ASSET RETIREMENT OBLIGATIONS REPORT

1 INTRODUCTION

In the utility industry, significant investments are required in infrastructure. Along with these investments comes an obligation to eventually remove the plant assets from service, and in some cases, remediate the impacted site. This paper discusses historical and recommended treatment for these asset removal costs and asset retirement obligations for the Fortis BC Utilities (consisting of FortisBC Inc. and the FortisBC Energy Utilities (consisting of FortisBC Energy Inc. ("FEI"), FortisBC Energy (Vancouver Island) Inc. ("FEVI"), and FortisBC Energy (Whistler) Inc. ("FEW")).

In this paper, the following definitions are used unless otherwise noted:

- Asset removal costs or asset retirement costs - costs incurred in the retirement of a long-lived asset.
- Asset retirement obligation – obligation to incur asset removal costs or asset retirement costs.
- Negative salvage – asset removal costs less any salvage proceeds received on sale.
- Retirement – other-than-temporary removal from service, including sale, abandonment, recycling or disposal.

The remainder of this paper is organized as follows:

Accounting Background – a discussion of the evolution of relevant accounting principles as they relate to Asset Removal Costs and Asset Retirement Obligations;

Regulatory Background – a discussion of the historical regulatory treatment of Negative Salvage and Asset Retirement Obligations;

Options for Collection of Negative Salvage Costs – summarizes the more commonly accepted methods of collecting asset removal costs from utility customers; and

Summary and Recommendations – recommended treatment for the Fortis BC Utilities for 2012 forward.

2 ACCOUNTING BACKGROUND

2.1 Canadian Generally Accepted Accounting Principles ("GAAP") Prior to 2004

Under CICA Handbook Section 3060 Capital Assets, accounting for asset retirement costs consisted of creating a provision for asset retirement costs on an entity's balance sheet that would increase every year until the asset is decommissioned. The annual increase to the liability account on the balance sheet is reflected as depreciation expense on the statement of operations. Actual retirement costs are charged against the liability on the balance sheet as incurred.

2.2 Canadian GAAP 2004 to 2010 and US GAAP 2003 to Present

CICA Handbook Section 3110 Asset Retirement Obligations ("ARO"s) effective January 1, 2004, requires the recognition of all **legal** obligations associated with the retirement of tangible long lived assets. These legal obligations are referred to as AROs. If a reasonable estimate of their fair value can be made, the obligations must be recorded on a company's balance sheet as a liability. If not, they must be disclosed in the notes to the financial statements and may not be recognized until the period in which a reasonable estimate can be made which may not be until they are incurred. This change was consistent with a change to US GAAP that was effective one year earlier, starting January 1, 2003.

At the time an ARO is incurred (an asset is constructed or purchased), an entry is made to increase the asset and create the offsetting ARO liability at the estimated net present value of the obligation. The asset is then depreciated annually, and the ARO is accreted each year by annual interest so that at the time of asset retirement, the removal costs have been fully provided for. Actual retirement costs that were accrued as part of the ARO reduce the ARO liability; retirement costs that were not provided for through AROs are expensed.

2.3 International Financial Reporting Standards ("IFRS")

Effective January 1, 2010 for comparative purposes, the majority of publicly traded Canadian companies will be complying with IFRS (January 1, 2011 for regulated entities that choose to defer adoption by one year). Under IAS 16 Property, Plant and Equipment and IAS 37 Provisions, Contingent Liabilities and Contingent Assets, the financial treatment of AROs is essentially the same as under Canadian GAAP, except that AROs now encompass not only **legal** obligations but also **constructive** obligations. A constructive obligation is an obligation that derives from an entity's actions where by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities; and as a result, the entity has created a valid expectation that it will discharge that obligation.

3 REGULATORY BACKGROUND

3.1 BC Hydro

Until Fiscal 2004, BC Hydro's regulatory treatment was aligned with Canadian GAAP, such that asset retirement/removal costs were collected through depreciation expense and when costs were incurred they were charged against that provision (called the Future Removal and Site Restoration account or "FRSR").

Then the CICA adopted Section 3110 Asset Retirement Obligations which replaced FRSR accounting. With the change in Canadian GAAP, in its 2005 fiscal year, BC Hydro established a regulatory deferral liability equal to the FRSR balance at March 31, 2004. There are no further additions to this account through depreciation expense collected from customers, but all removal costs are charged against this account as incurred, unless these costs relate to an ARO. BC Hydro has created an ARO obligation for those assets where it has determined it has an ARO, and increased the asset value accordingly. Each year, the depreciation of the asset and the accretion of the liability are included in rates. When actual retirement costs are incurred in relation to ARO assets, the costs are charged against the liability. If the costs are in excess of the liability, they will be applied instead against the FRSR liability. When the FRSR liability is depleted, non-ARO removal costs will be expensed. The following is an excerpt from BC Hydro's 2009 Annual Report describing the accounting for AROs:

"Asset retirement obligations are legal obligations associated with the retirement of long-lived assets. A liability is recorded in the period in which the obligation is incurred at the present value of the estimated future costs when a reasonable estimate of the fair value can be made. When a liability is initially recorded, BC Hydro capitalizes the costs by increasing the carrying value of the associated long-lived asset. The liability is adjusted for the passage of time through accretion (interest) expense and the capitalized cost is amortized over the useful life of the associated asset. Actual costs incurred upon settlement of an asset retirement obligation are charged against the related liability to the extent of the accrued balance. Any difference between the actual costs incurred upon settlement of the asset retirement obligation and the recorded liability is recognized as a gain or loss in earnings at that time."

The initial balance in the FRSR liability for Fiscal 2005 was $251 million; at the end of fiscal 2010 BC Hydro has forecast the remaining balance to be $150 million. Asset retirement obligations at the end of F2009 were $5 million and relate to only three assets.

Additionally, in March of 2010, BC Hydro filed an application with the British Columbia Utilities Commission ("BCUC") for Approval to Establish a Regulatory Asset Regarding Liability Provision for Environmental Compliance and Remediation. The liability is estimated at $375 million, and is required to record the costs BC Hydro will likely incur to (i) comply with the federal PCB Regulations enacted under the *Canadian Environmental Protection Act, 1999*, and (ii) remediate environmental contamination at one of BC Hydro's properties. The recording of the loss provision is required under CICA Handbook Section 3290 Contingencies. The component of that liability that is considered to be an ARO is estimated at $32 million, which is the part of the obligation that relates to removal costs for assets (equipment removal, transportation and destruction costs).

3.2 FortisBC Inc. ("FBC")

FBC's depreciation rates prior to 2005 did not include a component of negative salvage.

The 2005 Depreciation Study included in FBC's 2006 Revenue Requirements was completed on October 11, 2005 by Gannett Fleming stating that "the calculated annual depreciation accrual rates presented in the report are applicable to plant in service as of December 31, 2004." The 2005 Depreciation Study explicitly calculated depreciation rates to include negative salvage. The rates supported a composite depreciation rate of 3.6% for 2006, inclusive of negative salvage, which was included in the Company's 2006 Revenue Requirements. As a result of the 2006 Negotiated Settlement Process ("NSP"), BCUC Order No. G-58-06, Appendix 1, pages 8 and 9 stated the following:

- The Company and Participants agreed to change the proposed depreciation rates for six accounts which…and are adjusted to 3.0% to reflect longer average service lives for those assets.
- The Company and the Participants hold differing views on negative salvage values in the depreciation. The parties agree to defer the analysis of the issue of negative net salvage value in the depreciation study for the term of the PBR ending in 2008 or 2009.
- The parties did not agree that the findings of the Depreciation Study were otherwise appropriate and no precedent value is attached to the Depreciation Study.

As part of the approval of the 2009 Revenue Requirements process no changes were made to the original assumptions in the 2006 NSP regarding the issue of negative salvage value in depreciation rates. As a result FBC has not been collecting negative salvage in its depreciation rates.

For 2010 and 2011, any asset removal costs incurred continue to be charged against accumulated depreciation with recovery from customers to be settled through updated depreciation rates in 2012.

FBC does recognize that it has some AROs but that the obligations cannot be reasonably estimated, so no amounts have been recorded for regulatory purposes. Starting in 2010, FBC has recognized, for external financial reporting purposes only, an ARO relating to the removal of PCBs from certain electrical equipment under current regulations. Under either IFRS or US GAAP, FBC expects that it will not be required to record any additional AROs at this time, and that any amounts being collected from customers for asset removal costs in advance of the incurrence of those expenditures would be classified as a regulatory liability. For financial reporting purposes in 2010 and 2011, no regulatory liability is recorded on the balance sheet, consistent with the regulatory treatment.

3.3 FortisBC Energy Utilities ("FEU")

Historical practice for the FEU has been to include estimates for negative salvage recoveries as a component of depreciation rates, although these amounts have not been separately tracked in accumulated depreciation. For FEVI, negative salvage costs have been approved by the BCUC for collection from customers for a number of accounts, based on the depreciation rates implemented in 2003 resulting from the Gannett Fleming 2001 Review of Depreciation. For FEI, although negative salvage has been included as a component of depreciation rates in the depreciation studies that have been completed, the results of the studies were never implemented in customer rates except for a select few asset classes, so it is less clear how much, if any, negative salvage has been collected in rates.

The practice of including negative salvage in depreciation estimates was aligned with Canadian GAAP under Section 3060 until 2004, and the FEU had not applied for or been ordered to change the treatment from that time until 2010. Even though it represented a departure from GAAP during that time period, it was in accordance with rate-regulated accounting. With the Negotiated Settlement Agreements resulting from FEI's and FEVI's 2010 and 2011 Revenue Requirements Applications, negative salvage was removed as a component of depreciation being recovered from customers, and instead asset removal costs are being recovered on a cash basis as the costs are incurred, with a deferral account to capture any variances from the estimated asset removal costs included in rates.

The FEU have not historically recorded any AROs under Canadian GAAP since it was determined that no material legal obligations of this nature existed around their long-lived assets, or if they did exist the amount on a discounted basis would be immaterial. Under IFRS or US GAAP, and consistent with FBC and the Fortis Inc. group of companies, the FEU continue to expect that they will not be required to record any additional AROs, and that any amounts being collected from customers for asset removal costs in advance of the incurrence of those expenditures would be classified as a regulatory liability. For financial reporting purposes in 2010 and 2011, no regulatory liability is recorded on the balance sheet, consistent with the regulatory treatment.

3.4 Federal Energy Regulatory Commission ("FERC")

At the time that US GAAP changed to recognize AROs, the FERC revised its Uniform System of Accounts effective 2004 to include asset retirement obligation assets and related liabilities, and also the depreciation and accretion expense related to these amounts in the determination of rates. At the same time, the FERC clarified that for costs of removal that do not constitute a legal obligation (and therefore do not qualify as an ARO), utilities would continue to record the collection of costs as a component of depreciation expense, but that the accrued accumulated removal costs for other than legal retirement obligations must be separately identified and quantified in subsidiary records of accumulated depreciation to facilitate external reporting and for regulatory analysis, and rate setting purposes.

3.5 National Energy Board

In 2008, the National Energy Board ("NEB") initiated the Land Matters Consultation Initiative ("LMCI"). There were four streams to the initiative, with Stream 3 dealing with financial matters. After a series of consultations and written submissions, the NEB released its report and reasons for decision in May of 2009, applicable to all pipelines regulated under the NEB Act.

The following terms are used in the NEB Decision[1]:

Abandon – To permanently cease operation such that the cessation results in the discontinuance of service.

Decommission – To permanently cease operation such that the cessation does not result in the discontinuation of service, for example, when a tank is removed from operation on a pipeline and the pipeline continues to operate without the tank.

Perpetual Maintenance – The ongoing use of methods to maintain and abandoned pipeline to avoid collapse, subsidence, corrosion or other adverse impacts. This is sometimes referred to as continuing maintenance.

Terminal Negative Salvage – The costs incurred in the abandonment of pipeline facilities less any value realized from the disposition of such facilities.

The Panel in the LMCI recommended the following[2]:

"*The Panel recommends the following as key principles and considerations:*

1. *It is in the public interest that all pipelines regulated by the NEB be abandoned safely and effectively.*
2. *Pipeline companies are ultimately responsible for the full costs of constructing, operating and abandoning their pipelines, and the Board will hold the regulated company responsible for these costs.*
3. *The Board regulates using a goal-oriented, risk-based lifecycle approach; it does not subscribe to the concept of elimination of risk.*
4. *Landowners will not be liable for costs of pipeline abandonment.*

[1] Land Matters Consultation Initiative Stream 3 RH-2-2008 Pages 8 and 9
[2] Land Matters Consultation Initiative Stream 3 RH-2-2008 Pages 32 and 33

5. *At this time, the use of pooling as a general mechanism for setting aside funds to cover the costs of abandonment is not efficient from a regulatory or economic perspective.*
6. *Timing of abandonment of a pipeline for the purpose of estimating future abandonment costs should be the shorter of anticipated economic life or physical life.*
7. *The removal of all large-diameter abandoned pipe from agricultural land is not a prudent or effective approach for the purpose of establishing preliminary abandonment cost estimates.*
8. *Abandonment costs are a legitimate cost of providing service and are recoverable upon Board approval from users of the system.*
9. *Funds for abandonment costs should be collected and set aside in a transparent manner.*
10. *Funds for abandonment costs should not be collected as part of depreciation and should be a separate element of cost of service.*
11. *Any funds set aside for abandonment must be held in such a manner that they can only be used for the purposes of abandonment and abandonment planning.*
12. *The Board, as an independent and quasi-judicial tribunal, does not promote the development of tax policies or initiatives."*

The Panel, in reviewing key principles and considerations, also stated:[3]

"*The Panel recommends that any process and mechanism for setting aside the funds for abandonment have the following attributes:*

- *funds must be maintained in a segregated account and not be commingled with a company's general corporate funds;*
- *funds must be managed by an independent, third party;*
- *funds collected must be protected from creditors;*
- *funds must be protected from misuse or use for a purpose other than abandonment;*
- *regular reviews (at least every five years) of the amount of funds set aside and disbursed from the segregated account must be incorporated, and regular reporting to the Board and stakeholders must be built in;*
- *funds must be segregated by pipeline;*
- *funds must be subject to Board audit, as appropriate;*
- *companies must develop a sound investment policy for abandonment funds as ultimately, accountability for the collection and governance of the funds rests with each pipeline company; and*
- *the process for accessing the funds must be clearly set out in the mechanism."*

[3] Land Matters Consultation Initiative Stream 3 RH-2-2008 Page 41

The Panel recommended that a number of Base Case assumptions form the basis for preparing cost estimates for each pipeline company. The Base Case assumptions have not been included in this document as they are specific to pipelines regulated by the NEB.

4 OPTIONS FOR COLLECTION OF NEGATIVE SALVAGE

As discussed, the collection of negative salvage costs over the life of the related assets is the commonly accepted regulatory practice in both the United States and Canada. It is accepted by the US FERC in its Uniform System of Accounts and by the National Association of Regulatory Utility Commissioners in their Public Utilities Depreciation Practices. In Canada, it is an accepted practice for gas distribution utilities by the following Boards[4]:

- Alberta Utilities Commission
- Saskatchewan Rate Review Panel
- Manitoba Public Utilities Board
- Ontario Energy Board
- Régie de l'énergie du Québec
- Nova Scotia Utility and Rate Board

Throughout the regulatory guidance and decisions is the premise that property ownership includes the responsibility for the property's ultimate abandonment or removal, hence, if current users benefit from the use of the asset, they should pay their pro rata share of the cost involved in the retirement of the property.

The Fortis BC Utilities consider that goals for a regulatory policy on negative salvage costs include:

1. Distribute costs to ratepayers equitably over time;
2. Improve utility accountability for negative salvage costs collected from ratepayers;
3. Ensure that funds for asset removal are available at the time they are needed;
4. Minimize administrative costs related to implementation, maintenance and tracking of negative salvage costs.

Keeping these goals in mind and based on a review of the above policies, consultation with Gannett Fleming[5], and other available literature, there are four possible approaches to collection of negative salvage costs that will be discussed here. In all cases, it is expected that the resulting regulatory liability related to negative salvage liabilities would be tracked separately by asset class and disclosed as a separate line in rate base and in external financial reporting to assist with goal number two.

[4] Responses to BCOAPO IRs 1.7.4, 2.1.1 and 2.1.2 in the 2010-2011 Terasen Gas (Whistler) Inc. 2010-2011 Revenue Requirements and Rates Application
[5] See Gannett Fleming 2009 Depreciation Study included in Appendix E-1

4.1 Method 1 Pay as You Go

Under this method, negative salvage costs are collected from customers as they are actually incurred, with a deferral account if variances from forecasts are potentially significant.

Advantages:

- Easy to explain and administer.
- Only short-term estimation is involved in determining negative salvage costs since only projecting actual costs to be incurred for the period of the revenue requirement (usually based on previous experience with any adjustments for known events).

Disadvantages:

- Costs are not appropriately borne by the customers that are using the assets. The actual costs of abandonment are borne by today's customers who have not had use of the asset over its life.
- Amount included in rate determinations will differ from actual costs incurred; therefore likely to require deferral accounts to capture forecast vs. actual differences in removal costs.
- Customers are charged for costs relating to assets that have been removed from service.
- Risk of stranded assets, particularly in an environment of declining use rates and customer base.

4.2 Method 2 Depreciation Basis (traditional)

This is the traditional method employed by BC Utilities in their depreciation studies. There are variations to account for various price escalators, but the basic premise is the same. Under this method, the negative salvage percentages are a component of depreciation rates, and are calculated as the expected cost to remove the asset today divided by the cost to install that asset originally. The resulting rate is then incorporated into the depreciation rate as follows:

Assume an asset that originally cost $1,000 and an average service life of 50 years has estimated removal costs in today's dollars of $500. Therefore, the negative salvage percentage is 50%. To convert this into a depreciation rate, we use the following formula:

$$\frac{(1 - \text{net salvage percentage})}{\text{Avg. Service Life}} \times 100 = \frac{(1 - 50\%)}{50} \times 100 = 1\%$$

To summarize, if we collect 1% of $1,000 or $10 each year for 50 years then at the end of 50 years we will have $500 or enough to pay the negative salvage (removal) costs.

In this method, the only estimate being determined (other than the average service life which has already been determined as part of the depreciation study) is the estimated removal costs for the asset class. This estimate is usually determined based on a combination of a study of historical records adjusted to reflect the projects currently underway, and interviews with company personnel.

Since the numerator (removal costs) is estimated in today's dollars and the denominator (original cost) is in historical dollars, the calculation of the negative salvage percentage inherently recognizes the inflation that is expected between the time of original installation of the property and the time it will be removed or abandoned. As long as inflation is consistent with historical trends, the relationship should also hold true for the future.

To adjust for variations in the impact of inflation over time, a variation on the traditional approach called the Constant Dollar Net Salvage ("CDNS") has been used in the past. The CDNS approach brings both the original cost and the removal costs to today's dollars, removing all impacts of inflation. Then a forward looking estimate of the rate of inflation is applied based on current long term economic data for local labour markets to provide a more accurate indication of the true expected removal costs, and more closely align with accepted accounting methodologies.

Advantages:

- Collects removal costs from customers that benefit from the assets.
- Easy to administer.
- No deferral accounts required.
- Familiar to regulators and customers as it reflects the traditionally accepted model of collecting removal costs.

Disadvantages:

- Involves long-term estimates of removal costs, and either a dependence on the continuation of historical inflation rates, or estimating future inflation rates.
- More difficult to verify/replicate the calculations that collect the rates (sampling could be used).
- Requires periodic re-estimating.

4.3 Method 3 ARO

This method would mirror the calculation of an ARO under GAAP. Under this method, asset removal costs for each asset class would be estimated going out for the remaining asset class life by year, and then these removal costs would be discounted to today's dollars. These estimated amounts would then be added to the asset and an equal and offsetting ARO liability would be created. Each year, the asset would be depreciated and the liability would be accreted so that at the time the asset is removed the asset is fully depreciated and the liability fully funds the removal costs incurred.

Advantages:

- Collects removal costs from customers that benefit from the assets.
- Familiar to accountants as it is follows GAAP for AROs.

Disadvantages:

- The Fortis BC Utilities do not believe that the ongoing interim removal costs that are used in the calculation of negative salvage rates represent AROs; the same accounting treatment may cause confusion in differentiating the two.
- Difficult to understand and follow.
- Complex to record and track; additional costs likely to be incurred.
- Involves estimates of removal costs and also long-term estimates of inflation rates.
- Requires periodic re-estimating and annual adjustment to accretion rates.
- A further refinement of the ARO methodology is to segregate funds for future asset removals in a separate independent fund, similar to what is proposed by the NEB for pipelines. Although this methodology may work in situations where there is a single long-term asset with a significant decommissioning cost to be incurred, it could not be applied to the more common situation, where there are ongoing removal costs for many individual assets that make up a larger system. This is the case for the Fortis BC Utilities, and we believe that using segregated funds would not be an efficient methodology for administering the funds, and would be administratively expensive and burdensome.

4.4 Method 4 Hybrid

The possibility exists of combining any of the three above methods. One option would be that asset retirement costs for specific designated assets follow the ARO methodology; all other negative salvage estimates would follow the traditional depreciation methodology.

5 SUMMARY AND RECOMMENDATION

GAAP recommends that Canadian utilities record AROs where required. The Fortis BC Utilities will continue to comply with GAAP and record AROs where necessary under GAAP. In addition, any asset removal costs (negative salvage) collected from ratepayers but not yet incurred will be recorded as a regulatory liability.

Regulatory practice in the United States and throughout most of Canada allows for the collection of negative salvage costs through rates over the life of the associated assets. The most common practice is to recover these costs as a component of depreciation rates, and record the difference between the amounts collected and the amounts expended as a reduction in rate base.

There are a number of methods that can be used to calculate and track the collection of funds for removal costs, which can be held in a segregated fund similar to pension trust funds, four of which have been discussed in this paper. The first three methods achieve the goals of regulatory policy on removal costs to varying degrees, with Method #4 being a hybrid. The ranking of the four methods as compared to the stated regulatory policy goals is summarized in the following table. As stated above, the four goals are:

1. Distribute costs to ratepayers equitably over time;
2. Improve utility accountability for negative salvage costs collected from ratepayers;
3. Ensure that funds for asset removal are available at the time they are needed;
4. Minimize administrative costs related to implementation, maintenance and tracking of negative salvage costs.

Table 1: Ranking of Methods

Method	Goal 1	Goal 2	Goal 3	Goal 4
1 Pay As You Go	No	No	No	Yes
2 Depreciation Basis	Yes	No	Yes	Somewhat
3 ARO	Yes	Yes	Yes	No
4 Hybrid	Yes	Yes	Yes	Somewhat

The recommendation of the Fortis BC Utilities for implementation in their 2012 Revenue Requirements Applications is to adopt a Hybrid Approach. The traditional depreciation approach will be utilized for regulatory assets that require significant removal costs, with funds segregated by asset classes in a separate liability account. In addition, the utilities will continue to review their regulatory assets to determine if any AROs are required to be recorded under GAAP. If AROs are required to be recorded under GAAP for specific assets, the utilities propose to use the ARO methodology for regulatory purposes as well, overall incorporating a Hybrid Approach. All removal costs not provided for under either the traditional depreciation approach or the ARO approach will be expensed as incurred.

Appendix E-3

ASSET LOSS REPORT

1 ANALYSIS OF ASSET RETIREMENT LOSSES

1.1 Introduction

As part of the 2010 Depreciation Study update requested by the BCUC in its decision on FortisBC Energy Inc.'s ("FEI") 2009 RRA, FEI undertook a project to analyze and support the accumulated losses recorded to date. At the end of 2009, the total asset retirement loss balance stood at approximately $149 million with the asset categories, Mains, Services, Regulator and Meter Installation, and Meters accounting for the majority of the losses.

The purpose of this report is to provide:

- An overview of the asset retirement and accounting processes at FEI and how the processes led to the financial gains/losses recorded; and
- Explanations and reasons for the losses recorded for each of the asset categories noted.

1.2 Overview of Asset Retirement Process at FEI

Upon retirement of a fixed asset, the Plant Accounting department is notified. For retirement of recurring plant (Mains, Meters, Services), the plant units retired are provided by Field Operations. To calculate the retirement values, original costs per plant unit are used. If original costs are not known, estimates are used to retire specific plant. A plant retirement request form capturing the specifics of the plant being retired is completed and submitted to Plant Accounting. Each specific plant is identified in terms of its physical characteristics, function, location, etc.

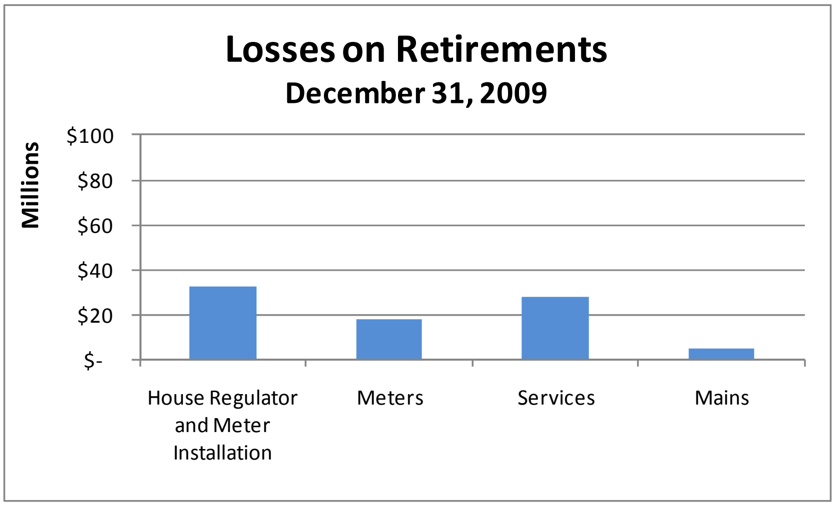
Upon retirement, the service value (i.e. original cost or estimate) of the retired asset is credited to the appropriate capital account with the associated accumulated depreciation amount debited to the accumulated depreciation account, with the difference (remaining net book value) remaining in a component of accumulated depreciation called "accumulated loss". Retirement costs (i.e. labour to dismantle the asset) and salvage proceeds (i.e. scrap value) are allocated also to the accumulated loss component of the accumulated depreciation account.

The treatment of both the removal costs and the remaining net book value of plant on retirement as a component of Accumulated Depreciation is an accepted regulatory accounting practice in accordance with the BCUC Uniform System of Accounts

1.3 Losses by Asset Category

Four asset categories totalling to $138 million account for over 90% of $149 million of the losses recorded to the end of 2009. The $138 million figure includes $54.1 million of removal costs less salvage proceeds. Excluding the removal costs less salvage proceeds, the "unrecovered losses" total to $84.1 million. This represents approximately 4% of the historical cost balance of $2 billion for these four asset categories. The losses by asset class are shown in Table E3-1 below, followed by an analysis of each class.

Table E3-1: Four Asset Categories Contribute to Accumulated Losses to end of 2009



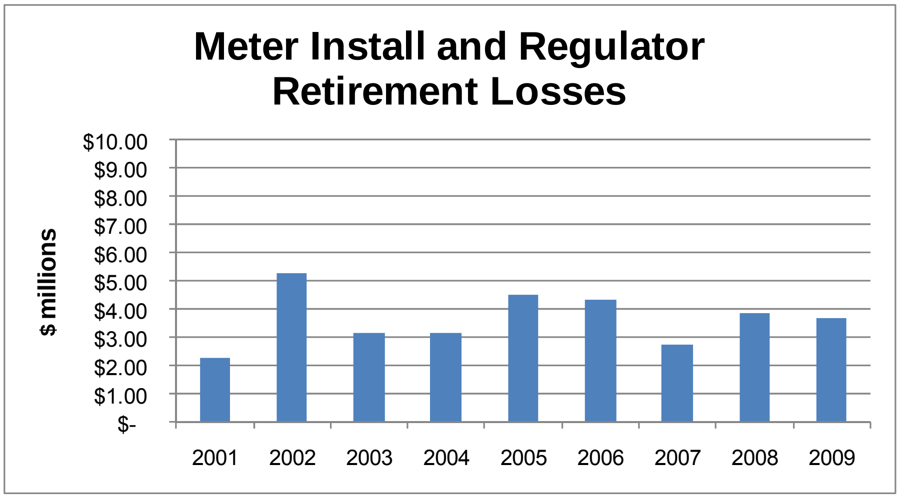
1.3.1 REGULATORS AND METER INSTALLATIONS (ASSET CLASS 474)

This account includes the cost of regulators, and labour and materials used and expenses incurred in the connection with the original installation of regulators and meters for all customer types including residential, commercial and industrial.

At the end of 2009, accumulated losses in this asset class were approximately $32.4 million (excluding removal costs less salvage proceeds of $5.6 million). As a percentage, the $32.4 million accumulated loss represents 22% of the historical cost balance of $148 million.

The following graph shows the losses recorded in this asset category for the years 2001 to 2009. Prior to the year 2001, the gains/losses observed for this asset category were minimal.

Figure E3-1: Losses for Asset Class 474 by Year



Further analysis of the retirement losses suggest that the attributed losses have been amplified as the result of an overstatement of the historic unit costs used for determining the gains/losses on retirements.

Starting in 2001, FEI implemented a process to retire the install labour costs included in this asset category, using the number of meters scrapped and the applicable historical unit costs based on a composite average of the activities being recorded in this account. However, there is a wide disparity in the actual cost for the different types of meter install activities, with a simple residential install costing approximately $60 per install compared to a larger diaphragm meter install for a commercial customer at double or more. For this reason, applying a composite unit cost to determine gains/losses for retirements, particularly a lower cost residential install, has resulted in an overstatement of losses.

Analysis of the losses reported for the recent years 2006 to 2009 show that of the approximately 120,000 meters scrapped during this period, over 90% were for smaller diaphragm meters used for residential customers. Yet, the loss reported on a per meter installed basis ranged from $100 to $150 each, significantly higher than the $60 per meter install stated earlier.

On a retrospective basis, if a revised historic unit cost ranging from $60 to $100 meter install was used for the period 2006 to 2009, the retirement loss recorded for that period would instead range only from $4 to $7 million compared to the actual reported loss of approximately $15 million. Total rate base would remain unchanged as the losses would be reclassified to accumulated depreciation from the asset loss balance.

The preceding analysis suggests that the losses reported of $32 million for the period 2001 to 2009 is likely to be overstated by approximately 50%, reflecting the challenges in coming up with an applicable representative unit cost. This conclusion is corroborated by the $16 million of losses recorded in the Meter asset category during the same time period. It is reasonable to expect retirement losses in the Meter Install (474) asset category to follow and be similar to that of the Meter (478) category. Currently, for 2001 to 2009, the retirement losses for the Meter Install asset category exceed that of the Meter asset category by approximately double ($32 million vs. $16 million). All else equal, the overstatement effect for this account will likely even out over time as future retirements are recorded using a lower unit cost based on an understated remaining cost pool.

The above analysis highlights the challenges with developing a retirement process for a wide and disparate asset category such as the Meter Install. To address this, Gannett Fleming recommends adopting an approach that records new plant additions for this asset class in a separate account, with depreciation calculated using a whole life rate. The existing meter install costs would remain in the current account and continue depreciating at the current depreciation rate, which includes a factor for recovery of the retirement losses. This recommended approach would simplify the retirement process (i.e. no retirement entries required) while still recording the appropriate level of depreciation expense.

1.3.2 METERS (ASSET CLASS 478)

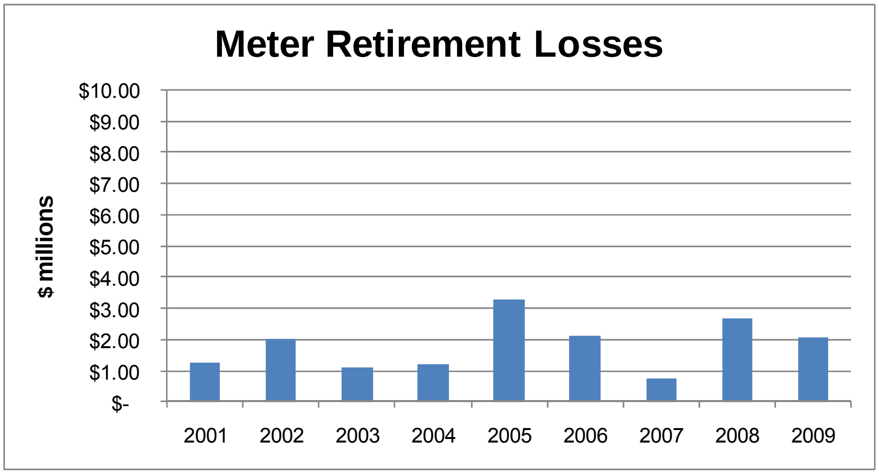
This account includes the cost of meters or devices (including the cost of badging and testing) for use in measuring the quantity of gas delivered to all customer types including residential, commercial and industrial.

Consistent with the industry, FEI currently expects the lives of its residential meter assets to currently last no longer than 15 to 20 years. Commercial and industrial meters, comprising approximately 20 – 25% of the investment in meters however are expected to last beyond 20 years as the larger volume meters are refurbished when they are removed for testing.

At the end of 2009, accumulated losses in this asset class were approximately $18.4 million (excluding removal costs less salvage proceeds of ($2.1) million). As a percentage, the $18.4 million accumulated loss represents approximately 9% of the historical cost balance of $205 million.

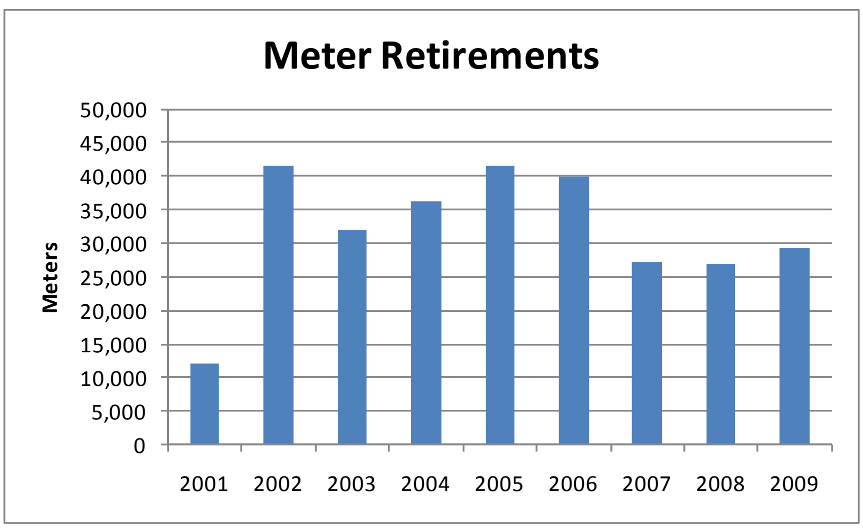
The following graph shows the losses recorded in this asset category for the period 2001 to 2009.

Figure E3-2: Losses for Asset Class 478 by Year



The following graph shows the numbers of meters retired for the years 2001 to 2009.

Figure E3-3: Number of Meters Retired by Year



Meters are retired and scrapped when they have reached the end of their useful lives. After the initial install of meters for new customers, meters subsequently are subject to a meter exchange program where in-service meters are removed and replaced with new or repaired meters to maintain accurate measurement as required by the Electricity and Gas Inspection Act of Canada.

For residential gas meters, upon installation, a seal with an associated expiry date is attached to the meters. A year prior to the expiration of the seal, the meters must be evaluated to ensure the accuracy is within federally regulated tolerances. A representative sample is extracted from pre-determined groups of meters according to Measurement Canada regulations. The sample meters are tested under strictly controlled conditions in certified test facilities with the test data analyzed using government mandated statistical methods. The test results are then used to determine if the meters from the group of which the sample was withdrawn are legally permitted to remain in service. The greater the level of error observed in the sampled meters, the shorter the time period of the seal extension as directed by the Electricity and Gas Inspection Act of Canada. Where test results fail to meet regulated accuracy requirements, the meter group in question will be removed from the field and replaced, at which time a determination is made whether the removed meters will be retired.

Based on the company's meter retirement data, FEI has observed that the average residential meter life has been less than the 25 – 28 years as previously anticipated. The shorter residential meter life is linked to the increased cost to refurbish residential meters relative to the cost to replace these same meters. In the past, FEI's operating model had residential meters being removed from the field after approximately 14 years in service for refurbishment. The meters were then re-installed with the expectation that these meters would again be removed from the field within another 14 years, for a service life totalling 28 years. However, since then, the cost of labour and materials for retrieval and refurbishment continued to rise with the cost to replace with new meters falling. Consequently, over the last decade, the refurbishment of residential meters has been become uneconomical. As a result, to maximize the full value of these meters, these meters have been allowed to remain in the field until such time they are replaced with a new meter. Recent FEI sampling results indicate that on average residential meters approach the maximum allowable error limit at approximately the 20 year mark.

To a lesser extent, another reason for the early retirement of meters is due to inferior residential meters, arising from manufacturing issues. A notable example is the planned removal of batches of meters installed during the late 1990s, with sample testing showing loss of accuracy at much faster rates than expected. FEI expects that these meters will be required to be removed from service in accordance with ongoing meter sample test results to prevent large scale unscheduled failures.

It is expected that the current 20 year life expectancy for residential meters will continue in the foreseeable future. As such, FEI will continue to require that a certain portion of the meter fleet be exchanged every year (i.e. 1 / 20 years or 5% of the meter fleet).

Finally, in 2005, Measurement Canada began the process of rewriting a number of specifications to reflect a change in approach toward regulation of organizations using custody transfer meters from being less prescriptive to more performance based, with a greater focus upon enforcement. Most recently, Specification SS06 came into effect January 1, 2011 with a required date for full implementation no later than January 1, 2014. This specification is designed to meet Measurement Canada`s goal of greater assurance of compliance with the Electricity and Gas Inspection Regulations among organizations which choose to apply compliance sampling in order to extend the use of their meters. At this time, FEI believes its existing meter fleet management practices will ensure the company remains in compliance with the increased rigor of this specification.

1.3.3 SERVICES (ASSET CLASS 473)

The assets in this class consist of installations of various service pipes for new and existing customers including:

- new and conversion distribution pressure (DP) and intermediate pressure (IP) services to single and multi-family dwellings;
- pre-installed service stubs from mains;
- services extended from stubs;
- vertical header subdivisions (a vertical service line system within a building such as a high-rise);
- DP and IP new or conversion service header mains (distribution mains installed on private property such as multi-family strata owned complexes); and
- DP and IP service header laterals.

FEI expects the lives of its distribution services assets to be within the range of its industry peers, with typical service lives ranging from 40 to 65 years. At the end of 2009, accumulated losses in this asset class were approximately $27.8 million (excluding removal costs less salvage proceeds of $45.8 million). As a percentage, the $27.8 million accumulated loss represents only 4% of the historical cost balance of $664 million.

Reasons that services may be retired earlier than their expected lives and contribute to the retirement losses recorded to date can be classified into two categories - Customer and Safety. The table below provides a summary of the services retired in recent years 2006 to 2009 with the length of the service pipe retired and the associated retirement costs separated into the categories Customer and Safety.

Table E3-2: Most Services Retired Due to Customer Requests

Reasons for Retirement	2006		2007		2008		2009	
	Metres of Services Retired	Retirement Costs	Metres of Services Retired	Retirement Costs	Metres of Services Retired	Retirement Costs	Metres of Services Retired	Retirement Costs
Customer	76,958	$ 4,079,701	76,893	$ 4,235,239	68,959	$ 4,913,276	72,817	$ 4,906,138
Safety	11,303	$ 584,850	30,733	$ 311,291	45,852	$ 471,291	10,811	$ 499,975
Total	88,261	$ 4,664,551	107,626	$ 4,546,530	114,811	$ 5,384,566	83,628	$ 5,406,113

The data above indicates that the majority of retirements expressed in metres of pipe retired and the retirement costs incurred were the result of customer initiated requests.

Customer requests to retire services originate as a result of land development activities and specific requirements of customers. As the demand for housing in the more densely populated regions (i.e. Lower Mainland) increases, existing housing and land are being redeveloped with larger plots of land being subdivided and existing housing demolished to make way for multi-family housing (i.e. townhouses, condos). This is contributing to a shorter useful life observed than originally anticipated. Other customer driven requests include those resulting from homeowners performing building modifications and landscaping activities that often require the retirement of service line assets. To mitigate the rate impact to all customers, FEI seeks to recover the retirement costs from the customer that initiates the work wherever possible.

The other contributor to early service retirements is safety. FEI has a service retirement program to remove inactive services. An inactive service to a premise is a live gas service or meter with no existing customer. These assets continue to attract regular maintenance but are not presently being used for gas delivery. Inactive services are often forgotten by the property owner and represent a significant risk of third party damage. Removal of inactive services initiated by FEI improves the safety of the public, the natural gas delivery system and its employees.

1.3.4 MAINS (ASSET CLASS 475)

This asset class consists of the installation and material costs of new and replacement intermediate pressure and distribution pressure mains from the pressure regulator station to the customer service line including:

- Main extensions and tie-ins to serve new customers;
- Gas main additions or replacements (i.e. system improvements) and tie-ins needed to service increasing demands placed on the system;
- Replacements (i.e. renewals) of portions of existing mains to remove corroded or damaged sections; and

- Replacement of pipe that has been identified as non-compliant due to geographical location (close to highways or bridges) or pipe configuration.

FEI expects the lives of its distribution mains assets to be within the range of its industry peers with typical service lives for mains ranging from 50 to 65 years. At the end of 2009, accumulated losses in this asset class were approximately $5.5 million (excluding removal costs less salvage proceeds of $4.8 million). As a percentage, the $5.5 million accumulated loss represents only 0.6% of the historical cost balance of $861 million.

Reasons that distribution mains may be retired earlier than their expected lives and that contribute to the retirement losses recorded to date can be classified into two categories, Customer and Safety/Reliability. The table below provides a summary of the distribution mains retired in recent years 2006 to 2009 with the length of the mains pipe retired and the associated retirement costs separated into Customer and Safety/Reliability.

Table E3-3: Most Mains Retired for Safety and Reliability Reasons

Reasons for Retirement	2006		2007		2008		2009	
	Metres of Main Retired	Retirement Costs	Metres of Main Retired	Retirement Costs	Metres of Main Retired	Retirement Costs	Metres of Main Retired	Retirement Costs
Customer	1,048	$ 22,981	-	$ 6,083	-	$ -	15	$ 535
Safety/Reliability	26,169	$ 513,060	54,548	$ 525,600	53,832	$ 474,834	21,107	$ 591,413
Total	27,217	$ 536,041	54,548	$ 531,683	53,832	$ 474,834	21,122	$ 591,948

The data above indicates that the majority of retirements, expressed in metres of pipe retired and correlated to the retirement costs are primarily the result of safety/reliability related reasons.

FEI is committed to ensure the safety and reliability of the distribution system. To achieve this, FEI regularly assesses and monitors the health of its distribution mains system, noting factors such as the age and condition of the pipe installed, identified leaks, effectiveness of corrosion prevention and condition of coatings on the pipe. Where warranted, the Company replaces the distribution mains earlier than expected in order to maintain the integrity of the pipe. Where the opportunity permits, FEI schedules mains pipe replacement to coincide with municipal or road construction activities in order to minimize the costs. In the past, high failure rates leading to early retirement of distribution mains have resulted from leaks caused by corrosion in mains installed prior to 1980. Prior construction practices, use of coal tar and asphalt enamel pipe coatings from 1930 to 1970, and use of tape coatings in the 1970s have been contributing factors to earlier retirements.

Customer requests to relocate distribution mains may also lead to earlier retirement than expected. Highway construction, municipality activities and private industry development may result in FEI having to retire and relocate an existing main. To mitigate the rate impact to all customers, FEI seeks to recover the related costs wherever possible from the initiator of the request.

1.4 Conclusion

As the above analysis and explanations indicate, FEI's recorded retirement losses for the asset categories mains, meters and services are reasonable and reflective of the regulations it faces and the environment which it operates in as a natural gas utility.

Appendix F-1

LOCK-OFF AND RECONNECTION REACTIVATION FEE

LOCK-OFF AND RECONNECTION/REACTIVATION FEE

The Companies plan to increase the reconnection/reactivation fee to $100 (regular hours) and $140 (after hours). The proposed change reasonably reflects the cost of providing this service. The proposed fee change also mitigates negative impacts to other ratepayers and reduces the O&M cost per customer for all customers.

The reconnection/reactivation charge applies to customers who request reinstatement of gas service after a disconnection. The fee includes the field cost of performing the disconnect (also known as lock-off or de-activation) and the reconnect (also known as unlock or re-activation and relight) together with a nominal office administrative cost for order creation and review, scheduling and dispatching. FEU plans to increase the reconnection/reactivation fee by $35 (regular hours) and by $35 (after hours) effective January 1, 2012, from the current charge of $65 (regular hours) and $105 (after hours).

Up until the end of 2011, Accenture Business Services for Utilities ("ABSU") (on behalf of CustomerWorks LP) will continue to provide a bundled suite of services which includes: billing, meter reading, customer contact (call centre operations) and credit and collections. A bundled rate per customer is charged for the services and includes the Lower Mainland lock-offs as part of credit and collections services provided. FEU is unable to determine the portion of the bundled rate that is related to the administrative costs to perform the Lower Mainland lock-off activities.

Following expiry of the ABSU contract at the end of 2011, FEU will manage all lock-offs including Lower Mainland lock-offs, starting on January 1, 2012. In response to this upcoming change, it is necessary to review the reconnection/reactivation fee to ensure revenues adequately recover the costs of performing the disconnection, reconnection, and reactivation service. The service is set out in the FortisBC Energy Inc. Tariff – Section 5.4, FortisBC Energy (Vancouver Island) Inc. Tariff – Section 5.4 and FortisBC Energy (Whistler) Inc. Tariff – Section 5.4, as follows:

> ***Reactivation Charges*** *- If*
>
> *(a) Service is terminated*
>
> > *(i) at the request of a Customer, or*
> >
> > *(ii) for any of the reasons described in Section 23 (Discontinuance of Service and Refusal of Service), or*
> >
> > *(iii) to permit Customers to make alterations to their Premises, and*

(b) the same Customer or the spouse, employee, contractor, agent or partner of the same Customer requests reactivation of Service to the Premises within one Year, the applicant for reactivation must pay the greater of

(i) the costs FortisBC Energy incurs in de-activating and re-activating the Service, or

(ii) the sum of the minimum charges set out in the applicable Rate Schedule which would have been paid by the Customer between the time of termination and the time of reactivation of Service.

A review of the actual and forecast costs of providing this service demonstrates that the current charges of $65 (regular hours) and $105 (after hours) do not adequately recover the disconnection and reconnection/reactivation costs. This is demonstrated in the following four tables which are based on the following assumptions:

- The 2012 – 2013 forecast activities are based on 2010 activities.
- Consistent with the current experience the proportion of relights completed after hours in relation to during working hours will not change significantly.
- Consistent with the current experience, most or all industrial meter unlocks will be done during working hours.
- $3 administration (dispatch) unit cost based on task duration and labour rate.

Table F-1: Fee Increase Required for the Mainland to Recover Cost of Service

Annual Activities for 2012-2013			
Mainland	**Forecast Costs**	**Forecast Activities**	**Unit Cost**
Lock-off Activities	$1,271,544	31,810	$40
Relight Activities - Regular hour	$1,311,349	23,689	$55
Relight Activities - After hour	$433,666	5,569	$78
Administration (Dispatch)	$94,650	31,810	$3
Total Costs	**$3,111,209**		
Recoveries	**Forecast Recoveries**	**Forecast Activities**	**Reconnect Fee**
Reconnects - Regular hour	$2,331,549	23,689	$98.42
Reconnects - After hour	$779,660	5,569	$140.00
Total Recoveries	**$3,111,209**		

Table F-2: Fee Increase Required for Vancouver Island to Recover Cost of Service

Annual Activities for 2012-2013			
Vancouver Island	**Forecast Costs**	**Forecast Activities**	**Unit Cost**
Lock-off Activities	$91,648	1,622	$57
Relight Activities - Regular hour	$127,938	1,870	$68
Relight Activities - After hour	$42,403	350	$121
Administration (Dispatch)	$4,800	1,622	$3
Total Costs	**$266,789**		
Recoveries	**Forecast Recoveries**	**Forecast Activities**	**Reconnect Fee**
Reconnects - Regular hour	$217,789	1,870	$116.46
Reconnects - After hour	$49,000	350	$140.00
Total Recoveries	**$266,789**		

Table F-3: Fee Increase Required for Whistler to Recover Cost of Service

Annual Activities for 2012-2013			
Whistler	**Forecast Costs**	**Forecast Activities**	**Unit Cost**
Lock-off Activities	$2,146	51	$42
Relight Activities - Regular hour	$2,518	61	$41
Relight Activities - After hour	$2,305	14	$165
Administration (Dispatch)	$141	51	$3
Total Costs	**$7,110**		
Recoveries	**Forecast Recoveries**	**Forecast Activities**	**Reconnect Fee**
Reconnects - Regular hour	$5,150	61	$84.42
Reconnects - After hour	$1,960	14	$140.00
Total Recoveries	**$7,110**		

A combined view of the forecast activities, cost and fee analysis is presented below to arrive at a required standard fee.

Table F-4: Fee Increase Required for FEU to Recover Cost of Service

Annual Activities for 2012-2013			
FEU	**Forecast Costs**	**Forecast Activities**	**Unit Cost**
Lock-off Activities	$1,365,338	33,483	$41
Relight Activities - Regular hour	$1,441,805	25,620	$56
Relight Activities - After hour	$478,374	5,933	$81
Administration (Dispatch)	$99,591	33,483	$3
Total Costs	**$3,385,107**		
Recoveries	**Forecast Recoveries**	**Forecast Activities**	**Reconnect Fee**
Reconnects - Regular hour	$2,554,487	25,620	$99.71
Reconnects - After hour	$830,620	5,933	$140.00
Total Recoveries	**$3,385,107**		

A standard reconnect fee of $100 (regular hours) and $140 (after hours) for FEU is required to recover the disconnection, reconnection, and reactivation costs, as shown in Table F-1 below.

Table F-5: Planned Fee Increase to Recover Disconnection, Reconnection/Reactivation Cost of Service

Plan	**Forecast Recoveries**	**Forecast Activities**	**Plan Reconnect Fee Required**
Reconnects - Regular hour	$2,562,000	25,620	$100
Reconnects - After hour	$830,620	5,933	$140
Total Plan Recoveries	**$3,392,620**		

The proposed fees are in the same range as compared to other gas and electric utilities in and outside the Province, as shown in Table F-6 below.

Table F-6: The Planned Reconnection/Reactivation Fee is Comparable to Other Utilities

	Regular hour	**After hour**
FortisBC (Gas) Current Fee	$65	$105
FortisBC (Gas) **Proposed Fee**	$100	$140
Gaz Metro	$225 or $310 (depends on the annual load)	Not Specified.
Enbridge Gas	$68.25 disconnection fee $200 reconnection fee	Not specified
Union Gas	For non-payment: $65	Not specified.
Centra Gas Manitoba Inc.	$50	$65
SaskEnergy	$68 or $100 (depends on the annual load)	$95 or $135 (depends on the annual load)
AltaGas	Residential: $50	Not specified
Atco Gas	$90	$205
BC Hydro**	$125	$158
FortisBC** (Electric)	$100	$132

** Although BC Hydro and FortisBC (Electric) are not gas utilities, they are listed for comparative purposes as labour rates are similar provincially. . The average reactivation fee for the two major electric utilities in the province is $112 and $145 for regular hour and after hour calls respectively. Unlike FortisBC (Gas), these companies do not enter the premise to reactivate appliances.

The Companies are proposing to increase the reconnection/reactivation fee to $100 (regular hours) and $140 (after hours). The proposed change reasonably reflects the cost of providing service. If the current reconnection/reactivation fee continues through 2012-2013, all ratepayers will be subsidizing the lock-off and reconnection/reactivation costs of customers who have not paid their bills and who have been disconnected. Therefore, the proposed fee change mitigates negative impacts to other ratepayers and reduces the O&M cost per customer for all customers.

Appendix F-2

BILL IMPACT AND TARIFF CONTINUITIES

DRAFT BILL IMPACT SCHEDULES AND TARIFF CONTINUITIES

This appendix includes draft bill impact schedules and tariff continuities that result from the financial schedules contained in Section 7 of this Application and the corresponding rate proposals contained in Section 3 of this Application.

This appendix includes fourteen tabs as follows:

Notes: Tariff rate schedule per GJ charges are set at 3 decimals. Individual tariff components are calculated and shown to 4 decimals; subtotal amounts, equivalent to the line items on customer bills, are rounded and shown to 2 decimals, consistent with actual invoice calculations. Slight differences in totals due to rounding. Where applicable, existing monthly January 1, 2011 basic chage rates are prorated to a daily equivalent comparison purposes.

Appendix G

NON RATE BASE DEFERRAL ACCOUNTS

1 OVERVIEW

The FortisBC Energy Utilities maintain both rate base and non rate base deferral accounts. The recommendation for one treatment over the other has primarily been one of timing, or as a means to stream cost recovery to a particular customer or group of customers separate from all other customers. In the case of a timing issue, if the FBU are able to forecast balances for deferral accounts and include them in revenue requirements, then that is the preferred treatment. In situations where the rates for a particular year have already been set and costs need to be recorded in a deferral account, that deferral account will be non-rate base attracting AFUDC until such time as rates are re-set under the next revenue requirement, and the account is rolled into rate base. Consistent with the Uniform System of Accounts, items that are recoverable from customers but not included in rate base (such as Work in Progress or non-rate base deferral accounts) are afforded AFUDC treatment so that the utility is afforded the opportunity to earn a fair return on costs prudently incurred to provide service to customers.

The following two sections discuss the existing non rate base deferral accounts for the Mainland and Vancouver Island. Neither Whistler nor Fort Nelson have non rate base deferral accounts.

2 MAINLAND

2.1 Biomethane Variance Account (BVA)

The Commission approved the creation of the BVA in its Order No. G-194-10, to capture costs to procure and process consumable biomethane gas as well as revenues collected through the biomethane energy recovery component of rates. The BVA captures biomethane commodity costs, the capital cost of service of the upgrader plant[1], O&M associated with the upgrader plant and O&M costs attributable to biomethane customer enrolment, account finalization and billing adjustments. The balance in the BVA is recovered through the Biomethane Energy Recovery Charge. Please refer to Appendix J for a comprehensive report on the biomethane program and details regarding the balance of all deferral accounts associated with biomethane.

2.2 Commodity Unbundling

At the end of 2010, the Commercial Commodity Unbundling deferral had a balance of $52.3 thousand, and the Residential Commodity Unbundling deferral had a balance of $102 thousand. Both of these deferral accounts are forecast to have a zero balance at the end of 2011, as the currently approved Rider 8 is forecast to recover the balance in the accounts. FEI projects that the marketer fee recoveries for these programs in the future will be sufficient to recover the ongoing costs, and is therefore requesting that these accounts be discontinued effective January 1, 2012. The costs and recoveries will be recorded in O&M starting in 2012, and have

1 As discussed in Section 5.5, Biomethane Recoveries are included in other revenue and transfer the capital cost of service of the upgrader plant from the delivery margin to the BVA

been forecast as net zero for this RRA, with the exception of the Customer Choice program expenditures which are included in the Customer Service department O&M discussed in Section 5.3.7.

2.3 Tilbury Property Purchase (Subdividable Land)

Approved by Commission Order No. G-68-10, the Tilbury Property Purchase deferral account had a balance of $3.353 million at the end of 2010. This represents the original allocation of the subdividable area ($3.3 million) plus interest recorded to date. As identified in the Tilbury CPCN application, and as required by Order G-68-10, FEI was to investigate opportunities to subdivide and sell a portion of the Tilbury Property not required for compliance purposes. On December 1, 2010, in compliance with Order G-68-10, FEI filed its semi-annual report with respect to its efforts to subdivide and sell a portion of the Tilbury Property. FEI continues to work with several parties and expects to file an application for approval of a subdivision and sale sometime before year end. The disposition of the Tilbury Property Purchase deferral account will be dealt with as part of that subdivision and sale application.

2.4 Thermal Energy Services[2] (formerly Alternative Energy Services)

FEI continues to work with customers in defining and developing their integrated energy needs. In response to those needs, development is underway on several Thermal Energy Services projects. FEI will be seeking appropriate Commission approvals for each project pursuant to item 8 of the Negotiated Settlement Agreement approved by Order G-141-09, dated November 26, 2009. These projects will come forward for BCUC approval once contracts are in place with customers. FEI expects to begin filing these contracts in the Spring or Summer of 2011 with the BCUC.

The market interest for Thermal Energy solutions is considerable. FEI currently has over 20 projects in development with a total estimated value exceeding $250 million. Several of these projects are anticipated to be submitted to the BCUC for approval in the near term. Table G-1 provides examples of some of the current Thermal Energy Services projects under development.

Table G-1: Customers are Seeking Complete Integrated Energy Solutions

Project	Description
Quesnel District Energy System, Quesnel, B.C.	FEI is developing a combined power and district heating project in the City. The project will use waste heat from the nearby pulp and paper mill to heat up to 22 buildings and generate about 1.7 megawatts of electricity. Natural gas will also continue to be an important part of the City's energy mix.

2 Thermal Energy Services means Geoexchange, Solar-thermal and District Energy Systems.

Project	Description
The Village at Fraser Mills, Coquitlam, B.C.	This district energy system will serve a new mixed-use community of up to 3,700 residential units; 150,000 square feet of commercial space; 100,000 square feet of institutional space; 235,000 square feet of industrial space; and a 44,000 square foot community building. The integrated energy solution being developed by FEI will include renewable thermal energy technology such as biomass or groundwater geoexchange.
Delta School District Geoexchange System, Delta, B.C.	FEI has an agreement with the Delta School District for the delivery of cleaner thermal energy for 17 schools and two school district buildings through the implementation of state-of-the-art geoexchange systems and high-efficiency condensing boilers, which will replace aging heating plants at school district sites. These systems provide many benefits, ranging from saving energy and improving indoor comfort to stable energy rates and a smaller carbon footprint.
City Centre and Pandosy Energy Systems, Kelowna, B.C.	FortisBC and the City of Kelowna have agreed in principle to develop two district energy systems. These FEI -owned and operated systems will use waste heat and water from the City's wastewater plant and a nearby industry as part of an integrated energy approach that can potentially save about 16,300 tonnes of CO2 per year – equivalent to removing approximately 3,500 cars from the road annually – according to the City's 2010 pre-feasibility study.

The Thermal Energy Services Deferral account was approved by Commission Order No. G-141-09 to capture and record revenues and costs related to geo-exchange, solar-thermal and district energy systems. FEI is proposing to continue segregating all costs and recoveries in this manner and is seeking approval for the continuation of the Thermal Energy Service Deferral Account in this Application. The recovery from Thermal Energy Services customers of the balance in this deferral account will be considered in FEI's future applications regarding individual contracts for approval by the BCUC. Consistent with the terms of the NSA, there are three components of costs charged to this deferral account, which are discussed in the following sections and include:

- Direct costs;
- Sales and marketing O&M and business development costs; and
- An overhead allocation from FEI.

All costs associated with Thermal Energy Services are included in the deferral account. Table G-2 summarizes the forecast costs added to the deferral account and attributable to Thermal Energy Services for 2010 and 2011, as agreed upon in the NSA, and also provides a comparison to the actual 2010 costs and the projected 2011 costs.

Table G-2: Thermal Energy Projects are in Development Stages

	2010			2011		
	NSA	Actual	Variance	NSA	Projected	Variance
Direct Costs	-	1,196	1,196	-	11,750	11,750
Sales & Marketing	1,000	1,435	435	1,500	1,550	50
Overhead Allocation	500	500	-	500	500	-
AFUDC	-	82	82	-	100	100
Tax	(428)	(682)	(254)	(530)	(543)	(13)
	1,073	2,530	1,458	1,470	13,357	11,887

2.4.1 THERMAL ENERGY SERVICES - DIRECT COSTS

The direct costs include feasibility assessment, design, equipment and construction of the various thermal energy solutions. These costs vary with the number, nature and development stage of projects. As such, an approved spending amount was not specified for 2010 and 2011 and a variance is therefore not reported. The increase in 2011 over 2010 is attributable to increased market interest in certain sectors such as schools and hospitals, with some projects beginning construction in 2011. These projects will be brought forward for BCUC approval in 2011.

2.4.2 THERMAL ENERGY SERVICES - SALES AND MARKETING O&M AND BUSINESS DEVELOPMENT

Sales and marketing O&M includes the labour of the 12 employees in Thermal Energy Services in 2011 as well as the direct labour charged through timesheets from individuals in other areas of the Companies. The costs also include contributions to industry associations of $15 thousand in 2011.[3] As agreed to in the NSA, these costs were budgeted at $1 million in 2010 and $1.5 million in 2011. As shown in Table G-2, the O&M and Business Development costs captured in the deferral account were $1.4 million in 2010 and are projected to be $1.6 million in 2011.

2.4.3 OVERHEAD ALLOCATION

In Commission Order G-141-09, FEI agreed to charge Alternative Energy Services customers $0.5 million for 2010 and $0.5 million for 2011 for administrative services provided by the gas utility to the alternative energy customers. As part of this application, FEI undertook a review of which services should be included in this administrative charge and what the charge should be for 2012 and 2013. Administrative services include those services not directly charged or chargeable and include the following categories:

- Executive: time to review current status of projects, monitor status of projects and reviewing and approving potential projects.

[3] Contributions of $5 thousand to The Canadian District Energy Association, The Community Energy Association and Geoexchange BC for a total of $15 thousand in 2011.

- Finance: management and financial reporting and accounts payable.
- Regulatory affairs: reviewing cost of service models, tariffs and project management
- Human Resources: recruiting and compensation and benefits.
- Information technology: IT support to existing employees charging time directly to the Thermal Energy Services deferral.
- Facilities: allocation of facilities costs for employees charging directly into the Thermal Energy Services deferral account. The facilities include space in the Surrey Operations Centre, Garbally/Langford and the Burnaby facility.

Based on the review, FEI has estimated that a charge of $0.5 million for both 2012 and 2013 be included as a recovery of overheads for the benefit of FEI and its ratepayers. This charge represents the expected administrative costs of supporting the Thermal Energy Services businesses.

2.5 Mark to Market – Hedging Transactions

This deferral account was approved by Commission Order No. E-22-95 to record the mark-to-market adjustment due to financial hedging transactions for System and Non-System Gas purchasing. The balance at the end of 2010 was $115.6 million credit.

2.6 Mark to Market – Customer Care Enhancement Project

This deferral account was approved by Commission Order No. G-96-10 to record mark-to-market adjustments due to fluctuations in rates on the foreign currency exchange forward contract for the CCE Project. The balance at the end of 2010 was $189.7 thousand debit.

2.7 Non Rate Base Deferrals Entering Rate Base in 2012

The following is a list of all of the non rate base deferral accounts that will be entering rate base in 2012. A discussion of each of these accounts is included in Section 6.3.

a) Tilbury Property Purchase (Land Retained)[4]
b) CCE Project Deferred O&M and Cost of Service (with allocation to Vancouver Island and Whistler)
c) Kootenay River Cost of Service
d) 2010-2011 Biomethane Program Costs
e) 2011 CNG and LNG Service Costs and Recoveries

[4] This account transfers to rate base through the appropriate Land account and is included in gross plant in 2012 as shown in Section 7, Tab 7.1, Schedule 46, Column 3, row 29

f) Residual Deferral - Rider 2 ROE Revenue Requirement Volume Variance

g) Residual Deferral – Rider 4 Delivery Refund Rider Volume Variance

h) Residual Deferral – Rider 4 Lochburn Land Costs Volume Variance

3 VANCOUVER ISLAND

3.1 Rate Stabilization Deferral Account

At the end of 2010, the balance in the Rate Stabilization Deferral Account ("RSDA") was $35.618 million. Commission Order No. G-140-09 approved the creation of the RSDA. to capture the differences in 2010 and 2011 between the net revenues received and the actual cost of service, excluding O&M variances from forecast, with the balance in the RSDA being amortized into cost of service after 2011 to offset future rate increases. Further discussion of the treatment of this account for 2012 and 2013 is included in Section 3.

3.2 Mark to Market – Hedging Transactions

This deferral account was approved by Commission Order No. E-22-95, to record the mark-to-market adjustment due to financial hedging transactions for System and Non-System Gas purchasing. The balance at the end of 2010 was $46 million credit.

3.3 Mark to Market - LNG Facility

This deferral account was approved by Commission Order No. C-9-07 to record currency exchange differences for the Mt Hayes LNG Project for an amount of contracted US dollar purchases expected to be $50 million USD. The balance at the end of 2010 was $48.8 thousand credit.

Appendix H
ORGANIZATION CHARTS

1 ORGANIZATION CHARTS

This appendix includes the Organization Charts for FEU as at December 31, 2011, reflecting the current organization stru cture. Consistent with Section 5 of the Application, the ch arts reflect annual FTEs as at December 31, 2011.

The charts in this appendix are organized as follows:

1. Operations (Natural Gas) (Distribution and Transmission)
2. Energy Supply & Resource Development
3. Customer Service
4. Energy Solution & External Relations
5. Information Technology
6. Business Services (Operations Engineering and Operations Support)
7. Facilit ies
8. Human Resources
9. Environmental Heatlh & Safety
10. Finance and Regulatory

Appendix I

CNG AND LNG FUELING REPORT

1 OVERVIEW

On December 1, 2010 FortisBC Energy Inc. ("FEI" or the "Company")[1] submitted its Application for Approval of a Service Agreement for Compressed Natural Gas ("CNG") Service and for Approval of General Terms and Conditions ("GT&Cs") for CNG and Liquefied Natural Gas ("LNG") Service (the "NGV Application") to the Commission. On December 6, 2010, the Commission issued Order G-181-10 establishing a Regulatory Timetable for consideration of the NGV Application. On April 13, 2010, FEI submitted to the Commission and Interveners our Final Written Reply Submission, and at the time that this RRA was submitted the NGV Application was still before the Commission for approval. Given customer support[2] for the NGV Application and the benefits the offering will confer upon natural gas customers, we have included in this 2012-2013 Revenue Requirements Application (the "RRA") our project costs and revenue to undertake this business for this period. These costs have been integrated into our rate base and O&M forecasts, however the detail provided in this Appendix allows the reader to identify these costs independently.

The NGV Application proposes a model for FEI to own and operate refuelling stations for natural gas vehicle ("NGV") customers in a manner which ensures that all FEI customers benefit from the increased system throughput resulting from NGV volumes, while ensuring that the forecast incremental costs of FEI owning and operating these stations are recovered through a contract rate charged to these incremental customers. The proposed rate structures require firm "take-or-pay" (i.e. minimum contract demand) commitments, with rates set to recover from the particular customer over the term of the service agreement the cost of investing in and maintaining CNG/LNG facilities located on the customer's property to permit fueling. FEI is targeting commercial, return-to-base fleet of buses, heavy duty trucks, vocational trucks, and marine vessels.

The forecasts made in relation to NGV fueling infrastructure in the Application and in this Appendix are premised on the assumption that the NGV Application will be approved as filed and all approvals sought will be granted. The forecasts are further premised on the assumption that the EEC incentives for NGVs from the Innovative Technology Program Area will continue during the test period of this RRA[3]. The growth of the NGV fueling business is inherently reliant upon the adoption of NGVs in our service territory and the Utilities believe that the adoption of NGVs in our service territory depends upon the continued availability of these EEC incentives

[1] In this RRA, NGV initiatives are described as only occurring within the FEI service territory. The Company's NGV initiatives have not yet attracted participants within FEVI for two main reasons. Firstly, most high mileage fleet operators are based in the Lower Mainland and central regions of BC. Secondly, the higher delivery rate of natural gas within FEVI reduces the price differential between diesel and natural gas, and the overall attractiveness of CNG and LNG as a transportation fuel.

