011, FEW submitted an Application for Permanent Rates for 2010 and 2011, where it proposed the creation of a rate-base deferral account, entitled “Pipeline Contribution Cost Variance Deferral Account” to record any differences between:

a) the cost of service from April of 2009 to December 31, 2011, associated with the Pipeline Contribution that is included in the calculation of the interim rates ($17.034 million); and

b) the cost of service from April of 2009 to December 31, 2011 associated with the final Pipeline Contribution amount ($14.550 million).

On April 21, 2011, the Commission approved the creation of the deferral account in Order No. G-71-11. The forecast balance in this account is amortized in delivery rates over one year, commencing January 1, 2012. Differences, if any, in cost of service for 2010 and 2011 resulting from the final determination of the actual Pipeline Contribution when known will be captured in this deferral account, for disposition in a future revenue requirements application.

6.3.5.4 Pension and OPEB Funding

This account records the difference between amounts funded by ratepayers for pension and OPEB and amounts actually paid out by the Company in a deferral account, on a net of tax basis. Amounts funded by ratepayers through both pension and OPEBs through the collection of actuarially-determined expense amounts in rates, but not yet paid out by the Company, should be included in deferrals and be a component of rate base. It also follows that any amounts funded by the Company in advance of being funded by ratepayers would also be included in a rate base deferral.

This treatment was approved by Commission Order No. G-135-99 and Commission Order No. G-141-09 for Mainland and by Commission Order No. G-140-09 for Vancouver Island.

6.3.5.5 Deferred Removal Costs

In accordance with Commission Order No. G-141-09 for Mainland, Commission Order No. G-140-09 for Vancouver Island, Commission Order No. G-138-10 for Whistler and Commission Order No. G-27-11 for Fort Nelson, the Companies removed the provision for net negative salvage from depreciation estimates and included a forecast of the actual amount of net removal costs in the 2010 and 2011 cost of service.

As agreed upon, for 2010 and 2011, the Deferred Removal Cost account was set up to capture any variances between the actual amount of net removal costs realized and the estimated amounts included in the cost of service. As discussed in Section 5.6.6.2, the Companies determined that it is reasonable to deduct removal costs in the year incurred for income tax purposes and accordingly have recorded this account on a net of tax basis. The amount accumulated in this account was to be recovered from or returned to customers through rates in 2012; however, due to the magnitude of the balances the Companies believe that two years is an appropriate amortization period for this account and accordingly, are seeking approval to amortize the balance in delivery rates over 2 years, beginning January 1, 2012.

6.3.5.6 Gains and Losses on Asset Disposition

IFRS require that gains and losses on disposal of assets be recognized in the income statement. As approved by Commission Order No. G-141-09 for Mainland, Commission Order No. G-140-09 for Vancouver Island and Commission Order No. G-138-10 for Whistler, the Companies will continue to defer the amount of these gains and losses during the term of this Application, for recovery in future years. The Companies do not forecast gains or losses on asset disposals; however, we request Commission approval for any gains and losses incurred during 2012 and 2013 to be included in this rate base deferral account, consistent with the treatment in 2010 and 2011.

In this Application the Companies are seeking approval to transfer the general plant gains and losses as at January 1, 2010 from the IFRS Transitional account into the Gains and Losses on

Asset Disposition account and to amortize the total balance in this account in delivery rates over 20 years, aligned with the average service life of the asset categories that are contributing to the losses.

6.3.5.7 IFRS Transitional Adjustments

In their 2010-2011 RRAs, the Utilities had forecast the adoption of IFRS in 2011. Under IFRS there is a one-time reset of the net pension asset/liabilities, resulting in any unamortized actuarial losses, past service cost and transitional obligations being recognized in retained earnings. Consistent with the approved treatment in the 2010-2011 RRAs, the Utilities have recorded this one-time adjustment in the IFRS Transitional Deferral Account, but due to the one-year deferral of adoption of IFRS, the entry has been made as of January 1, 2012 instead of January 1, 2011 as originally forecast. Table 6.3.13 below shows the composition of this entry for the Mainland and Vancouver Island.

Table 6.3-13: Pension and OPEB Transitional Adjustment on Adoption of IFRS

($ thousands)

	Transitional Amount			EARSL	
	Pension	OPEB	Total	Pension	OPEB
Mainland- M&E Legacy Plan	$ 19,470			6	
Mainland- M&E TI Plan	(1,202)			11	
Mainland- Cope and IBEW Plan	31,514			10	
Mainland	49,782	13,024	62,806		13
Vancouver Island	8,078	4,247	12,325	13	14
FortisBC Energy Utilities	$ 57,860	$ 17,271	$ 75,131		

The Utilities have considered alternative methods to amortize this IFRS Transitional Adjustment into delivery rates. We have selected the expected average remaining service life ("EARSL") by plan, to amortize this obligation over, since it results in a similar total expense to what would have been recorded under Canadian GAAP. These amounts have been included in amortization expense in the calculation of the cost of service. The status of transitioning to IFRS is addressed in Section 3.2.1 along with any deferral account impacts.

6.3.5.8 PCEC Start Up Costs

The PCEC Start Up Costs deferral includes the unrecovered balance of the original amount of pre-start up costs of $1,754,000 incurred by PCEC to operate a portion of the Vancouver Island pipeline facilities for several months prior to the "in-service" date of October 1, 1991. Vancouver Island began amortizing these costs over 40 years on October 1, 1994 in accordance with the Binding Agreement.

6.3.5.9 2010-2011 Customer Service O&M and Cost of Service

Pursuant to Commission Order No. C-1-10, Commission Order No. G-23-10 and Commission Order No. G-141-09, FEI has transferred the Customer Care Enhancement Project non-rate base deferral account to rate base effective January 1, 2012. This account captures the costs associated with the Project incurred prior to the project implementation and go live date of January 1, 2012 in addition to project costs expected to be incurred in the early months of 2012.[141] In this application FEI is seeking approval to allocate the balance in this deferral account amongst the FortisBC Energy Utilities on the basis of average customers, resulting in an allocation of 89 percent to Mainland, 10 percent to Vancouver Island and 1 percent to Whistler. The Companies are seeking approval to amortize this account in delivery rates over eight years, the same amortization period that was used in the CCE Project CPCN Application.

6.3.5.10 2011 Kootenay River Crossing Cost of Service

As approved by Commission Order No. C-9-10, FEI has transferred the Kootenay River Crossing Cost of Service non-rate base account to rate base effective January 1, 2012. This account captures the October through December 2011 cost of service related to the plant in service, consisting of depreciation expense, income taxes and earned return and is amortized in delivery rates over a three year period commencing January 1, 2012. Any variances between the forecast account balances and the actual incurred costs will be amortized in rates starting in 2014.

6.3.5.11 Gas Asset Records Project

Governments, Regulators, codes, and best practices have always required that pipeline operators collect, retain and manage records pertaining to their gas system assets. Due to more recent events and resulting public pressure, more stringent requirements have been put in place related to the collection, retention and management of gas system asset records. Along with industry, the FEU must continue to invest to ensure we meet the gas system records collection, retention and management requirements of the codes, regulations and standards that govern our business. The paragraphs that follow provide a summary of what is driving our specific records related actions, what steps we have taken in the last few years, and what we still need to do.

At this time, there are four key external drivers that are prompting the FEU to pursue more rigorous actions with their gas system records. First, on January 17, 2011, The OGC issued a Safety Advisory informing all pipeline operators in BC of their requirements under CSA Z662-07 with respect to records. The Advisory states that;

[141] The approved project costs as per Commission Order No. C-1-10 and Commission Order No. G-23-10 include deferred O&M of approximately $5 million in 2012.

> *In light of the San Bruno incident, the Commission reminds Pipeline Permit Holders that they must develop and maintain records of materials used within their pipeline system as part of their permanent records as per clause 5.7.1 of CSA Z662. The Commission recognizes that over time records may become damaged or lost due to causes beyond the Permit Holder's control. In such instances, the Commission expects that Permit Holders will have plans and programs in place for the management of their pipeline system in the absence of these records as well as programs for reestablishment of the records.*[142]

Second, on the same day, the OGC issued a directive to pipeline operators informing them of the OGC's Integrity Management Programs Self Assessment Protocols and Regulatory Process[143]. Under Section 6 of the Self Assessment form, the following requirement is specified.

> *The permit holder must establish, implement and maintain a records management program encompassing the creation, security, updating, retention, retrieval and deletion of all information and records necessary for the execution of the IMP. Permit holders are required to maintain all records as required within Annex N and within the broader context of CSA Z662. Where records are incomplete due to asset transfers or other reasons, the permit holder should acknowledge this in their self assessment and provide information on how the IMP manages in the absence of these records as well as how these records are being recovered.*[144]

Third, the Association of Professional Engineers of British Columbia ("APEGBC") has recently amended its Bylaws to expand the scope of its quality management clause. The new clause states that:

> *Members and licensees shall establish and maintain documented quality management processes for their practices, which shall include, as a minimum:*
>
> > *(1) retention of complete project documentation which may include, but is not limited to, correspondence, investigations, surveys, reports, data, background information, assessments, designs, specifications, field reviews, testing information, quality assurance documentation, and other engineering and geoscience documents for a minimum period of 10 years*[145]*;*

As seen above, the recent San Bruno gas pipeline explosion in September 2010, has led to a focus on the importance of gas system asset records. Even though the results of the various

---

[142] BC Oil and Gas Commission Safety Advisory 2011-01, January 17, 2011, Records Requirements for Pipelines
[143] BC Oil and Gas Commission Safety Advisory 2011-01, January 17, 2011, Records Requirements for Pipelines
[144] OGC Self Assessment Protocol – Integrity Management Programs for Pipeline Systems; OGC website
[145] http://www.apeg.bc.ca/resource/publications/governancepolicies/documents/bylaws.pdf

investigations and inquiries into the explosion are still pending, it appears that the lack of historical records for the pipeline in question played a key role in the incident.

The FortisBC Energy Utilities have been and will continue to be diligent about the collection, retention and management of gas system records. We have records in various systems, locations and formats dating back to the original construction of our gas systems. Recognizing the challenges presented by such disparate systems, locations and formats, we have been focusing on capturing all of our critical gas system asset compliance records into a formal and rigorous management system. In 2006, we implemented a pilot records project to test a Filenet[146] implementation for gas system asset records. Issues were identified and solutions developed thorough 2007 and 2008. In 2009, we successfully implemented a customized Filenet solution which includes a governance framework, and a sustainment organization for gas system asset compliance records. Gas system asset compliance records resulting from new gas system asset projects continue to be prudently managed in accordance with policy and regulatory requirements. In short, we have been actively pursuing strategic improvements to our collection, retention and management of our gas system records and, as explained below, we intend to continue with these improvements.

In 2010 and early 2011, the FEU undertook a review of and planning for its handling of historic gas system asset compliance records. The 2010/11 review and planning led to the development of three distinct projects which will improve access to records, the integrity of compliance record information, the completeness of existing compliance records, the protection of compliance records, and the retention and disposal of compliance records no longer needed for operational, or other requirements. These projects follow a phased and consistent approach to move historic gas system asset compliance records into Filenet. The historic gas system asset compliance records funding sought for 2012, 2013 and beyond will permit the Utilities to manage historic gas system asset compliance records and provide ready access, authenticity, security and disposition. It will also ensure that compliance records are correctly assigned to the asset and, in the case of drawings, confirm that all appropriate drawings are in place.

To take the collection, retention and management of our gas system asset compliance records to the next level of performance, we are seeking approval for the creation of a deferral account to capture and recover the costs of this project, as outlined in Table 6.3-14 below. The costs to be incurred under this Project are one time in nature and have lasting value for customers, and are more appropriately reflected in a deferral account than through an increase in the base level of O&M. This will allow the Utilities to spread the costs out over a longer period better matching with the period that benefits will be realized.

The project will consist of three distinct components. Project “A” will consolidate and scan or move vital records from various locations (paper and electronic based) into one electronic

[146] FileNet is an IBM software application that we are using for the secure capture, retention and management of gas system asset compliance records.

management system (Filenet). It will be implemented approximately equally over four years (2012 - 2015) using internal resources and an external scanning service. When completed, we will have processed the following records:

1. Pipeline Design Files (60 File Drawers)
2. Offsite Files - Project Files located in Interior offices (200 File Drawers)
3. Iron Mountain Files - Previous Engineers' Files (200 Boxes = 100 File Drawers)
4. Iron Mountain Files - OGC Reconciliation Project Files (30 boxes = 15 File Drawers)
5. Shared Drive - OGC Historic Certificate Files (Vancouver Island)

Project 'B' will review and improve the management and control systems related to engineering drawings management to support ongoing sustainment of a single set of current and as built drawings for assets. The review and improvement in the management and control systems will be undertaken to support the revised OGC and APEGBC requirements.

Project 'C' will review historical drawings to determine the best available complete and current set of drawings for each asset. Under this project we estimate that it will be necessary to index and scan approximately 50,000 hard copy drawings into Filenet, and index and move approximately 100,000 drawings from the shared drive into Filenet. We have taken great care to break this project down into manageable components to achieve a successful outcome.

Table 6.3-14: Forecast Costs for Gas Assets Records Project

	2012	2013	2014	2015
Project 'A' - Consolidate & scan critical Gas System Asset Records into Filenet	1,150,000	1,150,000	1,130,000	400,000
Project 'B' – Implement improved drawing management & control systems	350,000	275,000		
Project 'C' - Review & analyze historical drawings	550,000	870,000	1,050,000	1,400,000
Total	2,000,000	2,250,000	2,150,000	1,400,000

In summary, due to more recent events and resulting public pressure, the actions of Governments, Regulators, and Associations are sending a clear and direct signal to pipeline operators with respect to their gas system asset compliance records. That directive is to ensure that gas system asset compliance records are indeed collected, retained and managed prudently. The FEU has been working diligently for quite some time on the management of our gas system asset compliance records. We introduced the FileNet technology, reviewed and assed the state of our historic records and are now seeking funding to complete the work we started in a timely and systematic manner.

To continue to meet the records management requirements of the codes, regulations and standards that govern our business, we are requesting approval for up to $7.8 million for the four year period ending December 31, 2015 and to manage these costs within the framework of a deferral account mechanism, to be amortized in delivery rates over five years, commencing January 1, 2012. FEU believe that a five year amortization period is appropriate because it mitigates the rate impacts of the costs and generally coincides with the period over which the costs are incurred. The $7.8 million is an estimate of the total project costs; only the actual project costs will be recorded in the deferral account and ultimately recovered from customers. Furthermore, FEI is seeking approval to allocate the balance in this deferral account amongst FortisBC Energy Utilities on the basis of average customers, resulting in an allocation of 89 percent to Mainland, 10 percent to Vancouver Island and 1 percent to Whistler. The 2012 and 2013 forecasts as provided in Table 6.3-14 have been included in the deferral account for the purposes of determining the revenue requirements in this Application.

6.3.5.12 BCOneCall Project

The external environment around BCOneCall has been evolving and shifting since its inception in 1994. The corresponding actions of Government, the Regulator and industry have brought new requirements to the operations of many individual organizations. In response, we have implemented many successful initiatives in the past and we must build on those successes to take the FEU BCOneCall process to the next level of performance. As such, we need to fund a multi-stream project that will automate a portion of the BCOneCall process and allow us to realize significant benefits immediately upon completion of the project. The following sections describe the current state, the future state, the drivers for the project, the scope of work, and the benefits that are forecast to be realized.

Presently, the BCOneCall process is a "manual" process despite the use of software applications and technology. All BCOneCall tickets go through the same rigorous and labour intensive process. Location Records ticket processing staff use various technologies (SAP, AMFM[147], SIA[148], DCRS[149], and TelDig[150]) to identify the location and the nature of the request and then use these technologies to assemble the package of information that is sent to excavators. Even though different applications are involved, the current operating model is manually driven.

In the future, the processing of BCOneCall tickets will be significantly automated as determined by the nature of the request. The various technologies, SAP, AMFM, SIA, DCRS, and TelDig will be integrated and aligned such that they will automatically assemble certain BCOneCall

[147] AMFM is short for Asset Management/Facilities Management and refers to our GIS system.
[148] SIA is short for Service Information Application and is where we store the alpha numeric service data that is used to produce service lists and provide general service information.
[149] DCRS is short for Digitized Construction Records System and is where the actual copy of the service document resides in digital format.
[150] Teldig is the name of the company that provides the software we use for processing BC One Call tickets

packages with little or no human intervention. Following a Quality Assurance (QA)/Quality Control (QC) process, these assembled packages will then be sent to customers. Automation will be maximized and human intervention will be minimized in the new operating model.

The key drivers that influence the decision to proceed with this project at this time are:

- The Utilities have been continuously managing the efficiency and effectiveness of the BCOneCall process and this project is the next major step in that journey. This project will improve our ability to process increasing numbers of BCOneCall tickets more quickly and at a reduced unit cost in a sustainable and scalable manner.
- We expect our ticket volumes to continue to increase at 8 percent - 12 percent per year. Government, the BC Safety Authority, industry and individual organizations (including the FEU) are actively promoting the BCOneCall concept. Activities are in place to increase public and contractor awareness of BCOneCall and the requirement to "Call Before You Dig". The intended impact of these activities is to increase BCOneCall ticket volumes as much as possible and as quickly as possible.
- The current BCOneCall ticket processing operating model is not sustainable or scalable into the future. It is an inefficient model that takes a long time to ramp up production capacity to meet ticket volume demand.
- While we have no control over ticket volumes or their increase, we can control unit costs for processing tickets. As such, our only option is to establish an operating model that minimizes the response time and unit costs through the use of technology and automation.
- We believe that technology, municipal landbase and software integration capacity are at a state where we can achieve some degree of automation after we address key data related issues.

The scope of this project encompasses three streams - Technology, Data Consistency, and Conflation.

The Technology Stream of this project enhances and integrates technologies in a way that enables automatic classification of tickets in order to seamlessly process select groups of tickets. Most of the technology related work is on the AMFM system. Minor enhancements are planned for the SAP, SIA, and DCRS systems to allow them to continue to provide customer information but be more integrated with the other technologies to support the automation. Finally, TelDig is enhanced to perform the automatic assembly and dissemination of processed tickets. The Technology Stream will be completed by mid 2011 and is being funded through our IT capital process. The Technology Stream provides technology enhancements, integrations and process improvements necessary to automate a portion of the BCOneCall ticket process.

The intent of the Data Consistency Stream is to correct identified data inconsistency issues in order to reduce the numbers of exceptions requiring a stop to the BCOneCall process. For example, under this stream, we will ensure that we have consistent asset and customer data in our SIA system for all areas of the Province in order to be able to deploy automation Province wide. Improvement to the consistency of data consumed within the BCOneCall ticket process is one of the foundation elements of automation.

The Conflation Stream will import the most current landbase available for the FEI service territory and shift the FEI gas mains/assets so that they correctly align with this new landbase. This stream of the project is necessary because the gas mains in the AMFM system are attached to a landbase that is about 8 years old and somewhat out of date. Having the most current Municipal landbase is essential to the successful automation of the BCOneCall process.

Technology, consistent data, and current Municipal landbase are foundational to the success of our automation of the BCOneCall process. The Technology Stream is implementing the technology that will enable the automation, while the Data Consistency Stream and Conflation Stream will ensure that we have consistent data and current landbase in our various systems to reduce exceptions to the process.

The BCOneCall Ticket Process Improvement project offers a significant financial benefit that will see a reduction in our long term O&M costs required for processing BCOneCall tickets. The source of this financial benefit is from the direct reduction of the average ticket processing time by up to 34.7 percent as a result of automation. This equates to a decrease in processing time of up to 10.9 minutes (from the current average of 31.5 minutes). This processing time reduction is estimated to result in an average $540 thousand annual sustainable O&M savings per year after 2014 - once the project is fully implemented and stabilized.

Once approved, the project is expected take two and half years to fully implement and to stabilize. We are forecasting a budget of $2.3 million dollars to fund the project as shown in the table below for each of the streams.

Table 6.3-15: BC One Call Ticket Process Improvement Project Costs

($ thousands)

Stream	2012	2013	2014	Total
Technology Stream	$ 96	$ -	$ -	$ 96
Data Consistency Stream	760	510	-	1,270
Conflation Stream	375	375	190	940
Total	**$ 1,231**	**$ 885**	**$ 190**	**$ 2,306**

We are requesting approval to manage these costs within the framework of a deferral account mechanism, to be amortized in delivery rates over five years, commencing January 1, 2012. FEU believe that a five year amortization period is appropriate because it mitigates the rate impacts of the costs and generally coincides with the period over which the costs are incurred. The $2.3 million is an estimate of the total project costs; only the actual project costs will be recorded in the deferral account and ultimately recovered from customers. The costs to be incurred under this Project are one time in nature and have lasting value for customers, and are more appropriately reflected in a deferral account than through an increase in the base level of O&M. This will allow the Utilities to spread the costs out over a longer period better matching with the period that benefits will be realized. Furthermore, FEI is seeking approval to allocate the balance in this deferral account amongst FortisBC Energy Utilities on the basis of average customers, resulting in an allocation of 89 percent to Mainland, 10 percent to Vancouver Island and 1 percent to Whistler. The 2012 and 2013 forecasts as provided in Table 6.3-15 have been included in the deferral account for the purposes of determining the revenue requirements in this Application.

6.3.6 RESIDUAL DEFERRAL ACCOUNTS

The Utilities have included the following previously approved Residual deferrals in rate base for 2012 and 2013:

Table 6.3-16: Forecast 2012 and 2013 Residual Deferral Accounts[151]

2012 Forecast, Mid Year Balance, ($ thousands)					
Residual Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
SCP Tax Reassessment	$ 684	$ -	$ -	$ -	$ 684
Other	(63)	-	(23)	-	(86)
Residual Delivery Rate Riders	89	-	-	-	89
Mid Year Balance, Residual Deferral Accounts	**$ 711**	**$ -**	**$ (23)**	**$ -**	**$ 688**

2013 Forecast, Mid Year Balance, ($ thousands)					
Residual Deferral Accounts	**Mainland**	**Vancouver Island**	**Whistler**	**Fort Nelson**	**Total**
SCP Tax Reassessment	$ 684	$ -	$ -	$ -	$ 684
Other	-	-	-	-	-
Residual Delivery Rate Riders	-	-	-	-	-
Mid Year Balance, Residual Deferral Accounts	**$ 684**	**$ -**	**$ -**	**$ -**	**$ 684**

6.3.6.1 Southern Crossing Pipeline Tax Reassessment

FEI continues to hold an amount for reassessment of PST related to the SCP project in a rate base deferral account, as approved by Commission Orders No. G-160-06 and G-153-07. In 2007, the Province of B.C. reassessed the Company for provincial sales tax related to the SCP project. The Company had made a deposit of $7.043 million in respect of this matter. During 2010, the B.C. Court of Appeal decided the appeal in the Company's favour. In August 2010, the Company received a refund of $7.049 million, representing a refund of the Company's

[151] Section 7.1 to 7.4, Schedule 69 and 71

deposit plus interest of $647 thousand. However, the Province reassessed PST of $641 thousand on a different matter related to the SCP project and reduced the refund by this amount. This reassessment relates to the lease payments made by the Company in respect of pipe and compressor assets of the SCP.

The Company has appealed this reassessment of $641 thousand and if the Company is successful in its appeal, the amount will be refunded. If the Company is unsuccessful, an additional amount of $265 thousand plus interest could be assessed for the period from July 2007 to June 2010 which was not included in the assessment made during 2010.

The balance in the deferral account is comprised of the following amounts:

Table 6.3-17: SCP Reassessment 2012 Opening Account Balance

	($ Million)
Original Assessment	7.043
Legal and consulting fees net of tax	0.505
	7.548
Refund, Original Assessment	(7.043)
Refund, Interest net of tax	(0.462)
	(7.505)
2010 Reassessment	0.641
Opening Balance, 2012	0.684

FEI expects that this issue will be resolved within the 2012 and 2013 forecast period, after which time the Company will seek a Commission order with respect to the disposition of the deferral account.

6.3.6.2 Other

A number of deferral accounts were created for specific purposes during the term of the last RRA and previous PBR periods that are expected to be fully amortized by December 31, 2012. The Companies will be discontinuing the use of the following deferral accounts after the amounts are amortized in 2012.

- Mainland Carbon Tax Cost of Service
- Mainland OSC Certification Compliance
- Whistler Deferred ROE Variance

- Whistler 2009 Revenue Requirement Application Costs

6.3.6.3 Residual Delivery Rate Riders

FEI is seeking approval to combine three residual non-rate base deferral account balances into one account, the Residual Delivery Rate Riders account, and to recover the balance through delivery rates in 2012. The residual balances in the ROE Revenue Requirement Variance Account (Rate Rider 2) and the Lochburn Land Costs and Delivery Rate Refund Rider accounts (both accounts used Rate Rider 4) are a result of volume variances (the actual volumes for recovery of the riders differed from what was forecast). Approved by Commission Order No. G-158-09, delivery Rate Rider 2 captured the 2009 recoveries associated with the 2009 ROE and Capital Structure Decision and applied to all non-bypass customers. Approved by Commission Order No. G-116-07, delivery Rate Rider 4 was in place April 1, 2008 through March 31, 2009 and captured a refund associated with the sale of land at the Lochburn facilities and applied to all non-bypass customers. Approved by Commission Order No. G-23-09, Rate Rider 4 remained in place April 1, 2009 through December 31, 2009 to refund the balance in the Delivery Rate Refund Rider account to all non-bypass customers. The Delivery Rate Refund Rider account resulted from the recalculation of 2009 delivery rates.

6.3.7 SUMMARY OF DEFERRAL ACCOUNTS

The Companies believe that the deferral accounts requested above serve to add value to customers and our shareholder and appropriately address uncontrollable matters and significant non-recurring items.

In this application, the Companies are requesting approval for eight new rate base deferral accounts, the setting of, or modification to, the amortization period of eleven rate base deferral accounts, as well as additional requests or changes to five existing rate base deferral accounts. Table 6.3-18 provides a summary of the request for approvals in this Application related to all rate base deferral accounts.