[2] Final Submission Arguments from Registered Interveners BCSEA, BCOAPO, and CEC generally support the proposed NGV Application. Also see Letters of Support in Appendix F of the NGV Application.

[3] These incentives are presently under review through the process initiated by Commission Letter L-30-11.

for NGV adoption. The Utilities wish to make clear that there is no conditional connection between EEC incentives for NGV and the need for the Utilities to also build and operate the NGV fueling stations, other than that the availability of both as options are required in order to see the NGV adoption required to provide meaningful and material benefit to our existing customers.

The O&M resources that were approved in our previous RRA for 2010-2011 are sufficient to manage the forecast growth of the NGV fueling business for the 2012-2013 test period. As a result, there is no incremental O&M requirement for the ES&ER group being proposed at this time specifically for NGV. As agreed to in Item 14 (b) of the NSA, *"the marketing costs in support of NGV that are included in the revenue requirements Application are appropriately recoverable in 2010 and 2011 rates."*[4] The O&M costs in other departments are detailed in Section 5 of this Appendix.[5]

As the NGV fueling business increases in size over time, FEI expects that the need may arise for additional customer education and personnel to manage the growth of the business; however, there are no such incremental expenditures proposed for the test period of 2012 and 2013.

The Utilities presented a preliminary 20 year volume forecast estimate for NGV in the 2010 Long Term Resource Plan ("LTRP"), which was filed on July 15, 2010. The demand scenarios described in that filing were subsequently updated in the NGV Application.[6] Any discrepancies in forecast data between the LTRP and the NGV Application were due to updates in project information, refinement of baseline assumptions, and the availability of new data sources. The NGV Application also included preliminary fueling station forecasts and capital costs which were not discussed in the LTRP. In this RRA, the Utilities have again updated these projections and refined its assumptions based on contractual commitments with customers and actual project costs for the short term (2012 and 2013).

The Utilities have separated the costs and strategies of its NGV initiatives in this Appendix of the RRA, which is structured in the following order:

1. Fueling Infrastructure Investments
    a. Volume Projections
    b. Fueling Station Capital and Annual O&M
2. Revenue from NGV Initiatives
    a. Revenues from Transportation Rate Schedules

4 Commission Order No G-141-09, at page 10.
5 Other departments include Energy Products and Services, Commercial and Industrial Sales, Project Management Office
6 CNG/LNG Application, Appendix A-1, Section 3

   b. Fueling Service Revenues
   c. Rate Schedule 16 Revenues and Associated O&M
3. Main Extensions Costs Associated with Serving NGV Customers
4. General O&M Cost Estimate for 2010 and 2011

2 FUELING INFRASTRUCTURE INVESTMENTS

Offering CNG and LNG Services requires modest investments in fueling infrastructure, the cost of which is to be recovered through contractual rates charged to the fleet customer. Such investments are only made by FEI if service agreements are executed with the customer, filed with and approved by the Commission as proposed in the NGV Application. At this time, FEI has entered into contractual agreements with one customer to provide fueling infrastructure and anticipates two forthcoming agreements which will be filed with the Commission. The infrastructure costs from these three customers have or will be incurred during 2010 and 2011. Negotiations with future customers are ongoing, and have been captured in the volume and cost projections in this RRA.

2.1 Volume Projections

The volume projections in this Appendix includes the fueling service projects where FEI has contractual commitments with NGV customers, future customers with whom FEI has engaged, and future potential customers. A primary barrier to NGV adoption in BC is the high upfront capital cost of NGVs versus their diesel equivalents. In developing this forecast, FEI has assumed that incentive funding to help cover this incremental cost will be available through EEC's Innovative Technologies Program Area.[7] FEI's request in this RRA for EEC funding under the Innovative Technologies Program Area includes approximately $8 million in 2012 and $12 million in 2013 to fund NGV initiatives, for a total of $20 million over two years. In Appendix K of this RRA, this $20 million request is expressed as $10 million in 2012 and $10 million in 2013. FEI recognizes the relative uncertainty of its NGV forecast and as the adoption of NGVs in BC is minimal and relatively unpredictable at this time. In addition, the incremental capital cost of NGVs varies per application. Table I-1 below expresses this $20 million request over two years, and the potential number of NGVs that could be incented.

[7] See Section 10 of the 2010 EEC Annual Report filed March 31, 2011

Table I-1: Estimated Number of NGVs funded by EEC incentives

Category	EEC funding for NGVs		Average Number of Vehicles	
	2012	2013	2012	2013
CNG				
Garbage Trucks	$ 2,050,000	$ 1,390,000	41	28
Transit/School Buses	$ 1,600,000	$ 1,000,000	26	16
LNG				
Class 8 tractors	$ 4,400,000	$ 5,800,000	39	52
Marine Vessels	$ -	$ 3,500,000	0	1
Total:	$ 8,050,000	$ 11,690,000	106	96

Note: Incremental cost assumptions are Class 8 tractors $90,000, Vocational truck $40,000, Bus $50,000, Marine $3.5 million. Funding at 80% of incremental cost, except for marine

The number of vehicles in Table I-1 feed into the volume forecast presented next.
FEI has historically provided natural gas destined for the CNG transportation customers through Rate Schedules 6, 22, 23, 25, 26 and 27. These customers and their energy demands for 2012 and 2013 continue to be part of the forecast demand that is presented in Section 4 of this application.

Since FEI does not provide compression and dispensing service through these rates, customers must seek out fueling service providers to receive a complete end-to-end service offering. FEI's NGV Application, if approved, could provide customers with a complete, end-to-end service offering. Commission Order No. G-65-09 issued on June 4, 2009, approved Rate Schedule 16 Interruptible Liquefied Natural Gas Sales and Dispensing Service ("Rate Schedule 16") as a five-year pilot. Rate Schedule 16 gives the Company the ability to provide LNG supply in tank truck quantities from the Tilbury LNG bulk storage facility.

The NGV volume projections in this Appendix are presented by the Transportation Service Rate Schedules from which FEI expects its customers will receive gas supply. FEI has also divided its volume projections by each fuel type – CNG and LNG. The volumes presented below are used to calculate the revenues associated under each according Rate Schedule, as well as the fueling service revenues.

2.1.1 CNG VOLUMES

FEI received Decision Order G-6-11 on January 14, 2011, granting interim approval of CNG Service for refuse hauler Waste Management to fuel their fleet of 20 garbage trucks. This service agreement includes a 'take-or-pay" volume of 1,583 GJ per month, or approximately 19,000 GJ per year. Based on data from WM, the expected volume is 21,140 GJ per year. The initial term of the fueling service agreement is 10 years, with service commencing in Q1 of 2011. If the agreement with WM is approved on a permanent basis, FEI expects WM will consume gas under Rate Schedules 14A and 25, as well as the proposed CNG Service contract rate. WM anticipates adding more CNG trucks over the next few years to eventually convert their entire fleet of 100 trucks on to CNG.

FEI is endeavouring to enter into a contract to provide CNG Service with one other customer at this time. Okanagan School District No. 23 sought CNG Service to fuel its fleet of 13 school buses and light duty trucks, which could consume an estimated 6,000 GJ per year.[8] The terms and conditions of this agreement have not yet been negotiated, however service could commence in Q2 or Q3 of 2011. City of Surrey also operates one CNG garbage truck which is expected to consume approximately 1,500 GJ per year starting in Q2 of 2011. This customer presently owns and operates private fueling infrastructure on their premises and does not require CNG Service from FEI. In the future, however, City of Surrey anticipates contracting service for an additional 47 garbage trucks in late 2011, representing approximately 58,000 GJ per year.[9] Other potential CNG projects are in varying stages of development.

Over the near term, FEI anticipates incremental CNG demand will increase from 22,500 GJ in 2011 to 131,000 GJ in 2012 and 206,000 GJ in 2013 (see Table I-2 below). This includes the NGV customers described above,[10] plus the incremental load from vehicles additions due to the EEC funding for approximately 67 vehicles in 2012 and 44 vehicles in 2013.

Table I-2: Forecast CNG volume exceeds 200,000 GJ in 2013[11]

	Total Volume (GJ)		
	2011	**2012**	**2013**
Transportation Rate Schedule			
Rate Schedule 6	4,500	4,500	4,500
Rate Schedule 23	1,800	7,006	16,006
Rate Schedule 25	16,200	119,528	185,528
Total:	**22,500**	**131,034**	**206,034**

2.1.2 LNG VOLUMES

FEI is currently negotiating a service agreement with one LNG customer, Vedder Transport ("Vedder"), and is pursuing other potential customers. Vedder has purchased 50 LNG Class 8 tractors which are expected to commence a phased-in operating period in Q3 of 2011. The

[8] Under Rate Schedule 23

[9] Under Rate Schedule 25, with fueling service commencing in 2012.

[10] Volume estimates include WM in 2011 (16,200 GJ), 2012 (42,000 GJ) and 2013 (63,000 GJ); Kelowna School District in 2011 (1,800 GJ), 2012 (6,006 GJ), and 2013 (6,006 GJ); and City of Surrey in 2012 (57,528 GJ) and 2013 (57,528 GJ). Only WM has interim contract approval at this time. Incremental volumes from other potential customers represent the balance during these years. A lag may exist between when vehicles are purchased, delivered and ready for fueling service.

[11] Volumes under Rate Schedule 6 represent pre-existing light duty vehicles fueling at FEI's Surrey Operations and Burnaby facilities, pending submission and approval of an application to the Commission.

anticipated volume represents approximately 138,500 GJ per year, with LNG supplied under Rate Schedule 16. If approved by the Commission and operationally successful, Vedder could add more tractors in the future to their sizeable fleet. Table I-3 below also includes incremental load additions in 2012 and 2013 from another two trucking companies which have engaged FEI in preliminary discussions for LNG Service. The forecast includes the Vedder volumes[12] plus the incremental load from additional vehicles due to the EEC funding for approximately 39 tractors in 2012 and 52 tractors in 2013 (see Table I-1). FEI also estimates LNG Service development into the marine segment with an initial marine vessel funded during 2013.

Table I-3: Forecast LNG volume exceeds 500,000 GJ in 2013

	Total Volume (GJ)		
	2011	**2012**	**2013**
Transportation Rate Schedule			
Rate Schedule 16	57,500	385,500	535,750

Rate Schedule 16 presently has status as a pilot program which expires on December 31, 2014. The impact of this issue, amongst others, was contemplated during the NGV Application proceeding. From FEI's response to BCUC IR 3.20.1:

> *"FEI intends to make an application to the Commission in regards to the future of Rate Schedule 16 at a later date. Given that the pilot program has yet to yield a LNG customer despite significant market and government interest in LNG for transportation applications, FEI believes that approval of our proposed model for offering LNG refueling services in this Application will finally allow the LNG refueling market to develop in British Columbia, and as such, will likely necessitate a possible expansion and/or a permanence to the services offered under Rate Schedule 16."*

A 1,040 GJ per day supply limitation also exists under Rate Schedule 16. If FEI contracts 1,040 GJ for 365 days, a volume of 379,600 GJ per year would be reached. Based on Table I-3 above, FEI's fuel demand estimate would surpass the 379,600 GJ level at the end of 2012, necessitating supply beyond the 1,040 GJ per day limitation. This topic would also be addressed in a future application to the Commission. FEI believes that it would be premature to address this issue at this time given a decision on the NGV Application is forthcoming and no LNG service agreement has been filed with or approved by the Commission.

12 Volume estimates include Vedder in 2011 (57,500 GJ), 2012 (138,500 GJ) and 2013 (138,500 GJ) and Wastech Services in 2012 (193,000 GJ) and 2013 (193,000 GJ). Incremental volumes from other potential customers represent the balance during these years. A lag may exist between when vehicles are purchased, delivered and ready for fueling service. This means load additions do not necessarily occur in the same year as incentive payments are issued.

In summary, the CNG and LNG volume estimates presented in this subsection will continue to be refined and updated as future service agreements are negotiated and executed with the customer, filed with and approved by the Commission.

2.2 Fueling Station Capital and Annual O&M

The "take-or-pay" contract rates negotiated with NGV customers are set to recover the cost of investing in and maintaining CNG and LNG facilities occurring during the term of the service agreement. The forecast cost estimates in this Appendix are to be recovered in this manner.[13]

At this time, FEI has completed the construction of the Waste Management fueling service project. The cost for this station, and the CNG station for Kelowna School District, was considered when developing the capital cost estimates in the forecast presented below. FEI has also entered into negotiations with Vedder Transport to provide LNG Service at its Abbotsford, BC facility. Since CNG and LNG fueling stations vary in their scope, size and load requirements, FEI has made the following cost assumptions which are used in this forecast.

Table I-4: CNG / LNG Station Capital Cost and Annual O&M Assumptions[14]

Rate Schedule	Estimate Avg Station Cost (in thousands)	Estimate Annual O&M (in thousands)
CNG		
Rate Schedule 6	$400	$15
Rate Schedule 23	$400	$15
Rate Schedule 25	$1,000	$25
LNG		
Rate Schedule 16	$2,000	$60

The station capital cost estimates are based upon the projects completed to date and the quotations received during the project procurement process. The station capital cost includes major equipment (CNG compressor/LNG storage), dispensing equipment, field piping, civil and electrical work, engineering and project management costs, as well as commissioning and permitting fees. The annual O&M costs are estimates based on information from our manufacturers for each corresponding fueling facility, as well as FEI's prior experience operating and maintaining CNG fueling stations. CNG and LNG O&M cost estimates include the cost of safety inspections and preventative and routine maintenance as recommended by the

[13] Would not include public fueling service provided through FEI's Surrey and Burnaby fueling stations, pending filing with and approval by the Commission.

[14] FEI has estimated which Rate Schedule each category of NGV customer would take gas service under. In this Appendix, Rate Schedule 6 refers to light duty vehicles, Rate Schedule 23 refers to buses and medium duty trucks, Rate Schedule 25 refers to vocational trucks, and Rate Schedule 16 refers to Class 8 LNG tractors and marine vessels.

manufacturer. The cost of electricity for the facility is paid by the CNG or LNG customer and not included in these O&M cost estimates.

2.2.1 NUMBER OF FUELING STATIONS

Based on the volume assumptions for CNG in Table I-2 and LNG in Table I-3, the Company has developed an estimate of the number of fueling stations required from 2011 through 2013. FEI has also considered the redundancy (in other terms "excess capacity") provided in the near term by the fueling stations for WM and Vedder. The WM facility was designed to fuel approximately 60 trucks without substantive incremental capital investment. Similarly, the LNG station at Vedder is being designed to service additional vehicles as additional dispensing pumps have been incorporated into the design of this facility. However, like other potential LNG facilities, the station's fueling capacity is primarily tied to the frequency of LNG deliveries from Tilbury.

Table I-5: CNG and LNG Fueling Station growth to 11 by 2013

	Estimated Number of Stations		
Transportation Rate Schedule	**2011**	**2012**	**2013**
CNG			
Rate Schedule 6	1	1	2
Rate Schedule 23	1	1	2
Rate Schedule 25	1	3	4
LNG			
Rate Schedule 16	1	2	3
Total:	**4**	**7**	**11**
Annual Incremental:	**4**	**3**	**4**

The capital investments of providing this fueling infrastructure is discussed in the following subsection.

2.2.2 STATION CAPITAL AND ANNUAL O&M FROM 2011 THROUGH 2013

FEI has multiplied the cost assumptions in Table I-4 by the estimated number of fueling stations in Table I-5 to produce a future forecast of the total costs for FEI's NGV initiatives. The capital requirements for station capital and annual O&M are summarized below by Rate Schedule, in the following Tables I-6 and I-7:

Table I-6: NGV Fueling Station Capital Requirements

Transportation Rate Schedule	NGV Fueling Station Capital Requirements (in thousands) 2011	2012	2013
CNG			
Rate Schedule 6	$400	$400	$800
Rate Schedule 23	$400	$400	$800
Rate Schedule 25	$1,000	$3,000	$4,000
LNG			
Rate Schedule 16	$2,000	$4,000	$6,000
Total:	**$ 3,800**	**$ 7,800**	**$ 11,600**
Annual Incremental:	**$ 3,800**	**$ 4,000**	**$ 3,800**

Table I-6 shows the Company's modest station infrastructure investments, which are approximately $4 million per year for 2012 and 2013.

The annual Distribution O&M for FEI's NGV fueling projects in Table I-7 show annual requirements of approximately $225 thousand in 2012 and an incremental $115 thousand in 2013. These costs are for fueling station maintence.

Table I-7: NGV Annual Distribution O&M Requirements for Fueling Stations

Transportation Rate Schedule	NGV Annual O&M Requirements for Fueling Stations (in thousands) 2011	2012	2013
CNG			
Rate Schedule 6	$0	$15	$30
Rate Schedule 23	$0	$15	$30
Rate Schedule 25	$0	$75	$100
LNG			
Rate Schedule 16	$0	$120	$180
Total:	**$ -**	**$ 225**	**$ 340**
Annual Incremental:	**$ -**	**$ 225**	**$ 115**

The annual Transmission O&M for FEI's NGV fueling projects in Table I-8 show annual requirements of approximately $133 thousand in 2012 and an incremental $106 thousand in 2013. These costs are for increased electricity costs at the Tilbury LNG facility.

Table I-8: NGV Annual Transmission O&M Requirements for Fueling Stations

	NGV Annual O&M Requirements for Fueling Stations (in thousands)		
Transportation Rate Schedule	**2011**	**2012**	**2013**
LGN			
Rate Schedule 16	$ -	$ 133	$ 239
Total:	**$ -**	**$ 133**	**$ 239**
Annual Incremental:	**$ -**	**$ 133**	**$ 106**

The volume forecasts presented in this subsection are used to calculate the expected revenue benefits under each Rate Schedule, as described in the following subsection.

3 REVENUE FROM NGV INITIATIVES

3.1 Revenue from Transportation Rate Schedules

The CNG and LNG volumes presented in Section 2.1 of this Appendix are multiplied by the delivery charge under the corresponding 2011 Rate Schedule to produce a revenue forecast. A summary of the delivery margin revenue associated with CNG and LNG service is presented in Table I-8 below.

Table I-8: Delivery Margin Revenue from CNG/LNG Service[15]

	Transportation Delivery Margin Revenue (in thousands)		
Transportation Rate Schedule	**2011**	**2012**	**2013**
CNG			
Rate Schedule 6	$ 16	$ 16	$ 16
Rate Schedule 23	$ 4	$ 16	$ 37
Rate Schedule 25	$ 10	$ 77	$ 120
LNG			
Rate Schedule 16	$ 228	$ 1,527	$ 2,122
Total:	**$ 259**	**$ 1,636**	**$ 2,295**
Annual Incremental:	**$ 259**	**$ 1,378**	**$ 658**

Note: Delivery Charges are Rate Schedule 6, $3.648, Rate Schedule 23, $2.318,

Rate Schedule 25, $0.645, and Rate Schedule 16, $3.96

15 Revenues under Rate Schedule 6 represent pre-existing light duty vehicles fueling at FEI's Surrey Operations and Burnaby facilities, pending submission and approval of an application to the Commission.

Based on Table I-8 above, FEI anticipates annual increases in its delivery margin from its CNG and LNG Service of approximately $1,378 thousand in 2012 and $658 thousand in 2013. The reason for the expected decline from 2012 to 2013 is primarily due to FEI's funding allocation estimate. FEI anticipates a funding expenditure of $3.5 million for an LNG marine application will occur during 2013, with fueling service beginning in 2014 due to the pilot nature of the project. In absence of a $3.5 million marine expenditure, FEI could alternatively fund approximately 30 LNG Class 8 tractors. These vehicles would likely commence fueling service earlier (during 2013) than a marine application would.

The following subsection discusses the revenues associated with the fueling service agreements (ie. contract rates). Please see Section 5.5 of the RRA for an additional summary on the overall revenues from NGVs.

3.2 Fueling Service Revenues

To calculate the expected fueling service revenues under each Rate Schedule, FEI has multiplied the CNG and LNG volumes from Section 2.1.1 of this Appendix by the contract rate estimates in Table I-9 below.

Table I-9: Fueling Service Contract Rate Assumptions

Customer	Rate Schedule	Contract Rate ($/GJ)
Light Duty Vehicles	6	$5.50
Bus	23	$7.00
Garbage truck	25	$5.25
Class 8 tractor	16	$4.00
Marine Vessel	16	$3.00

These contract rates for fueling service are based on preliminary cost of service estimates for FEI's current and potential CNG and LNG customers.[16] The wide range in rates reflects very different situations regarding the type of fueling infrastructure that is needed and the wide range in gas consumption. Table I-9 does not show the actual contract rates for WM, Kelowna School District, or Vedder Transport, which FEI has kept confidential during negotiations.[17] However these rates, multiplied by the minimum monthly "take-or-pay", have been factored into the revenue forecast presented in the Table I-10 below.

[16] LNG Contract Rate does not include LNG transport and delivery charge

[17] Please refer to CNG/LNG Application Proceeding for rationale surrounding confidentiality of contract rates. The Commission's preliminary approval of the Waste Management contract required publication of rate schedules, but did not preclude confidentiality prior to Commission approval of the service agreement.

Table I-10: Fueling Service Contract Revenues[18]

Vehicle Class	Fueling Service Contract Revenue (in thousands) 2011	2012	2013
CNG			
Light Duty Vehicles	$ 25	$ 25	$ 25
Buses	$ 14	$ 54	$ 117
Garbage Trucks	$ 87	$ 618	$ 967
Total:	$ 126	$ 699	$ 1,114
LNG			
Class 8 Tractors	$ 216	$ 1,411	$ 1,995
Total NGV Revenue:	**$ 341**	**$ 2,107**	**$ 3,104**
Annual Incremental:	**$ 341**	**$ 1,766**	**$ 996**

Based on Table I-10 above, FEI anticipates annual increases in its contract revenues from its CNG and LNG Service of approximately $1.7 million in 2012 and $1 million in 2013. As stated in the delivery margin revenue section, the reason for the expected decline in revenue from 2012 to 2013 is primarily due to FEI's funding allocation estimate.

3.2.1 RATE SCHEDULE 16 REVENUES AND ASSOCIATED O&M

During the NGV Application proceeding, the Commission inquired about the breakdown of the delivery charge under Rate Schedule 16, and the appropriate allocation of costs. The costs incurred to provide Rate Schedule 16 service were discussed in FEI's response to BCUC 2.25.2:

> *"Production of LNG at Tilbury will generate incremental O&M cost associated with increased production of LNG at Tilbury and this cost will partially offset the revenue benefit referred to above. As discussed in the May 7, 2009 Rate Schedule 16 application, this incremental cost is estimated at $1.95/GJ or 52% of the rate. The remaining balance represents contributions that are incremental to existing O&M and capital accounts; thus they provide benefits to all rate payers.*
>
> *The full rate breakdown estimate is shown below:*

[18] Does not include revenues from Delivery, Demand and Fixed Monthly Charges

Table 1 - Rate Breakdown

O&M Charge- Liquefaction, Storage & Dispensing	*$1.95*
Capital Recovery	*$0.97*
Transportation from Huntingdon to Tilbury	*$0.73*
Peaking Arrangement Cost	*$0.08*
Total	***$3.73***

The $3.73 total charge has since increased to $3.89/GJ as a result of the annual rate adjustment as approved by the Commission (Order numbers G-141-09 / G-158-09)."

The delivery rate under Rate Schedule 16 has increased to $3.96 as of January 1, 2011. Therefore the incremental revenue benefits in Table I-8 (from Section 3.1 above) will be offset by approximately 52 percent for the LNG volumes under Rate Schedule 16.

With respect to the cost allocation of future LNG storage requirements, in its response to BCUC IR 3.21.2 in the NGV Application, FEI stated:

"The case for incremental investment in LNG storage would be justified by the benefits provided by such investment and these benefits may not be restricted just to Rate Schedule 16 customers. Incremental investment in LNG storage will directly benefit all NGV customers who use LNG under Rate Schedule 16, hence all members of this customer class should participate in bearing some or all of the costs associated with such investment. However, FEI also notes that incremental storage may also increase the capacity available to service peak load requirements, thereby providing a benefit to all customers. In addition as demonstrated in BCUC IR 2.25.2 and BCUC IR 2.26.1, addition of NGV load also provides load building benefits to all customers. Hence FEI does not rule out the possibility of presenting a case where all customers who benefit from the additional storage participate in sharing the costs. FEI has not made an application for additional investment in storage as part of this application and FEI believes that the best place to address the justification for incremental investment and how the costs will be recovered will be through a CPCN specifically addressing the project if appropriate."

FEI believes that it is not appropriate to address any issues related to Rate Schedule 16 in this RRA given a decision on the NGV Application is forthcoming and no LNG service agreement has been filed with or approved by the Commission.

4 MAIN EXTENSION COSTS ASSOCIATED WITH SERVING NGV CUSTOMERS

The Main Extension ("MX") Test[19] is employed to provide existing customers with some comfort that a main extension will be cost effective from the perspective of the utility. Incremental CNG customers requiring main extensions to bring service to a fueling facility will be subject to the existing MX Test to ensure NGV load is cost-effective (the costs of the fueling facility itself are the subject of the CNG service agreement, not the MX Test). LNG customers are not subject to the MX Test as fuel is being transported to their facility by tanker[20] and not through distribution piping.

When a fleet operator evaluates its fueling options, fuel consumption must be at a volume that makes the conversion to natural gas economical. In FEI's experience, volumes from heavy duty trucking fleets will pass the existing MX test without a CIAC from the customer.[21]

In sum, all potential CNG customers are required to undergo the existing MX Test. At this time, FEI does not anticipate other NGV projects necessitating CIACs to make the extension cost-effective.

5 GENERAL O&M COST ESTIMATE FOR 2010 AND 2011

At this time, there is no forecast incremental O&M requirement for the ES&ER group being proposed specifically for NGV in this RRA for 2012 and 2013. In the NSA, for 2010-2011 for FEI the parties agreed that marketing costs associated with NGV for 2010 and 2011 will be recovered through general O&M. FEI has adopted the same approach in this RRA, as the promotion of NGV represents a part of FEI's core natural gas business. The information set out below breaks out the O&M costs within the ES&ER department for information purposes only.

The O&M costs presented below are estimated costs, rather than actual amounts for the NGV costs within the ES&ER department. FEI was not required to track and report actual amounts for NGV separately during this period 2010-2011 period. These cost estimates do not include time for regulatory activities such as cost of service modelling, NGV Application support and review. FEI estimates a minimal customer education cost will be incurred in 2011 for NGV.

---

[19] The MX test protects existing ratepayers by requiring Contribution In Aid of Construction ("CIAC") from the individual customer in the event that the Profitability Index ("PI") s less than 0.8.

[20] NGV customers will be charged for the cost of owning and maintaining FEI's LNG tankers and the associated driver and transport costs.

[21] The WM facility, completed in February of 2011, passed the MX test and did not require a CIAC from the customer. This was due to the high level of expected natural gas volume WM's fleet of vehicles would consume.

Table I-11: O&M Cost Estimate for 2010 and 2011

Department or Activity	2010		2011	
	FTE	Cost Estimate	FTE	Cost Estimate
Business Development Managers	1.3	$ 148,836	1.3	$ 156,241
Energy Products and Service Manager, Commercial & Industrial Sales, Project Manager	2.7	$ 331,439	2.7	$ 345,396
Customer Education	N/A	$ -	N/A	$ 50,000
Total:	**4.0**	**$ 480,275**	**4.0**	**$ 551,637**

Of the 4.0 FTE estimate in the Table I-11, approximately 1.5 are involved in the fueling station installation. The balance of the FTE is involved due to the overall level of NGV activity during this development period. All O&M amounts related to NGV have been appropriately included in the overall O&M forecast for all of our core gas business. The estimates provided in Table I-11 are included here only for informational purposes with the intention of providing an order-of-magnitude of the impact of NGV activities on our O&M.

Appendix J

BIOMETHANE REPORT

1 REGULATORY BACKGROUND

On June 8, 2010, FortisBC Energy Inc. ("FEI")[1] filed an application for the approval of a Biomethane Service Offering and Supporting Business Model, including the approval of the Columbia Shushwap Regional District and Catalyst Power Biomethane Project (the "Biomethane Application"). On December 14, 2010, the British Columbia Utilities Commission (the "BCUC" or "Commission") issued its Decision and Order No. G-194-10 (the "Biomethane Decision"), allowing FEI to move forward with a Biomethane Service Offering/Program for a two year period from the date of the Biomethane Decision and approving the two agreements with Columbia Shushwap Regional District ("CSRD") and Catalyst Power Inc ("Catalyst").

As part of the Biomethane Decision, the Commission further approved the creation of a non-rate base deferral account, Biomethane Variance Account ("BVA"), to capture costs to procure and process consumable biomethane gas as well as revenues collected through biomethane energy recovery components of rates. FEI was directed to provide actual and forecasted biomethane operating and maintenance ("O&M") and capital costs and an analysis of these costs in its next Revenue Requirement Application:

> *"Commencing January 1, 2012, the treatment of all costs related to and resulting from ongoing Biomethane operations will be reviewed by the Commission as a component of Terasen's Revenue Requirements Application (RRA).* ***Within TGI's RRA for 2012 and onwards, Terasen is directed to include a separate section providing actual and forecasted Biomethane operating, maintenance and capital costs and an analysis of these costs.*** *This disclosure is to include, amongst other things, a breakdown of costs incurred by category of past and projected years and an explanation of the financial results experienced and expected in the test period. Details of all accumulations within the BVA should also be provided."*

In addition to the BVA, the Commission also approved two additional new non-rate base deferral accounts ("New Deferral Accounts") to capture costs, as described in the Application, incurred prior to January 1, 2012:

> i) Costs of service associated with the capital additions to the delivery system; and
> ii) Operating and maintenance costs applicable to all customers (attracting AFUDC).

In the Biomethane Decision, the Commission also directed FEI to report on the New Deferral Accounts:

> ***"As part of its 2012 Revenue Requirements Application, TGI is directed to report the total values accumulated in the New Deferral Accounts from inception as well***

[1] Then Terasen Gas Inc. or TGI

as a breakdown of the costs accumulated in the accounts by nature and dollar amount."

As the Biomethane Service Offering is still in its early stages of development, this Report provides a high level overview of FEI's work towards preparation to roll out the Biomethane Service Offering to customers since release of the Biomethane Decision in December 2010. Also, this Report outlines FEI's actual[2] and forecasted capital and O&M costs and provides an analysis of costs in the BVA and New Deferral Accounts, as directed by the Commission in its Biomethane Decision. The forecasted O&M and capital expenditures for the 2012-2013 test periods discussed in this Appendix are included in FEI's overall natural gas Revenue Requirement. FEI has prudently managed its biomethane O&M and capital costs and will continue to do so as the service offering evolves.

2 TAKING STEPS TOWARDS BIOMETHANE SERVICE OFFERING ROLL OUT

The following describes the activities that FEI has undertaken to roll out the Biomethane Service Offering for Phase 1 of the program, which is targeted at FEI Rate Schedule 1, residential customers in the Lower Mainland, Inland and Columbia regions for a 10% blend of biomethane, as approved as Rate 1B[3]. FEI has been making progress to ensure that Phase 1 of Biomethane Service Offering is successful in its roll out to customers.

2.1 Biomethane Service Offering Launch

As stated in the Biomethane Application, FEI had initially anticipated Phase 1 of the Biomethane Service Offering to begin in the Fall of 2010, based on the regulatory timetable initially proposed in the Biomethane Application. However, due to the duration of regulatory process, the timing of the Biomethane Decision in December 2010 and the time required by Customer Works LP to implement the billing changes, Phase 1 of the program launch has been delayed until mid June 2011.

The delay of the Phase 1 offering may push out the Phase 2 offering, which is targeted at small and large commercial customers, Rate Schedules 2 and 3, for a 10% blend of biomethane as well. . The Phase 2 offering was initially anticipated to take place in early 2012. FEI will continue to monitor the customer uptake from the Phase 1 launch, manage supply and eventually expand the product offering to other customer classes and offer higher percent blends when appropriate.

Over the past year FEI has been working with the provincial government to resolve the issue on whether or not the biomethane is carbon tax exempt. FEI is pleased with the progress to date.

2 As at March 31, 2011
3 Order No. G-28-11, effective Date March 1, 2011

The Budget Measures Implementation Act, 2011 (“Bill 2”) is currently before the legislature. Section 3 of Bill 2 amends the Carbon Tax Act to certify biomethane as a carbon-neutral fuel and to insert the language allowing the implementation of the biomethane credit promised in the 2011 provincial Budget. FEI has discussed the implementation of the credit with the Ministry of Finance and received direction that we may proceed with our plan to provide the credit to customers on their bills prior to Bill 2’s passage in the legislature and subsequent royal assent.

2.2 Customer Education

FEI is currently planning for a formal launch of the biomethane program for Residential customers by June 2011. FEI held a focus group session in Vancouver on March 7th 2011 comprised of more than twenty diverse participants to take feedback on several proposed communication concepts. FEI is currently processing feedback received through this focus group session to develop the right communication messaging and channels to achieve maximum customer education. The uptake and interest in Phase 1 will be key to encouraging continued development of additional supply sources allowing expansion of the program to other customer groups.

FEI currently has more than one hundred customers signed up to be notified for when the Biomethane Service Offering begins in early June 2011. FEI expects customer education to be an ongoing activity until the program reaches the level of maturity required for customer groups to make informed decisions whether or not they wish to participate in the program.

2.3 Supply Projects

Development of the two existing supply projects, Columbia Shuswap Regional District and Catalyst, that were approved as part of the Biomethane Decision, is underway to deliver an annual amount in the range of 60,000-70,000 GJs of biomethane into FEI’s distribution system by end of 2011.

2.3.1 CATALYST

The Catalyst project consists of an upgraded biomethane purchase (along with construction and operation of interconnection facilities), and began injecting biomethane into the system in September of 2010. As of March 31, 2011, the project has already delivered over 15,000 GJs into our system. The daily average production has increased steadily since start-up, building towards the minimum contracted volumes. The ramping up of supply volumes has been slower than originally forecasted, but Catalyst is taking steps to increase production levels and is expected to reach minimum contract levels within the contractual start-up window, as significant increases in production levels have been observed in the last few months. Based on the most recent production trends, FEI anticipates Catalyst will inject a minimum cumulative total of

59,000 GJs by the end of 2011 and reach their minimum average daily contract volumes by the end of 2012.

2.3.2 CSRD

The CSRD project includes interconnection facilities as well as an upgrading plant located at a landfill. To date, the interconnection facilities have been designed and fabricated and the main extension has been completed. The upgrading plant is in the final design stage. The CSRD completed the installation of the gas collection and flare system at the landfill and it has been in operation since January 2011.

During the summer and fall of 2010 FEI was cautious about spending on this project while waiting for a final regulatory decision. FEI took advantage of the time to complete more thorough gas sampling of the raw landfill gas to feed into the upgrade plant design. The results showed a difference between actual raw gas composition and expected gas composition. The raw gas contained more nitrogen than expected which had the potential to impact the final heating value of the biomethane negatively. As a result, FEI directed the supplier of the upgrader, Xebec Inc. ("Xebec"), to re-evaluate the design of the upgrading plant to reduce the risk of building a plant that may not be able to process raw biogas to meet the final biomethane specification. Xebec recommended a design change to a different version of their Pressure Swing Adsorption technology that could reliably manage higher levels of nitrogen while still meeting final biomethane specifications. The design change will increase the cost of the upgrading plant by approximately $300,000 from the original approved amount of 1,621,800 and result in a delivery delay. The project is now expected to be commissioned in late 2011 with an injection start date close to year end. Therefore, there will be no significant contribution to the biomethane supply before the end of 2011.

2.3.3 FUTURE PROJECTS

The future projects that FEI is evaluating are still in the contract negotiation stages with earliest possible injection dates in 2012. Currently, the two most likely prospects are the City of Kelowna and Annacis Island projects. The Kelowna landfill project would be structured very similar to the CSRD project with the expected volumes starting approximately at 50,000 GJ/year. The Annacis Island project would be an organic waste digester that would look similar to the Catalyst Project. In this case, however, the project developer is interested in FEI investing in the upgrading plant. The volumes are expected to start at 100,000 GJ/year.

FEI is incorporating lessons learned from the first two supply projects into the new project development. These lessons have informed how FEI estimates costs and allows for contingencies. FEI will ensure that any new supply contracts brought forward for approval meet the established criteria as approved by the BCUC in the Biomethane Decision.

3 BIOMETHANE CAPITAL AND O&M COSTS

This section describes an overview of total capital and O&M costs, including those allocated to customers who purchase biomethane and those allocated to all customers. The tables below provide an overview of forecast costs as described in the Application and approved in the Biomethane Decision, actual costs to date (from beginning of 2010 to end of March 2011), and projected costs for the period of 2012 and 2013. FEI has managed O&M and capital costs within the overall approved budget and will continue to manage costs prudently.

3.1 Capital Costs

FEI's overall capital costs incurred to date from the two approved supply projects are well under the overall approved budget. Additional capital investment will be required as the CSRD site gets commissioned in the coming months.

The Catalyst project is now complete, and the final capital costs are known. The overall costs for the Catalyst project came in well under the approved amount, although the allocation of costs across certain cost categories differs from the original estimate as seen from the table below. FEI's initial assumptions of how costs would arise across certain categories were made during the preliminary design phase. As the project progressed and FEI developed a better understanding of the actual costs and the allocations, FEI re-allocated the costs to match more closely with standard practice used for more established projects like regulator station design and construction. Going forward, FEI will incorporate these learnings into the CSRD project to allocate the expected costs into the appropriate categories as illustrated in the table below under future projects. FEI now has additional categories that are more aligned with the current standard practice in place for established projects such as station design and construction of interconnect facilities. Going forward FEI will report across these asset classes for future biogas supply projects.

For the Upgrading plant under CSRD, FEI anticipates spending an additional $300,000 from the original approved amount to accommodate for the design change as recommended by Xebec to manage higher levels of nitrogen while still meeting final biomethane specifications. Additional details are mentioned under the CSRD section. The BVA will capture such variances and will reflect any adjustments to BERC rate based on deferral account balances at that point in time and these increased costs for the Upgrader will be recovered from biomethane customers who elect into the program.

Capital costs are summarized in Table J-1 which follows.

Table J-1: Biomethane Capital Costs Summary

FEI Biomethane Capital Costs	Approved Until December 31, 2011	Actual Until March 31, 2011	Projected Until December 31, 2011	Forecast 2012	Forecast 2013
Capital Costs - All Customers					
Catalyst					
Interconnection(Valves, meter, regulator)	77,300	337,308	337,308		
Quality Monitoring	282,500	99,067	163,999		
Main and main connection costs	227,900	86,393	86,393		
Total Catalyst	587,700	522,768	587,700		
CSRD					
Interconnection(Valves, meter, regulator)	395,500	222,000	395,500		
Quality Monitoring	242,000		253,400		
Main and main connection costs	45,100	33,700	33,700		
Total CSRD	682,600	255,700	682,600		
Future projects					
Structure and Improvements				140,329	140,329
Mains -Muncipal Land				108,993	108,993
Mains-Private Land				61,309	61,309
Regulator & Meter Installations				16,349	16,349
Meters				24,523	24,523
Measuring and Regulating Equipment				663,497	663,497

The details of the future projects under consideration are explained under Supply Projects in Section 2.3 above.

3.2 O&M Costs

The O&M costs incurred to date are well within the approved budgeted values for 2011 as stated in the original Biomethane Application. As the Biomethane Program is still in development stages, FEI expects to incur additional costs as the program gets rolled out in June 2011 but expects to stay within the budgeted approved values. FEI has provided the total O&M costs broken out by biomethane Customers and all customers for years 2012 and 2013. The costs for 2012 and 2013 are adjusted by an inflation factor of 2% from the original approved spending amount in 2011.

In the financial schedules accompanying the original Biomethane Application, some O&M costs associated with interconnection facilities were erroneously included in the forecast Biomethane Energy Recovery Charge ("BERC"). As a result, the BERC was calculated to be slightly higher[4] than it should have been based on the Commission-approved approach and the levelized impact on all customers was calculated to be immaterially lower than it should have been. FEI is proposing to defer addressing this miscalculation until the BERC is next changed through the approved process, whereby costs and recoveries will be reviewed on an annual basis as part of FEI's 4th quarter gas cost report to the Commission and any changes to the BERC will be based on deferral account balances at that point in time.

Subject to any unanticipated system and operational risks, FEI does not expect any material changes to the projected capital and O&M costs until the end of 2011 as approved in the Application[5].

O&M costs are summarized in Table J-2 which follows.

[4] Had this been included in the initial Biomethane Application there would have been a downward revision to the price of Biomethane from $9.904/GJ to $9.626/GJ.

[5] Approved O&M of $783,200

Table J-2: Biomethane O&M Costs Summary

FEI Biomethane O&M Costs	Approved Until December 31, 2011	Actual Until March 31, 2011	Projected Until December 31, 2011	Forecast 2012	Forecast 2013****
O&M Costs - All Customers					
Labour Costs	125,000	24,491	125,000	102,000	104,040

Process for Updating Premise Heat Zone in New CIS system***				20,000	
Total O&M Costs - Biomethane Customers	**165,698**	**7,804**	**165,698**	**179,904**	**274,642**

* O&M costs for interconnect facilities includes for Catalyst and CSRD and future projects under consideration

** O&M costs for upgrader includes for CSRD and future projects under consideration

*** One time adjustment cost

**** 2013 forecast has been adjusted by an inflation factor of 2% from the 2012 estimates

4 OVERVIEW OF DEFERRAL ACCOUNTS

Table J-3 below provides the actual to date of the program O&M new deferral accounts. The tables following provide the 2010 Actual costs, 2011 Projected costs and the 2012 and 2013 forecast costs for: the BVA (Table J-4); and, the 2010 / 2011 O&M Biomethane Program deferral account and the Biomethane Program – Other Revenue deferral account (Table J-5). As per Biomethane Application and Decision, the Depreciation, Earned Return and related Income Tax are charged to the Biomethane Program Deferral Account.

Table J-3: Biomethane Actual Program New Deferral Accounts

Categories	Notes	Actuals to Date			
		2010	2011		
		Jan-Dec	Jan	Feb	Mar
Catalyst	Captures costs incurred to purchase pipeline ready biomethane	$ 59,570	$ 28,135	$ 21,949	$ 41,562
CSRD	Captures costs incurred to purchase raw biogas, O&M related to upgrader	-	-	-	-
Direct Biomethane Administration	Capture costs for biomethane customer enrollments/account finlization/billing adjustments	-	-	-	-
Biomethane Recoveries	Capture recoveries from biomethane sales at the BERC rate	-	-	-	-

Table J-4: Biomethane Variance Account

	Biomethane Variance Account		2010	2011	2012	2013
				($000's)		
	Volumes (GJ)			61,000	185,750	284,500
*	Cost of Biomethane Purchases		$ 59.6	$ 604.8	$ 1,253.6	$ 1,424.5
*	BVA O&M Activity		-	166.9	179.9	274.6
*	Property Taxes		-	1.0	1.6	1.4
	Depreciation - Upgrader / CIAC		-	(8.6)	202.2	387.2
	Income Tax		-	(126.4)	(246.1)	(372.9)
	Earned Return		-	(0.2)	184.2	343.8
	Other Revenue		-	(126.6)	(61.9)	(29.1)
*	BERC Rate Recoveries @	$ 9.904	-	(604.1)	(1,839.7)	(2,817.7)
	Tax Rate		28.5%	26.5%	25.0%	25.0%
	Tax Offset		(17.0)	(44.7)	101.1	279.3
	Net Additions		42.6	(11.3)	(163.1)	(479.8)
	Balance		$ 42.6	$ 31.3	$ (131.8)	$ (611.6)

Line items marked with an "*" are subject to net-of-tax offset. The negative Earned Return and Income Tax is due to the slightly negative Rate Base which is comprised CIAC that the Company has already received and with the biomethane not going into service until December 2011 the cost of the Upgrader Plant has a relatively smaller Rate Base impact. The negative Income Tax is the result of the timing differences between accelerated deduction provided in the Capital Cost Allowance and booked depreciation (which will begin in 2012). Recoveries are based on the forecast volumes times the current BERC rate which will potentially be adjusted later this year when the fourth quarter gas cost review is filed with the Commission.

Table J-5: 2010 / 2011 Biomethane Program Accounts (O&M and Other Revenue)

	($000's)				
	2010	2011	2012	2013	2014
2010 / 2011 Biomethane Program Accounts					
O&M Deferral Account					
Program O&M Activity	$ 1.2	$ 783.2			
Tax Offset	(0.3)	(207.5)			
AFUDC	0.1	39.4			
Net Additions	1.0	615.1			
Amortization	-	-	(205.3)	(205.3)	(205.3)
Balance	$ 1.0	$ 616.0	$ 410.7	$ 205.3	$ -
Biomethane Program Costs - Other Revenue					
Depreciation	$ -	$ 45.3			
Income Tax	-	8.8			
Earned Return	-	36.0			
Other Revenue	-	44.8			
Amortization	-	-	(30.0)	(30.0)	(30.0)
Balance	$ -	$ 90.1	$ 60.1	$ 30.0	$ -

The costs in the Biomethane – Other Revenue relate to the direct interconnecting facility costs and do not include an allocation of the Overheads Capitalized that would otherwise normally be allocated to the Distribution Mains and Measuring and Regulating Equipment. The amount of Overheads that will be allocated to the Interconnect facilities is dependent on all of the relative direct plant additions costs to which overheads are allocated.

Appendix K-1

EEC

1 INTRODUCTION

On April 16, 2009, the Commission released its Decision and Order No. G-36-09, which approved Energy Efficiency and Conservation ("EEC") funding for the 2009-2010 time period. The approved funding was $41.5 million in aggregate ($34.4 million for FEI and $7.1 million for FEVI for the period 2009 - 2010). FEI and FEVI applied in their respective 2010-2011 RRAs for additional funding for 2010 for interruptible industrial customers and for innovative technologies, and for funding for the overall EEC portfolio for 2011. The Commission approved FEI's and FEVI's NSAs (Order No. G-141-09 for FEI and Order No. G-140-09 for FEVI, both dated November 26, 2009), including the approval of EEC funding for 2010 and 2011.

As contemplated in the FEI and FEVI 2008 EEC application and addressed in Commission Order No. G-36-09, the Companies have established an EEC Stakeholder Group to seek input on the refinement of existing and development of new EEC programs and provide information to stakeholders about progress and development of its overall EEC initiatives. The Stakeholder Group meetings are an important forum for the Companies to get general feedback in all areas of the overall EEC initiative.

Subsequent to the approval of FEI's and FEVI's expanded EEC initiatives, the Province of BC has reaffirmed and strengthened its commitment to energy efficiency and conservation through the enactment of the *Clean Energy Act* ("CEA"). Energy efficiency and conservation, greenhouse gas emission reductions and the promotion of innovative clean energy development in BC are core themes in the CEA. The Companies' EEC proposals and funding requests are aligned with British Columbia's energy objectives as set out in the CEA.

This Appendix outlines the Companies' EEC funding requests for 2012 and 2013, and outlines in Section 5 below some additional changes that the Companies are proposing to:

a) expand customer eligibility for participation in EEC programs to include Interruptible Industrial customers of FEVI and to offer EEC programs to customers of FEW; and

b) modify the benefit-cost analysis by which EEC projects are assessed. The Companies believe that the requested funding for 2012 and 2013 is reasonable as it is well supported by the achievable potential identified in the Companies' recently completed Conservation Potential Review (discussed further below). The Conservation Potential Review summary is attached in Appendix K-2.

In the Companies' Long Term Resource Plan filed in 2010 ("2010 LTRP"), and in the regulatory proceeding related to the 2010 LTRP, the Companies had indicated that they believed that longer-term, sustained EEC funding was the optimum approach, and in response to one Information Request from the Commercial Energy Customers, had indicated that an EEC funding approval period of five years would be appropriate. Given that current EEC funding approvals expire at the end of 2011, and that this Revenue Requirement Application period is two years covering 2012 and 2013, the Companies have made a decision to proceed with requesting EEC funding approval to cover the years 2012 and 2013. The Companies will incorporate a longer-term funding request, and will incorporate the EEC scenario planning and impacts on demand forecasting, in the next Long Term Resource Plan, which FEU anticipates filing in 2013.

The remainder of this section is divided into the following parts:

- A discussion of the total requested funding for 2012 and 2013 (Section 2);
- A discussion of the budgeted EEC funding within the total funding envelope for previously approved "conventional" and Innovative Technologies program areas (Section 3);
- A discussion of the budgeted EEC funding within the total funding envelope for New Initiatives (Section 4); and
- A request for additional approvals related to customers of FEW, Interruptible Industrial customers on FEVI and benefit-cost analysis used to screen the Companies' EEC activity moving forward (Section 5); and
- Conclusion (Section 6).

2 REQUESTED FUNDING ENVELOPE FOR 2012 AND 2013

FEI and FEVI have had access to sufficient funding for 2010 activities, and the existing approvals ensure that there is sufficient funding for continued EEC activities in 2011. The approved funding for 2010 and 2011 is summarized in Table K-1 below.

Table K-1: Approved EEC Funding for 2010 and 2011

($ thousands)	**FEI**		**FEVI**	
	2010	**2011**	**2010**	**2011**
Residential, Commercial, Joint Initiatives, and CEO Programs	20,675	20,675	4,126	4,126
Affordable Housing	2,400	2,400	600	600
Industrial Interruptible	435	1,875	-	-
Innovative Technologies	2,300	4,669	478	956
Total	**25,845**	**29,619**	**5,204**	**5,682**

A summary of the Companies' overall request for approval for each EEC program area for 2012 and 2013 can be found in Table K-2 below:

Table K-2: 2012 and 2013 Overall EEC Funding Request by Program Area

	2012 Proposed Funding ($000's)	2013 Proposed Funding ($000's)
	Total	**Total**
Previously Approved EEC Activity		
Conventional EEC Activity		
Residential	9,500	9,500
High Carbon Fuel Switching	2,000	2,000
Low Income	5,000	5,000
Commercial	14,500	14,500
Conservation Education and Outreach	5,000	5,000
Industrial	2,000	2,000
Subtotal - Conventional EEC Activity	***38,000***	***38,000***
Subtotal - Innovative Technologies inc. NGV	***11,500***	***11,500***
Subtotal - Previously Approved EEC Activity	***49,500***	***49,500***
New Initiatives		
Furnace Scrap-It program	**10,000**	**10,000**
Solar Thermal	**4,000**	**4,000**
TES for Schools	**11,000**	**11,000**
Subtotal - New Initiatives	***25,000***	***25,000***
Total Funding	**74,500**	**74,500**

The Companies' proposed increase in the total EEC funding envelope for 2012 and 2013 is based on:

- increases in areas of program activity in respect of which the Commission has already approved funding in Orders G-36-09, G-140-09 and G-141-09, discussed in Section 3 below, and
- budgets for, and activity relating to some new initiatives, discussed in Section 4.

While the funding requests represent an increase in EEC spending, the Companies have proposed a revised financial treatment for EEC spending in 2012 and 2013 (see Section 6.3.2 of the Application) that protects ratepayers in the event that the Companies are unable to spend the full amount within the funding envelope ($74.5 million/year). Under the proposed financial treatment, however, only $20 million per year of EEC spending is reflected in the 2012-2013 rate base and revenue requirements. $20 million was selected as the appropriate number since it aligns with the expenditures of approximately $17.7 million that the Companies were able to commit to EEC activity in 2010.

Actual EEC spending in 2012 and 2013 above $20 million per year will be recorded in non-rate base deferral account (attracting AFUDC) and will not commence recovery in rates until 2014. This revised financial approach is intended to ensure that customers only pay for actual EEC expenditures that are incurred during 2012 and 2013. Stakeholders will have the opportunity to comment on proposed budgets for upcoming years during the EEC Stakeholder Group meeting held in the fall of each year, once programs have been planned for the following year. Further, the Companies file the EEC Annual Report by March 31 each year, giving the Commission and stakeholders an additional opportunity to comment on proposed EEC activity, including planned budgets, for the upcoming year. For further details on how the EEC expenditures are treated for 2012 and 2013, please refer to Section 6.3.2.1 in the Application.

Consistent with the Commission's Decision in the EEC proceeding, the Companies propose that

- the overall funding level of $74.5 million be considered a level that would not be exceeded;
- the Companies will spend those funds only on approved Program Areas; and
- the Companies will retain their ability to re-allocate funds initially budgeted for one approved Program Area to another approved Program Area(s) and the FEU will report on funding transfers in their Annual Report.

The Companies believe that retaining the flexibility to allocate more of the approved funding to successful previously approved Program Areas and scale back other programs that are not performing as well as expected (subject to the requirements and constraints of the DSM Regulation) will continue to provide a strong results-based framework for the Companies' EEC initiatives. It will support the overall success and cost effectiveness of the EEC program portfolio as a whole. This approach and support from customer groups is outlined in the following passage from the EEC Decision on pages 41-42:

> *"Terasen summarizes its proposal for accountability mechanisms as follows:*
>
> *In this Application the Companies have recognized the need for accountability for the funds approved for EEC programs. First, any funds not spent will not be charged to the regulatory asset deferral account. Second, the Companies intend to monitor the portfolio TRC on a monthly basis, and have proposed to file an Annual EEC Report with the Commission by the end of the first quarter every year. The Report will detail program activity, expenditures, and cost-benefit results for the previous year, as well as describe program activity and provide forecasts for the upcoming year. Third, in the event that the relief sought is granted, the Companies would form and engage an EEC stakeholder group with membership representing a broad cross section of stakeholders identified in the Application. Fourth, the Companies have indicated their intention to hold annual EEC workshops with stakeholders, at which the Companies would present updates on*

program progress and obtain stakeholder Input on new programs and refinements to existing programs. Fifth, the Companies are proposing to develop many of the programs for the commercial sector and the DSM for Affordable Housing sector in conjunction with stakeholder advisory groups." (Terasen Argument, p. 39)

Intervenor Positions
BCSEA-BCSC states that they: ". . . support this [funding] approach, noting that the proposed accountability mechanisms are designed to be more effective and efficient than having on-going Commission involvement in decision-making within the portfolio during the Funding Period" and BCSEA-SCBC acknowledge and support the additional accountability mechanisms proposed by Terasen in [Terasen Argument] paragraph 112." (BCSEA-SCBC Argument, pp. 5, 20)

BCOAPO argues that, should the Application be approved, an independent audit process should be Required with respect particularly to free ridership, attribution and redirection of funds. (BCOAPO Argument, p. 14)

Commission Determination
The Commission Panel accepts Terasen's accountability undertakings, and considers that, while the proposal to evaluate the EEC project using the TRC test at the Portfolio level has been accepted,TRC calculations for each program area, initiative and measure should also be included in the accountability reporting as a means of assessing the components of the Project and their ongoing effectiveness.

Commission Panel directs that the annual EEC Report include the following:

- *TRC, RIM, UC, and Participant test calculations of DSM at the Program Area initiative and individual measure levels in addition to the total Portfolio level reporting. Reporting of the Residential & Commercial EE program areas should also be made at the New Construction and Retrofit levels.*
- *any inter and intra Program Area initiative funding transfers, with supporting rationale, and the impact of such transfers on the transferor and transferee Program areas, initiatives, and measures as the case may be.*
- *data for fuel switching programs should be tracked in a manner which allows for reporting types of fuels replaced by natural gas, including estimated GHG impacts."*

The incremental funding amounts in previously approved Program Areas compared to 2010/11 funding levels are discussed in Section 3 below. Within the previously approved Program Areas, the amounts budgeted for "conventional" activity are based on increases to budgets for the "conventional" EEC activity reported in the 2009 and 2010 Annual Reports (included as Appendix K-3 and K-4 respectively). 2009 and 2010 "conventional" EEC activity in turn was based upon the "bottom up" budgets that were developed for the 2008 EEC Application. The budgeted total amounts for "conventional" or non-Innovative Technology activity for 2010 and 2011 for FEI and FEVI were approximately $28.2 million and $29.7 million respectively. The Companies have budgeted for an increase for "conventional" EEC activity to $38 million/year for each of 2012 and 2013, which will allow the Companies to continue and expand the "conventional" EEC activities derived from the "bottom up" budgets developed for the original EEC Application. Further, the Companies have increased the Innovative Technology Program area request in 2012 and 2013 to $11.5 million. Budgeted EEC funding for previously approved EEC activity is the subject matter of the next section below.

3 FUNDING FOR PREVIOUSLY APPROVED EEC ACTIVITY

In Orders G-36-09, G-140-09 and G-141-09, the Commission has approved funding and activity for the following types of EEC programming: residential, commercial, industrial, joint initiatives, low income, conservation education and outreach and Innovative Technologies. The material below in Sections 3.1 and 3.2 describes increases to funding for this previously approved activity. For the purposes of organizing this write-up, activity for Natural Gas Vehicles has been included with Innovative Technologies under the heading of "Previously Approved EEC Activity" EEC programs. Although the Companies believe that is an accurate characterization, we wish to make clear that we recognize that this issue is being addressed in a separate regulatory process regarding the approval to expend EEC funds for activity relating to NGV, and that this issue remains outstanding at the time of filing.

3.1 EEC Funding for "Conventional" EEC Activity

For the purposes of this discussion, "conventional" EEC activity refers to all activity excluding Innovative Technologies and New Initiatives, and supports EEC activity related to residential (including low income), commercial and industrial customers. The Companies propose that the general areas of activity and programs for "conventional" EEC activity that were implemented in 2010 and 2011 be extended to cover the 2012 and 2013 time period, with budgeted increases to funding for most program areas. Descriptions of that activity and these programs for 2011 can be found in the Companies' 2010 Annual EEC Report, submitted to the Commission on March 31 2011, in sections 3, 4, 5, 6, 7, 8, 9 and 11. This 2010 EEC Annual Report is also included as Appendix K-4 to this Application. Table K-2 above outlines the Companies' budgeted funding levels for "conventional" EEC activity. The Companies have not yet commenced detailed program design for 2012 and 2013, and the subsequent development of individual program budgets for "conventional" EEC activity, but it could be expected to be very similar to the type of "conventional" activity outlined in the Companies' 2010 EEC Annual Report, with budgeted increases to funding levels to allow for the expansion of "conventional" EEC activity. It is the Companies' intention to develop program activity for 2012 over the course of 2011, and as in previous years, contemplated program activity for 2012 will be presented to the EEC Stakeholder group in the EEC Stakeholder meeting to be held in Fall 2011, and feedback from this group will be solicited and incorporated prior to any refinement to existing program or new programs launching in 2012.

The Companies' proposed budget for EEC programs in 2012 and 2013 reflects the following changes from the budgets established for previously approved "conventional" EEC activity in 2011:

- Consolidation of "Joint Initiatives" activity with "Residential" as all the activity funded in the Joint Initiatives program area undertaken to date has been for residential customers. Collaborative activity with other utilities and government is taking place in all other program areas; it is not, however, broken out into a separate funding category in these other program areas. It makes sense to align funding for collaborative activity for residential customers within the residential program area.
- An increase in budgeted funding for residential customers from approximately $5.2 million (for Residential and Joint Initiatives activity combined) to $9.5 million. The Companies anticipate that a Residential New Home Construction Program, a Domestic Hot Water Program and participation in such collaborative programs as LiveSmartBC will require a larger budget for EEC activity for residential customers than previously established. Residential customers form the bulk of the Companies' accounts, and programs aimed at these customers are very important in creating the "culture of conservation" that will be needed in order to achieve government's energy objectives.
- An increase in budgeted funding for high-carbon fuel switching to lower carbon fuels (e.g. Heating oil to natural gas) from approximately $1.5 million to $2 million. This activity would be aimed at residential and commercial customers, and would have the goal of moving these customers off propane and heating oil, and onto natural gas. It could also be aimed at moving customers onto alternative forms of energy, such as geoexchange with natural gas backup. This funding does not include fuel switching from electricity to natural gas.
- An increase in budgeted funding for low income customers from $3 million to $5 million. Activity in this particular area has good support from government and stakeholders.
- An increase in budgeted funding for conservation education and outreach from $3.5 million to $5 million as the Companies seek to expand activity around influencing conservation behaviours by British Columbians.
- An increase in budgeted funding for all industrial customers, regardless of whether they are on a firm or an interruptible rate, from $1.875 million to $2 million. This is a relatively new area of activity for the Companies, and it is anticipated that we will need time to gain knowledge and experience in this area, therefore only this modest increase is anticipated over the 2012 and 2013 period.

The above budgets for "conventional" EEC activity program areas form the basis for the overall funding request, but as indicated above the Companies are proposing to maintain the approach used since the 2009 EEC Decision whereby the Companies retain the flexibility to reallocate funding among any of the approved program areas as required to optimize the portfolio.

The Companies' recently completed Conservation Potential Review, the Summary for which is attached as Appendix K-2, found that the Most Likely Achievable Potential energy savings in the Residential, Commercial and Industrial areas of activity were 2.2 million GJ/year by 2015, and 10.3 million GJ/year by 2030. This represents significant opportunity for energy savings. In 2010, the Companies committed approximately $12.1 million in EEC funding to non-NGV EEC activity aimed at the Companies' Residential, Commercial and Industrial customers, for annual energy savings of 166,110 GJ/year. While the Companies are relatively new to this scale of EEC expenditure and activity, and the funds committed in 2010 included some "one-time" costs such as a DSM tracking system, it can be seen that in order to achieve the energy savings found to be available in the CPR, higher expenditures will be necessary. Hence, the Companies believe that the proposed increase in the EEC funding envelope for 2012 and 2013, reflecting budgeted increases in "conventional" EEC programs, is warranted.

3.2 Innovative Technologies, including Natural Gas Vehicles ("NGV")

In the 2008 EEC application, FEI and FEVI requested funding for Innovative Technologies since the utility is in a unique position to foster and further the deployment of forward looking low carbon technologies. On April 16, 2009, the Commission issued the EEC Decision approving funding for FEI and FEVI for 2009 and 2010 programs. While the Companies did not receive approval for expenditures for the Innovative Technologies Program Area as part of that application, the Commission directed the Companies to bring forward projects for consideration as they became more fully developed[1].

FEI and FEVI submitted their respective applications for 2010 – 2011 Revenue Requirements and Delivery Rates on June 15, 2009 and June 29, 2009, respectively, which proposed innovative technologies programs and expenditures in order to meet the Commission's directives in Order No. G-36-09. On November 26, 2009, the Commission issued Order No. G-141-09 and Order No. G-140-09 approving the Innovative Technologies programs and expenditures as listed in the Negotiated Settlement Agreement ("NSA") for both FEI and FEVI.

As part of their respective NSAs, the parties agreed that the Innovative Technologies Program Area will be managed by FEI and FEVI as a separate segment of the overall EEC portfolio and have a weighted total resource cost ("TRC") of 1.0 or more. A program manager was hired in the second quarter of 2010 to develop program design and framework for the non-NGV activity in the Innovative Technologies program area.

1 BCUC Decision in the matter of Fortis BC Energy Inc. and Fortis BC Energy (Vancouver Island) Inc. Energy Efficiency and Conservation Application, April 16, 2009, p. 26.

On January 14, 2011, FEI received Decision Order G-6-11 which granted interim approval of CNG Service for Waste Management to fuel their fleet of 20 garbage trucks. In this decision, the Commission raised a potential issue with respect to the use of EEC incentives for NGV vehicle reimbursement.[2] As discussed in the 2010 EEC Annual Report ("Report"), filed March 31, 2011, the Companies believe that the use of Innovative Technologies Program Area EEC funding for NGV initiatives is consistent with previous Commission decisions[3] (Order Nos. G-36-09, G-141-09, and G-140-09), and that FEI has been open and transparent with stakeholders about EEC activities and expenditures, including the use of EEC incentives for NGV.[4] In the Report, the Companies requested that the Commission provide confirmation of the Companies' compliance with past orders without additional process, or alternatively, if the Commission was unable to provide this confirmation, the Commission provide its concurrence for the Companies to proceed with EEC incentive funding.

The Commission subsequently issued Order No. G-70-11 on April 20, 2011 which initiated an expedited process to review the appropriateness of the Companies' use of EEC funds as NGV incentives. The initial regulatory timetable is scheduled to conclude near the end of May 2011. Therefore the Utilities have developed their EEC funding request (and NGV volume and revenue forecast) in this RRA assuming that EEC incentive funding for NGV initiatives have been approved by the Commission.

In this RRA, the Companies have budgeted $11.5 million in 2012 and $11.5 million in 2013 to fund technologies with low market penetration including NGV, and enabling activities such as metering for these technologies, within the Innovative Technologies program area. Recognizing that the Commission's review process of incentive funding for NGV initiatives has not reached a conclusion at this time, the Companies have divided the Innovative Technologies section into two parts. The first section describes the $3 million funding contemplated ($1.5 million per year for each of 2012 and 2013) associated with non-NGV initiatives fostering the deployment of low carbon technologies. The second section describes the Companies' NGV funding contemplated of $20 million over two years ($10 million per year for each of 2012 and 2013). In each separate section the Companies provide some background on the programs, a description of the programs and its objectives, followed by a rationale of the funding amount contemplated by the Companies.

3.2.1 INNOVATIVE TECHNOLOGIES - NON-NGV INITIATIVES

Innovative technologies are solutions that the Companies can support through programs delivering energy reductions and savings to their customers for now and into the future. All programs within this program area are to foster and further the deployment of low carbon technologies. Those low carbon technologies are best described as being market ready but have little or no market penetration in BC. They can also be defined as emerging and/or

[2] Commission Order No. G-6-11, at page 5
[3] 2010 EEC Annual Report, at page 203
[4] 2010 EEC Annual Report, at page 216

enabling technologies. Some of these technologies include, but are not limited to, solar thermal domestic hot water systems, solar air systems, ground source heat pumps ("GSHPs"), hydronic systems, sterling engines, micro co-generation, and fuel cells. Hydronic systems can be classified as enabling technologies as they have the flexibility and potential to receive future energy from District Energy Systems ("DES").

The Innovative Technology programs pursue a number of objectives in order to support, review, and validate market-ready technologies. More specifically they focus on:

- Supporting local, provincial, and federal governments with climate action goals and policies focused on fostering the development of market-ready technologies that promote energy conservation and efficiency and the use of clean or renewable resources; and
- Evaluating market-ready technologies and conducting pilot studies and/or demonstration projects to validate manufacturer's claims about equipment and system performance, and energy efficiency.

The Companies are budgeting $3 million of the total requested funding envelope over 2 years ($1.5 million for each of 2012 and 2013) to support those objectives.

In 2010, the Companies committed $372,000 in funds to non-NGV Innovative Technologies activity, and we are estimating a commitment of approximately $715,000 in 2011. The 2011 commitments are almost double the amounts in 2010 due to the increased momentum of establishing and developing industry contacts, technology awareness and expertise, and further program design. The Companies expect this trend to continue into 2012 and 2013 as further market momentum for these technologies is gained.

The Innovative Technologies program area plays an integral role in the Companies' overall commitment to EEC activities, not only in reducing or replacing natural gas consumption with lower carbon technologies, but also in supporting the government's climate action goals. The Companies believe also that there is a strong need for measurement and verification of energy savings for these lower carbon technologies through conducting pilots and/or demonstration projects. The data from pilots can be used to validate manufacturer's claims about energy savings, help improve the quality and installation of future systems, and be used to understand and reduce market barriers. Traditionally costs to produce, distribute, install and monitor these technologies are higher due to a lack of market "scale" and require incentives for market transformation.

The Companies believe that continued funding for Innovative Technologies is critical in validating and piloting the energy saving performance of low carbon technologies for the development of future energy efficiency and conservation programs within the residential, commercial and industrial sectors.

3.2.2 INNOVATIVE TECHNOLOGIES - NATURAL GAS VEHICLE ("NGV") INITIATIVES

NGVs, which use liquefied natural gas ("LNG") or compressed natural gas ("CNG") as a heavy duty vehicle fuel (trucks and marine vessels), are considered part of the Innovative Technologies Program Area for two reasons. First, technologies used in NGV applications are market-ready, but can be classified as emerging technologies in the BC context as they have minimal market penetration in BC. Second, the Commercial NGV Demonstration program achieves GHG emissions reductions by displacing high-carbon diesel fuel with low-carbon natural gas. Through this program, the Companies (FEI and FEVI) provide funding to offset, in whole or in part, the incremental vehicle cost difference between an NGV compared to its diesel equivalent. The Companies' EEC request includes $10 million in 2012 and $10 million in 2013 to fund its NGV initiatives within the Innovative Technologies Program Area. Based on information provided by equipment vendors, the capital cost premiums associated with CNG and LNG vehicles are approximately:

- CNG Vocational truck (refuse, waste hauler) - $27,000 - $45,000
- CNG Transit bus - $50,000 - $70,000
- LNG Class 8 tractor - $80,000 - $90,000
- LNG Marine vessel - $3 - $4 million

In 2012 and 2013 the Companies anticipate a funding level which ranges from 80 percent to 100 percent of the incremental cost differential.[5] An exact percentage has not yet been determined and its timing will likely depend upon level of adoption of each vehicle category and the capital cost premium. The Utilities believe that capital cost premiums will decrease as NGV adoption increases in BC. Future adjustments to the funding levels will be assessed as NGV adoption occurs.

The Utilities have used these assumptions to calculate the approximate number of vehicles which could be funded with $10 million in 2012 and $10 million in 2013.[6] The potential number of vehicles which could be incented with this amount is presented in the volume forecast in Appendix I of this Application. FEI anticipates market adoption in vocational trucks, Class 8 tractors and buses to occur 2012 and 2013, with one marine vessel forecast for 2013. FEI also notes that a lag may exist between when vehicles are purchased, delivered and ready for

[5] Funding levels during 2010 and 2011 have ranged from 80 percent – 100 percent of the incremental cost between NGVs and its diesel equivalent. Future funding may be lower than 80 percent depending upon the level of NGV adoption and capital cost premium.

[6] At this time, FEI offers incentive funding ranging between 80 – 100 percent of the incremental cost. This reimbursement level may decrease in the future as NGV adoption increases and cost premiums decrease, however the exact amount and date is unknown at this time.

fuelling service. This means load additions do not necessarily occur in the same year as incentive payments are issued.

The growth of the NGV refueling business is inherently reliant upon the adoption of NGVs in our service territory and the Utilities believe that the adoption of NGVs in our service territory depends upon the continued availability of these EEC incentives for NGV adoption. The Utilities wish to make clear that there is no conditional connection between EEC incentives for NGV and the need for the Utilities to also build and operate the NGV refueling stations, other than that the availability of both as options are required in order to see the NGV adoption required to provide meaningful and material benefit to our existing customers. Further, regardless of who provides the fueling service the benefits of increased throughput across the FEI system for CNG and LNG will benefit existing customers.

For additional information on the NGV forecast and potential benefits of our NGV initiatives, please refer to Appendix I of this Application.

4 NEW INITIATIVES

The Companies' proposed EEC funding envelope for 2012 and 2013 includes funding for several new programs that have not yet been considered by the Commission and do not meet the cost effectiveness test requirements currently applicable to the Companies' EEC programs. Changes to the cost effectiveness tests such as employing the Societal Cost Test ("SCT") rather than the TRC or amendments to the DSM Regulation will be required in order for these new initiatives to meet cost effectiveness thresholds or other stipulations of the DSM regulation. The SCT is discussed in Section 5.2.2 below. In other words, the Companies cannot pursue these initiatives in the absence of a change to employing the Societal Cost Test or to the DSM Regulation. The reason that funding for new initiatives has been included in the overall requested funding envelope is that FortisBC has been made aware that the Ministry of Energy and Mines is considering developing amendments to the DSM Regulation and the program proposals below are intended to comply with possible amendments. The final form of DSM Regulation amendments, if any, and the timing of when they occur, is subject to the approval of the Minister of Energy and Mines. The Companies believe that it is most efficient and logical to include a request for funding in this application, rather than having to reapply for funding for New Initiatives if and when any changes to the DSM Regulation come into effect.

It is possible to address this funding now, as part of this RRA, because the proposed changes to the regulatory treatment of EEC funding in 2012 and 2013 will ensure that customers will not pay for the costs of these new initiatives in rates unless the programs proceed and the funds are actually spent. The Companies have also included a request (discussed in Section 5.2.2 below) to adopt the SCT for all EEC activity, including for these New Initiatives.

4.1 Furnace Scrap-It Program

The Companies requested EEC funding includes a budget of $10 million per year for each of 2012 and 2013 for a Furnace Scrap-It Program. Supporting energy bill reductions for families and small businesses throughout the FortisBC service territory, this proposed program would replace about 10,000 furnaces per year with super-efficient ones. Although many standard and mid-efficient furnaces are theoretically beyond their rated operating life (~20 years), they continue to function and owners are not upgrading them due to a poor payback period on the purchase of a new furnace (~20 years at current rates). However, the owners would have to replace the furnaces in 5-10 years anyway (and incur the full cost). As such, this program would provide an incentive for early replacement, resulting in short-term cost savings and emission reductions.

It is estimated that there are 560,000 standard- and mid-efficiency furnaces in British Columbia. In 2009, the total furnace shipments to BC were 36,000, although a sizable proportion of those are for new construction. Assuming two-thirds of those furnaces shipped were replacement, it would take 23 years for British Columbians to replace their inefficient furnaces, a lost opportunity for financial savings for homes and small businesses.

The LiveSmart BC: Efficiency Incentive Program is expected to provide rebates for about 3,900 super-efficient furnaces in 2011. The Furnace Scrap-It program would support an additional 10,000 furnaces per year, some of which might go through the LiveSmart program as well. This would accelerate the replacement of British Columbia's inefficient furnaces by about 50 percent.

There are several "non-energy benefits" of a furnace replacement that are not currently considered in the approved DSM evaluation models when evaluating programs. The Companies have outlined in Section 5.2.2 below a proposal to move to the SCT to evaluate all EEC activity. Such a change would allow the Companies to offer this program to our customers. As can be seen in the Residential section of the CPR Summary attached as Appendix K-2, space heating accounts for 80 percent of the residential energy savings, and the largest contributor to this space heating energy savings is a furnace early retirement initiative. The Companies' requested EEC funding includes a budget of $10 million per year for each of 2012 and 2013, to fund approximately 10,000 furnace retirements with an incentive of $1000 per participant. For the reasons described above, the Companies believe that the budgeted amount of funding is justified and should be reflected in the overall funding envelope ultimately approved by the Commission.

4.2 Solar Thermal

The Companies' requested funding includes a budget of $8 million over the next 2 years ($4 million for 2012 and $4 million for 2013) for Solar Thermal. This program offers energy source reductions from natural gas to solar for domestic hot water for residential and commercial applications, and solar for space conditioning preheat for commercial and industrial applications. Natural gas would still be part of the picture as a backup fuel source. It also supports the government's climate action goals and policies focused on fostering the development of market-ready technologies that promote energy conservation and efficiency and the use of renewable resources. Both of those initiatives will reduce natural gas consumption and carbon emissions.

There is a strong need for a utility program in this area, as Natural Resources Canada's EcoEnergy for Renewable Heat program and SolarBC's Residential program offering incentives for solar thermal were discontinued effective December 31, 2010. Budgets at other levels of government (provincial and municipal) are inadequate to provide the kind of scale needed to start the market transformation effort for solar thermal as customers are not willing to absorb the high upfront capital cost for the energy bill savings and other benefits expected. The SolarBC Residential program offered incentives to encourage 540 households across BC to install solar hot water which resulted in 4,353 GJ saved every year and annual GHG emission reductions of 94 tonnes of CO_2. 240 or (54 percent) of all the residential installations since 2008 occurred in 2010. NRCan's EcoEnergy for Renewable Heat program also proved to be a success, funding over $20.5 million for 1,268 commercial solar thermal hot water systems and industrial solar for space conditioning preheat systems throughout Canada. 514 or (41 percent) of all the commercial and industrial installations since 2007 occurred in 2010. The results of both the SolarBC Residential and NRCan's EcoEnergy for Renewable Heat program indicate an active industry interest for solar thermal and resulted in an increased uptake percentage each year that those programs were available. The Companies believe that those program results indicate a strong demand for solar thermal within the residential, commercial and industrial sectors to support the $8 million that the Companies have budgeted. The Companies also believe that it is essential for market transformation to continue the positive momentum that has been gained over the last few years through those programs with developing its market share, associated jobs and economic benefits.

Solar thermal projects fail the Total Resource Cost ("TRC") test, due to the high incremental cost of solar equipment, and the prevailing low cost of natural gas. Consequently, solar thermal programs will not be able to proceed in any material fashion in the absence of the application of the Societal Cost Test as requested by the Companies. In the case of solar thermal, using a deemed adder for non-energy benefits of 30 percent, as proposed in Section 5.2.2 below, would effectively capture such non-energy benefits as job creation, and environmental attributes.

For the reasons described above, the Companies believe that the budgeted amount of funding for Solar thermal is justified and should be reflected in the overall EEC funding envelope ultimately approved by the Commission.

4.3 Thermal Energy Services for Schools

FortisBC is proposing a $22 million incentive program for geoexchange and energy efficiency retrofits in up to 260 schools over two years. The TES for Schools program would provide capital incentives for state-of-the-art low carbon energy systems such as geoexchange systems, high-efficiency boiler upgrades, as well as educational energy monitoring equipment. These state-of-the-art low carbon energy systems continue to incorporate natural gas as a critical energy input, whether as the primary component or as a back-up and peaking energy source.

The need to replace worn out equipment (such as central boilers, individual rooftop air-handling units, and ancillary equipment) is urgent for many schools across BC, but the incremental costs are a major barrier for schools to proceed with replacing their energy systems. In addition, schools are challenged with compliance with government legislation to become carbon neutral via reduction in carbon emissions and/or through the purchase of carbon offsets. Faced with limited budgets and constraints on capital and debt, the ability of school districts to achieve these goals is limited.

To foster a competitive market, incentives would be available for projects using a third party ownership model and those owned and operated by school boards. Incentive levels are structured to ensure positive economics for participating school districts, while maximizing ratepayer value. As the highly efficient geoexchange systems do not meet the current cost-effectiveness test due to high incremental capital costs, the budgeted $22 million in program spending will employ a pooled approach in the cost-effectiveness evaluations for each school district, which aims to minimize GHG emissions while ensuring economical solutions through the selection of the optimal combination of technologies to fit within both operating and capital budget constraints. This approach enables a major increase in the total number of school retrofits and expands the share of geoexchange installations, while keeping incentives to 50 percent or below of a school district's combined equipment capital costs.

The scope of this program has been restricted to schools to address a clearly defined financial need, to provide benefits that target BC families, and to provide important educational and training opportunities about energy efficiency and environmental stewardship for present and future generations of students, which benefits would be among those captured using the 30 percent proposed deemed adder for non-energy benefits in the Societal Cost Test, as outlined in Section 5.2.2 below.

5 ADDITIONAL APPROVALS REQUESTED

In addition to funding approvals, in the EEC Decision the Companies received a number of additional approvals related to the principles guiding EEC activity, how programs are to be evaluated, and oversight mechanisms. The Companies are proposing some changes to some of these guiding principles discussed in this section, but by and large the Companies are proposing no changes to the existing EEC framework.

5.1 Elements of Existing EEC Framework to be Retained

Most aspects of the existing EEC framework continue to make sense going forward. The key approvals previously granted to which the Companies are proposing no change are as follows:

- The Commission approves an overall funding envelope comprised of a portfolio of approved program areas. Consistent with that notion, the Companies will continue to have the ability to move funds between programs and program areas to optimize the portfolio;
- Continue to use the portfolio level approach to benefit-cost analysis such that the overall portfolio including all EEC-funded activity should have a benefit-cost result of 1.0 or greater. (The Companies are proposing a change to measure cost-effectiveness of the portfolio using the Societal Cost Test as discussed in Section 5.2.2 below);
- Continue to evaluate the Innovative Technologies portfolio of activity on a separate segment of the overall portfolio, with a weighted average benefit-cost test result of 1.0 or greater. (The Companies are proposing a change to measure cost-effectiveness of the Innovative Technologies portfolio using the Societal Cost Test, as the Companies are proposing in Section 5.2.2 below that the Societal Cost Test be used for all EEC activity, including Innovative Technologies);
- Continue to be able to offer programs and measures with a benefit-cost result of less than 1.0, but provide information in annual reporting as to why the program should continue, including information on any environmental or social or other goals supported by the program or measure;
- Continue to use the approved accountability mechanisms that the Companies have put in place, that is the EEC Stakeholder group, and EEC Annual Report, which offer the Commission and Stakeholders the opportunity to comment on proposed program activity. The EEC Annual Report includes a supporting rationale for funding transfers between approved program areas and funding transfer impacts. It also includes reporting on the benefit-cost analysis, and justification for continuing with programs and measures with a benefit-cost result of less than 1.0.
- Continue to be guided by the “EEC Program Principles” put forward originally in Section 5 of the EEC Application; and
- Continue to capitalize the approved EEC expenditure to a regulatory deferral account, and to amortize deferral account balances for a period of up to ten years. The regulatory treatment for the first $20 million per year of EEC spending in 2012 and 2013 is the same as the treatment for EEC spending in 2011 and before (as approved by BCUC Order No. G-36-09). The proposed regulatory treatment for 2012 and 2013 EEC spending in excess of $20 million per year, whereby these amounts are recorded in a non-rate base deferral account and recovery in rates is not commenced until 2014, constitutes a small departure from this treatment. The Companies have proposed this change to recognize the variability in customer participation that may occur in the forecast period and to mitigate the risk of recovery in rates for budgeted EEC spending that does not actually occur.

Further, the Companies' EEC activity will continue to comply with the requirements for adequacy as laid out in the DSM Regulation.

5.2 Proposed Changes to Existing EEC Framework

The Companies are proposing few changes to the existing approved EEC framework. The proposed changes, discussed in the remainder of this section, are:

- Expand all EEC programs eligibility to customers of FEW and to offer the Interruptible Industrial program to customers of FEVI; and
- Move to use of the Societal Cost Test as the primary means of evaluating the cost-effectiveness of the Companies' EEC activity.
- Include spillover in "Net-to-Gross estimates of program effects

The Companies believe that these changes will make EEC funding more widely available to customers, and will help to make the EEC program more effective.

5.2.1 ELIGIBILITY EXTENDED TO FEW AND INDUSTRIAL INTERRUPTIBLE CUSTOMERS OF FEVI

The Companies are proposing the following:

- To extend eligibility for EEC program participation to customers of FEW in order to comply with Order G-138-10.[7];
- To expand eligibility for participation in programs to Interruptible Industrial customers of FEVI; and
- In the Companies' 2010-2011 Revenue Requirements proceeding, the Companies did not apply for funding for EEC activity for Interruptible Industrial customers of FEVI, as the Companies had very little experience with Industrial DSM and wished to hire an Industrial Program Manager and start to develop an Industrial strategy based on FEI's larger industrial customer base. That Industrial Program Manager is now in place, and the Industrial strategy developed. Thus, the Companies feel it is now appropriate to expand eligibility for participation in EEC activity to Industrial customers of FEVI. The Industrial strategy can be found in Section 9.1.5 of the Companies' 2010 EEC Annual Report, which is included in Appendix K-4.

[7] As per Commission's Reasons for Decision, Order No. G -138-10, as part of FEW (formally referred to as TGW) 2010-2011 RRA, indicating concerns about the lack of DSM initiatives in TGW's Application, and directing TGW to develop plans for DSM programs, consistent with British Columbia's energy objectives, in the next revenue requirements application.

5.2.2 ADOPTION OF THE SOCIETAL COST TEST AS THE PRIMARY COST-EFFECTIVENESS SCREEN

The Companies are proposing that the Societal Cost Test be used as the primary cost-effectiveness screen for all of the Companies' EEC activity, including "conventional" and Innovative Technologies, incorporating the following three proposed changes:

- The use of a social discount rate of 3 percent, rather than the Companies' weighted average cost of capital;
- The use of the ceiling price put forward by the Companies for biomethane, which is based on an efficiency-adjusted cost of electricity, as the avoided cost of gas; and
- The use of a "deemed adder" of 30 percent for non-energy benefits of EEC activity such as job creation and improved human health.

The following will discuss the rationale of the use of the Societal Cost Test in general, before discussing these three proposals in particular.

The Companies have to date employed the TRC test as the primary cost effectiveness screen in establishing EEC programs. While the Terasen Utilities proposed and obtained approval for a portfolio-level TRC approach, the Companies' EEC activity is increasingly expected to support government policy. Government policy incorporates wider goals than just energy savings reflected in the TRC test, such as achieving GHG reductions, or providing programs for low-income customers.

As stated in the 2010 LTRP, we believe that the current cost-benefit criteria for some programs limit the benefits that can be delivered for emission reductions and for certain customer groups such as low income earners.[8] In particular, the Companies' new initiatives described in Section 4 above would not be considered to be cost-effective under the TRC test. The Companies believe, however, that all these programs have merit and that the TRC test does not accurately value the benefits of these initiatives. Continued use of the TRC test has the potential to preclude programs that offer benefits to the public, including customers.

In the 2008 FEI-FEVI EEC Application filed May 28, 2008, the use of the Societal Cost Test was supported by intervenors, as recorded in the Reasons for Decision for Order No. G-36-09 (p. 34). In its Reasons for Decision, the Commission noted the following with respect to the Societal Test:

> *"The Commission Panel acknowledges the Societal test as one which addresses a broader spectrum of factors not included in the TRC test. While recognizing that societal factors have significance, the Commission Panel views many of these factors as being*

[8] 2010 LTRP, page 115.

rather subjective and difficult to measure, The Commission Panel also takes note of the DSM Regulation…requiring the Commission to use, in addition to any other test it considers appropriate, the TRC test in determining whether a demand-side measure is cost-effective.“

First, FEU agrees that the Societal Cost Test factors have significance. FEU's fundamental position is that these significant factors must be given some recognition, otherwise some EEC programs will not be permitted to proceed despite offering benefits to the public, including customers.

Second, while FEU agrees that the societal factors may be subjective and difficult to measure, the Companies have set out specific proposals to overcome the difficulties. As explained below, the Companies are proposing a 30 percent deemed adder, which recognizes the significant societal benefits of EEC programs.

Third, the DSM Regulation does not restrict the Commission's ability to use the Societal Cost Test. Section 4(2) of the DSM Regulation only requires the use of the TRC test with respect to demand-side measures specified in section 3(a) of the DSM Regulation, which refers to "a demand-side measure intended specifically to assist residents of low-income households to reduce their energy consumption". Further, while the DSM regulation requires that the TRC be used for these particular demand-side measures, it does not require that it be the only factor. To the contrary, section 4(2) specifically mandates that the Commission use the TRC "in addition to conducting any other analysis the commission considers appropriate." The Commission is therefore free to use other analysis in considering the cost-effectiveness of even the demand-side measures for low-income households.

The Companies are thus requesting approval to move toward a Societal Cost Test in order to capture some of the benefits associated with the broader goals of DSM. The Companies' particular proposed changes to the benefit/cost screen currently used for EEC activity are discussed below.

5.2.2.1 Use of a 3 percent Social Discount Rate

The discount rate currently being used to evaluate EEC programs is based on the Companies' weighted average cost of capital. Discounting at this rate is not appropriate as energy savings occurring beyond about the 7th year after a measure has been installed are accorded very little value, even though savings may accrue for up to 50 years in the case of some measures such as highly efficient new construction, and building envelope retrofits.

The use of the current discount rate understates the value of EEC measure as 100 percent of the cost of a measure is included in the benefit-cost analysis, but not all of the benefits, since much of the future benefits are so heavily discounted they have no material impact on the TRC result. A more robust analysis would more closely match the benefits of a measure to the costs of the measure. The Companies are therefore proposing the use of a social discount rate of 3 percent to more closely align the benefits associated with a measure with the costs.

5.2.2.2 Use of the Ceiling Price for Biomethane as the Avoided Cost of Gas

The avoided cost of gas currently being used is based upon a forward projection of market costs for conventional fossil fuel-based natural gas. It is used to calculate the "benefit" side of the equation in cost-effectiveness analysis of EEC activity. Because the avoided cost currently being used is based upon market prices, which are subject to volatility and fluctuation over time, the amount of EEC activity that is deemed "cost-effective" also fluctuates with this volatility. This is not a desirable situation given that the Companies' ultimate goal for much of its EEC activity is market transformation, which requires sustained, long-term utility activity in support of increasing market penetration of efficient technology. Moving to the ceiling price for biomethane, which is derived from an efficiency-adjusted cost of "green" electricity, more completely captures the environmental benefits of DSM. Biomethane and "green" electricity are considered to be zero-emission sources of energy; DSM activity is also zero-emission. Thus, using the avoided cost of biomethane or an efficiency-adjusted cost for "green" electricity in the benefit-cost test recognizes the typically higher cost of "green" energy sources such as biogas, electricity and DSM.[9]

5.2.2.3 Use of a "deemed adder" of 30 percent for Non-Energy Benefits

While societal factors/non-energy benefits may be subjective or difficult to measure, they have significance. Not including any benefit for these factors, therefore paints an unduly negative picture of the results of EEC activity. Alongside energy savings, EEC activity creates jobs, offers the opportunity for energy bill savings to be injected back into the economy by customers in the form of other spending, conserves other resources such as water, and can increase human health, comfort and productivity. While the financial value of these additional benefits may be challenging to quantify precisely so that this value can be included in a benefit-cost test, ignoring their value is not appropriate. Thus, the Companies are proposing a "deemed adder" of 30 percent for non-energy benefits be included in the benefit-cost analysis of the Companies' EEC activity. The deemed adder for non-low income EEC activity being proposed by the Companies is aligned with the deemed adder of 30 percent to account for non-energy benefits of low-income programs found in the DSM Regulation for EEC activity for low-income customers.

5.2.3 RECOGNITION OF SPILLOVER EFFECTS IN THE NET-TO-GROSS RATIO

In order to present a more complete view of program impacts, the Companies propose to include in the Net-to-Gross ratio the energy savings attributable to customers undertaking an

9 More information about the ceiling price for biogas can be found on pp 76-77 of FEI's Biomethane Application, dated June 8, 2010.

energy-saving activity who do not participate in a program. This effect is known as "spillover." Both the Net-to-Gross ratio and Spillover are defined below.

> **Net-to-gross ratio (NTG):** The NTG can be a significant driver in the results of TRC, PACT, RIM, and SCT. The NTG adjusts the impacts of the programs so that they only reflect those energy efficiency gains that are the result of the energy efficiency program. Therefore, the NTG deducts energy savings that would have been achieved without the efficiency program (e.g., "free-riders") and increases savings for any "spillover" effect that occurs as an indirect result of the program. Since the NTG attempts to measure what customers would have done in the absence of the energy efficiency program, it can be difficult to determine precisely. [10]
>
> **Spillover (simple definition):** Spillover is the opposite of the free rider effect: customers that adopt efficiency measures because they are influenced by program-related information and marketing efforts, though they do not actually participate in the program.[11]

Although estimating spillover effects is as difficult to determine as estimating free rider effects, it is important to attempt to capture additional energy savings from spillover in order to achieve a more balanced view of program impacts. Thus, the Companies are seeking approval to include spillover effects in Net-to-Gross calculations.

6 CONCLUSION

Subsequent to the approval of FEI's and FEVI's expanded EEC initiatives in 2009, the Province of BC has reaffirmed and strengthened its commitment to energy efficiency and conservation through the enactment of the *Clean Energy Act* ("CEA"). Energy efficiency and conservation, greenhouse gas emission reductions and the promotion of innovative clean energy development in BC are core themes in the CEA. The Companies' EEC proposals and funding requests are aligned with British Columbia's energy objectives as set out in the CEA. The Companies believe that the requested funding for 2012 and 2013 is reasonable as it is supported by the achievable potential identified in the Companies' recently completed Conservation Potential Review.

1 Introduction

1.1 Objectives

This Conservation Potential Review (CPR) provides FortisBC with a comprehensive planning document that the company can use on an ongoing basis to:

- Develop a long-range energy-efficiency strategy
- Design and implement energy-efficiency programs
- Assess the impact of energy-efficiency programs on both peak and annual loads
- Set annual energy-efficiency targets and budgets.
- Determine contribution energy-efficiency programs can make towards meeting greenhouse gas (GHG) reduction targets

However, it should be emphasized that this report does not aim to either set specific program targets or provide program design.

1.2 Scope

Sector Coverage: The study addresses three sectors: Residential, Commercial and Industrial. In contrast to the 2006 CPR, which excluded FortisBC's (then Terasen Gas's) 300 largest manufacturing accounts, this CPR includes all of FortisBC's customers.

Geographical Coverage: The study results are presented for the total FortisBC service region and for the five service areas of: Lower Mainland, Vancouver Island, Whistler, Northern Interior and Southern Interior.

Study Period: The Base Year for this study is calendar year 2010. The time period covered by this study is to 2030, with milestones at the intervening years of 2015, 2020 and 2025.

Technologies: The study addresses energy-efficiency, customer behaviour and alternative energy options such as renewables and combined heat and power technologies.

Relation to Previous B.C. CPRs: This study builds on the substantial body of information and modelling work prepared in previous CPR studies conducted for FortisBC (then Terasen Gas) (2006) and BC Hydro (2007). The 2006 FortisBC study was intended to mesh with the BC Hydro study from 2007 and therefore included all customers of either utility, not just FortisBC customers. This study includes only FortisBC natural gas customers because this permitted the study to make better use of the recently completed energy end-use studies.

1.2.1 *Data Caveat*

As in any study of this type, the results presented in this report are based on a large number of important assumptions. Assumptions such as those related to the current penetration of energy-efficient technologies, the rate of future economic growth and customer willingness to implement new energy-efficiency measures are particularly influential. Wherever possible, the assumptions used in this study are consistent with those used by FortisBC and are based on best available information, which in many cases includes the professional judgement of the consultant team, FortisBC personnel and/or local experts. The reader should use the results presented in this report as best available estimates; major assumptions, information sources and caveats are noted throughout the report.

1.3 Study Organization

The study has been organized into the following areas:[1]

- **Three individual sector reports** (Residential, Commercial and Industrial) that provide an assessment of the technical opportunities for more efficient use of natural gas within each sector. A summary report will bring together the findings of all three sectors.

- **A commercial end-use survey (CEUS)** that provides insight into current natural gas equipment efficiency levels, fuel share and annual consumption levels within key Commercial sub sectors. The CEUS results were used to refine the Commercial sector building archetypes employed in the assessment of technical opportunities.

- **An options paper** that outlines alternative approaches to the assessment of cost-effective levels of DSM activity outside of the California Standard Practice tests.

1.4 This Report

This report brings together the findings of the Residential, Commercial, and Industrial sectors, together with an estimate of the net job creation and other economic effects attributable to the achievable efficiency results within the three sectors. The report is organized as follows:

- **Section 2** presents a summary of the total study results, including the total Base Year, Reference Case, Economic and Achievable Potential results for the Residential, Commercial, and Industrial sectors.

- **Section 3** presents a summary of the Residential sector results for the study period 2010 to 2030.

- **Section 4** presents a summary of the Commercial sector results for the study period 2010 to 2030.

- **Section 5** presents a summary of the Industrial sector results for the study period 2010 to 2030.

- **Section 6** presents a summary of the economic impacts associated with the identified Achievable Potential savings.

[1] **Note:** A separate Customer Preferences study was prepared in parallel with this CPR. The two studies were, however, implemented in a coordinated manner and the results of the Customer Preferences study contributed to the results of this CPR.

1.5 Definitions

This study employs numerous terms that are unique to analyses such as this one and consequently it is important to ensure that all readers have a clear understanding of what each term means when applied to this study. Below is a brief description of some of the most important terms.

Base Year The Base Year is the starting point for the analysis. It provides a detailed description of "where" and "how" energy is currently used in the existing Residential, Commercial, and Industrial sectors. Creation of the Base Year required the development of profiles of natural gas use within each sector, sub sector and service area.

Reference Case (includes Natural Conservation) The Reference Case estimates the expected level of natural gas consumption that would occur over the study period in the absence of new demand side management (DSM) program initiatives. It provides the point of comparison for the subsequent calculation of "Economic" and "Achievable" savings potentials. Creation of the Reference Case required the development of detailed profiles for new buildings and plants in each of the sub sectors, estimation of the expected stock growth, estimation of the likely impacts of new building, appliance and equipment standards and, finally an estimation of "natural" changes affecting energy consumption over the study period.

Technology Assessment Energy-efficiency, customer behaviour, and alternative energy options were identified that met the criteria, as outlined above, in the study's scope. Technology cost and performance data were compiled relative to the base line technology and the measure total resource cost (TRC) was calculated for each option.

Measure Total Resource Cost The conventional measure TRC calculates the net present value of energy savings that result from an investment in an efficiency, behaviour, or alternative energy technology or measure. The measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and operating and maintenance (O&M) costs. This calculation includes, among others, the following inputs: the avoided natural gas and electricity supply costs, the life of the technology, and the selected discount rate, which in this analysis has been set at 7.38% for most of the regions and 6.87% for Vancouver Island. Societal impacts are not included in the TRC.

Economic Potential Forecasts The Economic Potential Forecast is the level of energy consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost effective, from FortisBC's perspective, when using lifecycle costing with the long-run avoided cost of new natural gas supply. All the energy-efficiency, behaviour, and alternative energy options included in the technology assessment that had a positive measure TRC, which is the conventional DSM screen, were incorporated into the Economic Potential Forecast.

Two Economic Potential Forecasts were prepared 1) energy efficiency and alternative energy, and 2) behaviour.

Achievable Potential The Achievable Potential is the proportion of the savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. Achievable Potential recognizes that it is difficult to induce customers to purchase and install all the energy-efficiency/alternative energy or behaviour options that meet the criteria defined by the Economic Potential Forecast. The results are presented as a range, defined as *most likely* and *aggressive*.

Estimates provided were developed in a workshop involving FortisBC energy-efficiency program personnel, trade allies, selected external experts and the consulting team.

Peak Day Load Impacts Load factors provided by FortisBC were used to derive peak day load impacts from the energy consumption values contained in each of the potential estimates noted above.

Residential Customers For the purposes of this study, residential customers are categorized under Rate 1 in most of the FortisBC service region, RGS in the Vancouver Island region, and RES SGS1/SGS2 in the Whistler region. Multi-storey apartment and strata buildings are addressed in the Commercial sector report.

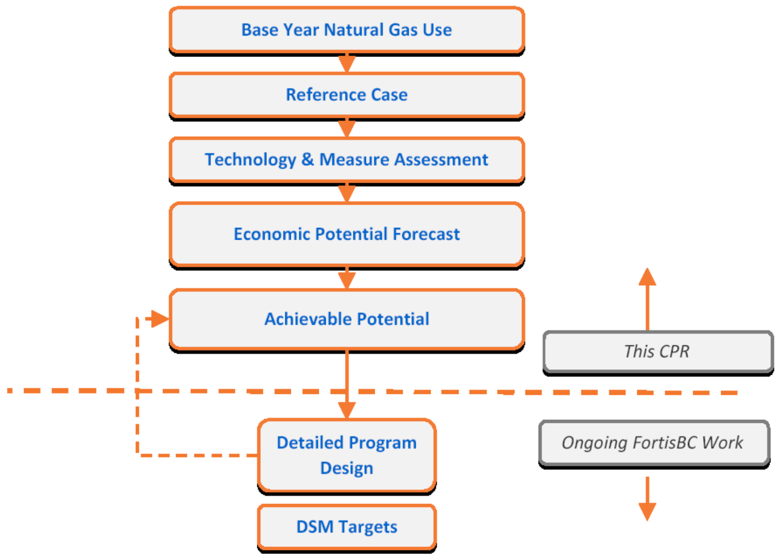
Commercial Customers For the purposes of this study, commercial customers are categorized under Rates 2, 3, 23, 22, 25, and 27 in most of the FortisBC service region. Note that this study classifies “Commercial” and “Industrial” facilities based on building/plant attributes, as represented by NAICS codes. This approach, which is consistent with CPR best practices throughout North America, is in contrast with the rate class approach employed by FortisBC. The rate-based approach tends to classify customers based on annual sales volumes. For example, light manufacturing facilities are typically included within FortisBC’s small commercial rate class; however, in this study these customers are included in the Industrial sector. Commercial customers also include multi-storey apartment and strata buildings.

Industrial Customers For the purposes of this study, industrial customers are categorized under Rates 2, 3, 5, 7, 23, 22, 25, and 27 in most of the FortisBC service region.

1.6 Overview of Approach

To meet the objectives outlined above, the study was conducted within an iterative process that involved a number of well-defined steps, as outlined in Exhibit 1. At the completion of each step, FortisBC reviewed the results and, as applicable, revisions were identified and incorporated into the interim results. The study then progressed to the next step.

Exhibit 1 Major Study Steps



A summary of these steps is presented below.

Step 1: Develop Base Year Calibration Using Actual FortisBC Sales Data

- Compile and analyze available data on British Columbia's existing building stock and plants.
- Develop detailed technical descriptions of the existing building stock and plants.
- Undertake computer simulations of energy use in each building type and compare these with actual building billing and audit data.
- Compile actual FortisBC billing data.
- Create sector model inputs and generate results.
- Calibrate sector models results using actual billing data.

Step 2: Develop Reference Case

- Compile and analyze building design, equipment and operations data, and develop detailed technical descriptions of the new building stock.
- Develop computer simulations of energy use in each new building type.
- Compile data on forecast levels of building stock growth and "natural" changes in equipment efficiency levels and/or practices.
- Define sector model inputs and create forecasts of energy use for each of the milestone years.
- Calibrate with FortisBC load forecast.

Step 3: Develop and Assess Energy-efficiency, Alternate Energy and Behaviour Measures

- Develop list of energy-efficiency, alternate energy and customer behaviour measures.
- Compile detailed cost and performance data for each measure.
- Identify the baseline technologies employed in the Reference Case.
- Compile FortisBC and BC Hydro economic data on current and forecast costs for new supply of natural gas and electricity generation.
- Determine the measure TRC for each energy-efficiency and fuel choice option.

Step 4: Estimate Economic Energy-efficiency, Alternative Energy Potential and Behaviour Measures

- Screen the identified energy-efficiency and alternative energy measures from Step 3 against the economic data.
- Identify the combinations of energy-efficiency measures and building types where the measure TRC is positive.
- Apply the economically attractive energy-efficiency measures from Step 3 within the energy-use simulation model developed previously for each building type.
- Determine annual natural gas consumption in each building and plant type when the economic efficiency measures are employed.
- Compare the consumption levels when all economic efficiency and alternate energy measures are used with the Reference Case consumption levels and calculate the natural gas consumption impacts.

Step 5: Estimate Achievable Savings Potential

- “Bundle” the energy-efficiency, alternative energy and customer behaviour options identified in the Economic Potential Forecast into a set of Actions.
- Create “Action Profiles” for each of the identified Actions that provide a high level rationale and direction, including target technologies and sub markets as well as key barriers and a broad intervention strategy.
- Review historical Achievable program results and prepare preliminary Action Assessment Worksheets.
- Consult with FortisBC personnel, review preliminary estimates and reach general agreement on *most likely* and *aggressive* range of Achievable Potential.

Step 6: Estimate Peak Day Load Impacts of Economic and Achievable Savings Potential

- Annual energy decreases/increases contained in each of the energy-efficiency/fuel choice scenarios were converted to average daily values based on annual load profile data provided by FortisBC.
- Load factors that correlate “average” to “peak” consumption were provided by FortisBC for each rate class and service area.
- Peak day load impacts were calculated for each of the energy-efficiency and fuel choice scenario results by applying the above load factors.

2 Summary of Total Study

2.1 Total Natural Gas Savings Potential

The study findings confirm the existence of significant remaining cost-effective natural gas DSM opportunities in the Residential, Commercial, and Industrial sectors within FortisBC's service area.

Exhibit 2 and Exhibit 3 summarize the total combined natural gas savings for the Residential, Commercial and Industrial sectors that have been identified in each of the individual sector technical reports. Selected highlights include:

- In the Reference Case, total natural gas consumption in the total FortisBC service area decreases from approximately 167.6 million GJ/yr. in 2010 to approximately 162.6 million GJ/yr. by 2030, a decrease of about 3%. As noted in Section 1.5, the Reference Case includes an estimation of the expected stock growth, the likely impacts of new building, appliance and equipment standards and, finally an estimation of "natural" changes affecting energy consumption over the study period.

- In the Economic Potential scenario, natural gas savings in the total FortisBC service area are approximately 17 million GJ/yr. in 2015 and increase to approximately 22.6 million GJ/yr. by 2030. The potential natural gas savings in 2030 would result in a decrease of gas consumption to approximately 140 million GJ/yr., a decrease of approximately 14%, relative to the Reference Case.

- In the *most likely* Achievable scenario, natural gas savings in the total FortisBC service area would be approximately 2.2 million GJ/yr. in 2015 and would increase to approximately 10.3 million GJ/yr. by 2030. The potential natural gas savings in 2030 would result in a decrease of gas consumption to approximately 152.4 million GJ/yr., a decrease of approximately 6%, relative to the Reference Case, and a reduction in GHG emissions of approximately 516 thousand tonnes CO_2e/yr.

- In the *aggressive* Achievable Potential scenario, natural gas savings in the total FortisBC service area would be approximately 3.6 million GJ/yr. in 2015 and would increase to approximately 15.2 million GJ/yr. by 2030. The potential natural gas savings in 2030 would result in a decrease of gas consumption to approximately 147.4 million GJ/yr., a decrease of approximately 9%, relative to the Reference Case, and a reduction in GHG emissions of approximately 764 thousand tonnes CO_2e/yr.

Exhibits 4, 5 and 6 provide additional details. Exhibit 4 shows the distribution of natural gas savings by scenario, sector and milestone year, while Exhibits 5 and 6 show the resulting impacts of those savings on FortisBC's peak day capacity requirement and the reduction of greenhouse gas (GHG) emissions.

Exhibit 2 Summary of Forecast Results for the Total FortisBC Service Area, Annual Natural Gas Consumption and Savings by Milestone Year and Forecast Scenario, 3 Sectors

Milestone Year	Annual Consumption, All 3 Sectors (1000 GJ/yr.)				Potential Annual Savings, All 3 Sectors (1000 GJ/yr.)		
	Reference Case	Economic Potential	Achievable Potential		Economic Potential	Achievable Potential	
			Most Likely	Aggressive		Most Likely	Aggressive
	(A)	(B)	(C)	(D)	(A-B)	(A-C)	(A-D)
2010	167,626						
2015	159,582	142,597	157,409	155,954	16,985	2,173	3,629
2020	161,489	141,895	156,775	153,360	19,594	4,714	8,129
2025	161,995	140,350	154,611	149,958	21,644	7,383	12,037
2030	162,630	140,037	152,376	147,436	22,593	10,254	15,194

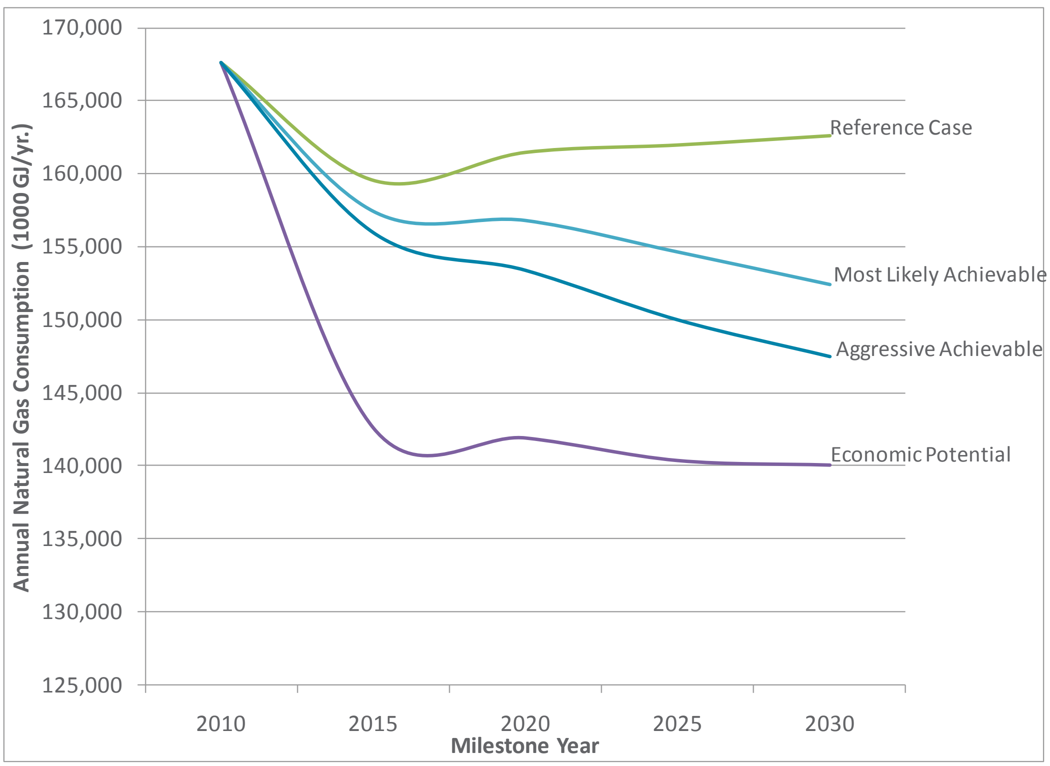

Exhibit 4 Graphic of Achievable Natural Gas Savings for the Total FortisBC Service Area by Scenario, Sector, and Milestone Year (1000 GJ/yr.), 3 Sectors

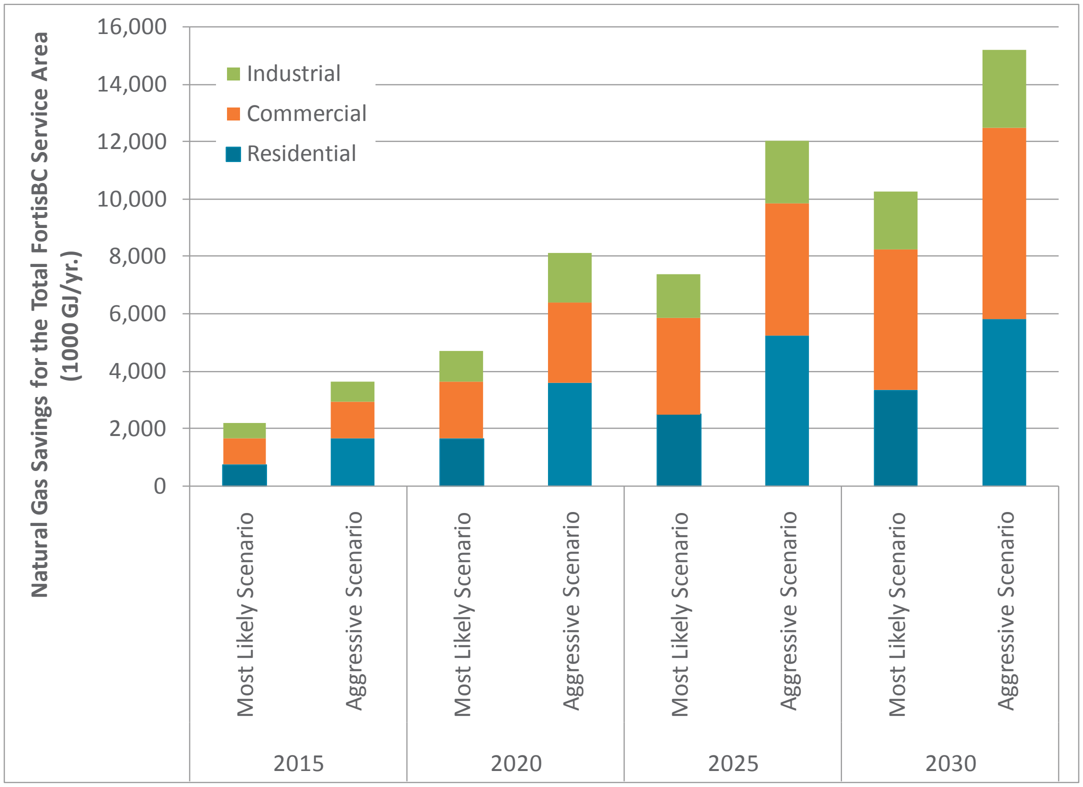

Exhibit 5 Graphic of Achievable Peak Day Capacity Impact by Scenario, Sector, and Milestone Year (GJ)

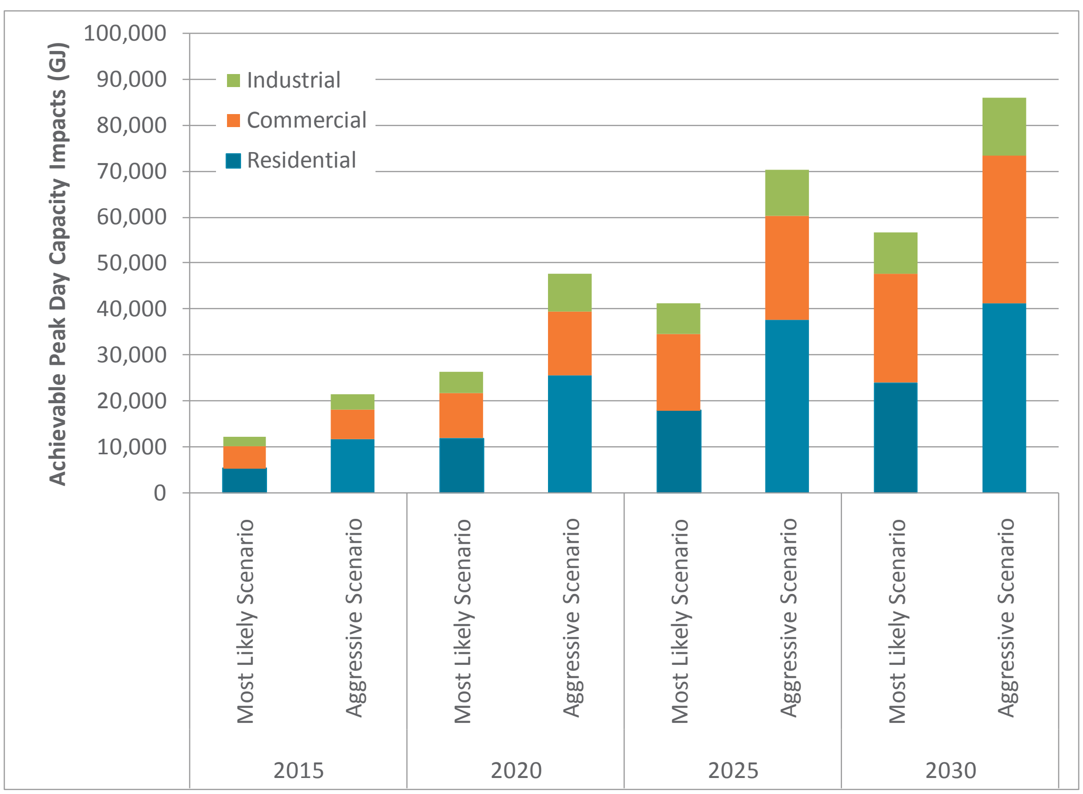

Exhibit 6 Graphic of Achievable Estimated GHG Emission Reductions by Scenario, Sector, and Milestone Year (tonnes CO_2e/yr.)

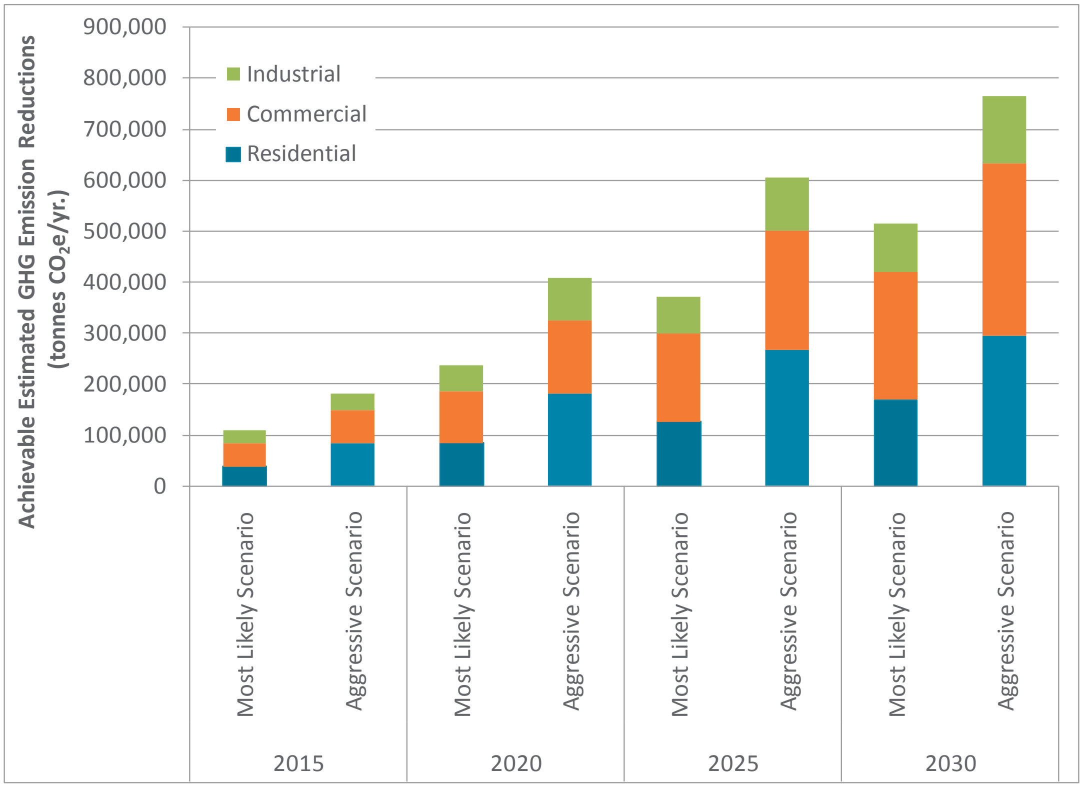


2.2 Key Observations

As was illustrated in the preceding exhibits, despite a decade of successful relatively small-scale DSM program implementation, there remains significant cost-effective DSM potential within FortisBC's service area. This remaining opportunity reflects, in part, how the continued technology cost and performance improvements have increased the availability of energy efficiency options. Key study observations are highlighted below.

Achievable Potential

Relative to the Reference Case forecast for 2030, the Achievable Potential savings range from 10.3 million GJ/yr. in the *most likely* Achievable scenario to approximately 15.2 million GJ/yr. in the *aggressive* scenario, which represent 45% and 67%, respectively, of the Economic Potential savings.

Key Technologies and Measures

In the Residential sector, space heating accounts for nearly 80% of the total energy savings. The largest contributor to these savings is the early retirement of gas furnaces, which accounts for approximately half of the total Achievable Potential savings. The remaining space heating savings are from programmable thermostats, homeowner air sealing, and improved insulation in basements, attics and walls. Fireplaces account for a further 12-13% of total energy savings; these savings are all from upgrading to more efficient fireplaces at the natural rate of replacement or new purchase.

In the Commercial sector, the most significant opportunities are actions that reduce space and water heating loads in existing buildings. Four measures account for approximately two-thirds of the savings. They are, in order of their contribution; O&M measures, advanced building automation systems, recommissioning, high-efficiency boilers, and low-flow plumbing fixtures.

In the Industrial sector, the most significant opportunities involve replacing medium size standard efficiency boilers in the food processing and manufacturing sub sectors with condensing models. For large boilers, such as in pulp mills, and for large process equipment such as cement kilns, lime kilns and coal driers, the most significant opportunities involve upgrading the equipment with better controls and heat recovery equipment. Improving the air heating efficiency of large industrial fabrication workspaces is another significant opportunity.

2.3 Additional Information

The summary of potential natural gas savings presented in this report are based on the detailed data and analysis contained in the CPR 2010 reports listed below. The reader is referred to these reports for additional information.

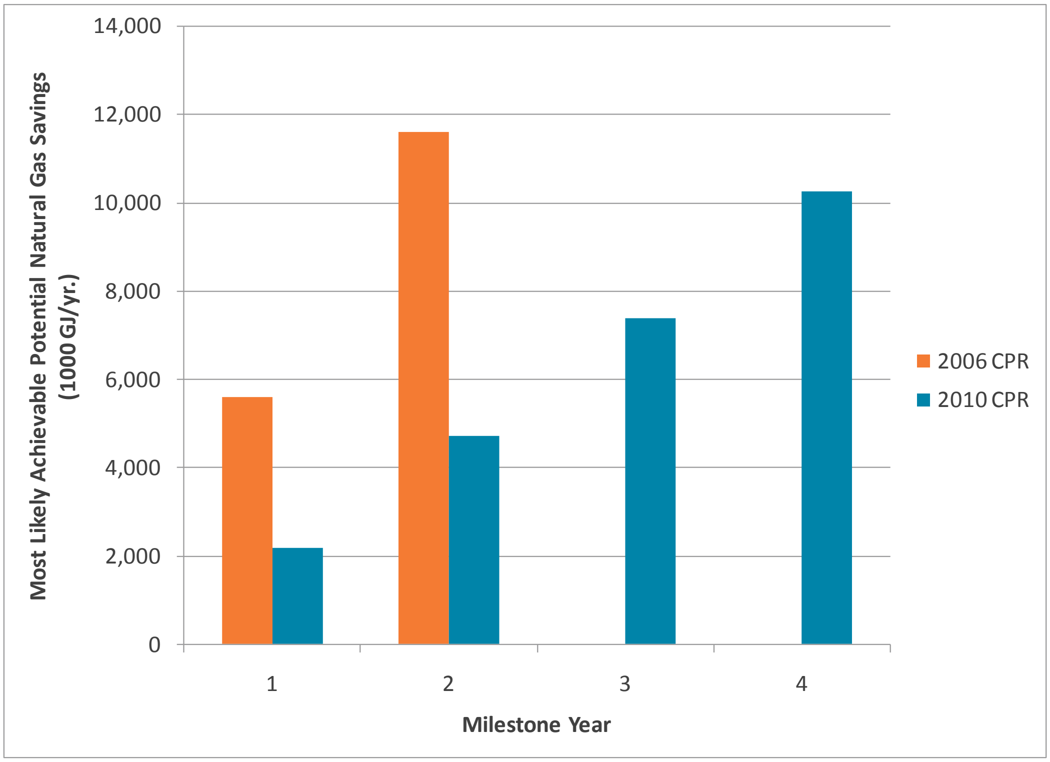
- Conservation Potential Review – 2010 FortisBC; Residential Sector Energy-efficiency, Alternative Energy and Customer Behaviour Opportunities (2010-2030).
- Conservation Potential Review – 2010 FortisBC; Commercial Sector Energy-efficiency and Alternative Energy Opportunities (2010-2030).
- Conservation Potential Review – 2010 FortisBC; Industrial Sector Energy-efficiency and Alternative Energy Opportunities (2010-2030).
- Conservation Potential Review – 2010 FortisBC; Impact of CPR 2010 Natural Gas Savings on the B.C. Economy (2010-2030).

2.3.1 Comparison of 2006 CPR Results to 2010 CPR Results

Both the 2006 and 2010 CPR results are calculated and presented at 5-year intervals, or milestone years. The milestone years in the 2006 CPR were 2011 and 2016; the milestone years in the 2010 are 2015, 2020, 2025, and 2030.

A comparison of the 2006 CPR results and the 2010 CPR results, according to milestone year is provided in Exhibit 7, overleaf.

Exhibit 7 Comparison of Annual Savings at 5-year Milestone Periods, Most Likely Achievable Potential Scenario, 2006 CPR vs 2010 CPR



The most significant contribution to the reduced level of Achievable Potential savings in the 2010 CPR relative to the 2006 CPR is the impact of energy performance standards. More specifically, the Reference Case for the 2010 CPR incorporates the expected natural gas savings from new space and water heating equipment performance standards as well as those due to new residential and commercial construction standards. These standards, which were introduced since the 2006 CPR, provide significant natural gas savings. This means that natural gas savings attributed to the new standards have been removed from the potential FortisBC program induced impacts, thus reducing the overall achievable potential.

In addition to the above market changes, there are some changes in the scope and structure of the 2010 CPR compared to the 2006 CPR:

- In contrast to the 2006 CPR, which excluded FortisBC's (then, Terasen Gas) 300 largest manufacturing accounts, the 2010 CPR includes all of FortisBC's customers, thus increasing the industrial share.

- The 2010 CPR examined only FortisBC customers whereas the 2006 CPR included all B.C. facilities, including non-FortisBC customers. The inclusion of non-FortisBC customers in the 2006 study was to facilitate a fuel choice analysis. However fuel choice was not within the scope of the 2010 CPR and, additionally, the focus on FortisBC customers (only) in the 2010 CPR enabled the study to use recent FortisBC customer market survey information.

- The approach to Commercial and Residential sector segmentation employed in the 2010 CPR differs from that employed in the 2006 CPR. The 2010 CPR includes Medium and Large Apartments in the Commercial sector; the 2006 study included them in the Residential sector. These changes were introduced to better accommodate the scope and objectives of the 2010 CPR.

- Commercial sector building profiles were also changed to incorporate more recent data. The net impact of the updates made to the 2006 CPR commercial sector building profiles for use in the 2010 CPR was an increase in “base load” (non-heating) gas consumption, especially for domestic hot water heating.

3 Residential sector

The Residential sector includes single-family detached/duplex houses, attached/row housing, and mobile/other homes. Multi-storey apartment and strata buildings are included in the Commercial sector.

3.1 Approach

The analysis of the Residential sector employed three modelling platforms:

- **HOT2000,** a commercially-supported, residential building simulation software.
- **RSEEM** (Residential Sector Energy End Use Model), a Marbek in-house spreadsheet based macro model.
- **RETScreen**, a commercially-supported, renewable energy systems modelling tool.

The major steps in the general approach to the study are outlined in Section 1.6 above (Overview of Approach). Specific procedures for the Residential sector were as follows:

- **Modelling of Base Year** – ICF Marbek used the FortisBC customer data to break down the Residential sector using four factors:

  - Type of dwelling (single detached, attached, apartment, etc.)
  - Heating category (natural gas or electric heat)
  - Building age
  - Service area.

  To estimate the natural gas used for space heating, the consultants factored in building characteristics such as insulation levels, floor space and air tightness using a variety of data sources, including the Ontario EnerGuide for Houses database, FortisBC billing data, local climate data and discussions with local contractors. They also used the results of FortisBC customer surveys that provided data on type of heating system, number and age of household appliances, renovation activity, etc. Based on the available data sources, the consultants calculated an average natural gas use by end use for each dwelling type. The consultant's models produced a close match with actual FortisBC sales data.

- **Reference Case Calculations** – For the Residential sector, the consultants developed profiles of new buildings for each type of dwelling. They estimated the growth in building stock using the same data as that contained in FortisBC's most recent load forecast and estimated the amount of natural gas used by both the existing building stock and the projected new buildings and appliances. As with the Base Year calibration, the consultant's projection closely matches FortisBC's own forecast of future natural gas requirements.

- **Assessment of DSM Measures** – To estimate the Economic and Achievable energy savings potentials, the consultants assessed a wide range of commercially available energy-efficiency measures and technologies such as:

  - Thermal upgrades to the walls, roofs and windows of existing buildings
  - More efficient space heating equipment and controls
  - More efficient water heating equipment and measures to reduce usage
  - Improved designs for new buildings.

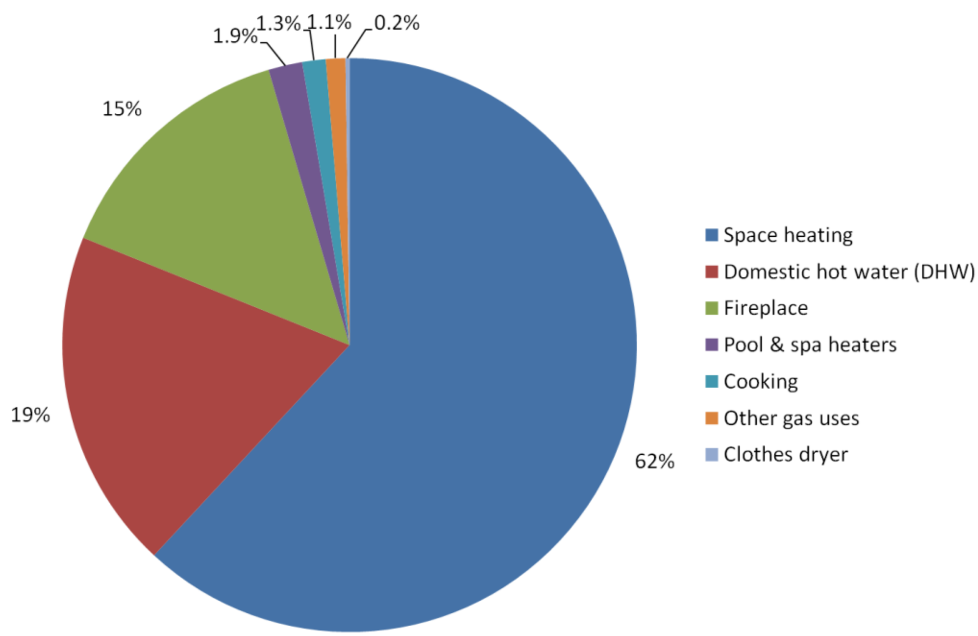
3.2 Base Year Natural Gas Use[2]

In the Base Year of 2010, FortisBC's Residential sector customers consumed approximately 74.4 million GJ of natural gas. Exhibit 8 and Exhibit 9 provide additional details on natural gas consumption by major end use and sub sector, respectively.

Exhibit 8 shows that space heating accounts for approximately 62% of the total residential natural gas use. Domestic hot water (DHW) is the next largest residential end use, accounting for approximately 19% of total residential natural gas use, followed by fireplaces (15%). Cooking, swimming pool heaters, clothes dryers, and other gas uses, combined, account for about 4% of residential natural gas use. The "Other gas uses" end use includes a variety of residential uses such as gas barbecues, outdoor fireplaces, garage or patio heaters, and outdoor lights.

Exhibit 9 shows that single-family dwellings (SFD) and duplexes account for about 92% of residential natural gas consumption followed by attached/row houses at 6%. Mobile/other dwellings account for the remaining 2% of residential natural gas use.

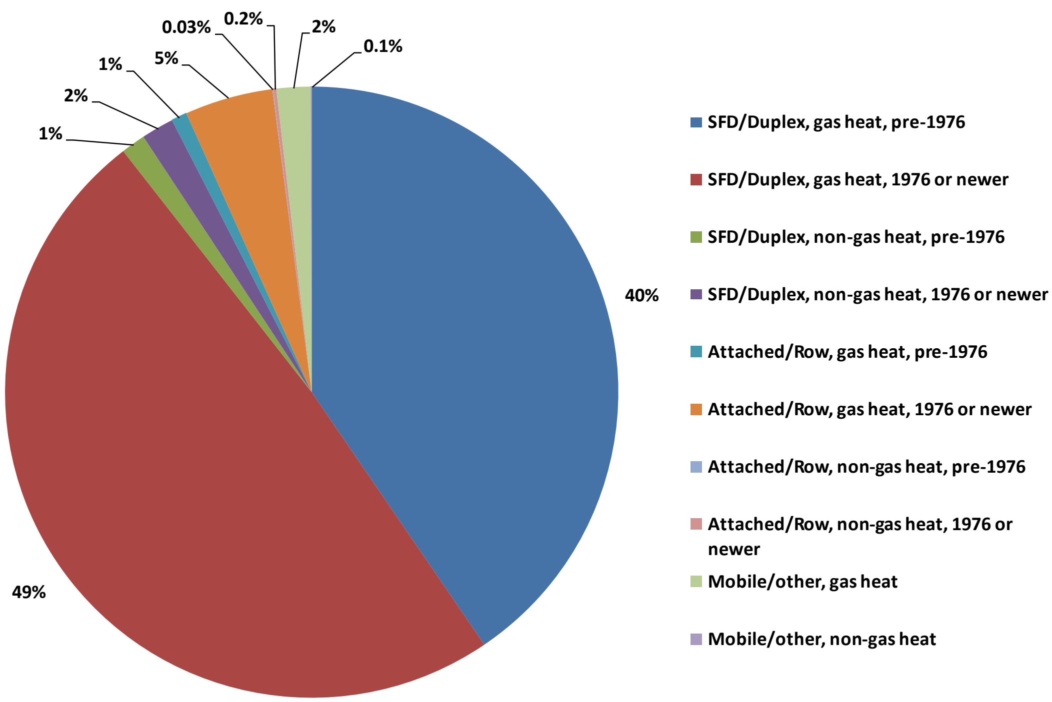
Exhibit 8 Base Year Residential Natural Gas Consumption for the Total FortisBC Service Area by End Use



[2] Readers attempting to compare these results with the CPR study completed for FortisBC (then Terasen Gas) in 2006 should be aware of two key difference between this study and the earlier one:

- The 2006 CPR was intended to complement a CPR completed for BC Hydro and therefore included all Residential sector customers of both utilities. This current study includes only those dwellings that have natural gas accounts with FortisBC.
- The 2006 CPR included high-rise multi-family buildings in the Residential sector, again for compatibility with the BC Hydro study. This study includes them in the Commercial sector, to be consistent with FortisBC's customer rate classes.

Exhibit 9 Base Year Residential Natural Gas Consumption for the Total FortisBC Service Area by Sub Sector



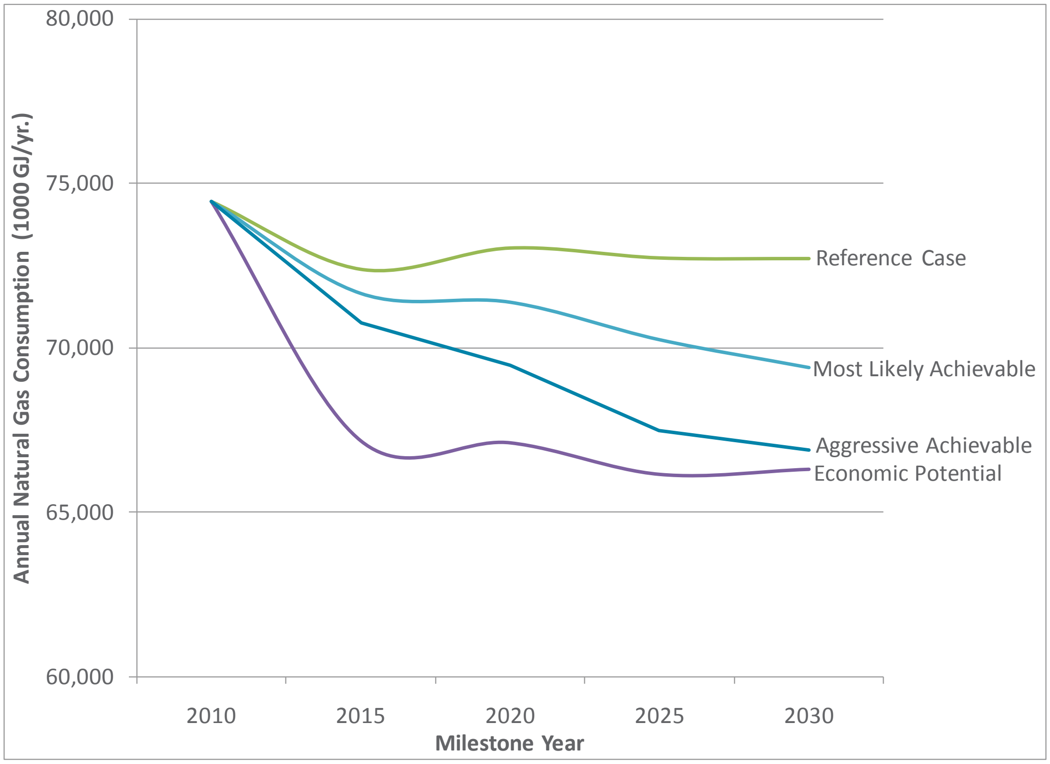
3.3 Results and Findings

A summary of the levels of annual natural gas consumption contained in the Reference Case and each of the energy-efficiency forecasts by milestone year is presented in Exhibit 10 and Exhibit 11 and discussed briefly in the paragraphs below.