Table 6.3-18: Summary of 2012 and 2013 Deferral Account Requests

Type of Change	Account	Company	Reference
New Account	Compliance to Emission Regulations	FEU	Section 6.3.2.3; Additions and Amortization period TBD
	Customer Service Variance Account	FEU	Section 6.3.3.10; Additions and Amortization period TBD
	Vancouver Island Joint Venture Litigation Costs	FEVI	Section 6.3.3.11; amortization period of 1 year commencing January 1, 2012

Type of Change	Account	Company	Reference
	2012-2013 Revenue Requirement Application Costs	FEU	Section 6.3.4.1; amortization period of 2 years commencing January 1, 2012, allocated to FEU based on average customers
	Long Term Resource Plan Application Costs	FEU	Section 6.3.4.1; amortization period of 2 years commencing January 1, 2013, allocated to FEU based on average customers
	Gas Assets Records Management Project	FEU	Section 6.3.5.11; amortization period of 5 years commencing January 1, 2012, allocated to FEU based on average customers
	BCOneCall Project	FEU	Section 6.3.5.12; amortization period of 5 years commencing January 1, 2012, allocated to FEU based on average customers
	Residual Delivery Rate Riders	FEI	Section 6.3.6.3; amortization period of 1 year commencing January 1, 2012
Amortization Period Change- New or Modified	Revenue Stabilization Account Mechanism	FEW	Section 6.3.1.3; recovery through Rate Rider 5, 3 year recovery period consistent with FEI and FN, commencing January 1, 2012
	Gas in Storage Interest	FEI	Section 6.3.1.4; 3 year amortization period, commencing January 1, 2012

CALCULATION OF AMORTIZATION OF RSAM (RIDER 5)
FOR THE YEARS ENDING DECEMBER 31, 2012 TO 2013
($000s)

Particulars	2012 Volumes (TJ)	2013 Volumes (TJ)	2012 Amortization ($000s)	2013 Amortization ($000s)	2012 Amortization of RSAM Unit Rider ($/GJ)	2013 Amortization of RSAM Unit Rider ($/GJ)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
RSAM (Rider 5) Calculation						
Schedule 1 - Residential	69,890.0	69,816.4			($0.032)	($0.032)
Schedule 2 - Small Commercial	23,438.1	23,331.9			($0.032)	($0.032)
Schedule 3 - Large Commercial	16,469.5	16,514.8			($0.032)	($0.032)
Schedule 23 - Large Commercial Transportation	7,151.3	7,485.3			($0.032)	($0.032)
	116,948.9	117,148.4	($3,716)	($3,711) [1]		

Note 1: RSAM Rider Change

In 2011, FortisBC Energy forecasts that there will be approximately $-2.1 million (net-of-tax) of RSAM additions. After offsetting the 2011 RSAM Rider recovery, the RSAM account including interest is now projected to be a credit balance of $-8 million on a net-of-tax basis by the end of 2011. The RSAM balance is to be amortized over three years. Accordingly, the net-of-tax RSAM balance to be amortized in each year in 2012 and 2013 is a credit of $-2.8 million. On a pre-tax basis, this amounts to $3.7 million or a refund to the customer of $0.032/GJ in 2012, which is a $0.012 increase from the existing charge of $-0.02/GJ. The corresponding 2013 refund to the customer is $0.032/GJ.

2012 Net-Of-Tax Amortization = 1/3 of Projected December 31, 2011 RSAM Balance
= 1/3 * ($-8,325 RSAM + $-34 RSAM Interest)
= 1/3 * $-8,359
= $-2,786 Net-of-tax amortization

2012 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
= $-2,786 / (1 - 25%)
= $-3,716 Pre-tax amortization

2013 Net-Of-Tax Amortization = 1/2 of Projected December 31, 2012 RSAM Balance
= 1/2 * ($-5,550 RSAM + $-22 RSAM Interest)
= 1/2 * $-5,572
= $-2,786 Net-of-tax amortization

2013 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
= $-2,786 / (1 - 25%)
= $-3,711 Pre-tax amortization

CALCULATION OF AMORTIZATION OF RSAM (RIDER 5)
FOR THE YEARS ENDING DECEMBER 31, 2012 TO 2013
($000s)

Line No.	Particulars	2012 Volumes (TJ)	2013 Volumes (TJ)	2012 Amortization ($000s)	2013 Amortization ($000s)	2012 Amortization of RSAM Unit Rider ($/GJ)	2013 Amortization of RSAM Unit Rider ($/GJ)
	(1)	(2)	(3)	(4)	(5)	(6)	(7)
1	**RSAM (Rider 5) Calculation**						
2							
3	SGS 1/2 RES	236.9	243.6			$0.524	$0.529
4	SGS 1/2 COMM	74.9	85.2			$0.524	$0.529
5	LGS 1	139.6	145.3			$0.524	$0.529
8	LGS 2	122.5	115.7			$0.524	$0.529
9	LGS 3	142.1	118.7			$0.524	$0.529
10							
11		716.0	708.5	$375	$375 (1)		

12
13
14 Note 1: RSAM Rider Change
15
16 In 2011, FortisBC (Whistler) Energy forecasts that there will be approximately $227 thousand (net-of-tax) of RSAM
17 additions. After offsetting the 2011 RSAM Rider recovery, the RSAM account including interest is now projected
18 to be a debit balance of $378 thousand on a net-of-tax basis by the end of 2011. The RSAM balance is to be amortized
19 over three years. Accordingly, the net-of-tax RSAM balance to be amortized in each year in 2012 and 2013 is
20 a debit of $281 thousand and $280 thousand, respectively. On a pre-tax basis, this amounts to $375 thousand, equivalent
21 to a charge to the customer of $0.524/GJ in 2012. The corresponding 2013 charge to the customer is $0.529/GJ."
22
23
24 2012 Net-Of-Tax Amortization = 1/3 of the sum of Projected December 31, 2011 RSAM Balance plus 2012 Opening Balance Adjustment
25 = 1/3 * ($843 RSAM + $-1 RSAM Interest)
26 = 1/3 * $842
27 = $281 Net-of-tax amortization
28
29 2012 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
30 = $281 / (1 - 25%)
31 = $375 Pre-tax amortization
32
33 2013 Net-Of-Tax Amortization = 1/2 of Projected December 31, 2012 RSAM Balance
34 = 1/2 * ($562 RSAM + $-2 RSAM Interest)
35 = 1/2 * $560
36 = $280 Net-of-tax amortization
37
38 2013 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
39 = $280 / (1 - 25%)
40 = $375 Pre-tax amortization

12
13
14 Note 1: RSAM Rider Change
15
16 In 2011, FortisBC Energy forecasts that there will be approximately $-35 thousand (net-of-tax) of RSAM additions.
17 After offsetting the 2011 RSAM Rider recovery, the RSAM account including interest is now projected to be a
18 credit balance of $-16 thousand on a net-of-tax basis by the end of 2011. The RSAM balance is to be amortized
19 over three years. Accordingly, the net-of-tax RSAM balance to be amortized in each year in 2012 and 2013 is
20 a credit of $-5 thousand. On a pre-tax basis, this amounts to $7 thousand or a refund to the customer of $0.011/GJ
21 in 2012, which is a $0.044 reduction from the existing charge of $0.033/GJ. The corresponding 2013 refund to the
22 customer is $0.011/GJ.
23
24 2012 Net-Of-Tax Amortization = 1/3 of Projected December 31, 2011 RSAM Balance
25 = 1/3 * ($-19 RSAM + $3 RSAM Interest)
26 = 1/3 * $-16
27 = $-5 Net-of-tax amortization
28
29 2012 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
30 = $-5 / (1 - 25%)
31 = $-7 Pre-tax amortization
32
33 2013 Net-Of-Tax Amortization = 1/2 of Projected December 31, 2012 RSAM Balance
34 = 1/2 * ($-12 RSAM + $2 RSAM Interest)
35 = 1/2 * $-10
36 = $-5 Net-of-tax amortization
37
38 2013 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
39 = $-5 / (1 - 25%)
40 = $-7 Pre-tax amortization

8 APPROVALS SOUGHT AND PROPOSED REGULATORY PROCESS

8.1 Approvals Sought

ORDER SOUGHT

The Order Sought has, in general, been broken out by company, but also by year (2012 and 2013). The reason for separating the orders for 2012 and 2013 is because some of the orders will be different in 2013 depending on whether amalgamation proceeds. The 2013 rate orders for each utility are thus conditional, as is the request for a consolidated cost of service.

In this Application, the FortisBC Energy Utilities are respectfully seeking an Order or Orders of the Commission granting the following approvals:

INTERIM 2012 RATES FOR FEI, FEVI, FEW AND FORT NELSON

1. Interim approval, pursuant to section 89 of the Act and section 15 of the *Administrative Tribunals Act,* effective January 1, 2012 of the 2012 rates for FEI, FEVI, FEW and Fort Nelson sought in this Application, as a decision on the permanent rates requested is unlikely to be received in time for implementation effective January 1, 2012, with any variance between interim rates and permanent rates to be refunded to or collected from customers by way of a rate rider following the approval of permanent rates.

2012 RATE APPROVALS FOR FEI

2. Approval pursuant to sections 59 to 61 of the Act of permanent delivery rates for FEI for all non-bypass customers effective January 1, 2012, to recover the revenue requirements as described in Section 3.3.1 of the Application, resulting in an increase of 5.0 per cent compared to 2011 delivery rates, with the increase to be applied to the delivery charge, holding the basic charge at 2011 levels.

3. Approval of the Rate Stabilization Adjustment Mechanism ("RSAM") rider for customers served under FEI Rate Schedules 1, 1B, 1S, 1X, 2, 2U, 2X, 3, 3U, 3X and 23 effective January 1, 2012 of ($0.032)/GJ as set out in Section 3.4.3 of the Application. (2013 RSAM rider will be adjusted with the FEI Fourth Quarter 2011 Gas Cost filing.)

4. Approval pursuant to sections 59 to 61 of the Act of the 2012 cost allocation to Thermal Energy Services (formerly Alternative Energy Services) as set out in Section 5.3.18 and Appendix G of the Application.

5. Approval of the continuation of the debiting of the MCRA and crediting of the delivery margin revenue in the amount of $3.6 million per year for the 2012 forecast period as set out in Section 5.5 of the Application.

6. Approval of the change in the allocation between the delivery margin and midstream of the SCP costs and revenues, and of the Spectra Energy Kingsvale South charges related to the NWN capacity as set out in Section 5.5 of the Application.

2012 RATE APPROVALS FOR FEVI

7. Approval pursuant to sections 59 to 61 of the Act and section 2.1 of the Vancouver Island Natural Gas Pipeline Agreement Special Direction ("Special Direction") of permanent rates for FEVI effective January 1, 2012 for Core Market sales and transportation customers, other than customers who have specified rates in their transportation service agreements, at the same level as 2011 rates.

8. Approval pursuant to section 2.10(a)(i) of the Special Direction of FEVI's forecast Cost of Service for 2012 as set out in Section 3.3.2 of the Application.

9. Approval pursuant to section 2.10(a)(i) of the Special Direction of FEVI's forecast capital expenditures for 2012, as set out in Section 6.2 of the Application.

10. Approval pursuant to section 2.10(a)(ii) of the Special Direction of FEVI's forecast revenue for 2012, based on its proposed rates, as set out in Section 4.5.6 of the Application.

11. Approval of the forecast gross O&M expenditures for 2012 of $35.236 million.

12. Approval of the 2012 cost of gas and discontinuation of the quarterly reporting of gas costs for FEVI as set out in Sections 5.2 and 6.3 of the Application.

13. Approval for the difference between the net revenues received and the actual cost of service, excluding O&M variances from forecast, to be allocated to the RSDA, as set out in Section 3.4.2 of the Application.

2012 RATE APPROVALS FOR FEW

14. Approval pursuant to sections 59 to 61 of the Act of permanent delivery rates for FEW for all customers effective January 1, 2012, to recover the requested revenue requirements as described in Section 3.3.3 of the Application, resulting in an increase of 2.2 per cent compared to 2011 delivery rates, with the increase to be applied to the delivery charge, holding the basic charge at 2011 levels.

15. Approval of the RSAM rider for customers served under FEW Rate Schedules SGS 1/2, LGS 1, LGS 2 and LGS 3 effective January 1, 2012 of $0.524/GJ as set out in Section 3.4.3 of the Application. (2013 RSAM rider will be adjusted with the FEW Fourth Quarter 2011 Gas Cost filing.)

2012 RATE APPROVALS FOR FORT NELSON

16. Approval pursuant to sections 59 to 61 of the Act of permanent delivery rates for Fort Nelson customers effective January 1, 2012, to recover the requested revenue requirements as described in Section 3.3.4 of the Application, resulting in an increase of 6.5 per cent compared to 2011 delivery rates, with the increase to be applied to the delivery charge and the minimum monthly service charge.

17. Approval of the RSAM rider for customers served under Fort Nelson Rate Schedules 1, 2.1, 2.2 and 25 effective January 1, 2012 of ($0.011)/GJ as set out in Section 3.4.3 of the Application. (2013 RSAM rider will be adjusted with the Fort Nelson Fourth Quarter 2011 Gas Cost filing.)

2013 RATE APPROVALS BY COMPANY, IN EFFECT UNLESS AMALGAMATION AND HARMONIZED RATES ARE PUT IN PLACE

18. The FortisBC Energy Utilities seek the following orders for the implementation of 2013 rates by utility, which will be in effect unless the following occurs: (i) the amalgamation of the FortisBC Energy Utilities proceeds, having obtained the necessary approvals, and (ii) the Commission, in a future proceeding, fixes harmonized rates for the amalgamated entity:

2013 FEI Rates (Stand Alone Basis - No Amalgamation or Rate Harmonization)

(a) Approval pursuant to sections 59 to 61 of the Act of permanent delivery rates for FEI for all non-bypass customers effective January 1, 2013, to recover the requested revenue requirements as described in Section 3.3.1 of the Application, resulting in an increase of 6.4 per cent compared to 2012 delivery rates, with the increase to be applied to the delivery charge, holding the basic charge at 2011 levels.

(b) Approval pursuant to sections 59 to 61 of the Act of the 2013 cost allocation to the Thermal Energy Services (previously referred to as Alternative Energy Services) customer class as set out in Section 5.3.18 and Appendix G of the Application.

(c) Approval to continue debiting of the MCRA and crediting of the delivery margin revenue in the amount of $3.6 million per year for the 2013 forecast period as set out in Section 5.5 of the Application.

FEVI 2013 Rates (Stand Alone Basis - No Amalgamation or Rate Harmonization)

(d) Approval pursuant to sections 59 to 61 of the Act and section 2.1 of the Special Direction of permanent rates for FEVI effective January 1, 2013 for Core Market sales and transportation customers, other than customers who have specified rates in their transportation service agreements, at the same level as 2011 rates.

(e) Approval pursuant to section 2.10(a)(i) of the Special Direction of FEVI's forecast Cost of Service for 2013 as set out in Section 3.3.2 of the Application.

(f) Approval pursuant to section 2.10(a)(i) of the Special Direction of FEVI's forecast capital expenditures for 2013, as set out in Section 6.2 of the Application.

(g) Approval pursuant to section 2.10(a)(ii) of the Special Direction of FEVI's forecast revenue for 2013, based on its proposed rates, as set out in Section 4.5.6 of the Application.

(h) Approval of the forecast gross O&M expenditures for 2013 of $35.482 million.

(i) Approval of the 2013 cost of gas as set out in Section 5.2 of the Application;

(j) Approval for the difference between the net revenues received and the actual cost of service, excluding O&M variances from forecast, to be allocated to the RSDA, as set out in Section 3.4.2 of the Application.

FEW 2013 Rates (Stand Alone Basis - No Amalgamation or Rate Harmonization)

(k) Approval pursuant to sections 59 to 61 of the Act of permanent delivery rates for FEW for all customers effective January 1, 2013, to recover the requested revenue requirements as described in Section 3.3.3 of the Application, resulting in an increase of 11.9 per cent compared to 2012 delivery rates, with the increase to be applied to the delivery charge, holding the basic charge at 2011 levels.

Fort Nelson 2013 Rates (Stand Alone Basis - No Amalgamation or Rate Harmonization)

(l) Approval pursuant to sections 59 to 61 of the Act of permanent delivery rates for Fort Nelson customers effective January 1, 2013, to recover the requested revenue requirements as described in Section 3.3.4 of the Application, resulting in an increase of 1.6 per cent compared to 2012 delivery rates, with the increase to be applied to the delivery charge and the minimum monthly service charge.

COMBINED COST OF SERVICE AND OTHER ORDERS IN ANTICIPATION OF APPLICATION FOR AMALGAMATION AND HARMONIZED RATES

19. Determination of an amalgamated cost of service for 2013 for FEI, FEVI, FEW and Fort Nelson combined as set out in Section 3.3.5 of the Application, in anticipation of an Amalgamation and Rate Design Phase 'A' Application to be filed in Fall 2011. The determination of the amalgamated cost of service does not in any way pre-determine the merits of any future application by the FEU to address amalgamation and harmonized rates, or the allocation of costs among rate classes or as between delivery rates and the midstream.

20. Approval of a deferral account to capture the costs and savings related to the amalgamation that vary from the forecast of zero for 2013. The approval of this deferral account does not in any way pre-determine the merits of any future application by the FEU to address amalgamation and harmonized rates, or the allocation of costs among rate classes or as between delivery rates and the midstream.

21. Approval to defer the filing of evidence with respect to FEVI and FEW's equity component required by Directive No. 7 of Commission Order G-158-09, to the Amalgamation and Rate Design Phase 'A' Application in Fall 2011 as described in Section 5.7 of the Application.

ANCILLARY RATE APPROVALS FOR FEI, FEVI, FEW AND FORT NELSON

22. Approval of the allocation of costs for corporate services between FortisBC Holdings Inc. and each of FEI, FEVI and FEW, as reflected in the Corporate Services Agreements between FortisBC Energy Holdings Inc. and FEI, FEVI and FEW as described in Section 5.3.18 of the Application.

23. Approval of the allocation of costs for shared services between FEI and FEVI, as described in Section 5.3.18 of the Application.

24. Approval of the allocation of costs for shared services between FEI and FEW, as described in Section 5.3.18 of the Application.

25. Approval to allow for charges between regulated entities to be based on a fully loaded benefits and concessions charge and to not include overheads, including a facilities fee as described in Section 5.3.18 of the Application.

26. Approval of the consolidated Core Market Administration Expense (for FEI, FEVI and FEW), and allocation percentages, as set out in Section 5.2 of the Application.

27. Approval of the discontinuance, modification, and creation of deferral accounts, and the amortization and disposition of balances of deferral accounts, for FEI, FEVI, FEW and

Fort Nelson all as set out in Section 6.2 and Appendix G of the Application and summarized in the following table.

Type of Change	Account	Company	Reference
New Account	Compliance to Emission Regulations	FEU	Section 6.3.2.3; Additions and Amortization period TBD
	Customer Service Variance Account	FEU	Section 6.3.3.10; Additions and Amortization period TBD
	Vancouver Island Joint Venture Litigation Costs	FEVI	Section 6.3.3.11; amortization period of 1 year commencing January 1, 2012
	2012-2013 Revenue Requirement Application Costs	FEU	Section 6.3.4.1; amortization period of 2 years commencing January 1, 2012, allocated to FEU based on average customers
	Long Term Resource Plan Application Costs	FEU	Section 6.3.4.1; amortization period of 2 years commencing January 1, 2013, allocated to FEU based on average customers
	Gas Assets Records Management Project	FEU	Section 6.3.5.11; amortization period of 5 years commencing January 1, 2012, allocated to FEU based on average customers
	BCOneCall Project	FEU	Section 6.3.5.12; amortization period of 5 years commencing January 1, 2012, allocated to FEU based on average customers
	Residual Delivery Rate Riders	FEI	Section 6.3.6.3; amortization period of 1 year commencing January 1, 2012
Amortization Period Change- New or Modified	Revenue Stabilization Account Mechanism	FEW	Section 6.3.1.3; recovery through Rate Rider 5, 3 year recovery period consistent with FEI and FN, commencing January 1, 2012
	Gas in Storage Interest	FEI	Section 6.3.1.4; 3 year amortization period, commencing January 1, 2012

	Tax Variance Account	FEW	Section 6.3.3.6; 1 year amortization period, commencing January 1, 2012
	Vancouver Island HST Implementation	FEVI	Section 6.3.3.7; 1 year amortization period, commencing January 1, 2012
	Victoria Regional Centre CPCN	FEVI	Section 6.3.4.3; 1 year amortization period, commencing January 1, 2012
	Pipeline Contributions Variance Account	FEW	Section 6.3.5.3; 1 year amortization period, commencing January 1, 2012

Type of Change	Account	Company	Reference
	Deferred Removal Costs	FEU	Section 6.3.5.5; 2 year amortization period, commencing January 1, 2012
	IFRS Transitional Account	FEI, FEVI	Section 6.3.5.7; amortization by plan over EARSL
	2010-2011 Customer Service O&M and Cost of Service	FEU	Section 6.3.5.9; 8 year amortization period, commencing January 1, 2012
Other	Energy Efficiency and Conservation	FEU	Section 6.3.2.1; 4. Combined EEC rate base deferral account additions of $20.0 million in 2012 and $20.0 million in 2013, included on a net-of-tax basis and amortized in rates over a ten year period; 5. The allocation of the 2012 and 2013 EEC rate base deferral account additions amongst Mainland, Vancouver Island and Whistler on an average customer basis; 6. The creation of the EEC Incentive non-rate base deferral account, attracting AFUDC, to capture the remaining portion of the EEC costs as incurred on an actual spend basis in 2012 and 2013, and to recover the balance over a ten year period beginning in 2014.
	CNG and LNG Service Costs and Recoveries	FEI	Section 6.3.2.6; inclusion of variations from the revenue forecast pertaining to Rate Schedule 16
	Property Tax Variance Account	FEW	Section 6.3.3.1; include the forecast balance of the existing Propane Plant Property Tax Deferral account in the Property Tax Variance account
	Tax Variance Account	FEI	Section 6.3.3.6; inclusion of LILO reassessment costs
	Gains and Losses on Asset Disposition	FEU	Section 6.3.5.6; transfer the general plant gains and losses as at January 1, 2010 from the IFRS Transitional account into the Gains and Losses on Asset Disposition account; 20 year amortization period, commencing January 1, 2012
Discontinuance	Residential Commodity Unbundling Account	FEI	Appendix G, 2.2; discontinuation of this account effective January 1, 2012
	Commercial Commodity Unbundling Account	FEI	Appendix G, 2.2; discontinuation of this account effective January 1, 2012

28. Approvals pursuant to sections 59-61 of the Act of changes to the following accounting policies to be used in the determination of rates for FEI, FEVI, FEW and Fort Nelson effective January 1, 2012:

    (a) The depreciation and amortization rates and the creation of a separate sub account (474.02) to record future additions to Distribution Systems Meters/Regulator Installations with depreciation expense for this sub account calculated using a whole life rate, set out in Sections 5.4.2 and 5.4.5 of the Application.

    (b) The negative salvage rates and the treatment of negative salvage as set out in Section 5.4.3 of the Application.

    (c) Modification to the approved Lead Lag days with the removal of the GST and PST lead days and the insertion of the proposed HST and REC lead days as set out in Section 6.1 of the Application.

ENERGY EFFICIENCY AND CONSERVATION ORDERS FOR 2012 AND 2013

29. Acceptance pursuant to section 44.2 of the Act of the EEC expenditures of up to $74.5 million for FEU in 2012 and 2013, with expansion of all EEC program eligibility to customers of FEW and to offer the interruptible industrial program area to customers of FEVI, all as set out in Appendix K-1 of the Application. For clarity, the overall funding level of $74.5 million may not be exceeded and, while the Companies may only spend those funds on approved Program Areas (e.g.: Residential, Commercial, and Innovative Technologies), the Companies may transfer funds between approved program areas and will report on funding transfers in their EEC Annual Report. Treatment of EEC costs will be in accordance with the EEC deferral accounts set out above.

30. With respect to the assessment of EEC expenditures, as described in Appendix K-1 of the Application:

    (a) Approval to continue evaluating EEC expenditures as an overall portfolio, and with Innovative Technologies having an additional criterion that as an individual program area it must have a benefit-cost ratio of 1.0 or greater, as previously approved in the 2010-2011 RRA;

    (b) Approval to continue evaluating EEC expenditures on the basis previously approved by the Commission, except with respect to the following changes.

        (i) The overall portfolio including all EEC-funded activity, and the Innovative Technology program area individually, should have a benefit-cost result of 1.0 or greater, using a Societal Cost Test consisting of the following three modifications to the current benefit-cost analysis:

(A) Use of a social discount rate of 3 percent, rather than the Companies' weighted average cost of capital;

(B) Use of the ceiling price for biomethane, which is based on an efficiency-adjusted cost of electricity, as the avoided cost of gas;

(C) Use of a "deemed adder" of 30 percent for non-energy benefits of EEC activity.

(ii) The inclusion of spillover in the calculation of the Net-to-Gross Ratio when estimating program effects.

(c) The evaluation of EEC programs will continue to take place in the context of the EEC Annual Report to be filed by the FEU.

8.2 Proposed Regulatory Process

The FEU propose that this Application can be addressed efficiently and effectively through a Negotiated Settlement Process ("NSP"), or in the alternative, by a written hearing process. ,

The FEU propose the following draft regulatory timetable which acknowledges the workload required by the Commission and all parties and which will promote an efficient regulatory process.

ACTION	DATE (2011)
Workshop (commencing at 1:00 pm)	Wednesday, May 18
Procedural Conference (Timetable and Process - commencing at 9:00 am)	Tuesday, May 24
Procedural Order	Thursday, May 26
Commission Information Request No. 1 to FEU	Thursday, June 2
Intervener Information Request No. 1 to FEU	Thursday, June 9
FEU Response to Information Requests No. 1	Thursday, June 30
Commission Information Request No. 2 to FEU	Thursday, July 21
Intervener Information Request No. 2 to FEU	Thursday, July 21
FEU Response to Information Requests No. 2	Friday, August 19
Negotiated Settlement Process or Hearing if Required (proposed date range)	Tuesday, September 6 to Friday, September 30
FEU Final Argument Submissions	Friday, October 7

ACTION	DATE (2011)
Intervener Final Argument Submissions	Friday, October 21
FEU Reply Argument Submissions	Friday, November 4
Workshop (commencing at 1:00 pm)	Wednesday, May 18

At the procedural conference contemplated in the above timetable, the Companies will address matters including the following:

1. The rationale for requesting an NSP, or alternatively a written hearing process.
2. The request for interim rates effective January 1, 2012, pursuant to section 89 of the UCA and section 15 of the *Administrative Tribunals Act*. The rationale for the request for interim rates is that, based on the proposed schedule, the timing of a Commission Decision on this Application would be well into 2012. The contemplated process would not be possible without having interim rates in place because not having interim rates in effect January 1, 2012 precludes recovery of the cost of service between January 1, 2012 and the implementation date of the permanent rates. Interim rates thus allow the Commission and interveners to consider this Application within a reasonable time frame, without having to unduly hasten the process to facilitate a Commission determination prior to January 1, 2012.

   In terms of whether the interim rates should reflect the current rates or the proposed rates, the FEU are seeking interim approval of the proposed 2012 rates for FEI, FEVI, FEW and Fort Nelson. This request is fair to the Company and customers and is warranted on the basis of the evidence filed. Any variance between interim rates and permanent rates would be refunded to or collected from customers by way of a rate rider following the approval of permanent rates, as contemplated in the Orders Sought.

3. The Companies' request for approval to defer the filing of evidence with respect to FEVI and FEW's equity component required by Directive No. 7 of Commission Order G-158-09 to the Amalgamation and Rate Design Phase 'A' Application in Fall 2011 as described in Section 5.7 of the Application.

The FEU are optimistic that the Commission will be in a position to make its determination regarding the type of hearing process and the other matters following the procedural conference proposed for May 24, 2011.

The FEU look forward to working with the Commission and Interveners towards an efficient review of this Application.