Exhibit 10 Summary of Forecast Results for the Total FortisBC Service Area, Annual Natural Gas Consumption and Savings by Milestone Year and Forecast Scenario, Residential Sector

Milestone Year	Annual Consumption, Residential sector (1000 GJ/yr.)				Potential Annual Savings, Residential sector (1000 GJ/yr.)		
	Reference Case	Economic Potential	Achievable Potential		Economic Potential	Achievable Potential	
			Most Likely	Aggressive		Most Likely	Aggressive
	(A)	(B)	(C)	(D)	(A-B)	(A-C)	(A-D)
2010	74,440						
2015	72,382	67,173	71,638	70,742	5,209	744	1,640
2020	73,027	67,110	71,369	69,453	5,917	1,658	3,574
2025	72,726	66,152	70,226	67,474	6,574	2,500	5,252
2030	72,707	66,306	69,378	66,871	6,401	3,329	5,836

Exhibit 11 Graphic of Forecast Results for the Total FortisBC Service Area, Annual Natural Gas Consumption and Savings by Milestone Year and Forecast Scenario, Residential Sector



Reference Case

In the absence of continued DSM initiatives, the study estimates that natural gas consumption in the Residential sector will decline from the Base Year (2010) consumption of approximately 74.4 million GJ/yr. to 73.0 million GJ/yr. by 2020 and 72.7 million GJ/yr. by 2030. This represents an overall decrease of about 2% in the period. Gas consumption per customer is expected to decline over the study period, partly because of the natural replacement of furnaces and water heaters with more efficient models, as required by new mandatory minimum efficiency standards, and partly because of new minimum performance standards for the construction of new homes. The decline in consumption per customer is expected to more than compensate for the increasing number of customers over the period, so that the overall residential gas consumption will decline.

Economic Potential Forecast

Under the conditions of the Economic Potential Forecast, the study estimated that consumption in the Residential sector would decline to about 66.3 million GJ/yr. by 2030. Annual savings relative to the Reference Case are about 6.4 million GJ/yr. or about 9%. The Economic Potential annual savings are about 5.9 million GJ/yr. in 2020.

Achievable Potential – Energy-efficiency Scenario

A selection of the natural gas savings opportunities identified in the Economic Potential Forecast were discussed in a full-day workshop. The guided participant discussions provided estimated levels of participation under a *most likely* scenario of program activity and an *aggressive* scenario of program activity. These levels were applied to the Economic Potential savings to estimate the Achievable Potential for these two scenarios. For technologies not specifically discussed in the workshops, participation levels were estimated through extrapolation from the technologies that were discussed. The results are presented in Exhibit 12 and Exhibit 13 by action and by milestone year.

Exhibit 12 Most Likely Achievable Natural Gas Savings for the Total FortisBC Service Area by Technology and Milestone Year (1000 GJ/yr.), Residential Sector[3]

End Use	Measure	2015	2020	2025	2030	% Savings 2030 Relative to Total 2030 Savings	Average B/C Ratio
Domestic hot water	DHW pipe insulation	11	18	20	20	1%	17.1
Domestic hot water	Showerheads	35	49	47	38	1%	9.5
Space heating	Prog. thermostats	198	292	303	256	8%	7.1
Domestic hot water	faucet aerators	21	29	28	22	1%	5.0
Fireplace	Gas fireplaces	23	111	336	391	12%	3.5
Pool & spa heaters	Solar pool heaters	12	50	116	210	6%	1.2
Space heating	Wall insulation	8	24	46	74	2%	1.2
Domestic hot water	DHW tank insulation	2	4	5	5	0%	1.2
Space heating	Attic insulation	44	85	123	159	5%	1.2

[3] Early retirement of gas furnaces is included in Exhibit 12 and Exhibit 13 at the request of FortisBC. This is because, although the measure is not considered cost effective when viewed through conventional DSM screens (it does not pass the TRC test as applied in this study), fully 76% of FortisBC's customers (or 91% of those who heat with gas furnaces) have standard- and mid-efficiency furnaces. It is the desire of FortisBC to offer its customers a program to encourage these customers to replace their standard- and mid-efficiency furnaces at or before the end of equipment life with high-efficiency furnaces. Thus, FortisBC wanted to discover through this study the impacts of such a program on the savings available from the Residential sector.

Peak Day Load Impacts – Energy-efficiency Scenarios

The peak day savings associated with each of the Achievable energy-efficiency scenarios were calculated using load factor data provided by FortisBC. The results are summarized in Exhibit 14 and Exhibit 15. As illustrated, the Achievable peak day savings in 2030 range from a decrease of about 34,000 GJ/day (*most likely* scenario) to a decrease of approximately 59,000 GJ/day (*aggressive* scenario) for the total FortisBC service region.

Exhibit 14 Most Likely Achievable Peak Day Capacity Impacts by Service Region and Milestone Year (GJ), Residential Sector

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total

Electricity Impacts

The natural gas savings associated with the Economic Potential scenario shown in Exhibit 10 would also result in collateral electricity savings as some efficiency measures affect both energy sources. The study estimated that in 2030 the natural gas efficiency measures contained in the Economic Potential scenario would result in additional electrical savings of 24 GWh/yr.

Greenhouse Gas Impacts – Energy-efficiency Scenarios

The natural gas savings associated with each of the Achievable energy-efficiency scenarios shown in Exhibit 12 and Exhibit 13 would result in significant greenhouse gas reductions. The study estimated that in 2030 the natural gas efficiency measures contained in the *aggressive* and *most likely* Achievable Potential scenarios would reduce GHG emissions by 296,000 and 169,000 of CO_2e/yr., respectively. Further details are provided in Exhibit 16 and Exhibit 17. The electricity savings associated with the natural gas efficiency measures would also result in additional GHG reductions, which have not been included in this calculation.

Exhibit 16 Most Likely Achievable Estimated GHG Emission Reductions by Scenario and Milestone Year (tonnes CO_2e/yr.), Residential Sector

Achievable Potential - Customer Behaviour

The study also assessed potential from customer behaviours changes. Exhibit 18 presents a summary of the results for both the *aggressive* and *most likely* achievable potential scenarios.

It should be noted that there is significant potential overlap with the reported savings from energy efficiency technologies. Consequently, the behaviour savings shown in Exhibit 18 have not been added to those for the energy efficiency technologies.

Exhibit 18 Achievable Potential from Customer Behaviour Changes, Aggressive and Most Likely Achievable Natural Gas Savings, by Milestone Year (1000 GJ/yr.)

Achievable Scenario	Energy Impact (1000 GJ/yr.)			
	2015	2020	2025	2030
Most Likely	383	975	1,727	2,649
Aggressive	199	518	930	1,439

3.4 Summary of Findings

The study findings confirm the existence of potential cost-effective natural gas efficiency improvements in British Columbia's Residential sector, but highlight the increasing challenges in finding opportunities. In the *most likely* and *aggressive* Achievable scenarios energy-efficiency improvements would provide between 3,329,000 and 5,836,000 GJ/yr. of savings in 2030 as well as peak day load reductions of approximately 34,000 to 59,000 GJ.

These potential savings are smaller than those found in previous studies, both because of the success of previous program initiatives on the part of FortisBC and other utilities, and because of new standards for furnaces, water heaters, and new home construction. Consequently, there is a need to look beyond the "easy" and the "conventional" to more innovative approaches to seeking continued energy-efficiency and GHG reduction opportunities.

As an example of one possible approach, this study explored the potential offered by early retirement of gas furnaces. This measure was included in the Achievable Potential at the request of FortisBC. This is because although the measure is not considered cost effective when viewed through conventional DSM screens (it does not pass the measure TRC test as applied in this study), fully 76% of FortisBC's customers (or 91% of those who heat with gas furnaces) have standard and mid-efficiency furnaces. It is the desire of FortisBC to offer its customers a program to encourage these customers to replace their standard and mid-efficiency furnaces before the end of equipment life with high-efficiency furnaces.

Partly because of the inclusion of the furnace early retirement measure, space heating accounts for nearly 80% of the total energy savings in the two Achievable Potential scenarios. The largest contributor to these savings is the early retirement of gas furnaces, which accounts for approximately half of the total Achievable Potential savings. Improvements in gas fireplace efficiency offer 12-13% of the total energy savings in the two Achievable Potential scenarios, swimming pool heater efficiency offers 6%, and water heating efficiency offers 3% of the savings.

4 Commercial Sector

The Commercial sector includes office and retail buildings, hotels and motels, restaurants, high-rise and mid-rise apartments, warehouses and a variety of small buildings. In this study, it also includes buildings that are often classified as "institutional," such as hospitals and nursing homes, schools and universities.

Throughout this report, use of the word "commercial" includes both commercial and institutional buildings, unless otherwise noted.

4.1 Approach

The detailed end-use analysis of energy-efficiency opportunities in the Commercial sector employed two linked modelling platforms: **CEEAM** (Commercial Energy and Emissions Analysis Model), an ICF Marbek in-house simulation model developed in conjunction with Natural Resources Canada (NRCan) for modelling natural gas use in commercial/institutional building stock, and **CSEEM** (Commercial sector Energy End-use Model), an in-house spreadsheet-based macro model.

The major steps in the general approach to the study were outlined in Section 1.6. Specific procedures for the Commercial sector were as follows:

- **Modelling of Base Year** – ICF Marbek compiled data that defines "where" and "how" natural gas is currently used in existing commercial buildings. The consultants then created building energy-use simulations for each type of commercial building and calibrated the models to reflect actual FortisBC customer sales data. Estimated savings for the Other Commercial Buildings category were derived from the results of the modelled segments. They did not directly model that category because it is extremely diverse and the natural gas use of individual facility types is relatively small. The consultant's model produced a close match with actual FortisBC sales data.

- **Reference Case Calculations** – For the Commercial sector, ICF Marbek developed detailed profiles of new buildings in each of the building segments, estimated the growth in building stock and estimated "natural" changes affecting natural gas consumption over the study period. As with the Base Year calibration, the consultant's projection closely matches the FortisBC 2010 forecast of future natural gas requirements.

- **Assessment of DSM Measures** – To estimate the Economic and Achievable natural gas savings potentials, the consultants assessed a wide range of commercially available DSM measures and technologies such as:

  - Measures to improve building envelope efficiency
  - Measures to reduce domestic hot water use, including solar hot water systems
  - Upgraded heating and ventilating systems
  - Improved construction in new buildings
  - Efficient cooking appliances.

4.2 Base Year Natural Gas Use

In the Base Year of 2010, FortisBC's Commercial sector customers consumed approximately 57 million GJ. Exhibit 19 and Exhibit 20 provide additional details on natural gas consumption by major end use and sub sector, respectively.

Exhibit 19 shows that space heating accounts for approximately 59% of the total Commercial sector natural gas use. Domestic hot water heating is the next largest end use, accounting for approximately 25% of total commercial natural gas use, followed by commercial cooking (15%). Other end uses such as dehumidification, steam system distribution losses, laundry equipment, and pool heating account for about 7% of commercial natural gas use.

Exhibit 20 shows that Small Commercial buildings account for about 30% of natural gas consumption followed by Large and Medium Apartments, (approximately 25% combined). No other sub sector accounts for more than 10% of Commercial sector natural gas use.

Exhibit 19 Base Year Commercial Natural Gas Consumption for the Total FortisBC Service Area by End Use

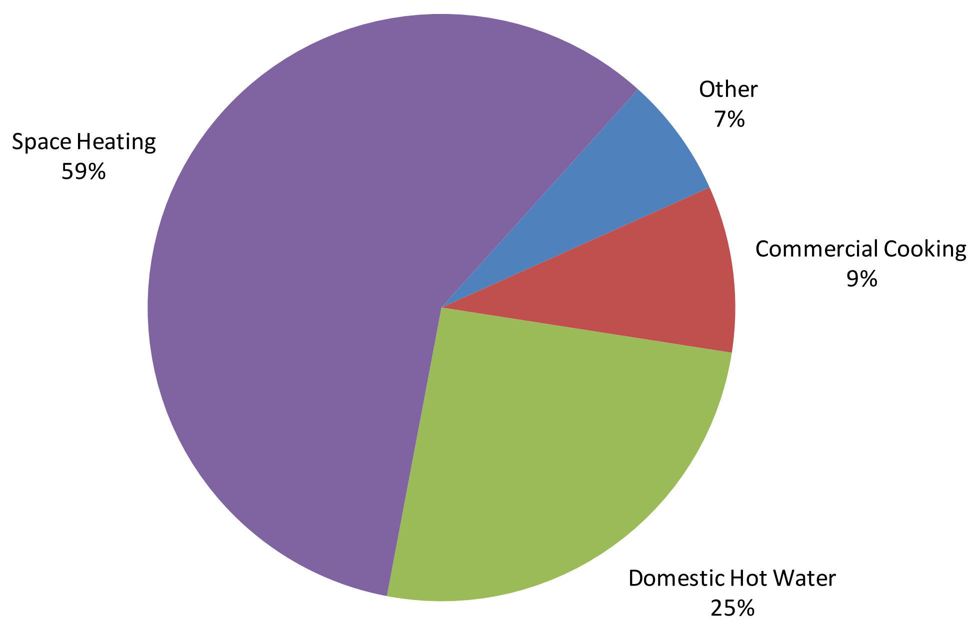

Exhibit 20 Base Year Commercial Natural Gas Consumption for the Total FortisBC Service Area by Sub Sector

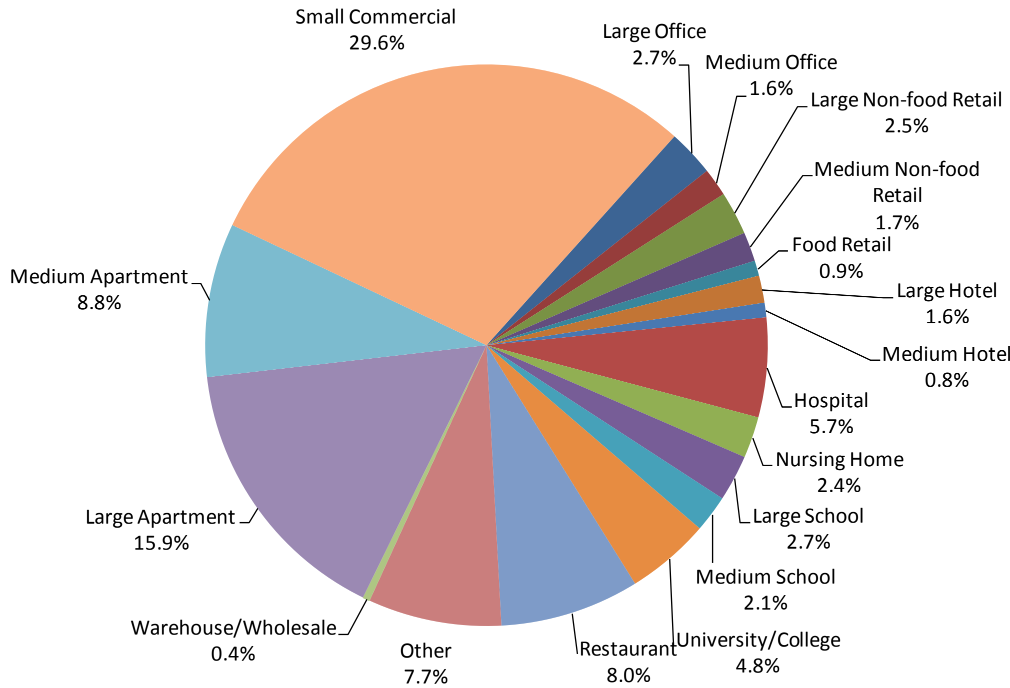


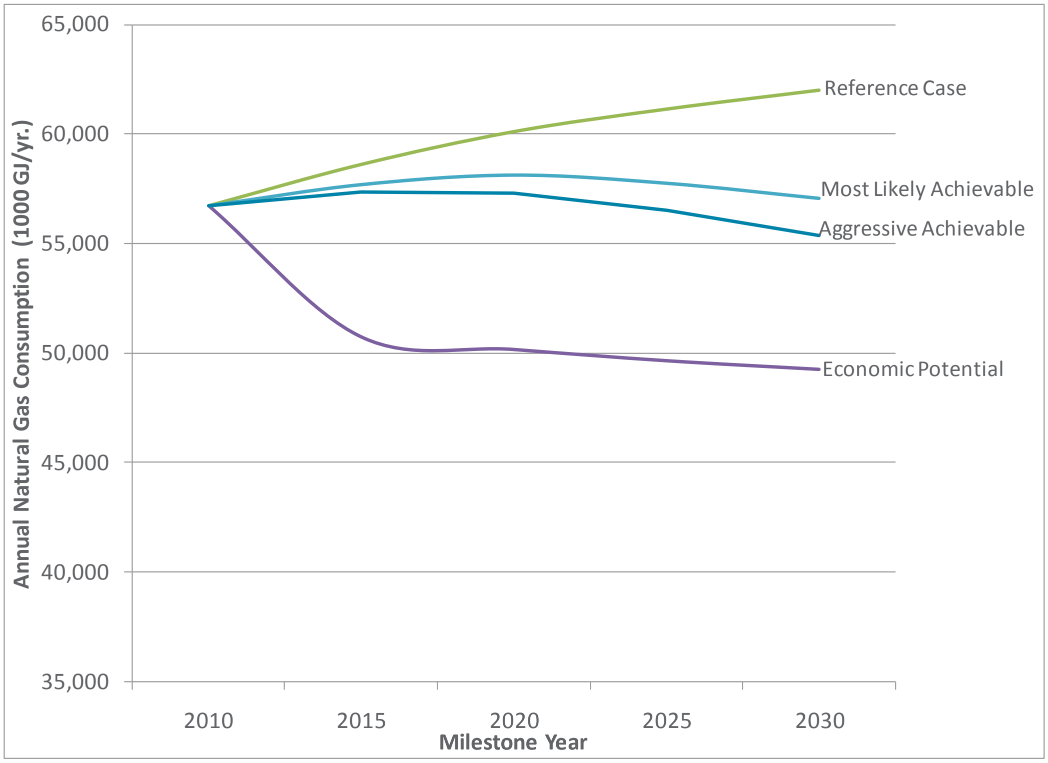
4.3 Results and Findings

A summary of the levels of annual natural gas consumption contained in the Reference Case and each of the energy-efficiency forecasts by milestone year is presented in Exhibit 21 and Exhibit 22 and discussed briefly in the paragraphs below.

Exhibit 21 Summary of Forecast Results for the Total FortisBC Service Area, Annual Natural Gas Consumption and Savings by Milestone Year and Forecast Scenario, Commercial Sector

Milestone Year	Annual Consumption, Commercial sector (1000 GJ/yr.)				Potential Annual Savings, Commercial sector (1000 GJ/yr.)		
	Reference Case	Economic Potential	Achievable Potential		Economic Potential	Achievable Potential	
			Most Likely	Aggressive		Most Likely	Aggressive
	(A)	(B)	(C)	(D)	(A-B)	(A-C)	(A-D)
2010	56,730						
2015	58,607	50,714	57,676	57,332	7,893	930	1,275
2020	60,095	50,137	58,104	57,286	9,958	1,991	2,809
2025	61,118	49,622	57,739	56,498	11,496	3,379	4,619
2030	61,977	49,225	57,062	55,344	12,752	4,915	6,633

Exhibit 22 Graphic of Forecast Results for the Total FortisBC Service Area Annual Natural Gas Consumption and Savings by Milestone Year and Forecast Scenario, Commercial Sector



Reference Case

In the absence of continued DSM initiatives, the study estimates that natural gas consumption in the Commercial sector will increase from the Base Year (2010) consumption of approximately 56.7 million GJ/yr. to 60.1 million GJ/yr. by 2020 and 62.0 million GJ/yr. by 2030. This represents an overall increase of about 9% in the period.

Economic Potential Forecast

Under the conditions of the Economic Potential Forecast, the study estimated that consumption in the Commercial sector would decline to about 49.2 million GJ/yr. by 2030. Annual savings relative to the Reference Case are about 12.8 million GJ/yr. or about 22%. The Economic Potential annual savings are about 10 million GJ/yr. in 2020.

Achievable Potential – Energy-efficiency Scenario

A selection of the natural gas savings opportunities identified in the Economic Potential Forecast was discussed in a full-day workshop. The guided participant discussions provided estimated levels of participation under a *most likely* scenario of program activity and an *aggressive* scenario of program activity. These levels were applied to the Economic Potential savings to estimate the Achievable Potential for these two scenarios. For technologies not specifically discussed in the workshops, participation levels were estimated through extrapolation from the technologies that were discussed. Results by sub sector and end use are presented in Exhibit 23 and Exhibit 24 for both Achievable scenarios.

Peak Day Load Impacts – Energy-efficiency Scenarios

The peak day savings associated with each of the Achievable energy-efficiency scenarios were calculated using load factor data provided by FortisBC. The results are summarized in Exhibit 25 and Exhibit 26. As illustrated, the Achievable peak day savings in 2030 range from a decrease of about 38,000 GJ in the *most likely* Achievable scenario to a decrease of approximately 51,000 GJ in the *aggressive* Scenario for the total FortisBC service region.

4.4 Summary of Findings

The study findings confirm the existence of significant potential cost-effective natural gas efficiency improvements in British Columbia's Commercial sector. In the *most likely* and *aggressive* Achievable scenarios those energy-efficiency improvements would provide between 4,915,000 and 6,633,000 GJ/yr. of savings in 2030 as well as peak day load reductions of approximately 38,000 to 51,000 GJ. Savings are primarily associated with the space heating and water heating end uses, with approximately two-thirds of the savings in both Achievable scenarios associated with space heating measures.

Four measures each account for more than 10% of the savings in both the *most likely* and *aggressive* Achievable scenarios. These are, in order of their contribution: O&M measures, advanced building automation systems/recommissioning, high-efficiency boilers, and low-flow plumbing fixtures. These four measures represent a total of 69% of the *most likely* Achievable scenario savings and 65% of the *aggressive* Achievable scenario savings.

5 Industrial Sector

The Industrial sector consists of the eight largest natural gas consuming Industrial sub sectors within the FortisBC service area, an additional category (Other) that combines the remaining smaller industry groups, and the agriculture sub sector. The largest natural gas consuming Industrial sub sectors within the FortisBC service area, which are the primary focus of this study, are: Chemical, Fabricated Metal, Food & Beverage, Mining, Miscellaneous Manufacturing, Non-Metal Manufacturing, Pulp & Paper, and Wood Products.

This study includes analysis of the interruptible natural gas loads for large customers and the savings measures associated with their process requirements. As a result the Mining and Pulp and Paper sub sectors have been added for the 2010 review, compared to those sub sectors previously studied in the 2006 CPR.

5.1 Approach

The analysis of the Industrial sector employed a customized spreadsheet model. The model applies appropriate end-use technologies to each sub sector in each service area. The input energy-use information and equipment efficiencies are organized by service area, major sub sector, major end use, and technology.

The major steps in the general approach to the study were outlined in Section 1.6. Specific procedures for the Industrial sector were as follows:

- **Modelling of Base Year** – The consultants compiled data that defines "where" and "how" natural gas is currently used in industry. The primary input variables affecting the consumption of natural gas, based on industrial process, are:
  - Type and efficiency of specific major processing equipment
  - Energy consumption and operating hours for heating equipment
  - Economic activity levels within each sub sector (useful heat requirement)
  - Production processes employed.

- The average natural gas consumption for June through August provided the basis for the annual process heat load for the industries, with process consumption not affected by climate.

- **Reference Case Calculations** – The energy-use changes that would occur without utility programs are in the Reference Case. A constant rate of improvement was applied for each technology that reflects the natural rate of equipment replacement and upgrades seen in B.C.'s Industrial sector. The natural gas sales were calculated for each sub sector and service area along with the useful heat based on the conversion efficiencies of technologies for both comfort and process heating.

- **Assessment of DSM Measures** – To estimate the Economic and Achievable natural gas savings potentials, the consultants assessed a wide range of commercially available DSM measures and technologies such as:
  - Controls and high-efficiency burners (bundled standard upgrades)
  - Heat recovery (off of boiler)
  - Insulation – equipment and distribution systems
  - Heat recovery (off of process)
  - Optimized heat balance and control
  - Steam trap maintenance.

5.2 Base Year Natural Gas Use

In the Base Year of 2010, FortisBC's Industrial sector customers consumed approximately 36,456,000 GJ. Exhibit 29 and Exhibit 30 provide additional details of the Industrial sector natural gas consumption by major end uses and sub sector, respectively.

Exhibit 29 shows that boilers account for approximately 43% of the total industrial natural gas use. Most of the boiler load involves process steam use. Furnaces for air heating large industrial areas account for about 12% of the industrial consumption and another 12% is used in kilns at pulp and paper sites, and for manufacturing lime for the Kraft pulping process. The remaining natural gas is used in a variety of industrial processes, including lumber kilns, coal driers, and cement kilns.

Exhibit 30 indicates the distribution among the sub sectors. The Pulp and Paper sector dominates at 32%, followed by Agriculture, Food & Beverage at 12% each, Chemical at 10%, Wood Products at 9%, Mining at 8%, and Fabricated Metal at 6%.

Exhibit 29 Base Year Industrial Natural Gas Consumption for the Total FortisBC Service Area by End Use

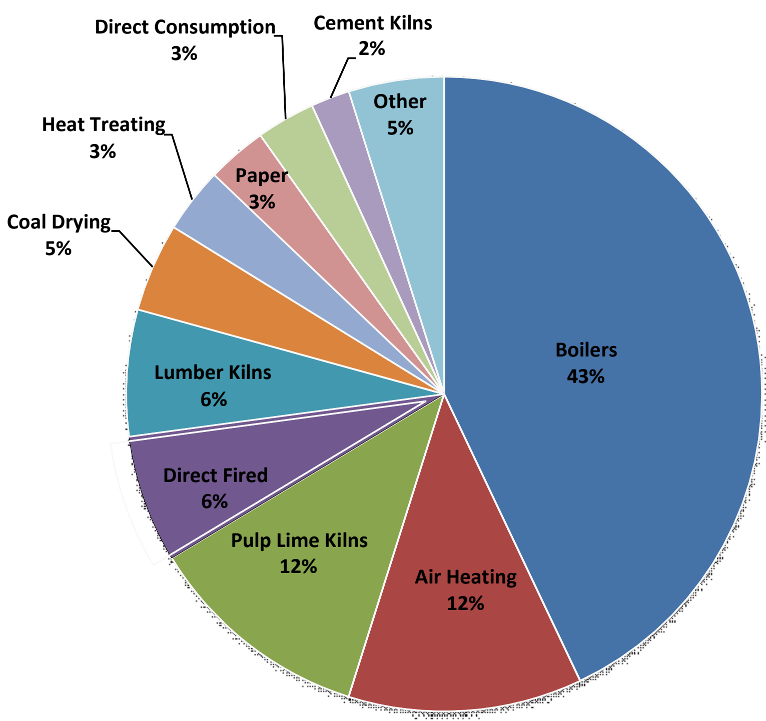

Exhibit 30 Base Year Industrial Natural Gas Consumption for the Total FortisBC Service Area by Sub Sector

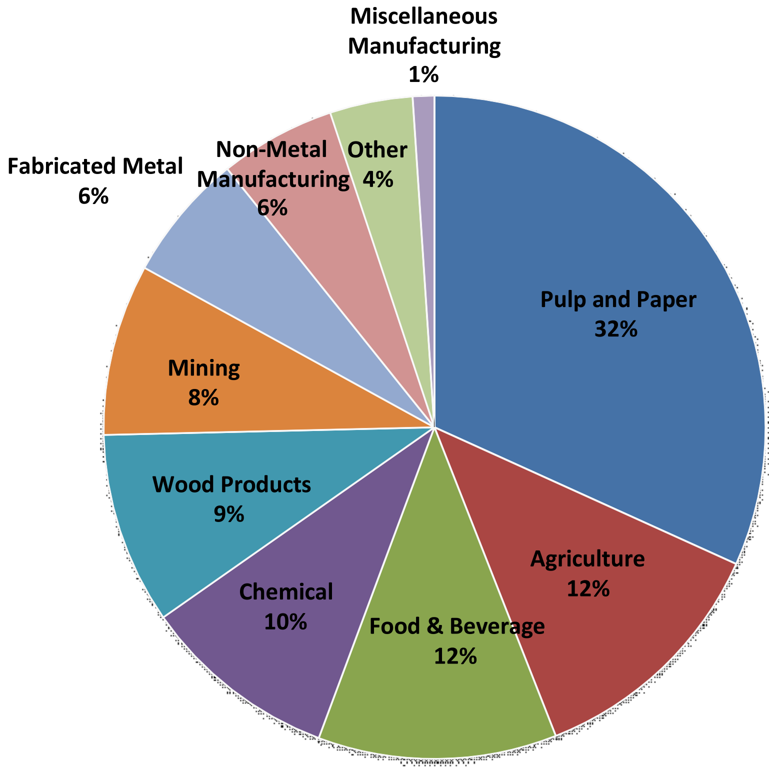


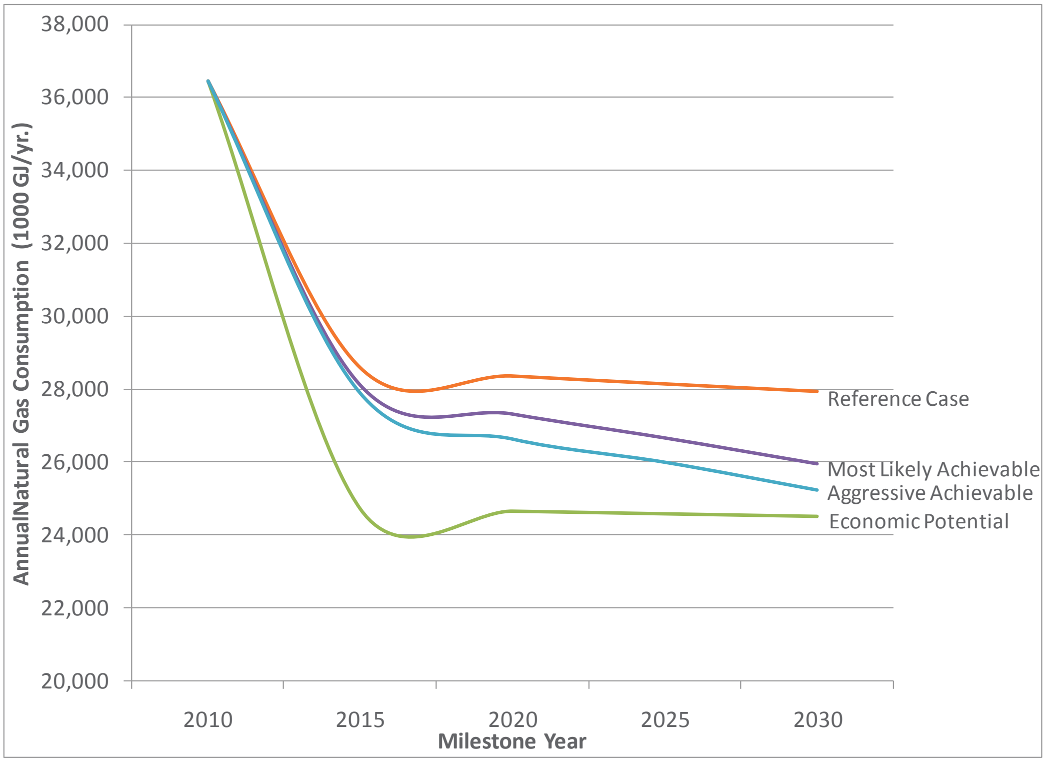
5.3 Results and Findings

A summary of the levels of annual natural gas consumption contained in the Reference Case and each of the energy-efficiency forecasts by milestone year is presented in Exhibit 31 and Exhibit 32 and discussed briefly in the paragraphs below.

Exhibit 31 Summary of Forecast Results for the Total FortisBC Service Area, Annual Natural Gas Consumption and Savings by Milestone Year and Forecast Scenario, Industrial Sector

Milestone Year	Annual Consumption, Industrial sector (1000 GJ/yr.)				Potential Annual Savings, Industrial sector (1000 GJ/yr.)		
	Reference Case	Economic Potential	Achievable Potential		Economic Potential	Achievable Potential	
			Most Likely	Aggressive		Most Likely	Aggressive
	(A)	(B)	(C)	(D)	(A-B)	(A-C)	(A-D)
2010	36,456						
2015	28,594	24,710	28,095	27,880	3,884	499	714
2020	28,367	24,648	27,302	26,621	3,719	1,065	1,746
2025	28,151	24,576	26,646	25,985	3,575	1,505	2,166
2030	27,946	24,506	25,936	25,221	3,440	2,010	2,725

Exhibit 32 Graphic of Forecast Results for the Total FortisBC Service Area Annual Natural Gas Consumption and Savings by Milestone Year and Forecast Scenario, Industrial Sector



Reference Case

In the absence of continued DSM initiatives, the study estimates that natural gas consumption in the Industrial sector will decline from the base year (2010) consumption of approximately 36.5 million GJ/yr. to 28.4 million GJ/yr. by 2020 and 27.9 million GJ/yr. by 2030. This represents an overall decrease of about 23% in the period. The forecast decrease is due to an expected continued decline in the wood products and pulp and paper industry as well as a continuation of the move to wood waste from natural gas. The move to wood waste will be mainly due to the provincial government policy of encouraging a reduction of GHG emissions.

Economic Potential Forecast

Under the conditions of the Economic Potential Forecast, the study estimated that consumption in the Industrial sector would decline to about 24,506,000 GJ/yr. by 2030. Annual savings relative to the Reference Case are about 3,439,000 GJ/yr. or about 12%. The Economic Potential is obtained relatively quickly due to the analysis indicating that, from a strictly economic perspective, most of the inefficient equipment could be replaced by more efficient alternatives within the next five years.

Achievable Potential – Energy-efficiency Scenario

A selection of the natural gas savings opportunities identified in the Economic Potential Forecast were discussed in a full-day workshop. The guided participant discussions provided estimated levels of participation under a *most likely* scenario of program activity and an *aggressive* scenario of program activity. These levels were applied to the Economic Potential savings to estimate the Achievable Potential for these two scenarios. For technologies not specifically discussed in the workshops, participation levels were estimated through extrapolation from the technologies that were discussed. The results are presented in Exhibit 33 and Exhibit 34 by technology and by milestone year for the *most likely* and *aggressive* Achievable Potential scenarios, respectively.

Exhibit 33 Most Likely Achievable Natural Gas Savings for the Total FortisBC Service Area by End Use and Milestone Year (GJ/yr.), Industrial Sector

End Use	2015	2020	2025	2030	% Savings 2030 Relative to Ref Case	% Savings 2030 Relative to Total 2030 Savings

Peak Day Load Impacts – Energy-efficiency Scenarios

The peak day savings associated with each of the Achievable energy-efficiency scenarios were calculated using load factor data provided by FortisBC. The results are summarized in Exhibit 35 and Exhibit 36. As illustrated, the Achievable peak day savings in 2030 range from a decrease of 16,990 GJ in the *most likely* Achievable scenario to a decrease of 23,080 GJ/day in the *aggressive* scenario for the total FortisBC service region.

Exhibit 35 Most Likely Achievable Peak Day Capacity Impacts by Service Region and Milestone Year (GJ), Industrial Sector

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Grand Total
2015	2,197	936	971	110	4,213
2020	4,633	1,936	2,150	227	8,973
2025	6,749	2,978	2,659	328	12,715
2030	9,055	4,064	3,462	409	16,990

Savings 2030 Relative to Total 2030 Savings	54%	25%	19%	2%	100%

Greenhouse Gas Impacts – Energy-efficiency Scenarios

The natural gas savings associated with each of the Achievable Potential scenarios would also result in a reduction of GHG emissions.[4] As illustrated in Exhibit 37 and Exhibit 38, by 2030 the GHG reductions are estimated to be in the range of 96,000 to 130,000 tonnes CO_2e per year, depending on the scenario.

[4] GHG impacts are estimated based on an emissions factor of 48kg of CO_2e/GJ of natural gas. This is the B.C. Natural Gas Emission Factor.

Savings 2030 Relative to Total 2030 Savings	50%	27%	20%	3%	100%

5.4 Summary of Findings

The study findings indicated that even with a declining load there are significant potential cost-effective natural gas efficiency improvements in the Industrial sector. This potential is due to the existence of older inefficient boilers, lumber kilns, lime kilns, and a variety of other industrial process equipment that could be economically replaced. It would be cost effective for this replacement to occur by 2015, but due to other market barriers, it is estimated that in the *most likely* scenario and *aggressive* scenario it will take until 2030 to obtain the savings.

The major market barriers constraining faster market penetration include:

- Higher capital cost of efficient product(s)
- Need to recover investment costs in a short period (payback)
- Lack of product performance information
- Lack of available product.

In the *most likely* and *aggressive* Achievable scenarios these energy-efficiency improvements would provide between 2,010,000 and 2,725,000 GJ/yr. of savings in 2030 as well as peak day load reductions of approximately 16,990 to 23,080 GJ.

A variety of efficient boiler technologies accounts for nearly 57% of the total energy savings in the two Achievable Potential scenarios. The major opportunity involves replacing standard efficiency boilers in the 68% to 80% efficiency range with condensing boilers in the plus 90% efficiency range. This opportunity is mainly applicable to medium size boilers in the food processing and manufacturing sectors.

For large boilers, such as in pulp mills, and for large process equipment such as cement kilns, lime kilns and coal driers, the *most likely* opportunities will involve upgrading the equipment with better controls or heat recovery equipment rather than replacing the complete unit.

Another significant energy saving opportunity is improving the air heating efficiency of large industrial fabrication work spaces. Generally, these spaces are now heated with unit heaters. In some cases, inefficient unit heaters could be replaced by more efficient unit heaters but a larger opportunity is with replacing the unit heaters with gas radiant heaters.

6 Economic Impacts

6.1 Introduction

In addition to energy savings, FortisBC's investment in DSM programs can have broad impacts on the provincial economy as measured through metrics such as employment, GDP, and industrial output. Impacts arise from short term investment activities, such as building retrofits, and longer term changes in household/business spending, which can be attributed to the persistence of energy savings.

This analysis uses the results from the FortisBC Conservation Potential Review (CPR) Update 2010 to provide an estimate of the net macroeconomic impacts expected from implementing the *most likely* and *aggressive* Achievable Potential scenarios outlined in each of the main sector reports.

Three sets of economic impacts are reported in this analysis:

- Changes in output (total industry revenues)
- Changes in GDP at factor cost (total value added at producers' prices, or total output minus costs of production)
- Changes in employment (number of jobs).[5]

The above economic impacts are reported for three sectors (Residential, Commercial and Industrial) under the *most likely* and *aggressive* Achievable Potential scenarios at two milestone years: 2021 (10 years out) and 2030 (19 years out).

6.2 Approach

The economic analysis is based on the application of economic multipliers, which are a set of proportionality constants that relate changes in domestic production in a particular sector to its impacts on the entire B.C. economy. BC Stats released a report in March 2008 documenting the British Columbia provincial economic multipliers based on 2004 economic data. These multipliers were applied to various activities across all sectors from the energy-efficiency strategy and totalled to determine the net impacts, which are relative to the scenario where no energy-efficiency strategy is implemented.

6.3 Results and Conclusion

The study concludes that:

- The impacts on output, GDP, and employment are all positive across all sectors for every scenario
- Impacts increase over time and are larger for the *aggressive* Achievable scenario
- The Residential sector, in every scenario, accounts for the greatest share of economic impacts
- By 2021, the net employment gains from CPR activities will range between 362 - 682 jobs, depending on the scenario
- By 2031 the net employment gains from CPR activities would grow to between 580 - 881 jobs, depending on the scenario.

British Columbia Utilities Commission
6th Floor, 900 Howe Street
Vancouver, BC
V6Z 2N3

Attention: Ms. Erica M. Hamilton, Commission Secretary

Dear Ms. Hamilton:

Re: Terasen Gas Inc. ("TGI") and Terasen Gas (Vancouver Island) Inc. ("TGVI") (collectively the "Companies")
Energy Efficiency and Conservation Program - 2009 Annual Report

British Columbia Utilities Commission (the "Commission") Decision dated April 16, 2009 and Order No. G-36-09 Compliance Filing

---

On April 16, 2009, the Commission issued its Decision and Order No. G-36-09 (the "Decision") on the Companies Energy Efficiency and Conservation ("EEC") Application approving funding for TGI and TGVI for 2009 and 2010 programs.

In the Decision, the Companies were directed to file annual EEC Reports on all of the EEC initiatives and activities, expenditures and results by the end of the first quarter following year-end and for each year of the funding period.

Further funding for 2011 was approved for each of the Companies in their respective 2010-2011 Negotiated Settlement Agreements[1] approved by the Commission

Attached, pursuant to the Decision, the Companies respectfully submit their first annual EEC Report for 2009 (the "Report"). In the Report, the Companies seek the following from the Commission:

1. Acceptance of the 2009 EEC Report;
2. Approval of the attribution of savings from regulation to be on a case-by-case basis; and
3. Approval for the attribution of 6 years of post-regulation savings to a Condensing Water Heater Initiative.

---

[1] Negotiated Settlement Agreements approved on November 26, 2009 for TGI by Order No. G-141-09 and TGVI by Order No. G-140-09

If you have any questions regarding this submission please contact the undersigned or Sarah Smith, Manager, Marketing and Energy Efficiency at (604) 592-7528.

Yours very truly,

TERASEN GAS INC.
TERASEN GAS (VANCOUVER ISLAND) INC.

1. REPORT OVERVIEW

1.1 Background

Terasen Gas Inc. ("Terasen Gas" or "TGI") and Terasen Gas (Vancouver Island) Inc. ("TGVI") (collectively referred to as "the Companies") have been involved with Energy Efficiency and Conservation ("EEC") since the 1990's. The Companies' earlier EEC activities were referred to in previous regulatory filings with the British Columbia Utilities Commission (the "Commission" or the "BCUC") as Demand Side Management ("DSM") activity.

Simply defined, EEC or DSM activity refers to activities designed to affect customers' use of natural gas – generally to encourage them to reduce their consumption. These programs have been successful in the past in promoting the efficient use of natural gas, encouraging the adoption of low carbon energy alternatives, reducing energy costs for customers, and supporting government policy by reducing greenhouse gas emissions ("GHGs"). Yet until recently the Companies' efforts were limited in terms of impact because of the relatively minimal funding allocated for EEC programs.

On May 28, 2008, TGI and TGVI collectively filed their Energy Efficiency and Conservation Programs Application (the "EEC Application"), seeking approval of increased funding of EEC programs for the timeframe of 2008-2010. On April 16, 2009, the Commission released its decision on the EEC Application and Order No. G-36-09 (the "EEC Decision"), which approved funding in aggregate of $41.5 million ($34.4 million for TGI and $7.1 million for TGVI). On November 26 2009, the Commission released Orders G-141-09 and G-140-09 approving Negotiated Settlement Agreements ("NSAs") in the 2010 – 2011 Revenue Requirement Applications for TGI and TGVI respectively. The NSAs allocated a further $32.35 million in EEC expenditure for TGI, and $6.1 million for TGVI, to bring the total approved EEC expenditure to 2011 for both utilities to approximately $80 million.

This EEC Annual Report ("EEC Annual Report" or the "Report") outlines how the Companies are already using this additional funding to further EEC, and how they will continue to broaden and enhance these efforts in 2010-2011. As the Report will make clear, the Companies are making effective use of the newly available funds to promote EEC and support the province's goal of GHG reductions.

This report overview outlines the purpose of this Report and its content.

1.2 EEC Annual Report: Taking Stock of Progress, Taking Accountability

This Report serves two purposes.

First, this Report demonstrates that the Companies are meeting the accountability mechanisms included in their proposal to the Commission. One such mechanism was the requirement to file EEC Annual Reports as follows:

"A requirement that Terasen submit annually to the Commission, by the end of the first quarter following year-end, for each year of the funding period, a report on all EEC initiatives and activities, expenditures and results for TGI and TGVI."[1]

Second, it reflects the Companies' commitment to taking stock of the success and progress of efforts to promote EEC since the Commission's EEC Decision. The Commission specified the following information be included in the EEC Annual Reports:

"The Commission panel accepts Terasen's accountability undertakings, and considers that, while the proposal to evaluate the EEC project using the TRC test at the Portfolio level has been accepted, TRC calculations for each program area, initiative and measure should also be included in the accountability reporting as a means of assessing the components of the Project and their ongoing effectiveness.

Commission Panel directs that the annual EEC Report include the following:

- *TRC, RIM, UC, and Participant test calculations of DSM at the Program Area initiative and individual measure levels in addition to the total Portfolio level reporting. Reporting of the Residential & Commercial EE program areas should also be made at the New Construction and Retrofit levels.*

- *any inter and intra Program Area initiative funding transfers, with supporting rationale, and the impact of such transfers on the transferor and transferee Program areas, initiatives, and measures as the case may be.*

- *data for fuel switching programs should be tracked in a manner which allows for reporting types of fuels replaced by natural gas, including estimated GHG impacts.*

The Commission Panel also directs Terasen to include in its annual EEC Report to the Commission a discussion of its internal data gathering, monitoring and reporting control processes. The discussion should include a description of how these processes ensure that funds expended and the statistical results of the programs implemented are completely and accurately recorded and monitored, including any related internal check and audit processes. The report should also discuss how Terasen has measured or estimated the results of the EEC expenditure initiatives."[2]

The Commission also directed the Companies to redesign and resubmit the Attribution to Regulatory Change with its next EEC Annual Report, "reflecting the provisions of the DSM regulation which come into effect for [the Companies] on June 1, 2009"[3] (please refer to Section 8).

The Companies believe that the details contained in this EEC Annual Report satisfy the requirements of the EEC Decision.

1 EEC Decision, page 2

2 Ibid, page 42

3 Ibid, page 40

1.3 Organization of the EEC Annual Report

This Report is a comprehensive overview of the Companies' efforts to seek funding for, and then to resource, design and implement a comprehensive EEC initiative in 2009 and beyond. It officially serves as the EEC Annual Report for 2009; it also identifies the Companies' plans for EEC activities in 2010. Collectively these sections (and this EEC Annual Report) demonstrate that the Companies are developing and carrying out an effective portfolio of EEC Programs and associated activities.

This Report includes the following sections:

2. A History of Commitment to DSM

This section outlines the Companies' long-standing commitment to DSM activities, despite a comparatively low level of funding. The fact that the Companies have historically been engaged in DSM efforts will help to ensure that the transition to a broad, robust EEC portfolio is a smooth one.

3. Appropriate Resources: Financial and Human

In this section, the Companies describe the funding requested for EEC activities and the amounts approved by the Commission. It details how these funds are necessary for the Companies to create the kind of robust EEC plan that will reshape customer behavior. The section also details how the Companies have established a well-resourced EEC team and how external consultants will be used to supplement that team's expertise.

4. 2009 Activities: Establishing the EEC Foundation

This section details how the Companies have developed a comprehensive EEC Portfolio of programs with associated activities. It will outline that while 2009 and early 2010 were collectively a transition period, the Companies used this time to launch programs that have already delivered value to stakeholders.

5. 2010 Plan: Building on the EEC Foundation

This section outlines how the 2010 EEC activity will build on the existing portfolio by adding several other programs and initiatives. These include High-Carbon Fuel Switching, Conservation for the Interruptible Industrial Sector, and Innovative Technologies.

6. Conservation Potential Review ("CPR")

In this section, the Companies describe their plans for conducting an update to the 2006 CPR in 2010 to establish the basis for EEC funding in 2012 and beyond.

7. Sound Internal Controls and Reporting Mechanisms

This section outlines the data collection plan and business practices the Companies have put in place for EEC activities to ensure that these activities are in compliance with the general controls of the Company.

8. Market Transformation and Attribution

This section recognizes the Companies' leadership role related to the introduction of Regulated Standards and their commitment to undertake activities which encourage and support Market Transformation. The Companies also set out their proposal for the attribution of savings from regulation to be attributed to utility programs on a case-by-case basis.

1.4 Summary

The Companies have a long history of delivering successful DSM and EEC programs efficiently and effectively, which have brought value to stakeholders, while providing energy savings and GHG reductions.

Now that the Commission has granted increased funding to the Companies, both the scope of EEC efforts and their impact has increased significantly. This Report outlines these successes and how they lay the groundwork for an ongoing EEC campaign.

1.5 Approvals Sought

The Companies respectfully request the following from the Commission:

1. Acceptance of the 2009 EEC Annual Report; and
2. Approval for the attribution of savings from regulation to be on a case-by-case basis as outlined in Section 8; and
3. Approval for the attribution of 6 years of post-regulation savings to a Condensing Water Heater Initiative, as described in Section 8.

A draft form of Order is provided in Appendix K.

2. A HISTORY OF COMMITMENT TO DSM

The EEC Program approved by the Commission and launched by the Companies in 2009 builds upon a legacy of commitment to DSM. Despite limited funding, TGI has, since 1997, created and carried out DSM programs. TGVI also has a track record of managing DSM programs (i.e. fuel switching, load building). This experience and understanding of DSM priorities serves as an important foundation for the Companies' expanded efforts.

This section outlines the Companies' proven commitment to DSM (and now EEC).

2.1 Historical EEC Activities Overview: 1990s - 2008

The Companies have a track record of being committed to DSM and EEC initiatives.

Since 1997, TGI has delivered value to its customers through DSM initiatives. These began on July 23, 1997 when TGI received approval from the Commission for its 1998-2002 Revenue Requirements Application. In this Application the Commission endorsed a mechanism to pursue DSM resources.

On July 29, 2003, by Order No. G-51-03, TGI received approval from the Commission for a Multi-Year Performance Based Rate Plan Settlement Agreement (the "PBR Settlement Agreement") for the period 2004-2007. This PBR Settlement Agreement was extended by the Commission, by Order No. G-33-07, for the 2008-2009 period.

EEC funding levels were established at approximately $1.50 million per year for incentives with funds being placed in a deferral account and amortized over three years. Additionally, non-incentive expenses of approximately $1.624 million per year were treated as Operations and Maintenance ("O&M") expense and were expensed in the year incurred.

TGVI too has a history of pursuing DSM efforts.

Since its inception TGVI has successfully delivered load building and fuel switching programs, delivering value for both customers and TGVI despite the limited funding available. Historically, TGVI's DSM activities were aimed at employing marketing programs to attract new customers and add load in order to improve the utilization of the gas delivery system on Vancouver Island.

TGVI's efforts became more formal and developed when in 2005 TGVI received approval from the Commission for the 2006-2007 Negotiated Settlement Agreement, through which DSM expenditures were approved. In addition, the Commission approved the two-year extension of the Negotiated Settlement Agreement terms for 2008 and 2009 by Order No. G-34-07, which included approval for DSM expenditures.

TGVI has historically had DSM expenditures of approximately $650,000 per year for incentives, plus $500,000 per year for non-incentive costs. For TGVI, incentive expenditures were placed in a deferral account and fully amortized the year following incurrence and non-incentive costs were treated as O&M and were expensed in the year incurred.

In summary, despite the relatively low level of funding and resources available up until 2008, TGI and TGVI delivered cost-effective programs bringing value for stakeholders.

3. THE RIGHT RESOURCES: FINANCIAL AND HUMAN

The Companies' EEC efforts depend on having access to the requisite resources to create and execute a broad portfolio of initiatives. As this section demonstrates, through 2011, the Companies have access to a level of funding that will allow the Companies to deliver the EEC activities identified in the EEC Application. As well, the Companies have established an initial organizational structure that will enable delivery of most of the initiatives identified in the EEC Application. This section describes funding approvals for EEC activity through 2011, and the Companies anticipate filing a request for continued funding for EEC activity for 2012 and beyond early in 2011. The long-term success of the Companies' EEC activity and efforts to support market transformation is dependent on continued stable, secure funding for EEC initiatives.

3.1 Appropriate Funding: 2008-2010

On May 28, 2008, TGI and TGVI collectively filed their Energy Efficiency and Conservation Programs Application (the "EEC Application"), seeking approval of increased funding of EEC programs for the timeframe of 2008-2010. The EEC Application requested approval for total funding of $56.6 million over three years ($46.944 million for TGI and $9.667 million for TGVI), deferral treatment by charging the expenditures to a regulatory asset deferral account with an amortization period of 20 years, and a portfolio methodology for evaluating the costs and benefits of the overall EEC portfolio.

On April 16, 2009, the Commission released its Decision and Order No. G-36-09 (the "EEC Decision"), which approved funding in aggregate of $41.5 million ($34.4 million for TGI and $7.1 million for TGVI).

This funding represented a significant increase from what had been previously allocated for DSM activities and ensures the Companies have the financial resources to execute on proposed EEC initiatives between 2008 and 2010.

Specifically, the following proposed expenditures were accepted:

(a) $31.077 million for the combined Residential Energy Efficiency and Commercial Energy Efficiency programs;

(b) Expenditures for programs or initiatives directed at fuel switching away from fossil fuels which have a higher carbon content than that of natural gas;

(c) $6.918 million for Conservation, Education and Outreach;

(d) $3.0 million for Joint Initiatives; and

(e) $0.5 million for a Conservation Potential Review.

The Commission also approved deferral treatment of all expenditures with an amortization period not to exceed 10 years, and approval of a portfolio approach to evaluating the costs and benefits of the overall EEC portfolio.

The above funding approvals from the Commission provided the Companies with the financial resources they required to create and launch a portfolio of EEC programs that have already begun to deliver value to customers while supporting provincial goals of promoting conservation and reducing GHGs. The programs and their impact to date are described in more detail in Section 4.

3.2 Funding for the Future: 2010 and 2011 EEC Funding

In June 2009, both TGI and TGVI filed their respective 2010-2011 Revenue Requirements Applications. In these applications the Companies sought, among other things, to:

- Increase EEC funding to add programs for Interruptible Industrial customers (TGI only) and Innovative Technologies;
- Reallocate approved funding to add to Affordable Housing; and
- Extend to 2011 the programs and funding approved by the Commission in the EEC Decision.

The expenditures for conventional energy efficiency for 2011 were set to match the forecast expenditures for 2010. Furthermore, the same portfolio-level Total Resource Cost ("TRC") approach as that which was approved in the EEC Decision was used to analyze and assess EEC expenditures.

When the Commission approved TGI's and TGVI's NSAs[4], this included the approval of EEC funding for TGI and TGVI for 2010 and 2011. This funding (summarized in Table 3-1) ensures that TGI and TGVI will have access to requisite funding for continued EEC activities in the 2010 to 2011 period.

Table 3-1: TGI and TGVI EEC Approved Funding for 2010 and 2011

	TGI		TGVI	
($000s)	2010	2011	2010	2011
Residential and Commercial Programs	23,075	23,075	4,726	4,726
Affordable Housing	2,400	2,400	600	600
Industrial Interruptible	435	1,875	-	-
Innovative Technologies	2,300	4,669	478	956
Total	**28,210**	**32,019**	**5,804**	**6,282**

As a result of the additional approved funding through their respective NSAs, the Companies have greater flexibility and funding available to continue to offer energy savings activities to customers through 2011.

3.3 Resources and Staffing

The Companies were effective in delivering DSM initiatives from 2005 to 2008 through their Marketing and EEC team. As a result of the increased EEC funding approved in the EEC Decision, the Companies have restructured their Marketing and EEC teams to add the

[4] For TGI Order No. G-141-09 and for TGVI Order No. G-140-09, both dated November 26, 2009.

resources necessary to effectively deliver the EEC programs. The Companies will manage the EEC resource requirements as necessary, on an ongoing basis, to efficiently and effectively develop, implement and deliver the portfolio of EEC activities and programs.

The following sections outline the structure of the Companies' internal and external resources designed to optimally deliver the EEC programs.

3.3.1 Resources and Staffing Expenditures

As discussed earlier in Section 2, TGI and TGVI have historically been able to deliver a certain level of energy savings to customers by delivering EEC programs with relatively few resources.

The Companies drew on the experience it had developed in these earlier, successful DSM/EEC initiatives to determine how to best allocate its resources. Careful consideration was given to where to allocate funding.

Table 3-2 below provides a resource view of the EEC expenditures for 2009.

Table 3-2: Resource View of EEC Expenditures for 2009 ($000)

	TGI	TGVI	**TGI & TGVI**
Labour Costs	854	15	869
Non-Labour Costs	4,750	453	5,203
Employee Expenses/Supplies	167	15	182
Incentives, Program Admin Costs & Fees	3,667	86	3,753
Promo & Advertising	642	344	986
Contractor Costs	274	8	282
Total Costs	**5,604**	**468**	**6,072**

3.3.2 Staffing for EEC: Assembling the Right Internal Resources

The EEC team was built on a small but strong foundation. Prior to the EEC Decision, the Marketing and Energy Efficiency team consisted of four core staff members including a DSM Lead, a Marketing Program Specialist and a Program Specialist all reporting to the Manager of Marketing and Efficiency. Additional support for the DSM activities was provided by the Technical Sales Support staff, the Commercial and Industrial Account Management team, and the Residential New Construction Account Management team, on a part-time, as needed basis.

In order to deliver on the programs and activities approved in the EEC Decision, the Marketing group went through an extensive organizational structure change to put in place a cohesive team for the development and execution of the EEC initiatives.

Much of the group's time in 2009 was spent on recruiting, hiring and training the staff the Companies would need in order to successfully deliver the activities approved in the EEC Decision. A recruiting process commenced after the EEC Decision for approximately three months duration. The following additional positions were established and filled in 2009 to support the EEC activities and programs:

- EEC Program Manager Residential
- EEC Program Manager Commercial
- EEC Program Manager Affordable Housing
- EEC Program Manager Conservation, Education and Outreach
- EEC Program Manager Qualified Dealer
- Marketing Program Specialist Residential
- Marketing Program Specialist Commercial
- Marketing Program Specialist Conservation, Education & Outreach
- Marketing Program Specialist Affordable Housing
- Energy Technology Specialist
- EEC Communications Coordinator
- EEC Administration Assistant

The new structure of the Marketing and EEC team for 2009 is designed and effectively resourced to deliver on the expanded portfolio of EEC programs the Companies must deliver.

3.3.3 2010 Internal Resources: Continuing to Develop Organizational Capability

For 2010, the Companies are anticipating the necessary addition of EEC Program Managers for Innovative Technologies, Interruptible Industrial and Customer Financing. At this time, the labour budget for the EEC activities for 2010 is estimated at $1.545 million. The structure of the EEC team for 2010 may change over the course of the year as new opportunities and activities are identified and deployed. Additional staff and changes in reporting structure may need to be put in place in order for the Companies to continue to deliver the expanded Portfolio of EEC Programs.

3.3.4 Staffing for EEC: Drawing on the Right External Resources

While the EEC team provides the primary resources for design, implementation, administration and delivery of the EEC programs, for specific or specialized EEC activities, the Companies also engage the services of outside consultants. These consultants are engaged to supplement internal resources and expertise. External consultant resources are used to support certain activities on an as-required basis determined by the business needs.

The following is a summary of the primary external consultants used and the services for which they are typically engaged.

- Habart and Associates: The Companies have been working with Habart and Associates ("Habart") consulting firm for a number of years. In 2009, Habart provided support and services on a number of projects, including a DSM training seminar for the new members of the EEC team, Information Requests ("IRs") support, furnace program billing analysis (in partnership with John Sampson Research), estimation of energy impacts for program measures as well as several other projects.

- Willis Energy Services ("Willis"): Willis is another long-term external consultant who has provided the Companies with consulting and support of the DSM models as well as support with answering IRs specific to these models.

- KnowledgeTech Consulting ("KnowledgeTech"): The Companies have also engaged KnowledgeTech, whose Information Technology ("IT") expertise was used to assist with the Demand Side Management System ("DSMS"). The DSMS addresses the requirement for more robust program tracking and reporting. More information about the DSMS can be found in Section 7.1.

In addition to the consultants mentioned above, the EEC team hired several other consultants to assist with program evaluation, market research projects and specific requests. The details of this activity are provided under the Enabling Activities sections, Section 4.8 for 2009 and Section 5.13 for 2010.

3.4 Resources: Conclusion

The April 16, 2009 Commission approval of funding in aggregate of $41.5 million and subsequent approval of TGI and TGVI's 2010-2011 NSAs (and associated 2010 and 2011 EEC funding) ensured the Companies would have access to the financial resources so that programs could be launched for the benefit of customers.

Drawing on these funds, the Companies have since developed and structured the appropriate internal team to carry out their mandate. Further, the Companies have prudently engaged external consultants where appropriate to draw on expertise.

The resources that are now in place ensure the Companies are appropriately positioned to develop, implement and deliver the expanded portfolio of EEC activities and programs.

4. 2009 ACTIVITIES: ESTABLISHING THE EEC FOUNDATION

Following the EEC Decision in April of 2009, the Companies set out to establish a foundation that year for broader EEC programs. The primary focus of 2009 (a "transition" year) was building the EEC team described in Section 3.

While most programs and activities did not get underway until the second half of 2009, the results achieved in this short time demonstrate successful execution of an expanded EEC portfolio and programs.

This section will elaborate on this by examining at a high level:

- 4.1 EEC Program Portfolio and Associated Program Areas: Growing Scope
- 4.2 2009 Portfolio & Program Results – Delivering Value While Laying Foundation

Then this section continues with program specific details as follows, looking in detail at how the Companies pursued EEC objectives through:

- 4.3 Residential Energy Efficiency Programs
- 4.4 Commercial Energy Efficiency Programs
- 4.5 Conservation for Affordable Housing Programs
- 4.6 Joint Initiatives
- 4.7 Conservation, Education and Outreach Programs
- 4.8 Enabling Activities
- 4.9 EEC Stakeholder Group Activities
- 4.10 Summary 2009 EEC Activities: Successfully Establishing the Foundation

The results reflect a partial year of activity for 2009 as most of the programs were rolled out in the second half of 2009 once the EEC Decision was issued and the staffing resources were set in place; these results are for programs where activities were performed in 2009 and where the related program expenditures may continue to occur in 2010.

Yet despite the relatively short time frame in which they have been launched, these programs are already delivering value to customers while furthering the province's goals around GHGs reduction and the promotion of conservation.

4.1 EEC Program Portfolio and Associated Program Areas: Growing Scope

The Companies' EEC Portfolio consists of multiple Program Areas. Each Program Area includes all specifically related programs, measures and activities. While the Companies had an EEC Portfolio for many years, the limited funding meant the scope of the Portfolio was limited. With the Commission's approval of additional funding (see Section 3.1), the groundwork was laid to expand the Portfolio.

As might be expected, EEC activity in 2009 experienced a considerable expansion in all Program Areas. Furthermore, a new Program Area was created for Conservation for Affordable Housing, in order to recognize its importance and profile within the Companies' EEC activity.

Also created were two additional non-Program Area specific sections related to the EEC Portfolio:

- Enabling Activities (activities that are supportive of the Companies' EEC program development and delivery) and
- EEC Stakeholder Group Activities (the work achieved with the EEC Stakeholder Group in 2009).

Further information for each Program Area and Activity can be found in subsequent sections of this Report.

4.2 2009 Portfolio and Program Results: Delivering Value While Laying Foundation

Considering that the Companies' expanded EEC activity did not get underway until late Q3 when the additional EEC staff had been hired and trained, the overall portfolio results are reasonable.

Table 4-1 below shows overall program results including the overall incentive and non-incentive amounts spent on EEC programs, annual energy savings, Net Present Value ("NPV") of the energy savings over measure life, and the TRC results. For 2009, the overall EEC portfolio achieved close to 1.3 million Gigajoules ("GJs") in measure life energy savings which is considerably higher than the measure life energy savings achieved in 2008 (612,651 GJs).

Table 4-1: 2009 Overall Portfolio Results Brought Value to Customers and the Companies

Utility	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
TGI	3,245	2,498	5,743	125,267	1,223,559	1.2
TGVI	98	419	518	5,698	60,541	0.8
Total Results	3,344	2,917	6,261	130,965	1,284,100	1.2

The TRC results for TGI are at 1.2 and for TGVI are at 0.8 and the overall Portfolio TRC results are 1.2, so the overall Portfolio result complies with the Commission's acceptance of the Companies' proposal regarding Portfolio level TRC of greater than one to be considered cost-effective. The 2009 TRC result for TGVI was 0.8. This is because programs for TGVI were halted in 2007, pending submission and approval of the EEC Application and only restarted in Q2 of 2009 once the EEC Application was approved. Thus the programs for TGVI in 2009 had very little opportunity to gather momentum in terms of participation rates, leading to a lower TRC. The Companies anticipate that over the course of 2010, participation in programs on TGVI will increase as the market becomes more aware of the availability of EEC initiatives for TGVI. Note the difference between the Total for Incentive and Non-Incentive Expenditure ($6.261 million) shown in the table above, and the Total Costs ($6.072 million) in the Table 3-2 of Section 3.3.1 is $188,306. This is because the latter figure ($6.072 million) is based on the actual expenditures in 2009, while the former figure ($6.261 million) is based on the amounts associated with each 2009 program that might be incurred in 2010, thus providing a more complete view of individual program costs.

The value delivered through these early Portfolio efforts can be seen in more detail when the results are presented by Program Areas. These results are shown below in Table 4-2. Further details on cost-benefit analysis can be found in Appendix J.

Table 4-2: 2009 Expanded Program Areas Brought Value to Customers and the Companies

Program Area	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
Residential Programs	**2,022**	**166**	**55,031**	**574,607**	**1.2**
TGI	1,975	138	52,901	553,543	1.2
TGVI	47	28	2,130	21,063	1.4
Commercial Programs	**925**	**147**	**74,373**	**693,352**	**2.1**
TGI	874	140	70,804	653,874	2.1
TGVI	51	7	3,569	39,478	2.0
Conservation for Affordable Housing (TGI & TGVI)	**390**	**0**	**1,352**	**14,236**	**0.7**
Joint Initiatives (TGI & TGVI)	**7**	**428**	**210**	**1,905**	**0.8**
Conservation, Education & Outreach (TGI & TGVI)	N/A	**612**	N/A	N/A	N/A
Enabling Activities (TGI & TGVI)	N/A	**266**	N/A	N/A	N/A
Other Portfolio Level Activities (TGI & TGVI)*	N/A	**1,298**	N/A	N/A	N/A
Total	**3,344**	**2,917**	**130,965**	**1,284,100**	**1.2**

*Other Portfolio Level Activities include research & evaluation, consultants' fees, non-program administation activities & labour

Note that the Companies have created a discrete Program Area specific to Conservation for Affordable Housing, moving it out of the Joint Initiatives Program Area in order to recognize its importance, which was emphasized in the EEC Decision and the NSAs. Further, the Companies have specifically allocated $3 million annually to Conservation for Affordable Housing for 2010 and 2011, so the budget for this Program Area is considerable.

As shown in the Table 4-1 and 4-2 above, the EEC portfolio in 2009 brought value to customers and the Companies. The details of each Program Area are further discussed in the following sub-sections and more comprehensive program details can be found in Appendix D.

In 2010, the EEC team will further expand the program portfolio by building on the existing programs and by adding three Program Areas, the details of which are discussed in Section 5. Overall, the EEC Portfolio delivered value for customers in 2009, as measured by a Portfolio-level TRC of 1.2.

This Report will now examine each of the programs and activities through which the Companies pursued EEC objectives in 2009; these programs and activities also serve to lay the foundation for broader work and greater results in 2010 and beyond.

4.3 Residential Energy Efficiency Programs

Residential Energy Efficiency programs are offered in TGI and TGVI service areas. For EEC purposes, residential customers include end-use customers living in a residential single-family home, row house, townhouse or mobile home.

4.3.1 Program Goals

Residential Energy Efficiency programs encourage households to reduce their overall consumption of natural gas and help to manage their energy bills.

In addition to saving energy, Residential Energy Efficiency programs focus on the following objectives:

- Prepare the market for adoption of new energy efficient technologies through incentives, and support of government regulations;
- Upgrade existing low efficiency systems to capture energy savings associated with reducing the overall consumption of natural gas;
- Educate the trades community about upcoming regulations and gain an understanding of technical requirements or other barriers associated with new product introductions;
- Educate consumers about the advantages of energy efficient furnaces and boilers and provide incentives for their adoption when necessary;
- Engage manufacturers by supporting new technologies and provide advertising opportunities to the Companies customer base;
- Develop cost-effective programs with a TRC greater than 1.0 that optimize the proportion of incentives over administration and marketing costs; and
- Conduct program evaluation that confirms savings claims and guides program development of future programs.

4.3.2 Two Retrofit Programs in the Market

There were two Residential Energy Efficiency retrofit programs offered in 2009: the ENERGY STAR® Heating System Upgrade Program, which includes participants from the provincial government's LiveSmart BC Residential Retrofit Incentive Initiative, and the EnerChoice Fireplace Program.

Table 4-3 provides a summary of the 2009 Residential Energy Efficiency programs for TGI and TGVI. The ENERGY STAR® Heating System Upgrade Program surpassed its original target of 8,180 heating systems, achieving 7,930 by December 31, 2009 with the expectation of achieving 15,000 upgrades once all applications are processed in 2010. The EnerChoice Fireplace program, although program participation numbers were less than expected, achieved its primary objective of education and outreach about the importance of energy efficient fireplaces.

Table 4-3: 2009 Residential Energy Efficiency Programs for TGI and TGVI are cost effective and deliver substantial energy savings

	Program	Description	Retrofit			
			Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	TRC	
					TGI	TGVI
1	ENERGY STAR® Heating System Upgrade	$250 Incentive for upgrading heating system to ENERGY STAR® rated appliance	1,233	299,201	1.1	0.9
	ENERGY STAR® Heating System Upgrade - LiveSmart BC	$250 Incentive for upgrading heating system to ENERGY STAR® rated appliance as part of LiveSmart BC incentive portfolio	871	231,121	1.2	1.2
2	EnerChoice Fireplace	$50 Dealer Incentive to promote and educate customers about Energy Efficient Fireplaces	84	44,285	2.6	2.4

The highlights of the 2009 Residential Energy Efficiency programs are as follows:

- The ENERGY STAR® Heating System Upgrade Program, including participants from LiveSmart BC, will surpass the replacement target of 8,180 furnaces or boilers outlined in the EEC Application, upon completion of application processing in 2010. The program will achieve energy savings of 530,322 GJs over the life time of the measure. The program achieved a TRC of 1.1 in TGI and 1.0 in TGVI. This demonstrates that the program is cost-effective and has substantial energy savings over the lifetime of the measure.

- The EnerChoice Fireplace Program encouraged dealers to educate consumers about the merits of energy efficient fireplaces through a $50 sales promotion incentive ("SPIFF")[5]. Participant numbers were lower than the 2008 program because dealers found the SPIFF application process to be onerous during their peak sales season. The program achieved energy savings of 44,285 GJs over the life time of the measure. The program achieved a TRC of 2.6 in TGI and 2.4 in TGVI. Although the program's projected energy savings goals were not met, the education and outreach objectives of the program were met. Since EnerChoice education for dealers has been met, the 2010 program will involve consumer incentives.

[5] A Sale Promotion Incentive Fund, or SPIFF, is an incentive directed to a salesperson for selling a specific product. For the purpose of the EnerChoice Fireplace program, sales people were eligible for a $50 rebate cheque for each EnerChoice fireplace they sold.

Residential Energy Efficiency programs are described in further detail below.

4.3.3 ENERGY STAR® Heating System Upgrade Programs

Program Area:	Residential Energy Efficiency Programs
Target Market:	Retrofit
Duration:	TGI: Sep 1, 2008 through Dec 31, 2009 TGVI: April 16, 2009 through Dec 31, 2009
Incentives:	$250 bill credit Manufacturer's coupons September through December, 2008 and 2009
Partner:	LiveSmart BC Residential Retrofit Incentive Initiative

Program Administration:

Accenture Utilities Business Process Outsourcing Services ("ABSU"), a subsidiary of Accenture Inc., through a subcontracting arrangement with CustomerWorks LP.

Program Objectives:

- Upgrade a minimum of 8,180 heating systems;
- Prepare market for adoption of ENERGY STAR® provincial furnace regulations for retrofit market, January 1, 2010;
- Educate the trades community about upcoming regulations;
- Educate consumers about the advantages of energy efficient furnaces and boilers and provide an incentive that promotes a proactive replacement decision;
- Engage manufacturers by distributing coupons for ENERGY STAR® furnaces and boilers and providing funds for co-marketing opportunities; and
- Develop a cost effective program with TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.

Background:

The Companies have maintained ENERGY STAR® Heating Upgrade programs in the market since 1996. The most recent iteration of the ENERGY STAR® Heating System Upgrade Program was launched September 1, 2008 in the TGI service territory and April 16, 2009 in the TGVI service territory.

The program offered a $250 bill credit to partially offset the estimated $850 incremental cost of purchasing ENERGY STAR® furnaces or boilers over mid-efficiency models. In addition to the $250 incentive, from September to December, 2009 furnace and boiler manufacturers provided coupons for discounts and extended warranties for ENERGY STAR® heating systems.
The primary program objective was to reap the energy savings associated with upgrading low or mid-efficiency heating systems. In addition, the program focused on preparing the market for

January 1, 2010 changes to the BC Energy Efficiency Act Standards for gas furnaces outlined in the Ministry of Energy Mines and Petroleum Resources ("MEMPR") Enforcement Bulletin 09-03[6]. The regulated energy efficiency standard for these products is an Annual Fuel Utilization Efficiency ("AFUE") equal to or greater than 90%. These regulations took effect for new residential construction on January 1, 2008 and for replacement furnaces in existing dwellings on December 31, 2009. The BC provincial regulation changes align with Natural Resources Canada ("NRCan") regulations for new and existing buildings across Canada. Significant outreach to consumers, trades and manufacturers helped facilitate the industry's transition to the new regulation.

Please refer to Appendix D for detailed program description.

Results:

As of December 31, 2009, the number of participants to date was 7,930 with expectations of achieving over 15,000 participants once final applications are processed in 2010. Given that the goal for program participation in the EEC Application was 8,180, this program has been extremely successful with participation surpassing that goal.

Table 4-4 provides program highlights of the ENERGY STAR® Heating System Upgrade Program performance metrics for 2009 including number of participants, incentives to non-incentives spending, net annual energy savings, and the savings over the lifetime of the measure. The free rider rate suggests that 43% of participants may have upgraded their appliance without the incentive, so this proportion of participants has been backed out of the energy savings. The positive TRC indicates that there are positive energy savings within a cost-effective program.

[6] Please refer to Appendix C for a copy of the MEMPR Enforcement Bulletin 09-03.

Table 4-4: ENERGY STAR® Heating System Upgrade Program Performance Summary illustrates that programs are cost effective and deliver substantial energy savings

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
The Companies	TGI	4,391	1,098	101	27,882	293,682	43%	1.1
	TGVI	83	21	14	527	5,519	43%	0.9
LiveSmart BC	TGI	3,391	848	7	21,532	226,799	43%	1.2
	TGVI	65	16	-	413	4,322	43%	1.2
Total	**TGI**	**7,782**	**1,946**	**108**	**49,414**	**520,482**	**43%**	**1.1**
	TGVI	**148**	**37**	**14**	**940**	**9,840**	**43%**	**1.0**

Note: The Companies Participation Rates are based on the number of bill credits issued as of December 31, 2009 including 371 bill credits that were issued in 2008 that were not included in previous program reports.
The LiveSmart BC participant numbers were based on number of furnaces invoiced as of Dec 31, 2009.

In 2009, $1.98 million in incentives were distributed. Total spend for non-incentive dollars was $122,000. Notably, non-incentive spending represented only 6% of total spending. This demonstrates that the most significant portion of the program's expenditures are going towards incentives and that program administration and marketing are very cost effective.

As outlined in Table 4-4 above, based on 2009 participants, the program is achieving annual gas savings of 50,354 GJ's and 530,322 GJ's over the life time of the measure.

The Free Rider Rate used for this analysis was 43% based on customer feedback from the extensive 2005-2007 Furnace Program Evaluation (refer to Appendix D) that surveyed consumers and contractors. The 2005-2007 Furnace Program evaluation highlighted additional program benefits of a 30% spillover and noted that customers were advancing their purchase decision an average of 2.3 years. The additional energy savings benefits from spillover are not included in the program's TRC calculations, thus the TRC reported is conservative.

TRC results were 1.1 for TGI and 1.0 for TGVI. The TGVI TRC is slightly lower due to lower participant numbers as the program was introduced over seven months later than the TGI program. In addition, the TGVI opportunity for furnace replacement is lower due to the fact that there is newer furnace stock since natural gas service was first introduced to Vancouver Island in 1990.

For cost benefit analysis please refer to Appendix J.

Summary:

The most recent iteration of the ENERGY STAR® Heating System Upgrade Program achieved its objectives in preparing the market for the introduction of provincial and federal regulations requiring the installation of ENERGY STAR® furnaces in 2010, in addition to replacing a significant number of furnaces resulting in energy savings. In wrapping up this program in 2010, it is anticipated that the Companies will have provided $3.75 Million in funding for 15,000 heating system upgrades since September 2008, a significant contribution to this industry, resulting in large energy savings impacts. The full program overview and results will be discussed in the 2010 EEC Annual Report.

The partnership with LiveSmart BC was very successful in terms of adding 3,456 participants in 2009 with an additional 3,835 projected to be processed in 2010. The LiveSmart BC Residential Retrofit Incentive Initiative, launched in May 2008 by the Provincial government, provided incentives to reward residential retrofits that saved energy and reduced GHGs. This high profile program was very successful attracting over 40,000 participants in 15 months. In order to receive the $250 Terasen rebate through LiveSmart BC homeowners were required to complete a home energy assessment with a Certified Energy Advisor, licensed by NRCan[7]. The data was transferred from NRCan to LiveSmart BC. LiveSmart BC then invoiced Terasen. The partnership with LiveSmart BC is discussed in greater detail in the Section 4.6.

Since regulations require that mid-efficiency furnaces can no longer be manufactured, but can still be sold, the Companies are monitoring mid-efficiency furnace inventory through communications with industry. The results of these stakeholder discussions will determine the market need for a 2010 ENERGY STAR® Heating System Upgrade early retirement program as outlined in Section 5.5.2.6. Such a program would have the additional benefit of proactive furnace replacement savings.

4.3.4 EnerChoice Fireplace Program

Program Area: Residential Energy Efficiency Programs

Target Market: Retrofit

Duration: TGI and TGVI: Sep 1, 2009 through Dec 31, 2009

Incentive: $50 Sales Promotion Incentive Fund (“SPIFF”) for each fireplace sold

Manufacturer Coupons

Partner: Hearth Patio and Barbecue Association of Canada (“HPBAC”)

Program Administration:

HPBAC and EEC staff

[7] Home Energy Assessments for existing homes are provided by NRCan-certified Home Energy Advisors. The initial assessment is referred to as the D-visit and includes a detailed evaluation of the home’s energy efficiency levels, as well as various tests to determine air leaks and recommendations for retrofits that will improve the home’s energy efficiency rating. The second visit, referred to as the E-visit, measures energy performance after the recommended retrofits have been completed.

Program Objectives:

- Encourage the sale and installation of energy efficient heater style fireplaces to reap the associated energy savings;
- Further the education and awareness of the EnerChoice label to consumers and industry;
- Further relationships with manufacturers and distributors of natural gas fireplaces, through the HPBAC;
- Engage manufacturers by distributing coupons for EnerChoice fireplace discounts and accessories; and
- Develop a cost effective program with TRC greater than 1.0.

Background:

Promoting energy efficient fireplaces is an important component to EEC programs since natural gas fireplaces account for 13% of residential natural gas consumption (based on 2006 CPR findings). In addition, 85% of The Companies customers have at least one fireplace or heating stove, based on the 2008 Residential End Use Study ("REUS") findings. The Companies are encouraging their customers to adopt energy efficient gas fireplaces designed for heating rather than simply decorative fireplaces for ambience.

The Enerchoice Fireplace label is a Canadian label reserved for products that meet or exceed efficiency levels as determined by an independent committee managed by HPBAC. Since there is currently no ENERGY STAR® rating for natural gas fireplaces, and there are no pending standards from the U.S. Department of Energy, the Canadian fireplace industry has developed its own efficiency label, branded EnerChoice. The EnerChoice designation can only be applied to free-standing stoves with Fireplace Efficiency ("FE") 66% or higher, fireplaces that are 62.4% or higher and inserts that are 61% and higher.

Please refer to Appendix D for detailed program description.

Results:

The EnerChoice Fireplace Program achieved some positive results, and the Companies gained valuable insight into how to further improve and modify the program in 2010.

Table 4-5 provides program highlights of the EnerChoice Fireplace Program performance metrics for 2009, including number of participants, incentives and non-incentives spending, net annual energy savings, and the savings over the lifetime of the measure. The free rider rate suggests that 24% of participants may have selected an EnerChoice fireplace without the incentive, so this proportion of participants has been backed out of the energy savings. The positive TRC indicates that there are positive energy savings within a cost-effective program.

Table 4-5: EnerChoice Fireplace Program Performance Summary illustrates that programs are cost effective by their positive TRC and had a strong educational component as evidenced by the non-incentive spending component that was primarily marketing costs

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
TGI	592	30	31	3,487	33,062	24%	2.6
TGVI	202	10	14	1,190	11,223	24%	2.4

Note: Actual numbers are based on the number of SPIFF applications processed by March 1, 2010 to reflect 2009 overall program performance. The incentives are not in the 2009 actuals budget but presented as an adjustment.

Based on the 2008 program, the Companies projected a program participant goal of 1,200 although only 794 units were achieved. Dealers reported that they found the SPIFF application process to be onerous during their peak sales season. Based on this feedback, the 2010 program will be a consumer-based incentive.
In 2009, $40,000 in incentives was distributed while total spend for non-incentive dollars was $45,000, which is to be expected given that the primary objective of the program was education and outreach.

As outlined in Table 4-5, the program is achieving annual gas savings of 4,677 GJ's and 44,285 GJ's over the life time of the measure. The Free Rider Rate was 24% as used on former fireplace programs.

When total program spending is compared to the avoided cost of gas, positive TRC calculations were 2.6 for TGI and 2.4 for TGVI.

For cost benefit analysis please refer to Appendix J.

Planned Improvements For 2010

Enerchoice Fireplace program evaluation on the 2008 and 2009 programs will be conducted in 2010. Billing analysis will be conducted on a random sample of 2008 program participants to validate energy savings claims for EnerChoice appliances. An EnerChoice awareness survey to dealers is being proposed to determine the market penetration of EnerChoice education and awareness programs and gain feedback on future requirements for EnerChoice educational programs.

The EnerChoice Fireplace Program achieved its primary objective in encouraging dealers to educate consumers about the merits of energy efficient fireplaces, through a $50 dealer incentive. Although EnerChoice fireplace program participation numbers by dealers was down over 2008, education and awareness of energy efficient fireplaces was met, as demonstrated by industry feedback on the success of the manufacturers' coupon program. This could be an example of spillover since customers purchased EnerChoice through the awareness building aspects of the program, rather than the incentive itself. The result is a cost-effective program in terms of reduced expenditures on incentives, marketing and administration.

Dealers are well educated on the merits of the EnerChoice label through the Companies' 2008 and 2009 dealer incentive program. As a result, a consumer incentive program to promote the purchase of energy efficient fireplaces is under development. Please refer to Section 5.5.2.3 for a discussion of the Companies' planned 2010 activities for EnerChoice fireplaces.

4.3.5 Summary

Overall the 2009 Residential Energy Efficiency Programs were very successful. They engaged customers in upgrading appliances to capture energy savings, supported the introduction of new provincial regulations, and reached out to the trades community for education and program awareness. These programs exemplify the role that a utility can play in market transformation.

4.4 Commercial Energy Efficiency Programs

Commercial customers are comprised of a variety of different organizations, both private and public in nature. They consume anywhere from 100 to over 40,000 GJ/yr, and are provided service through various customer rate classes. Typical examples include small and large multi residential buildings, small businesses, retail stores, large commercial office space, schools and universities, government, hospitals, and manufacturing facilities.

Commercial Energy Efficiency programs are aimed at encouraging commercial customers to reduce their overall consumption of natural gas, and their energy costs. These programs are offered in TGI and TGVI service areas, to both New Construction and Retrofit applications. Program offerings for TGI and TGVI are identical, and there is little difference for new construction and retrofit participants.

4.4.1 Program Goals

Commercial Energy Efficiency programs focus on the following objectives:

- Upgrade existing low efficiency systems to capture energy savings associated with reducing the overall consumption of natural gas
- Prepare the market for the adoption of new energy efficient technologies through incentives, and support of government regulations.
- Educate commercial customers about the advantages of energy efficient appliances and provide incentives for their adoption when necessary.
- Engage the trades community and manufacturers by supporting new, energy efficient technologies.
- Develop cost effective programs with a TRC greater than 1.0 that optimize the proportion of incentives over administration and marketing costs
- Conduct program evaluations that confirm savings claims and guide the development of future programs.

4.4.2 Three Commercial Energy Efficiency Offerings

Space heating accounts for approximately 75% of gas consumption in the commercial sector. Thus the Companies program offerings in this initial year of EEC activity are heavily oriented towards this end use. There were three Commercial Energy Efficiency programs offered in 2009:

- The Efficient Boiler Program,
- The Light Commercial ENERGY STAR® Boiler Program, and
- The Energy Assessment Program.

Table 4-6 provides a summary of the 2009 Commercial Energy Efficiency programs for TGI and TGVI.

Table 4-6: Solid performance from Commercial Energy Efficiency Programs in 2009

Program		Description	New Construction		Retrofit		TRC	
			Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	TGI	TGVI
1	Efficient Boiler Program	Rebate program for high efficiency commerical boilers > 300 MBH Input	15	9,869	928	635,497	2.0	2.0
2	Light Commercial ENERGY STAR® Boiler Program	Rebate program for high efficiency commerical boilers < 300 MBH Input	-	-	52	35,589	3.3	-
3	Energy Assessment Program	No charge energy use assessments of commercial facilities	N/A	N/A	77	12,396	2.4	-

The highlights of the 2009 Commercial Energy Efficiency programs are as follows:

- The Efficient Boiler Program increased its participant numbers over both 2007 and 2008 combined, due in large part to the reinstitution of funding for retrofit applications. As such, total spending and energy savings have increased significantly, while the TRC has remained a healthy 2.0, indicating that the program benefits are double its costs. The program will accrue net energy savings of 635,497 GJ's over the life time of the measure.
- The Light Commercial ENERGY STAR® Boiler Program was officially launched in August, and had, by year's end had provided incentives for 29 boilers. The program is already logging gas savings, and has initially turned in a strong TRC of 3.3, despite initial development and communications costs. The program accrued net energy savings of 35,589 GJ's over the life time of the measure.
- The Energy Assessment Program has continued to provide guidance in energy efficiency to commercial customers and has saved an average of 299 GJ/yr per participant, translating into a total projected energy savings of 12,396 GJ's. In 2009 the program turned in a TRC result of 2.4.

The Commercial Energy Efficiency programs are described in further detail below.

4.4.3 Efficient Boiler Program

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: 2005 – December 31, 2011
TGVI: 2005 – December 31, 2011

Incentive: Refer to Appendix D for full incentive details

Program Objectives:

- Reduce commercial sector gas consumption by encouraging the installation and use of high as opposed to standard efficiency boilers for space heating.
- Increase year over year participation rates in view of maximizing gas savings.
- Educate medium to large commercial customers about the advantages of high efficiency boilers and provide an incentive to facilitate the purchase of high efficiency technology.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs
- Support and prepare the way for any provincial regulation requiring increased boiler efficiency.

Background:

In operation since 2005, the Efficient Boiler Program is TGI and TGVI's flagship Commercial Energy Efficiency program aimed at reducing gas consumption associated with space heating. Fully ¾ of commercial gas consumption in British Columbia is used for space heating. The program is designed to stimulate investment in appropriately sized, energy-efficient space heating boilers that reduce natural gas usage and associated operating costs.

High efficiency boiler technology, when used as part of a properly designed heating system, generates significant annual energy savings over a comparatively long estimated measure life. In fact, high efficiency boilers represent one of the most significant sources of achievable savings for the commercial sector in British Columbia[8]. Fully 35% of such savings is attributable to high efficiency boilers. The use of boilers can be found, to varying degrees, in virtually all commercial area groups including the large and medium classes of commercial, multi-residential, and institutional customers. Typical installations include:

- Office buildings
- Apartment buildings / Stratas
- Schools / Universities
- Hospitals
- Care Homes

[8] *Terasen Gas Conservation Potential Review, Commercial Sector Report*, Marbek Resource Consultants, *April 2006*

Small commercial customers also use boilers, however this program is designed to incent larger boilers than they would typically require. Refer to the Light Commercial ENERGY STAR® Boiler program for a boiler program geared towards smaller commercial customers.

High efficiency boiler technology can be up to 95% efficient versus roughly 80% for new standard efficiency boilers. By encouraging the use of high efficiency boilers, the Efficient Boiler Program directly targets the commercial sector's most significant source of gas consumption (space heating) via one of its most widely used, and longest lasting gas burning appliances (boilers). Installing such boilers today has a lasting impact by reducing gas consumption now, while paving the way for market transformation and ultimately more stringent regulation.

Please refer to Appendix D for detailed program description.

Results:

Table 4-7 provides program highlights of the Efficient Boiler Program performance metrics for 2009. As may be seen, the performance as judged by TRC was solid, though some participation issues need to be addressed. A discussion of the results and program learnings follows the table.

Table 4-7: Efficient Boiler Program – Solid TRC performance

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	TGVI	1	13	2	892	9,869	18%	2.0
Retrofit	TGI	61	783	101	54,422	605,888	18%	2.0
	TGVI	3	39	5	2,676	29,608	18%	2.0

The program significantly increased its participation rate surpassing the combined totals of 2007 and 2008. This was largely due to the reinstitution of incentives for retrofit applications as of October 1, 2008; all but 1 participant in 2009 was a retrofit customer. Incentives for retrofit customers were excluded throughout most of 2008 due to budgetary constraints. Once the DSM budget situation improved, incentives for retrofits were once again made available.

While program participation in 2009 remains less than the program's all time high participation rate of 85 participants in 2006, it never-the-less represents a notable success in view of the generally poor prevailing economic climate and the uncertainty over the availability of incentives created by the exclusion of retrofit customers in early 2008. Furthermore, participants who complete the installation of their boiler and receive an incentive payment generally report that the incentive is better than adequate.

While the increased participation is encouraging, the lack of new construction participants as well as the low participation rate from Vancouver Island are both notable. There are several factors which have likely contributed to this situation:

1. It seems reasonable that the economic situation of late 2008 through most of 2009 played a central role in discouraging new construction projects which may have otherwise participated in the program.

2. Based on discussions with potential participants there appears to be a perception of uncertainty in the market surrounding the availability of the incentive. This seems to be largely due to program termination dates previously in place (i.e. previous program deadline, August 2009). New construction participants especially believe that the program's funding will expire before they can finish constructing their new building / facility, leading them to conclude that attempting to participate in the program is not worth their time or effort.

3. The use of fuel oil for boilers remains significant on the island. A sizeable proportion of these oil burning potential participants have limited familiarity with TGVI may thus not be aware of the company's incentive programs. This would necessarily preclude their participation in the program.

By year end the efficient boiler program had committed to pay as much as $834,800 to participants who successfully complete their boiler installation within 1 year of submitting their program application. This compares reasonably well with the highest ever annual commitment of $1,075,455 experienced in 2006, before the availability of the rebate was first eliminated and then reinstated for retrofit applications. The objective now is to build upon the current momentum and rate of participation in the program in order to maximize commercial sector gas savings.

When total program spending is compared to the avoided cost of the gas the program turns in healthy TRC results in the neighbourhood of 2.0 indicating significant total benefits result from the operation of this program. With Free Rider Rate estimated to be approximately 18%, the annual net energy savings derived from the program's participants is 57,990 GJ's. Given that the program's target customer group annually consumes more than 13,000,000 GJ's for space heating, significant room for growth remains.
For cost benefit analysis please refer to Appendix J.

<u>Planned Improvements For 2010</u>

In 2010 the Companies' will expend additional time and effort dedicated to promotions in order to raise awareness of the program and increase participation from the new construction and Vancouver Island markets.

In 2010 the Companies plan to perform an in-depth evaluation study on the program's performance at reducing gas consumption. The results of this study will serve to confirm and/or provide additional insight into the gas savings associated with the program. For additional information on the proposed evaluation study please refer to Section 5.13.3.1.

Further to the issues noted above, the program process has received generalized criticism from program participants for being too cumbersome. In addition to making the program complex and difficult for many potential participants to understand, the process also imposes a significant administrative burden on the Companies. The Companies plan to streamline the program process in 2010.

4.4.4 Light Commercial ENERGY STAR® Boiler Program

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: August, 2009 – December 31, 2011
TGVI: August, 2009 – December 31, 2011

Incentive:

Providing that the boiler is used for space heating and/or domestic water heating in combination with space heating:

- Condensing boilers: $5 per MBH[9]
- Near condensing boilers: $3 per MBH

Program Objectives:

- Reduce commercial sector gas consumption by encouraging the installation and use of high efficiency (ENERGY STAR® rated) as opposed to standard efficiency boilers for space heating.
- Increase year over year participation rates in view of maximizing gas savings.
- Educate small to medium commercial customers about the advantages of energy efficient appliances and provide incentives for their adoption when necessary.
- Engage the trades community and manufacturers by supporting new, energy efficient technologies.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs
- Support and prepare the way for any provincial regulation requiring increased boiler efficiency.

Background:

Launched in August of 2009, the Light Commercial ENERGY STAR® Boiler Program is TGI and TGVI's most recent offering aimed at reducing energy consumption associated with space heating. In contrast to the Efficient Boiler Program described above, this program focuses on smaller boilers. The program designed to encourage small to medium commercial customers to install energy efficient boilers by offering a cash incentive that is calculated based on the quantity, size and type of boiler.

High efficiency boiler technology, when used as part of a properly designed heating system, generates significant annual energy savings over a comparatively long estimated measure life. Refer to Section 4.4.3 for a description of the benefits and energy saving potential of high efficiency boilers. Typical facilities which see the installation of small boilers include:

- Small to medium apartment buildings

[9] Note: 1 MBH = 1000 BTU/hr (BTU = British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit)

- Small to medium office buildings
- Schools / Universities

Please refer to Appendix D for a detailed program description.

Results:

While the program's newness resulted in limited initial uptake, the TRC performance was generally encouraging.

Table 4-8 provides program highlights of the Light Commercial ENERGY STAR® Boiler Program performance metrics for 2009. A discussion of the results and program learnings follows the table.

Table 4-8: Light Commercial ENERGY STAR® Boiler Program – Encouraging start but work to be done on participation

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	TGI	11	32	20	3,197	35,589	18%	3.3

The Light Commercial ENERGY STAR® boiler program is brand new as of August of 2009. The initial response to the program has been positive from those who have successfully participated, with participants citing the program's simplicity and speed of response as positive qualities.

On the other hand program awareness remains low for the moment due to its relative newness; a situation which is quite clearly reflected in the participation numbers. The program's participants have thus far been entirely from the TGI retrofit market. Many design professionals, trades people and target customers remain unaware of the program's existence. A sustained direct promotional effort, as well as collaboration with partners in industry associations, is required to raise the program's profile among a wider audience.

For cost benefit analysis please refer to Appendix J.

Planned Improvements For 2010

2010 will see enhanced program promotions and, late in the year, a stakeholder feedback session in view of raising awareness and participation levels for the program for both TGI and TGV.

So far, the program has turned in a very healthy TRC result of 3.3 in the TGI retrofit market. It is however too early in the program lifespan to draw solid conclusions based on this number. Should the TRC remain high through 2010 despite increased spending on program promotions, consideration will be given to increasing the value of the incentive or providing an additional incentive to the installer, independent of that which is currently delivered to the customer.

4.4.5 Energy Assessment Program

Program Area: Commercial Energy Efficiency Programs

Target Market: Retrofit

Duration: TGI: 2001 – December 31, 2011
TGVI: 2001 – December 31, 2011

Incentive: A free, walkthrough energy assessment ($1200 value).

Program Objectives:

- Enable and encourage commercial customers to reduce gas consumption by identifying sources of high gas consumption within their facilities and proposing implementable measures aimed at reducing consumption.
- Educate commercial customers about gas use within their own facilities and the steps they can take to minimize consumption.
- Foster a culture of conservation among commercial sector customers (including Multi-Unit Residential Buildings (“MURBs”), institutional and manufacturing customers) by assisting them to review their energy consumption critically.
- Direct (where applicable) participants to available incentive programs including Terasen’s existing boiler programs.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs

Background:

The Energy Assessment Program has been in operation since 2001 with minor modifications over the years. This program is designed to identify inefficiencies in natural gas energy consumption and provide recommended solutions in the following sectors: condominium and apartments, food processors, greenhouses, hospitals, hotels, industry, offices, recreation centres, restaurants, schools, warehouses/offices, and wood products.

Inefficiencies are identified in participant’s facilities via an onsite walkthrough assessment by an energy efficiency consultant. The consultant then produces a report, describing the observed inefficiencies and outlining proposed energy savings measures which may be implemented to reduce gas consumption. The Companies then forward the report to the participant.

The Energy Assessment program allows the Companies to help foster a culture of conservation among commercial customers by visiting their facilities directly and helping educate them on their gas use. It is an important “first contact” which can lead to subsequent savings via the implementation of energy savings measures, with the assistance of incentive programs where applicable.

Please refer to Appendix D for a detailed program description and Section 5.13.3.3 for details on the Energy Assessment Program Evaluation.

Results:

While participation in the program declined between 2008 and 2009, the program was still able to generate gas savings.

Table 4-9 provides program highlights of the Energy Assessment Program performance metrics for 2009. The program continues to generate savings, though modifications are required in 2010. A discussion of the results and program learnings follows the table.

Table 4-9: Energy Assessment Program - Continues to generate savings

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	TGI	49	59	18	13,186	12,396	10%	2.4

Participation in this program was down from 77 participants in 2008 to 49 in 2009 and there were no participants in the program for TGVI. Despite the "free to participant" nature of the program, the economic situation of 2008 / 2009 no doubt precluded any thought of investing in energy efficiency among many organizations as business managers focused on the health of their core business. Furthermore the program has not been strenuously promoted due to issues as discussed below.
For cost benefit analysis please refer to Appendix J.
Planned Improvements For 2010

The current design of the program will undergo several changes in 2010 in view of addressing several current and future issues as well as enhancing its overall performance at reducing gas consumption per participant. More specifically some of the areas for improvement include:

1. A low rate of implementation of the recommended energy savings measures.
2. No commitment by participants to implement any of the energy savings measures.
3. The lack of a formal mechanism to track energy savings.
4. The level of detail provided is increasingly not up to what many participants require.
5. The attribution of energy savings will increasingly conflict with other programs

For a description of the proposed modifications to address these issues refer to Section 5.6.2.4. Once changes are made to the program process and administration more effort will be expended on raising the program's awareness level in the market place. This can very likely be accomplished via industry partners in addition to the Companies' own promotional efforts.

The Companies are currently engaged in a second evaluation study of the program (an initial study was completed in 2008) based on participation from July 2007 through July 2009. This study will provide additional needed insight into the program's performance and allow the Companies to confirm the data underlying the performance results presented above. Furthermore the evaluation study will provide additional insight into where the program may be modified to enhance its performance. Refer to Section 5.13.3.3 for details on the Energy Assessment Program Evaluation.

4.4.6 Summary

The Companies have a track record of promoting Commercial Energy Efficiency programs. With the additional funding provided through Commission approvals they significantly broadened their efforts in TGI and TGVI service areas, to both New Construction and Retrofit applications. The Efficient Boiler Program, the Light Commercial ENERGY STAR® Boiler Program, and the Energy Assessment Program all generally performed well in 2009, delivering value to Customers. Using the experience gleaned from these programs the Companies have identified targeted opportunities to improve effectiveness and produce further gains in 2010.

4.5 Conservation for Affordable Housing Programs

Conservation for Affordable Housing programs focuses on reducing energy consumption for low income customers, which in turn reduces their energy costs and their GHGs. Conservation for Affordable Housing is a new area of activity for the Companies. In order to recognize its importance, the Companies have created a discrete Program Area for Conservation for Affordable Housing. Although the Companies have in the past been active within working groups and task forces related to energy conservation in affordable housing, there previously weren't financial resources to contribute towards implementing programs that reduce energy consumption for residents of Affordable Housing. Now, with the additional funding provided by the Commission EEC Decision, the Companies have been able to develop programs that target this important stakeholder group.

4.5.1 2009 Programs Led to Meaningful Early Results

After receiving approval to invest in the Conservation for Affordable Housing Program Area, the Companies have spent a significant portion of 2009 on facilitation, coordination, planning, and development of programs that will be implemented in 2010 and beyond.

Despite the longer term focus of this work, the Companies also rolled out three projects that were completed in 2009. These projects were:

- The Meridian Village Project;
- The LiveSmart Carry Over Project (through the MEMPR Low Income Partnership Funding); and
- The Energy Conservation for Affordable Housing Forum.

In addition, the Companies have also continued the facilitation of the BC Working Group for Energy Efficiency for Affordable Housing and the Affordable Energy Conservation Task Force.

Table 4-10 provides a summary of the 2009 Conservation for Affordable Housing projects for the Companies. The 2009 projects were focused on retrofits and were implemented in TGI's service territory however the Energy Conservation for Affordable Housing Forum had a province-wide perspective.

Table 4-10: 2009 Conservation for Affordable Housing Projects for TGI and TGVI

Project		Description	Retrofit			
			# of Units or Participants	Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	TRC
1	Meridian Village	A partnership to upgrade 124 furnaces in a MetroVancouver owned social housing complex	124	230	14,236	0.7
2	LiveSmart Carry Over	Energy efficiency retrofits in five affordable housing complexes as part of the completion of LEAP.	557	989	67,601	1.1
3	Energy Conservation for Affordable Housing Forum	A collaborative forum to strengthen energy conservation for affordable housing in BC.	83	5	N/A	N/A

Notes:
1) The final assessments have not been completed for the LiveSmart Carry Over project. Figures presented here are estimates only.
2) LiveSmart Carry Over was funded through the MEMPR Low Income Partnership Funding and therefore not included in the portfolio level TRC calculation.
3) As per DSM regulation, the TRC caluculation for all low income programs applies a deemed benefit of 130% of what the benefit would recognized as in an able-to-pay program's TRC calculation. This regulation is applied in the TRC figures shown above.

Notable achievements through the Conservation for Affordable Housing projects in 2009 are:

- In 2009 the Companies invested a total of $1.219 million in retrofits benefiting 557 units and achieved a NPV of 81,837 GJs in energy savings.
- The Meridian Village project completed furnace upgrades in 124 town house units and achieved a projected energy savings of 14,236 GJs over the lifetime of the furnaces. The program achieved a TRC of 0.7. This set of town houses received upgraded furnaces through this Meridian Village project and also received additional energy efficiency measures through the LiveSmart Carry Over project.
- The LiveSmart Carry Over project completed a variety of energy efficiency upgrades benefiting a total of 557 units. Final evaluation of this project will be completed by the end of April, 2010. Estimated savings are 67,601 GJs based on prior LiveSmart Energy Assistance Program experience which would equate to a TRC of 1.1.
- The Energy Conservation for Affordable Housing Forum attracted a total of 83 participants. The Companies were a sponsor of the Forum, contributing $5,000 to the costs of the forum, and played a central role in the coordination, administration and facilitation of the Forum.

Conservation for Affordable Housing projects are described in further detail below.

4.5.2 Meridian Village Furnace Upgrade

Program Area: Conservation for Affordable Housing Programs

Target Market: Retrofit

Duration: Furnaces installed between September 2009 and December 2009

Incentive: $1,850 per furnace

Partners: Metro Vancouver Housing Corporation ("MVHC"), LiveSmart Energy Assistance Program ("LEAP"), ecoEnergy

Program Objectives:

- Carry out an exploratory furnace upgrade project in a social housing complex to determine savings potential.
- Extend the LiveSmart Carry Over project's energy savings by upgrading 124 furnaces to high efficiency models.
- Create a partnership with MVHC, a key social housing provider.
- Gain experience and build capacity within the Conservation for Affordable Housing Program Area.

Background:

The Meridian Village furnace upgrade project was the Companies' first project in the Conservation for Affordable Housing program area. The furnace upgrade project, described in this section was an opportunity to extend the other energy savings measures that this town house complex received under the LiveSmart Carry Over project, described in the following section. Together, these two projects provided the opportunity to analyse the impact of a comprehensive energy efficiency retrofit in low income town houses. Total savings from the Meridian Village project combined with the LiveSmart Carry Over project will be compiled in April 2010. This section describes savings attributed to the furnace installation alone.

The Meridian Village project was presented to Terasen Gas as a proposal from eaga Canada Services Inc[10] on behalf of the MEMPR's LEAP program aimed at social housing providers. The Meridian Village complex, located in Port Coquitlam, is owned by MVHC.

TGI contributed $229,400 of the total $620,000 that was used to install 124 high-efficiency furnaces. Contributions are summarized in Table 4-11.

Table 4-11: Meridian Village Contributors

# of Furnaces	LEAP	ecoENERGY	Terasen Gas	MVHC
124	$80,600	$80,600	$229,400	$229,400

The townhouses in this complex are individually metered and the tenants all pay rent to the owner. This was an especially good selection for energy efficiency investments because all the furnaces were oversized at 60,000 to 70,000 BTU. By installing smaller, two-stage high efficiency furnaces (94% AFUE, 45,000 BTU), the furnaces will now be able to run at approximately 25,000 BTU the majority of the time.

Results:

Table 4-12 provides highlights of the Meridian Village Project performance metrics for 2009.

[10] eaga Canada Services Inc. a social enterprise and provider of green support services and solutions in the residential sector. eaga Canada Services Inc. focuses on tackling climate change, promoting residential energy efficiency and delivering social inclusion for low income households

Table 4-12: Meridian Village Performance Summary

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
TGI	124	229	0	1352	14,236	N/A	0.7

Note: As per DSM regulation, the TRC caluculation for all low income programs applies a deemed benefit of 130% of what the benefit would recognized as in an able-to-pay program's TRC calculation. This regulation is applied in the TRC figures shown above.

Overall, this project achieved the objective of extending the LEAP and ecoEnergy grants and extending the measures that were installed through the LiveSmart Carry Over Program. All 124 units had new high efficiency furnaces installed which resulted in NPV energy savings of 14,236 GJ's based on 10.9 GJ's savings per unit annually. The Companies incurred less than $500 in non-incentive costs largely due to MVHC taking on much of the administration of this project. The Free Rider Rate was not applicable for this project because none of these furnaces would have been upgraded if it were not for TGI's incentive.

An additional benefit of this project is that there is an improvement to quality-of-life for the residents resulting from better air quality and quieter furnaces. By installing new high efficiency furnaces that use smaller motors, the noise from the furnace operation was reduced considerably and the new standard-sized air filters can be easily and regularly replaced resulting in far more effective air filtration than the old custom-sized and improperly fitted filters, however this benefit cannot be monetized.

The resulting TRC (0.7) is lower than 1.0, which indicates that the 30% energy savings benefits allowed for low-income conservation activities may not be adequate to push programs for this sector, where the full cost of the measure rather than just the incremental cost for energy efficiency goes into the cost side of the TRC calculation. The Companies intend to hold discussions with MEMPR on this topic, to see what actions need to be taken to ensure that covering the full cost of a measure is viable from a benefit-cost perspective.

For cost benefit analysis please refer to Appendix J.

4.5.3 LiveSmart Carry Over

Program Area: Conservation for Affordable Housing Programs

Target Market: Retrofit

Duration: Installations completed between September 2009 and January 2010.

Incentive: Average incentive of $1,700 per unit

Program Objectives:

Complete the energy efficiency installations that were identified under the LEAP program.

Background:

On March 31, 2009, through the Low Income Partnership Funding agreement, MEMPR awarded TGI and TGVI a grant of $5.155 million to support and develop DSM programs for low-income individuals in British Columbia. These funds are incremental to the funds approved in the EEC Decision and the LiveSmart Carry Over project was entirely funded with the Low Income Partnership Funding (described further in Section 5.8.3.4).

In August 2009, MEMPR informed the Companies that due to fiscal restructuring occurring within government, the budget that MEMPR had allocated for the LEAP was cut by as much as $1.4 million. The LEAP was a provincial energy efficiency program for low income residents of British Columbia that was developed and administered by MEMPR. MEMPR encouraged the Companies to use the Low Income Partnership Funding to complete energy efficiency retrofits in five affordable housing complexes throughout Metro Vancouver. These retrofits would otherwise not be completed. These retrofits included items such as new high efficiency boilers, programmable thermostats, attic insulation, draft proofing and other energy savings measures. The buildings and estimated efficiency measures for this project are shown in Appendix E.

The Companies committed $965,803 to complete the energy efficiency retrofits for the five sites that were gas customers. As at the end of 2009, this contract was substantially complete.

Results:

Table 4-13 provides highlights of the LiveSmart Carry Over Project performance metrics for 2009 based on the budgeted expectations given that the final results of the project will not be known until the formal post-installation energy assessments are completed.

Table 4-13: LiveSmart Carry Over Performance Summary (Based on Budget Expectations)

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
TGI	557	947	42	7,130	67,601	N/A	1.1

Note: The cost-benefit analysis and the TRC shown above are using the same cost-benefit analysis used for all low-income EEC programs (including the deemed benefit of 130% for low-income programs) however, this program is funded through the MEMPR Low Income Partnership Funding (not the funds approved through the EEC Application).

The $947,000 in incentives is based on a budget allowance of $1,700 per unit. Estimates at the onset of the project were that the installations would average $1,667 per unit as represented by the total installation amount of $928,462 in Appendix E. The Non-Incentive amount of $42,000 includes the estimated $37,341 for assessments and an estimate of $5,000 for the Companies' administration, communication, evaluation and development. The projected NPV energy savings is 67,601 GJs which yields a TRC of 1.1.

4.5.4 Working Group and Task Force

Throughout 2009, the Companies have continued the facilitation of the BC Working Group for Energy Efficiency for Affordable Housing ("Working Group") and the Affordable Energy Conservation Task Force ("Task Force").

At the request of MEMPR, the Companies formed the Working Group in September 2008 with the objective of ensuring that lower income homes can actively participate in, and benefit from, targeted energy efficiency programs. The Working Group consists of a large and diverse group of stakeholders engaged in the topic of energy efficiency in the low income niche. Refer to Appendix E for the member organizations of this Working Group.

To meet the objective of ensuring that lower income homes are included in energy efficiency programs, work has begun on an Affordable Energy Conservation Strategy paper ("Strategy Paper"). Because the Working Group is large and geographically dispersed, a subset of the Working Group, called the Task Force has taken on the coordination role for the development of the Strategy Paper. The Task Force has also been responsible for coordinating an Affordable Energy Conservation Forum, held in March 2009. The Affordable Energy Conservation Forum is further described in the next section and the Member organizations of the Task Force are presented in Appendix E. The Strategy Paper is further described in Section 5.8.2.1.

4.5.5 Affordable Energy Conservation Forum

The Affordable Energy Conservation Forum (the "Forum") was coordinated by the Task Force and attended by many members of the Working Group. The Companies were a Sponsor for the Forum (contributing $5,000) and a primary coordinator for the event with two staff members actively involved in many aspects of facilitation, coordination and administration for the forum.

The event was successful in attracting a diverse group of 83 stakeholders (a full list of attending organizations is shown in Appendix E) to come together to discuss opportunities to deliver affordable energy conservation strategies to lower-income groups across the province.

The Forum focused on household energy efficiency and its objectives were as follows:

- To share information, strengthen relationships and build trust among stakeholders in energy efficiency, low-income service support and affordable housing sectors;
- To identify key issues, challenges and opportunities associated with integrating energy efficiency into low-income service support and affordable housing sectors;
- To identify best-practices from Low Income Energy Efficiency Programs ("LIEEPs") around the globe;
- To identify the key components of a "made in BC strategy" to address improving efficiency for low-income families; and
- To identify concrete steps to strengthen the availability of energy efficiency for low-income families with a focus on opportunities for increased coordination and/or collaboration among key stakeholders.

It was the hope of the Task Force that by establishing a baseline for dialogue, efforts at the forum could be directed toward finding affordable energy conservation solutions for lower income households in British Columbia.

Feedback from the Forum suggested that the event was effective in bringing together stakeholders to focus on energy poverty and the surrounding issues. The attendees appreciated hearing about success stories in other jurisdictions and expressed the desire to attend another similar forum in the future.

Another outcome of the Forum is the initiative of the Task Force to oversee the creation of the Strategy Paper. The Task Force has taken some steps towards creating this Strategy Paper however it is a lengthy process. This process is described further in Section 5.8.2.1.

The Task Force has had some initial discussions about hosting another Affordable Energy Conservation Forum and there is general agreement that a Forum should be held again at some point in 2010 or 2011 after the draft strategy has been written.

4.5.6 Summary

Conservation for Affordable Housing programs represent a new area of activity and focus for the Companies, one made viable through the funding approved by the Commission. And while 2009 was a year where the groundwork was being laid for this portfolio, three projects were also launched that delivered immediate results.

With this foundation in place the Companies look forward to continuing and broadening their efforts in 2010 and beyond.

4.6 Joint Initiatives

Joint Initiatives are EEC programs that involve mutually beneficial collaborations between groups such as government agencies or other utility partners. To further such Joint Initiatives programs, in July 2009 the Companies signed a Memorandum of Understanding ("MOU") with BC Hydro to facilitate increased utility collaboration on DSM. The purpose of the MOU is to drive efficiencies in program promotion, administration, and share DSM expertise to bring education and incentive programs to residents across BC. It is the Companies' intention to complete a similar MOU with FortisBC in 2010.

4.6.1 Joint Initiatives Draw on Complementary Strengths

The first Joint Initiatives the Companies will pursue are collaborations between utilities and government to develop market adoption of new technologies and energy efficiency education and outreach. Utilities have the funds and technical resources to manage pilots for new technologies to validate savings claims. As technology becomes main stream, utility incentive programs can help support education and ultimately compliance of new efficiency regulations across the supply chain. Governments can support activities such as home energy assessments, where no energy savings can be attributed to the assessments themselves, while utilizing the utility's cost-effective marketing channels to their shared constituency of consumers and trades.

The second type of Joint Initiative the Companies intend to seek out are those between utility partners. These are compelling because they can extend the market reach of a program to include all households regardless of whether or not they use electric or natural gas space and water heating. Each utility has strong brand recognition and cost-effective marketing channels. Working together creates synergies that drive program participation, energy savings and outreach while reducing administration and marketing costs.

4.6.2 Overview: 2009 Joint Initiatives

The Companies have launched Joint Initiatives that are benefiting customers and furthering EEC goals. Joint Initiatives are EEC programs that enable partnerships between utilities and government or utilities and other utilities. These partnerships enable sharing of costs, expertise and more in furthering the pursuit of EEC goals.

There were two actual Joint Initiative programs offered in 2009: EcoEnergy Home Energy Assessments in partnership with LiveSmart BC and a Tier 3 ENERGY STAR® Washer and Dryer Rebate Program in partnership with FortisBC. Table 4-14 provides a summary of the 2009 Joint Initiatives programs for TGI and TGVI.

Table 4-14: 2009 Joint Initiatives Programs for TGI and TGVI

	Program	Description	Retrofit			
			Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	TRC	
					TGI	TGVI
1	EcoEnergy Home Energy Assessments (D-Visits) through LiveSmart BC	$75 Incentive to cover the partial cost of Home Energy Assessment provided by an NRCan certified Home Energy Advisor	408	0	N/A	N/A
2	Tier 3 ENERGY STAR® Washer and Dryer Rebate with Fortis BC - Six week pilot	$50 Incentive for Tier 3 washers and dryers in Fortis BC service territory	6.5	1,905	0.8	N/A

The highlights of the 2009 Joint Initiatives programs are as follows:

- EcoEnergy Home Assessment funding, provided through a partnership with LiveSmart BC, demonstrates the Companies' support for energy assessments as a critical first step in the retrofit process and "whole home" incentives. Over $400,000 in assessment funding was distributed in 2009, although no energy savings can be claimed directly as a result of this program. Rather, energy assessments are an avenue into other retrofit incentive programs that drive energy savings.

- Fortis BC Tier 3 ENERGY STAR® Washer and Dryer Rebate Pilot promoted energy and water efficient laundry practices in the Okanagan. TGI partnered with FortisBC in order to extend the reach to natural gas water heating customers. The six-week pilot was so successful that a 2010 program is under development.

These Joint Initiatives programs are described in further detail below.

4.6.2.1 EcoEnergy Home Energy Assessment (D-Visit Audit) through LiveSmart BC

Program Area: Joint Initiatives

Target Market: Retrofit

Duration: August 16, 2009 through March 31, 2010

Incentive: $75 subsidy from utility partner (based on fuel source) and $75 from MEMPR

Partners: TGI, TGVI, BC Hydro, FortisBC and MEMPR

Program Administration:

LiveSmart BC

Program Objectives:

This program intends to achieve the following:

- Provide incentives for Home Energy Assessments as the first step in improving the energy efficiency of existing building stock
- Support LiveSmart BC in the interim funding period prior to new program iteration in April, 2010
- Initiate collaborative discussions with BC Hydro, FortisBC and MEMPR

Background:

The LiveSmart BC Residential Retrofit Incentive Initiative was initially launched in May 2008 as a three year program. However with significant federal and provincial incentives, the program was oversubscribed, and provincial funding expired on August 16, 2009. At that time the Companies chose to contribute funds in support of the LiveSmart BC program, and to expand the opportunities for energy efficient retrofits for their customers.

The Companies agreed to provide a $75 subsidy for home energy assessments (D-Visit audits) to natural gas heated homes in their service territory, while the electric utilities provide the same subsidy for electrically heated homes in their service territories. MEMPR matched the utilities $75 for a total of $150 subsidy for home energy assessments. LiveSmart BC administered the program and utilities flowed subsidy payments through MEMPR to the service organizations known as Certified Energy Advisors.

Results:

In 2009, TGI supported 5,182 assessments and TGVI supported 263 for a distribution of $408,375 in subsidy funds. Total non-incentive dollars were $15,895 for TGI and $3,516 for TGVI and included $10,000 for LiveSmart BC program data for evaluation. LiveSmart BC covered program administration costs.

Due to the nature of this project in that the assessment is an evaluation step only, the Companies cannot claim energy savings for these expenditures.

Planned Improvements for 2010:

The Companies recognize the importance of home energy assessments as the first step in the energy efficient retrofits. Through the process, homeowners are made aware of retrofits that can be undertaken to improve energy efficiency, reduce energy bills and improve the comfort of their home. It is anticipated that the Companies will have provided funding for an estimated 15, 000 assessments and contributed $1.125 million from August 16, 2009 through March 31, 2010, which is the provincial fiscal year end.

4.6.2.2 FortisBC PowerSense ENERGY STAR® Tier 3 Washer Dryer Pilot

Program Area: Joint Initiatives

Target Market: Retrofit market in FortisBC territory (Okanagan)

Duration: Six Weeks Summer 2009

Incentive: $50 per washer and $50 per dryer

Partner: FortisBC

Program Administration:

FortisBC

Program Objectives:

- Capture the energy savings associated with promoting energy and water efficient laundry practices in the Okanagan.
- Determine program participation rates and logistics for a 2010 program
- Determine logistics associated with utility collaboration for appliance programs

Background:

As part of the EEC domestic hot water strategy, the Companies can provide incentives for energy and water efficient appliances. To do so most effectively the Companies will partner with BC Hydro and FortisBC in order to extend the reach of the FortisBC washer and dryer rebate program to homes with natural gas space heating and water heating.

The FortisBC washer and dryer rebate program was part of a larger pilot project to promote energy efficient laundry practices in the Okanagan. FortisBC ran a six week pilot in the early summer of 2009. In partnership with Terasen Gas, it provided $100 incentives to customers who purchased a Tier 3 ENERGY STAR® washer and dryer or $50 for a Tier 3 washer.

Tier 3 is the Consortium of Energy Efficiency's highest energy efficiency designation for the most energy and water efficient models available in the marketplace. TGI provided the Tier 3 washer and dryer incentives to any program participants who heated their water with natural gas or installed natural gas dryers.

In joining with FortisBC the Companies and their partner are able to share marketing and administration costs, and more effectively educate customers about the advantages of ENERGY STAR® appliances and conservation.

Results:

Although the pilot project was conducted during a low purchase season and with limited advertising and promotion, the program was successful, far exceeding projected goals. In total, 239 rebates were distributed with about 90 per cent of the rebates given to participants who replaced both a washer and a dryer.

Table 4-15 provides program highlights of the FortisBC Tier 3 ENERGY STAR® Washer and Dryer Rebate Program Performance metrics for 2009.

Table 4-15: FortisBC Tier 3 ENERGY STAR® Washer and Dryer Rebate Program Performance Summary

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
TGI	130	6.5	-	210	1,905	43%	0.8

Participant numbers are based on 121 washers and 9 natural gas dryers

One hundred and twenty-one washers and nine natural gas dryers were eligible for a TGI rebate. The washer count was based on participants declaring that they had natural gas water heating. The dryer count was based on an eight per cent estimate of natural gas dryers in the FortisBC service areas as determined by their 2008 REUS.

As outlined in Table 4-15, based on 2009 participants, the program is achieving annual gas savings of 210 GJ's and a projected 1,905 GJ's over the life time of the measure. For this analysis a Free Rider Rate of 43% was used. This represents the proportion of 2006 shipped appliances that are ENERGY STAR®, a number obtained from FortisBC, and BC Hydro. Since rebates are only applied to the Tier 3 portion of ENERGY STAR® models, TGI recognizes that the Free Rider Rate is over-estimated. The Companies are contacting Canadian Appliance Manufacturers Association ("CAMA") and NRCan, to obtain a more accurate estimate of the market share of Tier 3 washers and dryers as a portion of total ENERGY STAR® appliances in the market. Once known, this number will be used for the Free Rider Rate for 2010 program development.

TGI paid out $6,500 in incentive dollars and all marketing and administrative support was provided by FortisBC. The TRC was 0.8 based on the 43% Free Rider Rate that over-estimates the portion of Tier 3 appliances. The model will be revised once Tier 3 market data is obtained.

For cost benefit analysis please refer to Appendix J.

Planned Improvements for 2010:

The FortisBC Tier 3 ENERGY STAR® washer and dryer program met the objectives of promoting energy and water efficient laundry practices in the Okanagan, capturing the savings associated with the installations, and gaining the knowledge to roll out a more extensive program in 2010. Although the TRC was marginal, the Companies believe energy efficient washer programs are fundamental to the domestic hot water strategy in terms of renewing appliances and outreach on the importance of hot water conservation.

The outcome of this pilot is a learning exercise for future energy and water efficiency appliance programs for utility partner collaboration.

4.6.3 Summary

Joint Initiative programs provide numerous mutually beneficial advantages to all partners in the collaboration. In working together, utilities and government partners can extend the reach of incentives, provide cost-effective education and outreach, and generate even greater energy savings and greenhouse gas reductions. Based on 2009 successes, the Companies are expanding their Joint Initiative projects in 2010 (refer to Section 5.9).

4.7 Conservation, Education and Outreach ("CEO") Programs

Successful EEC programs depend on creating and promoting awareness, which in turn generates desire by all customers to participate in EEC activities. One important way to generate this kind of support is to foster and develop a conservation culture within British Columbia. To achieve this, the Companies have established and implemented Conservation, Education and Outreach ("CEO") initiatives. The goal is to ensure that customers are aware of and will be receptive to incentive programs when they are proposed. Additionally, CEO initiatives support the energy conservation and GHG reduction goals established by the Government of BC.

4.7.1 Supporting EEC Goals through Shared Principles

CEO initiatives have two priorities:

- Assist the community in embracing change through education of the public on energy conservation behaviours and benefits; and
- Increase participation in EEC incentive programs through education on the Companies' conservation initiatives in general.

CEO initiatives follow many of the same program principles that were put forth in the EEC Application, in particular:

- Programs will have a goal of universality; offering access to energy efficiency and conservation for all residential and commercial customers, including low income customers through the DSM for Affordable Housing initiative;

- Where possible, programs will be uniform across the service territories of the Companies, so customers will have equal participation opportunity; and
- Programs will be multi-year so as to create a sense of funding certainty necessary to effectively implement them in the marketplace.

4.7.2 Diverse Possibilities Require Careful Screening

Given the diverse range of possible CEO activities, and the numerous regions and customer groups they can target, care must be taken when decided which initiatives to pursue. The Companies consider many factors before settling on the right initiatives. These include (but are not limited to):

- potential participant reach;
- geographically spread across TGI and TGVI service territories;
- attendance demographics and alignment of those demographics with our customers;
- media involvement, i.e. print, online, radio, in-person, cooperative advertising, or a combination thereof; and
- level of engagement with customers; activity-based vs. sponsorships and partnerships with third parties.

CEO initiatives are not individually put through the California Standards Tests at a program level. For further discussion on CEO evaluation techniques, refer to Section 5.13.3.4 and Appendix D.

4.7.3 Evolving Focus of CEO Activities Reflected in 2009 Priorities

With the EEC Decision and the new funding that accompanied it also came a new focus for CEO activities. This new focus came partly from the Commission Panel, which directed the Companies to review and refocus the CEO program.

Historically, the Companies have distributed print and online publications, exhibited at home and trade shows, and engaged in limited involvement with school programs.

And while in its EEC Application the Companies submitted a proposal developed in consultation with Wasserman + Partners Advertising, the EEC Decision suggested allocating funds away from the mass media campaign. Instead it was suggested initiatives should encompass other initiatives, including conservation education activities within the school system and affordable housing initiatives.

In 2009, the Companies expanded on initiatives which had previous proven to be successful in reaching a large number of consumers. In addition, the Companies also launched a number of new initiatives in Q4. Existing and new CEO initiatives have used limited mass media channels, and instead increased the engagement level with the public in order to achieve the CEO objectives.

As many of these initiatives began in Q4 and are continuing into 2010, much of evaluation for the CEO initiatives will be conducted in 2010 and are further described in Section 5.10. Table 4-16 provides a summary of the 2009 CEO initiatives and costs for TGI and TGVI.

Table 4-16: 2009 CEO Initiatives and Costs

	Initiatives	Description	Expenditures ($000s) TGI	TGVI	Total Expenditure ($000s)
1	Print and Online Publications	Energy conservation education promoted through bill inserts, newspaper and magazine ads, trade show guides, newsletters, directories, and terasengas.com.	**209**	**12**	**221**
2	Trade Shows and Events	Participated in residential home shows and commercial trade shows to reach customers and educate on energy efficiency rebate programs.	**76**	**26**	**102**
3	Students and Schools Outreach: Destination Conservation	K-12 program educating students and teachers about energy conservation and efficiency and providing them with cirricula and support materials.			
4	Students and Schools Outreach: Beyond Recycling	K-7 program educating students and teachers about energy conservation in West and East Kootenays			
5	Students and Schools Outreach: BC Green Games	K-12 competition for students to submit digital entries of their environmental projects.			
6	Students and Schools Outreach: School Assembly Presentations	K-7 school assembly presentations on energy conservation through interactive competitions.	**77**	**40**	**117**
7	Energy Champion Program	Educate children and youth about energy conservation behaviour changes, using tlregional sports team events..	**123**	**3**	**126**
8	Team Terasen Outreach	Outreach group delivering the Company's EEC message by connecting with customers at community events and festivals.	**45**	**0**	**45**
Total - Actual			**530**	**81**	**611**

The activities that make up the CEO initiatives are designed to create and promote awareness and educate the public. Increased awareness and education results in higher levels of participation in EEC activities and programs. The CEO activities for 2009 are set out and described in further detail below.

4.7.4 Print and Online Publications

Print and online publications are a cost-effective communications channel for delivery of information when compared to other communication channels such as television and mass media. The goal of the CEO print and online publications is to continually inform customers about various low-cost and no-cost upgrades they can perform at home to reduce their energy consumption. These publications also provide tips and hints to help guide consumers in their decision making when purchasing energy efficient equipment. Print publications target customers that are already contemplating home renovations or equipment upgrades.

In 2009, the Companies continued to provide information through: customer bill inserts, magazine advertisements, appliance information sheets, industry association newsletters and directories, and the corporate website, www.terasengas.com. Conservation messages focus on seasonal actions that coincide with customers' usage of natural gas, for example water heating actions in the summer and space heating in the fall and winter. The core conservation educational print publication is the "Hot Tips" booklet. This booklet contains a number of energy saving tips for homeowners. It is distributed to customers who participate in EEC activities and programs to identify further opportunities for energy efficiency. The Hot Tips booklet is distributed at all trade shows and events.

4.7.5 Trade Shows and Events

Trade show and event activities remain an effective way to reach customers with general low-cost and no-cost energy saving information. Trade shows and events create opportunities for dialogue with customers to answer general energy related questions, the Companies' incentive programs and promote participation.

The Companies have exhibited in trade shows since 2006, and continued trade show activity in 2009 by participating in residential home shows, and Canadian Home Builders' Association ("CHBA") events. The CHBA branches represent the British Columbia residential housing industry. The CHBA branches are made up of members within the residential construction industry who liaise with local governments, promote the interests of housing consumers, and work to ensure a fair market place.

The majority of the attendees to these trade shows are homeowners specifically looking for home renovation and equipment upgrade information. Depending on the show's size, total attendance can range from 5,000 to 45,000. In addition, the Companies have display exhibits at industry specific shows targeting business customers. Based on the increasing number of customer inquiries regarding conservation and equipment retrofits, the Companies believe that participation in trade shows is an essential initiative in educating customers about EEC programs. For a complete list of 2009 trade shows and events, please refer to Appendix D.

4.7.6 Students and Schools Outreach

While limited EEC funds limited the scope of activity, the Companies have historically supported conservation education in schools. Since receiving the EEC Decision, the Companies have increased their student and schools outreach through a variety of initiatives.

The goal of the Companies' school outreach activities is to educate students on natural gas and how gas fits into the province's energy picture. Education also explores energy conservation. By reaching out to students, the Companies are instilling conservation knowledge early. The goal is to foster a "culture of conservation".

As school programs generally run over the September to June time period, the initiatives described below are continuing into 2010 and will undergo an evaluation after they have been completed.

4.7.6.1 Destination Conservation

TGI has been supporting the Pacific Resource Conservation Society's Destination Conservation ("DC") program since the 1999-2000 school year. DC is a three-year K-12 school program involving students, teachers and school facilities management staff. In 2009, the DC program was made available for the TGVI service territory. The main purpose of the program is to educate schools on ways to reduce consumption of energy, waste and water, and motivate them to participate in energy conservation projects.

The Companies' support for DC is with a goal to bring in at least two additional school districts each year that would not have participated if the funding had not been available. With a multi-year school program in place, this provides stability in planning for the teacher and students to be able to build upon previous lessons and projects. Please refer to Appendix D for further detail on the Companies' funding and summary of the school districts that are currently participating in the DC program.

4.7.6.2 Beyond Recycling Program

The Beyond Recycling program is a new program in 2009, delivered by the Wildsight organization. Wildsight is a non-profit organization that focuses on biodiversity and healthy human communities in the Columbia region. Beyond Recycling provides students with an understanding of the connection between consumption patterns and environmental impacts.

The program contains lessons in reducing waste and greenhouse gas emissions and the role of natural gas in BC. The Companies co-fund the program with Environment Canada's EcoAction Community Funding Program, and FortisBC. The funding of this program is to ensure conservation outreach to schools that may not otherwise have been able to participate. See Appendix D for additional details on the Beyond Recycling program.

4.7.6.3 BC Green Games

BC Green Games, which first started in the 2008-2009 school year, is a province-wide competition hosted by Science World. This is a new initiative for the Companies, who are co-sponsoring with BC Hydro, and participate in both the Advisory Committee and Judging Panel. By co-sponsoring this initiative, the Companies are able to introduce the concept of natural gas as a resource and the need for energy conservation into the students' environmental projects.

The Green Games competition requires student teams to submit digital entries on their environmental projects for prizes. BC Green Games ties into other initiatives such as Destination Conservation and Beyond Recycling by providing a means to showcase team projects that were developed in those programs. Where Destination Conservation and Beyond Recycling successes would have been limited to the school or community, BC Green Games allows students to learn about initiatives in other schools, learn from their peers, and build on their existing or new projects for the next year. See Appendix D for additional details on BC Green Games.

4.7.6.4 School Assembly Presentations

By reaching into schools in partnership with athletes the Companies have taken meaningful actions in their efforts to foster a "culture of conservation." One such new initiative that the Companies supported in 2009 was a partnership with the BC Lions, where players from the team delivered interactive and informative presentations to assemblies at 50 elementary schools throughout BC.

The Companies co-funded the program along with LiveSmart BC, including both the Ministry of Education and the Ministry of the Environment, and Plutonic Power. The goal of this initiative was to launch a program that interacted with students and brought conservation education directly into the schools.

The assembly presentation featured B.C. Lions players talking to students about environmental responsibility and then engaging with them in competitive games that focused on recycling, water, and energy conservation. After the assembly, the players visited a Grade 5 class for a more in-depth lesson. This initiative was successful in that it reached at least 15,000 students. Partnering with the BC Lions has been beneficial as the players act as role models in promoting energy conservation and teamwork. Refer to Appendix D for a list of the schools that received the presentations.

4.7.6.5 Energy Champion Program

The Energy Champion program is a new initiative that the Companies developed and executed through local sports teams such as the BC Lions, Vancouver Giants, and the BC Hockey League. The goal of this program is to educate children and youth on energy conservation behaviour in a fun and rewarding manner.

These partnerships enable the Companies to leverage traditional media channels, such as radio, as well as the sports teams' online and social media channels. Because these channels are well developed in the market and reach out to a large number of the teams' fans, they provide the Companies with easy and immediate access to important stakeholders.

Moreover, partnering with regional sports clubs is an excellent way to reach out to families. Many families have children participating on sports teams and this program contributes to building positive associations with sports. Sports fans are generally loyal and highly engaged with teams they identify with. Often, engaging through team websites and newsletters allows the Companies targeted access to a specific audience through a low-cost communication channel.

The Energy Champion program is designed to engage both the youth audience and their parents. As the sports clubs' season runs from approximately September to April, the Energy Champion program will be continuing into 2010 and will undergo an evaluation after it has been completed. Please refer to Appendix D for detailed program description.

4.7.7 Team Terasen Outreach

The Team Terasen Outreach group ("Team Terasen") is similar to the BC Hydro Community Outreach team. First launched in 2007, it is a grassroots channel for delivering the Companies' EEC messages. It connects the Companies' customers through educational and interactive activities.

These events and activities generally attract a large audience as most of the events are free for the public to attend and reside in local communities. These activities have proven to be a cost-effective method of reaching out to the public that would normally be absent from home shows. By attending local community events, this allows customers to put a "face" to Terasen and learn about energy conservation. These opportunities contribute to the Companies' goal of building a culture of conservation.

In 2009, the goal of the Team Terasen was to expand into the Fraser Valley area and generally into corporate offices Refer to Appendix D for a complete list of events attended in 2009.

4.7.8 Summary

The CEO initiatives follow many of the same Program Principles that were put forth in the EEC Application. They are programs that are designed to be accessible to all customers, uniformly across TGI and TGVI territories, and are multi-year programs to ensure effective implementation and stability in the marketplace. The objective of CEO initiatives is to support the development of a conservation culture within British Columbia.

The initiatives described throughout this section will continue to promote and educate the public on energy conservation behaviours. The result will be fostering a "culture of conservation", which will benefit communities, increase participation in EEC incentive programs, and ultimately support shared goals of the Companies and province.