Appendix A

GLOSSARY

APPENDIX A – GLOSSARY OF TERMS

AAM – Adjustment Mechanism

ABSU – Accenture Utilities Business Process Outsourcing Services

ACESA – American Clean Energy Security Act

ACP – Annual Contracting Plans, which are yearly filings with the Commission providing details on the Company's gas supply and midstream resource procurement activities for the year and discussion of the factors and influences affecting gas supply costs in the short and longer term.

Act – Utilities Commission Act

AES – formerly Alternative Energy Services, see "Thermal Energy Services"

AFUDC – Allowance for Funds Used During Construction, which is an allowance for the cost of debt and equity funding of capital projects before they are completed and placed into service and included in rate base; the AFUDC recorded for a project is added to the overall project cost.

AFUE – Annual Fuel Utilization Efficiency

AGS – FEVI Apartment General Service Rate Class (serve the common energy requirements of six or more residential units)

AHRI – Air-Conditioning, Heating, and Refrigeration Institute

AIMP – Asset Integrity Management Plan

AIT – Agreement on Internal Trade

AKBLG – Association of Kootenay Boundary Local Government

AM/FM – Automated Mapping/Facilities Management system

AMR – Automated Meter Reading

AMS – Application Management Services

ANSI – American National Standards Institute

APEGBC – Association of Professional Engineers and Geoscientists of BC

API – American Petroleum Institute

Application – FortisBC Energy Utilities 2012-2014 Revenue Requirements Application

ARO – Asset Retirement Obligation

ASL – Average Service Life

ASTTBC – Applied Science Technologists and Technicians of British Columbia, or Association for Technology Professionals in British Columbia

AUBPOS – Accenture Utilities BPO Services

AVICC – Association of Vancouver Island and Coastal Communities

BC or B.C. – British Columbia

BCAOMA – British Columbia Apartment Owners & Managers Association

BCBC – Business Council of British Columbia

BCHL – BC Hockey League

BC Hydro – British Columbia Hydro and Power Authority

BCIT – British Columbia Institute of Technology

BCSA – British Columbia Safety Authority

BCSEA – British Columbia Sustainable Energy Association

BCUC – British Columbia Utilities Commission, the provincial body regulating utilities in British Columbia.

Biomethane (Biogas) - a gas substantially composed of methane that is produced by the breakdown of organic matter (biomass) in the absence of oxygen. This breakdown process is also known as anaerobic decomposition. One of the primary products of anaerobic decomposition is gaseous methane, which is also the primary component of natural gas.

BOC – Bank of Canada

BPO – Business Process Outsource

BSI – British Standards Institute

BTU – British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit

BVA – Biomethane Variance Account

CAFÉ – Customer Attraction Front End project

Capex – Capital expenditures

CAT – Climate Action Team

CBOC – Conference Board of Canada

CCA – Capital Cost Allowance

CCE – Customer Care Enhancement Project

CCE – Consortium for Energy Efficiency (EEC 2010 Report)

CCRA – Commodity Cost Reconciliation Account

CEA – Clean Energy Act (Bill 17 – 2010)

CEC – Commercial Energy Consumers Association of British Columbia

CEO – Conservation Education and Outreach

CEPA - Canadian Energy Pipeline Association

CFA – Compressor Facilities Agreement

CGA – Canadian Gas Association

CHBA – Canadian Home Builders' Association

CHF – Co-operative Housing Federation

CIAC – Contributions in Aid of Construction, which is composed of opening contributions plus additions, less retirements.

CICA – Canadian Institute of Chartered Accountants

CIPH – Canadian Institute of Plumbing and Heating

CIS – Customer Information System

ClickSchedule – a Distribution field resources work scheduling platform

CMAE - Core Market Administration Expense, which are costs resulting from the management activities performed within the Gas Supply area to serve core market customers and are treated as a flow-through cost to core market customers as part of gas costs.

CMHC – Canada Mortgage and Housing Corporation

CNG – Compressed Natural Gas, which refers to CNG Service for Natural Gas Vehicles.

COC – Code of Conduct, which is a policy document approved by the Commission setting out the working relationships between Terasen Gas Inc. and non-regulated affiliates

COG – Cost of Gas

Cogeneration – refers to the simultaneous generation of electricity and useful thermal energy by utilizing the waste heat from a gas turbine to generate steam to be used in another process.

Commission - British Columbia Utilities Commission, the provincial body regulating utilities in British Columbia.

Company – FortisBC Energy Inc. or FEI

Compression / Compressor Station – the application of increased pressure to a natural gas pipeline system to create gas flow. Higher levels of compression can be applied to increase the carrying and storage capacity of the pipeline. Increased pressure is applied through a compressor station constructed along the pipeline.

COPE – Canadian Office of Professional Employees

COR – Certificate of Recognition by WorkSafeBC

Core / Core Customers / Core Market – residential, commercial and small industrial customers that have gas delivered to their home or business (bundled sales). Terasen Gas purchases natural gas and delivers it to the customer in a bundled sales rate. Core Market customers typically use a significant portion of their gas requirements for heating applications, resulting in weather sensitive demand.

COS – Cost of Service, a term used in utility ratemaking referring to the total costs of providing a service, typically including operating expenses, depreciation expense, taxes and a fair return on investment for the utility. In some cases Cost of Service also includes cost of gas

COSA – Cost of Service Analysis

COV – City of Vancouver

CP – Cathodic Protection

CPCN – Certificate of Public Convenience and Necessity, a certificate is obtained from the BCUC under Section 45 of the Utilities Commission Act for the construction and, or operation of, a public utility plant or system, or an extension of either, that is required for public convenience and necessity.

CPI – Consumer Price Index

CPR - Conservation Potential Review, a study completed to identify opportunities for energy savings across gas and electrical energy delivery infrastructures and improvements to overall energy utilization efficiency.

CRA – Canada Revenue Agency

CS – Compression Service

CS – Customer Service Department

CSA – Canadian Standards Association

CST – California Standard Tests

CWHI - Condensing Water Heater Initiative

CWLP – CustomerWorks Limited Partnership

DA – Distribution Apprentice

DC – Pacific Resource Conservation Society's Destination Conservation program

DCRS – Digitized Construction Records System

Deferred Costs (or Charges) – operating and maintenance costs that are incurred but that will be expensed in the future.

Demand Forecast – a prediction of the demand for natural gas into the future for a given period and under a specified set of expected future conditions. Separate demand forecasts are developed for annual energy demand and peak day demand and utilized for different aspects of utility operations and planning.

DES – District Energy Systems

DHW – Domestic Hot Water

DLE – Diesel Litre Equivalent,

DP – Distribution Pressure, pipelines operating at pressures of 100 psig or less (700 kPa or less)

DMS – Distribution Mobile Solution

DR – Disaster Recovery

DRP – Disaster Recovery Plan

DSM – Demand-Side Management, defined as "any utility activity that modifies or influences the way in which customers utilize energy services". From Terasen Gas' perspective, the primary objectives of DSM are to increase the overall economic efficiency of the energy services it provides to customers and maintain the competitive position of natural gas relative to other energy sources.

DSMS – Demand Side Management System

EARSL – Expected Average Remaining Service Life

ECAP – Energy Conservation Assistance Program

ECM – Electronically Commutated Motors

EEC – Energy Efficiency and Conservation.

EEC Application – 2008 Energy Efficiency and Conservation Programs Application

EEC Decision – BCUC Order No. G-36-09

EF – Efficiency Factor

EH&S – Environment, Health & Safety

ELG – Equal Life Group

ELT – Executive Leadership Team

EMA – Environmental Management Act

EMP – Environmental Management Plan

EMS – Energy Management Services

ERM – Enterprise Risk Management

ESK – Energy Saving Kit

ESM – Earnings Sharing Mechanism

ES&ER – Energy Solutions and External Relations

ES&RD – Energy Supply & Resource Development

ESS/MSS – Employee Self Serve and Manager Self Serve

FBU – The Fortis BC Utilities (comprised of FortisBC Inc. and the FortisBC Energy Utilities [including FortisBC Energy Inc., FortisBC Energy (Vancouver Island) Inc. and FortisBC Energy (Whistler) Inc.])

FE – Fireplace Efficiency

FEED – Front End Engineering and Design

FEI – FortisBC Energy Inc. (formerly Terasen Gas Inc.)

FEVI – FortisBC Energy (Vancouver Island) Inc. (formerly Terasen Gas (Vancouver Island) Inc.)

FEW – FortisBC Energy (Whistler) Inc. (formerly Terasen Gas (Whistler) Inc.)

FERC – Federal Energy Regulatory Commission

Fort Nelson – FortisBC Energy Inc. – Fort Nelson Service Area (formerly Terasen Gas Inc. – Fort Nelson Service Area)

FEU – FortisBC Energy Utilities (comprised of FortisBC Energy Inc., FortisBC Energy (Vancouver Island) Inc. and FortisBC Energy (Whistler) Inc. (formerly Terasen Gas Utilities)

FHI – FortisBC Holdings Inc. (formerly Terasen Inc.)

Fraser Basin – Fraser Basin Council

Free Rider Rate – percent who would have implemented an energy efficiency measure even without the program.

FT – FEVI Firm Transportation Service Rate Class

FTE – Full time equivalent employee

GAAP – Generally Accepted Accounting Principles

GCRA – Gas Cost Reconciliation Account

GCVA – Gas Cost Variance Account

GDP – Gross Domestic Product

GGRTA – Greenhouse Gas Reduction Targets Act

GHG – Greenhouse Gas

GHSP – Ground Source Heat Pump

GI – Ground Improvement barriers, used in geotechnical remediation.

GIS – Geographic Information Systems

GJ or Gigajoule – a measure of energy equivalent to one billion joules. One joule of energy is equivalent to the heat needed to raise the temperature of one gram (g) of water by one degree Celsius (ºC) at standard pressure (101.325 kPa) and standard temperature (15ºC).

GLE – Gasoline Litre Equivalent

GPIS – Gross Plant In-Service ending balances consist of opening GPIS plus plant additions, both regular and CPCNs, less retirements.

GSMIP – Gas Supply Mitigation Incentive Plan

GSHP – Ground Source Heat Pump

GST – Goods and Services Tax (replaced by the Harmonized Sales Tax)

GT&C – General Terms and Conditions

GWh – Gigawatt-hours

HDD – Heating Degree Day, which is a measurement designed to reflect the demand for energy needed to heat a home or business, and derived from measurements of outside air temperature.

HEX Pilot – Heat Exchanger Pilot Program

HLF – FEVI Large Commercial Service Rate High Load Factor (consumption 6,000 GJ per year or greater, contract for service, monthly coincident peak load factor greater than 85%)

HPBAC – Hearth, Patio & Barbecue Association of Canada

HR – Human Resources

HRIS – Human Resources Information System

HST – Harmonized Sales Tax

HVAC – Heating, Ventilation, and Air Conditioning

IAS – Internal Audit Services

IASB – International Accounting Standards Board

IBEW – International Brotherhood of Electrical Workers

ICE Fund – Innovative Clean Energy Fund

ICE Levy – Innovative Clean Energy levy of 0.4% on purchases of energy including electricity and natural gas was eliminated effective July 1, 2010.

ICP – Island Cogeneration Plant

IFRS – International Financial Reporting Standards

ILF – Inverse Load Factor - FEVI Large Commercial Service Rate Inverse Load Factor (seasonal use, contract for service)

ILI – In-line inspection

IMP – Integrity Management Plan

IP – Intermediate pressure

IPPs – Independent Power Producers

IRs – Information Requests

IRM – Integrated Resource Management

ISO – International Organization for Standardization

IT – Information Technology

IT (related to rate classes) – FEVI Interruptible Service Rate Class

ITC – Input Tax Credit

ITI – Infrastructure Management

ITS – Interior Transmission System

IVR – Interactive Voice Response

JPS – Jackson Prairie Storage

JV – Joint Venture

KMI – Kinder Morgan Inc.

LCS – Large Commercial Service Rate Class

LCS-1 – FEVI Large Commercial Service Rate Class (consumption 600 GJ per year or greater)

LCS-2 – FEVI Large Commercial Service Rate Class (consumption 2,000 GJ per year or greater)

LCS-3 – FEVI Large Commercial Service Rate Class (consumption 6,000 GJ per year or greater)

LCS-13 – FEVI Large Commercial Service Rate Class – Transport Service (consumption 6,000 GJ per year or greater, sign contract for service, daily energy metering required, customer to supply own gas)

LCT – Large Corporations Tax

LDC – Local Distribution Company

LEAP – LiveSmart BC Energy Assistance Program

LGIC – Lieutenant Governor in Council

LGMA - Local Government Management Association

LGS – Large General Service Rate Schedule

LILO – Lease In-Lease Out

LiveSmart BC – LiveSmart BC Efficiency Incentive Program

LMLGA – Lower Mainland Local Government Association

LMS – Learning Management System

LNG – Liquefied natural gas, natural gas stored at a low temperature turns to liquid form. Approximately 600 times as much natural gas can be stored in its liquid state than in its typical gaseous state; however, specialized storage facilities must be constructed.

LNG Facility – Mt. Hayes LNG Storage Facility

LP – Low Pressure

LTAP – Long Term Acquisition Plan

LTRP – Long Term Resource Plan

LTSP – Long Term Sustainment Plan, which includes enhancements to the Companies' asset management and system integrity processes.

M&E – Management and Exempt employees

MBH – 1 MBH = 1000 BTU/hr (BTU = British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit)

Mainland – FortisBC Energy Inc. service region (encompasses Lower Mainland, Columbia and Interior)

MCRA – Midstream Cost Reconciliation Account

MEM – Ministry of Energy and Mines

MFD – Multi Family Dwelling

MFT – Motor Fuel Tax of 1.9 cents per 810.32 litres of natural gas used in compressors.

MIT – Manager-in-Training

MMcfd – One Million Cubic Feet per Day

MOU – Memorandum of Understanding

Mt – Megatonne

MTBO – mean time between overhauls

MTN – Medium Term Note

MURB – Multi-Unit Residential Buildings

MVHC – Metro Vancouver Housing Corporation

MX Test – Main Extension economic test analyzes cost estimates for installing a gas main, projections in numbers of customers attached as well as forecast customer gas usage.

MW – Megawatt

NCMA – Northern Community Municipal Association

NEB – National Energy Board

NGT – Natural Gas Transportation, which refers to the NGV initiatives within the Innovative Technologies Program Area.

NGTL – Nova Gas Transmission Limited

NGV – Natural Gas for Vehicles

NPIS – Net Plant in Service is the sum of the averages of the gross plant in-service, CIAC, accumulated depreciation, and negative salvage.

NPV – Net Present Value

NRB – Non-regulated Business

NRCan – Natural Resources Canada

NSA – Negotiated Settlement Agreement

NSP – Negotiated Settlement Process

NSF – Not Sufficient Funds

NWGA – Northwest Gas Association

NWN – Northwest Natural Gas Company

NWP – Northwest Pipeline Corporation

OEM – Other Equipment Manufacture

OGC – British Columbia Oil and Gas Commission

OGAA – British Columbia Oil and Gas Activities Act

OPEB – Other Post Employment Benefits

O&M or Operating and Maintenance Costs - all costs incurred to operate and maintain the completed Customer Care Enhancement Project and that do not result in an improvement of a long-term asset; these costs will be included in regular operating budgets and treated as an operating and maintenance expense.

OSC – Ontario Securities Commission

OSR – Operations Support Representatives

Participant Test – is the measure of the quantifiable benefits and costs to the customer due to participation in a program.

PBR – Performance Based Rates

PBR Agreement – FortisBC Energy Inc's former PBR Agreements covering the periods of 2004-2009 approved pursuant Order No. G-51-03 and extended pursuant to Order No. G-33-07

PCBs – Polychlorinated Biphenyls

PCEC – Pacific Coast Energy Corporation

PCEPA – Pacific Coast Energy Pipeline Agreement revolving credit facility, which matures in January 2013.

PCT – Pacific Carbon Trust

PI – Profitability Index

PJ – Petajoule – equal to 1000 terajoules or 10^6 gigajoules.

PLE – Propane Litre Equivalent

PMO – Project Management Office (Terasen Gas department)

PNG – Pacific Northern Gas

PPE – Property, Plant and Equipment

PPM – Project Portfolio Management

PRMP – Price Risk Management Plan

PST – Provincial Sales Tax in British Columbia

PV – Present Value

QDP – Qualified Dealers Program

QUEST - Quality Urban Energy Systems of Tomorrow

RACOG – Royalty Adjusted Cost of Gas

Rate Volatility – the magnitude and frequency of natural gas rate fluctuations

RDA – Rate Design Application

RDDA – Revenue Deficiency Deferral Account

REC – Residential Energy Credit

REnEW – Residential Energy and Efficiency Works

REUS – Residential End Use Survey

RFEOI – Request for Expressions of Interest

RGS – FEVI Residential General Service Rate Class

RIB – Residential Inclining Block

RIM or Rate Impact Measure – a test that measures what happens to customer bills or rates due to changes in utility revenues and operating costs caused by the program.

RLCFRR – Renewable and Low Carbon Fuel Requirements Regulation

RMDM – Retail Markets Downstream of the Meter

ROE – Return on Equity

ROW – Right of Way

RRA – Revenue Requirements Application

RRSP – Registered Retirement Savings Plan

RSAM – Revenue Stabilization Adjustment Mechanism

RSDA – Rate Stabilization Deferral Account

RR Settlement Agreement – FEVI's Revenue Requirements Settlement Agreement approved pursuant Order No. G-126-05 and extended pursuant to Order No. G-33-07

RR Settlement Period – Four year period of FEVI's PBR Agreement commencing January 1, 2006 ending December 31, 2009

SAP – System, Applications and Products

SCADA – Supervisory Control and Data Acquisition

SCC – Stress Corrosion Cracking

Scorecard – a strategic performance management tool containing business performance metrics which include a mixture of financial and non-financial measures each compared to a 'target' value

SCP – Southern Crossing Pipeline

SCS – Small Commercial Service Rate Class

SCS-1 – FEVI Small Commercial Service Rate Class (consumption less than 200 GJ per year)

SCS-2 – FEVI Small Commercial Service Rate Class (consumption 200 GJ per year or greater)

SDE – Service Delivery Enhancement Project

SEMP – Strategic Energy Management Plan

SENC – Super Efficient New Construction

SERP – Supplemental Executive Retirement Plan

SFU – Simon Fraser University

SGS – FEW General Service Rate Class

SHIFT – Sustainability and Social Responsibility Attitudes Study

SIA – Service Information Application, used to store the alpha numeric service data to produce gas service lists and provide general gas service information.

SILGA – Southern Interior Local Government Association

SLCA – Service Line Cost Allowance

SMI – Smart Metering Initiative (BC Hydro)

SPIFF – Sales Promotion Incentive Fund

SQI – Service Quality Indicator

SST – Social Services Tax

ST&Cs – Standard Terms and Conditions (Tariff)

Task Force – Affordable Energy Conservation Task Force

TCPL – TransCanada Pipelines Limited

TDGA – Transportation of Dangerous Goods Act

TEEC – Technology Education and Career Council

Terasen or Terasen Inc. – the former name for FortisBC Holdings Inc., a wholly owned subsidiary of Fortis Inc., parent company to the FortisBC Energy Utilities

Terasen Utilities – the former name of the FortisBC Energy Utilities comprised of FEI, FEVI and FEW (formerly comprised of Terasen Gas Inc., Terasen Gas (Vancouver Island) Inc., and Terasen Gas (Whistler) Inc.)

TES or Terasen Energy Services Inc. – the former name for FortisBC Alternative Energy Services Inc.

TGI or Terasen Gas Inc. – the former name for ,FortisBC Energy Inc. or FEI

TGVI or Terasen Gas (Vancouver Island) Inc. – the former name for FortisBC Energy (Vancouver Island) Inc. or FEVI

TGW or Terasen Gas (Whistler) Inc. – the former name FortisBC Energy (Whistler) Inc. or FEW

Thermal Energy Services – formerly referred to as Alternative Energy Services ("AES") programs and activities

TILMA – Trade, Investment and Labour Mobility Agreement

TJ – Terajoule – equal to 1000 gigajoules.

TRC – Total Resource Cost test, which that measures the net costs of a demand-side management program as a resource option based on the total costs of the program, including both the participants' and the utility's costs.

Total Rewards – all of the tools available to an employer that may be used to attract, motivate and retain employees. Total Rewards includes everything the employee perceives to be of value resulting from the employment relationship.

TPIP – Transmission Pipeline Integrity Program

TPP – Transfer Pricing Policy

TSA – Transportation Services Agreement

UAF – Unaccounted-for Gas, which refers to gas that is not specifically accounted for in gas energy balance of receipts, deliveries, and operations use.

UBC – University of British Columbia

UBCM - Union of British Columbia Municipalities

UCA – Utilities Commission Act

UCC – Undepreciated Capital Cost

UFV – University of the Fraser Valley

UOC – Utilities Operating Committee

UPC – Use per Customer

USP - Utilities Strategy Project

Utility Cost Test – measures the net costs of demand-side management programs as a resource option based on the costs incurred by the utility (including incentive costs) and exclude the net costs incurred by the participant.

VIGJV – Vancouver Island Gas Joint Venture

VINGPA – Vancouver Island Natural Gas Pipeline Agreement

WACC – Weighted Average Cost of Capital

WACOG – Weighted Average Cost of Gas

WCI – Western Climate Initiative

WEI – Western Energy Institute

Westcoast – Westcoast Energy Inc.

WHIMIS - Workplace Hazardous Materials Information System

WIP – Work in Progress

WM – Waste Management of Canada Corporation

WMS/PM – Work Management System/Preventive Maintenance

WWTP – Waste Water Treatment Plant

Appendix B-1

COMPANY HISTORY

CORPORATE HISTORY

1 FORTISBC ENERGY INC.

1.1 Overview

The FortisBC Energy Inc. ("FEI")[1] is a company incorporated under the laws of the Province of British Columbia ("BC" or "Province") with almost 60 years of history in the natural gas business offering a reliable supply of natural gas, delivered safely and efficiently at a reasonable cost.

The company began distribution and transmission of natural gas in BC in the 1950's. In 1952, Inland Natural Gas Co. Ltd. ("Inland") was incorporated to distribute natural gas throughout the BC interior. In the 1950's, Inland purchased several subsidiaries, including St. John Oil and Gas, Peace River Transmission, Canadian Northern Oil and Gas, and Grand Prairie Transmission. In 1977, Inland purchased Columbia Natural Gas in the East Kootenays, which positioned Inland as the major distributor of natural gas for most of the BC Interior. In 1985 Inland acquired Fort Nelson Gas Ltd., the owner of the gas distribution system in and around Fort Nelson, from Colonial Oil and Gas Limited and in 1987, Inland purchased Squamish Gas Co. Ltd. from Superior Propane Ltd. In 1988, through a holding company named B.C. Gas Inc., Inland purchased the Lower Mainland gas division of British Columbia Hydro and Power Authority. In 1989, Inland was amalgamated with BC Gas Inc., Columbia Natural Gas Limited, and Fort Nelson Gas Ltd. under the name BC Gas Inc. and become the fourth largest gas distribution utility in Canada.

In 1990, BC Gas commenced construction, operation and maintenance of a piped propane distribution system to serve residential and commercial customers in Revelstoke. Propane is transported to Revelstoke by railcar and tanker-truck and off-loaded at an above-ground site. The propane is vapourized at the above-ground site and then distributed through underground gas lines, today serving approximately 1,600 residential and commercial customers.

In 1993 restructuring caused BC Gas Inc. to change its name to BC Gas Utility Ltd. and a holding company that held all the shares of BC Gas Utility Ltd. was named BC Gas Inc. A subsidiary of BC Gas Utility Ltd. was Squamish Gas Co. Ltd. BC Gas Inc. purchased Centra Gas BC Inc. and Centra Gas Whistler Inc. in 2002, adding natural gas customers on the Sunshine Coast and Vancouver Island and piped propane customers in Whistler. In 2003, BC Gas Inc. changed the name of each of its corporate entities, with BC Gas Inc. becoming Terasen Inc. (the holding company of the natural gas utilities) and BC Gas Utility Ltd. becoming Terasen Gas Inc.

In 2005, Terasen Inc. (the holding company of the natural gas utilities) was acquired by Kinder Morgan Inc., a U.S. energy storage and transportation company operating on behalf of Kinder

[1] Formerly Terasen Gas Inc.

Morgan Energy Partners, L.P. In 2007, Terasen Gas Inc. and Terasen Gas (Squamish) Inc. were amalgamated to operate as one company under the name, Terasen Gas Inc.

In 2007, Fortis Inc. acquired Terasen Inc. from Kinder Morgan Inc., and on March 1, 2011, the Terasen group of companies was renamed, and Terasen Inc. became FortisBC Holdings Inc., and Terasen Gas Inc. became FortisBC Energy Inc.

1.2 Fort Nelson Service Area

The natural gas distribution system in the Fort Nelson service area was acquired in 1985 through the acquisition of Fort Nelson Gas Ltd. by Inland Natural Gas Co. Ltd. Fort Nelson Gas Ltd. was amalgamated in 1989 with Inland Natural Gas and other companies and continued at that time as BC Gas Inc. (now FortisBC Energy Inc.).

Operations in Fort Nelson consist of a transmission lateral from the nearby Westcoast Energy Inc., (formerly owned by Duke Energy – BC Pipeline Division and now Spectra Energy) processing plant to the town of Fort Nelson together with a gas distribution system. Also included in the service area is the distribution system in Prophet River.

Rates have been set separately for the Fort Nelson service area from the date the company was acquired to the present. The Company sought regulatory consolidation of the Fort Nelson service area with the remainder of the Company in its 1992 Revenue Requirement Application, but the application was not approved. Since then, the Fort Nelson service area has been excluded from the Company's general revenue requirement applications and Performance Based Ratemaking plans.

1.3 Summary

FEI, a wholly owned subsidiary of FortisBC Holdings Inc., provides natural gas transmission and distribution services to approximately 840,000 residential, commercial, and industrial customers in approximately 100 communities on the mainland including the Inland, Columbia, Fort Nelson, and Lower Mainland service areas. Service is provided through approximately 40,000 kilometres of distribution mains and transmission pipelines.

2 FORTISBC ENERGY (VANCOUVER ISLAND) INC.

FortisBC Energy (Vancouver Island) Inc. ("FEVI")[2] is a company incorporated under the laws of the Province of BC offering a reliable supply of natural gas, delivered safely and efficiently at a reasonable cost.

[2] Formerly known as Terasen Gas (Vancouver Island) Inc. ("TGVI"), Centra Gas British Columbia Inc. and Pacific Coast Energy Corporation ("PCEC")

The Company began distribution of natural gas on Vancouver Island and the Sunshine Coast in 1991, at which time natural gas was first available to those communities through the Vancouver Island Natural Gas Pipeline. FEVI's predecessor, PCEC, operated the high pressure transmission pipeline and three Centra companies (Centra Gas British Columbia Inc. (Inc. No. 0060334), Centra Gas Victoria Inc. (Inc. no 0356486) and Centra Gas Vancouver Island Inc. (Inc. no 0355320)) operated the distribution systems. On January 1, 1996, PCEC acquired, by way of asset transfer agreement, the assets of the three Centra companies. On January 1, 1996, PCEC changed its name to Centra Gas British Columbia Inc. ("Centra Gas")". In 2002, BC Gas Inc. purchased Centra Gas, and in 2003, BC Gas Inc. changed its own name and the names of each of its corporate entities, with the holding company becoming Terasen Inc. and Centra Gas becoming Terasen Gas (Vancouver Island) Inc.