4.8 Enabling Activities

Enabling Activities are activities that support the Companies' EEC program development and delivery. They play a very important role within EEC in that they provide resources common to the support and ultimately, the delivery of all Program area activities.

4.8.1 Four Key Areas of Focus In 2009

In 2009, Enabling Activities fall into four major categories:

Research and Evaluation (Section 4.8.2): These include two general areas of activity: market research and program evaluation. Market research provides invaluable information used for planning and implementing effective programs and program evaluation helps to measure the effectiveness of a particular program and/or initiative. The highlights of the 2009 Research and Evaluation activities are as follows:

- Delivery of the 2008 REUS results, which includes data that assists in program planning and development, marketing, education and communication activities.

- Participation in the second wave of a study that focuses on North Americans' attitudes, perceptions and behaviours around sustainability and social responsibility as well as the impacts they have on lifestyle choices, brand relationships and purchase decisions.

- Completion of the Residential Retrofit Market Evaluation for Terasen Gas, to evaluate the residential retrofit market and audit the LiveSmart BC Residential Retrofit Incentive program to determine the viability of the LiveSmart BC brand and identify opportunities and threats in regarding its continued use.

- Completion of the second phase of the ENERGY STAR® Heating System Upgrade Evaluation that provides the Companies with estimates of program impact on natural gas sales and carbon dioxide emissions, in addition to determining the status of market transformation for high efficiency furnaces.

Efficiency Partners Program (Section 4.8.3): Formed to consolidate and enhance existing service and supplier relationships, to provide a delivery pathway for all EEC programs to customers. The EEC Decision ruling did not approve the discrete Trade Relations budget area put forward for these supporting activities as it was identified as a duplication of commercial and residential program delivery expenditure. The expenditures in this area are part of the overall overhead of EEC program delivery and are included in the overall EEC TRC. The EEC Stakeholder Group has not identified any objection to this approach. These various industry groups, including manufactures, service contractors, distributors and retailers, influence end use Residential and Commercial customers who make energy efficiency decisions. Customers will defer to advice received from these groups. The activity highlights of the Efficiency Partners Program for 2009 are as follows:

- Evaluation of the existing Qualified Dealer program and development of a new Contractor program for B-Ticket Contracting companies.

- Establish energy efficiency equipment manufacturer and supplier contacts.

- Identify all contractor stakeholder groups.

- Development of the new Contractor program with a rebrand and expansion of the scope of the existing TGVI Qualified Dealer program. Expansion of service areas to include the TGI Lower Mainland and Interior.

- TGVI surveys and Contractor focus groups were completed where EEC gained valuable information useful in developing the new support programs.

Codes and Standards (Section 4.8.4): Utilities play an important role in energy efficiency market transformation through support for the development of Codes and Standards. Government and regulating bodies are constantly seeking the participation and input of stakeholder groups, such as utilities, which have a unique understanding of energy supply and customer demand cycles. The Province's Energy Plan target levels and the timing of implementation are directly connected to effective market transformation in all EEC Program Areas. Utilities also play a role in keeping industry informed of developing codes and in alerting stakeholder groups of any unintended consequences that may arise out of proposed codes and standards. The activity highlights for the Codes and Standards for 2009 are as follows:

- Codes and Standards that have relevance to EEC program development were benchmarked.

- A focus on the development of the upcoming new construction building code with an EnerGuide 80 efficiency target. Involvement at this time is crucial as very aggressive code changes with poor direction could have a negative effect on EEC programs and the market transformation process.

Pilot Programs (4.8.5): These test the effectiveness of a particular measure in the EEC market place. Pilots are utilised to verify potential savings and identify potential market transformation barriers in order to effectively design and implement EEC programs. They are also theoretically (and practically) known to improve the success of market adoption of a particular technology; allowing for a select group of customers to test new technologies prior to widespread delivery to the market place. The highlights for the 2009 Pilot Programs are as follows:

- The Okanagan Spray N' Save Pilot Program was developed and launched. Its primary goal to verify potential energy savings for kitchen spray valves used in the commercial kitchen applications.

- The TGVI Furnace Servicing Pilot Program was implemented with the objective of promoting the benefits of annual furnace servicing. Increasing awareness of energy efficiency appliances. Customers are rewarded for their service with a $25 gift card to a local food store chain.

Table 4-17 below provides an overview of the 2009 expenditures for the Enabling Activities.

Table 4-17: 2009 Enabling Activities – Expenditures

Program		Description	Expenditure ($000s)	
			TGI	TGVI
1	Research and Evaluation*	Market Research and Evaluation for potential EEC programs	12	3
2	Efficiency Partners Program	Delivering EEC programs through B-Ticket Contract Companies	7	20
3	Codes and Standards	Codes and Standards related to EEC Program areas	10	3
4	Pilot Programs	Verify potential savings and identify market barriers	28	224**

*Note that $15K ($12K for TGI and $3K for TGVI) shown in this table reflects the actual amount spent on R&E Activities in 2009; the variance is expained in table 4-18.

**Note that $224,000 is based on $199,023 paid out in 2009 and $26,000 that will be paid in 2010.

Further information on each of the four areas of the 2009 Enabling Activities is listed below.

4.8.2 Research and Evaluation

In general, the Companies engage in two general areas of activity in this area: market research and program evaluation. Both are important – market research because it provides invaluable information used for planning and implementing effective programs; and program evaluation because it helps to measure the effectiveness of a particular program and/or initiative. This section provides a high level description of the research and evaluation activities EEC undertook in 2009; further details for these studies are provided in Appendix D.

4.8.2.1 Overview: Research

Market research is defined as systematic, objective collection and analysis of data about a particular target market, competition, and/or environment. It always incorporates some form of data collection; sometimes this means primary research (collected directly from a respondent), in other cases it means secondary research (collected from additional sources including related literature, the Internet and media sources).

It is important to conduct both secondary and primary research because together they allow the researchers to gain valuable insight about energy efficiency and conservation. Armed with this knowledge they are better able to develop, implement and evaluate programs and activities.

4.8.2.2 Overview: Evaluation

Evaluation of EEC programs and activities allows EEC staff to measure the effectiveness of the programs. Historically, the Companies have conducted evaluation studies for DSM programs since the late 1990s.

In general, program evaluations are designed in two stages. During the program design phase, the program evaluation concept is determined. The primary purpose of this is to understand the data that will be required for the evaluation, and to determine how much of this can be collected during program operation, for example, as part of the incentive application. By doing this development prior to program launch, better quality data can be collected and at a lower cost than if evaluation design is left until the time for the evaluation.

Once the program has operated for a sufficient period of time, an impact evaluation can be undertaken, and the detailed program evaluation plan will be developed. In the past, the evaluations conducted on behalf of the Companies have been conducted by outside consultants who have been selected based on relevant experience and cost. Once selected, the consultant then develops the detailed evaluation plan for review and discussion with the Companies. When the plan has been approved, the consultant typically begins the field research begins which includes but not limited to field research (i.e. with participants and with the relevant trade allies), billing analysis, sub metering etc. Once field research is completed, the study moves into the analysis phase that results into a final report and develops a report.

4.8.2.3 Research and Evaluation Studies Conducted In 2009

As enabling activities, these expenditures are included in the overall portfolio-level EEC TRC test results. Each of the research and evaluation activities the Companies undertook in 2009 are further discussed below; the costs associated with these activities are shown in the table below:

Table 4-18: 2009 Research and Evaluation Studies

	Study	Description	Expenditure ($000s)	Expenditure ($000s) 2009	Variance
1	REUS	Usage of natural gas in the residential sector	20	0	Paid in 2008
2	Residential Retrofit Market Evaluation	Assess LiveSmart BC brand awareness among BC residents	18	0	Paid in 2010
3	ENERGY STAR® Heating System Upgrade Evaluation	Verify energy savings for furninces and boilers	9	0	Paid in 2008
4	SHIFT Report	Attitudes towards sustainability	30	15	$15,000 paid in 2009 $15,000 paid in 2010
	Total		**77**	**15**	

In 2009, the Companies undertook a number of EEC research and evaluation activities, including REUS, Sustainability and Social Responsibility Attitudes Study ("SHIFT") Report, Residential Retrofit Market Evaluation for Terasen Gas, and ENERGY STAR® Heating System Upgrade Evaluation. The details of each study and summary of results are provided below.

4.8.2.4 Residential End USE Study ("REUS")

The primary aim of the 2008 REUS was to understand how natural gas was being used by TGI and TGVI's existing residential customers – and to compare the results with those from the earlier studies (described in Appendix D).

The findings suggest that declines in weather- normalized use rates (i.e. gas consumption per household) have been experienced in four of the five TGI's regions between 1999 and 2008. Overall, the Companies' use rates are down 15.5% since 2002, and 20.7% since 1999. Whistler was the only region experiencing an increase in its residential use rate since 2002 (+6.4%).

The 2008 REUS report is a resource for the Companies' management and staff to determine attributes regarding the existing customer base. It summarizes the survey data and identifies key trends specifically to meet the needs of forecasting, program planning, marketing, and communication functions within the Company. The EEC team uses the findings for program planning and development, marketing, education and communication activities. Further details are described in Appendix D.

4.8.2.5 Sustainability & Social Responsibility Attitudes Study Report ("SHIFT Report")

In the early 2009, the Companies had an opportunity to be involved in the second wave of an annual market research study that focuses on North Americans' attitudes, perceptions and behaviours around sustainability and social responsibility as well as the impacts they have on lifestyle choices, brand relationships and purchase decisions.

The Companies participated in the study with a goal to gain an insight on what drives consumers to make sustainable and socially responsible choices as it relates to energy efficiency, insight into the sustainability profile of people who had already made sustainable and socially responsible choices related to home energy, and their behavioural profile. The study found that 69% of Canadians say they have already made sustainable and socially responsible choices related to home energy; lighting and home heating are the top two areas they say they have made such choices and purchase decisions.

The findings will be used as a reference guide to develop products & programs, select strategic affiliations and develop positioning and marketing communications strategies. Further details are described in Appendix D.

4.8.2.6 Residential Retrofit Market Evaluation for Terasen Gas

In November 2009, Terasen Gas commissioned Angus Reid Strategies to evaluate awareness levels among members of the general population regarding energy efficiency programs, rebates and incentives. The study was designed to provide insight into the various factors that motivate homeowners to participate in incentive programs, as well as to determine awareness of existing programs and brands.

The findings demonstrate that respondents are interested in reducing their energy bills and choose to participate in incentive programs for financial reasons, especially to save money over time. Reducing waste and protecting the environment were also identified as important reasons to participate in energy efficiency programs. In addition to incentive amounts, administrative processes can also influence participation rates, and respondents stated that program simplicity and centralized information were key factors in deciding whether or not to participate in an incentive program. Brands evaluated in the survey included Terasen Gas, BC Hydro Power Smart, Fortis BC PowerSense, LiveSmart BC, ENERGY STAR®, EnerChoice, among others.

The findings from this study will be used by the Companies and the utility partners to determine the strategy for the joint residential retrofit program described in Section 4.6. The findings will also act to guide program planning and development, marketing, education and communication activities. Further details are described in Appendix D.

4.8.2.7 ENERGY STAR® Heating System Upgrade Evaluation

In order to evaluate the effectiveness of the 2005-2007 ENERGY STAR® Heating System Upgrade Program, the Companies commissioned Habart in summer 2007. The goal of the study was to assess the effectiveness and participant satisfaction of the program through field research and verify energy savings through billing analysis.

The report consisted of two phases. The completed report of phase one of this study and the costs associated with it was filed in the response to EEC Application BCUC IR 1.71.2.1 on July 11, 2008. The primary objective of the second phase of the evaluation was to update estimates of program energy and demand savings using a comparison of weather-normalized billing histories for participants, and a comparative sample of non-participants (billing analysis).

The study found that 57% of participants in the Companies program credited it for influencing their decision to purchase a high efficiency furnace. Furthermore, based on net 9.6 GJ per annum savings per high efficiency furnace, the program generated 78.8 terajoules ("TJs") in annual savings for the first 2.3 years and 47.4 TJs of annual savings in subsequent years. The findings were used for program development and for estimating energy savings achieved through the subsequent waves of the programs. For further details, please refer to Appendix D.

4.8.3 Efficiency Partners Program

End use Commercial and Residential gas customers rely heavily on the opinions of industry specialists when making efficiency decisions. The Efficiency Partners program area was formed in the latter part of 2009, to enhance existing supporting activities and identify new activity areas to meet the needs of delivering new EEC programs.

4.8.3.1 Overview

The Efficiency Partners program areas are aimed at building relationships with various industry groups. These groups include: manufacturers, service contractors, distributors retailers, and companies that influence residential/commercial end use customers who are making energy efficiency decisions. As customers rely on the advice of these groups, an ongoing relationship with these efficiency partners is vital to effective EEC program delivery.

4.8.3.2 2009 Focus and Expenditures

For 2009 the program focus was on evaluating and developing the new Contractor program and maintaining the Qualified Dealer Co-op advertising activities for the TGVI service area. Table 4-19 identifies areas of operation and annual expenditures.

Table 4-19: 2009 Efficiency Partners Expenditures

Contractor Program	Expenditures ($000s)				
	Q1	Q2	Q3	Q4	Total
TGI	0	1	2	4	7
TGVI	0	0	2	4	6
TGVI Co-op Advertising	3	3	3	4	14

The 2009 Efficiency Partners Contractor program detail are further discussed in Appendix D of this Report.

4.8.4 Codes and Standards

With the expansion of the Companies EEC activities, efforts were made to identify current codes and standards that have relevance to EEC program development and implementation. The BC Energy Plan maps out emission and energy reduction targets levels. These aggressive target levels have a direct effect EEC programs in almost every area.

4.8.4.1 Potentially Significant Impact of Codes and Standards

One of the outcomes of market transformation is regulation through Codes and Standards. EEC programs are directly affected by these regulations. Prematurely aggressive efficiency target levels with a lack of equipment and service history to meet these performance levels could slow down or stop market transformation. This could result in substantial load shift to other energy sources, disturbing the energy supply balance thus effecting energy delivery rates to all customers.

Utilities also play a role in keeping industry informed of developing regulations and alerting the stakeholders groups of any unintended consequences that may arise out of proposed codes and standards.

There are a number of product areas where regulations are connected to EEC programs:

- Commercial Water Heaters and Boilers
- Residential Furnace
- BC Building Code
- Residential Boiler
- Hearth Products
- Residential Domestic Hot Water Heater
- EnerGuide 80 Building Code For 2010
- Towards Net Zero Buildings in BC for 2020

EEC department members work on key market committees that have the greatest effect on program areas. The Companies' Technical Sales and Support ("TSS") department maintains working relationships with various additional committees. A staff member of Technical Sales is assigned to the EEC group to provide a conduit to the services and knowledge of the Companies' TSS department and a point of liaison with TSS on regulation and codes and standards.

4.8.4.2 Focused on Regulatory Involvement to Promote EEC Goals

Keeping current is important, however the Companies' participation in the development phase of regulation allows for more effective EEC program delivery and successful DSM market transformation. This requires various levels of involvement. Codes and Standards are established at a Federal level and adopted with or without changes at the Provincial level. The BC Provincial government has a history of early adoption of regulations with aggressive energy and emission reduction levels. This puts BC industry stakeholder groups in the market transformation hot seat.

In the highlights section of Codes and Standards, the Utilities level of regulatory involvement is indicated by one of three involvement classifications:

- Monitoring: For most applications the Companies *Monitor* the status of Codes and Standards through update reviews and representation on the Canadian Standards Association steering committee. This gives us the ability to keep current and provide input to potential changes to <u>all</u> CSA codes. This is the lowest level of involvement.

- Stakeholder Engagement: For select Provincial Code adoption committees, the Companies participate at a *Stakeholder* level, actively attending meetings with other key market stakeholders and providing guidance to the end adoption recommendations.

- Developing Regulations: In support of Government's Energy and Climate Change objectives, the Companies take a *Development* role with potential Provincial regulations that potentially have a direct effect on EEC program market development. This may or may not involve financial support to provide computer modelling to identify the differences in Natural Gas use. This is the highest level of Involvement.

The sections that follow are the highlights of codes and standards as they apply to EEC program areas and are presented in order of the Companies Involvement Level.

4.8.4.3 Standards and Company Involvement: Monitoring Level

What follows is a list of codes and standards where the Companies monitor status and remains abreast of potential changing CSA codes.

<u>Commercial Water Heater and Boiler Regulations</u>

There are no current proposals for regulation changes to commercial water heater or commercial boiler standards. However these products have been discussed in 2009, and discussions will continue in 2010. There are a number of different codes and regulations here defined by BTU cut points and domestic potable vs. heat usage application. We monitor these codes and ongoing changes.

<u>Residential Furnace Regulations</u>

For new construction, gas furnaces manufactured on or after January 1st 2008, must have minimum fuel efficiency level of 90% AFUE.

For existing dwelling retrofits, gas furnaces manufactured on or after December 31st, 2009 must have a minimum fuel efficiency level of 90% AFUE. As in stock furnaces manufactured before the cutoff date can still be retailed, customers still have a mid-efficiency choice. The Utilities had a stakeholder evolvement with the adoption of this standard and now will monitor any changes that may come out of implementation.

<u>New Construction BC Building Codes</u>

The following Federal regulation changes came into effect on September 2008 as the first steps to reduce greenhouse gas emissions related to buildings and construction.

- R20 Insulation for frame walls Natural Gas heated buildings for areas of 3500 deg days or less
- Increase attic space insulation from RSI 7.7 (R43.72) to RSI 9.0 (R 51.1) in the colder areas of BC (4500 deg days and more)

- Achievement of an EnerGuide System rating of 77 as an acceptable alternative to compliance with insulation table for residential buildings
- Non residential building Part 9 buildings must now provide thermal insulation in wall, roof and suspended floor assemblies. The amount of insulation is derived from ASHRAE 90.1-2004
- All other buildings (primarily Part 3) must comply with ASHRAE 901-2004 standard

The Companies worked on a stakeholder level with the Provincial adoption of this code and monitors implementation.

4.8.4.4 Standards and Company Involvement: Stakeholder Level

Below is a list of codes and standards where the Companies participate with other industry stakeholders and provide input as regulations are developed.

Residential Boiler Regulations (Still in proposal stage)

Effective September 2010, gas hot water boilers are to have a minimum 82% AFUE and no constant burning pilot light.

Table 4-20 outlines NRCan's proposed standards for residential boilers:

Table 4-20: Proposed Residential Boiler Regulations

Boiler Type Minimum	Effective Date September 1, 2010	Effective Date September 1, 2012
Gas Hot Water	82% AFUE No constant burning pilot	Automatic means for adjusting water temperature
Gas Hot Water equipped with tank-less domestic water heating coils	82% AFUE No constant burning pilot	-
Gas Steam	80% AFUE No constant burning pilot	-
Oil Hot Water	84% AFUE No constant burning pilot	Automatic means for adjusting water temperature
Oil Hot Water equipped with tankless domestic water heating coils	84% AFUE	-
Oil Steam	82% AFUE	-
Electric Hot water	-	Automatic means for adjusting water temperature

The Residential boiler code has remained unchanged since 1998, and the new version is due to come out in 2010, with no major changes expected. We will review the code at a monitoring level.

Hearth Product Regulations

There is currently no regulation for minimum efficiency of Hearth Products. However, Natural Resources Canada requires that fireplace should have Fireplace Efficiency ("FE") rating label. Models currently available range from 30% to 70% AFUE.

The CSA has established an appliance testing procedure for manufacturers to establish efficiency ratings. The Companies were involved with industry stakeholders to develop the EnerChoice top tier labelling system to help customers identify efficiency levels.

4.8.4.5 Standards and Company Involvement: Developing Level

The following is a list of codes and standards where the Companies are involving in developing regulation:

Residential Domestic Hot Water Heater Regulations

Water heating represents about 20% of household energy use in Canada. Water heating will account for an ever increasing share of energy use as envelope construction, appliances and HVAC continue to improve in efficiency while conventional water heating equipment has changed little. A proposed 5 year plan to regulation changes are listed in Table 4-21.

Table 4-21: Proposed Domestic Hot Water Tank Regulations

Type	Minimum Efficiency	Effective Date
Gas Storage -151L water heater	0.62 EF	September 1, 2010
Gas Storage -189L water heater	0.61 EF	September 1, 2010
Gas Storage Water Heater	0.67 EF	2011 (Proposed)
Gas Storage Water Heater	0.80 EF	2014 (Proposed)
For the first two items, EF rating is based on a formula EF= 0.70 – (0.0005*V)		
V=volume of storage water tanks in litres.		
Storage tank volumes of 151 litres and 189 litres are typical residential heater sizes.		

The first phase of this regulation begins September 1st 2010, but still allows for the sale of any less efficient water heaters manufactured prior to this date. Customers will still have a choice until existing inventories are exhausted. This first tier of change should not provide adverse market problems, however manufacturers have indicated that they have concerns with the second and third tiers of the proposed regulation. Utilities are working to try to bring stakeholders together to determine the appropriate market transformation plan.

The Companies' proposal for the attribution of savings from the introduction of the 2014 water heater regulations is discussed in Section 7 of this report.

EnerGuide 80 New Construction Building Code For 2010

The Provincial Government has announced that they are working toward the implementation of EnerGuide 80 ratings for the BC Building Code to take effect in late 2010. The current rating of 77 and the new 80 rating are stepping stones toward a Net zero level set for 2020. The Province of British Columbia is updating the energy efficiency requirements in Part 10 of the BC Building Code for residential buildings. Along with Industry stakeholders a study was started in 2009 to determine potential combinations of overall building envelope thermal requirements, air tightness, and equipment efficiency which will meet EnerGuide 80.

The Companies are involved at a partner level with BC Hydro and other industry stakeholders in the steps involved with code assessment and development. A number of base cases were modelled utilising the NRCan Hot 2000 program, using the following variations:

- Various archetypes of detached home, row home

- Primary space heating system: electric, natural gas (water heating is assumed to match)
- Climate Zones in BC: Southern Coastal (<4000 DD), Southern Interior (4000 – 5000 DD), Northern Interior (>5000 DD)

The modelling study will be completed by the end of January 2010. A stakeholder committee will be struck to develop the guidelines for changes to the BC building code biased on the results of the modelling study and input from the representing groups.

To date it is clear that a review of the existing D audit process will be required as more weight is placed on the resulting EnerGuide rating of the home. Our participation is vital as decisions here will affect Companies EEC programs.

Towards Net Zero Buildings in BC for 2020 (Future Code)

The Province of BC has announced that they are moving toward a net zero energy or net zero energy capable (Passive House standard) construction code by 2020. Terasen Gas participates in both the EnerGuide 80 and Net Zero committees as the first leads to the second as and end goal.

A net zero home at a minimum, supplies to the power grid, an amount equal to the total amount of energy consumed. Combining the amount of energy (electricity and if applicable natural gas) utilised to operate a home and provide an equal amount of solar generated energy back to the grid when possible. A Passive house generates and stores all it requires without connection to any utility supply. Net zero energy capable construction code by 2020 will require the development of an implementation road map to identify the barriers and develop solutions with all stakeholder groups.

We are participating at a stakeholder level at this point in development. The group is identifying barriers at this point and listed below are some of the questions we will need to answer:

- What will be the role of the utilities be when net zero and passive houses appear in numbers?
- What are the ramifications to the Gas Industry of pursuing net zero energy buildings as opposed to net zero *emissions* buildings as a target for building codes?
- With EnerGuide 80 and Net Zero what is the best measuring stick for energy performance in buildings? For the residential sector? For the commercial/institutional sectors? How should we set our targets and how do we know in the future if we're achieving them?
- What actions need to be undertaken with building the trades/professions/industries and their associations to rapidly facilitate net zero/high energy performance in new construction and retrofit work when we as a province may be ahead of the regulatory requirement nationally?
- What is the role of occupant energy efficiency education and behaviour and who shares responsibility for ongoing, impactful occupant education?

4.8.5 Pilot Programs

As previously outlined, Pilot Programs test the effectiveness of a particular measure in the EEC market place. Pilots are utilised to verify potential savings and identify potential market transformation barriers in order to effectively design and implement larger-scale EEC programs. In 2009, EEC conducted the following two Pilot Programs; the details and the costs associated with these Pilot Programs are provided below.

- TGI developed and launched the Okanagan Spray N' Save Pilot program to investigate and confirm both the potential energy savings as well as the market acceptance of low flow pre-rinse spray valves used in commercial kitchens.

- The EEC team developed the TGVI Furnace Servicing Pilot program, "Give Your Furnace Some TLC," to promote the benefits of annual furnace servicing.

Table 4-22: 2009 Pilot Program - Expenditure

	Pilot Program	Description	Expenditure ($000s)
1	Okanagan Spray N' Save Pilot Program	Verify energy savings for commercial kitchen spray valves	28
2	TGVI Servicing Pilot Program	Promote the benefits of annual furnace servicing	199

4.8.5.1 Okanagan Spray N' Save Pilot

Program Area: Commercial Energy Efficiency Programs

Target Market: Retrofit

Duration: Okanagan only May – September, 2009

The program focused on the Okanagan Valley because it is geographically concentrated area with a relatively high concentration of restaurants.

Similar low flow spray valve programs exist at other utilities, however some doubt exists as to the ultimate benefits of the technology. Running the Okanagan Spray N' Save pilot has allowed Terasen Gas to gather the data required to more properly assess the merits of low flow spray valves as part of a DSM program offering.

Low flow spray valves were installed free of charge in 276 restaurants, representing 92% of the program's target. An initial arithmetic analysis of the recorded data suggests that each spray valve saves over 8 GJ/year. The program therefore achieved a projected energy savings of 9,513 GJ's, and a TRC of 2.8 over the 5 year life time of the low flow spray valves.

A more empirically driven evaluation study is slated for completion in 2010. The details of the evaluation are provided in Section 5.13.3.2. Refer to Appendix D for further details on the Okanagan Spray N' Save Pilot program and Evaluation of Okanagan Spray N' Save Pilot Program.

4.8.5.2 TGVI Furnace Servicing Pilot

Program Area: Residential Energy Efficiency Programs

Target Market: Retrofit

Duration: TGVI October 2009 – June 30 2010

Customers are rewarded for their service with a $25 Save-On-Foods gift card. The objectives of the pilot were to:

- Provide education and awareness about energy efficient appliances and their maintenance
- Determine if a $25 Gift Card was enough value to incent customers to take action
- Obtain feedback from the trades community on whether the program helped them engage customers in conversations about efficiency, safety and the opportunity to upgrade existing appliances

If the pilot is successful, a similar program will be launched across the province in January of 2011. Due to the Companies' inability to verify savings from the program, direct savings claims cannot be made; however, it can be argued that there is the increased potential for appliance replacements post furnace servicing. The total budget for this program is $224,000 which includes incentives, program administration, marketing, and evaluation of which $199,023 was paid out in 2009. Refer to Appendix D for further details.

4.8.6 Summary

Enabling Activities provide important support for effective EEC program development, delivery and evaluation. Most EEC programs work on the principal of market transformation with eventual mandate by regulation as the end game.

Research and Evaluation provides the information required to develop a market development plan. Pilot Programs verify savings and help identify market barriers. The Efficiency Partners Program aids in efficient delivery of EEC programs and provides the vital industry feedback for program adjustments. Regulation target levels and implementation timeframes require guidance from industry stakeholders.

Given the aggressive BC government provincial emission targets, participation on the various Codes and Standards committees is critical to establish a proper energy balance. Poorly constructed or timed regulations could result in a void of products and services and disrupt market transformation process. Unsuccessful area market transformation could result in an unbalanced shift to one energy source creating a supply and demand problem, resulting in rate increases to the customer base.

The Companies believe that the results of Enabling Activities in 2009 demonstrate their value and intend to continue, refine and improve such activities in 2010.

4.9 EEC Stakeholder Group Activities

In the EEC Application, the Companies recognized the need for accountability for the EEC initiative and proposed to form and engage an EEC Stakeholder Group. The objectives of the EEC Stakeholder Group are to guide and provide input on EEC activity.

4.9.1 Soliciting Appropriate Stakeholder Involvement

The Companies intend to hold biannual EEC workshops with at which the Companies would present updates on program progress; these would also act as a forum for stakeholder input on developing new programs and refining existing programs.

The members of the EEC Stakeholder Group were solicited through Regulatory Stakeholders (those that have historically intervened in the Companies' regulatory proceedings), from industry groups that the Companies' engage with, experts in design of programs and initiatives, and from key contacts from the Companies' Residential, Commercial, and Community Relations departments.

Representation was sought from the following areas within both TGI and TGVI service territories for the stakeholder group:

- Provincial, municipal, and First Nation governments
- Non-Governmental Organizations
- Consumer advocates, representing residential customers
- Affordable housing advocates
- Commercial customers
- Trade organizations
- Equipment manufacturers
- Other utilities

4.9.2 Early Progress from Stakeholder Meetings

The first EEC Stakeholder Group meeting was held on December 9, 2009. As this was the first EEC Stakeholder meeting, the Companies presented an introduction to DSM/EEC, a summary of the EEC Application and the resulting EEC Decision, government regulation, and a general description from each program area of initiatives to come.

A post-meeting survey was emailed to the EEC Stakeholder Group shortly after and received a 65% response rate, with over 90% of respondents stated that they were overall, either very or somewhat satisfied with the first EEC Stakeholder Group meeting. Attendees commented on the strong presenters and expressed their desire to provide ongoing feedback in future meetings.

Appendix F includes the EEC Stakeholder Group members list, and the 2009 EEC Stakeholder Group meeting invitation, agenda, and meeting minutes.

Please also refer to Section 5.14 for the description of the completed and proposed EEC Stakeholder Group activities for 2010.

4.9.3 Summary and Next Steps

The initial meeting was successful in introducing key stakeholders to the EEC Decision and its resulting programs. The EEC Stakeholder Group will provide a forum for open dialogue and feedback on future program design and initiatives.

4.10 Summary 2009 EEC Activities: Successfully Establishing the Foundation

The second half of 2009 represented the inception of the Companies' efforts to develop and execute on the broader EEC mandate; a mandate made possible by earlier Commission approval of funding. While the year could fairly be characterized as one of transition, (from earlier, narrowly focused but successful DSM activities, to the broad efforts of 2010 and beyond), it should also be considered one of meaningful results.

In addition to the establishment of the EEC team, the Company:

- Overall - Established a new, broadened EEC Program Portfolio and Associated Program Areas.

- Residential - Launched two Residential Energy Efficiency retrofit programs: the ENERGY STAR® Heating System Upgrade Program, and the EnerChoice Fireplace Program. The ENERGY STAR® program surpassed its original target of 8,180 furnaces to achieve 15,000 furnace replacements once all applications are processed in 2010.

- Commercial - Expanded its Commercial programs by increasing participation in the Efficient Boiler Program and by continuing to help customers save energy every year through the Energy Assessment Program. Finally, the Companies launched the Light Commercial ENERGY STAR® Boiler program, which is already logging gas savings.

- Affordable Housing - Laid the foundation for the Conservation for Affordable Housing program area, while also rolling out three projects: the Meridian Village Project, the MEMPR Low Income Partnership Funding, and the Energy Conservation for Affordable Housing Forum.

- CEO - Introduced and continued Conservation Education and Outreach Programs, which collectively sought to foster a "culture of conservation". Through targeting powerful media channels, traditional forums such as trade shows, innovative partnerships with local sports clubs and more, the Companies promoted attitudes and values that will increase commitment to EEC activities.

- Enabling - Undertook Enabling Activities that deepened understanding of markets, verified savings, identified market barriers, established relationships with suppliers to the energy efficiency industry, and built upon regulatory policy.

- EEC Stakeholders - Selected the right stakeholders to make up the EEC Stakeholder Group, then provided them with an overview of DSM/EEC, the EEC Application and the resulting EEC Decision, government regulation, and a general description from each program area of initiatives to come.

While these results reflect a partial year of activity for 2009 (most of the programs were rolled out later in the second half of 2009 once the EEC Decision was issued and the staffing resources were set in place), they are nevertheless ones the Companies take pride in. Collectively they represent a strong foundation for EEC activities in the latter part of 2010 and beyond.

5. 2010 PLAN: BUILDING ON THE EEC FOUNDATION

The establishment of an EEC team and broad Program Portfolio in 2009 (and early 2010) provides the Companies with a strong foundation to build on in 2010. The material presented in this section on 2010 planned activity represents only the activity planned at the time of writing. The Companies anticipate that there will be more and other activities undertaken in 2010 as additional opportunities for EEC activity are identified. While the Companies intend to continue with the majority of Portfolio Programs from 2009, they will take steps to refine their effectiveness while introducing three new Program Areas.

5.1 Three New Program Areas

In 2010, the Companies' EEC team plans to further expand the program portfolio by adding three additional Program Areas: High-Carbon Fuel Switching, Interruptible Industrial Program Area and Innovative Technologies.

- The High-Carbon Fuel Switching Program Area lowers GHGs by using natural gas in place of higher carbon fuels such as coal, oil or propane. In addition, further energy savings will be recovered by replacing high-carbon appliances with efficient natural gas appliances such as ENERGY STAR® furnaces or boilers.

- The Interruptible Industrial Program Area implements energy efficiency and conservation activities for these customers, while at the same time managing the risk associated with large financial investments in energy efficiency for interruptible industrial customers and the resulting magnitude of the anticipated energy savings.

- The Innovative Technology Programs will promote and pilot emerging commercially available technologies. The current portfolio of Innovative Technologies includes Solar Thermal Hot Water, NGV for Commercial Vehicles, Hydronic and Combination Space Heating Systems, Residential Ground Source Heat Pumps ("GSHP") and Commercial and Industrial GSHP Systems.

Note that these Program Areas are in the very early stages of their development and as such, their scope is not yet fully formed. It is therefore necessary to engage in further research, and explore and address additional opportunities in these Program Areas as they arise.

5.2 New Program Areas Complement Existing Offerings

This section looks carefully at these three new Program Areas while also examining the set of offerings within existing Program Areas, which will be refined and continued. In aggregate, the Companies believe the Program Areas and associated activities constitute a robust and effective collection of EEC initiatives.

The Program Areas examined in this section are as follows:

5.5 Residential Energy Efficiency;

5.6 Commercial Energy Efficiency;

5.7 High-Carbon Fuel Switching;

5.8 Conservation for Affordable Housing;

5.9 Joint Initiatives;

5.10 Conservation, Education and Outreach;

5.11 Interruptible Industrial Sector;

5.12 Innovative Technologies;

5.13 Enabling Activities;

5.14 EEC Stakeholder Group Activities; and

5.15 2010 EEC Portfolio: Summary.

5.3 Expected Programs

The Companies' EEC Portfolio consists of multiple Program Areas. Each Program Area includes all specifically related programs, measures and activities.

Table 5-1 below shows overall program results including the overall incentive and non-incentive amounts that will be spent on EEC programs, annual energy savings, present value energy savings over measure life, and the TRC results.

Spending in 2010 will increase over 2009, as will expected savings. The total amount budgeted thus far for incentives for 2010 is $7.979 million. This is significantly higher than the 2009 expenditure on incentives of $3.344 million. Similarly, the total non-incentive amount for 2010 is $9.912 million which is again significantly higher than the non-incentive expenditure of $2.917 million for 2009. It should be noted that these are projected activities and expenditures in Q1 2010; as more activities and budgets are developed through the course of the year, projected expenditures and the associated savings will increase. These increases are associated with the increased amount of activity planned for EEC activities in 2010, which will result in higher annual energy savings (208,725 GJs for 2010 vs. 130,965 GJ s for 2009) and the present value of the measure life energy savings is significantly higher in 2010 at 2,031,015 GJs for 2010 than 1,284,100 GJs for 2009.

The projected portfolio TRC result for 2010 is 1.0 which includes non-program expenses that are allocated to the Portfolio level of $8.553 million. While the TRC analysis presented below includes these portfolio-level expenditures on the cost side of the equation, there is currently nothing allocated on the benefit side of equation for these portfolio-level expenditures, even though some of the portfolio-level activity will result in energy savings. This is the case because the Companies do not currently have enough information to be able to estimate with confidence the magnitude of the benefit from some of these portfolio-level expenditures. A key example of this would be in the area of Pilots – the Companies have allocated $1.432 million to Pilots such as the Custom Design Pilot discussed in Section 5.13.6.2. Energy savings will accrue from the Custom Design Pilot, however these savings are unknown at the time of writing and so are not included in the benefits side of the TRC analysis presented below. The Companies are conducting these Pilots in order to determine the benefits from the technologies and systems that are being piloted.

Further, the one-time costs for implementation of the DSMS are included in the portfolio-level expenditures for 2010, as are the one-time costs for the CPR. Similarly, the funds approved for the development of an Interruptible Industrial EEC program are also included in the 2010 portfolio-level TRC. These one-time costs reduce the overall TRC because the Companies account for the costs but these expenditures will provide value over years to come. The Companies will be monitoring the performance of the 2010 portfolio on a monthly basis to ensure that the overall Portfolio level TRC remains at 1.0 or greater and will consult with the EEC Stakeholder group if it appears that the performance of the Portfolio will be challenged by the fact that 2010 is very much a development year, where a number of new programs will be heavily front-end-loaded with pilot, development and promotional costs. The final actual 2010 portfolio-level TRC will be presented in the 2010 Annual Report to be filed in March 2011.

Table 5-1: 2010 Overall Portfolio Will Bring Value to Customers and the Companies

Utility	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
TGI	6,447	7,917	14,365	191,183	1,869,069	1.0
TGVI	1,531	1,994	3,526	17,542	161,946	1.1
Total Results	7,979	9,912	17,890	208,725	2,031,015	1.0

5.4 2010 Activities by Program Area Level and Activity

Table 5-2 below shows the results for 2010 activities by Program Area. The work completed in 2009 set the stage for the 2010 EEC portfolio and program activities. In 2010, the Companies plan on continuing to operate a number of existing programs (with some modifications), while rolling out several new incentive programs to the market place. The 2010 EEC portfolio is responsive to the requirements in the DSM Regulation that to be considered adequate, a public utility's plan portfolio submitted after June 1, 2009 should include the following:

a) a demand-side measure intended specifically to assist residents of low-income households to reduce their energy consumption (see Section 5.8.3);

b) if the plan portfolio is submitted on or after June 1, 2009, a demand-side measure intended specifically to improve the energy efficiency of rental accommodations (see Section 5.8.3 and 5.8.3);

c) an education program for students enrolled in the public utility's service area (see Section 5.10.2.4);

d) if the plan portfolio is submitted on or after June 1, 2009, an education program for students enrolled in post-secondary institutions in the public utility's service area (see Section 5.10.2.4).

Additional consideration will be given to simplifying program processes and administrative burdens for participants and the Companies. The 2010 programs will aim to meet customer and market needs; for example, high carbon fuel switching program initiatives will provide significant benefits to the Province of BC's GHGs reduction strategy, and increased Conservation for Affordable Housing programs will continue to meet the EEC program principle of universality – offering access to energy efficiency and conservation for all customers.

Other activities will increase the Companies' participation in mutually beneficial collaborations between groups such as government agencies or BC utility partners. CEO programs and Enabling Activities will continue to support, and promote awareness of EEC Activities, which in turn, generate buy-in from partners and desire to participate in program activities from customers.

The Commission's approval of the NSAs confirmed funding of EEC programs through 2011, with the addition of funding for two new Program Areas: Interruptible Industrial Program Area and Innovative Technologies. High-Carbon Fuel Switching was approved in the EEC Decision in 2009. These new Program Areas will see the development and delivery of programs in the second half of 2010, and through 2011. In 2011, the Companies plan to file an application to the Commission related to EEC funding for the timeframe beyond 2011, so preparation for this filing will commence in the latter part of 2010.

Table 5-2: 2010 Programs Will Bring Value to Customers and the Companies

Program Area	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
Residential Programs	**2,791**	**220**	**74,906**	**755,601**	**1.4**
TGI	2,561	180	68,385	692,757	1.3
TGVI	230	40	6,521	62,844	1.5
Commercial Programs	**1,527**	**346**	**112,562**	**1,106,704**	**2.1**
TGI	1,332	277	97,730	956,981	2.1

Conservation for Affordable Housing	**2,911**	**567**	**37,382**	**337,855**	**0.0**
TGI	2,329	454	29,905	270,285	0.0
TGVI	582	113	7,476	67,571	1.0
Joint Initiatives (TGI & TGVI)	N/A	**717**	N/A	N/A	N/A
Conservation, Education & Outreach (TGI & TGVI)	N/A	**1,775**	N/A	N/A	N/A
Enabling Activities (TGI & TGVI)	N/A	**439**	N/A	N/A	N/A
Interruptible Industrial DSM (TGI & TGVI)	N/A	**435**	N/A	N/A	N/A
Other Portfolio Level Activities (TGI &TGVI)*	N/A	**5,188**	N/A	N/A	N/A
Total	**7,979**	**9,912**	**208,725**	**2,031,015**	**1.0**

*Other Portfolio Level Activities include CPR, Research, Evaluation & Training, Consultants' fees, implementation of DSM Tracking System, Pilot Programs, efficiency partners programs and non-program administration activities (labour costs)

Note that the "Other Portfolio Level Activities" include a number of portfolio-level items. For 2010 these activities and the costs associated with them are listed below:

- Conservation Potential Review ($500,000)
- Research, Evaluation and Training ($906,587)

- Consultant Fees ($100,000)
- Efficiency Partners and Codes and Standards ($439,000)
- Implementation of DSM Tracking System ($704,000)
- Pilot Programs ($1,432,500)
- Labour Costs ($1,545,000)

As shown in the Table 5-1 and 5-2 above, the EEC portfolio in 2010 will bring value to customers and the Companies. The details of each Program Area are further discussed in the following sub-sections.

5.5 Residential Energy Efficiency Programs

In 2010, the Companies plan on completing the existing 2009 Residential Energy Efficiency programs, while rolling out several new incentive programs to the market place. The programs are categorized as: 2009 programs that are under completion, new programs being launched in Q1 and Q2 in 2010, and programs under consideration for Q3 and Q4. Table 5-3 provides a summary of the 2010 Residential Energy Efficiency programs for TGI and TGVI.

5.5.1 Program Goals

2010 Residential Energy Efficiency programs are focused on the following general objectives:

- Upgrade existing low efficiency systems to capture energy savings associated with reducing the overall consumption of natural gas. The focus in 2010 will be on hot water heaters, fireplaces, and possibly a furnace early retirement program.
- Prepare the market for the adoption of new energy efficient technologies through incentive programs and support of government regulations. The focus in 2010 will be on domestic hot water technologies. A program for 0.61 Efficiency Factor ("EF") tanks will be launched in Q2. During Q3 and Q4, the Companies plan to conduct pilots for Tier 3 water tanks (0.80 EF and higher) in order to develop programs for 2011 and beyond. (Please refer to Section 5.13.6 for information about these pilots.)
- Introduce programs for new home construction to ensure that all new homes adopt the latest energy efficient technologies and provide incentives where necessary.
- Educate the trades community about upcoming regulations and gain an understanding of technical requirements or other barriers associated with new product introductions
- Educate consumers about the advantages of energy efficient appliances and provide incentives for their adoption when necessary. Take the opportunity to incorporate energy conservation messaging within program marketing materials.
- Engage manufacturers by supporting new technologies and providing advertising opportunities to the Companies' customer base

- Develop cost effective programs with a TRC greater than 1.0 that optimize the proportion of incentives over administration and marketing costs
- Conduct program evaluation that confirms savings claims and guides program development of future programs.

5.5.2 Residential Energy Efficiency Programs – Portfolio Overview: New and Existing Programs

Generally speaking, the Companies' 2010 residential EEC programs fall into three categories. There are 2009 programs that are ongoing and expected to be completed in 2010. There are new programs launching in Q1 and Q2 and there are programs under consideration for launch. The chart below outlines the programs in each category and their associated costs and savings.

Table 5-3: 2010 Residential Energy Efficiency Programs for TGI and TGVI

The highlights of the 2009 retrofit energy efficiency programs under completion are as follows:

- The ENERGY STAR® Heating System Upgrade Program, including participants from LiveSmart BC, will surpass the EEC application replacement target of 8180 furnaces or boilers, with expectations of 15,000 participants. Final overview of program performance will be presented in the Companies' Report on 2010 EEC activities, to be presented by the end of Q1 2011.

The highlights of 2010 retrofit and new construction energy efficiency programs are as follows:

- The ENERGY STAR® Hot Water Heater Retrofit Program (61%+ EF) is being launched in Q2 to prepare the trades community for the implementation of the September 1, 2010 provincial regulations requiring 61% EF minimum efficiency levels, and educate consumers about ENERGY STAR® water tanks.

- The EnerChoice Fireplace Retrofit program will educate consumers about the merits of choosing energy efficient fireplaces.

The highlights of new programs under consideration are as follows:

- The ENERGY STAR® Hot Water Heater New Construction Program will be launched in Q2 with the objective of ensuring that all new homes adopt the energy efficient hot water heaters.
- The EnerChoice Fireplace New Construction Program will be launched in Q2 with the objective of ensuring that all new homes adopt energy efficient natural gas fireplaces.
- A Furnace Early Retirement Program may be launched based on stakeholder feedback on the numbers of mid-efficient furnace inventory remaining for sale and the results of economic modelling.
- A Furnace Service Program, based on the TGVI pilot (refer to Section 4.8.5.2) may be launched province-wide during the summer months that are generally a slow time for gas contractors.

The Residential Energy Efficiency programs for 2010 are described in further detail below.

5.5.2.1 ENERGY STAR® Heating System Upgrade Program

It is anticipated that the ENERGY STAR® Heating System Upgrade Program (which includes participants from LiveSmart BC) will surpass the EEC application replacement target of 8180 furnaces or boilers, with expectations of well over 15,000 participants. This will make it a tremendously successful Program in the Residential portfolio.

Although this Program completed in 2009, it is discussed here because the application deadline for the Companies' program is March 31, 2010 and participant data from the LiveSmart BC program may not be received until the second quarter of 2010. Therefore, the final program overview will be reported in the Companies' EEC report on 2010, once all final participation numbers have been received.

Table 5-4 outlines the energy savings estimates for participants that will be processed in 2010. In this period, it is projected that an additional $1.9 million in incentives will be distributed generating an additional 504,854 GJ's in energy savings over the life time of the measure.

Table 5-4: ENERGY STAR® Heating System Upgrade Participants Processed in 2010 forecasts significant energy savings within a cost-effective program

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
The Companies	TGI	3,609	902	40	22,916	241,380	43%	1.2
	TGVI	120	30	5	762	7,979	43%	1.1
LiveSmart BC	TGI	3,635	909	10	23,082	242,246	43%	1.2
	TGVI	200	50	5	1,270	13,250	43%	1.1
Total	**TGI**	**7,244**	**1,811**	**50**	**45,998**	**483,626**	**43%**	**1.2**
	TGVI	**320**	**80**	**10**	**2,032**	**21,229**	**43%**	**1.1**

Note: The Companies Participation Rates are based on the estimated number of bill credits issued from January 1, 2010 through to completion of application processing by ABSU (expected April 30, 2010.) The LiveSmart BC participant numbers are an estimate of the total number of heating systems invoiced to TGI/TGVI in 2010 (expected June 30, 2010). This is an estimate from MEMPR based on 2009 trends and is subject to change. The forecasted number of heating systems from MEMPR's LiveSmart BC participant data is a total of 8000, of which 3835 are for the 2010 invoicing period. Full program overview will be presented in the 2010 EEC Report.

For cost benefit analysis please refer to Appendix J.

5.5.2.2 ENERGY STAR® Domestic Hot Water Heater Retrofit Program

Program Area: Residential Energy Efficiency Programs

Target Market: Retrofit

Duration: TGI & TGVI: May 1, 2010 through April 1, 2011

Incentive:

$50 rebate cheque for consumer
$50 rebate cheque for contractor / Point of Sale Contact

Program Administration:

Consumer-Response Marketing

Program Objectives:

- Educate the market about the introduction of provincial regulations on September 1, 2010

- Educate consumers about ENERGY STAR® water heaters and the importance of hot water conservation
- Upgrade a minimum of 3600 Hot Water Heaters to 0.61 EF or higher
- Promote contractor relations between the Companies and contractors, as well as between contractors and customers
- Engage manufacturers and distributors through co-marketing opportunities
- Engage manufacturers in labelling tanks for Efficiency Factor

Background:

The primary program objective is to educate the market about September 1, 2010 changes to the BC Energy Efficiency Act Standards for gas and propane fired water heaters outlined in MEMPR Information Bulletin 09-05[11]. The secondary program objective is to reap the energy savings associated with upgrading water heating systems.

BC provincial regulations require that all water tanks manufactured after September 1, 2010 be Tier One with an efficiency rating of at least 0.61 depending on tank size. Program benefits include education and outreach to consumers, trades, distributors, Big Box and small retailers, and manufacturers. One program challenge is the fact that manufacturers do not label water heaters with efficiency ratings. Manufacturer engagement will be an important component of the program.

Estimates of hot water energy consumption as a percentage of household energy use range from 15% (2006 Terasen Gas Conservation Potential Review ("CPR")) to 30% (BC Govt Energy Efficient Building Strategy). The CPR states that Domestic Hot Water ("DHW") accounts for 21% of residential natural gas consumption and notes a 2% annual energy improvement as hot water systems are upgraded. Even greater savings will be realized as water heating appliances become more efficient.

BC's hot water tank market is difficult to estimate. The following data is collected from the Canadian Institute of Plumbing and Heating ("CIPH"), MEMPR 2008, and the 2008 REUS.

- 60% of the residential market is comprised of natural gas hot water tanks.
- Based on estimates from CIPH, approximately 121,409 hot water tanks are sold annually in BC.
- 68,840 are natural gas tanks and of those, 20% are high efficiency models, meaning 0.61 EF and greater.

Water tank statistics from the 2008 REUS include the following:

- 89% of the Companies customers have gas hot water tanks
- 38% of the Companies customers have replaced water tanks over the past five years which by calculation represents a 7.6% annual churn rate.
- Of those that are replaced:
  - 83% are only done at the time of failure or imminent failure
  - 9% were undertaken for the purpose of increasing energy efficiency

[11] Please refer to Appendix C for the MEMPR Information Bulletin 09-05. *BC Energy Efficiency Act Standards: Gas and Propane-Fired Water Heaters*.

The $50 Consumer Incentive will drive public awareness about the importance of water tank efficiency, increase prominence of the ENERGY STAR® label, urge customers to be proactive about the water tank purchase decision, and provide an opportunity to raise awareness about the importance of hot water conservation. By developing this program, we are encouraging customers to request high efficiency water heaters in all retrofit situations. However, this process will take time to drive market transformation.

A $50 Contractor Incentive will urge contractors and distributors to promote efficient water tanks. Since the large majority of purchase decisions are completed out of necessity due to tank failure, customers are reliant on independent contractors to provide energy efficient appliances and advise them on the benefits of choosing energy efficient appliances.

Please refer to Appendix D for detailed program description.

Projected Outcome:

Table 5-5 provides highlights of the ENERGY STAR® Hot Water Program energy savings estimates:

Table 5-5: ENERGY STAR® Domestic Hot Water Heater Performance Forecast indicates a marginal cost benefit test although regulation compliance is the most important aspect of this program

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	TGI	3,000	300	80	4,800	41,589	20%	0.8
	TGVI	600	60	20	960	8,280	20%	0.8

*In the retrofit program, the number of participants actually refers to number of units (water tanks sold). This is a split incentive between between contractor and customer. Distributing two cheques per unit will cost more and thus the administration costs are higher on the retrofit program over new construction.

As outlined in Table 5-5, the projected program participant target of 3,600 is achievable with a modest marketing budget. By offering an incentive for both the contractor and for the consumer buy-in from one or both stakeholders will help drive program participation. Through bill inserts, The Companies have a cost-effective direct-to-consumer marketing channel. Through mail-outs to the BC Safety Authority Registered Contractor database, the Companies have a cost-effective direct to trades marketing channel. Furthering the relationship between trades and consumers will drive the promotion of all energy efficiency programs.

The projected spending forecast is $360,000 in incentives and $100,000 for non-incentives. Non-incentive spend is less than 30% of total spend. The program is forecasted to achieve annual gas savings of 5760 GJ's and close to 50,000 GJ's over the lifetime of the measure. Although the TRC for this program is marginally less than 1.0, the program is an important component in an overall campaign to help manufacturers, distributors, installers, and customers prepare for new Provincial regulations, in effect September 1, 2010, which require that all Hot Water Heaters manufactured after that date be Tier One. By planning and promoting this program in conjunction with MEMPR, the Companies are building an important relationship and demonstrating a willingness to support regulations and efficiency compliance among trades.

Program evaluation will include billing analysis in 2012 and potentially surveys to distributors and contractors to monitor the trends in market penetration of ENERGY STAR® eligible models.

For cost benefit analysis please refer to Appendix J.

Summary:

The market information presented demonstrates the great need for Energy Efficiency education across the hot water equipment supply chain – from manufacturers and distributors through to consumer education. Through the joint incentive, provided to customers and installers, the program is also designed to increase awareness of the ENERGY STAR® brand, and to help ensure that customers who are replacing their tank in an emergency situation both choose install an ENERGY STAR® (or equivalent) tank and have access to an ENERGY STAR® (or equivalent) tank through their installer.

This program is an important component in an overall strategy to help manufacturers, distributors, installers, and customers prepare and adopt new Provincial regulations, in effect September 1, 2010, which require that all Hot Water Tanks manufactured after that date be Tier One. The Companies will be actively evaluating Tier Three Technologies (>0.8 EF) and developing a market transformation strategy. Please refer to Section 5.13.6.4 for more information about Tier 3 pilot programs that will be launched in Q3 and Q4.

5.5.2.3 EnerChoice Fireplace Consumer Incentive Program

Program Area: Residential Energy Efficiency Programs

Target Market: Retrofit

Duration: May 2010 through April 2011, with possible extension

Incentive: $150 (proposed)

Partners: HPBAC

Program Administration:

Consumer Response Marketing Ltd.

Program Objectives:

- Encourage the sale and installation of energy efficient heater style fireplaces to reap the associated energy savings.
- Further the education and awareness of the EnerChoice label to consumers and industry.
- Further relationships with manufacturers and distributors of natural gas fireplaces, through the HPBAC.

- Develop a cost effective program with TRC greater than 1.0 and maximize the proportion of incentives over administration and marketing costs

Background:

Promoting energy efficient fireplaces is an important component to EEC programs. Natural gas fireplaces account for 13% of residential natural gas consumption (2006 CPR), and 85% of customers have at least one fireplace or heating stove (2008 REUS). Through this program the Companies are encouraging their customers to adopt energy efficient gas fireplaces designed for heating rather than simply decorative fireplaces for ambience.

In 2009, TGI and TGVI offered fireplace retailers the opportunity to receive a $50 SPIFF for educating customers and promoting the purchase of energy efficient fireplaces. According to the HPBAC members, the marketing campaign and manufacturer's coupons were well-received. They believe that dealers are now well educated on the merits of EnerChoice fireplaces coming out of the 2008 and 2009 TGI programs and 2009 TGVI programs.

In order to further educate consumers about the merits of energy efficient fireplaces, the 2010 EnerChoice program will provide a $150 consumer rebate for EnerChoice purchases. TGI and TGVI will engage HPBAC members to co-promote the offer through retailer and manufacturer channels. Promotions will include bill inserts, advertisements in community newspapers, summer home shows, Team Terasen, online media purchase, and partnering with associations and NGO's.

Please refer to Appendix D for detailed program description.

Projected Outcome:

Table 5-6 provides program highlights of the EnerChoice Fireplace Consumer Incentive Program performance metrics for 2010 based on our forecast.

Table 5-6: EnerChoice Fireplace Consumer Incentive Performance Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	TGI	3,000	450	50	17,670	167,542	24%	2.8
	TGVI	600	90	10	3,534	33,336	24%	2.8

The projected participation rates of 3600 participants should be achievable when partnering with HPBAC members to cost-effectively drive the program The Free Rider Rate is 24% based on previous customer surveys.

As outlined in Table 5-6 the projected spending forecast is $540,000 in incentives and $60,000 for non-incentives. The program is forecasted to achieve annual gas savings of 21,000 GJ's and 200,000 GJ's over the life time of the measure.

Program evaluation from 2008 and 2009 programs will help determine the future direction of EnerChoice programs.

For cost benefit analysis please refer to Appendix J.

Summary:

With fireplaces using 13% of residential natural gas consumption, it is critical to educate homeowners about the importance of choosing energy efficient models. As more models become available the minimum efficiency standard can be increased over time. The Companies will continue to foster their relationship with HPBAC to assist in driving fireplace efficiency.

5.5.2.4 ENERGY STAR® Domestic Hot Water Heater New Construction (Under Development)

Program Area: Residential Energy Efficiency Programs

Target Market: New Construction

Duration: To be Determined

Incentive: To be Determined

Program Objectives:

- Educate the market about the introduction of provincial regulations on September 1, 2010
- Encourage the sale and installation of energy efficient water heaters to reap the associated energy savings.
- Educate builders and developers about ENERGY STAR® water heaters and the importance of hot water conservation

Background:

The Companies' goal is to promote the adoption of the latest energy efficient appliances as standard practice for new construction. Incentive programs help build this awareness. The $100 incentive will go to the builder or developer of a new home, to encourage the installation of ENERGY STAR® Domestic Hot Water heater. The new construction component of the ENERGY STAR® Domestic Hot Water program has not been finalized at the time of writing but will be based on the retrofit program assumptions and processes.

5.5.2.5 EnerChoice Fireplace New Construction Component (Under Development)

Program Area: Residential Energy Efficiency Programs

Target Market: New Construction

Duration: To be determined

Incentive: To be determined

Program Objectives:

- Encourage the sale and installation of energy efficient heater style fireplaces to reap the associated energy savings.
- Further the education and awareness of the EnerChoice label to builders and developers.
- Further relationships with manufacturers and distributors of natural gas fireplaces, through the HPBAC.

Background:

The Companies' goal is to promote the adoption of the latest energy efficient appliances as standard practice for new construction. Incentive programs help build this awareness. The $150 incentive will go to the developer or builder of a new home. The opportunity to extend this program to multi-family residential is under consideration based on further research. The new construction program has not been finalized at the time of writing but will be based on the retrofit program assumptions and processes.

5.5.2.6 Furnace Early Retirement Program (Under Development)

Program Area: Residential Energy Efficiency Programs

Target Market: Retrofit

Duration: To be determined

Incentive: To be determined

Program Objectives:

If research suggests the program is viable, the Companies may consider launching an ENERGY STAR® Heating System Early Retirement program, with a limited time offer. This program will educate homeowners about the value of high efficiency ENERGY STAR® furnaces and persuade homeowners to make a proactive replacement decision for additional energy savings.

Background:

The 2008 REUS suggests that only 16% of the Companies' customers have high efficiency furnaces (90% AFUE and higher), 39% have mid-efficiency furnaces (78% to 85% AFUE), and 45% have standard efficiency (less than 78% AFUE) furnaces. This means that 45% of the Companies' customers have an urgent need to upgrade their standard efficiency furnaces – some of which may have efficiency levels as low as 55%. This Program, should it be launched, would be designed to promote and encourage upgrades to high efficiency furnaces.

This program is in the early stages of development and still requires discussions with a large number of stakeholders. The Companies are evaluating available market and technical data to establish a sound business case and cost benefit analysis before proceeding.

Inventory stocks must be assessed. Although the BC Energy Efficiency Act Standards for Gas Furnaces applies to furnaces manufactured after December 31, 2009, mid-efficiency models can still be sold. Therefore there remains a large inventory of mid-efficiency furnaces in the market. The Companies are gathering industry feedback to estimate the size of the leftover mid-efficiency inventory.

The Companies are also gathering anecdotal evidence of lower efficiency furnaces that are due for replacement remaining in place and having repairs "jerry rigged" as a way to avoid some of the venting issues that British Columbians may face with the introduction of government's 90% efficient furnace regulation.

5.5.2.7 Furnace Service ("Give Your Furnace Some TLC") Program (Under Development)

Program Area: Residential Energy Efficiency Programs

Target Market: Retrofit

Duration: To be determined

Incentive: $25 Save-On Foods Gift Card

Program Objectives:

The primary objectives of the program will be:

- Provide education and awareness about energy efficient appliances and their maintenance
- Engage customers and contractors in conversations about efficiency, safety and the opportunity to upgrade existing appliances

No direct savings claims can be made from this program however the spillover effects would be appliance replacement.

Background:

In 2009, the EEC team developed the TGVI furnace servicing pilot program, "Give Your Furnace Some TLC," to promote the benefits of annual furnace servicing. The program was successful with over 300 applications received within 8 weeks of launching the program, demonstrating that customers will respond well to a $25 gift card incentive. Due to the success of the pilot, the Companies intend to roll out the program across the province in the summer of 2010.

5.5.3 Summary

Building on the success of the 2009 Residential Energy Efficiency Programs, 2010 programs will focus on energy savings associated with hot water heaters, fireplaces, a furnace service program, and possibly a furnace early retirement program. The Companies are also assessing opportunities for the New Construction market. In addition to energy and GHG savings, the programs will assist the provincial government with engaging industry in compliance with regulations, include conservation messaging in program outreach materials, and engage the trades, suppliers and manufacturers.. These programs are critical to the Companies' role in driving market transformation in the residential sector.

5.6 Commercial Energy Efficiency Programs

The Companies' commitment to Commercial Energy Efficiency programs was demonstrated in the 2009 initiatives described in Section 4.4. In 2010, the Companies plan on continuing to operate a number of these existing programs (with some modifications), while rolling out several new energy efficiency incentive programs to the market place.

5.6.1 Program Goals

Commercial Energy Efficiency programs focus on the following objectives:

- Upgrade existing low efficiency systems to capture energy savings associated with reducing the overall consumption of natural gas
- Prepare the market for the adoption of new energy efficient technologies through incentives, and support of government regulations.
- Educate commercial customers about the advantages of energy efficient appliances and provide incentives for their adoption when necessary.
- Engage the trades community and manufacturers by supporting new, energy efficient technologies.
- Develop cost effective programs with a TRC greater than 1.0 that optimize the proportion of incentives over administration and marketing costs
- Conduct program evaluations that confirm savings claims and guide the development of future programs.

5.6.2 Commercial Energy Efficiency Programs – Portfolio Overview: New and Existing Programs

The focus of 2010 will be to build on successes while broadening offerings to capitalize on new opportunities to promote Commercial Energy Efficiency programs.

Existing programs which will be continued and/or improved include:

- Efficient Boiler Program;
- Light Commercial ENERGY STAR® Boiler Program; and
- Energy Assessment Program.

New programs for 2010 will include the;

- Efficient Commercial Water Heater Program;
- Commercial Cooking Program;
- Commissioning Program; and
- Process Heat Program.

Table 5-7 provides a summary of the 2010 Commercial Energy Efficiency programs for TGI and TGVI.

Table 5-7: Solid performance expected again in 2010

	Program	Description	New Construction		Retrofit		TRC	
			Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	TGI	TGVI
1	Efficient Boiler Program	Rebate program for high efficiency commerical boilers > 300 MBH Input	148	99,200	1,068	724,574	2.1	2.0
2	Light Commercial Energy Star Boiler Program	Rebate program for high efficiency commerical boilers < 300 MBH Input	37	25,821	235	131,721	3.4	3.4
3	Efficient Commercial Water Heater Program	Rebate program for high efficiency commercial water heaters with thermal efficiency > 84%	91	21,193	214	49,959	1.1	1.0
4	Energy Assessment Program	No charge energy use assessments of commercial facilities	N/A		80	24,538	2.6	2.1
5	Process Heat Program	Rebate program targeted at Manufacturing processes	Under Development					
6	Commercial Cooking Program	Rebate program targeted at commercial cooking appliances	Under Development					
7	Commissioning Program	Incentive program to capture energy savings via building comissioning	Under Development					
8	Victoria Spray N' Save Program	Free provision and install of low flow pre rinse spray valves. Partnership with BC Hydro	Under Development					

Both existing and new programs in this Portfolio are expected to deliver value. The anticipated benefits from the 2010 existing Commercial Energy Efficiency programs are as follows:

- The Efficient Boiler Program will continue to generate gas savings in 2010. The Companies look forward to extending the incentive to include domestic hot water heating in combination heat / hot water systems, as well as simplifying the program process. These measures combined with improved program promotions should contribute to increase participation in 2010.

- In 2010 the Light Commercial ENERGY STAR® Boiler Program will provide strong value via TRC performance, while reducing commercial sector gas consumption. A sustained effort at raising the program's profile should lead to increased participation.
- The Energy Assessment Program will see changes aimed at increasing its effectiveness at getting participants to implement energy savings measures. Additional administrative changes will be implemented to avoid double counting of gas savings where such may be attributed to either the energy assessment program, or one of the Companies' other incentive programs.

The 2010 new Commercial Energy Efficiency programs are also expected to produce meaningful results in the following ways:

- The new Efficient Water Heater Program will round out the Companies' incentive offering for high efficiency potable water heating equipment. 2010 will be a learning year which will set the tone for the future of the program.
- The Commercial Cooking Program will provide rebates to reduce the incremental cost of high efficiency commercial kitchen appliances and help drive their adoption by the market.
- The Commissioning Program will capture gas savings by encouraging owners to critically examine their building or facility's operating performance and take simple yet powerful, operationally focused steps to reduce gas consumption.
- The Process Heat program will enable the Companies to assist manufacturing, agricultural and light industrial customers reduce their gas consumption by reducing the incremental cost of investing in high efficiency process heating appliances. The program is likely to be built around high efficiency boilers, though it may include incentives for additional measures.

The Commercial Energy Efficiency programs for 2010 are described in further detail below.

5.6.2.1 Efficient Boiler Program

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: 2005 – December 31, 2011
TGVI: 2005 – December 31, 2011

Program Updates for 2010:

For 2010, the program will be subject to several initiatives aimed at addressing the issues noted in Section 4.4.3, and encouraging increased participation:

1. The program's terms and conditions will be modified to include domestic hot water loads in the incentive calculation providing the program will maintain a healthy positive TRC. This will increase the value of the incentive and explicitly recognize the value of generating potable hot water from a high efficiency source.

2. The Companies will organize a program stakeholder feedback session, including contractors, suppliers, governing authorities and major customers, to gather input on the program design from the market. This will accomplish two objectives: It will help raise awareness of the program and, it will provide needed and direct insight from industry participants on the program's structure and operation.

3. Subsequent to the stakeholder feedback session the Companies will work to simplify and adapt the program's process and update its communications collateral in view of:
    - Making it easier / simpler for participants to take advantage of the program
    - Educating participants on boilers and the steps involved in their installation
    - Reducing the program's administrative burden / overhead

Background:

As discussed in Section 4.4.3, the Efficient Boiler Program is TGI and TGVI's flagship Commercial Energy Efficiency program. Its aim is to reduce gas consumption associated with space heating.

Results in 2009 were generally positive as the Programs saw strong performance despite an underperforming economy. On the other hand, participation from certain sectors – New Construction, Vancouver Island – was noticeably absent.

Please refer to Appendix D for a detailed program description.

Projected Outcome:

The Companies believe that the Efficient Boiler Program will continue to provide solid performance throughout 2010.

Table 5-8 provides program highlights of the Efficient Boiler Program performance metrics for 2010 based on our forecast.

Table 5-8: Efficient Boiler Program continues to reduce gas consumption in 2010

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	TGI	8	103	13	7,137	79,461	18%	2.1
	TGVI	2	26	6	1,784	19,739	18%	2.0
Retrofit	TGI	65	835	107	57,990	645,619	18%	2.1
	TGVI	8	103	24	7,137	78,955	18%	2.0

As noted above, there are, however changes envisioned for the program in 2010. All of the changes will ultimately be designed to encourage additional customers to participate in the program by increasing the value of the incentive, and reducing the administrative burden currently imposed on those who wish to participate. Increasing the program's participant numbers furthers the Companies' goal of reducing the commercial sector's gas consumption and bringing about market transformation.