In 2007, Fortis Inc. acquired Terasen Inc. from Kinder Morgan Inc., and on March 1, 2011, the Terasen group of companies was renamed, and Terasen Inc. became FortisBC Holdings Inc., and Terasen Gas (Vancouver Island) Inc. became FortisBC Energy (Vancouver Island) Inc.

Today, FEVI, a wholly owned subsidiary of FortisBC Holdings Inc.[3], provides natural gas transmission and distribution services to approximately 100,000 residential, commercial, and industrial customers in approximately 40 communities on Vancouver Island and the Sunshine Coast. Service is provided through approximately 4,160 kilometres of pipelines.

3 FORTISBC ENERGY (WHISTLER) INC.

FortisBC Energy (Whistler) Inc. ("FEW")[4] is a company incorporated under the laws of the Province of BC offering a reliable supply of natural gas, delivered safely and efficiently at a reasonable cost.

Until 2009, Whistler was serviced by a piped propane distribution system. In April 2009, the construction of the natural gas pipeline lateral connecting the Resort Municipality of Whistler (the "RMOW") to the transmission system of FEVI was completed. From May to August of 2009, the piped propane system and customer appliances were converted to natural gas. The distribution system now consists of an underground distribution piping system and IP/DP station at Function Junction in Whistler. Natural gas is received at the IP/DP station from the Intermediate Pressure Line of FEVI which interconnects with the FEVI transmission line at FEVI's Squamish station.

The prior propane gas distribution system in Whistler was established in 1980 and was originally owned and operated by the RMOW. In 1985 ICG Liquid Gas Ltd. ("ICG") purchased the distribution system from the RMOW in a sale authorized by the Minister of Municipal Affairs. In addition, the Commission granted ICG an exemption from the *Utilities Commission Act* (the

[3] Formerly Terasen Inc.
[4] Formerly known as Terasen Gas (Whistler) Inc. ("TGW"), Centra Gas British Columbia Inc. and Centra Gas Whistler Inc.

"Act"), S.B.C. 1980 c.60, until December 31, 1994. In 1987, ICG Utilities (British Columbia) Ltd. ("ICG Utilities") purchased the distribution system, resulting in the exemption from regulation, pursuant to Section 103(3) of the Act being vacated.

Westcoast Energy Inc. ("WEI") acquired ICG Canada Inc, including ICG Utilities in April 1990. Later that year in November, ICG Utilities became Centra Gas British Columbia Inc. ("CGBC"). CGBC operated the Whistler system from 1990 to 1995. In 1996, CGBC was restructured and the Whistler-based assets of the company were transferred to a new company, Centra Gas Whistler Inc. In March 2002, BC Gas Inc. purchased Centra Gas Whistler Inc. from WEI. In 2003, BC Gas Inc. changed its own name and the names of each of its corporate entities, with the holding company becoming Terasen Inc. and Centra Gas Whistler Inc. changed its name to Terasen Gas (Whistler) Inc.

In 2007, Fortis Inc. acquired Terasen Inc. from Kinder Morgan Inc., and on March 1, 2011, the Terasen group of companies was renamed, and Terasen Inc. became FortisBC Holdings Inc., and Terasen Gas (Whistler) Inc. became FortisBC Energy (Whistler) Inc.

Today, FEW, a wholly owned subsidiary of FortisBC Holdings Inc.[5], provides natural gas transmission and distribution services to approximately 2,600 residential and commercial customers in Whistler. Service is provided through approximately 125 kilometres of pipelines.

4 THE FORTISBC ENERGY UTILITIES

On March 1, 2011, the Terasen group of companies was renamed to the FortisBC brand. FortisBC Holdings Inc.[6] (the holding company of the natural gas utilities) is a wholly-owned subsidiary of Fortis Inc.. Fortis Inc. is the largest investor-owned distribution utility in Canada. The gas distribution utilities in BC are currently organized as three wholly-owned subsidiaries of FortisBC Holdings Inc., specifically FEI, FEVI, and FEW, collectively referred to as the FortisBC Energy Utilities (the "FEU").

Today, the FEU combined are the largest natural gas distribution utility in BC, providing sales and transportation services to residential, commercial, and industrial customers in more than 140 communities throughout the Province, with in excess of 940,000 customers served throughout the province. The FEU own and operate natural gas pipelines and natural gas distribution facilities in BC, including approximately 44,000 kilometres of transmission pipelines and distribution mains. The FEU's distribution network serves close to 88 per cent of natural gas customers in BC and delivers more than 20 per cent of the total energy consumed in Province.

Appendix B-2

REGULATORY HISTORY

REGULATORY HISTORY

1 FORTISBC ENERGY INC.

For the 2010 and 2011 period, the Commission approved a two-year Negotiated Settlement Agreement for FortisBC Energy Inc. [1] ("FEI") which, among other things, allowed the utility to pursue Thermal Energy Solutions[2] through the use of a deferral account to record revenues and costs associated with Thermal Energy business to be allocated to Thermal Energy customers.

In the 15 years prior to 2010, the regulatory model used to set rates for FEI moved away from traditional cost of service regulation towards incentive-based ratemaking models. From 1994 to 2009, FEI had operated under an evolving model of performance-based ratemaking ("PBR") through settlements negotiated with customers and approved by the Commission. PBR models seek to enhance the performance of utilities through the use of incentive mechanisms not found in traditional cost of service regulation. A common theme that emerges is the need to break or weaken the link between costs and rates so as to enhance the incentive for utilities to reduce costs. In the regulatory processes leading to the past PBR plan settlements, parties have participated in the exchange of information, commentary, workshops, analyses, negotiations and settlement discussions. The processes culminated in agreements containing incentives to enhance utility performance while maintaining excellent customer service, and established ongoing annual reviews to monitor the PBR results in a Commission sponsored process. The comprehensive PBR plans (1998-2001 and 2004-2009) have also included earnings sharing mechanisms by which customers have shared in the benefits achieved. Therefore, these settlements have moved the interests of FEI and customers into closer alignment and have encouraged the attainment of greater efficiencies.

In 1997, the Commission approved a PBR Plan for the three years from 1998 to 2000. In 2000, by agreement of customers and FEI, and as approved by the BCUC, the PBR Plan was extended to include 2001. During this period, FEI undertook initiatives to meet and exceed productivity targets in the PBR Plan without deterioration in the quality of service to customers. These initiatives led to a significant reduction of FEI's workforce and to the achievement of operating cost per customer efficiencies. Although FEI achieved a high level of performance in the area that was the primary focus of the incentives in the 1998 - 2001 PBR Plan, namely O&M expenses, the delivery rates of FEI increased during this term of the PBR Plan. The primary driver of this increase was the necessary and required investment in capital to provide safe, reliable and efficient service to customer. Under the 1998 - 2001 PBR Plan, the extent to which FEI could recover restructuring costs was dampened by the absence of an adequate multi-year payback mechanism in the areas of capital expenditures and operating costs.

[1] Formerly Terasen Gas Inc.
[2] Previously referred to as Alternative Energy Solutions, which includes Geo-exchange, Solar-thermal and District Energy Systems

On August 24, 2001 FEI filed a revenue requirements application for 2002 seeking a 7 percent increase in delivery rates, corresponding to an approximate 2 percent increase in burner-tip rates. On November 1, 2001, FEI filed notice with the Commission that it was withdrawing its 2002 revenue requirements application. After an information session regarding the application withdrawal on November 8, 2001 and intervener submissions on November 9, 2001 the Commission issued Order No. G-123-01 and Reasons for Decision approving the withdrawal of the application and directing FEI to address certain matters raised in the Reasons for Decision in its 2003 Revenue Requirements Application. As a result, the 2001 base delivery rates remained in effect throughout 2002.

On June 17, 2002, FEI filed a 2003 Revenue Requirements and Multi-Year Performance-Based Ratemaking Application seeking approval for its 2003 revenue requirements, approval to determine its 2003 rates and to establish a comprehensive multi-year performance-based rate plan for 2003 to 2007 through a negotiated settlement process. A public hearing was held commencing November 12, 2002 for the review of 2003 revenue requirements and the Commission issued its Decision and Order G-7-03 on February 4, 2003. That Decision reviewed FEI's costs and revenues, and established rates for 2003. At page 53, the Commission's Decision stated:

> *"The Commission anticipates that [FEI] will file, early in 2003, a multiyear PBR Application for revenue requirements for 2004 and beyond which incorporates the determinations made in this Decision. The Commission would then establish a procedure in accordance with the Commission's Negotiated Settlement Process Guidelines."*

On April 17, 2003, FEI filed its Multi-Year PBR Plan for 2004 – 2008. Following a Negotiated Settlement Process, the Commission accepted the agreement reached by the parties, by Order No. G-51-03 dated July 29, 2003. The agreement was based on a four-year term rather than the proposed five-year term and thus approved the 2004-2007 Multi-Year Performance-Based Rate Plan Settlement (the "2004-2007 PBR Settlement Agreement"). The key elements in this order included:

- Allowed O&M costs and base capital expenditures set on an incentive formula basis;
- 50:50 sharing between customers and FEI of achieved efficiencies (after paying for restructuring costs) beyond those already embedded in the O&M and the base capital expenditure formulas;
- Restructuring costs funded through achieved efficiencies, not from customers;
- Mechanisms to continue the incentive to invest in efficiencies throughout the term of the plan;
- Results-based Service Quality Indicators;
- 4-year term with opportunity for mid-term review/adjustments; and

- An Annual Review process and other provisions to keep customers informed of the functioning of PBR settlement agreement such as a mid-term review process and the formation of a Customer Advisory Council.

In carrying out the provisions of the 2004-2007 PBR Settlement Agreement FEI delivered significant value to its customers relative to what would have been achieved under traditional cost of service regulation. Some of the benefits achieved include lower delivery rates through achieved efficiencies, greater certainty in delivery rates by establishing results-based formulas and improved regulatory and administrative efficiency. The most important benefit of PBR is that it fostered strong alignment between customer and company interests by encouraging innovation, customer focus and the on-going pursuit of operating efficiencies. The interests of customers were also well served in the 2004-2007 PBR Settlement through other means such as the Customer Advisory Council (which met twice yearly during the PBR term), the requirement for FEI to meet and measure customer service levels through an extensive set of Service Quality Indicators ("SQIs"), Annual Reviews and the Mid-term Assessment Review.

For 2004 and onwards, FEI was required to update its forecast of customer additions, use per account and industrial revenues annually. The impact on revenues resulting from the updated forecasts would be flowed through in delivery rates in the following year. The settlement also provided for the flow through of the impacts of changes approved by BCUC orders and exogenous factors. The terms of the Settlement Agreement also required FEI to hold a Mid-Term Assessment Review to provide an expanded annual review and information on its current and future year activities prior to the end of the third year (2006) of the Settlement Agreement.

On January 19, 2007, shortly after the Mid-Term Assessment Review, FEI filed its Application for the Approval of a Two-Year Extension (2008-2009) of the Settlement Agreement (the "Extended Settlement Agreement"). By Order No. G-33-07 dated March 23, 2007 the Commission approved the two-year extension of the 2004-2007 Multi-Year Performance-Based Rate Plan.

The annual reviews have been a process for FEI, customers and stakeholders to ensure that the objectives of the Settlement Agreement were being achieved and to review the cost drivers and financial forecasts for the purposes of establishing revenue requirements for the following year. FEI had performed well over the PBR period by delivering value to its customers. In addition to achieving efficiencies, FEI implemented comprehensive and customer-focused service quality assurance measures (SQIs) to ensure that service quality standards were maintained throughout the term of the PBR. Moreover, customers have received benefits from FEI's continued efficiencies through the 50:50 sharing mechanism, whereby significant amounts have been refunded to customers through Earnings Sharing Mechanism ("ESM") riders.

The following sections will provide a synopsis of FEI's annual review applications and the Commission's decisions for each year since 2003.

1.1 2003 Annual Review of 2004 Revenue Requirements

On October 31, 2003, FEI filed its Annual review advance material and on November 28, 2003, applied for approval of its 2004 revenue requirements and delivery rates, pursuant to section 58, 60 and 61 of the Act and the terms of the Settlement Agreement, for an increase to delivery rates by 4.3 percent to recover a revenue deficiency of $19.15 million. This filling also contained a business case study on the separation of FortisBC Holdings Inc. ("FHI") (then Terasen Inc.) and the creation of a corporate centre as directed in the 2003 Decision.

By Order No. G-80-03, dated December 17, 2003, the Commission approved FEI's request for an increase in delivery rates effective January 1, 2004. The key drivers contributing to the revenue requirements increase were:

- Lower residential and commercial use rates;
- Higher depreciation and amortization;
- Change in accounting for Transmission Pipeline Integrity Program ("TPIP") expenditures;
- Higher O&M per formula; and
- Higher rate base due to plant additions.

The Commission also approved the following:

- The cancellation of the ten-month rider that was established by Commission Order No. G-7-03. This rider recovered the foregone January/February 2003 rate increase over the remaining the months of 2003; and
- An increase in the Revenue Stabilization Adjustment Mechanism ("RSAM") rider by $0.061/GJ from $0.134/GJ to $0.195/GJ.

The Commission denied the following requests:

- The increase property tax incentive from 10 percent to 25 percent;
- The Utility Asset Utilization Incentive; and
- The incentive for pension and insurance costs similar to the property tax incentive mechanism.

1.2 2004 Annual Review of 2005 Revenue Requirements

On October 29, 2004, FEI filed its Annual Review advance materials and subsequently on November 26, 2004, FEI applied for approval of its 2005 Revenue Requirements and delivery rates pursuant to sections 58, 60 and 61 of the Act and the terms of the Settlement Agreement. The 2005 revenue requirements calculations, according to the provisions of the Settlement Agreement, resulted in a revenue requirements decrease of $2.108 million. This revenue surplus corresponded to an overall 0.42 percent decrease in gross margin or a 0.15 percent decrease in revenue. After excluding bypass and special rate revenues, the decrease in delivery rates for customers subject to general revenue requirements decrease was 0.45 percent.

FEI also requested approval for the following:

- to decrease the RSAM rider applicable to the residential and commercial rate classes from $0.195/GJ to $0.143/GJ;
- ESM riders for the customers' portion of the projected 2004 earnings shortfall of $204,000, representing 0.04 percent of the gross margin;
- to transfer the balance of the Coastal Facilities assets into rate base and finance by 67 percent debt and 33 percent equity (the approved capital structure then in effect);
- to utilize customer security deposits as a substitute for short-term borrowing; and
- to establish deferral accounts for OSC compliance costs and BCUC levies, as the cost increases associated with these items were deemed to be exogenous factors.

By Order No. G-112-04 dated December 15, 2004, the Commission approved FEI's request for a decrease in delivery rates effective January 1, 2005. The key drivers contributing to the revenue requirements decrease were:

- Customer growth and industrial revenue changes;
- Higher other revenues from the Southern Crossing Pipeline ("SCP");
- Change in pension and insurance forecast;
- Lower income taxes;
- Large Corporations Tax rate reduction;
- Lower depreciation and amortization; and
- Change in use rates.

1.3 2005 Annual Review of 2006 Revenue Requirements

On October 19, 2005, FEI filed its Annual Review advance materials, followed on November 7, 2005, by a revision pursuant to Commission Order No. G-98-05, then subsequently on December 2, 2005, FEI applied for approval of its 2006 Revenue Requirements and delivery rates pursuant to sections 58, 60 and 61 of the Act and the terms of the Settlement Agreement. The 2006 revenue requirements calculations, according to the provisions of the Settlement Agreement, resulted in a revenue requirements increase of $18.044 million. This revenue deficiency corresponded to an overall 3.68 percent increase in gross margin or a 1.10 percent increase in revenue. After excluding bypass and special rate revenues, the increase in delivery rates for customers subject to the general revenue requirements increase was 3.90 percent.

FEI also requested the following approvals:

- to continue the 2005 approved return on equity of 9.03 percent and common equity component of 33 percent for the purpose of setting interim rates for 2006;
- to increase the RSAM rider by $0.023/GJ from the currently approved level of $0.143/GJ to $0.166/GJ;
- customers' portion of the 2005 ESM surplus projected at $6.0 million on a pre-tax basis, equivalent to a refund of 1.30 percent of gross margin; and
- to establish deferral treatment for the net book value difference of $1.533 million resulting from the replacement on November 1, 2005 of the existing fleet service provider, from BC Hydro to PHH Arval, and to amortize over 3 years commencing January 1, 2006 this difference between BC Hydro's stated net book value and the fair market value assigned by PHH Arval.

On December 14, 2005, by Order No. G-132-05, the Commission approved FEI's 2006 request for an increase in delivery rates on an interim basis, pending the decision on FEI and FortisBC Energy (Vancouver Island) Inc. ("FEVI") 2005 Return on Equity ("ROE") and Capital Structure Application, effective January 1, 2006, subject to refund with interest at the average prime rate of FEI's principal bank. The key drivers contributing to the revenue requirements increase were:

- Lower use rates;
- Higher rate base due to plant additions;
- Lower revenue from the SCP; and
- Higher depreciation and amortization.

On March 2, 2006, the Commission issued its Decision and Order No. G-14-06 in the FEI-FEVI 2005 ROE and Capital Structure Application setting the ROE for FEI at 8.80 percent and its equity component at 35 percent.

1.4 2006 Annual Review of 2007 Revenue Requirements

On October 16, 2006, FEI filed its Annual Review advance materials which included a request that the Commission approve the amalgamation of FEI and Squamish (then Terasen Gas (Squamish) Inc.) ("Squamish"), effective January 1, 2007. On December 1, 2006, FEI applied for approval of its 2007 Revenue Requirements and delivery rates pursuant to sections 58, 60 and 61 of the Act and the terms of the Settlement Agreement. The 2007 revenue requirements calculations, according to the provisions of the Settlement Agreement, resulted in a revenue requirements decrease of $9.6 million. This revenue surplus corresponded to an overall 1.87 percent decrease in gross margin or a 0.65 percent decrease in revenue. After excluding bypass and special rate revenues, the decrease in delivery rates for customers subject to the general revenue requirements decrease was 0.60 percent. The key drivers contributing to the revenue requirements decrease were:

- Elimination of the large corporations tax;

- Lower rate base and others;
- Change in the pension and insurance forecast;
- Change in customer growth; and
- Higher income tax deductions.

By Order No. G-160-06, dated December 18, 2006, the Commission determined the following:

- Accepted FEI's opinion regarding the applicability of sections 41, 50, 52, 53 and 54 of the Act to the amalgamation of FEI and Squamish. The Commission agreed that Commission approval was not required for the amalgamation of FEI and Squamish. The Commission approved the cancellation of FEI Tariff Supplement I-3 and Squamish Tariff, effective January 1, 2007. In accordance with Special Direction No. 3, the Commission approved the amalgamated of FEI and Squamish;
- Approved the $0.021/GJ decrease in the Rate Stabilization Adjustment Mechanism rider from $0.166/GJ to $0.145/GJ, effective January 1, 2007;
- Approved customers' portion of the 2006 ESM surplus projected at $8.2 million on a pre-tax basis, representing 1.69 percent of the gross margin;
- Approved the establishment of a rate base deferral account to record the $10 million payment and the cost of the Social Service Tax appeal, subject to the $414 million SCP Project maximum capital cost approved by Commission Order No. G-95-00;
- Accepted FEI's submission that the inclusion of non-executive bonuses in pension costs recovered from customers and the exclusion of executive bonuses in pension costs recovered from customers is consistent with Commission's 1992, 1994 and 2003 Decisions;
- Accepted FEI's submission that terms of the Settlement prevent it from increasing the Demand-Side Management ("DSM") incentive grants over the $1.5 million during the period of the Settlement. FEI was instructed to include the Ratepayer Impact Measure test, the Participant Cost test and the percentage of "free riders" for the each program in the 2006 DSM portfolio and in future DSM reports.

1.5 Two-Year Extension of the 2004-2007 Multi-Year PBR Plan for 2008-2009

On January 19, 2007, FEI applied for approval of the Extended Settlement Agreement, effectively a two-year extension to the terms of the existing 2004-2007 Multi-Year PBR Plan Settlement Agreement for the years 2008 and 2009. During the regulatory review process for the Extended Settlement Agreement, on March 1, 2007, Fortis Inc. applied for approval of the acquisition of the issued and outstanding shares of FEI's parent (then Terasen Inc.) (the "Acquisition"). Interveners filed no objections or concerns regarding the Acquisition as it related to the Extended Settlement Agreement, and on March 23, 2007, the Commission issued Order No. G-33-07 approving the Extended Settlement Agreement.

1.6 2007 Annual Review of 2008 Revenue Requirements

On October 5, 2007, FEI filed its Annual Review advance materials and on November 30, 2007, FEI applied for approval of its 2008 Revenue Requirements and delivery rates pursuant to sections 58, 60 and 61 of the Act and the terms of the Extended Settlement Agreement. The 2008 revenue requirements calculations, according to the provisions of the Extended Settlement Agreement, resulted in a revenue requirements increase of $9.43 million, before consideration of the customer portion of the ESM. This revenue requirement corresponded to an overall 1.89 percent increase in gross margin or a 0.62 percent increase in revenue. After excluding bypass and special rate revenues, the increase in delivery rates for customers subject to the general revenue requirements was a 0.57 percent increase in revenue. After taking into consideration the earnings surplus incentive sharing of $15.0 million the revenue requirements was a decrease of $5.6 million, equivalent to a 1.1 percent decrease in gross margin. The further impact on revenue decrease was due to amended FEVI Wheeling Revenue and final FEI ROE decision of 8.62 percent. The key drivers contributing to the revenue requirements decrease were:

- Higher income tax deductions;
- Change in pension and insurance forecast;
- Lower depreciation and amortization; and
- Lower income tax rates.

By Order No. G-153-07, dated December 10, 2007, the Commission approved the following:

- The increase of applicable charges for most rate classes of customers, effective January 1, 2008, as provided in the Revised Application;
- Customers' portion of the 2007 incentive earnings surplus projected at $12.6 million on a pre-tax basis, representing 2.67 percent of the gross margin; the $0.05/GJ decrease in the RSAM rider from the currently approved level of $0.145/GJ to $0.095/GJ, effective January 1, 2008;
- the continuation of the rate base deferral account established for the ongoing Provincial Sales Tax appeal related to the SCP project;
- the establishment of a rate base deferral account to record any differences in the Service Line Installation fees and Service Line Cost Allowance resulting from the Commission Decision in the System Extension and Customer Connection Charges Review Application, to be amortized in the following year;
- the establishment of a rate base deferral account to record cost of service reductions related to the timing of the Lochburn land sale; and
- the request for FEI to follow Section 3061.04 of the CICA Handbook revision that will result in a reclassification in FEI's financial statements between inventory and property, plant and equipment for pipe, valves, fittings and other items that would ultimately be used for gas plant in service, whereby these costs will be transferred to Plant Work in

Process ("WIP") in the financial statements, effective January 1, 2009, as described in the Advance Materials.

1.7 2008 Annual Review of 2009 Revenue Requirements

On October 8, 2008, FEI filed the Annual Review advance materials and on December 3, 2008, FEI applied for approval of its 2009 Revenue Requirements and delivery rates pursuant to sections 58, 60 and 61 of the Act and the terms of the Extended Settlement Agreement. The 2009 revenue requirements calculations, according to the provisions of the Extended Settlement Agreement, resulted in a revenue requirements increase of $35.12 million, before consideration of the customer portion of the ESM. This revenue requirements corresponded to an overall 7.30 percent increase in gross margin or a 2.10 percent increase in revenue. After excluding bypass and special rate revenues, the increase in delivery rates for customers subject to the general revenue requirements was a 1.95 percent increase in revenue.

In addition, FEI requested deferral account treatment for incremental costs associated with the implementation of International Financial Reporting Standards ("IFRS") to be amortized beginning in 2011, a deferral account treatment of incremental costs for Olympic and Paralympic Games Security to be amortized beginning 2011, a change to the amortization of the Large Corporations Tax deferral account, and changes to the non rate base Residential and Commercial Commodity Unbundling deferral accounts.

The key drivers contributing to the revenue requirements increase were:

- Change in use rate;
- Higher depreciation and amortization;
- Higher property taxes;
- Higher O&M;
- Lower income tax deductions; and
- Higher rate base to support customer growth.

By Order No. G-191-08, dated December 11, 2008, the Commission approved the following:

- Customers' portion of the 2008 incentive earnings surplus projected at $12.0 million on a pre-tax basis, representing 2.61 percent of the gross margin;
- The $0.093/GJ decrease in the RSAM rider from the currently approved level of $0.094/GJ to $0.001/GJ effective January 1, 2009;
- The establishment of a rate base deferral account to recover the critical security costs associated with the 2010 Olympic and Paralympic Winter Games;
- The establishment of a rate base deferral account to recover the incremental costs associated with IFRS implementation;
- The change to the amortization of the Large Corporations Tax deferral account; and

- The changes to the non-rate base Residential and Commercial Commodity Unbundling deferral accounts.

FEI was ordered to revise its 2009 forecast to account for any direction from the review of the Customer Choice operating and capital expenditure budgets. The Commission also ordered that if there is delay in the issuance of the Customer Choice Decision then FEI should record the difference between the 2009 budget and the 2009 allowed operating expenditures and capital expenditures in rate base deferral accounts for disposition in the next year's revenue requirements.

1.8 2010-2011 Revenue Requirements Negotiated Settlement Agreement

On June 15, 2009, FEI filed an application for approval of its 2010 and 2011 Revenue Requirements, pursuant to sections 59 to 61 and 89 of the Act, seeking an increase in delivery rates for a two-year period. The increase sought for 2010 was equivalent to an approximate effective base delivery rate increase of 5.3 percent and for 2010 a further 4.1 percent in 2011 (cumulative 9.4 over both years). The revenue requirements increase identified for 2010 was $27.9 million and for 2010 was $21.9 million.

Notable in the application were the significant changes taking place in the external operating environment, including:

- Evolving energy and environmental policies;
- The changing expectations of customers, regulators, and other stakeholders;
- FEI's level of competitiveness as an energy provider; and
- Changing economic and demographic realities.

The single, most significant key driver contributing to the revenue requirements increase was the accounting changes associated with the adoption of new accounting standards. But for the accounting changes, the revenue requirements would have indicated a rate decrease for 2010 and a small increase for 2011. Other key drivers contributing to the revenue requirements increase were:

- Change in use rate;
- Lower capital expenditures;
- Lower O&M;
- Lower depreciation and amortization;
- Higher property taxes;
- Lower income tax deductions; and
- Higher rate base to support customer growth.

A Negotiated Settlement Process commended on October 21, 2009 and concluded on November 3, 2009, and on November 26, 2009, the Commission issued Order No. G-141-09 approving the 2010-2011 NSA including, among other things, the following:

- Delivery rates remain unchanged and that the 2010 forecast revenue surplus of $9.2 million be recorded in a rate base deferral account, entitled 2010 Revenue Surplus Deferral Account, and be applied to offset any forecast increase in delivery rates in 2011 (subject to changes from the impending decision on the FEU 2009 ROE and Capital Structure Application);
- Continue tracking and posting on the FEI website the SQIs as set out in the prior PBR Agreement and extension thereto;
- Revise the customer additions forecast to 5,952 in 2010 and 6,166 in 2011, and the 2009 year end number of customers to 835,862;
- Revise the Residential annual user per customer to 91.7 in 2010 and to 90.3 in 2011;
- Revise the industrial demand forecast in 2010 to 46.5 PJ and in 2011 to 46.5 PJ;
- Continue to include the annual cost of SCP capacity of $3.6 million in the MCRA;
- EEC Funding for 2010:
    - Reallocate from residential and commercial EEC programs an additional $1.6 million to low income and rental housing programs (bringing the total of for those programs to $2.4 million for 2010);
    - Industrial interruptible programs funding be $435,000;
    - Innovative technologies funding be $2.3 million, and will be managed as a separate segment of the overall portfolio and have a weighted average Total Resource Cost of 1.0 or more;
- EEC Funding for 2011:
    - Residential and commercial program funding for 2011 be $23.075 million;
    - Reallocate from residential and commercial EEC programs an additional $1.6 million to low income and rental housing programs (bringing the total of for those programs to $2.4 million for 2011);
    - Industrial interruptible programs funding be $1.875 million
    - Innovative technologies funding be $4.669 million, and will be managed as a separate segment of the overall portfolio and have a weighted average Total Resource Cost of 1.0 or more;
- Alternative Energy Solutions (now referred to as Thermal Energy Solutions or “Thermal Energy”):
    - Thermal Energy means Geo-exchange, Solar-thermal and District Energy Systems;
    - Cost incurred to provide Thermal Energy will be recorded in a deferral account, entitled, “New Energy Solutions Deferral Account”, attracting AFUDC, and will capture and record:
        - Direct costs associated with projects;

- Sales and marketing O&M and other development costs charged directly to the deferral account by time sheet or direct charge (estimated to be $1.0 million in 2010 and $1.5 million in 2011;
- An agreed upon overhead allocation of $500,000 in each of 2010 and 2011;
- Revenue from Thermal Energy customers;
- Revenue and costs be captured on a project-specific basis and reported as part of the next Revenue Requirements application;

- Natural Gas for Vehicles ("NGV"):
  - Rate Schedule 26 – NGV Transportation Service was approved and costs as applied for in support of NGV be recovered in 2010 and 2011 rates;
  - Marketing costs in support of NGV included in the application are appropriate and recoverable in 2010 and 2011 rates;
- CPCN Threshold to remain at $5 million;
- Category A Capital be $43.3 million for 2010 and $46.0 million for 2011;
- Category B Capital be $17.4 million in 2010 and $14.9 million in 2011;
- Category C Capital be $32.8 million in 2010 and $32.7 million in 2011;
- Reduction in O&M from the amount requested in the Application by $4.0 million in 2010 and by $5.5 million in 2011, with a resulting reduction to the Shared Services and Corporate Services allocations;
- Total depreciation expense of $98.3 million in 2010 and $100.5 million in 2011;
- An estimate of net removal costs of $8.038 million in 2010 and $11.29 million in 2011 be included in the cost of service, with the variance between actual realized net removal costs and the estimated amounts be recorded in a new deferral account, entitled "Removal Cost Deferral Account". The amount accumulated in the Removal Cost Deferral Account over the two-year period will be recovered from or returned to customers in 2012;
- Include the full value of the incremental tax benefit with the difference in CCA rates for 2007 and 2008 totalling $921,000;
- Tax benefits relating to prior periods for SCP Landscaping costs reducing revenue requirements for 2010 by approximately $7.9 million and in 2011 by approximately $2.3 million;
- Change in the Overheads Capitalized rate to 14 percent of Gross O&M for 2010 and 2011;
- A maximum of $1.0 million of the 2010 revenue requirements impact of IFRS be recovered in 2011, with amounts, if any, over $1.0 million be deferred and recovered in rates after 2011;
- Maintaining the existing Code of Conduct and Transfer Pricing Policy;

- Various accounting policy changes, accounting related proposals, tariff changes, and deferral account changes were approved as applied for;
- Allocation of delivery margin rate changes - Annual margin increase allocated to variable (volumetric & demand) based delivery charges, with no change to fixed (basic and admin fee) charges in each year;
- ESM rider (incl. end of term capital) - Change the ESM rate rider to be ($0.040)/GJ effective January 1st, 2010, and change the estimated ESM rate rider to be ($0.046)/GJ effective January 1st. 2011. ESM amount to include End of Term Capital phase out and to be amortized over two years. The final 2011 rider amount will be adjusted based on 2009 actual earnings. TGI will submit an application to change the 2011 ESM rate rider at the same time it submits its Q4 quarterly gas cost report in early December 2010; and
- RSAM rider - Change the RSAM rate rider to be ($0.053)/GJ effective January 1st, 2010 and change the estimated RSAM rate rider to be ($0.052)/GJ effective January 1st, 2011. The 2011 rider amount will be adjusted based on 2009 actual results and 2010 year to date actual results. TGI will submit an application to change the 2011 RSAM rate rider at the same time it submits its Q4 quarterly gas cost report in early December 2010.

As part of reaching the Agreement with the Parties and upon acceptance of the Agreement by the Commission, FEI agreed to withdraw its requests related to NGV and Biogas as follows:

- NGV:
  - Rate Schedule 6C NGV Compression and Refueling Service and Rate Schedule 6A NGV Refueling Service;
  - The Compression Service Test;
  - NGV non-rate base deferral account; and
  - The Parties agreed that the withdrawal of the requests was done without prejudice to FEI’s right to bring forward similar requests in 2010, 2011 or in the future; acknowledged that FEI intended to develop this area of business; and FEI anticipated bringing forward applications on NGV projects on a case-by-case basis.
- Biogas:
  - All requests related to Biogas; and
  - the Parties agreed that FEI would bring forward an application for Biogas (the “Biogas Application”) during the test period that would:
    - Address the economic assessment model;
    - Provide Biogas rates (including green rate, transportation rate, etc.);
    - Provide recovery of costs associated with providing Biogas service; and

- FEI may include any Biogas Projects under development at that time and that FEI may apply for Commission approval of individual Biogas Projects at any time, either prior to the Biogas Application or afterward.

Further, on December 16, 2009, the Commission issued its Decision and Order No. G-158-09 on the FEU 2009 ROE and Capital Structure Application setting the ROE for FEI to 9.50 percent effective July 1, 2009, and that the appropriate equity ratio be 40 percent effective January 10, 2010.

1.9 Summary

As discussed above, FEI has lived up to the expectations of its regulatory commitments through the settlement periods. During these periods, FEI performed well by achieving efficiencies and maintaining customer-focused service quality standards. Consequently, the settlement agreements since 2003, coupled with annual reviews, have served their purpose by aligning the interest of FEI's customers, stakeholders, and shareholder.

1.10 Fort Nelson Region

Rates have been set separately for the FEI Fort Nelson region from the date the company was acquired to the present. FEI (then as BC Gas Utility Ltd.) sought regulatory consolidation of the Fort Nelson service area ("Fort Nelson") with the remainder of FEI in its 1992 Revenue Requirement Application, but the application was not approved. Since then, Fort Nelson has been excluded from FEI's general revenue requirements applications and PBR plans.

Fort Nelson's gas supply has typically been obtained through one contract. In recent years, FEI has used a small portion of its contracted gas storage capacity at Aitken Creek to improve the load factor of Fort Nelson and to mitigate the impact of gas volatility for Fort Nelson customers. The diversity of FEI's overall gas supply portfolio has assisted over the years in providing favourable gas supply arrangements for Fort Nelson.

Customers in Fort Nelson have benefited and continue to benefit in various ways from being part of a much larger gas distribution company. Some of these benefits include:

- Access to the necessary resources, expertise and training in all areas affecting gas distribution utilities;
- Access to low cost capital funding;
- Access to the buying power of a larger company, reducing the costs of pipe and other materials and supplies; and
- Access to the commodity-related benefits of being in a company that is a large regional buyer of natural gas and a significant holder of various natural gas storage, transportation, peaking and other gas supply arrangements designed to mitigate and optimize gas supply costs.

Since 1985, most rate changes have been limited to those approved from time to time for flow-through cost of gas increases or decreases.

In 1995, delivery rates were decreased by 15.04 percent. Delivery rates thereafter remained unchanged until 2004, when there was a slight revenue requirements increase of $49,000 (1.08 percent increase in delivery rates), approved by Commission Order No. G-17-04, effective January 1, 2004.

On November 30, 2007, Fort Nelson filed its 2008 Revenue Requirements Application requesting an increase effective January 1, 2008. As a result of the regulatory review process, on February 28, 2008, the Commission issued Order No. G-27-08 which approved a revenue requirements increase of $227,000. That revenue requirements change was primarily attributed to the downturn of the forest industry affecting the industrial demand for the Fort Nelson region.

On November 20, 2008 by Order No. G-172-08, the Commission approved an increase in rates for Fort Nelson, effective January 1, 2009, to recover a revenue deficiency of $377,000, resulting in an average 6.7 percent rate increase for all sales rate classes or a 36.0 percent increase on a gross margin basis for all customers. This increase was required primarily due to a decline in industrial demand and use rates per customer.

On December 3, 2009 by Order No. G-147-09, the Commission approved the continuation in 2010 of the approved 2009 rates, effective January 1, 2010, and the creation of two new deferral accounts along with the continuation of existing deferral accounts, and changes to the RSAM rate rider. These requests were driven primarily by changes to Fort Nelson's return on equity and capital structure, and the proposed adoption by FEI of updated depreciation rates and overheads capitalized rate.

Most recently, on February 4, 2011, by Order No. G-27-11, the Commission approved an increase in rates for Fort Nelson, effective January 1, 2011, to recover a revenue deficiency of $315,000 resulting in an increase of 21.74 percent. The Commission also approved the continuation of existing deferral accounts and the adoption of accounting and other policy changes consistent with FEI in its 2010-2011 NSA. Also approved was the proposed 2011 capital expenditure of $3,015,650 to be included in rate base, related to the Muskwa River Crossing Project, directing that the total amortization/depreciation be recorded as a reduction to the carrying amount of the Project Assets in 2012 and that the Project Assets not attract Allowance for Funds Used During Construction ("AFUDC") after the projected in-service date of October 1, 2011.

2 FORTISBC ENERGY (VANCOUVER ISLAND) INC.

For the 2010 and 2011 period, the Commission approved a two-year Negotiated Settlement Agreement for FEVI which, among other things, allowed the utility to pursue Thermal Energy Solutions[3] for Vancouver Island customers through FEI.

Prior to 2010, FEVI was covered by settlement agreements, and the annual reviews and settlement updates over the 2003 to 2009 timeframe had been a process for FEVI and stakeholders to ensure that the objectives of settlement agreements were achieved and to review the cost drivers and financial forecasts for the purposes of establishing revenue requirements for the following year. The results of these settlements have helped to align the interest of FEVI and its customers.

What follows, is a synopsis of the FEVI's regulatory history by reviewing FEVI (and its predecessor companies) applications and Commission decisions for each year since 2003.

2.1 2003-2005 Revenue Requirements

On July 31, 2002, FEVI (then Centra Gas British Columbia Inc.), applied for approval of its 2003 – 2005 Revenue Requirements, which it proposed be reviewed through a Negotiated Settlement Process. That application was the first application in a two-phase process, with the second application to address rate design and rates. A Negotiated Settlement was reached among participants and the 2003 – 2005 Revenue Requirements application was approved by Commission on January 14, 2003 by Order No. G-2-03.

The Revenue Requirements Settlement agreement set out several items including, but not limited to: a three year term 2003 through 2005, items-at-risk for FEVI, gross allowed O&M expenses, depreciation rates, amortization, capital expenditure forecasts, a Gas Cost Variance Account ("GCVA"), capital structure and return on equity and the treatment of revenues variances with respect to the Revenue Deficiency Deferral Account ("RDDA"). Specifically, FEVI forecast the following:

- Revenue requirements to be $169,357,177 in 2003, $179,186,012 in 2004, and $184,046,880 in 2005;
- Utility rate base of $442,193,2077 in 2003, $446,480,221 in 2004, and $448,914,850 in 2005;
- Cost of sales to be $74,373,459 in 2003, $77,398,574 in 2004, and $80,730,206 in 2005
- Gross operating, maintenance, general and administrative expenses to be $32,919,154 in 2003, $34,810,466 in 2004, and $35,093,301 in 2005; and
- Operating and maintenance to be $5,408,154 in 2003, $5,526,728 in 2004, and $5,677,256 in 2005.

---

[3] Previously referred to as Alternative Energy Solutions, which includes Geo-exchange, Solar-thermal and District Energy Systems

Through the Negotiated Settlement to the 2003-2005 Revenue Requirements Application, FEVI was to provide annual updates to ongoing operations and information on known and forecast changes affecting next period rate recommendations via an Annual Review process.

2.2 2003 Annual Review of 2004 Revenue Requirements

On November 12, 2003, FEVI filed its 2003 Annual Review of 2004 Revenue Requirements advance material for the following purpose:

1. Review and approve FEVI's 2002 actual cost of service and revenue deficiency results;
2. Update the forecast 2003 cost of service and revenue deficiency for known changes; and
3. Establish the 2004 test year cost of service and resulting rates for each class of effective January 1, 2004.

The forecast of 2004 revenue requirements indicated an annual revenue deficiency of $9.3 million. The key drivers contributing to this revenue deficiency were:

- Lower adjusted cost of gas
- Lower income tax
- Lower return on rate base
- Lower amortization of GCVA
- Lower sales rates and revenues

The Commission, by Order No. G-81-03 dated December 15, 2003, approved the following:

- The 2002 actual revenue requirements as filed in the Application and a 2002 revenue deficiency of $2,873,609 with a cumulative balance in the RDDA of $87,910,503 at the end of 2002;
- The creation of an Apartment Rate Class, AGS, to replace the existing ACR-2 rate class that expired on December 31, 2003 as required by the Special Direction;
- The rates effective January 1, 2004 for RGS, AGS, LCS-1, LCS-2, LCS-3, LCS-13, HLF, Firm Transportation and Interruptible Transportation classes as proposed in the Application;
- 2004 OM&A capitalization of $5,028,115;
- The 2004 Royalty-Adjusted unit cost of gas of $3.753/GJ is accepted based on a sales forecast of 11.4 PJ; and
- The incremental OM&A costs of the Sooke extension were approved as forecast in the Sooke CPCN Application.

2.3 2004 Annual Review of 2005 Revenue Requirements

On November 5, 2004, FEVI filed its 2004 Annual Review of 2005 Revenue Requirements advance material for the following purpose:

1. Review and approve FEVI's 2003 actual cost of service and revenue surplus results;
2. Update the forecast 2004 cost of service and revenue surplus for known changes, and;
3. Establish the 2005 test year cost of service and resulting rates for each class of effective January 1, 2005.

On November 26, 2004, FEV filed its Revised Application providing the most current forecast results for 2005 revenue requirements indicated an annual revenue surplus of $3.5 million. The key drivers contributing to this revenue surplus were:

- Higher adjusted cost of gas
- Lower income tax
- Higher return on rate base
- Amortization of GCVA
- Higher sales revenues

The Commission by its Order No. G-113-04, dated December 15, 2004, approved the following:

- The 2003 actual revenue requirements as filed in the Revised Application and a 2003 revenue surplus of $12,622,751 with a cumulative balance in the RDDA of $75,287,752 at the end of 2003;
- The 10 percent SAP Operating Lease charge from FEI to FEVI was appropriate and the calculation of the lease was to be based on FEI's cost of service;
- The $8.00 million of capital additions for FEVI related to the Utilities Strategy Project;
- The allocation of Shared Services costs to FEVI as proposed in the Revised Application;
- The 10 percent allocation of Gas Supply Core Market Administration Expense to FEVI as proposed in the Revised Application;
- The permanent rates effective January 1, 2005 for RGS, AGS, SCS-1, SCS-2, LCS-1, LCS-2, LCS-3, LCS-13, HLF, and ILF rate classes as proposed in the Revised Application;
- The Amending Agreement between FEVI and VIGJV;
- Charging interim firm and interruptible rates, effective January 1, 2005, to BC Hydro that were equal to the existing rates;
- The 2005 capitalization of OM&A of $4,626,494;

- The 2005 Royalty Adjusted unit cost of gas of $4.29/GJ based on a sales forecast of 11.9 PJ;
- Setting the October 1, 2004 GCVA Rate Rider D to zero effective January 1, 2005. The Commission approved the amortization of the forecast December 31, 2004 balance of the GCVA into rates;
- The 2005 incremental OM&A costs of $22,000 from the Sooke extension; and
- Directed that $78,500 be removed from project costs for the Sooke extension.

2.4 2006 – 2007 Revenue Requirements

On July 20, 2005, FEVI applied for approval of its forecast rates and Cost of Service for the years 2006 and 2007 and its Revenue Deficiency deferral Account balance as at December 31, 2004. On November 22, 2005, following the conclusion of a negotiated settlement process, the Commission issued Order No. G-126-05, dated November 30, 2005, approving FEVI's 2006-2007 Negotiated Settlement Agreement, which included:

- The 2004 revenue surplus of $14,243,422 with a cumulative balance in the Revenue Deficiency Deferral Account of $61,044,330 at the end of 2004.
- Interim rates effective January 1, 2006 for RGS, AGS, SCS-1, SC2-2, LCS-1, LCS-2, LCS-3, HLF, and ILF rate classes as proposed in the Negotiated Settlement.
- Interim rates effective January 1, 2006 for Firm Transportation, summer Interruptible Transportation, and winter Interruptible Transportation rates as proposed in the Negotiated Settlement.

Under the terms of the Negotiated Settlement Agreement, FEVI was to submit to the Commission and interested parties advance materials for the Settlement Update Filing three weeks prior to a Settlement Update Meeting. The details of the Settlement Update Meeting were set out in Item 15, Page 11 of Appendix A to the Settlement Order, specifically:

> *The parties agree that in the particular circumstances of the negotiation respecting revenue requirements and rates for 2006 and 2007 that a Settlement Update Meeting will be held in November 2006, rather than the customary Annual Review. The purpose of the Settlement Update Meeting will be for the Company to provide an update on the operations of the Company through 2006 and the outlook for 2007, with customers being provided the opportunity to make submissions regarding these matters. FEVI will provide a minimum 3 weeks written notice of the meeting, and will include with that notice updated information set out in Schedules 1 to 34B and in the tables provided by FEVI in response to BC Hydro's IR 4 from the 2006-2007 Revenue Requirements Application.*
>
> *FEVI will advise participants in this process of any significant applications it makes to the Commission.*

The 2006 Settlement Update Meeting was a process whereby TGVI and stakeholders could ensure that the objectives of the Settlement were being achieved. Specifically, at the Settlement Update meeting, FEVI was to:

- Provide an update on operations through 2006;
- Review the cost drivers and financial forecasts for the purposes of establishing the 2007 revenue requirements; and
- Provide an update on the undertakings identified in Appendix A to the Settlement Order.

2.5 2006 Settlement Update of 2007 Revenue Requirements

On October 23, 2006, FEVI filed its 2006 Settlement Update filing and application in accordance with the 2006-2007 Negotiated Settlement Agreement, and on November 24, 2006, FEVI filed its Revised Application. FEVI requested Commission approval for the following:

- Rates set forth to be effective January 1, 2007;
- Forecast Cost of Service (Revenue Requirements) for 2007;
- Allowable capital expenditures forecast for 2007, other than those expenditures that require a Certificate of Public Convenience and Necessity ("CPCN");
- Forecast revenue proposed for 2007; and
- The December 31, 2005 year- end balance in the RDDA.

By Order No. G-161-06 dated December 18, 2006, the Commission approved the following:

- The December 31, 2005 year-end balance in the Revenue Deficiency Deferral Account in the amount of $48,731,214;
- Permanent rates effective January 1, 2007 for RGS, AGS, SCS-1, SCS-2, LCS-1, LCS-2, LCS-3, LCS-13, HLF, and ILF rates classes as proposed in the Revised Application. The Commission also approved permanent rates effective January 1, 2007 for Firm Transportation, summer Interruptible Transportation, and winter Interruptible Transportation rates as proposed in the Revised Application;
- The forecast Cost of Service and Revenues for 2007 as filed in the Revised Application; and
- Allowable capital expenditures for 2007, other than those expenditures that require a CPCN, which will be reviewed in separate regulatory processes, as included in the Revised Application.

2.6 2008-2009 Extension of 2006-2007 Settlement

On January 22, 2007, FEVI filed its application for approval of a two-year extension of the 2006-2007 Revenue Requirements Negotiated Settlement Agreement terms for 2008 and 2009 (the

"FEVI Extended Settlement Agreement"). By Order No. G-34-07 dated March 23, 2007, the Commission approved the two-year extension.

The Commission directed that FEVI provide an Integrity Management Plan for Pipeline Facilities commencing for the 2007 forecast year and annually up to and including 2010.

2.7 2007 Settlement Update of 2008 Revenue Requirements

On October 5, 2007, FEVI filed its 2007 Settlement Update filing in accordance with the FEVI Extended Settlement Agreement. Further on November 2, 2007, FEVI filed a amendment, and on November 30, 2007, FEVI filed its Revised Application to update the 2008 ROE for FEVI to 9.32 percent in response to the Commission setting the benchmark ROE at 8.62 percent pursuant to Commission Letter No. L-93-07. In the application, FEVI requested Commission approval for:

- Rates set forth to be effective January 1, 2008;
- Forecast Cost of Service (Revenue Requirements) for 2008;
- Allowable capital expenditures forecast for 2008, other than those expenditures that require a CPCN;
- Forecast revenue proposed for 2008;
- The December 31, 2006 year- end balance in the RDDA; and
- Departure from using the Uniform System of and to prepare reports using the New Code of Accounts, providing both a resource-based view and an activity-view.

By Order No. G-154-07, dated December 11, 2007, the Commission approved the following:

- The December 31, 2006 year-end balance in the revenue Deficiency Deferral Account in the amount of $42,626,420;
- The permanent rates effective January 1, 2008 for RGS, AGS, SCS-1, SCS-2, LCS-1, LCS-2, LCS-3, LCS-13, HLF, and ILF rate classes as well as Firm Transportation, summer Interruptible Transportation, and winter Interruptible Transportation rates as proposed in the Revised Application, effective January 1, 2008 for rates; and
- The forecast Cost of Service and Revenues for 2008 as filed in the Revised Application
- Allowable capital expenditures for 2008, other than those expenditures that require a CPCN, which will be reviewed in separate regulatory processes, as included in the Revised Application.

2.8 2008 Settlement Update of 2009 Revenue Requirements

On October 8, 2008, FEVI filed its 2008 Settlement Update filing in accordance with the FEVI Extended Settlement Agreement. Further, on October 17, 2008, FEVI filed an amendment and on December 3, 2008, FEVI filed its Revised Application supplemented by a filing on December 9, 2008. In the application, FEVI requested Commission approval for the following:

- Rates set forth to be effective January 1, 2009;
- Forecast Cost of Service (Revenue Requirements) for 2009;
- Allowable capital expenditures forecast for 2009, other than those expenditures that require a CPCN;
- Forecast revenue proposed for 2009;
- The December 31, 2007 year- end balance in the RDDA;
- Proposals to deal with the event that the pipeline project to Whistler ;
- Deferral account treatment of incremental costs associated with the implementation of IFRS Implementation, to be amortized beginning 2011; and
- Deferral account treatment of incremental costs associated Olympic and Paralympic Games Security, to be amortized beginning 2011.

By Order No. G-192-08, dated December 12, 2008, the Commission approved the following:

- The December 31, 2007 year-end balance in the Revenue Deficiency Deferral Account in the amount of $27,907,609;
- The permanent rates, effective January 1, 2009, for RGS, AGS, SCS-1, SCS-2, LCS-1, LCS-2, LCS-3, LCS-13, HLF, and ILF rates classes as proposed in Schedules 28D and 28E of the Updated Application. The Commission also approves permanent rates effective January 1, 2009 for Firm Transportation ("FT"), summer Interruptible Transportation ("IT"), and winter IT rates as proposed in Schedule 28F of the October 17 filing;
- The permanent rate for Firm Transportation to Whistler as calculated in the December 9 filing;
- The forecast Cost of Service and Revenues for 2009 as filed in the Oct 17 filing;
- Proposals to deal with the event that the pipeline project to Whistler is energized in 2009 and conversion of the Whistler system is complete such that natural gas is flowing prior to year end as contained in Section 2 of the Application;
- The recording of the incremental costs in the requested IFRS deferral account and the Olympic and Paralympic Games deferral account; and
- To track the monthly activity in RDDA and when the account has reached an actual zero balance, FEVI was to file, within 30 days, a proposal to the Commission for the disposition of the surplus collected along with recommended rate changes.

2.9 2010-2011 Revenue Requirements

On June 29, 2009, FEVI filed an application for approval of its 2010 and 2011 Revenue Requirements, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account balance as at December 31, 2008. The Application was filed, pursuant to sections 59 to 61 and 89 of the Act and section 2.2 of the Special Direction issued pursuant to Order in Council 1510. FEVI requested no change in the 2009 sales service rates and a reduction to rates for firm transportation service, other than those customers who have specified rates in their transportation service agreements, in the amount of 4.75 percent.

Notable in the application were the significant changes taking place in the external operating environment, including:

- Evolving energy and environmental policies;
- The changing expectations of customers, regulators, and other stakeholders;
- FEI's level of competitiveness as an energy provider; and
- Changing economic and demographic realities.