While the Companies do expect the programs participation numbers to increase in 2010 versus those of 2009, some dampening effect is to be expected as the lag effect from the poor economic climate in 2009 carries through in the construction sector through much of 2010. Participation from the New Construction market seems likely to increase at a modest pace as many multi residential projects, which may have applied for an incentive in 2010, were put on hold in 2009.

For cost benefit analysis please refer to Appendix J.

Summary:

In 2010 the Companies plan to perform an in-depth evaluation study on the program's performance in reducing gas consumption. The results of this study will serve to confirm and/or provide additional insight into the gas savings associated with the program. For additional information on the proposed evaluation study please refer to Section 5.13.3.1.

5.6.2.2 Light Commercial ENERGY STAR® Boiler Program

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: August 2009 – December 31, 2011
TGVI: August 2009 – December 31, 2011

Program Updates for 2010:

Because the program is still relatively new, changes or updates to the program will be limited in 2010 as the Companies gather feedback from participants. The program's initially strong TRC performance suggests that there is some opportunity to adjust the program in view of attracting additional participants. Such a change may be made later in the year and could include:

- An increase to the value of the participant's incentive
- A sales incentive for boiler distributors to encourage the sale of ENERGY STAR® boilers
- An installation incentive for contractors to encourage them to install ENERGY STAR® boilers

Background:

Launched in August 2009, the Light Commercial ENERGY STAR® Boiler Program is the Companies' most recent offering aimed at reducing energy consumption associated with space heating. Program objectives for 2010 are the same as those outlined in Section 4.4.4, the 2009 Light Commercial ENERGY STAR® Boiler Program.

Please refer to Appendix D for a detailed program description.

Projected Outcome:

Table 5-9 provides program highlights of the Light Commercial ENERGY STAR® Boiler Program forecasted performance metrics for 2010.

Table 5-9: Light Commercial ENERGY STAR® Boiler Program to gain market traction

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	TGI	5	14	9	1,453	16,177	18%	3.4
	TGVI	3	9	5	872	9,644	18%	3.4
Retrofit	TGI	40	115	75	11,624	129,270	18%	3.4
	TGVI	10	29	16	2,906	2,451	18%	3.4

The Light Commercial ENERGY STAR® Boiler program is expected to turn in a TRC performance in 2010 more or less in line with what has been seen in 2009. Contributing to the program's forecasted strong performance in terms of TRC is its relative simplicity. This serves to make participation easier for customers and keeps administrative overhead low for the Companies.

Participation should improve throughout the year though as a new program, a sustained effort at program promotions is essential to raise awareness of and ensure increased participation. To garner participants for TGVI the profile of the EEC programs needs to be raised on Vancouver Island. Sustained promotional efforts in conjunction with the Efficiency Partners are expected to significantly address this situation moving forward. As more market participants become aware of the program and the benefits of installing high performance boilers, participation in the Light Commercial ENERGY STAR® boiler program is expected to exceed what was seen in 2009.

For cost benefit analysis please refer to Appendix J.

Summary:

A performance evaluation study will be conducted on the program towards the end of 2010 or early in 2011. While the cost of this study has not been firmly established as of the writing of this report, it is not expected to exceed the $30,000 estimated cost of the Efficient Boiler Program performance evaluation. A $30,000 charge for program evaluation has been included in the numbers presented above.

5.6.2.3 Efficient Commercial Water Heater Program

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: April, 2010 – December 31, 2011
TGVI: April, 2010 – December 31, 2011

Incentive:

Providing that the water heater is used for domestic water heating only:

Storage water heaters / Hot water supply boilers
- $5 per MBH[12] for water heaters with a thermal efficiency of 90% or higher
- $3 per MBH for water heaters with a thermal efficiency of 84% to 89.9%

On-demand water heaters
- $2.50 per MBH for water heaters with a thermal efficiency of 90% or higher

Program Objectives:

The Companies will be making the Efficient Water Heater program available to their commercial customers in early 2010. Through this program the Companies intend to:

- Reduce commercial sector gas consumption by encouraging the installation and use of high as opposed to standard efficiency water heaters for domestic hot water heating.
- Increase year over year participation rates in view of maximizing gas savings and bringing about market transformation.
- Educate commercial customers about the advantages of high efficiency water heaters and provide an incentive to facilitate the purchase of high efficiency technology.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.
- Prepare the way for and support any provincial regulation requiring increased water heater efficiency.
- Given that one of the targets for this program is Multi-Family Residential Buildings, this program will satisfy clause 3(a) of the DSM Regulation, which states that in order to be considered adequate, a utility's plan portfolio must include measures for rental accommodation.

[12] Note: 1 MBH = 1000 BTU/hr (BTU = British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit)

Background:

The 2006 CPR identifies water heating as the commercial sector's second greatest source of natural gas consumption by volume, at around 14% percent of the total. Yet despite their prevalence, few water heaters are as efficient as they could be. This presents an opportunity for a program that encourages commercial enterprises to upgrade or purchase heaters that are more efficient.

The need is clear: data from the Air-Conditioning, Heating, and Refrigeration Institute ("AHRI")[13], Consortium for Energy Efficiency ("CEE")[14] and discussions with manufacturer's reps indicates a maximum combustion efficiency of approximately 80%. High efficiency water heating equipment is generally "condensing" type with a combustion efficiency of approximately 95%. Moreover, the penetration rate of high efficiency technologies in the DWH market is low[15], especially for stand-alone DHW plants.

Uptake of the more efficient technology is inhibited by several barriers:

1. Higher initial cost / length of simple payback
2. Lack of awareness of products available
3. Nature of replacement market (Emergency replacement handled entirely by a plumber or gas fitter)
4. Negative perception of high efficiency technologies
5. Skeptical as to positive net benefits
6. Split Incentives

As a result, the existing market momentum favours the continued installation of standard efficiency units. While the existing boiler programs will provide a financial incentive for customers who generate DHW in combination space heat/DHW plants, a gap in market coverage exists for segments which make use of standalone DHW plants. The new Efficient Water heater program will bridge this gap.

Targeting Heavy Users:

The program is expected to appeal primarily to commercial customers who typically exhibit high domestic hot water usage such as:

- Commercial Kitchens
- Multi-Unit Residential Buildings
- Hotels/Motels
- Laundries

Some limited participation may be expected from other sectors such as:

- Hospitals & Medical Facilities

[13] *AHRI Database of Certified Product Performance, Water heaters*, available at: http://www.ahridirectory.org/
[14] "Market and Technology Characterization for Commercial GasWater Heaters", CEE, June 2008
[15] "Measures and Assumptions for Demand Side Management (DSM) Planning", Navigant Consulting, April 16, 2009

- Secondary Schools
- Large Commercial/Retail buildings

Please refer to Appendix D for a detailed program description.

Projected Outcome:

In the short to medium terms, the efficient water heater program is not expected to provide results similar to those realised by the boiler programs. Table 5-10 provides program highlights of the Efficient Water Heater Program forecasted performance metrics for 2010.

Table 5-10: Modest initial TRC performance in the program's first year

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	TGI	25	62	17	2,185	18,932	5%	1.1
	TGVI	3	7	5	262	2,261	5%	1.0
Retrofit	TGI	60	149	41	5,244	45,436	5%	1.1
	TGVI	6	15	10	524	4,523	5%	1.0

The performance of the program in its introductory year is expected to be modest. TRC's and program participation rates should remain relatively low while spending on promotions will be high in view of raising awareness. Vancouver Island is expected to see low participation, given TGVI's experience with its current incentive programs; the island generally lags behind the mainland in terms of participation on a per capita basis. The profile of the EEC programs needs to be raised on the island. Sustained promotional efforts in conjunction with the Efficiency Partners Program are expected to significantly redress this situation moving forward.

Also minimizing initial effectiveness is the reality that high efficiency technology is relatively new to domestic hot water heating, and as such the incremental price difference remains high. The cost to benefit ratio is therefore adversely impacted from the outset. As the incremental cost of the technology is reduced over time this situation will be improved. Furthermore, participation in the program is expected to be more limited than in the boiler programs, as only participants with high hot water requirements (as outlined above) are expected to obtain a reasonable payback by using high efficiency hot water heaters.

For cost benefit analysis please refer to Appendix J.

Summary:

As the market place becomes more aware of the program it is expected that increased participation will lead to improved performance in 2011. The program's simple structure should, similar to the Light Commercial ENERGY STAR® Boiler Program, help to keep administrative spending low over the long run and also contribute to a solid TRC showing.

5.6.2.4 Energy Assessment Program

Program Area: Commercial Energy Efficiency Programs

Target Market: Retrofit

Duration: TGI: 2001 – December 31, 2011
TGVI: 2001 – December 31, 2011

Program Updates for 2010:

The program will see several changes in 2010 aimed at improving its performance. Changes will include:

1. Requiring participants to pay for 50% of the assessment initially. The remaining 50% will be reimbursed once a participant has implemented all identified energy savings measures with a payback period of less than 2 years.

2. Developing a formalized energy savings tracking methodology.

3. Remarketing and promoting the program so as not to conflict with the Custom Design Program (refer to Section 5.13.6.2 Custom Design Pilot Program for a description of this program) and to ensure that participants in the program are those for whom a simple energy assessment as opposed to a full energy audit will suffice.

As the Companies continue to develop additional Energy Efficiency incentive programs, the Energy Assessment program risks coming into conflict with those programs when claiming GJ savings. As such, the Companies are considering restructuring the Energy Assessment Program as an enabling activity whose costs may be accounted for in the overall Commercial Energy Efficiency Program TRC.

Background:

As discussed in Section 4.4.5, the Energy Assessment Program is designed to identify inefficiencies in natural gas energy consumption and provide recommended solutions to commercial customers who consume more than 2000 GJ per year. The Companies strongly believe that an Energy Assessment program is essential to:

1. Reaching out to and engaging commercial customers on matters of energy efficiency.

2. Fostering a culture of conservation within the commercial sector in the province.

Please refer to Appendix D for a detailed program description.

Projected Outcome:

The Energy Assessment Program will be modified in late 2010 to improve its effectiveness in terms of GJ's saved per dollar spent, at reducing commercial sector gas consumption. In the meantime TGI and TGVI will run the program as is, though promotion of the program will be limited and its performance is expected to be impacted as a result.

Table 5-11 provides program highlights of the Energy Assessment Program performance metrics for 2010 based on our forecast.

For cost benefit analysis please refer to Appendix J.

Table 5-11: Energy Assessment Program Performance Metrics

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	TGI	45	54	16	12,110	22,087	10%	2.6
	TGVI	5	6	4	1,346	2,451	10%	2.1

The Companies are currently engaged in a second evaluation study of the program (an initial study was completed in 2008) based on participation from July 2007 through July 2009. This study will provide additional needed insight into the program's performance and allow the Companies to confirm the data underlying the performance results presented above. Furthermore the evaluation study will provide additional insight into where the program may be modified to enhance its performance. Refer to Section 5.13.3.3 for details on the Energy Assessment Program Evaluation.

5.6.2.5 Process Heat Program (Under Development)

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: To be determined
TGVI: To be determined

Program Objectives:

- Reduce gas consumption among manufacturing / light industrial customers by encouraging the installation and use of high as opposed to standard efficiency water appliances in manufacturing processes.
- Increase year over year participation rates in view of maximizing gas savings.
- Educate manufacturing / light industrial customers about the advantages of reducing gas consumption and provide an incentive to facilitate the purchase of high efficiency technology.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.

Background:

The Process Heat program will capture gas savings by directly addressing inefficient equipment or operations in manufacturing processes. This may include items such as old boilers, piping insulation, process controls, etc. Target participants will include organizations in agriculture, food processing and manufacturing such as asphalt production. The program is likely to include a capital cost incentive and may include an additional monitoring and performance incentive.

5.6.2.6 Commercial Cooking Program (Under Development)

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: To be determined
TGVI: To be determined

Program Objectives:

- Reduce gas consumption in commercial cooking operations by encouraging the installation and use of high as opposed to standard efficiency cooking appliances.
- Increase year over year participation rates in view of maximizing gas savings and bringing about market transformation.
- Educate commercial kitchen customers about the advantages of reducing gas consumption and provide an incentive to facilitate the purchase of high efficiency technology.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.
- Prepare the way for and support any provincial regulation requiring increased commercial cooking appliance efficiency.

Background:

According to the 2006 CPR, commercial cooking represents the third most important consumer of gas in British Columbia's commercial sector gas users. The Commercial Cooking program will capture gas savings by encouraging the use of high efficiency (generally ENERGY STAR® rated) cooking appliances in commercial kitchens. Typical appliances include fryers, ovens, boilers, steamers and ranges. Target participants will include restaurants, health care, care homes, education and institutional organizations. The program will likely be delivered in the form of an appliance purchase rebate.

5.6.2.7 Commissioning Program (Under Development)

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: To be determined
TGVI: To be determined

Program Objectives:

- Reduce gas consumption among the commercial sector's existing building stock by providing an incentive to help commercial customers maximize their facilities operating performance.
- Increase year over year participation rates in view of maximizing gas savings.
- Educate commercial sector customers about the impacts of poorly maintained / operated building systems and provide an incentive to facilitate both the maintenance of existing equipment, as well as the implementation of proper operating strategies.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.

Background:

Studies indicate that building commissioning, especially of existing buildings, represents one of the most cost effective sources of energy savings and GHG reductions. The Commissioning program will capture gas savings by ensuring that participating facilities / buildings are operated in the most efficient and effective manner possible.

Target participants will generally include government, medium to large commercial, large multi-residential, health care, education and institutional organizations. The program will likely be delivered in the form of a performance based incentive, wherein participants will be given a certain dollar amount per GJ actually saved.

The Companies are working to partner with BC Hydro on its currently operating commissioning program known as the Continuous Optimization program. If the TRC tests are positive, the Companies will begin paying for the gas side measures required to operate the program and subsequently claim the GJ savings.

5.6.2.8 Victoria Spray Saver Program (Under Development)

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI: Not Available
TGVI: May through August 2010

Program Objectives:

- Reduce gas consumption in associated with dishwashing by installing low flow pre rinse spray valves in food service establishments.
- Install new low-flow pre-rinse spray valves in approximately 300 locations in the greater Victoria area.
- Maintain a program TRC greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.

Background:

The Companies are planning to run another Spray Saver program in 2010 in conjunction with BC Hydro. The program will focus on the greater Victoria region and, similar to the Okanagan program, will seek to achieve a reduction in natural gas consumption associated with the production of hot water by reducing hot water use in commercial kitchens. TGVI will install, free of charge, new low-flow pre-rinse spray valves in willing food service facilities (i.e. restaurants, coffee shops, delis, groceries, etc.) in order to reduce the volume of hot water used in dishwashing.

5.6.3 Summary

The Companies intend to broaden their commitment to Commercial Energy Efficiency programs in 2010.

Existing programs such as the Efficient Boiler Program, Light Commercial ENERGY STAR® Boiler Program, and the Energy Assessment Program will each be refined and continued.

Where market research suggests it will create value to do so, the Companies will also roll out new programs to increase the Portfolio's impact in the Commercial space. These new programs include the Efficient Water Heater Program, Commercial Cooking Program, the Commissioning Program, and the Process Heat Program.

Collectively this portfolio will continue to create value in 2010 with the important stakeholder group of Commercial customers while laying a foundation for continued EEC efforts in 2011 and beyond.

5.7 High Carbon Fuel Switching

High Carbon Fuel Switching program initiatives are designed to result in lower overall GHGs by using natural gas in place of higher carbon fuels such as coal, oil or propane. In addition, further GJ savings will be recovered by replacing older less efficient high-carbon appliances with high efficiency natural gas appliances such as ENERGY STAR® furnaces or boilers.

5.7.1 Residential Retrofit Program Focus for Portfolio in 2010

The first program is a residential retrofit program, focused on converting oil or propane heating systems to ENERGY STAR® natural gas appliances. This program, the Switch 'N' Shrink Program, is described below.

As 2010 progresses, other programs still at the initial concept stage will be evaluated for inclusion in this Program Area.

5.7.1.1 Switch 'N' Shrink Program

Program Area: High Carbon Fuel Switching

Market: Retrofit

Duration: January 1, 2010 to December 31, 2010 with possible extension

Incentive: $1000 rebate cheque for oil or propane conversion

$50 rebate cheque for Electronically Commutated Motors ("ECM") from BCHydro or FortisBC

Partners: BCHydro and FortisBC

Program Administration:

Consumer Response Marketing

Program Objectives:

The program is designed to achieve the following:

- Provide a $1000 incentive to encourage homeowners to convert their primary heating system from higher carbon oil or propane to a high efficiency natural gas heating system
- Upgrade a minimum of 750 homes
- Develop relationships with associations for co-marketing opportunities, for example BC Insurance Brokers Association, real estate associations, environmental groups
- Work with MEMPR to include this program as part of the provincial greenhouse gas reduction strategy
- Develop a cost effective program with TRC greater than 1.0 that achieves significant energy savings, cost savings and greenhouse gas reduction benefits

Background:

A 2005 Statistics Canada Victoria market report indicated that 21% of the households still used oil (19% natural gas) and represented 29,000 oil customers. This market potential demonstrates the huge opportunity to reduce GHG's through natural gas conversions.

The Switch 'N' Shrink Program offers participants a $1000 rebate for converting their primary home heating system (furnace or boiler) from higher carbon oil or propane to an ENERGY STAR® natural gas heating system. The participant lowers their energy bills, increases their property value, reduces the potential of an environmental hazard, and shrinks their carbon footprint.

The program is available to all new and existing customers (where primary heating source is oil or propane) in all of the Companies' service areas except Whistler, beginning January 1, 2010.

ENERGY STAR® heating systems installed with an ECM are eligible for an additional $50 incentive funded by BC Hydro and FortisBC.

The program is offered to all BC residents, however almost 70% of the 1233 conversions in 2009 were on Vancouver Island, where the use of oil is more prevalent than in the rest of the Companies' service territory. Homes near a gas main are more likely to participate, however all potential customers may want to take advantage of this program. On-Main Market potential for TGVI oil and propane conversions is difficult to estimate, but could range from 20,000 to 40,000 households.

Please refer to Appendix D for a detailed program description.

Projected Outcome:

The program will deliver significant energy, cost, and GHG benefits through 750 conversions. Table 5-12 provides program highlights of the projected Switch 'N' Shrink Program performance metrics for 2010.

Table 5-12: Switch 'N' Shrink Program Performance Forecast illustrating the effective cost benefit tests associated with the Switch 'N' Shrink program

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)*	NPV Energy Savings (GJ)*	Free Rider Rate	TRC
TGI	225	225	25	(4,838)	(50,954)	50%	1.6
TGVI	525	525	200	(11,288)	(118,191)	50%	1.4
Total	750	750	225	(16,125)	(169,145)	50%	1.5

* Note: Energy savings in a fuel switching program are negative since this is a load building program from higher carbon fuel sources (oil and propane) to lower carbon natural gas.

The overall program benefits are captured by avoiding higher carbon fuel costs while incurring lower natural gas fuel costs for an overall reduction in net GHG emissions. The net benefit for the participant is in reduced energy costs while helping BC meet its provincial GHG reduction targets. From a Utility standpoint, the benefit is in adding more customers to the distribution system, especially where a gas service already exists in close proximity, keeping the overall system costs per customer down. Table 5-13 illustrates these points and the significant energy, cost and GHG savings that are obtained based on 750 furnaces converted from oil to natural gas.

Table 5-13: Switch 'N' Shrink Program Benefits analysis illustrating significant energy, cost, and GHG benefits per 750 conversions

Utility	NPV Natural Gas Incurred (GJ)	NPV Oil Displaced (GJ)	NPV Energy Savings (GJ)	NPV Costs to Purchase Natural Gas ($000s)	NPV Costs to Purchase Oil ($000s)*	NPV Cost Savings upon Conversion ($000s)	GHG Savings (tCO2e)
TGI	50,954	56,033	5,079	540	1,226	687	1,375
TGVI	118,191	130,743	12,552	1,259	2,845	1,586	3,242
Total	**169,145**	**186,776**	**17,631**	**1,799**	**4,071**	**2,273**	**4,617**

* Note: Source of Energy prices –November, 2009 http://www.mjervin.com/index_PetroleumPrices.htm where Oil = $22.50 / GJ

The oil to natural gas conversion overall program benefits are significant when considering the energy savings over the lifetime of the measure. Significant benefits per 750 conversions include the following:

- 17,631 net GJ's of energy saved
- $2.27 Million in net cost savings
- 4,617 net tCO2e

The program performance estimate of 750 participants is likely conservative based on initial interest from contractors, as well as considerable interest from the BC Interior region for conversion projects. Incentive dollars are forecasted at $750,000 while total spend for non-incentive dollars is estimated at $225,000. The $1000 incentive is meant to cover the incremental cost of upgrading to a natural gas furnace, rather than replacing an existing oil furnace with another oil furnace. Non-incentive spending represents only 30% of total spend.

The 50% Free Rider Rate was based on the assumption that half of the program participants would convert because of the incentive and the other half would have converted regardless of the program. This Free Rider Rate is in alignment with the 43% Free Rider Rate used in the ENERGY STAR® Heating System Upgrade Program. The overall TRC for this program is 1.5.

Please refer to Appendix D for a detailed program description.

<u>Summary</u>

The High Carbon Fuel Switching Program Area, within which Switch 'N' Save is the first program to market, will result in significant energy, dollars, and GHG savings over time. For every 750 oil-to-efficient natural gas conversions, fossil fuel consumption is reduced by 17,631 GJ's of energy, approximately $2.2 Million is saved by customers, and 4617 tons of GHG's are reduced. High carbon fuel switching program initiatives, such as the Switch 'N' Shrink program, will provide significant benefits to the Province of BC's GHG reduction strategy.

5.8 Conservation for Affordable Housing Programs

The first of the EEC Program Principles is that, “Programs will have a goal of being universal, offering access to energy efficiency and conservation for all residential and commercial customers, including low income customers through the DSM for Affordable Housing initiative.”

The Companies are staying true to this principle by developing and implementing programs that are of no cost or low cost to low-income participants. Further, the DSM Regulation states that a (public) utilities’ portfolio is adequate only if it provides (amongst other things) measures specifically intended to assist residents of low-income households and those living in rental accommodations to reduce their energy consumption.[16]

The Companies believe firmly in these guiding principles, and their commitment to them is reflected in the Conservation for Affordable Housing Programs they will implement in 2010.

5.8.1 Program Portfolio Overview

The 2010 Conservation for Affordable Housing Portfolio consists of two program categories: studies and programs aimed at low-income individuals and renters. The initiatives discussed in this section satisfy the requirements in clauses 3(a) and 3 (b) of the DSM Regulations for measures aimed at residents of low-income households and rental accommodations.

Table 5-14 provides a summary of the 2010 Conservation for Affordable Housing program’s initiatives.

Table 5-14: 2010 Conservation for Affordable Housing Programs Initiatives

	Project	Description	Retrofit		
			Incentive & Non-Incentive Expenditure ($000s)	NPV Energy Savings (GJ)	TRC
1	BC Affordable Energy Conservation Strategy (study)	A province-wide strategy paper for addressing conservation for affordable housing.	50	N/A	N/A
2	Strategic Energy Management Plan (study)	A study focused specifically on the non-profit housing sector in BC.	18	N/A	N/A
3	CHF BC Energy Performance Housing Inventory (study)	A building inventory of co-operative housing in BC.	15	N/A	N/A
4	REnEW	Capacity building program focused on increasing the supply of energy efficiency assessors and installers	258	N/A	N/A
5	Energy Savings Kits (ESK)	Partnership with BC Hydro for self-install energy efficiency measures	349	30,193	1.2
6	Energy Conservation Assistance Program*	Partnership with BC Hydro for direct-install energy efficiency measures	3,130	307,662	1.0

* The Companies plan to use $1.5 million of the MEMPR Low Income Partnership funds to contribute to BC Hydro through our ECAP partnership. The remaining budget for ECAP and all the remaining investments shown above are EEC investments in the Conservation for Affordable Housing program area. Only EEC investments will be included in the overall portfolio level TRC calculation.
Note: As per DSM regulation, the TRC caluculation for all low income programs applies a deemed benefit of 130% of what the benefit would recognized as in an able-to-pay program's TRC calculation. This regulation is applied in the TRC figures shown above.

[16] See Appendix B, Demand Side Measures Regulation, November 7, 2008, Section 3 (b).

5.8.2 Committed to Developing Expertise Through Research

The first component of the Conservation for Affordable Housing Program Area is a set of studies the Companies will participate in during 2010. Through these studies, TGI and TGVI will gain expertise in and insight into this market segment and its unique requirements.

There are three studies related to Conservation for Affordable Housing that the Companies are already planning to be involved in during 2010.

5.8.2.1 BC Affordable Energy Conservation Strategy Paper

The Affordable Energy Conservation Strategy Paper ("Strategy Paper") is being developed (through research and a consultation process) to provide recommendations that ensure that low income homes can actively participate in and benefit from targeted energy efficiency programs in this province.

The Companies are facilitating the Working Group and Task Force which is overseeing the development of this Strategy Paper. Currently, the Strategy Paper is in the research phase which is expected to be completed by the end of March. The research is focused on the current challenges, opportunities and best practices relating to energy efficiency programs for low income individuals and is being completed by a University of Victoria Environmental Law Centre student.

Following the research, the Task Force will identify what areas of research are still lacking and undergo a consultation process in order to address the gaps identified in the research. The research outcomes and the plan for consultation process will be shared with the Working Group at the next Working Group meeting in May, 2010. It is expected that the strategy paper will be developed by the end of 2010.

5.8.2.2 Strategic Energy Management Plan Study ("SEMP")

The second study that the Companies are supporting is the Strategic Energy Management Plan ("SEMP"). This study is commissioned by the Companies and BC Hydro and will be performed by City Green Solutions and the BC Non-Profit Housing Association. The study is specifically focused on the non-profit housing sector and seeks to match energy consumption information with building characteristics in order to prioritize energy efficiency investments. This study will be completed by Q3 2010.

5.8.2.3 Co-Operative Housing Federation – BC Energy Performance Housing Inventory

The third study is the Co-operative Housing Federation's ("CHF") BC Energy Performance Housing Inventory which is a first step towards addressing the complex nature of working with Co-operative Housing. This step will allow CHF BC to gain a better understanding of their housing stock. This is modelled on the success of BC Non-Profit Housing Association's Asset Analysis study. This inventory will allow for a strategic approach to be designed that will ultimately allow for the prioritization of energy retrofits in Co-ops in BC. This study will be commissioned by the Companies, BC Hydro and BC Housing and will be performed by City Green and eaga Canada Ltd.

5.8.2.4 Additional Studies

The above studies are presently the only three planned for 2010. However, there may be other opportunities in 2010 for further studies and those opportunities will be assessed as they arise.

5.8.3 Conservation for Affordable Housing Programs

The second component of the Portfolio is a collection of tactical programs. These have been developed by the Companies in partnership with electric utilities.

The Companies have developed and launched an Energy Efficiency Training Program titled, Residential Energy and Efficiency Works ("REnEW"). The Companies have also made progress towards the implementation of an Energy Savings Kit, and integration into the Energy Conservation Assistance Program. As well, initial concepts have been developed to further invest some of the MEMPR Low Income Partnership Funding.

These programs are described in detail below.

5.8.3.1 REnEW, Residential Energy and Efficiency Works

Program Area: Conservation for Affordable Housing Programs

Target Market: Retrofit

Duration: February, 2010 to December, 2011

Incentive: The Companies will contribute approximately $257,500 per year.

Funding Partners:

- FortisBC
- BC Hydro
- Ministry of Advanced Education and Labour Market Development

Delivery Partners:

- The Companies are the lead developer and administrator for this program. Other contributors and delivery partners include:
    - BladeRunners
    - Aboriginal Community Career Employment Services Society ("ACCESS")
    - John Howard Society, Central and South Okanagan
    - Southern Interior Construction Association

Program Objectives:

- Enhance and expand the energy efficiency retrofit industry
- Add energy-efficiency-focused capacity to delivery agents that work within low-income sectors
- Increase the quality of energy efficiency retrofitting installations through training

- In the long term, by increasing the supply of skilled energy efficiency workers, utilities will be able to implement energy efficiency retrofits at lower costs.

Background:

The Companies are leading a capacity-building program aimed at increasing the supply of qualified energy assessors and installers. This energy-efficiency focused training has been developed by the Companies, John Howard Society, Bladerunners, the Southern Interior Construction Association, FortisBC and BC Hydro. By facilitating this training course and increasing the supply of workers skilled in energy efficiency retrofitting, the Companies believe that the delivery costs of DSM programs that involve retrofitting will be decreased, and our ability to implement programs in remote communities will be enhanced.

The training program has been initially designed for, and targeted to, the clientele of the John Howard Society in Kelowna, and BladeRunners in the Lower Mainland. John Howard Society's clientele is primarily those who have had contact with the justice system. BladeRunners works with Inner City disadvantaged 'street-involved' youth. The Companies intend to offer the course a total of 5 times in 2010 and will include at least one Vancouver Island course offering.

Given the clientele that the Companies are seeking to assist through this initiative, the training will not require any prerequisite qualifications other than the desire to pursue work in the energy efficiency industry. Training will be 4-5 weeks and includes classroom time and in-the-field, hands-on experience. The training will cover a breadth of content including general energy conservation education, an understanding of energy as a resource, concepts such as 'house as a system', as well as the application and installation of energy efficiency measures. In addition to the energy-related education, the program includes general construction trade training and highly desired certifications such as WHMIS, First Aid, and Construction Safety Training System. The program is primarily focused on the energy efficiency industry and prepares graduates for employment relating to utilities' direct-install DSM programs. The training also opens the door to further formal training such as certified energy advisors.

Projected Costs:

The average estimated cost per course in-take is based on costs associated with the first two in-takes. The cost estimate of $103,000 includes the costs of trainers, course development costs, food for participants during the course, a full set of tools for the participants, and overhead costs of program delivery agents.

Table 5-15 shows estimates of costs associated with offering this program.

Table 5-15: REnEW Program Cost Estimates

Utility cost per in-take	$ 103,000
Number of in-takes	5
Total Annual Utility Costs	**$ 515,000**
BC Hydro and/or Fortis BC Annual Contributions	$ 257,500
The Companies Annual Contribution	$ 257,500

As the program is expanded to other parts of our service territory the Companies will look for additional funding partners.

5.8.3.2 Energy Savings Kits ("ESK")

Program Area: Conservation for Affordable Housing Programs

Target Market: Retrofit

Duration: May, 2010 to December, 2011

Incentive: The Companies will contribute approximately $13.76 per ESK

Partners:

- FortisBC
- BC Hydro

Program Objectives:

- Enable over 11,000 low-income participants to self-install energy efficiency measures in their homes.
- Make energy efficiency more accessible to low-income customers by addressing the key barriers to energy efficiency in this sector (including affordability, availability and awareness)
- Provide energy savings for TGI/TGVI
- Provide low-income customers with the opportunity to reduce their energy consumption which will also reduce their energy bills and GHG emissions.
- Create a culture of conservation through increased knowledge and awareness of conservation behaviours.

Background:

ESK is a self-installed kit of energy saving measures. BC Hydro and FortisBC have ESK's already available to their low-income electricity customers. The intention is to partner with BC Hydro and FortisBC in order to simplify the process for shared customers and reduce administration and marketing costs.

With the Companies' involvement in this project the ESK offer will become a broadly marketed and easily accessed program available to customers in all three utility partners' regions, regardless of their fuel type. Participants will be able to call a toll-free number, or visit a website to apply for the program. Based on the approval of a customer's application, instructions will be sent to a supplier to send out the kit. The only eligibility criteria will be that the participant is a low income customer of any of the three utilities. The definition of "low income customer" for this program is based upon Statistics Canada Low Income Cutoff ("LICO").

The intention is to have the application process and the packaging of the ESK jointly branded so that the customer will have a seamless experience from the time they hear about the ESK offer to the time it is delivered to their home. The kit will be delivered at no cost to the participants and will include several easy to install energy savings measures, such as water heater pipe wraps, low flow shower heads, faucet aerators, weather stripping, foam tape for door insulation, and other measures. The ESK will also include educational brochures that will help customers reduce their energy consumption through simple behavioural changes.

The intention is to have the kits available by May 2010.

Projected Outcome:

The incentive amount of $162,000 (for both TGI and TGVI) is the estimated cost of the ESK including packaging and delivery. The Energy Savings NPV of 30,193 GJs is based on achieving an aggressive goal of sending 11,000 ESKs to customers in 2010. The resulting TRC is 1.2.

Table 5-16 describes estimated performance and investments in the ESK.

Table 5-16: ESK Program Estimates

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
TGI	9,000	130	150	3,947	24,155	8%	1.2
TGVI	2,000	32	37	987	6,038	8%	1.2

Note: As per DSM regulation, the TRC caluculation for all low income programs applies a deemed benefit of 130% of what the benefit would recognized as in an able-to-pay program's TRC calculation. This regulation is applied in the TRC figures shown above.

5.8.3.3 Energy Conservation Assistance Program ("ECAP")

Program Area: Conservation for Affordable Housing Programs

Target Market: Retrofit

Duration: June, 2010 to December, 2011

Incentive: The Companies will contribute approximately $850 per participant.

Partner: BC Hydro

Program Objectives:

- Enable over 3,000 low-income participants to receive comprehensive energy evaluations in their homes and have a suite of energy efficiency measures installed for them.

- Make energy efficiency more accessible to low-income customers by addressing the key barriers to energy efficiency in this sector (including affordability, availability and awareness)
- Provide energy savings for TGI/TGVI
- Provide low-income customers with the opportunity to reduce their energy consumption which will also reduce their energy bills and GHG emissions.
- Create a culture of conservation through increased knowledge and awareness of conservation behaviours.
- Leverage the graduates of the REnEW program to perform retrofits in qualified customers homes.

Background:

The Energy Conservation Assistance Program ("ECAP") is a targeted program that, in its current state, is only offered by BC Hydro to low income high electricity users. The Companies intend to participate in this program and broaden its reach and impact to include low income natural gas users.

Presently prospects are identified through social housing providers, program delivery agents and targeted communications. Recipients of the Energy Savings Kits are also prospects for participation in this program if they meet the minimum energy consumption criteria. The program involves assessments of energy savings opportunities, and installation of energy efficiency measures, which currently include items such as attic insulation, crawl space insulation and draft proofing.

With the Companies' involvement in this program, the target will be expanded to include all high energy users regardless of their home heating fuel source.

Projected Outcome:

This initiative is in its very early stages of development, and budgeted amounts may vary significantly from the early estimates provided in Table 5-17. The intention is to have the program available to gas customers by the end of Q2, 2010.

Table 5-17: ECAP Early Budget Estimates

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
TGI	2,600	2,200	304	25,955	246,130	4%	1.0
TGVI	650	550	76	6,489	61,532	4%	1.0

As per DSM regulation, the TRC caluculation for all low income programs applies a deemed benefit of 130% of what the benefit would recognized as in an able-to-pay program's TRC calculation. This regulation is applied in the TRC figures shown above.

The incentive amount of $2,750,000 (for both TGI and TGVI) is based on an average of just under $850 per participant. The Energy Savings NPV of 307,662 GJ is based on achieving an aggressive goal of 3,250 participants in 2010. The resulting TRC is 1.0.

5.8.3.4 MEMPR Low Income Partnership Funding

As discussed in Section 4.5.3, on March 31, 2009, MEMPR awarded TGI and TGVI a grant of $5.155 million to support and develop programs for low-income individuals in British Columbia. This agreement stipulated that $1.5 million is to be contributed to projects with BC Housing, $1.5 million for projects with BC Hydro, and $2.155 million allocated for the development of additional TGI and TGVI programs for low-income participants. This funding is to be invested by March 31, 2012.

The $1.5 million that was stipulated to go to BC Housing has since had $1 million re-allocated at the request of MEMPR to go towards the Super Efficient New Construction ("SENC") program for superior energy performance in new construction projects that house low-income occupants. The SENC Program Oversight and Evaluation Committee chaired by MEMPR and including representatives from the Companies, MEMPR, BC Hydro and FortisBC selected six projects, and intend to have the contracts finalized and signed with individual construction project proponents by April 30, 2010. Table 5-18 below includes the selected projects.

Table 5-18: Super Efficient New Construction

	Project	Funding Request in Submission	Total Funding by SENC
1	Elizabeth Fry Society Transition House for Women and Children	$500,000	$222,000
2	Union Street EcoHeritage Project	$269,000	$125,000
3	Educational / Commercial Affordable Housing Project	$250,000	$200,000
4	Ucluelet Passive House	Unclear From Proposal	$75,000
5	CRD Affordable Housing Project	$500,000	$278,000
6	Dawson Green	$180,000	$100,000
	Total		**$1,000,000**

The remaining $500,000 was allocated to the $2.155 million for the development of additional TGI and TGVI programs for low-income participants.

The $1.5 million for projects with BC Hydro is stipulated to go towards comprehensive retrofits of 750 natural gas heated homes in partnership with BC Hydro's low income programs. Specifically, the Companies intention is to apply this $1.5 million to a partnership on BC Hydro's ECAP program described above. The estimated investments in the ECAP program is well above $1.5 million and the remaining investment will come from the EEC approved funding for Conservation for Affordable Housing.

A portion ($965,803) of the $2.655 million stipulated for TGI and TGVI programs for low-income participants has been used to fund retrofits under the LiveSmart Carry Over project described in Section 4.5.3. The remaining $1.689 million will go towards additional TGI and TGVI programs that have not yet been developed, but that may include a partnership with FortisBC to fund the energy efficiency retrofits in four buildings in Kelowna where John Howard Society clients live.

5.8.4 Summary

The Companies are committed to developing and implementing programs that are of no cost or low cost to low-income participants. Further to this commitment, the Companies will participate in at least three studies in 2010 to gain further insight into the unique needs of this market segment. The Companies will also introduce a series of programs developed in partnership with electric utilities – an Energy Efficiency Training Program (REnEW), an Energy Savings Kit, and integration into the Energy Conservation Assistance Program.

These initiatives will promote conservation attitudes and create value through savings in a market segment that needs to be included in EEC programming. The programs described in this section satisfy the plan portfolio adequacy requirements in the DSM Regulation for energy savings measures for residents of low income housing.

5.9 Joint Initiatives For Energy Efficiency Programs

In 2010, the Companies will continue to participate in mutually beneficial collaborations between groups such as government agencies or BC utility partners. Please refer to Section 4.6 for more background on Joint Initiative projects.

5.9.1 Joint Initiative Program Portfolio

In 2010 the Companies will continue to carry out the EcoEnergy Home Assessment (in partnership with LiveSmart BC) while developing and rolling out new Joint Initiatives.

Joint Initiatives programs for 2010 include the EcoEnergy Home Assessments with LiveSmart BC, BC Hydro and FortisBC that will end March 31, 2010. Utility Partners are collaborating on developing a program for energy efficient home retrofits for the able-to-pay sector (as opposed to the Affordable Housing sector discussed above). Other programs under consideration include appliance rebates with FortisBC, and working with BC Hydro to fund Energy Specialists to complement BC Hydro's Energy Manager Initiative.

Table 5-19 provides a summary of the 2010 Joint Initiatives.

Table 5-19: 2010 Joint Initiatives Energy Efficiency Programs are currently under development with Utility Partners and government to provide energy savings programs and outreach across the province

	Program	Description	New Construction		Retrofit		TRC	
			Incentive & Non-Incentive Expenditure	NPV Energy Savings	Incentive & Non-Incentive Expenditure	NPV Energy Savings	TGI	TGVI
1	EcoEnergy Home Energy Assessments (D-Visits) through LiveSmart BC	$75 Incentive to cover the partial cost of Home Energy Assessment provided by an NRCan certified Home Energy Advisor	N/A		717	0	N/A	N/A
2	Utility Partner Collaboration - Home Renovation Project	TGI, TGVI, BCH, FortisBC and MEMPR in discussions.	N/A		Under Development			
3	Energy and Water Efficient Appliance Programs	Work with FortisBC to provide incentives for energy and water efficient appliances	N/A		Under Development			
4	Energy Specialists	Provide funding for Energy specialist focused on natural gas savings to complement BCHydro's Energy Manager	N/A		Under Development			

The highlights of the 2010 existing Joint Initiatives programs are as follows:

- EcoEnergy Home Assessment funding, provided through a partnership with LiveSmart BC, demonstrates the Companies' support for energy assessments as a critical first step in the retrofit process and "whole home" incentives. From August 16, 2009 to March 31, 2010 the Companies expect to provide funding for 15,000 assessments with a contribution of $1.125 Million.

The highlights of the new 2010 Joint Initiatives programs are as follows:

- Utility Partners have been collaborating to develop a program for energy efficient home retrofits. The Companies are working with utility partners and MEMPR to define roles and determine how each party will contribute to delivering a successful program to customers.

- TGI is working with FortisBC on programs for energy and hot water efficient appliance rebates. TGI's participation extended the program reach to natural gas water heating customers and those with gas dryers.

- The Companies are in discussion with BC Hydro about providing funding for an Energy Specialist that would be put in place to complement the BC Hydro Energy Manager program. Through utility collaboration, large commercial and institutional entities, municipalities, universities, school districts, health regions and industry associations could access expertise to reduce energy (both electric and natural gas) and save money.

The Joint Initiatives programs for 2010 are described in further detail below.

5.9.1.1 EcoEnergy Home Assessment (D-Visit Audit) Support Through LiveSmart BC

Program Area: Joint Initiatives

Target Market: Retrofit

Duration: August 16, 2009 through March 31, 2010

Incentive: $75 subsidy from Utility Partner (based on fuel source) and $75 from MEMPR

Partners: TGI, TGVI, BC Hydro, FortisBC and MEMPR

Program Administration:

LiveSmart BC

Program Objectives:

- Provide incentives for Home Energy Assessments as the first step in improving the energy efficiency of existing building stock
- Support LiveSmart BC in the interim funding period prior to new program iteration in April, 2010

Background:

Please refer to Section 4.6.2.1 for more information about this program

Projected Outcome:

Table 5-20 provides program highlights of the EcoEnergy Home Assessments Program estimated performance metrics for 2010.

Table 5-20: EcoEnergy Home Assessments Participant Numbers and Contribution

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)
Invoiced: Aug 16 - Dec 31, 2009	TGI	5,182	389	16
	TGVI	263	20	4
Estimates: Jan 1 - Mar 31, 2010	TGI	7,644	573	-
	TGVI	1,911	143	-
Total	TGI	12,826	962	16
	TGVI	2,174	163	4
Program Total Estimates *		15,000	1,125	20

* program estimates from MEMPR based on NRCan D- visit data

Recognizing the importance of the home energy assessment as the first step in energy efficient retrofits, the Companies anticipate subsidizing a total of 15,000 assessments for a contribution $1.125 million from August 16, 2009 through March 31, 2010, which is the provincial fiscal year end. Due to the nature of this project, in that the assessment is an evaluation step only, the Companies recognize that no energy savings can be claimed directly as a result of this program. Rather, the Home Energy Assessment is an avenue into other retrofit incentives that result in energy savings.

5.9.1.2 Utility Partner and LiveSmartBC - Home Renovation Program (Under Development)

Program Area: Joint Initiatives

Target Market: Retrofit

Duration: To be determined

Offer: Final offer to be determined

Partners: TGI, TGVI, BC Hydro, FortisBC, NRCan, and MEMPR

Background:

The Companies are working with BC Hydro and FortisBC to establish a Utility Partner collaboration model for a BC Home Renovation program. The primary objective of the collaboration is to develop a platform that is sustainable and can remain in the market for many years without relying on the contribution of any one partner. The Utility Partners support the "whole home" or "house as a system" approach to energy savings, and in parallel to consumer incentives the Utility Partners will develop a longer term vision to jointly fund education and outreach, working to engage consumers and the trades in energy efficient retrofits.

This Joint Initiative between Terasen Gas, BC Hydro and Fortis BC is in the design stage and the structure of the program is subject to change. The Utility Partners remain committed to working together with other stakeholders to bring a sustainable home renovation program to the province of BC.

5.9.1.3 Water and Energy Efficient Appliance Programs (Under Development)

During the summer of 2009, the Companies partnered with FortisBC on a six week pilot to promote energy and water savings by providing $50 incentives to customers in their service territory who purchased a Tier 3 ENERGY STAR® Washer or Dryer. An expanded program is being planned for 2010 in the FortisBC service territory. Working with other utilities will leverage administrative processes, reduce costs and increase program participation by sharing marketing channels.

5.9.1.4 5.9.5 Energy Specialist Program with BC Hydro (Under Development)

The Companies are working with BC Hydro to provide funding for an Energy Specialist that would be put in place to complement the BC Hydro Energy Manager program.

There are a number of large commercial and institutional entities, municipalities, universities, school districts, health regions and industry associations where BC Hydro funds the activities of an Energy Manager, who is charged with uncovering opportunities for energy savings projects. The Companies will fund the activities of an Energy Specialist, for mutual customers where a BC Hydro Energy Manager is in place, who would complement the activities of the Energy Manager by focussing on natural gas savings opportunities. Due to the early development stage for this program, no budget had yet been set at the time of writing.

This would bring a more complete approach to energy savings projects for large commercial and institutional entities, municipalities, universities, school districts, health regions and industry associations in British Columbia.

5.9.2 Summary

Joint Initiatives provide numerous mutually beneficial advantages for the Companies' energy efficiency programs. In working together, utilities and government partners can extend the reach of incentives, provide cost effective education and outreach, and generate significant savings and greenhouse gas reductions.

5.10 Conservation, Education and Outreach ("CEO") Programs

As described in Section 4.7, the objective of CEO initiatives is to support the development of a conservation culture within British Columbia. CEO activities help to ensure that customers are aware of and will be receptive to incentive programs when they are proposed.

Crucial to the success of EEC programs is creating and promoting awareness of conservation in general which generates desire by participants to engage in EEC activities. The CEO objectives ultimately lead to the success of the individual programs and support the energy conservation and GHG reduction goals established by the Government of BC.

5.10.1 Guiding Principles Remain in Place

The CEO programs are intended to allow engagement and opportunities for participation by all customer sectors. As with the CEO activity in 2009, the CEO activity for 2010 will follow many of the same Program Principles that were put forth in the EEC Application, in particular:

1. Programs will have a goal of universality; offering access to energy efficiency and conservation for all residential and commercial customers, including low income customers through the DSM for Affordable Housing initiative;
2. Where possible, programs will be uniform across the service territories of the Companies, so customers will have equal participation opportunity; and

3. Programs will be multi-year so as to create a sense of funding certainty necessary to effectively implement them in the marketplace.

5.10.2 CEO – Portfolio Overview: Existing and New Programs

Several initiatives undertaken in 2009 launched in Q4 of that year and are continuing into 2010. As many of these initiatives are still very new to the market, they have not had time to achieve momentum. Evaluation of the initiatives will be conducted at completion. For the proposed evaluation budget refer to Section 5.13.3.4 and for a further description of techniques for evaluation for this Program Area, refer to Appendix D.

New initiatives are also being pursued in 2010, some of which include ethnic outreach and employee education. Table 5-21 summarizes the initiatives and proposed expenditures for 2010, which align with the approved funds for the CEO program area for TGI and TGVI.

Table 5-21: 2010 CEO Initiatives and Proposed Expenditures

	Initiatives	Description	Expenditures ($000s)		Total Expenditure ($000s)
			TGI	TGVI	
1	Print and Online Publications	Energy conservation education promoted through bill inserts, newspaper and magazine ads, trade show guides, newsletters, directories, and terasengas.com.	165	33	**198**
2	Ethnic Outreach	Targeted in-language (Punjabi and Mandarin) online & print media, and event attendance, to reach key ethnic markets.	75	15	**90**
3	Trade Shows and Events	Participation in residential home shows and commercial trade shows to reach customers and educate on energy efficiency rebate programs.	245	49	**294**
4	Students and Schools Outreach	Destination Conservation Beyond Recycling BC Green Games School Assembly presentations	400	80	**480**
5	Energy Champion Program	Educate children and youth about energy conservation behaviour changes, using regional sports team events.	446	89	**535**
6	Team Terasen Outreach	Outreach group delivering the DSM message by connecting with customers at community events and festivals.	112	23	**135**
7	Employee Education	Energy conservation education and action program focused on engaging employees in the Company.	36	7	**43**
	Total (Budget)		1479	296	**1775**

CEO initiatives that will be undertaken in 2010 are described in further detail below.

5.10.2.1 Print and Online

As noted in Section 4.7.4, print and online advertising are more cost effective compared to television and mass media approaches, and will be targeted at customers already inclined to home renovations. Consequently in 2010, the Companies will continue to promote energy conservation through a variety of print and online channels.

The goal of print and online information pieces is to keep conservation top of mind through continued and consistent education. These educational pieces have also been vital among our stakeholders, such as contractors and industry associations, for distribution among their customers and members, so this method of communication will continue. Feedback from the March 11, 2010 EEC Stakeholder meeting has indicated that additional education initiatives provided from the Companies would be valuable for stakeholder members and constituents. Please refer to the Stakeholder Priorities in Appendix F.

5.10.2.2 Ethnic Outreach

British Columbia is a culturally diverse province, and a successful EEC portfolio will be aware of the unique needs of ethnic groups. The ethnic marketing and communications outreach campaign beginning in 2010 is to make conservation education accessible to all customers.

New Canadians - primarily coming from China (23%), India, the Philippines and South Korea[17] - are a main source of population growth and housing demand in British Columbia. Within six months of arrival, 17% of new immigrants to British Columbia are homeowners, and after four years more than half are homeowners. Statistics show that 17% of the British Columbia's do not speak English in their homes as a primary language and in over 28% of those homes, English is their second language.[18] Thus, it is important to communicate conservation information that is relevant and easily understood by these ethnic audiences. Refer to Appendix D for proposed initiatives planned for the ethnic audiences.

5.10.2.3 Trade Shows and Events

The Companies will continue to engage with customers at various home and trade shows around the Province to promote energy conservation, and the new EEC programs.

Similar to Section 4.7.5, the goals for the trade show and event activities in 2010 will be to provide face to face interaction with customers to communicate incentive programs, CEO initiatives and engagement programs, and to provide educational materials that can be distributed or displayed at customers' facilities. Refer to Appendix D for a proposed list of trade shows and events.

5.10.2.4 Student and Schools Outreach

As indicated in Section 4.7.6 school programs run over the September to June time period and so many initiatives will continue into the first half of 2010. For the 2010-2011 school year, the Companies will continue to support educational programs that have an energy conservation

[17] According to the Canadian Mortgage and Housing Corporation's 2009 Annual Provincial Outlook on Housing
[18] http://www12.statcan.ca/census-recensement/2006/as-sa/97-555/tables-tableaux-notes-eng.cfm

component, like Destination Conservation, Beyond Recycling, BC Green Games and school assembly presentations. The goal of these programs is to increase the number, awareness and involvement of schools and students around the province. With continued funding support made available to these programs, this allows for improved planning by teachers and school environmental groups to build on existing knowledge and conservation projects. Lastly, new initiatives and increased engagement on energy conservation with post secondary students will also be pursued. This area of activity satisfies clauses 3(c) and 3(d) of the DSM regulation, which requires a utility to have education programs for school-age and post-secondary students in the portfolio plan in order to be considered adequate.

5.10.2.5 Energy Champion Program

As in Section 4.7.6.5, the goal of the Energy Champion program is to educate children and youth on energy conservation. Similar to the school year, program activations with the various sports teams such as Vancouver Giants, BC Lions, and with teams in the BC Hockey League run from September to April/May. As these partnerships began only in Q4 of 2009, they will be continuing into 2010.

The purpose of these partnerships is to enable the Companies to leverage on traditional media channels, such as radio, as well as the sports teams' online and social media channels - channels that are well developed in the market and reach out to a large number of the teams' fans.

In 2010, an exciting new partnership for the Energy Champion Program with the Vancouver Canucks is being launched. The objective of this partnership is to engage the Vancouver Canucks' audience on energy conservation, through a variety of online and in-game activities. Refer to Appendix D for further detail on executing the Energy Champion program.

5.10.2.6 Team Terasen Outreach

The Team Terasen will continue to reach out to the public at local community events in 2010.

As described in Section 4.7.7, as most of the community events are free to the public, this is a cost effective method for the Companies to reach out to a large number of customers. One of the goals for Team Terasen for 2010 is to increase the number of events attended in the service territories of TGI and TGVI, and expand the geographic scope of events attended beyond the Lower Mainland.

Refer to Appendix D for a proposed list of Team Terasen events.

5.10.2.7 Terasen Employee Education

The Companies employ approximately 1,300 individuals, many of whom are themselves customers – and many of whom regularly interact with customers.

The EEC department has traditionally communicated EEC initiatives and incentive programs to employees via the Companies' intranet, newsletters and training specifically for the call centre staff. The goal of the Terasen Employee Education program is to create a large group of "EEC Ambassadors" within the Companies that are able to promote EEC programs and initiatives which they can engage in for their own benefit, as well as communicate EEC programs and initiatives in their dealings with the public, friends and family.

The expansion of EEC initiatives and programs makes it necessary to provide the Companies' employees with continual education on all EEC programs, incentives, CEO activities and initiatives being implemented.

5.10.3 Summary

The objective of CEO initiatives is to keep conservation top of mind with customers, thus supporting the development of a conservation culture within British Columbia.

The 2010 CEO initiatives follow many of the same Program Principles that were put forth in the EEC Application. Universality and accessibility to all customers, uniformity across TGI and TGVI service territories, and the notion that multi-year programs are ideally suited to ensure effective implementation and stability in the marketplace.

The initiatives promote and educate the public on energy conservation behaviours which benefit the community and help embrace change. The CEO activities inform the public about the Companies' conservation initiatives and result in increased participation in EEC incentive programs.

5.11 Interruptible Industrial Sector Programs

As discussed in Section 3.2, TGI sought funding approval for EEC Programs for Interruptible Industrial customers in the 2010-2011 Revenue Requirements Application. As part of the NSA, the parties agreed that EEC funding for Interruptible Industrial programs for 2010 would be $435,000. These programs will focus on mitigating the risks associated with large financial investments in energy efficiency for interruptible industrial customers.

TGI is currently in the process of developing a strategy for EEC for Interruptible Industrial customers; however, the broad areas of activity for this program area for 2010 are not expected to deviate significantly from the information put forward in the 2010-2011 Revenue Requirements Application.

The Industrial Stakeholder group will be re-convened and significant input garnered from this group on program design and implementation. The main area of activity in the Interruptible Industrial Program Area for 2010 will be to undertake the Energy Savings Potential Studies identified in the proceeding.

The Companies believe these investments in this portfolio will better lay the foundation for significant capital investments by large industrial customers and that these investments can produce significant reductions in commercial energy use.

5.12 Innovative Technologies

Innovative Technologies are best described as market ready technologies that have little or no market penetration in the BC energy efficiency landscape. They can be defined as emerging and/or enabling technologies. Some of these technologies include, but are not limited to, solar thermal DHW systems, GSHPs, hydronic systems, sterling engines, micro co-generation, natural gas transportation, and fuel cells. Hydronic systems can be classified as enabling technologies as they have the flexibility and potential to receive future energy from District Energy Systems ("DES"). Innovative Technologies are solutions the Companies can support though programs delivering energy reductions and savings to our customers for now and into the future.

5.12.1 Funding in Place for 2010-2011 Program Development

As discussed in Section 3.2, TGI and TGVI sought funding approval for EEC Programs related to Innovative Technologies in their respective 2010-2011 Revenue Requirements Applications. In November 2009, TGI received approval for Innovative Technologies program budget of $2.334 million in 2010 and $4.669 million for 2011, for a total budget of $7.003 million. TGVI also received approval for Innovative Technologies budget of $478,000 in 2010 and $958,000 for 2011, for a total budget of $1.435 million.

As part of their respective NSAs, the parties agreed that the Innovative Technology Programs will be managed by TGI and TGVI as a separate segment of the overall EEC portfolio.

5.12.2 Late 2009 – Early 2010: Working With Stakeholders

Stakeholder consultation has been a critical component in laying the foundation for future Innovative Technology programs. As discussed in Section 4.9, an EEC Stakeholder Group was formed in December 2009, and had its second meeting on March 11, 2010 (the details of which are provided in Appendix F).

The meeting achieved several important goals; it:

- Provided an opportunity to discuss details of how the weighted average TRC is applied to the Innovative Technologies portfolio. It also allowed the group to discuss proposed Innovative Technologies program portfolio and program costs.
- It introduced the EEC Stakeholder Group to the feedback mechanism that affords them an opportunity to voice any concerns on the Companies' approach to Innovative Technologies, and to provide ongoing dialogue.

Following the meeting, the Companies' Manager of Technical Sales Support sent a request for feedback from the Stakeholder Group. The goal was to ensure any concerns they may have with the practical application of the weighted average TRC or with the portfolio of proposed activity for Innovative Technologies have been brought forward and noted. At the time this report was written, we received feedback from two members of the Stakeholder Group – and since no opposition on the proposed Innovative Technologies portfolio and TRC approach had been voiced, it seems reasonable to conclude the Stakeholder Group is supportive.

5.12.3 Late 2009 – Early 2010: Establishing the Innovative Technologies Framework

At a high level, TGI and TGVI also took important actions to lay the groundwork for the introduction of incentive programs for Innovative Technologies in 2010. Specifically:

- TGI and TGVI restructured the existing portfolio list of Innovative Technologies to include Solar Thermal Hot Water, NGV for Commercial Vehicles, Hydronic and Combination Space Heating Systems, Residential GSHP and Commercial and Industrial GSHP Systems. TGI and TGVI will treat NGV fuel switching from diesel as part of or normal course of EEC activities.

The restructured Innovative Technologies portfolio is described below in Table 5-22 and Table 5-23, along with possible program costs and the relevant TRC weighting of technologies. As program design progress, some technologies may be replaced in the portfolio. However the weighted average of the portfolio will be 1.0 or greater.

Table 5-22: Innovative Technologies Portfolio Program Cost Breakdown TGI

	Incentive Expenditures ($000s)	Non-Incentive Expenditures ($000s)	Total Expenditures ($000s)	TRC
Solar Thermal Hot Water	240	48	$288	0.8
NGV Commercial Vehicles	800	8	$808	1.5
Hydronic and Combination Heating Systems	100	20	$120	0.4
Residential GSHP Systems	100	7	$107	0.2
Commercial/Industrial GSHP Systems	600	5	$605	1.0
Total	**1,840**	**88**	**$1,928**	**1.2**

Table 5-23: Innovative Technologies Portfolio Cost Breakdown TGVI

	Incentive Expenditures ($000s)	Non-Incentive Expenditures ($000s)	Total Expenditures ($000s)	TRC
Solar Thermal Hot Water	$50	$10	$60	0.6
NGV Commercial Vehicles	$166	$2	$168	1.4
Hydronic and Combination Heating Systems	$21	$4	$25	0.4
Residential GSHP Systems	$21	$1	$22	0.2
Commercial/Industrial GSHP Systems	$125	$2	$127	1.1
Total	**$383**	**$19**	**$402**	**1.2**

5.12.4 Striving to Establish Appropriate Incentives

TGI and TGVI recognize how critical it is for the Innovative Technologies portfolio to carefully set and offer incentives.

Further to this, the Companies intend to remove the Partner Incentive Costs currently provided for Solar Thermal from the TRC calculations for the Innovative Technologies portfolio. Utility incentives for Innovative Technologies are designed to promote emerging technologies. As in the case of solar thermal, incentives are provided by the local, provincial and federal governments. These incentives are also intended to encourage the adoption of this technology.

As the California Standard Practice Manual states "… *all equipment costs, installation, operation and maintenance, cost of removal (less salvage value), and administration costs, no matter who pays for them, are included in this test.* ***Any tax credits are considered a reduction to costs in this test*** (Emphasis Added)". Therefore the Companies believes that Partnership Incentives that come from local, provincial and federal governments may be treated as if they are a tax credits and will be applied to reduce the costs of the technology in the test.

While the Commission and the Companies agree the Innovative Technologies Portfolio will have a weighted average TRC of 1.0 or greater for 2010 and 2011, the Companies may seek the Commission's approval allowing a weighted average TRC of less than 1.0 in future filings. By their nature, Innovative Technologies are new and costs for encouraging adoption may be high, but early experience is necessary to develop knowledge and encourage market uptake.

5.12.5 Summary and Next Steps

Innovative Technologies represent an important component of the Companies' overall commitment to EEC activities. There is appropriate funding in place, and a forum for stakeholder consultation and feedback has been established. Inventive Technologies are solutions the Companies can support though programs delivering energy reductions and savings to our customers for now and into the future.

The next step: TGI and TGVI will begin program design in Q2 2010 for Innovative Technologies.

5.13 Enabling Activities

As discussed in Section 4.8, in 2009 the Companies pursued Enabling Activities in support of broader EEC activities and programs. They fall into four major categories: Research and Evaluation, Efficiency Partners Program, Codes and Standards and Pilot Programs. In 2010 these four areas of focus will remain the same and the Companies will increase and broaden their planned activities in each.

5.13.1 Broader Commitment In Four Continued Areas of Focus

Research and Evaluation:

The highlights of the 2010 Research and Evaluation activities are as follows:

- TGI and TGVI plan to undertake a thorough investigation of the gas savings associated with the Efficient Boiler Program. The results of this investigation will serve to confirm or modify the underlying assumptions currently used to evaluate this program and to establish incentive levels.
- TGI will empirically evaluate the results of the Okanagan Spray N' Save program that took place in 2009. The results will be used to establish a reasonable and prudent

estimate of the gas savings attributable to low flow spray valves, and the program more generally.

- TGI and TGVI are engaged in an evaluation of the Energy Assessment Program This exercise will evaluate program effectiveness, verify energy savings, and identify areas of improvement via billing analysis and phone based interviews.
- CEO activities to be evaluated for effectiveness through methods such as: advertising tracking, process evaluations, and web analytics.

Efficiency Partners Program:

As described in Section 4.8.3, 2009 provided a good starting point to develop the Efficiency Partners Program. The highlights of the 2010 Efficiency Partners program activities are as follows:

- Contractor program focus group meetings will be held in the Lower Mainland and Interior to gather input from contractors on what elements of a contractor program they would find to be of most interest, and most beneficial to them and our mutual customers.
- Develop and roll-out the new Contractors program.
- Develop and start quarterly Efficiency Partners newsletters.
- The Co-op Advertising program will still be available for those that are registered with the Company's contractor program and a review of the value of this element will be conducted.

Codes and Standards:

A full listing of all monitored areas of regulation can be found in Section 4.8.4. EEC will remain active with developments on Code and Standards committees as they pertain to EEC program and market development, and this will continue to be an important activity area. The activity highlights for the Codes and Standards for 2009 are as follows:

- In 2010, monitoring and participation in developing codes and standards that have relevance to EEC program areas will enable the EEC team to anticipate, develop and implement effective programs.
- Of particular interest in 2010 will be the development of the BC Building Code for new home construction with EnerGuide 80 efficiency targets.
- Residential Hot Water heater regulations will continue to require a partnership with government and manufacturers to achieve a market transformation plan.

Pilot Programs:

In 2010, EEC plans to expand this area by including six new pilot programs. The highlights for the 2010 Pilot Programs are as follows:

- Behaviour Change Pilot Programs are currently in development to influence commercial and municipal customers' behaviour and if successful, the program design will expand to other large commercial, institutional, and municipal customers.
- The Custom Design Pilot Program is slated to be offered to commercial programs in 2010. The program seeks to capture energy savings associated with measures and systems (technologies or operational strategies), which are otherwise difficult to incent as part of a prescriptive program. It will apply to measures which reduce gas consumption of space and / or domestic hot water heating, for both new construction as well as retrofits.
- Fireplace Timers Pilot Program is in currently in market, and aims to study the effect that installing electronic timers on 'decorative' natural gas fireplaces in multi-family residential strata and apartment buildings has on natural gas consumption.
- A Tier 3 Domestic Hot Water Heater Pilot Program to confirm energy savings and build a knowledge base as we approach 0.80 EF regulations in 2013. All viable technologies will be identified and tested including condensing tankless and condensing storage tank systems. This pilot will include technical issues, installation difficulties and establish methods for overcoming marketing barriers.
- Drain Water Heat Recovery Pilot Program will be conducted to validate manufacturers' claims about energy efficiency on the technology.
- The EnerGuide 80 Pilot Program for new homes and retrofits to determine the best way to incent customers and builders to adopt more energy efficient building practices.

5.13.2 Enabling Activities Budget

The expenditures in this area are part of the overall overhead of EEC program delivery and are included in the overall portfolio level expenditures.

The Commission did not approve the EEC discrete Trade Relations budget area put forward for these supporting activities as it was identified as a duplication of commercial and residential program delivery expenditure.

As the Companies' EEC initiative continues to expand through 2010 and beyond, the Efficiency Partner and Codes and Standards areas have the potential to consume significant resources. As the Efficiency Partner and Codes and Standards areas develop, it may be necessary to reassess the need to establish a separate Program Area for these activities in the future, with its own budget.

Table 5-24 below shows the budgeted amount for Enabling Activities for 2010.

Table 5-24: 2010 Expanded Enabling Activities Budget

Program		Description	Expenditure ($000s)	
			TGI	TGVI
1	Research and Evaluation	Market research used for planning & implementing programs and measure program/activity effectiveness	452	113
2	Efficiency Partners Program	Delivering EEC programs through B-Ticket Contract Companies	311	78
3	Codes and Standards	Codes and Standards related to EEC Program areas	40	10
4	Pilot Programs	Test the effectiveness of measure/activity in the market	1,146	287

Further information on each of the four areas of the 2010 Enabling Activities is listed below.

5.13.3 Research and Evaluation

In addition to the Conservation Potential Review Study, discussed in detail in Section 6, the Companies' EEC group has a number of other research and evaluation projects planned for 2010 outlined below.

Note that this is not an exhaustive list and may change as the year progresses, based on business priorities. Those initiatives currently planned are discussed below.

The estimated costs associated with these activities are also shown in Table 5-25. The first line item in the Table is a contingency amount of $100,000 for potential studies that the EEC team might undertake in 2010 the subjects of which have not yet been identified. The second line item in the table of $33,000 includes two studies carried out in 2009 as shown in Table 4-18 : $15,000 for the second milestone of the Sustainability & Social Responsibility Attitudes Study Report ("SHIFT Report") and $17,800 for Residential Retrofit Market Evaluation for Terasen Gas. Due to the timing of these two studies, these payments were made in January 2010. Further details for these studies are provided in Appendix D.

Table 5-25: Research and Evaluation Activities 2010 Budget

	Study	Description	Expenditure ($000s)
1	Contingency/Additional Studies	Budget for additional studies & contingency amount	100
2	Variance between 2009 & 2010	Studies conducted in 2009 but paid in 2010	33
3	Efficient Boiler Program Evaluation	Gas savings associated with the Efficient Boiler Program	35
4	Okanagan Spray N' Save Pilot Program Evaluation	Determine average gas savings per spray valve	40
5	Energy Assessment Program Evaluation	Verify energy savings and identify areas of improvement.	18
6	Conservation, Education and Outreach Evaluation (Multiple Programs)	Cost effectiveness of CEO initiatives	340
	Total Estimate Amount		**566**

5.13.3.1 Efficient Boiler Program Evaluation

In 2010, TGI and TGVI plan to undertake a thorough investigation of the gas savings associated with the Efficient Boiler Program. The study will assess the actual savings per boiler installation as well the rate of successful boiler installation. The results of this investigation will serve to confirm or modify the underlying assumptions currently used to analyze the program. The costs of the study are estimated at $35,000. Furthermore, if the proposed methodology does not impose significant administrative costs on the program, it may subsequently be used to track gas savings on an on-going basis. For further details refer to Appendix D.

5.13.3.2 Okanagan Spray N' Save Pilot Evaluation

In the first half of 2010, TGI will evaluate the results of the Okanagan Spray N' Save program that took place in 2009. The cost of the study is estimated to be $40,000. Results will be compared and used to establish a reasonable and prudent estimate of the gas savings attributable to this technology program.