A Negotiated Settlement Process commenced on October 29, 2009 and concluded on November 5, 2009, and on November 26, 2009, the Commission issued Order No. G-140-09 approving the 2010-2011 FEVI NSA including, among other things, the following:

- User per customer rates as applied for;
- EEC Funding for 2010:
    - Reallocate from residential and commercial EEC programs an additional $0.4 million to low income and rental housing programs (bringing the total of for those programs to $0.6 million for 2010);
    - Innovative technologies funding be $0.478 million, and will be managed as a separate segment of the overall portfolio and have a weighted average Total Resource Cost of 1.0 or more;
- EEC Funding for 2011:
    - Residential and commercial program funding for 2011 be $4.726 million;
    - Reallocate from residential and commercial EEC programs an additional $0.4 million to low income and rental housing programs (bringing the total of for those programs to $0.6 million for 2011);
    - Innovative technologies funding be $0.956 million, and will be managed as a separate segment of the overall portfolio and have a weighted average Total Resource Cost of 1.0 or more and FEVI will report on innovative technology programs as part of the annual EEC report;
- Alternative Energy Solutions (now referred to as Thermal Energy Solutions or "Thermal Energy"):

    - Thermal Energy mean Geo-exchange, Solar-thermal and District Energy Systems;
    - FEI will be pursuing Thermal Energy projects within the FEVI service area and costs incurred by FEI will not be recovered in FEVI's natural gas service rates but those costs will be directly charged to the FEI New Energy Solutions Deferral Account;
- Natural Gas Vehicles ("NGV"):
    - Service Rate Schedule was approved;
    - NGV Grants will be accounted for on a net-of-tax basis in a deferral account and amortized over a five year term;
    - Marketing costs in support of NGV that are included in the Application are appropriately included in the 2010 and 2011 cost of service;
- CPCN Threshold to remain at $5 million;
- Category A Capital be $188,000 for 2010 and $154,000 for 2011;
- Category C Capital be $4.4 million in 2010 and $4.1 million in 2011;
- Reduction in O&M from the amount requested in the Application by $0.874 million in 2010 and by $0.947 million in 2011, resulting:
    - Reduction to the Shared Services costs from FEI in the amount of $0.339 million in 2010 and $0.491 million in 2011 ;
    - Reduction to Corporate Services costs from FHI in the amount of $0.535 million in 2010 and $0.54 million in 2011;
- Total depreciation expense of $21.8 million in 2010 and $26.0 million in 2011;
- An estimate of net removal costs of $0.343 million in 2010 and $0.344 million in 2011 be included in the cost of service, with the variance between actual realized net removal costs and the estimated amounts be recorded in a new deferral account, entitled "Removal Cost Deferral Account". The amount accumulated in the Removal Cost Deferral Account over the two-year period will be recovered from or returned to customers in 2012;
- Change in the Overheads Capitalized rate to 14 percent of Gross O&M for 2010 and 2011;
- Defer the 2010 revenue requirements impact of IFRS to be reflected in the revenue requirements in 2011 up to a maximum of $2.0 million with amounts, if any, over $2.0 million be deferred and recovered in rates after 2011;
- The forecast balance in the 2009 RSA of $2.962 million be amortized equally over 2010 and 2011 to all customers, other than the VIGJV and Squamish as follows:
    - $2.677 million to Core Market
    - $0.246 million to BC Hydro
    - $0.039 million to FEW

- Any variance between the forecast and actual 2009 RSA balance will be captured in the Rate Stabilization Deferral Account ("RSDA")

- Variance between forecast cost of service and actual cost of service, other than O&M, are items that will be "trued up to actual" as per the Special Direction. The allowed ROE will be adjusted to that approved which will apply to actual rate base. The RSDA will be established to record:
    - Differences in 2010 and 2011 between the net revenue received and the actual "trued-up" cost of service, excluding O&M variances from forecast; and
    - Any accumulated revenue deficiency in the RDDA after December 31, 2009
- Any balance in the RSDA will be amortized into the cost of service after 2011. How any balance in the RSDA will be allocated among customer classes and the period over which any balance in the RSDA will be amortized into cost of service will be deferred to a future proceeding.
- Rates for transportation customers, effective January 1, 2010 (other than those that have specified rates set out in their contracts (VIGJV and Squamish) are;
    - BC Hydro: Firm Transportation Rate $0.830 per GJ; Summer Interruptible Rate $0.830 per GJ; and Winter Interruptible Rate $1.1330 per GJ;
    - FEW: Firm Transportation Rate $0.930 per GJ;
    - These rates are subject to changes flowing from the Commission's impending decision on the FEU 2009 ROE and Capital Structure Application by a formula of for every 1 basis point difference in the approved ROE as compared to the current ROE of 9.17 percent will cause the firm and interruptible rates to change in the same direction by 0.034 cents per GJ rounded to the nearest tenth of a cent.

As part of reaching the Agreement with the Parties and upon acceptance of the Agreement by the Commission, FEVI agreed to withdraw its requests related to NGV and Biogas as follows:

- NGV:
    - Rate Schedule 6C NGV Compression and Refueling Service and Rate Schedule 6A NGV Refueling Service;
    - The Compression Service Test;
    - NGV non-rate base deferral account; and
    - The Parties agreed that the withdrawal of the requests was done without prejudice to FEVI's right to bring forward similar requests in 2010, 2011 or in the future; acknowledged that FEVI intended to develop this area of business; and FEVI anticipated bringing forward applications on NGV projects on a case-by-case basis.
- Biogas:
    - All requests related to Biogas; and

- the Parties agreed that FEVI would bring forward an application for Biogas (the "Biogas Application") during the test period that would:
  - Address the economic assessment model;
  - Provide Biogas rates (including green rate, transportation rate, etc.);
  - Provide recovery of costs associated with providing Biogas service; and
  - FEVI may include any Biogas Projects under development at that time and that FEVI may apply for Commission approval of individual Biogas Projects at any time, either prior to the Biogas Application or afterward.

Further, on December 16, 2009, the Commission issued its Decision and Order No. G-158-09 on the FEU 2009 ROE and Capital Structure Application setting the ROE for FEI (the benchmark) to 9.50 percent effective July 1, 2009, and determined that FEVI should be allowed a 50 basis points premium over FEI's ROE. FEVI's equity ratio remained at 40 percent, and its ROE was set at 10.00 percent, effective January 10, 2010.

2.10 Summary

As discussed above, FEVI has met the expectations of its regulatory commitments through the settlement periods. Consequently, the settlement agreements coupled with annual reviews and settlement updates have served their purpose by aligning the interest of FEI's customers, stakeholders, and shareholder.

3 FORTISBC ENERGY (WHISTLER) INC.

Until 2009, FEW owned and operated a propane gas distribution system in Whistler. The original propane distribution system was established in 1980.

Construction of the natural gas pipeline lateral (the "Pipeline Project") connecting the Resort Municipality of Whistler ("RMOW") to the transmission system of FEVI was completed in April 2009. Throughout the period from May to August, 2009, the piped propane system and customer appliances were converted to natural gas. The distribution system now consists of an underground distribution piping system and IP/DP station at Function Junction in Whistler. Natural gas is received at the IP/DP station from the Intermediate Pressure Line of FEVI which interconnects with the FEVI transmission line at FEVI's Squamish station.

What follows, is a brief synopsis of the FEW's regulatory history by reviewing FEW's application to convert Whistler from propane to natural gas, followed by its applications and Commission decisions for each year since 2006.

3.1 2005 CPCN Application to Convert Whistler from Propane to Natural Gas

On December 16, 2005, FEW filed an application with the Commission that included requests for the following:

- A CPCN to convert the FEW system from propane to natural gas;
- Approval to enter into a long-term natural gas transportation agreement with FEVI;
- Approval to make a capital contribution to FEVI for the construction of an intermediate pressure pipeline to connect Whistler with the FEVI high pressure transmission system at Squamish and to add that contribution to rate base;
- Approval to amortize the net book value of the propane facilities; and
- Approval to recover the pipeline study costs incurred prior to 2004.

In Order No. C-3-06, dated June 26, 2006, the Commission granted the following:

- A CPCN to convert FEW's system to natural gas;
- Additions to FEW's rate base subject to cost risk-sharing mechanisms;
- A Transportation Services Agreement and a Contribution Agreement between FEVI and FEW;
- Permission for FEW to discontinue propane service to Whistler when natural gas service is fully in place; and
- Commencing September 30, 2006, FEW was to file quarterly progress reports on the schedule and costs of the Whistler conversion, followed by a final completion report.

3.2 2007 Rates

On December 7, 2006, FEW applied to the Commission to roll over existing rates and clarify accounting treatment for certain deferral accounts. By Order No. G-172-06, dated December 21, 2006 the Commission approved the continuation of:

- Existing rates and the Rate Rider 'A' adjustment mechanism; and
- The recording of variances in the Interest Rate Differential deferral account, Property Tax deferral account, Sales Margin Differential deferral account and Deferred Return on Equity variance account.

3.3 2008 Rates

On November 16, 2007, FEW applied to the Commission for Deferral Account Continuity for 2008. At the time, FEW expected the natural gas pipeline lateral connecting the RMOW to the

FEVI transmission system and conversion of its system to natural gas to be completed in mid-2009. FEW reiterated its intent to file a two-year revenue requirements application for 2009 and 2010 that would address appropriate ROE, capital structure, rates and deferral account disposition. The Commission approved FEW's Deferral Account Continuity request in Order No. G-146-07, dated November 29, 2007, as well as the establishment of a non-rate base deferral account to record consulting costs incurred regarding FEW's capital structure and ROE.

3.4 2009 Revenue Requirements and Rates and Return on Equity and Capital Structure Application

On October 3, 2008, FEW filed its 2009 Revenue Requirements and Rates and Return on Equity and Capital Structure Application. An update to the Application was filed on November 21, 2008 to address a number of matters. On April 7, 2009, the Commission rendered its Decision on the Application and issued Order No. G-35-09. In the Decision the Commission approved a number of deferral accounts such as Margin Deferral, Interest Deferral Account, and Property Tax Deferral. The Commission also approved other deferrals related to the CPCN to convert Whistler from a propane system to natural gas; and other one-time deferrals were also approved. FEW did file a Reconsideration of this Decision that was limited in nature and based on a mistake of fact that $1.076 million dollars of conversion costs represented the tax benefit of a carry back that was not returned to customers. The Decision on this particular point would have denied FEW from proper recovery of $1.076 million of conversion costs. Commission Order No. G-52-09 dated May 15, 2009 approved the request in the Reconsideration by FEW.

3.5 2010-2011 Revenue Requirements and Rates Application

On November 9, 2009, FEW applied for approval of its 2010-2011 Revenue Requirements and Rates Application to amend its rates, effective January 1, 2010, pursuant to sections 58, 60, 61 and 89 of the Act. Among other things, the Application sought:

- To unbundle tariff rates, resulting in a decrease of approximately 13.5 percent of total tariff revenue in 2010 as compared to 2009, and a further 2.9 percent decrease in 2011;
- Inclusion in FEW's rate base of the costs of the Whistler Conversion in the amount of $11.87 million ($5.86 million in excess of the maximum Conversion costs approved in Orders No. C-3-06 and C-53-06);
- Amendments to certain Pipeline Project costs; and
- Changes to certain accounting treatments to harmonize the FEW Tariff and Special Rates Schedules with FEI and FEVI.

On December 16, 2009, the Commission issued its Decision and Order No. G-158-09 on the FEU 2009 ROE and Capital Structure Application setting the ROE for FEI (the benchmark) to 9.50 percent effective July 1, 2009, and determined that FEW should be allowed a 50 basis points premium over FEI's ROE. FEW's equity ratio remained at 40 percent, and its ROE was set at 10.00 percent, effective January 1, 2010.

On September 1, 2010, the Commission issued Order No. G-138-10, set rates as interim, pending the finalization of the Pipeline Project costs. Order No. G-138-10 approved, among other things, the following:

- An unbundled rate decrease of approximately 13.5 percent in 2010 and a further 2.9 percent in 2011, adjusted to reflect any Commission-approved quarterly adjustments to the Gas Cost Recovery Charge and ROE adjustments required under Order No. G-158-09, and directed FEW to:
  - Adopt IFRS for regulatory purposes as the same time as such standards have been adopted for financial accounting purposes;
  - Establish separate sub-accounts to track Harmonized Sales Tax adjustments related to O&M and capital items;
  - Apply an overheads capitalization rate of 14 percent in 2010 and 2011;
  - Record an estimate of actual removal costs incurred in 2010 and 2011 rather than a provision for negative salvage; and
  - Include in rate base for recovery from customers $11.03 million in costs related to the Conversion Project.
- Amendments to certain Pipeline Project costs as requested in the Application;
- Calculate revised interim rates based on the directives in Order No. G-158-09;
- Revised interim rates to remain in effect until all Pipeline Project costs are finalized or until addressed by further order of the Commission; and
- Difference, if any, between the 2010 interim and permanent delivery rates that are determined following final disposition of the Pipeline Project costs or upon issuance of a further order making rates permanent, those amounts are subject to refund/recovery, with interest at the average prime rate of FEW's principal bank, as soon as practicable.

As a result ongoing negotiations with the Pipeline contractor in trying to reach resolution of the final Pipeline Project costs, FEW anticipates a further six or more months may be required before the final Pipeline Project costs are know. On April 14, 2011, FEW applied for approval of the interim rates on a permanent basis, and proposed the creation of a rate-base deferral account, entitled "Pipeline Contribution Cost Variance Deferral Account" to record any differences between:

a) the cost of service from April of 2009 to December 31, 2011 associated with the Pipeline Contribution that is included in the calculation of the interim rates ($17.034 million), and

b) the cost of service from April of 2009 to December 31, 2011 associated with the final Pipeline Contribution amount.

FEW also proposed to provide as part of its 2012-2013 revenue requirements application an estimate of the final contribution amount and that the forecast balance in the Pipeline

Contribution Cost Variance Deferral Account (the Forecast Balance) be returned to customers in 2012 with the difference, if any, between that Forecast Balance returned to customers in 2012 rates, and the final actual balance in that account once the final Pipeline contribution is known, remain recorded in that account for disposition in a future revenue requirements application. A decision on this application had not yet been rendered at the time of filing its 2012-2013 revenue requirements application.

3.1 Summary

Apart from a reduction in overall rates as a result of the conversion from propane to natural gas, there have been several other benefits that Whistler customers have enjoyed, these include:

- Significantly improved system safety and reliability;
- Reduction in Greenhouse Gas Emissions;
- Contribution towards the RMOW's comprehensive community sustainability plan;
- Access to commodity-related benefits of being a part of the gas supply portfolio for FEI, which is a large regional buyer of natural gas and a significant holder of various natural gas storage, transportation, peaking and other gas supply arrangements designed to mitigate and optimize gas supply costs; and
- Access to necessary resources, expertise and training in all areas affecting gas distribution facilities.

STATUS OF PAST DIRECTIVES

No.	BCUC Order and Directive	Details	Status, Action Taken, Relevant Filing Dates and Comments	Section in this Application
G-141-09 – FEI (then TGI) 2010-2011 Revenue Requirements Negotiated Settlement Agreement				
1.	Appendix A, Page 10, Section 13	**Alternative Energy Services:** TGI will capture costs and revenue on a project specific basis and will report on AES projects as part of the next Revenue Requirements application.	Included in this RRA.	Appendix G
2.	Appendix A, Page 13, Section 22	**Depreciation Study:** TGI will undertake an updated depreciation study to be included as part of TGI's next Revenue Requirements Application. This study will address the methodology and rates for net negative salvage to be included in cost of service for future periods. TGI will work with Commission staff and a depreciation rate specialist in determining the requirements of the study.	Depreciation Study completed, including negative salvage discussion.	Section 5.4 and Appendix E-1
3.	Appendix A, Pages 13 and 14, Section 23	**Negative Salvage:** Any variances between the actual amount of net removal costs realized and the estimated amounts included in cost of service will be recorded in a new deferral account created for this purpose that will be called the "Removal Cost Deferral Account". The amount accumulated in the Removal Cost Deferral Account over the two year period of this Agreement will be recovered from (or returned to) customers in 2012. TGI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the removal costs and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.	Removal cost variances have been collected in the Removal Cost Deferral Account and are being recovered from customers in 2012 and 2013. Negative salvage discussion included in Depreciation Study; Asset Removal Costs and Asset Retirement Obligations report also filed.	Section 5.4 and Appendix E-2
4.	Appendix A, Page 14, Section 24	**Unrecovered Losses:** The Parties agree that the treatment for unrecovered losses as proposed in the Application is acceptable for the 2010 and 2011 period covered by this agreement. TGI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the unrecovered losses and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.	Analysis of unrecovered losses and disposition included in Loss Analysis Report.	Section 5.4 and Appendix E-3

No.	BCUC Order and Directive	Details	Status, Action Taken, Relevant Filing Dates and Comments	Section in this Application
G-140-09 – FEVI (then TGVI) 2010-2011 Revenue Requirements Negotiated Settlement Agreement				
5.	Appendix A, Page 14, Section 16	**Depreciation Study:** The Parties agree that TGVI will undertake an updated depreciation study to be included as part of TGVI's next Revenue Requirements Application. This study will address the methodology and rates for net negative salvage to be included in cost of service for future periods. TGVI will work with Commission staff and a depreciation rate specialist in determining the requirements of the study.	Depreciation Study completed, including negative salvage discussion.	Section 5.4 and Appendix E-1
6.	Appendix A, Page 15, Section 17	**Negative Salvage:** TGVI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the removal costs and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.	Removal cost variances have been collected in the Removal Cost Deferral Account and are being recovered from customers in 2012 and 2013. Negative salvage discussion included in Depreciation Study; Asset Removal Costs and Asset Retirement Obligations report also filed.	Section 5.4 and Appendix E-2
7.	Appendix A, Page 15, Section 18	**Unrecovered Losses:** TGVI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the unrecovered losses and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.	Analysis of unrecovered losses and disposition included in Loss Analysis Report.	Section 5.4 and Appendix E-3
8.	Appendix A, Page 17, Section 22	**RSDA Balance:** The Parties agree that any balance in the RSDA will be amortized into the cost of service after 2011. However, the Parties agree that the following issues will be deferred to a future proceeding: (a) how any balance in the RSDA will be allocated among customer classes; and (b) the period over which any balance in the RSDA will be amortized into the cost of service.	The future proceeding during which this issue will be addressed is the Amalgamation and Rate Design Application to be filed Q3 2011.	N/A

No.	BCUC Order and Directive	Details	Status, Action Taken, Relevant Filing Dates and Comments	Section in this Application
G-158-09 – FEU (then Terasen Utilities) 2009 ROE and Capital Structure Decision				
9.	Directive No. 7	7. TGVI and TGW are to file in their respective next revenue requirement applications evidence on the equity component that best reflects their respective long-term business risks.	FEVI and FEW are requesting leave to defer filing evidence for theie capital structures until the Amalgamation and Rate Design Phase 'A' Application to be filed in Fall 2011.	Section 5.7.2
G-138-10 – FEW (then TGW) 2010-2011 Revenue Requirements Decision				
10.	Appendix A, Page 6, Section 2.1.2	**RSAM:** The Commission Panel agrees that aligning TGW's methodology with that of TGI is beneficial. The creation of the RSAM account to replace the Sales Margin Differential Account is approved. The commencement of amortization of the RSAM account over three years commencing in 2012 is also approved. The Commission Panel directs TGW to provide details of any balance accumulated in the RSAM deferral account during 2010 and 2011 in its next revenue requirements application, and to propose a method for recovery from, or refund to, customers at that time.	Amounts accumulated in 2010 and proposed amortization period included in Rate Base Deferrals section of the Application.	Section 6.3
11.	Appendix A, Page 7, Section 2.1.3	**DSM/EEC:** The Commission Panel shares RMOW's concern about the lack of DSM initiatives in TGW's Application, and directs TGW to develop plans for DSM programs, consistent with British Columbia's energy objectives, in its next revenue requirements application.	EEC programs will be offered in Whistler; details included in the EEC Report	Appendix K

No.	BCUC Order and Directive	Details	Status, Action Taken, Relevant Filing Dates and Comments	Section in this Application
12.	Appendix A, Page 9, Section 2.4	**Tax Variance Deferral Account:** The Commission Panel considers that the proposal to use a Tax Variance Deferral Account is an appropriate mechanism for the regulatory treatment of taxes. The Commission Panel agrees with the comments of BCOAPO concerning separation of operating and capital adjustments, and for those reasons directs TGW to establish separate sub-accounts to specifically track HST adjustments related to O&M and capital items and to provide this information with future revenue requirements applications. TGW is also directed to provide details of any balance accumulated in the Tax Variance Deferral Account during 2010 and 2011 and to propose a method for recovery from or refund to customers in its next revenue requirements application.	The Report "Harmonized Sales Tax Impacts on the 2010-2011 Revenue Requirements of the Terasen Utilities" was filed on September 27, 2010 indicating that, net of implementation costs, there were no amounts to be returned to customers. The amount was approved by Commission Letter L-96-10 (see Item 17 below)	N/A
13.	Appendix A, Page 10, Section 2.5.1	**IFRS:** The Commission Panel considers that the use of deferrals accounts is an appropriate mechanism for regulatory purposes to account for the transitional and ongoing impacts of the conversion of financial accounting standards to IFRS as described by TGW. TGW is directed to provide a report containing the details, with descriptions and explanations, of the amounts transferred to the new deferral accounts. The report is to be provided to the Commission within 60 days of the effective date of TGW's adoption of IFRS. TGW is further directed to provide details of any balance accumulated in the deferral accounts during 2010 and 2011 and to propose a method for recovery from or refund to customers where appropriate.	Due to the current uncertainty around the adoption of IFRS or US GAAP, the triggering event (adoption of IFRS) has not occurred. Any balances accumulated in the deferral accounts during 2010 and 2011 are included in the discussion of Rate Base Deferral Accounts.	Section 6.3
14.	Appendix A, Page 12, Section 2.7.2	**Overheads Capitalized:** The Commission Panel agrees that aligning TGW's overhead capitalization rate with that of TGI and TGVI is appropriate in order to achieve consistent accounting treatment amongst the related utilities. The Commission Panel directs TGW to apply an overhead capitalization rate of 14 percent in 2010 and 2011 in order to remain consistent with TGW's sister companies, TGI and TGVI. TGW is further directed to file a report with the Commission discussing overhead capitalization rates when the proposed accounting standards have been clarified and approved.	Due to the current uncertainty around the adoption of IFRS or US GAAP, the triggering event (clarification and approval of proposed accounting standards) has not occurred.	N/A

No.	BCUC Order and Directive	Details	Status, Action Taken, Relevant Filing Dates and Comments	Section in this Application
15.	Appendix A, Page 13, Section 2.7.3	**Negative Salvage:** The Commission Panel takes note of the depreciation methods and policies adopted for TGI and TGVI as part of their respective Negotiated Settlement Agreements for 2010 and 2011. As noted in previous sections above, the Commission Panel generally agrees that it is beneficial to align TGW's policies and methodologies with those of TGI and TGVI where appropriate. Accordingly, the Commission Panel approves the depreciation policies and practices requested by TGW, for the forecast years 2010 and 2011, subject to the removal of the negative salvage provision from the composite depreciation rate as discussed above. Notwithstanding the foregoing approval, the Commission Panel is not convinced that the elimination of the negative salvage provision in the determination of the composite depreciation rate is appropriate on an ongoing basis. TGW is directed to include evidence with respect to negative salvage in future revenue requirement applications. The Commission Panel also suggests that consistent with the above comments concerning the alignment of TGW's policies and methodologies with those of TGI and TGVI, those utilities also include evidence with respect to negative salvage in their future revenue requirement applications.	Removal cost variances have been collected in the Removal Cost Deferral Account and are being recovered from customers in 2012 and 2013. Negative salvage discussion included in Depreciation Study; Asset Removal Costs and Asset Retirement Obligations report also filed.	Section 5.4 and Appendix E-2
16.	Appendix A, Page 14, Section 2.7.4	**IFRS Adoption:** The Commission Panel further directs TGW to adopt IFRS for regulatory purposes as at the same date it adopts IFRS for financial accounting purposes. In order to mitigate uncertainty surrounding accounting standards, TGW is directed, for regulatory purposes, to adopt only those accounting standards that have received final approval and are in force. TGW is directed to record any IFRS reconciliation adjustments in the IFRS Transitional Deferral Account. The Commission Panel directs TGW to provide, in its next revenue requirements application, details of any balances accumulated in the IFRS Transitional Deferral Account and to propose a method to recover from, or refund to, customers such balances at that time.	Whistler will be adopting US GAAP and not IFRS for financial accounting purposes. The accounting treatment to be adopted for regulatory accounting purposes is subject to a separate proceeding (FortisBC Utilities Application to Adopt US GAAP). Any balances accumulated in the deferral accounts during 2010 and 2011 are included in the discussion of Rate Base Deferral Accounts.	Section 6.3

No.	BCUC Order and Directive	Details	Status, Action Taken, Relevant Filing Dates and Comments	Section in this Application
L-96-10 – FEU (then Terasen Utilities) Harmonized Sales Tax Impacts in the 2010-2011 Revenue Requirements				
17.	Paragraph 4	**HST Impacts:** The Commission accepts that the final amounts to be returned to customers, and the potential recovery of any implementation costs, will be addressed as part of TGI, TGVI and TGW's 2012 Revenue Requirements Applications.	Included in this RRA Rate Base Deferral Accounts.	Section 6.3
G-194-10 – FEI (then TGI) Biomethane Decision				
18.	Page 58, Section 5.1	**Biomethane Variance Account (BVA) and O&M and Capital Costs:** Commencing January 1, 2012, the treatment of all costs related to and resulting from ongoing Biomethane operations will be reviewed by the Commission as a component of Terasen's Revenue Requirements Application (RRA). Within TGI's RRA for 2012 and onwards, Terasen is directed to include a separate section providing actual and forecasted Biomethane operating, maintenance and capital costs and an analysis of these costs. This disclosure is to include, amongst other things, a breakdown of costs incurred by category of past and projected years and an explanation of the financial results experienced and expected in the test period. Details of all accumulations within the BVA should also be provided.	Included in this RRA.	Appendix J
19.	Page 59, Section 5.1 and Directive No. 10, bullet 3	**Biomethane Non-Rate Base Deferral Accounts:** As part of its 2012 Revenue Requirements Application, TGI is directed to report the total values accumulated in the New Deferral Accounts from inception as well as a breakdown of the costs accumulated in the accounts by nature and dollar amount. Further, the Company is directed to present within its annual regulatory report to the Commission, the total value of each of these deferral accounts, net of any amortization. This is to be done each year until the remaining balance is $nil.	Included in this RRA.	Appendix J
C-1-11 – FEVI (then TGVI) Victoria Regional Office CPCN Decision				
20.	Appendix A, Page 13, Section 4.1	**TGVI Staffing Levels:** Commission Panel concludes that TGVI must undertake a detailed review and evaluation to assess the reasonableness of the number of staff and vehicles that TGVI reasonably needs to service the Victoria area. The detailed analysis of these matters which is requested in Section 5.1 could supplement an evaluation of the efficiency of TGVI's Victoria operations in its next revenue requirements proceeding.	TGVI Staffing Report filed February 28, 2011, CPCN C-6-11 granted to construct the Victoria Regional Facility as applied for.	N/A

No.	BCUC Order and Directive	Details	Status, Action Taken, Relevant Filing Dates and Comments	Section in this Application
G-2-11 – FEU (then Terasen Utilities) Administration of the Basic Charge to a Daily Basis				
21.	Directive No. 4	4. Terasen Utilities should provide any cost savings due to the change in the administration and the invoicing of the Basic Charge from a monthly basis to a daily basis in the next Revenue Requirement Applications for the Terasen Utilities.	Included in this RRA.	Section 5.3.7
G-14-11 – FEU (then Terasen Utilities) Long Term Resource Plan Decision				
22.	Page 17	Terasen states that it plans to submit a request for on-going funding beyond 2011 for all Terasen Utilities in its 2012 Revenue Requirement Application.	Included in this RRA.	Section 5.3.8
G-27-11 – FEI (then TGI) Fort Nelson 2011 Revenue Requirements Application Decision				
23.	Directive No. 4	Approval of the proposed 2011 capital expenditures including $3,015,650 of capital costs (excluding AFUDC) related to the Muskwa River Crossing Project (Project)...the Commission approves the inclusion of Project costs...in 2011 ratebase...the total amortization/depreciation projected in this Application shall be recorded as a reduction to the carrying amount of the Project Assets in 2012. The Project assets shall not attract AFUDC after the projected in-service date [October 1, 2011] included in this Application.	Included in this RRA.	Section 7 Fort Nelson Schedule 43
24.	Appendix A, Page 11, Section 3.6.4	TGFN has not yet proposed a recovery strategy for the IFRS Transitional Deferral account as one will be proposed in the next revenue requirements application, consistent with TGI, when the accounting changeover is complete.	Due to the current uncertainty around the adoption of IFRS or US GAAP, the triggering event (accounting changeover completed) has not occurred. Any balances accumulated in the deferral accounts during 2010 and 2011 are included in the discussion of Rate Base Deferral Accounts	Section 6.3

1 GENERAL ASSUMPTIONS

This appendix includes the inflation, tax rate and debt assumptions and supporting information used in the determination of 2012 and 2013 revenue requirements. Historic information from 2006 to 2010 has also been provided.

Please refer to the Summary of General Assumptions page of this appendix for detail information for 2006-2013.

2 INFLATION

Introduction

The forecast British Columbia CPI is used as a cost driver for aspects of the cost of service because it is widely regarded as a reasonable measure of the forecast inflation applicable to the Province. The CPI is generally used to index wages, salaries, pension, and various other expenses.

Review History Highlights (2006-2010 Actuals)

Pursuant to the provisions of the Settlement Agreements (Order No. G-51-03 and Order No. G-33-07), the B.C. CPI inflation forecast was determined as the average of the forecasts from four reputable industry sources: Conference Board of Canada, B.C. Ministry of Finance, RBC Financial Group and the Toronto-Dominion Bank. In addition to the forecast CPI, and also in accordance with the Settlement Agreements, an adjustment factor was applied to the B.C. CPI to arrive at the inflation applied the formula operating and maintenance expense and formula capital additions throughout the 2006 – 2009 PBR period. The following table provides a summary of the B.C. CPI and the adjusted CPI embedded in the revenue requirements from 2006-2010:

Table C-1: Historic B.C. CPI and TGI Adjustment Factors (2006-2010)

	2006	2007	2008	2009	2010
CPI	2.20%	2.00%	2.00%	2.10%	1.80%
Adjustment Factor	-1.45%	-1.32%	-1.32%	-1.39%	
Adjusted CPI	0.75%	0.68%	0.68%	0.71%	1.80%

Table C-2: Summary of sources and dates of CPI forecasts are as follows:

Source	Forecast Publish Date
Conference Board of Canada	October 2010
B.C. Ministry of Finance	February 2011
RBC Financial Group	April 2011
Toronto-Dominion Bank	March 2011

3 ATTACHMENTS

The following attachments are included with this appendix:

1. Summary of General Assumptions, 2006 – 2013
2. Conference Board of Canada CPI report
3. B.C. Ministry of Finance CPI report
4. Royal Bank of Canada CPI report
5. Toronto Dominion Bank CPI report
6. Bank of Nova Scotia short-term interest rates
7. Toronto Dominion Bank short-term interest rates
8. Canadian Imperial Bank of Commerce short-term interest rates
9. Royal Bank of Canada short-term interest rates

CANADA

With energy prices set to stay lofty for longer, we've revised up our 2011 CPI call by three ticks to 2.5%, although core should come in at a slightly tamer 1.6%, given its recent weakness. Growth is still on track to hit 2.8% for 2011, helped by a strong start, as rebounding manufacturing activity looks to take the Q1 growth rate to 4%. But with fiscal drag and rate hikes on their way in the second half of the year, economic growth should revert to a lower gear.

UNITED STATES

We've slashed our US first quarter growth rate to 2.8%, after having expected growth to top 4% a month ago, prior to the deepening supply shock to oil prices. The downward revision is centred on consumption, where weakness in wage gains, falling house prices and costly gasoline has put the squeeze on spending. Business capital spending also looks to be coming up short. We expect even slower growth in the second half, in part allowing for fiscal restraint that Republicans are pushing for. Our CPI targets are higher in the near term due to the shock to gasoline.

HISTORIC DATA

1 HISTORIC DATA

This appendix includes the historic Operating and Maintenance expenses, a history of FTEs, historic data of the Utility Income and Earned Return, Income taxes, Return on Capital, Utility Rate Base, Capital Expenditure, and Customer Service Call Volume information.

2 OPERATING AND MAINTENANCE EXPENSE HISTORY

The following table illustrates the O&M expenses years 2006-2013 in Resource view. A detailed O&M expense schedule by Resource and Activity view per company is included in this appendix with all years restated to reflect the current organization structure.

Table D-1: O&M Resourse View, 2006-2013

When the O&M expense is adjusted for inflation, the increase in FEU O&M per customer from 2006 through 2010 is virtually flat, increasing approximately 1.3% or an average of 0.3% per year over the five year period. The proposed O&M expense in 2013 results in an increase of approximately 6.8% or an average of less than 1% per year, when compared to 2006.

Table D-2: Nominal O&M per Customer is Stable

HISTORICAL AND FORECAST O&M EXPENSES BY CUSTOMER
($000)

4 FINANCIAL SCHEDULES

Historic data from 2006-2010 is provided, which includes Utility Income and Earned Return, Income taxes, Return on Capital, and Utility Rate Base per company. The consolidated view of FEU for the historic period is a summation of the individual Utilities without amalgamation adjustments. Amalgamation adjustments are discussed in Section 3 of the Application.

5 CAPITAL EXPENDITURES

Base capital expenditures and additions are provided per company from years 2006-2010.

6 CUSTOMER SERVICE DEPARTMENT

Actual call volumes for the Contact Centre is provided for the years 2008-2010.

7 ATTACHEMENTS

The following attachments are included with this appendix:

1. Historic and Forecast Operating and Maintenance Expense both in Resource and Activity view per company and combined.
2. Historic and Forecast Operating and Maintenance Expense by Business Unit per company.
3. Historic and Forecast FTE by Business Unit and Affiliation per company.
4. Historic Financial Summaries of Utility Income and Earned Return, Income taxes, Return on Capital, and Utility Rate Base per company.
5. Historic Capital Expenditure per company.
6. Customer Service Call Volume Data.

This call volume data is the information derived from the Peace data system and represents data entered by Accenture's (current outsourced provider) customer service representatives.

The 2009 call volumes were used to estimate staffing numbers, as this call volume was close to the average for 2008 to 2010 three year period.

Notes

Billing Calls refer to general customer service account inquiries including requests for account balances, payment information, processing of payments, and meter read investigation

Emergency calls refer to inbound calls from customers advising of a potential gas leak in their home environment, details are documented and a technician is immediately dispatched to investigate

Outbound collection calls refer to calls to customers who have been delinquent in payment on their outstanding account balance.

Inbound collections are calls received from customers who have been delinquent on their payment of their outstanding account balance and are looking to resolve the issue or to make payment arrangements. In addition, inbound calls include calls from customers with whom we have left a voice message in reference to their account.

Surrey, British Columbia V4N 0E8

Attention: Mr. James Wong
Director, Finance and Planning

Gentlemen:

Pursuant to your request, we have conducted a depreciation study related to the gas plant of FortisBC Energy Inc. at December 31, 2009. The depreciation study has developed depreciation rates for the Mainland, Vancouver Island, and Whistler systems. Our report presents a description of the methods used in the estimation of depreciation, the statistical analyses of service life and net salvage, and the summary and detailed tabulations of annual and accrued depreciation.

We gratefully acknowledge the assistance of FortisBC Energy Inc. personnel in the completion of the study.

Respectfully submitted,

GANNETT FLEMING INC.

LARRY E. KENNEDY
Director, Canadian Services
Valuation and Rate Division

FORTISBC ENERGY INC.
DEPRECIATION STUDY

CALCULATED ANNUAL DEPRECIATION ACCRUALS
RELATED TO GAS PLANT
AT DECEMBER 31, 2009

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study conducted by Gannett Fleming, Inc. ("Gannett Fleming") for FortisBC Energy Inc. (FortisBC) to determine the annual depreciation accrual rates and amounts for book and ratemaking purposes applicable to the original cost of gas plant at December 31, 2009. Separate annual accrual rates have been developed for the provision applicable to the average service life and net salvage components of depreciation expense for each of the FortisBC Energy Inc., FortisBC Energy Inc. (Vancouver Island) Inc., and FortisBC (Whistler) Inc. systems.

The depreciation accrual rates presented herein are based on generally-accepted methods and procedures for calculating depreciation. The service life estimates were based on analyses incorporating data through December 31, 2009, a review of Company practices and outlook as they relate to plant operation and retirement, and the service life and net salvage estimates for other gas transmission and distribution companies.

Part I, Introduction, of this report, contains statements with respect to the scope and plan of the report and the basis of the study. Part II, Methods Used in the Estimation of Depreciation, presents the methods used in the estimation of average service lives, survivor curves and net salvage, and in the calculation of depreciation. Part III, Results of Study, presents a summary of annual and accrued depreciation. Part lV, Service Life Statistics presents the statistical analyses of service life. Part V, Net Salvage Statistics presents the annual, 3 year moving average and the most recent 5 year moving average, statistical analysis of historic net salvage transactions. Part VI, Detailed Depreciation Calculations presents the detailed tabulations of annual and accrued depreciation.

BASIS OF THE STUDY

Depreciation. The annual and accrued depreciation were calculated by the straight line method using the average service life procedure and applied on a remaining life basis. The calculations of composite remaining life and annual depreciation accrual amounts were based on attained ages and estimated service life and net salvage characteristics for each depreciable group of assets.

Service Life and Net Salvage Estimates. The method of estimating service lives consisted of compiling the service life history of the plant accounts and subaccounts, reducing this history to trends through the use of Retirement Rate Method of analysis as further described in Part III of this report, and then applying judgment to make a final estimate of average service life. The results of the statistical analysis resulted in the forecasting of the trend of survivors for each depreciable group on the basis of interpretations of past trends and consideration of Company plans for the future. The combination of historical trend and the estimated future trend yielded a complete pattern of life characteristics from which the average service life was derived.

The service life estimates used in the depreciation calculations incorporated historical data compiled from the property records of the Company. Such data included plant additions, retirements, transfers and other activity from 1958 through 2009. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirement were obtained through discussions with operating and management personnel, and through a your of company facilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for gas plant. Iowa type survivor curves were used to depict the estimated survivor curves. The estimates of net salvage were based on judgment which incorporated analyses of available historical data, a review of policies and outlook with management, a general knowledge of the gas utility industry, and comparison of the net salvage estimates from studies of other gas utilities. The estimates of net salvage are expressed as the average net percent of the investment to be incurred or recovered upon its retirement. In order to comply with announcements from the Canadian Accounting Standards Board relating to the implementation of the International Financial Reporting Standards ("IFRS"), FortisBC has asked Gannett Fleming to develop separate annual accrual and accumulated depreciation calculations related to the requirements for net salvage. A summary of the calculations relating specifically to the net salvage requirement is presented in the Results section of this report.

RECOMMENDATIONS

The calculated annual depreciation accrual rates set forth herein apply specifically to gas plant as of December 31, 2009. Continued surveillance and periodic revisions are required to maintain use of appropriate depreciation rates. The survivor curves, amortization periods and net salvage percents determined in this study should be the basis for periodic recalculations. Complete depreciation studies which re-evaluate these parameters should be performed every three to five years.

PART II. METHODS USED IN THE ESTIMATION OF DEPRECIATION

PART II. METHODS USED IN THE ESTIMATION OF DEPRECIATION

DEPRECIATION

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy and obsolescence.

Service Value, in public utility regulation, means the difference between original cost and the net salvage value of gas plant.[1] Net Salvage Value is considered to be the amount received for property retired less any expenses incurred in connection with the sale of the asset, or in preparing the asset for sale.[2] As such, the depreciation study completed by Gannett Fleming and as presented in this report has developed annual accrual rates applicable to both the recovery of the original costs and separately for the net salvage component of the utility assets in service as at December 31, 2009.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders

[1]Federal Energy Regulatory Commission, Natural Gas Act, Part 201-Uniform System of Accounts Prescribed for Natural Gas Companies subject to the Provisions of the Natural Gas Act, Page 516-Definitions.

[2] Ibid, footnote 1

service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

The calculation of annual depreciation based on the straight line method requires the estimation of average life and salvage and the selection of group depreciation procedures. These subjects are discussed in the sections that follow.

ESTIMATION OF SURVIVOR CURVES

Average Service Life The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages. A discussion of the general concept of survivor curves is presented. Also, the Iowa type survivor curves are reviewed.

Survivor Curves The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval and is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

Iowa Type Curves The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family.

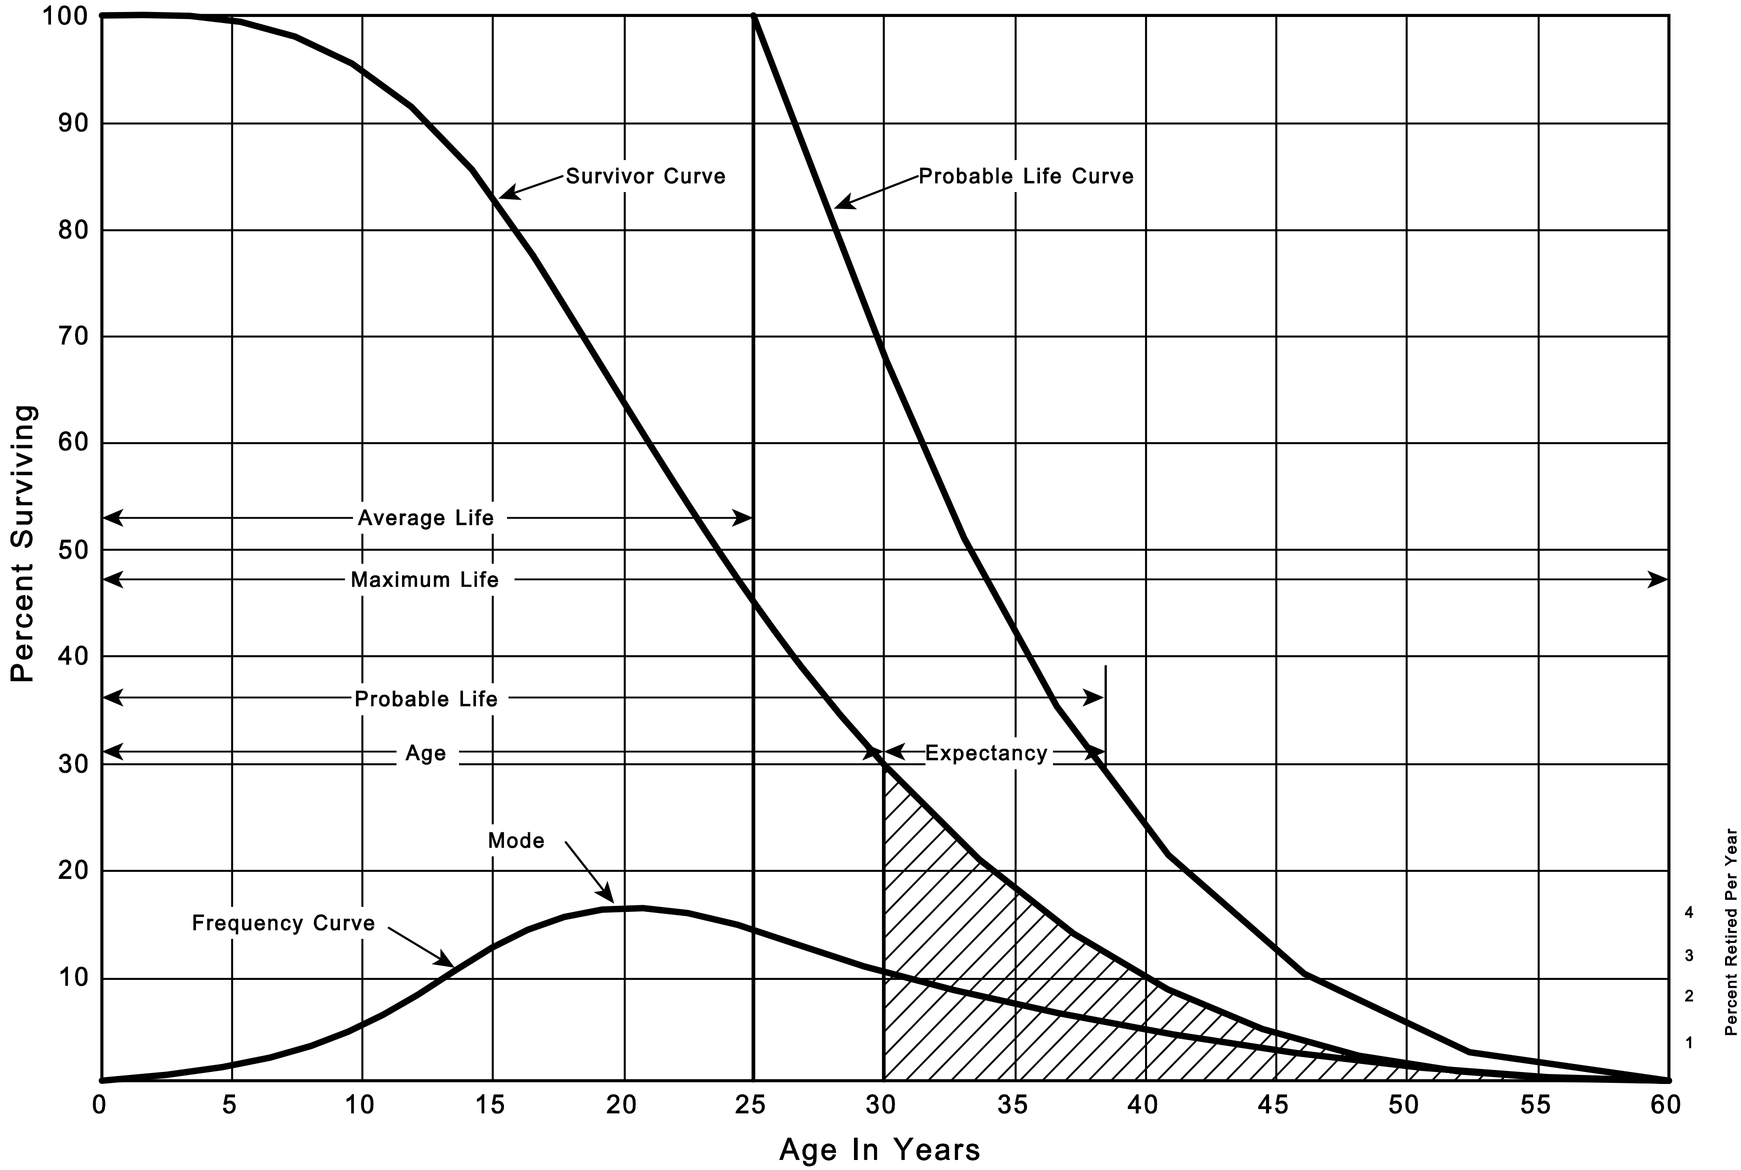

Figure 1. A Typical Survivor Curve and Derived Curves

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.[3] These type curves have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[4] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis[5] presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis. The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available or for which aged accounting experience is developed by statistically aging un-aged amounts and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text, and is also explained in several publications, including "Statistical Analyses of Industrial Property Retirements,"[6] "Engineering Valuation and Depreciation,"[7] and "Depreciation Systems."[8]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginnings of the age intervals during the same period. The period of observation is referred to as the experience band, and the band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records The property group used to illustrate the retirement rate method is observed for the experience band 2000-2009 during which there were placements during the years 1995-2009. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Tables 1 and 2 on the following pages. In Table 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 1995 were retired in 2000. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of

[a] Transfer Affecting Exposures at Beginning of Year
[b] Transfer Affecting Exposures at End of Year
[c] Sale with Continued Use
Parentheses denote Credit amount

time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Table 1 immediately above the stairstep line drawn on the table beginning with the 2000 retirements of 1995 installations and ending with the 2009 retirements of the 2004 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

In Table 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement. The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Table 3 on page II-16. The surviving plant at the beginning of each year from 2000 through 2009 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Table 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Tables 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2005 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

For the entire experience band 2000-2009, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Table 1). For example, the figure of 3,789, shown in Table 3 as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table. The original life table, illustrated in Table 4 on page II-17, is developed from the totals shown on the schedules of retirements and exposures, Tables 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of

Column 2 from Table 3, Column 12, Plant Exposed to Retirement.
Column 3 from Table 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 divided by Column 2.
Column 5 = 1.0000 minus Column 4.
Column 6 = Column 5 multiplied by Column 6 as of the Preceding Age Interval.

the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ as shown in Table 4 are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Tables 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

The original survivor curve is plotted from the original life table (column 6, Table 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

<u>Smoothing the Original Survivor Curve</u>. The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any

irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Table 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

<u>Field Trip</u> In order to be familiar with the Company and observe a representative portion of the plant, field trips are often conducted. Gannett Fleming, has in prior depreciation studies, completed field trips, and did not view the time and cost associated with extensive field trips to provide any significant benefit in the completion of this current study. Rather, Gannett Fleming asked to only visit the Liquified Natural Gas ("LNG") terminal on Vancouver Island during the course of this study.

Operational Interviews. Interviews and discussions were held with a number of operational and engineering groups. The interviews and discussions, combined with the information gained in the interviews and discussions from prior depreciation studies, assisted Gannett Fleming in the understanding of the historic forces of retirement that have resulted in the statistically developed average service life indications and on the anticipated future forces of retirement. Based on these discussions, Gannett Fleming is better able to determine if the results of the retirement rate analysis should be adjusted to better reflect the future forces of retirement, or changes in technology. Additionally, operational interviews provide information regarding the reuse practices and policies and cost of retirement information.

The following groups were interviewed by Gannett Fleming during the Depreciation Study:

- Information Systems
- Transmission
- Compression
- Distribution
- Metering
- Communication Systems
- Vehicle and Fleet
- Facilities

The information gained from these interviews was used in combination with the retirement rate study, comparisons to peers and the experience of Gannett Fleming in the final determination of average service life estimates and net salvage percentages.

Survivor Curve Judgments. Each retirement rate analysis resulted in a life table which, when plotted, formed an original survivor curve. Each original survivor curve, as plotted from the life table, represents the average survivor pattern experienced by several vintage groups during the experience band studied. Inasmuch as this survivor pattern does not necessarily describe the life characteristics, interpretation of the original survivor curves is required to use them as valid considerations in service life estimation. Iowa type curves were used in these interpretations. The survivor curve estimates were based on judgment which considered a number of factors as discussed above. The primary factors were the statistical analysis of data, current policies and outlook as determined during conversations with management and the field trip, and survivor curve estimates from previous studies of this Company and other gas transmission and distribution companies. The specific factors for the largest accounts follow.

Account 475.00 – Dist. Systems - Mains, is the largest account studied and represents 26% of FortisBC's depreciable plant. The retirements, additions and other plant transactions for the period 1963 through 2009 were analyzed by the retirement rate method. The original and smooth survivor curves are plotted on page IV-37. Typical service lives for distribution mains range from 50 to 65 years.

In previous studies Gannett Fleming recommended the Iowa 60-R3. The statistical analysis of this account has indicated a best fit of historic retirements consistent with the 64-R2 Iowa curve. Since the last study, this account has continued to incur retirements at a consistent rate which provide for a reliable statistical indication of average service life characteristics. To date, this account has experienced nearly

$36 million of retirement actively. Discussions with operating and engineering staff have not indicated any specific reasons to believe that the future retirement trends in this account will be significantly different than historic pattern. Furthermore, operations staff has indicated that it would be expected that the life of the FortisBC distribution mains would be in the range of other industry peers and with the FortisBC Transmission mains. Typical service lives for distribution mains range from 50 to 65 years.

The retirement rate analysis indicates a significant rate of retirement activity as plant reaches 50 years of age, with large retirement ratios through to age 75. In order to better fit to this retirement pattern, Gannett Fleming has recommended the Iowa 64-R2 survivor curve to better reflect the trend towards increased retirement rates beyond age 50 as compared to the previous estimate of the 60-R2.5. This minor decrease in the mode of the Iowa curve combined with a small increase in the average service life expectation provides a reasonable interpretation of the original survivor curve, and falls within the range of typical service lives for this account and is therefore recommend for this account.

Account 465.00 – Trans. Plant – Trans. Pipeline, represents approximately 22% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1957 through 2009 were studied. The original survivor curve as plotted on page IV-16 indicates only a modest level of retirements through age 45. Typical service lives for transmission mains range from 50 to 70 years. Previous depreciation studies have indicated a 60-R3 Iowa curve for this account.

The Retirement Rate Analysis as presented at page IV-17 of this report and discussions with the operations and engineering staff have indicated that to date the pipe has experienced only a limited level of retirement activity. However, the retirement activity to date of over $10 Million of originally installed cost, has provided some data upon which a life analysis can be made, particularly when combined with the experience of the operations staff.

The mortality study produced a statically based best fit consistent with the Iowa 70-R3 curve. However the Operations staff felt that the future retirement patterns may differ from those witnessed to date. Operations staff has indicated that the original system consisting of pipes ranging from 12 inches to 3 inches, installed in 1957 represents about 30 to 40 percent of the currently installed transmission pipe. This pipe was not initially cathodically protected. However the cathodic protection was gradually added in the late 1960's with cathodic protection added to the 10 inch line after 10 years of service. FortisBC does internally inspect the transmission lines using inspection pigs through an on-going inspection program which began in the mid 1980's. Recent inspections have indicated some corrosion in the 10-inch line. Additionally the Operations staff indicated that the following retirement programs will be undertaken over the next few years:

- A number of specific mainline segments identified during seismic inspections;
- A number of river crossings;

Additionally, the company is reviewing a number of other potential transmission system programs to deal with changing supply and market demands.

In previous studies Gannett Fleming recommended an Iowa 60-R3 curve. However, the average service life in this study has been lengthened to an Iowa 65-R3 to better fit the historic retirement activity, but still recognize the anticipated increased level of retirements in future years. The Iowa 65-R3 survivor curve, selected in this study to represent the life characteristics for this account, is within the typical range of lives used for transmission mains in the industry, and conforms to the expectations of management.

Account 473.00 – Dist. Systems - Services, represents 20% of FortisBC's depreciable plant. The retirements, additions and other plant transactions for the period 1963 through 2009 were analyzed by the retirement rate method. The original and smooth survivor curves are plotted on page IV-30.

In previous studies Gannett Fleming recommended the Iowa 55-R2.5. Since the last study, this account has continued to incur retirements due to a number of retirement programs, which provides for a reliable statistical indication of average service life characteristics. To date, this account has experienced over $64 million of retirement activity. Discussions with operating and engineering staff have not indicated any specific reasons to believe that the future retirement trends in this account will be significantly different than historic patterns. Furthermore, operations staff have indicated that it would be expected that the life of the FortisBC distribution services would be in the range of other industry peers. Typical service lives for distribution services range from 40 to 65 years.

The retirement rate analysis indicates a significant rate of retirement activity as plant reaches 20 years of age, with large retirement rates through to age 75. In order to better fit to this retirement pattern, Gannett Fleming has recommended the Iowa 50-R1 survivor curve to better reflect the trend toward increased retirement rates beyond age 40, as compared to the previous estimate of the Iowa 55-R2.5. This decrease in both the mode of the Iowa curve and the average service life expectation provides a reasonable interpretation of the original survivor curve, and falls within the range of typical service lives for this account and is, therefore recommended for this account.

Account 478.10, Dist. Systems - Meters, represents 6% of FortisBC's depreciable plant. The retirements, additions and other plant transactions for the period 1963 through 2009 were analyzed by the retirement rate method. The original and smooth survivor curves are plotted on page IV-50. In recent years, the gas distribution industry has been moving toward increased used of digital metering and Automated Meter Reading (AMR) technology. Additionally, in early 2010, Measurement Canada has announced more stringent metering testing guidelines. The new testing guidelines place increasingly strict criteria on the test results as the age of the meters increase.

Interviews with the operational metering staff have indicated that the implementation of the new Measurement Canada requirements will result in residential meters continuing to be retired by the time they reach 20 years of age. In the experience of Gannett Fleming, this assumption is consistent with the metering experts across Canada, all of whom have indicated that residential meters will no longer be tested when they reach 15 to 20 years of age. Operations staff did indicate that the meters related to commercial and industrial customers are expected to last beyond 20 years, and would likely be refurbished when removed for testing. It is estimated that these larger commercial and industrial meters comprise less than 25% of the investment in this account.

Since the previous Gannett Fleming study which recommended an Iowa 25-R2-Iowa curve to represent the retirement characteristics for this account, FortisBC has continued the program to replace a older electro-mechanical meters with newer technology digital metering equipment. The retirement rate analysis for this account, as presented at page IV-51, indicates retirement activity throughout the accounts life constant with an Iowa 21-R2.5. This account is experiencing significant change in both the capitalization policies and in the technology associated with the assets within this account. Therefore, given the future expectation that residential meters will be retired prior to reaching an age of 20 years, the Iowa 20-R2 has been selected for this account. This account will be closely monitored over the next few years to determine if a shortening of the average service life estimate becomes necessary.

<u>Account 466.00 – Trans. Plant - Compressor Equipment</u>, represents approximately 3% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1973 through 2009 were analyzed by the retirement rate method. The original survivor curve as plotted on page IV-19 indicates only a modest level of historical retirements through age 15, and a significantly faster rate of retirement from ages 16 through 30.

In previous depreciation studies, Gannett Fleming has recommended a 33-R3 Iowa curve. Typical service lives for compression equipment range from 25 to 35 years. The compression units, utilized by FortisBC are Solar and Rolls-Royce units which have proven to be reliable both at FortisBC and within the industry as a whole. As such, it is expected that these units would perform at the longer end of the range of average service lives. However, the high rate of retirement ratios beginning at approximately age 15 need to be recognized. Gannett Fleming recommends a slight lengthening of the average service life to 35 years to deal with the company and industry experience.   As such, an adjustment to the Iowa 35-R3, selected in this study, provides a reasonable interpretation of the historical data, and is within the range of lives used in the industry and anticipated by management.

The survivor curves for the remaining accounts were based on similar considerations of historical analysis, management outlook and estimates of this company and other gas distribution companies.

ESTIMATION OF NET SALVAGE

Appropriate depreciation policies should provide for the recovery of the service value of assets in regulatory service over the period of time for which the assets being depreciated are forecast to be in service. The total cost of an asset includes the original cost of the material and installation of the asset when originally placed into utility service. Additionally, at the time of retirement of an asset, the utility may be faced with significant costs associated with the removal and retirement of the asset. These retirement costs are directly related to the asset being removed at the end of its useful utility service.

The costs of removal are part of the overall costs of an asset to provide utility service and are considered to be part of the service value of the asset. The recovery of the cost of removal or retirement should be recovered over the service life of the asset. If the costs of retirement are deferred until after the assets are removed from service, an intergenerational issue develops wherein the future consumers that will be incurring the costs related to the recovery of the replacement asset, will also be responsible for the funding of the asset that has been removed and no longer provided service. In contrast, the recovery of the estimated costs of retirement (net of any potential salvage proceeds realized from the sale of assets to third parties or from re-use within the utility) over the period of time that the asset is providing utility service provides generational equity. The toll payers receive the benefit of an asset in service fund the total cost of the asset, including the eventual costs of retirement of the asset.

The concept of recovery of the total service value including both the original costs of the asset and the net salvage costs incurred at the time of retirement over the life of the assets useful service has been held by numerous regulatory jurisdictions throughout North America for many years.[9] As such, in the completion of the depreciation study for FortisBC, Gannett Fleming has developed appropriate net salvage rates, which when applied to the original cost of plant in service, will result in the provision of funds estimated to be required at the time of retirement.

Recently, the Canadian Accounting Standards Board has announced that Canadian Generally Accepted Accounting Principles (GAAP) will cease to exist as of 2011. From that date forward, companies will be required to report under International Financial Reporting Standards ("IFRS"). One of the areas of change relate to the depreciation of assets relating to net salvage requirements. In order to comply with these new standards, FortisBC has asked that Gannett Fleming prepare separate depreciation accrual rates specifically applicable to the net salvage requirements. As such, Schedule 1, as presented in the Results section of this report, provides for the recovery of the original cost of assets in service; and Schedule 2 separately provides for

[9] For example as identified by the FERC as noted in footnote 2 to this report and in the General Instructions to the Canadian Gas Association Uniform Classification of Accounts for Natural Gas Utilities under the Jurisdiction of the Public Utilities Board of the Province of Alberta, page 8

the recovery of the estimated costs of retirement. It is the recent experience of Gannett Fleming that regulated Canadian Utilities are complying with the IFRS in this manner.

The estimates of net salvage were based primarily on the professional judgment of Gannett Fleming, in part on historical data for the years 2000 through 2009, and in part through a comparison to peer natural gas transmission and distribution companies. Gross salvage and cost of removal as recorded to the depreciation reserve account and related to experienced retirements were used. Percentages of the cost of plant retired were calculated for each component of net salvage on both annual and five-year moving average bases.

The net salvage percentages estimated in this study have been determined using the Traditional Approach for net salvage estimation. The estimates of net salvage were based in part on the database of historic transactions encompassing the period 2000 through 2009, as presented beginning on page of this report.

When a utility retires plant, the plant may be: (1) sold to a third party; (2) re-used by the utility for additional service; (3) abandoned in place; or (4) physically removed. In the circumstances where the plant is sold or re-used, a salvage proceed (or positive salvage amount) is normally recognized. In circumstances where the plant is abandoned in place or physically removed, a cost of removal expenditure (or negative salvage) is incurred. The net of these estimated gross salvage proceeds and the estimated costs of removal are expressed as a percentage of the account's original cost to determine a net salvage percentage. In the circumstances where the salvage proceeds exceed the costs of retirement, a net positive salvage percentage exists. In the circumstances where the costs of removal exceed the salvage proceeds, a net negative salvage percentage results.

The estimation of the net salvage percentages developed using the traditional approach, included the following steps:

1. The annual retirement, gross salvage and cost of removal transactions for the period January 1, 2000 through December 31, 2009 were extracted from the plant accounting systems.

2. A net salvage amount (gross salvage proceeds less cost of retirement) was calculated for each historic year. Additionally, a net salvage amount was also calculated for each historic 3-year rolling band and the most recent 5-year rolling band.

3. The net salvage amount determined above was compared to the original booked costs retired for each period in the manner described, which resulted in a net salvage percentage of original costs retired for each year, in addition to 3-year rolling bands and the most recent 5-year rolling band.

4. The annual, the 3-year rolling average, and the most recent 5-year rolling average net salvage percentages were analyzed to determine a reasonable estimated net salvage percentage. At this point the net salvage percentage was based purely upon statistical analysis.

5. Each account was then compared to the net salvage percentage currently approved and compared to peer natural gas transmission and distribution companies. Based on the statistical analysis, the review of current and peer company net salvage percentages, and with the professional judgment of Gannett Fleming, a net salvage percentage was determined for each account.

6. The net salvage percentage was then used in the depreciation rate calculations in the technical update.

Following is a brief summary by for each account where a net salvage recommendation is made, outlining the various factors considered by Gannett Fleming in forming the net salvage recommendation

<u>Account 442.00 – LNG Gas - Structures</u> - This account has very limited retirement and net salvage transaction history. Therefore the net salvage percentage of

-10% was based on the professional judgment of Gannett Fleming. As there is only limited experience throughout Canada of regulated LNG storage facilities, a peer analysis for this account was not completed. As part of the last depreciation study completed by Gannett Fleming, a site tour of the LNG facility was conducted. Additionally as part of this current depreciation study, a site tour of the facility currently under construction was completed, providing a prospective of the type of structures required for these facilities. Gannett Fleming views that upon retirement of the LNG facilities, a significant cost of removal will be required for the LNG structures and that a net salvage percentage of at least -10% is appropriate. A net salvage percentage of -10% was recommended in the last depreciation study, and Gannett Fleming recommends that, at this time, the -10% be continued. Gannett Fleming notes that the net salvage percentage may need to be increased in future studies, once this account begins to experience more retirement activity.

Account 443.00 – LNG Gas Equipment - A net salvage percentage of -20% was based on the professional judgment of Gannett Fleming. As there is only limited experience throughout Canada of regulated LNG storage facilities, a peer analysis for this account was not completed. As part of the last depreciation study completed by Gannett Fleming, a site tour of the LNG facility was conducted. Additionally as part of this current depreciation study, Gannett Fleming completed a site tour of the facility currently under construction. These site tours have provided Gannett Fleming with a prospective of the type of the large amount of specialized equipment required for these facilities. Gannett Fleming views that upon retirement of the LNG facilities, a significant cost of removal will be required for the LNG structures. The equipment and supporting infrastructure is very large, and in the view of Gannett Fleming a significant amount of labor will be required at the time of retirement for the decommissioning of these facilities. Therefore, Gannett Fleming views that a net salvage percentage of at least -20% is appropriate. A net salvage percentage of -20% was recommended in the last depreciation study, and Gannett Fleming recommends that, at this time, the -20% be continued. Gannett Fleming notes that the net salvage percentage need to be increased in future studies, once this account begins to experience more retirement activity.

Account 449.00 – LNG Gas – Other Equipment – This account has experienced a significant amount of retirements in 2008, resulting in a net salvage percentage of -16% in 2008. However, other years of minor retirement activity have resulted in no cost of removal expenditures.

As there is only limited experience throughout Canada of regulated LNG storage facilities, a peer analysis for this account was not completed. As part of the last depreciation study completed by Gannett Fleming, a site tour of the LNG facility was conducted. Additionally as part of this current depreciation study, Gannett Fleming completed a site tour of the facility currently under construction. These site tours have provided Gannett Fleming with a prospective of the type of the large amount of specialized equipment required for these facilities. Based on the cost of removal history and on the background gained through the site tours, Gannett Fleming recommends a net salvage percentage of -10%, which is consistent with the recommendation in the last depreciation study.

Account 462.00 – Compressor Structures – As indicated at page V-2 of this report, this account has experienced only minimal amounts of retirements over the past 10 years. As such, there was no retirement history upon which to base a statistical analysis of net salvage. However, Gannett Fleming did review the approved net salvage parameters of a peer group gas transmission companies as follows:

- ATCO Pipelines – (20)%
- AltaGas – 0%
- Manitoba Hydro/Centra Gas Manitoba- (5)%

Interviews were held where operational and management staff provided insight into the operations, policies and practices related to a number of asset types, including the Compressor Structures. During these interviews, the operations staff viewed that there would be a small amount of cost of removal associated with the Compression Structures at the time of retirement. As such, Gannett Fleming recommends a small provision of -5% for this account. This recommendation is consistent with the experience of Gannett Fleming within the industry, and also with the expectations of operational staff and management.

Account 463.00 – Measuring/Regulating Structures - As indicated at page V-3 of this report, this account has experienced only minimal amounts of retirements over the past 10 years. The minimal retirement activity has shown a net salvage percentage of -5%. However, given the minimal amount of activity, Gannett Fleming reviewed the approved net salvage parameters of a peer group gas transmission companies as follows:

- ATCO Pipelines – (15)%

- AltaGas – (10)%
- Manitoba Hydro/Centra Gas Manitoba- (5)%

Interviews were held where operational and management staff to provided insight into the operations, policies and practices related to a number of asset types, including the Regulating Structures. During these interviews, the operations staff viewed that there would be a small amount of cost of removal associated with the Regulating Structures at the time of retirement. As such, Gannett Fleming recommends a small provision of -5% for this account. This recommendation is consistent with the limited actual experience, is within the range of experience of Gannett Fleming within industry, and also with the expectations of operational staff and management.

Account 464.00 – Other Structures - As indicated at page V-4 of this report, this account has experienced only minimal amounts of retirements over the past 10 years. The minimal retirement activity that has shown a net salvage percentage of -85% has been discounted given the limited number of retirement transactions. Given the minimal amount of activity, Gannett Fleming reviewed the approved net salvage parameters of a peer group gas transmission companies as follows:

- ATCO Pipelines – (15)%
- AltaGas – N/A
- Manitoba Hydro/Centra Gas Manitoba - (5)%

Interviews were held where operational and management staff to provided insight into the operations, policies and practices related to a number of asset types, including the Regulating Structures. During these interviews, the operations staff viewed that there would be a small amount of cost of removal associated with the Regulating Structures at the time of retirement. It was considered that the other Transmission Structure accounts have been assigned a net salvage percentage of -5%. In order to maintain consistency with the other Structure accounts, Gannett Fleming recommends a small provision of -5% for this account. This recommendation is significantly lower than the limited actual experience, but is within the range of experience of Gannett Fleming within industry, and also with the expectations of operational staff and management.

Account 465.00 – Transmission Mains – As indicated in the net salvage analysis provided at page V-5, this account has witnessed a significant amount of retirement activity over the last 10-year period. The salvage analysis provides the annual net salvage percentage, a three-year rolling average and the most recent five-year rolling average. While these trends have all shown a large increase in net salvage requirements over the past few years, it has been indicated that the recent costs of removal have been related to an effort to clean up a backlog of required work. As such it felt that the longer term averages provide a better indication of the net salvage requirements. A review of peer natural gas utilities has indicated the following:

- ATCO Pipelines – (25)%
- AltaGas – (10)%
- Manitoba Hydro/Centra Gas Manitoba- (15)%

The Gannett Fleming recommendation to continue to use the current -10% is lower than the 10 year average, and at the lower end of the peer averages. However, Gannett Fleming believes that a longer period of increased net salvage indications is required prior to increasing the net salvage percentage. Therefore, the continuation of the -10% net salvage percentage is recommended.

Account 466.00 – Compressor Equipment – As indicated at page V-6 of this report, this account has experienced only minimal amounts of retirements over the past 10 years. The minimal retirement activity that has shown a net salvage percentage of -19% has been discounted given the limited number of retirement transactions. Given the minimal amount of activity, Gannett Fleming reviewed the approved net salvage parameters of a peer group gas transmission companies as follows:

- ATCO Pipelines – (10)%
- AltaGas – N/A
- Manitoba Hydro/Centra Gas Manitoba- N/A

During interviews with the operations staff it was indicated that there would be a small amount of cost of removal associated with the compression equipment at the time of retirement. While the recommendation of -10% is lower than the limited actual experience, it is within the range of experience of Gannett Fleming within the industry, and also with the expectations of operational staff and management.

Account 467.10 – Transmission Measuring/Regulating Equipment - As indicated in the net salvage analysis provided at page V-7, this account has witnessed a significant amount of retirement activity over the last 10 year period. The salvage analysis provides the annual net salvage percentage ranging from 0% to -25%, in addition to three-year rolling averages ranging from -3% to -11%, and the most recent five-year rolling average indicating -7%. A review of peer natural gas utilities has indicated the following:

- ATCO Pipelines – (15)%
- AltaGas – (50)%
- Manitoba Hydro/Centra Gas Manitoba- (5)%

The Gannett Fleming recommendation to continue to use the current -5% is consistent with the statistical analysis performed, and is consistent (although at the lower end) of the peer averages.

Account 472.00 – Distribution Structures - As indicated in the net salvage analysis provided at page V-10, this account has witnessed a moderate amount of retirement activity over the last 10 year period. The salvage analysis provides the annual net salvage percentage, a three-year rolling average and the most recent five-year rolling average. While these trends have all shown a large increase in net salvage requirements over the past few years, the increases have been on small amounts of original costs retired. A review of peer natural gas utilities has indicated the following:

- ATCO Gas – (40)%
- Enbridge Gas Distribution – (5)%
- AltaGas – 0%
- Manitoba Hydro/Centra Gas Manitoba- (10)%
- SaskEnergy – (5)%

The Gannett Fleming recommendation to continue to use the current -5% is lower than the 10 year average, and within the peer averages. Additionally, the recommended -5% is consistent with the Transmission structure accounts.

Account 473.00 – Distribution Services – As indicated in the net salvage analysis provided at page V-11, this account has witnessed a significant amount of retirement activity over the last 10 year period. The salvage analysis provides annual net salvage percentages ranging from 0% to -153%, in addition to three-year rolling averages ranging from -11% to -153%, and the most recent five-year rolling average indicating -49%. A review of peer natural gas utilities has indicated the following:

- ATCO Gas – (100)%
- Enbridge Gas Distribution – (45)%
- AltaGas – (75)%
- Manitoba Hydro/Centra Gas Manitoba- (25)%
- SaskEnergy – (40)%

The Gannett Fleming recommendation to continue to use the current -50% is predominately based on the statistical analysis, and is within the range of the peer averages. However, it is noted that the recent trends from 2003 through 2009, in many years have indicated a net salvage percentage in excess of -100%. In future studies, if these trends continue, increased amounts of net negative salvage will be required.

Account 475.00 – Distribution Mains – As indicated in the net salvage analysis provided at page V-13, this account has witnessed a significant amount of retirement activity over the last 10 year period. The salvage analysis provides annual net salvage percentages ranging from 0% to -89%, in addition to three-year rolling averages ranging from -1% to -70%, and the most recent five-year rolling average indicating -15%. A review of peer natural gas utilities has indicated the following:

- ATCO Gas – (60)%
- Enbridge Gas Distribution – (75)% to (145)%
- AltaGas – (10)%
- Manitoba Hydro/Centra Gas Manitoba- (20)%
- SaskEnergy – (10)%

The Gannett Fleming recommendation to continue to use the current -20% is predominately based on the statistical analysis, and is within the range of the peer averages. However, it is noted that the recent trends from 2003 through 2009, in many years have indicated a net salvage percentage in excess of -20%. In future studies, if these trends continue, increased amounts of net negative salvage will be required.

Account 476.00 – NGV Fuel Equipment - This account has not occurred any retirement activity since the year 2000, and no net salvage transactions. As the investment in this account relates to equipment that will be labor intensive to remove, Gannett Fleming views that a net salvage percentage that result in excess of $100,000 will be required. Additionally, the retirement booked in the year 2000, may have physical plant to remove for the investment dollars have been previously retired. Therefore, only a small amount of investment remains in this account, which will be the basis for the accrual of all of the required cost of removal expenditures. It is the view of Gannett Fleming that a net salvage percentage of -20% is required to collection of the funds required for the removal of the physical plant.

Account 477.30 – Distribution Measuring and Regulating Equipment – The historic retirement and net salvage transactions for this account have been previously recorded in Account 477.10. As such the statistical analysis of net salvage is based on the history as indicated at page V-15 of this report. The historic investment in account 477.10 indicates a significant level of retirement experience, with an overall 10 year average net salvage indication of -10%. The three-year rolling average net salvage indications have typically indicated a net salvage requirement of approximately -15%., which is consistent with the most recent five-year average. A review of peer natural gas utilities has indicated the following:

- ATCO Gas – (40)%
- Enbridge Gas Distribution – (10)%
- AltaGas – (15)%
- Manitoba Hydro/Centra Gas Manitoba- (20)%
- SaskEnergy – (5)%

The Gannett Fleming recommendation to continue to use the current -5% is predominately based on the statistical analysis, and is at the low end, but within the range of the peer averages. However, it is noted that the recent trends have indicated a net salvage percentage in excess of -5%. In future studies, if these trends continue, increased amounts of net negative salvage will be required.

<u>Account 477.30 – Distribution Meters</u> – The historic retirement trend relating to the retirement and replacement of meters has been largely discounted in this study. As indicated at page II-29 of this report, the rate of retirements of the meters currently in place is expected to dramatically accelerate over the next few years, due to recently announced Measurement Canada guidelines and the implementation of an AMR

program. The program nature of the retirement of meters currently in place will result in increases in costs of retirement. Historically, costs of retirement have been offset by the ability to sell used meters to third parties or to re-use meters within the FortisBC Energy system. However, given the change in technology, and the amount of used analog meters available throughout the North American marketplace, it is Gannett Fleming's view that a resale or reuse market does not exist. Therefore a small net salvage provision of -5% is recommended.

Account 484.00 – Vehicles – Interviews with operational and accounting staff have indicated that net salvage proceeds related to the sale of vehicles have only been separately recorded since 2008. Therefore a detailed database with historic sales transactions is not available. Prior to 2008, the trade-in value of used vehicles was offset against the purchase cost of the replacement vehicle. As such, Gannett Fleming has relied on the limited amount of the two years experience, but also on the comments of the fleet management group, and on the peer group in the development of the net salvage recommendations.

A review of peer natural gas utilities has indicated the following:

- ATCO Gas – 25%
- Enbridge Gas Distribution – 15%
- AltaGas – 25%
- Manitoba Hydro/Centra Gas Manitoba- 15%
- SaskEnergy – 20%

Interviews with the Fleet Management group indicated an expectation of positive salvage proceeds of at least 20%. As this is consistent with the peer group experience, Gannett Fleming recommends the continuation of the 20% net salvage percentage.

Account 485.10 – Heavy Work Equipment – Interviews with operational and accounting staff have indicated that net salvage proceeds related to the sale of heavy work equipment have only been separately recorded since 2008. Therefore a detailed database with historic sales transactional is not available. Prior to 2008, the trade-in value of work equipment was offset against the purchase cost of the replacement equipment. As such, Gannett Fleming has relied on the comments of the fleet management group, and on the peer group in the development of the net salvage recommendations.

A review of peer natural gas utilities has indicated the following:

- ATCO Gas – 30%
- Enbridge Gas Distribution – 25%
- AltaGas – 20%
- Manitoba Hydro/Centra Gas Manitoba- 20%
- SaskEnergy – 20%

Interviews with the Fleet Management group indicated an expectation of positive salvage proceeds of at least 15%. Although this is lower than the peer group experience, given the low volume of sale transactions, Gannett Fleming recommends the continuation of the 15% net salvage percentage.

Account 485.20 – Heavy Mobile Equipment - Interviews with operational and accounting staff have indicated that net salvage proceeds related to the sale of heavy mobile equipment have only been separately recorded since 2008. Therefore a detailed database with historic sales transactional data is not available. Prior to 2008, the trade-in value of the equipment was offset against the purchase cost of the replacement equipment. As such, Gannett Fleming has relied on the comments of the fleet management group, indicating an expectation of 10% upon resale. This equipment is not typically separated in the circumstances of the peer group of companies; therefore a peer analysis was not undertaken. Based on the comments of the fleet management group, the continuation of the 10% net salvage percentage is recommended.

CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

Group Depreciation Procedures. When more than a single item of property is under consideration, a group procedure for depreciation is appropriate because normally all of the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. There are two primary group procedures, namely, the average service life and equal life group procedures.

In the average service life procedure, the rate of annual depreciation is based on the average service life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to the average life is more than full y recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

In the equal life group procedure, also known as the unit summation procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life unit. Although the equal life group procedure is superior to the average service life procedure in matching depreciation expense and consumption of service value, the average service life procedure was used in order to conform to past Company practices and for consistency with practices of other companies regulated by the British Columbia Utilities Commission.

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is proposed for certain General Plant accounts that represent numerous units of property, but a very small portion of depreciable gas plant in service. The accounts and their amortization periods are as follows:

	Account	Amortization Period Years
483.10	Computer Hardware	5
483.20	Computer Software	5 and 8
483.30	Office Equipment	15
483.40	Office Furniture	20
486.00	Small Tools/Equipment	20
487.20	NGV Cylinders	15
488.10	Telephone Equipment	15
488.20	Radio Equipment	15

The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the original cost by the period of amortization for the account for those vintages with an age less than the amortization period.

In addition to the above accounts, amortization accounting is recommended for a new account 474.02 - Distribution Systems Meters/Regulator Installations. This account is used to capture new plant additions in this category. Rather than relying on individual retirement of assets in this category which are wide and disparate, an alternative and representative approach to follow an amortization accounting is recommended. Additions to the account will be depreciated at an initial whole life rate of 4.5%, representative of an expected life of 22 years. The existing meter install costs would remain in the current account (474.00) and continue depreciating at the recommended depreciation rate, which includes a factor for recovery of existing retirement losses

PART III. RESULT OF STUDY

PART III. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculation of the composition remaining lives and the determination of the annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revision are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and salvage, and for the change of the composition of property in service. The annual accrual rates and the accrued depreciation were calculated in accordance with the straight line average service life method of depreciation based on estimates which reflect consideration of current historical evidence and expected future conditions. The calculated accrued depreciation represents that portion of the depreciable cost which will not be allocated to future annual expense through depreciation accruals if current forecasts of service life and salvage materialize and are used as a basis for straight line average service life depreciation accounting.

DESCRIPTION OF DEPRECIATION TABULATIONS

A summary of the results of the study, as applied to the original cost of gas plant of FortisBC Energy Inc., FortisBC Energy (Vancouver Island) Inc., and FortisBC Energy (Whistler) Inc. as of December 31, 2009, are presented in Tables 1 and 2 attached to this report. Table 1 sets forth the original cost, the booked accumulated depreciation amounts, and the required future accruals prior to consideration of the net salvage provision for FortisBC Energy Inc., FortisBC Energy (Vancouver Island) Inc., and

FortisBC Energy (Whistler) Inc. As such, Table 1 for each system provides for the recovery of the original costs of the assets within each system. Table 2 presents the calculations related to the recovery of the net salvage requirements for each of the same three systems.

The service life estimates were based on judgment that incorporated statistical analysis of retirement data, discussions with management and operating staff, and consideration of estimates made for other gas companies as discussed in Part II of this report. For each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table plotted on the charts is presented starting at page lV-2. The survivor curve estimated for the depreciable groups is shown as a dark smooth curve on the charts. Each smooth curve is denoted by a numerical average service life indication followed by the curve type designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. The titles of each chart indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables that are plotted. The experience band indicates the range of years fro which retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual and accrued depreciation are presented in account sequence in the section beginning on V-2**.** The tables are first presented for all of the FortisBC accounts, followed by all of the FortisBC Energy (Vancouver Island) Inc. accounts and then for all accounts related to FortisBC Energy (Whistler) Inc. Each table indicates the estimated survivor curve and net salvage percent for the account; and sets forth, for each installation year, the original cost, the calculated annual accrual rate and amount, and the calculated accrued depreciation factor and amount.

FORTISBC ENERGY INC.

SCHEDULE 1. ESTIMATED SURVIVOR CURVE, ORIGINAL COST, BOOK DEPRECIATION RESERVE AND CALCULATED ANNUAL DEPRECIATION ACCRUALS RELATED TO UTILITY PLANT AS OF DECEMBER 31, 2009

DEPRECIATION RELATED TO LIFE