The initial phase of the evaluation has been completed. It consisted of an arithmetic analysis of participant specific survey information collected by the program operator at the time of low flow spray valve installation. The analysis made use of the recorded water flow reduction volumes and output water temperatures as well as the average ground water temperature in the Okanagan region and the estimated spray valve operating hours to determine the average gas savings per spray valve. Preliminary analysis suggests savings of approximately 8.71 GJ/yr.

In the second phase of the evaluation, approximately 30 participants will be selected for metering of their actual hot water consumption in order to empirically confirm the gas savings associated with the spray valves. For further details on this subsequent phase of the evaluation study refer to Appendix D.

5.13.3.3 Energy Assessment Program Evaluation

TGI and TGVI are currently in the process of evaluating the performance of the Energy Assessment Program. The goal of this evaluation study is to evaluate program effectiveness, verify energy savings and identify areas of improvement.

In 2008, the Companies retained a consultant to perform an evaluation study of the Commercial Energy Assessment Program for the period of mid – 2005 through June 2007. The study determined that approximately 35% of customers who received Terasen Gas energy assessments implemented some or all of the recommended measures and that the total amount of energy savings resulting from audits conducted during the 2005 -2007 audit period was 129,000 GJs.

In January 2010, the same consultant was retained to conduct the second wave of the study. The company was awarded the contract to maintain the continuity of the project and to manage costs; the cost of the second wave was $17,800. Starting in January 2010, the consultant interviewed 53 participants out of the 158 customers who participated in the Commercial Energy Assessment program between July 2007, and July 2009. These customers included the following groups: care homes; manufacturing companies; apartments and stratas; hotels and restaurants; as well as large public facilities and offices.

It is anticipated that the complete finalized report will be available by the end of April, 2010.

5.13.3.4 Conservation Education and Outreach Evaluation

As several new CEO initiatives have been introduced into the portfolio, it has become increasingly important to evaluate the cost effectiveness of CEO initiatives in order to justify the expenditures associated with these activities. The estimated budget for evaluation of the CEO activities is set at $340,000 (which is based 15% of the overall CEO budget for 2010). The Companies intend to use these funds to evaluate CEO programs in 2010.

CEO initiatives are diverse and can vary in nature. Their effectiveness can be measured through methods such as: advertising tracking, process evaluations, and web analytics. These evaluation methods will be used to evaluate the CEO initiatives described in Section 5.10.

Advertising tracking can investigate the effectiveness of specific commercials or campaigns in terms of the recall of specific messages, changes in people's perceptions, and behavioural changes in the target audience. Process evaluations measure the effectiveness of the program by assessing how well the program met a set of goals or metrics defined by the program administrators. Web analytics is the process of understanding the Companies' online presence so that it can be optimized. Modifications to improve the initiatives can take place once one or more of these forms of evaluation takes place. For a further description of the evaluation techniques for CEO initiatives, please refer to Appendix D.

The specific methods to evaluate each CEO initiative will be selected later in the year and depending on the scope of the evaluation, may be assessed internally or evaluated by an independent research firm.

5.13.4 EEC Efficiency Partners Program

Strong uptake of EEC programs through the course of 2010 will require strong Efficiency Partner group support. It is important for industry stakeholders with end-use customer influence to be aligned with the Companies' stance of promoting high efficiency appliances, due to their direct customer contact. To promote this support the Companies will broaden their Partners Program in 2010.

Focus groups will be held in the Lower Mainland and Interior; the focus will be the development of the new Contractor program. These focus groups will differ from those held on Vancouver Island in 2009, as there is no established Qualified Dealer Program in the Lower Mainland and Interior. The purpose of these meetings is to gather input from contractors on what elements of a contractor program they would find to be of most interest, and most beneficial to them and the Companies' mutual customers. Program framework and procedures will be developed based on information gathered and the new program will be rolled out in conjunction with a new name and logo in the second and third quarter of 2010.

The focus of the second and third quarter of 2010 will be on promoting the program to contractors. From second quarter to year end, the focus will be on registering contractors in the program. Energy efficiency workshops will be offered in the last quarter of 2010 with the support of equipment suppliers.

Direct contact with gas contracting companies, manufacturers, suppliers, and other service groups connected to the gas industry (e.g. home auditors and inspectors) is essential; these groups must be educated as to the benefits of high efficiency equipment and their concerns of availability and complexity assuaged.

Table 5-26 is an estimate of the expenditures required to develop and maintain the 2010 contractor program.

Table 5-26: Expanded 2010 Contractor Program Budget

Contractor Program	Expenditure ($000s)	
	TGI	TGVI
Promotion, Brochures and Trade Magazine adds	8	2
Conference and Trade Shows	40	10
Application Admin $5.00 per	4	1
Quarterly Contractor Newsletter	19	5
Program Development Labour	72	18
Program Development Expenses	40	10
Efficiency Work Shops	72	18
Website portion development with user tools	16	4
Co-op Advertising	20	5
Total	**291**	**73**

To help promote energy efficient natural gas products and services, a Co-op Advertising program will still be available for those that are currently registered with the Company's contractor program. In the future, Co-op Advertising will be included as part of the program package for the new Contractors' Program.

The 2009 guidelines (as discussed in Section 4.8.3) will remain in effect with the addition of an energy efficiency component or promotion of an EEC Program. Table 5-27 identifies estimates of the Co-op advertising reimbursement activity projected for 2010 by quarter.

Table 5-27: Co-op Advertising Reimbursement Estimate

Contractor Co-op Advertising	Expenditure ($000s)				
	Q1	Q2	Q3	Q4	**Total**
TGI	2	3	7	7	**20**
TGVI	1	1	2	2	**5**

Increased levels of participation in the Co-op advertising program are expected as the numbers of participants increase in the new Contractor program. A review of the current structure and effectiveness of the Co-op Advertising program is underway and adjustments will be made as the year progresses.

The Efficiency Partners New Contractor program is further discussed in greater detail in Appendix D of this Report.

5.13.5 Codes and Standards

In 2009, current codes and standards that have relevance to EEC program development and implementation were benchmarked for monitoring. See Section 4.8.4for details of Codes and Standards as they pertain to EEC program areas. The regulatory focus for 2010 will be on the new construction building code to EnerGuide 80 development, and the Residential Hot water storage tank Tier Three regulations starting at 0.61 EF and ending at 0.80 EF.

As mentioned before in Section 4.8.4.3, the Provincial Government has announced that they are working toward the implementation of EnerGuide 80 ratings for the BC Building Code to take effect in late 2010. The current rating of EnerGuide 77 and the new EnerGuide 80 rating are stepping stones toward a Net zero level set for 2020. The Province of British Columbia is updating the energy efficiency requirements for residential buildings in Part 10 of the BC Building Code. Along with Industry stakeholders, a study was started in 2009 to determine potential combinations of overall building envelope thermal requirements, air tightness, and equipment efficiency which will meet EnerGuide 80.

A modelling study is complete and a stakeholder committee has been struck to develop the guidelines for changes to the BC building code based on the results of the modelling study and input from the representing groups. Actual implementation of the code changes are targeted for September of 2011. As a partner in this code development, it is important to ensure the code does not dictate energy type. New homes may require different construction processes for different fuels at this efficiency rating.

As mentioned previously, actual measurement of the EnerGuide ratings may be compulsory in the new code. A review of the existing D audit process, including the fuel use inconsistencies of the *HOT2000* software that is currently in use, will be required. With whole home labelling and industry moving toward performance measurement, more weight will be placed on the resulting EnerGuide rating of the home. Utility representation is vital as decisions related to the BC Building Code will affect Companies' EEC programs. This EcoEnergy audit review will be conducted under the Joint Initiatives program area, see Section 5.9.1.2.

As industry moves toward a net zero energy or net zero energy capable construction code (also known as the Passive House) by 2020, each tier of code development demands lower energy utilisation, increasing the cost of building design, construction techniques, and insulating materials that make up the building shell. At the EnerGuide 85 efficiency level, energy generation devices must be utilized for any further efficiency gains. These differences are also affected by the type of energy utilised to heat the home. Terasen Gas participates in both the EnerGuide 80 and Net Zero committees as the first leads to the second as an end goal. Below is the definition of a Net Zero home:

- A net zero home, at a minimum, supplies to the power grid, an amount equal to the total amount of energy consumed. Combining the amount of energy (electricity and if applicable natural gas) utilised to operate a home and provide an equal amount of solar generated energy back to the grid when possible. A Passive house generates and stores all it requires without connection to any utility supply.

In the area of domestic hot water, government has announced plans to introduce three-tier efficiency regulations in 2010 leading to a regulation requiring a minimum EF of 0.80 in 2013. The Companies' approach to water heater market transformation is discussed in greater detail in Section 8. 2010 will see a continuation of the Companies' work on Residential Domestic Hot Water Regulations discussed in Section 4.8.4.5.

In 2010, monitoring and participation in developing codes and standards that have relevance to EEC program areas will enable the EEC team to anticipate, develop and implement effective programs. The planned budget for this area of activity for 2010 is estimated at $50,000; this is based on a time commitment equivalent to ½ full-time position.

5.13.6 Pilot Programs

In 2009, two Pilot Programs were conducted and with the growth of all Program Areas, Pilot Programs will become the second step after research in developing effective new EEC programs. To date, there are six Pilot Programs underway or planned to start in 2010.

Table 5-28 identifies estimates of the Pilot Programs activity projected for 2010.

Table 5-28: 2010 Estimated Pilot Programs Activities - Budget

	Pilot Program	Description	Expenditure ($000s)
1	Behaviour Change Pilot Programs (Commercial & Institutional Pilot)	Commercial & Institutional Pilot: Online tool where users learn about energy conservation, and make social commitments towards behavioural changes and GHG reducing actions.	485
2	Behaviour Change Pilot Programs (Municipalities)	Municipalities Pilot: staff engagement plan for 5 municipal customers	25
3	Custom Design Pilot	Incentive program to encourage energy savings via otherwise difficult to incent measures	457
4	Fireplace Timers Pilot	Pilot program to evaluate the effectiveness of time of operation control devices on decorative fireplaces	75
5	Domestic Hot Water Tier Three Technologies Pilot	Initial studies to develop market transformation for Tier Three Water Heater Systems	250
6	Drain Water Heat Recovery Pilot	To validate manufacturers' claims regarding energy efficiency	25
7	Home Labelling Pilot in Price George	To raise awareness of the value of purchasing an energy efficient home	10
8	EnerGuide 80 Pilot Program	To develop new building code standard for EnerGuide 80 (New Construction & Retrofit)	80
9	TGVI Servicing Pilot Program	To promote the benefits of annual furnace servicing (carry over from 2009)	26
	Total		**1,433**

5.13.6.1 Behavior Change Pilot Programs

The Companies are currently exploring programs that can influence commercial, institutional and municipal customer behaviour. The goal of the behaviour change pilot programs is to develop a successful program design and then expand to other (large) commercial, institutional and municipal customers.

Behaviour change, or community based social marketing, looks to identify the barriers to behaviour change, design a strategy utilizing behaviour change tools, and then implement that strategy.

The benefits of implementing a behaviour change program include understanding the psychological and motivational aspects of human behaviour in decision-making and the power of community and peer influence to develop an engagement strategy that may have a longer-lasting impact than traditional mass media campaigns.

In dealing with some commercial, institutional and municipal customers, they have anecdotally indicated that as they are strapped for financial resources, they have to focus their efforts in low cost, or no cost, behaviours in an effort to reduce energy costs. Refer to Section Appendix D for detailed examples of behaviour change pilot programs the Companies are pursuing as a result of customer demand.

5.13.6.2 Custom Design Pilot

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI and TGVI: May 2010 – December 31, 2011

The Custom Design Pilot is currently in development. It is slated to be the next major Commercial Energy Efficiency Program Area offering of 2010 after the Efficient Water Heater Program. The program seeks to capture energy savings associated with measures and systems (technologies or operational strategies), which are otherwise difficult to incent as part of a prescriptive program. Running the Custom Design Pilot in 2010 will allow the company to develop experience with a large scale, non-prescriptive program, while evaluating the assumption underlying the proposed incentives for appropriateness. Learning from 2010 can then be incorporated into a full-blown Custom Design program for 2011.

This pilot will apply to measures which reduce gas consumption of space and / or domestic hot water heating, for both new construction as well as retrofits. Process loads and fuel switching measures other than to renewable energy sources will not generally be eligible for participation in the program. However, measures which recuperate waste heat from manufacturing process for use in reducing space or hot water heating requirements may be eligible.

The Custom Design Pilot will capitalize upon the creative potential of the marketplace, and help foster expertise in advanced energy efficiency design in the province of BC. The program will build additional insight into energy efficiency within Terasen Gas.

The proposed Custom Design Pilot consists of two components:

a) A fully funded energy study (up to $50,000) to estimate the potential energy savings from client proposed measures
b) A capital cost incentive (initial estimate of approximately $3/GJ saved) based upon the estimated energy savings and expected persistency of the measures implemented by the client

The Companies are working with BC Hydro in view of harmonizing the energy study requirements of the proposed Custom Design pilot with those of BC Hydro's Power Smart Partners and Commercial New Construction programs. The utilities aim to allow participants in either BC Hydro's programs or the Companies' programs to have a single energy study performed, which could be submitted for incentive funding at both the gas and electricity utilities. The budget for 2010 for this complex Pilot is $457,000; the high costs are associated with the engineering studies required for this pilot.

5.13.6.3 Fireplace Timers Pilot

Program Area: Commercial Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI and TGVI: Present – March 31, 2011

The purpose of the Fireplace Timers Pilot is to study the effect that installing electronic timers on 'decorative' natural gas fireplaces in multi-family residential strata and apartment buildings has on natural gas consumption. Should the gas savings potential prove significant enough, the pilot can be rolled out as a full scale program.

Decorative gas fireplaces are those which are installed to provide ambiance as opposed to space heat. It is believed that these fireplaces tend to be used excessively when they are present in apartment buildings or stratas in the absence of a user-pay scenario (i.e. the occupant who consumes the gas via the fireplace does not pay a bill associated with its operation). Selected participants who comply with all of the program requirements will be eligible to receive free timers and an incentive of $30 per timer installation.

Preliminary studies have suggested that the gas saving potential of these timers could be as high as 6 GJ/yr per fireplace, while market research indicates there are approximately 17,000 decorative gas fireplaces in multi residential buildings in the Vancouver area alone. The evaluation of the results, slated for spring of 2011 (after the timers have been in operation for 1 full heating season) will confirm the savings obtained per timer. The budget for this pilot program is set at $75,000.

5.13.6.4 Domestic Hot Water Tier Three Technologies Pilot

Program Area: Residential Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI and TGVI: Present – March 31, 2011

Provincial regulations may require that all hot water tanks manufactured be Tier Three (EF 0.80 or greater) as early as 2013. Given that Tier Three technologies are fairly new to residential applications, the Companies will develop a pilot to confirm energy savings and build a knowledge base about Tier Three technologies, including technical issues or difficulties in installation and end-use.

Water heating accounts for approximately 20% of energy use in an average residential home, so increasing the efficiency factor of water heating appliances can have a significant impact on total energy use. Habart developed an implementation plan for market transformation in the condensing water tank market, in a recent report commissioned by the Companies and attached in Appendix I. The report outlines the importance of conducting a pilot for condensing water tank technology, due to the newness of the product, and further identifies pilots as an opportunity to provide training to the contracting community as well as to develop relationships with manufacturers and distributors, ensuring that the product can reach the shelves for consumers.

Tier Three technologies are varied, but two important methods for achieving Tier Three efficiency levels (EF 0.80 or greater) are condensing hot water tanks and tankless water heaters.

- A condensing water heater is similar to a standard efficiency gas storage water heater but has an improved heat exchanger that allows thermal efficiency ratings as high as 96% and recovery rates as much as four gallons per minute.

- On-demand or "tankless" water heaters heat water only as it is needed and used. This equipment may incorporate condensing technology with resulting efficiencies higher than 90%.

Working with a variety of manufacturers, the Companies will measure the gas and water consumption in approximately 20 homes for 6 months, installing the Tier Three technologies after three months, and measuring the difference in energy consumption between the three months prior to installation and the three months following the installation of the Tier Three tanks. The Tier Three Technologies pilot is in the early design stages and the structure of the pilot is subject to change, based on feedback from industry, manufacturers, and contractors.

The pilot will also give the Companies the opportunity to work with manufacturers and contractors to provide training on Tier Three Technology installation procedures. They will also have the opportunity to help develop solutions, in advance of regulations, to technical and marketing issues.

The budget for the Tier Three technologies pilot is expected to be $250,000 to cover the purchase and installation of 20 Tier Three tanks, the purchase and installation of sub-metering devices for gas and water flow, and pilot evaluation. This pilot is the foundation for all future programs with the primary objective of water heater transformation that will result in significant energy savings across the residential sector.

For further details refer to Appendix D.

5.13.6.5 Drain Water Heat Recovery Pilot program

Program Area: Residential Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI and TGVI: Present – March 31, 2011

The Companies will conduct a pilot program to identify opportunities to save energy through Drain Water Heat Recovery technology.

At first glance there seems to be a significant opportunity for savings. Conventionally, most of the heat from domestic hot water is washed down the drain. Drain Water Heat Recovery technology can capture large amounts of wasted heat energy by using it to preheat the incoming cold water thereby substantially lowering water heating costs. Consisting of a copper potable water tube wound and moulded around a central copper drain tube, heat is transferred from the waste water flowing down the drain tube to the cold water simultaneously moving upward through the wound coil. The water can be increased by as much as 15°C by the Drain Water Heat Recovery unit.

Since this is new technology, pilot tests will be conducted to confirm energy savings, develop the cost benefit analysis, and develop a drain water heat recovery program for new construction. The estimated costs to run this pilot in 2010 are $25,000.

Given that this pilot is in the very early stages of development, it requires discussions with a large number of stakeholders. The Companies are evaluating available market and technical data to establish a sound business case and cost benefit analysis.

5.13.6.6 Home Labeling Pilot in Prince George

Program Area: Residential Energy Efficiency Programs

Target Market: Retrofit

Duration: Prince George: Present – March 31, 2011

The Companies have agreed to partner with the City of Prince George and MEMPR to provide $10,000 each in marketing support to this initiative. The City of Prince George will encourage home sellers/buyers to conduct an energy audit for houses before they are listed for sale.

The program provides a $75.00 rebate to home sellers for participating in a home energy audit. In addition to the home energy audit, home sellers are required to work with their local Real Estate agent to post the audit outcomes on Multiple-Listing Service MLS®. Posting the EnerGuide Rating on MLS® provides information to the new home owner on the energy efficiency of the home, therefore increasing home marketability.

Before a province wide program can be considered this pilot will help identify:

- potential changes required to the home auditing process to insure consistency
- potential label format and mounting location
- marketing strategies to gain acceptance

One of the major objectives of the Industry and Government is to establish Whole Home Efficiency Labelling, which would provide a label to be mounted on a home, posting an EnerGuide performance rating. The posted efficiency rating will be a valuable tool for home buyers, raising awareness of the value in purchasing an energy efficient home. This pilot will provide a good first step toward a potential Province wide program.

5.13.6.7 EnerGuide 80 Pilot

Program Area: Residential Energy Efficiency Programs

Target Market: New Construction / Retrofit

Duration: TGI and TGVI: Present – March 31, 2011

At present, the Province of British Columbia is in the process of evaluating and developing new building code standards which would move the current EnerGuide 77 efficiency rating to a new target of EnerGuide 80 for new home construction. There is potential for the Companies to provide incentives to encourage the early adoption of EnerGuide 80 ratings for new home construction, and to provide existing gas heated homeowners with incentives to perform efficiency upgrades that result in EnerGuide rating improvements.

EnerGuide home efficiency performance levels are determined by performing Home Energy Assessments. Older homes need periodic renewal of major energy efficiency components including windows, furnace, and fresh air ventilation systems, so the actual score of a 20 year old home will depend in large part on whether these systems have been updated or are original. The EnerGuide 80 retrofit program would help customers increase the EnerGuide rating of their home, and aid in preparing the market for a home labelling requirement before mandatory requirements are established.

Currently, there are two compliance paths that builders and developers can follow to meet the building code EnerGuide 77 standard: Prescriptive and Measurement. The Prescriptive path exists in the code as a guideline or recipe to build a home that potentially meets the EnerGuide 77 level. A Measurement path requires the measurement and verification of the actual performance level of the home through New Home Energy Assessments, performed by a contractor working in concert with the builder. If the update to the BC Building Code in late 2010 recommends eliminating or discouraging the prescriptive path, all new home constructions will require a New Home Energy Assessment.

Retrofits

Incentives for retrofits in the EnerGuide 80 program will focus on moving older houses up the EnerGuide scale. The EnerGuide 80 program would potentially assign incentives based on the number of points a house moves up the EnerGuide scale

New Construction

As new building codes will not take effect until mid-2011, now is the time to encourage builders and developers, through incentives, to begin building homes to the EnerGuide 80 standards. Ideally, incentives will help builders and developers define the prescriptive measures that will achieve EnerGuide 80 standards, and prepare the market for the new building code changes.

The estimated budget for this pilot program is $80,000. For further details refer to Appendix D.

5.13.7 Summary

Enabling Activities are important initiatives that support broader EEC activities and programs. The Companies initiated these activities in 2009 in four categories, and as outlined above, the amount of activity for all four areas will increase dramatically in 2010. This increase is designed to further create supportive conditions for a successful 2010 EEC portfolio.

Research and Evaluation activities have a number of studies planned and the list of Pilot Programs will expand as well. The Efficiency Partners Program will grow to include the TGI service area represented by potentially adding another 1000 contractors delivering EEC programs. Given the aggressive BC government provincial emission targets, participation in the development of the new construction building code will strengthen our communication with the building industry. Hot water tank regulations and tier three pilots will be necessary for the development of an effective market transformation plan to help protect the end use customer.

Many of these enabling activities are supportive of the province's Energy Plan. The degree of the Companies' work in Enabling Activities will be evaluated over the course of the year to determine whether the Efficiency Partners program and the Codes and Standards work require the establishment of a discrete budget for this work.

5.14 EEC Stakeholder Group Activities

The EEC Stakeholder Group serves an important function; it provides the Companies with guidance and input on its EEC activities. The Group first met in late 2009, and has since indicated it is supportive of planned activities. In 2010 the Companies intend to continue working closely with the Stakeholder Group to gain their insight and perspective as the broader EEC Portfolio is rolled out.

5.14.1 Planned Activities

Two meetings are planned for 2010 with the EEC Stakeholder Group with the first meeting having already taken place on March 11.

The March 11 meeting afforded each group the opportunity to understand each other's respective organizations. The EEC department asked the stakeholders to present their organization's priorities and described how the Companies can help each of their organization. The Companies provided this information, and also presented on an overview of alternative energy solutions and innovative technologies program area. Finally they reviewed with the group at a high level the contents of this EEC Annual Report.

The agenda, meeting minutes, and list of stakeholder priorities from the March 2010 EEC Stakeholder Group meeting can be found in Appendix F.

The Companies intend to hold an additional EEC Stakeholder Group meeting in Q4 2010 to gather feedback about improvements to existing programs, and potential new programs.

5.14.2 Proposed Budget

Table 5-29 summarizes a proposed budget for the stakeholder sessions.

Table 5-29: Proposed Budget for EEC Stakeholder Group Meetings for 2010

	Expenditure ($)
Venues and Equipment Rental	1,500
Meals	5600
Stakeholder travel and administration	7,500
Total Budgeted Expenditure	**14,600**

5.15 2010 EEC Portfolio: Summary

The Companies' commitment to develop and roll out a comprehensive EEC Portfolio was demonstrated in 2009 and early 2010.

Those programs which were very successful in this early “transition” period will form the foundation of the Companies’ 2010 Portfolio. For example, the Efficient Boiler Program (generating gas savings for commercial customers) will be continued and improved in 2010. The Companies will continue to forge partnerships through Joint Initiatives to draw on the knowledge and expertise of LiveSmart BC, BC Hydro and FortisBC, among others.

The 2010 Portfolio will introduce initiatives and programs that seek to reach more than traditional residential and commercial customers. The Companies will continue their efforts to develop a better understanding of the needs of low-income home-owners and renters so they can assist them in making smart energy choices; the Companies will also work to promote conservation with new immigrants; they will reach out to children and schools; and they will work to create conservation champions from within TGI and TGVI’s employees.

New Program Areas will also be introduced in 2010. The High-Carbon Fuel Switching Program Area lowers GHGs by using natural gas in place of higher carbon fuels. The Interruptible Industrial Program will help large customers become more efficient while also reducing the risk to the Companies and ratepayers associated with large financial investments in energy efficiency. And the Innovative Technology Programs will promote and pilot emerging commercially available technologies.

Through this broader Portfolio in 2010 the Companies are confident they will increase their efforts to promote conservation in all customer classes.

6. CONSERVATION POTENTIAL REVIEW ("CPR")

Results of a CPR form the basis for future program development within a comprehensive EEC portfolio. The Companies drew heavily on the 2006 CPR as they moved from the small set of DSM activities to the broader Portfolio of EEC initiatives. Now the Commission has approved the request for $500,000 to fund a new CPR, and the Companies intend to undertake one and so establish the basis for a request for funding in 2011 and beyond.

6.1 Purpose of CPR

A CPR study examines available technologies and determines their "conservation potential", which includes the amount of energy savings that can be achieved through energy efficiency and conservation programs over the study period, through economic screening. The CPR compares the economic and achievable potential of viable measures to a base case scenario[19]. In general, the CPR has three key objectives:

- Characterization of available natural gas technologies inclusive of energy efficiency and fuel substitution;
- Identification of the size of the potential opportunities over a set study period; and
- Economic modeling of EEC measures, fuel substitution and energy efficiency measures.

6.2 New CPR In 2010 Will Create Important Planning Document

The EEC Decision approved the request for $500,000 for an updated CPR, specifically: "The Commission considered the CPR to be an important tool for use in developing, supporting and assessing this and future EEC/DSM expenditure Applications. The Commission accepted the EEC Application's CPR update expenditure proposal."

In 2010, the Companies intend to develop the requirements for the updated CPR, which would form the basis for an application to the Commission for approval for EEC funding beyond 2011. It is anticipated that the preparation phase will commence during Q2, 2010. The Companies plan to outsource the research, development and delivery of CPR and will release a Request For Proposals for the project with the intent to find the best consultant organization to perform the work. It is estimated that the study will be completed by Q4, 2010.

Similar to the goals of 2006 CPR, the goals of the 2010 CPR are to provide a comprehensive planning document that the Companies can use on an ongoing basis to:

- Develop a long range energy efficiency and fuel choice strategy, including an analysis of the savings opportunities available from the implementation of large-scale Alternative Energy Systems;

[19] Economic Potential is the proportion of energy savings that could be achieved if all measures identified in the CPR were implemented. Achievable Potential is the proportion of energy savings identified in the Economic Potential that could be realistically achieved within the study period. Achievable Potential recognized that it is practically difficult to induce customers to purchase and install all the energy efficiency or fuel choice option that meet the criteria identified in the study.

- Design and implement energy efficiency and fuel choice programs and initiatives;
- Assess the impact of energy efficiency and fuel choice program on both peak and annual loads;
- Identify equipment and technologies that could be used for energy efficiency and fuel choice programs; and
- Set annual energy efficiency and fuel choice targets and budgets.

Assuming the study is launched in April, Figure 6-1 provides a timeline for the rollout of the deliverables for the CPR study.

6.3 Summary

The 2006 CPR was an important foundational document for the Companies EEC Application. Now, with the Commission's approval of $500,000 for an updated CPR, the Companies intend to create this revised document that will identify the most compelling EEC opportunities.

When it is completed, the updated 2010 CPR will form the primary basis of the Companies' EEC funding requests for 2012 and beyond, which the Companies anticipate they will submit in 2011. It is the Companies' belief that sustained and stable funding for utility EEC efforts is necessary in order to create market momentum and to support the transformation of the energy market with ever-increasing efficiency levels.

7. DATA GATHERING, REPORTING AND INTERNAL CONTROL PROCESSES

In its EEC Decision, the Commission directed the Companies to include a discussion in the Annual Report of the Companies internal data gathering, monitoring and reporting control practices. This section addresses that direction. As this section demonstrates, the Companies have business practices in place for EEC activities to ensure that these activities are in compliance with the general controls of the Company.

This section provides high level information on data gathering, and on the Companies' business practices related to program development and application processing. It also includes comments from the Companies' Internal Audit group on EEC initiative controls.

7.1 DSM System Project: Meeting the Growing Need for New Tracking and Reporting

The expansion of EEC programs resulting from the EEC Decision has created a need to develop a robust data capture and reporting system. With the anticipated increase in the number of programs and participants, the existing Excel-based DSM tracking and reporting methods would not be capable of handling the future business needs and requirements of the EEC Activities. The Companies determined that a new tracking system was needed to enable it to:

- Track EEC program participation, costs and energy savings for incentive-based programs;
- Track information about non-incentive programs and activities;
- Track actual and forecasts vs. budgets;
- Provide reports for internal and external stakeholders including program partners and the Commission;
- Allow for scenario modelling for program planning and design; and
- Support DSM benefit-cost analysis on a program by program basis as well as at the portfolio level (or EEC plan level).

To address the requirement for more robust program data gathering, tracking and reporting, the DSM System ("DSMS") project was launched in the fall of 2008. The Companies conducted research on the potential solutions available in the marketplace, as well as investigated having a system custom-built.

The Companies eventually selected a web-based program tracking and reporting system called TrakSmart, and entered into an Agreement with TrakSmart's provider Nexant, to obtain the TrakSmart system. Project implementation commenced early in 2010. Based on the project schedule, the DSMS will be implemented and will be operational by November 2010. The costs associated with implementing and maintaining DSMS will be added to the portfolio level expenditures in 2010. The costs to implement DSMS are $685,000 US and they are included in the Portfolio-level expenditures for 2010.

Once the DSMS is implemented, it will increase the ability of the Companies to capture and report on the following features:

- Program participants' information, costs and energy savings for EEC programs and activities;
- Forecasting / extrapolation based on estimates and actuals;
- Expenses and budget tracking associated with the EEC;
- Interface with SAP[20] application;
- Costs (program, incentive and administrations) associated with EEC projects; and
- Capture of information on a per participant basis i.e. equipment models, reasons for rejection etc.

Once the DSMS is in place and the transition period from the current system to new is completed, these features will help the EEC team to make data gathering, tracking and reporting more efficient and increase the overall efficiency of the workflow.

7.2 Robust Business Case Process Applied to All Programs

Before a new EEC program can be implemented, a program plan or business case must first be developed. The Companies are committed to putting each program through a high level of internal scrutiny before moving ahead with a program, and believe doing so ensures an increased chance of program effectiveness.

The business case developed includes information about program rationale and purpose as well as description of target audience, assumptions, costs-benefit tests and proposed evaluation methods is developed. Cost-benefit analysis is performed using the California Standard Tests ("CST") as outlined in California Standard Practice Manual. In partnership with Willis, the Companies have developed an in-house cost-benefit modelling tool based on CST that provides the following areas of analysis:

- Benefits incurred over measure life of the individual programs; including energy savings over the measure life of the program;
- Total costs incurred in implementing the program including administrative, incentive, marketing and evaluation; and
- The four CST tests (Rate Impact Measure ("RIM"), Utility, Participant and TRC).

The results from this modelling are used as inputs for the business cases, which are approved in accordance with the Companies' policy on financial authorization levels.

[20] System, Applications and Products ("SAP") is a financial tool used by the Companies. All EEC expenditures are captured within SAP.

7.3 Incentive Applications Vetted for Compliance with Program Requirements

Ensuring that all customer applications are compliant with program requirements is also part of the internal control process. The Companies' EEC activity has a number of mechanisms in place to ensure compliance of incentive applications with program requirements.

The verification process is specific to each program and is dependent on the type of program, its complexity, the financial value of the incentive and other parameters. The general principles applied are as follows:

1. Each application is reviewed for completeness and accuracy.

2. Applications must meet the criteria outlined in the terms and conditions of the program put forward through the approval process. Please refer to Appendix G for a copy of the Efficient Boiler Program's Terms and Conditions as an example.

3. Once approved, incentives are distributed to participants.

4. Copies of application and supporting documents are filed and stored for seven years in case of an audit.

7.4 Internal Audit Services

The EEC team engaged the Companies own Internal Audit Services ("IAS") group to review the controls associated with the EEC Initiative. Generally speaking, IAS found that there were no major weaknesses in the process and control environment, but that there were minor weaknesses requiring prompt management attention to ensure that the risks identified were mitigated. Management either has already taken action to address IAS' recommendations, or is going to do so as agreed upon on a timely basis.

The primary findings of weaknesses within the controls related to the Companies' EEC initiative are presented and commented upon below:

- Process and internal control documentation for various EEC programs was not readily available. This is true of some of the Companies' long-running initiatives such as the Efficient Boiler Program, however all new programs have process documentation in the Business Case for the Program, and on a go-forward basis, the EEC team will seek input from IAS on controls needed on a program-by-program basis
- Some of the EEC programs are administered by third-parties; however, their performance was not often monitored by the Companies. A periodic review of the effectiveness of third party administrators is recommended to ensure that quality of the program administration is acceptable, and this will be implemented by the EEC team on a go-forward basis
- There was one incident noted by IAS where an application approved did not follow one of the published terms and conditions of a program. The EEC team will ensure that program terms and conditions are followed.

The full report from the Companies' IAS group can be found at Appendix H.

7.5 Summary

The Companies are committed to strong internal controls in all aspects of the EEC Program. As demonstrated in this section, the Companies' business practices related to program development, application processing, and ongoing monitoring are all sound and subject to continuous improvement.

The Companies' EEC team is implementing a robust data gathering and program participation tracking system (the DSMS) in order to accommodate the increased level of EEC activity arising from the funding approval. Expenditures reported through the DSMS will be gathered from SAP, which tracks all of the Companies' financial activity.

All business case and financial approvals are performed in accordance with the Administrative Policy on the Companies' Authorization Levels. There are solid business practices in place related to EEC activity, such as a requirement for a detailed business case for all new programs and initiatives.

The Companies' Internal Audit group has reviewed the processes of the EEC team and while generally the controls related to EEC activity are adequate, there are some areas for improvement that the EEC team either already has addressed, or is in the process of addressing.

In 2010 and beyond the Company will continue to monitor its internal controls and to work with Internal Audit to do the same so that all aspects of the EEC Program are carried out with appropriate diligence and scrutiny.

8. MARKET TRANSFORMATION AND ATTRIBUTION

The Companies' EEC Application outlined a number of Principles that will guide the Companies' EEC activity, one of which is that EEC programs will support Market Transformation. The Companies believe in this mandate and are taking action to ensure that its activities encourage and support Market Transformation.

Moreover, the Utility is playing a leadership role in paving the way for the introduction of Regulated Standards, and believes energy savings resulting from these standards should be attributed to utility programs.

This section outlines the Companies' belief in these two guiding principles, and the actions that are being taken in support of each.

8.1 Committed to Contributing to Market Transformation

The EEC activity around water heaters, whole home initiatives such as labelling and the move to a performance-based building code, and codes and standards work in general, supports market transformation efforts. Utility EEC activity is a key component of Market Transformation efforts.

The Companies have a role to play in preparing the marketplace for the introduction of Regulated Standards. The areas where the Companies could contribute to market transformation include:

- disseminating information;
- educating stakeholders about efficient products, systems, and buildings;
- supporting training related to the design, installation and maintenance of efficient products, systems and buildings;
- addressing price barriers through incentives;
- supporting the development of voluntary measures; and
- advising government on the development of Regulated Standards.

There are a number of EEC initiatives discussed in this report that support Market Transformation, however the most immediate initiative is for domestic hot water, which is discussed below

8.2 Playing a Leadership Role in Market Transformation: Attribution of Savings

Utilities play an integral role in paving the way for the introduction of Regulated Standards. It is because of this key role, the Companies believe that energy savings resulting from regulation should be attributed to utility programs.

In the EEC Application, the Companies proposed a formulaic approach to the attribution of savings from the introduction of minimum energy efficiency performance standards (henceforth referred to as "regulation") to utility market transformation programs. In the EEC Decision, this proposal was rejected, and the Companies were directed to redesign and resubmit a modified proposal for attribution of savings from the introduction of regulation in this report. Further, in its EEC Decision, the Commission noted that:

> *"The Commission Panel accepts the position of BC Hydro that attribution of savings should be considered on a case-by-case basis and that the attribution rate should reflect the level of support for market transformation. The Commission Panel shares the BCSEA/SCBC's concern, as detailed in Mr. Plunkett's evidence, that the attribution concept can distort program design."*[21]

The Commission Panel further directed the Companies to give consideration to factors such as the length of time a particular program element has been operative at the time any applicable regulation is introduced and how compatible the program initiative is with the new regulation (i.e. if a regulation is introduced with a higher or lower threshold or standard than the program design).

8.3 <u>Newly Developed Attribution Model Reflects Industry Best Practices</u>

In the process of developing a modified proposal for attribution of savings from regulation, the Companies reviewed practices in Ontario and consulted with BC Hydro and FortisBC. As a result of the review and consultation, the Companies propose that the attribution of savings from regulation should be considered on a case-by-case basis, consistent with BC Hydro's position. The Companies would propose any cases for attribution from the introduction of regulation in their Annual EEC Report to the Commission.

The information below outlines the Companies' proposal to attribute savings from the introduction of a provincial government regulation requiring condensing water heaters in residential installations in 2013. It is based upon a strategy paper on Condensing Water Heaters written for the Companies by Habart, which is provided in Appendix I.

MEMPR has indicated that in 2013, the minimum efficiency threshold for residential water heaters will be 0.80 EF. In order to reach 0.80 EF, water heater manufacturers will need to use condensing technology. At this time, there are currently no models of condensing water heaters available that are appropriately sized for residential applications. While no pricing information is available on this product, Habart has assumed the incremental cost for a condensing water heater is likely to be approximately $1,750, which makes the technology non-cost-effective for customers.

In support of the government's proposed regulation, the Companies propose implementing a Condensing Water Heater Initiative ("CWHI") to transform the market for residential water heaters. The CWHI consists of a customer purchase incentive of $1,000 along with a fairly significant training and marketing campaign as outlined in Habart's strategy paper in Appendix I. The Companies believe this CWHI would encourage the development of residential condensing

[21] EEC Decision, page 40-41

water heaters by manufacturers, and encourage the uptake of these water heaters by the marketplace. Increased demand will result in incremental manufacturing cost savings through economies of scale and cause lower pricing to the end consumer. The CWHI assumes that this level of activity by the Companies will result in an annual decline of 10% in the cost of Condensing Water Heaters, and increasing penetration of Condensing Water Heaters year over year.

It is the Companies' view that the market transformation process to transform the market for residential domestic hot water to the point where there is sufficient market penetration of 0.80 EF equipment to be able to introduce regulation of 0.80 EF as the minimum efficiency standard will take approximately 7 years.

Without the Companies' activity in this area, it is unlikely that government's proposed regulation will be successful as this technology does not exist today. In order to make this CWHI cost-effective, the Companies would need attribution of 6 years of savings from this particular regulation, which is not unreasonable given that the regulation will not succeed without the Companies' activity to transform this marketplace.

A spreadsheet detailing the benefit-cost scenario for the CWHI can be found in Appendix I.

The proposal above aligns with BC Hydro's policy of attribution on a case-by-case basis, as well as the BCSEA's concerns in that without this Initiative, government's desire to introduce regulation of residential water heaters to 0.80 EF is not likely to succeed.

The Companies are requesting Commission approval of this modified proposal for the attribution of savings from regulation to be on a case-by-case basis. The Companies are also seeking approval to attribute 6 years of post-regulation savings to a market transformation initiative for condensing water heaters.

8.4 Summary

Changing market behaviour and developing Regulated Standards that encourage conservation are both complementary yet critical components of a broader EEC Portfolio. The Companies believe firmly in both principles; they are taking a lead role in promoting market transformation making it possible for government to introduce new standards. Because of this leadership the Companies believe that energy savings resulting from the new standards should be attributed to utility programs. The attribution model put forward in this Report reflects industry best practices and has the confidence of the Companies.

The Companies will continue with their efforts to transform the marketplace while seeking Commission approval of its modified proposal for the attribution of savings on a case-by-case basis.

Appendix A

GLOSSARY

GLOSSARY OF TERMS

ABSU – Accenture Utilities Business Process Outsourcing Services

AFUE – Annual Fuel Utilization Efficiency

AHRI – Air-Conditioning, Heating, and Refrigeration Institute

BC Hydro – British Columbia Hydro and Power Authority

BCUC – British Columbia Utilities Commission, the provincial body regulating utilities in British Columbia.

BTU - British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit)

CCE – Consortium for Energy Efficiency

CEO – Conservation, Education and Outreach

CHBA – Canadian Home Builders' Association

CHF – Co-operative Housing Federation

CIPH – Canadian Institute of Plumbing and Heating

Commission – British Columbia Utilities Commission, the provincial body regulating utilities in British Columbia.

Companies – Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc.

CPR – Conservation Potential Review, a study completed to identify opportunities for energy savings across gas and electrical energy delivery infrastructures and improvements to overall energy utilization efficiency.

CST – California Standard Tests

CWHI - Condensing Water Heater Initiative

DC – Pacific Resource Conservation Society's Destination Conservation program

DES - District Energy Systems

DHW – Domestic Hot Water

DSM – Demand-Side Management, defined as "any utility activity that modifies or influences the way in which customers utilize energy services". From Terasen Gas' perspective, the primary objectives of DSM are to increase the overall economic efficiency of the energy services it provides to customers and maintain the competitive position of natural gas relative to other energy sources.

DSMS – Demand Side Management System

ECAP - Energy Conservation Assistance Program

ECM - Electronically Commutated Motors

EEC – Energy Efficiency and Conservation

EEC Application – 2008 Energy Efficiency and Conservation Programs Application

EEC Decision – BCUC Order No. G-36-09

EF – Efficiency Factor

ESK - Energy Savings Kit

FE – Fireplace Efficiency

Forum – Affordable Energy Conservation Forum

Free Rider Rate – percent who would have implemented an EE measure even without the program.

GHGs – Greenhouse Gas Emissions

GJ – Gigajoule – a measure of energy equivalent to one billion joules. One joule of energy is equivalent to the heat needed to raise the temperature of one gram (g) of water by one degree Celsius (ºC) at standard pressure (101.325 kPa) and standard temperature (15ºC).

GSHP – Ground Source Heat Pump

Habart - Habart & Associates

HPBAC – Hearth, Patio & Barbecue Association of Canada

IAS – Internal Audit Services

IRs – Information Requests

IT – Information Technology

KnowledgeTech – KnowledgeTech Consulting Inc.

LEAP – LiveSmart Energy Assistance Program

LIEEPs – Low Income Energy Efficiency Programs

MBH - 1 MBH = 1000 BTU/hr (BTU = British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit)

MEMPR – Ministry of Energy Mines and Petroleum Resources

MOU – Memorandum of Understanding

MURB – Multi-Unit Residential Buildings

MVHC – Metro Vancouver Housing Corporation

NPV – Net Present Value

NRCan – Natural Resources Canada

NSA – Negotiated Settlement Agreement

NSP – Negotiated Settlement Process

O&M – Operating and Maintenance Costs

Participant Test – is the measure of the quantifiable benefits and costs to the customer due to participation in a program.

PBR – Performance Based Rate

PBR Settlement Agreement – Multi-Year Performance Based Rate Plan Settlement Agreement

QDP – Qualified Dealers Program

REnEW - Residential Energy and Efficiency Works

Report – EEC Annual Report

REUS – Residential End Use Survey

RIM – Rate Impact Measure test measures what happens to customer bills or rates due to changes in utility revenues and operating costs caused by the program.

SAP - System, Applications and Products - financial tool in which EEC expenditures are captured within

SEMP - Strategic Energy Management Plan

SENC - Super Efficient New Construction

SHIFT - Sustainability and Social Responsibility Attitudes Study

SPIFF – Sales Promotion Incentive Fund

Strategy Paper - Affordable Energy Conservation Strategy Paper

Task Force – Affordable Energy Conservation Task Force

Team Terasen – Team Terasen Outreach group

Terasen Gas – Terasen Gas Inc, TGI, a subsidiary of Terasen Inc.

TGI – Terasen Gas Inc., a subsidiary of Terasen Inc.

TGI RRA – TGI 2010-2011 Revenue Requirements Application

TGVI – Terasen Gas (Vancouver Island) Inc., a subsidiary of Terasen Inc.

TGVI RRA RDA – TGVI 2010-2011 Revenue Requirements and Rate Design Application

TJ – Terajoule – equal to 1000 gigajoules.

TRC – Total Resource Cost test measures the net costs of a demand-side management program as a resource option based on the total costs of the program, including both the participants' and the utility's costs.

TSS - Technical Sales and Support department

Utility Cost Test – measures the net costs of demand-side management programs as a resource option based on the costs incurred by the utility (including incentive costs) and exclude the net costs incurred by the participant.

Willis – Willis Energy Services

Working Group – BC Working Group for Energy Efficiency for Affordable Housing

Appendix B

DSM REGULATION

PROVINCE OF BRITISH COLUMBIA

REGULATION OF THE MINISTER OF ENERGY, MINES AND PETROLEUM RESOURCES

Ministerial Order No.

M 271

I, Richard Neufeld, Minister of Energy, Mines and Petroleum Resources, order that the attached regulation is made.

DEPOSITED
NOV 7 2008
B.C. REG. 326/2008

Date

November 6, 2008

Minister of Energy, Mines and Petroleum Resources

(This part is for administrative purposes only and is not part of the Order.)

Authority under which Order is made:

Act and section:- *Utilities Commission Act*, R.S.B.C. 1996, c. 473, s. 125.1 (4) (e)

Other (specify):-

November 3, 2008

R/1175/2008/27

DEMAND-SIDE MEASURES REGULATION

Definitions

1 In this regulation:

"Act" means the *Utilities Commission Act*;

"bulk electricity purchaser" means a public utility that purchases electricity from the authority for resale to the public utility's customers;

"community engagement program" means a program delivered by

(a) a public utility to a public entity either

(i) to increase the public entity's awareness about ways to increase energy conservation and energy efficiency or to encourage the public entity to conserve energy or use energy efficiently, or

(ii) to assist the public entity to increase the public's awareness about ways to increase energy conservation and energy efficiency or to encourage the public to conserve energy or use energy efficiently, or

(b) a public utility in cooperation with a public entity to increase the public's awareness about ways to increase energy conservation and energy efficiency or to encourage the public to conserve energy or use energy efficiently;

"education program" means an education program about energy conservation and efficiency, and includes the funding of the development of such a program;

"energy device" has the same meaning as in the *Energy Efficiency Act*;

"energy efficiency training" means training for persons who

(a) manufacture, sell or install energy-efficient products,

(b) design, construct or act as a real estate broker with respect to energy-efficient buildings,

(c) manage energy systems in buildings, or

(d) conduct energy efficiency audits;

"energy-using product" has the same meaning as in the *Energy Efficiency Act* (Canada);

"expenditure portfolio" means the class of demand-side measures that is composed of all of the demand-side measures proposed by a public utility in an expenditure schedule submitted under section 44.2 of the Act;

"low-income household" means a household whose residents receive service from the public utility and who have, in a taxation year, a before-tax annual household income equal to or less than the low-income cut off established by Statistics Canada for that year for households of that type;

"plan portfolio" means the class of demand-side measures that is composed of all of the demand-side measures proposed by a public utility in a plan submitted under section 44.1 of the Act;

"public awareness program" means a program delivered by a public utility

(a) to increase the awareness of the public, including the public utility's customers, about ways to increase energy conservation and energy efficiency or to encourage the public, including the public utility's customers, to conserve energy or use energy efficiently, or

(b) to increase participation by the public utility's customers in other demand-side measures proposed by the public utility in an expenditure portfolio or a plan portfolio

but does not include a program to increase the amount of energy sold or delivered by the public utility;

"public entity" means a local government, first nation, non-profit society incorporated under the *Society Act* or trade union;

"regulated item" means

(a) an energy device,

(b) an energy-using product,

(c) a building design, or

(d) thermal insulation;

"school" means a school regulated under the *School Act* or the *Independent School Act*;

"specified demand-side measure" means

(a) a demand-side measure referred to in section 3 (c) or (d),

(b) the funding of energy efficiency training,

(c) a community engagement program, or

(d) a technology innovation program;

"specified standard" means a standard in any of the following:

(a) the Energy Efficiency Standards Regulation, B.C. Reg. 389/93;

(b) the Energy Efficiency Regulations S.O.R./94-651;

(c) the British Columbia Building Code, if the standard promotes energy conservation or the efficient use of energy;

"technology innovation program" means a program

(a) to develop a technology, a system of technologies, a building design or an industrial facility design that is

(i) not commonly used in British Columbia, and

(ii) the use of which could directly or indirectly result in significant reductions of energy use or significantly more efficient use of energy,

(b) to do what is described in paragraph (a) and to give demonstrations to the public of any results of doing what is described in paragraph (a), or

(c) to gather information about a technology, a system of technologies, a building design or an industrial design referred to in paragraph (a).

Application

2 (1) This regulation applies only with respect to demand-side measures proposed by the authority.

(2) Effective June 1, 2009,

(a) subsection (1) is repealed, and

(b) section 3 does not apply to a public utility that is owned or operated by a local government or has fewer than 10,000 customers.

Adequacy

3 A public utility's plan portfolio is adequate for the purposes of section 44.1 (8) (c) of the Act only if the plan portfolio includes all of the following:

(a) a demand-side measure intended specifically to assist residents of low-income households to reduce their energy consumption;

(b) if the plan portfolio is submitted on or after June 1, 2009, a demand-side measure intended specifically to improve the energy efficiency of rental accommodations;

(c) an education program for students enrolled in schools in the public utility's service area,

(d) if the plan portfolio is submitted on or after June 1, 2009, an education program for students enrolled in post-secondary institutions in the public utility's service area.

Cost effectiveness

4 (1) Subject to subsections (4) and (5), the commission, in determining for the purposes of section 44.1 (8) (c) or 44.2 (5) (d) of the Act the cost-effectiveness of a demand-side measure proposed in an expenditure portfolio or a plan portfolio, may compare the costs and benefits of

(a) the demand-side measure individually,

(b) the demand-side measure and other demand-side measures in the portfolio, or

(c) the portfolio as a whole.

(2) In determining whether a demand-side measure referred to in section 3 (a) is cost effective, the commission must,

(a) in addition to conducting any other analysis the commission considers appropriate, use the total resource cost test, and

(b) in using the total resource cost test, consider the benefit of the demand-side measure to be 130% of its value when determined without reference to this subsection.

(3) In determining whether a demand-side measure of a bulk electricity purchaser is cost-effective, the commission must consider the benefit of the avoided supply cost to be the authority's long-term marginal cost of acquiring new electricity to replace the electricity sold to the bulk electricity purchaser and not the bulk electricity purchaser's cost of purchasing electricity from the authority.

(4) The commission must determine the cost-effectiveness of a specified demand-side measure proposed in a plan portfolio or an expenditure portfolio by determining whether the portfolio is cost effective as a whole.

(5) If the commission is satisfied that a public awareness program proposed in a plan portfolio or an expenditure portfolio is likely to accomplish the goals set out in paragraph (a) or (b) of the definition of "public awareness program", the commission must determine the cost-effectiveness of the program by determining whether the portfolio is cost-effective as a whole.

(6) The commission may not determine that a proposed demand-side measure is not cost effective on the basis of the result obtained by using a ratepayer impact measure test to assess the demand-side measure.

(7) In considering the benefit of a demand-side measure that, in the commission's opinion, will increase the market share of a regulated item with respect to which there is a specified standard that has not yet commenced, the commission may include in the benefit a proportion of the benefit that, in the commission's opinion, will result from the commencement and application of the specified standard with respect to the regulated item.

Appendix C

BC ENERGY EFFICIENCY ACT STANDARDS

Appendix C provides the reader with the Provincial regulations pertaining to the two most common Residential gas-fired appliances:

- Forced Air Furnaces – MEMPR Enforcement Bulletin 09-03
- Water Heaters – MEMPR Information Bulletin 09-05

B.C. ENERGY EFFICIENCY ACT STANDARDS:

Gas Furnaces

BRITISH COLUMBIA
The Best Place on Earth

MEMPR ENFORCEMENT BULLETIN 09-03

What products are you regulating? The British Columbia *Energy Efficiency Act (EEA)* Automatic operating gas-fired central forced-air furnaces that use propane or natural gas and have an input rate not exceeding 66 kW (225 000 Btu/h). The regulation applies to residential and commercial furnaces.

Are you forcing me to replace my furnace? No. The regulation only applies to purchases of new or replacement furnaces. Individuals can keep their existing furnaces for as long as they wish.

What is the regulated energy efficiency standard for those products? Such products must achieve an Annual Fuel Utilization Efficiency (AFUE) equal to or greater than 90%, as tested under the standard CSA P.2-07: *Testing Method for Measuring the Annual Fuel Utilization Efficiency of Residential Gas-fired Furnaces and Boilers*. These products are commonly known as "condensing furnaces."

When will the regulations take effect in British Columbia?
For furnaces for new residential construction and all commercial buildings: January 1, 2008.
Replacement furnaces in existing dwellings: December 31, 2009.

Can I sell my inventory of non-compliant products after the effective date? For furnaces for new residential construction, any products manufactured after January 1, 2008 must comply with the regulation.

For replacement furnaces, any products manufactured after December 31, 2009 must comply with the regulation. If you have unsold inventory of products manufactured before the effective date, they can still be sold legally in British Columbia after the effective date.

Are there any exemptions to these regulations? Furnaces for recreational vehicles are exempted from the regulation. The Ministry is also providing an extended timeline for "through the wall' furnaces. A through-the-wall gas furnace is a gas-fired furnace that is designed and marketed to be installed in an opening in an exterior wall that is fitted with a weatherized sleeve. For through-the-wall gas-fired furnaces only, the 90% AFUE standard will come into effect on December 31, 2012.

B.C. ENERGY EFFICIENCY ACT STANDARDS:
Gas Furnaces

BRITISH COLUMBIA
The Best Place on Earth

MEMPR ENFORCEMENT BULLETIN 09-03

How can I tell if a product is compliant with the energy efficiency regulations? Suppliers can demonstrate compliance with the standard by ensuring that the product is listed in the Natural Resources Canada furnace database, and that the database indicates an AFUE equal to, or greater than 90%: www.oee.nrcan.gc.ca/residential/business/manu¬facturers/search/gas-furnace-search.cfm?attr=4

Who enforces this regulation? The Ministry of Energy, Mines and Petroleum Resources is responsible for enforcing all regulated standards under the *EEA*.

What are the penalties for non-compliance? Under the *EEA*, the Ministry can conduct inspections to verify compliance with the *Act* and regulations. *EEA* enforcement begins with education and voluntary compliance measures. Ministry staff follow up on all complaints and other information respecting non-compliance, and communicate directly with industry participants to develop a compliance plan.

The Ministry can also seek to have those who have contravened the legislation charged under the *Offence Act*. An offence can result in fines up to $2,000.

What do I do if I see a non-compliant product for sale or distribution? Please circulate this enforcement bulletin to the retailer or distributor. You can also report infractions to Erik Kaye, Ministry of Energy, Mines and Petroleum Resources at 250-356-1507 or Erik.Kaye@gov.bc.ca

For more information on B.C.'s *Energy Efficiency Act*:
www.empr.gov.bc.ca/EAED/EnergyEfficiency/Pages/EEAct.aspx

Last Updated April, 2009

B.C. ENERGY EFFICIENCY ACT STANDARDS:

Gas and Propane-Fired Water Heaters

BRITISH COLUMBIA
The Best Place on Earth

MEMPR INFORMATION BULLETIN 09-05

What products are you regulating? Storage-type water heaters with a rated storage capacity of 76 to 380 litres and an input of 75 000 Btu/h or less, for use with natural gas or propane.

Are you forcing me to replace my water heater? No. The regulation applies to voluntary purchases of new or replacement water heaters. Individuals can keep their existing water heaters for as long as they wish.

What is the regulated energy efficiency standard for those products?
The Energy Factor (EF) must be greater or equal to[1] :
$0.70 - (0.0005 \times V)$

Here are the new minimum EF levels for several common sizes:

Rated Storage Capacity in litres (US gallons)	Minimum Energy Factor
114 L (30 US gal)	0.64
151 L (40 US gal)	0.62
181 L (48 US gal)	0.61
189 L (50 US gal)	0.61
246 L (65 US gal)	0.58
283 L (75 US gal)	0.56

For a lookup table with all sizes, go to:
www.empr.gov.bc.ca/EAED/EnergyEfficiency/Pages/EEAct.aspx

When will the regulation take effect? September 1, 2010

Can I sell my inventory of non-compliant products after the effective date? Any water heaters manufactured after September 1, 2010 must comply with the regulation. If you have unsold inventory of products manufactured before the effective date, they can still be sold legally in British Columbia after the effective date.

How can I tell if a product is compliant with efficiency regulations? Suppliers can ensure compliance with the standard by stocking only products that meet the minimum EF level outlined above. If the manufacturer's product literature is not clear on this point, Natural Resources Canada has a gas water heater database which lists EF by model number, which can be found at www.oee.nrcan.gc.ca/residential/business/manufacturers/search/gas-water-heaters-search.cfm?attr=4

[1] In this equation, V is the water heater's rated storage capacity in litres, as tested under the standard *CAN/CSA-P.3-04: Testing Method for Measuring Energy Consumption and Determining Efficiencies of Gas-Fired Storage Water Heaters.*

Do ENERGY STAR water heaters meet the new standard?
As of September 1, 2010, all new ENERGY STAR water heaters will be compliant with the B.C. regulation. ENERGY STAR water heaters manufactured before September 1, 2010 may not meet the standard in all cases, please check the database referenced in the previous question to confirm. Note: the ENERGY STAR standard is the same for all water heater sizes, whereas the new B.C. requirements vary with the tank size.

Who enforces this regulation? The Ministry of Energy, Mines and Petroleum Resources is responsible for enforcing all regulated standards under the *EEA*.

What are the penalties for non-compliance? Under the *EEA,* the Ministry can conduct inspections to verify compliance with the *Act* and regulations. *EEA* enforcement begins with education and voluntary compliance measures. Ministry staff follow up on all complaints and other information respecting non-compliance, and communicate directly with industry participants to develop a compliance plan.

The Ministry can also seek to have those who have contravened the legislation charged under the *Offence Act*. An offence can result in fines up to $2,000.

What do I do if I see a non-compliant product for sale or distribution?
Please circulate this information bulletin to the retailer or distributor. You can also report infractions to Erik Kaye, Ministry of Energy, Mines and Petroleum Resources at 250-356-1507 or Erik.Kaye@gov.bc.ca.

For more information on B.C.'s *Energy Efficiency Act*:
www.empr.gov.bc.ca/EEC/Strategy/EEA/Pages/default.aspx

Appendix D

PROGRAM DETAILS

OVERVIEW AND INTRODUCTION

This appendix includes further details not included in Sections 4 and 5 regarding the Companies 2009 and 2010 EEC Portfolio of programs and associated activities. Only when additional details are available, are the programs and associated activities included in this appendix. These details are organized into sections, outlined below:

- Residential Energy Efficiency Programs
- High Carbon Fuel Switching
- Commercial Energy Efficiency Programs
- Conservation, Education, and Outreach Programs
- Enabling Activities
- Pilot Studies (2009)
- Pilot Studies (2010)

The function of this appendix is to provide the reader with information pertaining but not limited to program background, objectives, target market, research methodology, detailed findings, etc.

TABLE OF CONTENTS

RESIDENTIAL ENERGY EFFICIENCY PROGRAMS

Details of the Residential Energy Efficiency Programs are described in this section. These programs include:

- ENERGY STAR® Heating System Upgrade Program
- EnerChoice Fireplace Program
- ENERGY STAR® Domestic Hot Water Heaters Program

PROGRAM: ENERGY STAR® HEATING SYSTEM UPGRADE PROGRAM

Program Area: Residential Energy Efficiency

Target Market: Retrofit

Duration: TGI: September 1, 2008 through December 31, 2009
TGVI: April 16, 2009 through December 31, 2009

Incentive: $250 bill credit

Program Objectives:

- Prepare market for adoption of ENERGY STAR® provincial furnace regulations for retrofit market, January 1, 2010
- Upgrade a minimum of 8,180 heating systems
- Educate trades community about upcoming regulations
- Educate consumers about the advantages of energy efficient furnaces and boilers and provide an incentive that promotes a proactive replacement decision
- Engage manufacturers by distributing coupons for ENERGY STAR® furnaces and boilers and providing funds for co-marketing opportunities
- Develop a cost effective program with TRC > 1.0 and optimize the proportion of incentives over administration and marketing costs

Partner: LiveSmart BC Residential Retrofit Incentive Initiative

Communications Plan:

The following initiatives were implemented to provide consumer awareness and engagement by the trades community and manufacturers.

- www.terasengas.com – included program information, application forms and program terms and conditions. The site included manufacturer coupons for download from September through December 2008, and September through December 2009.
- Bill inserts with program information and instructions for downloading coupons
- Contractor brochures, Point of Sale information, distributed to BC Safety Authority registered gas contractors
- Information distributed to all customer touch points including call centres and sales and service staff
- Co-op advertising funds reimbursed participating manufacturers' or their dealers 50 per cent of their media print advertising costs to support their ENERGY STAR® heating systems advertisements
- Program information was distributed at all trade shows and Team Terasen events

Program Administration:

Program administration was handled by Accenture Utilities Business Process Outsourcing Services ("ABSU"), a subsidiary of Accenture Inc., through a subcontracting arrangement with CustomerWorks LP. The program administration costs invoiced in 2009 were $60,000. ABSU handled data entry for applications, validation of ENERGY STAR® rated heating systems, the batch process that administered the $250 bill credit, customer support, and reporting. To receive the bill credit, customers were required to submit their completed application and a photocopy of the furnace invoice, including the installation date, the contractor's BC Safety Authority registration number, and the gas permit installation number.

LiveSmart BC Partnership:

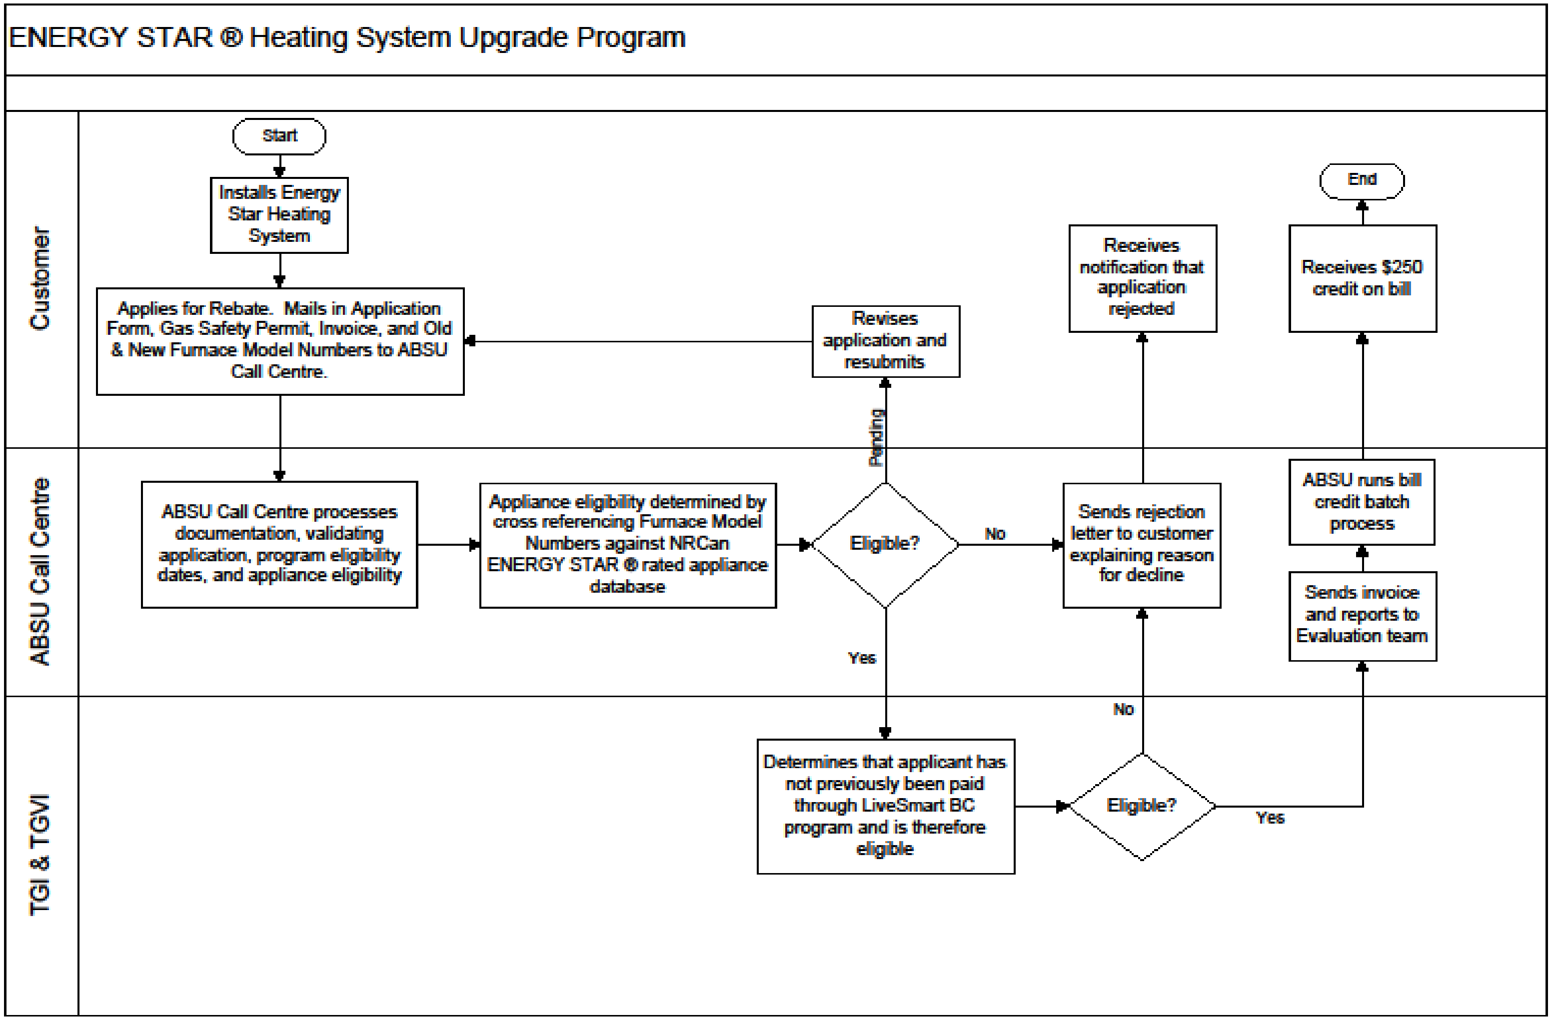
There were two channels for customers to receive the Companies' $250 ENERGY STAR® Heating System incentive. TGI and TGVI customers could apply directly to the Companies for the incentive or alternatively complete a home energy assessment through the LiveSmart BC program to receive the $250 incentive paid out through a cheque from LiveSmart BC.

The LiveSmart BC Residential Retrofit Incentive Initiative, launched in May 2008 by the Provincial government, provided incentives to reward residential retrofits that saved energy and reduced GHGs. As part of the Energy Efficient Buildings Strategy, the goal was to create a one-stop shop to provide homeowners with coordinated, easy access to utility, provincial, and federal incentives Data-gathering for the LiveSmart partnership was completed through NRCan ecoENERGY Home Renovation program. In order to receive these incentives, homeowners had to complete both a pre (D-visit) and post-retrofit (E-Visit) home energy assessment with a Certified Energy Advisor, licensed by NRCan[1]. At the time of the Home Energy Assessment, Certified Energy Advisors input data into NRCan's Hot 2000 software, and data files are transferred from NRCan to LiveSmart BC for program administration.

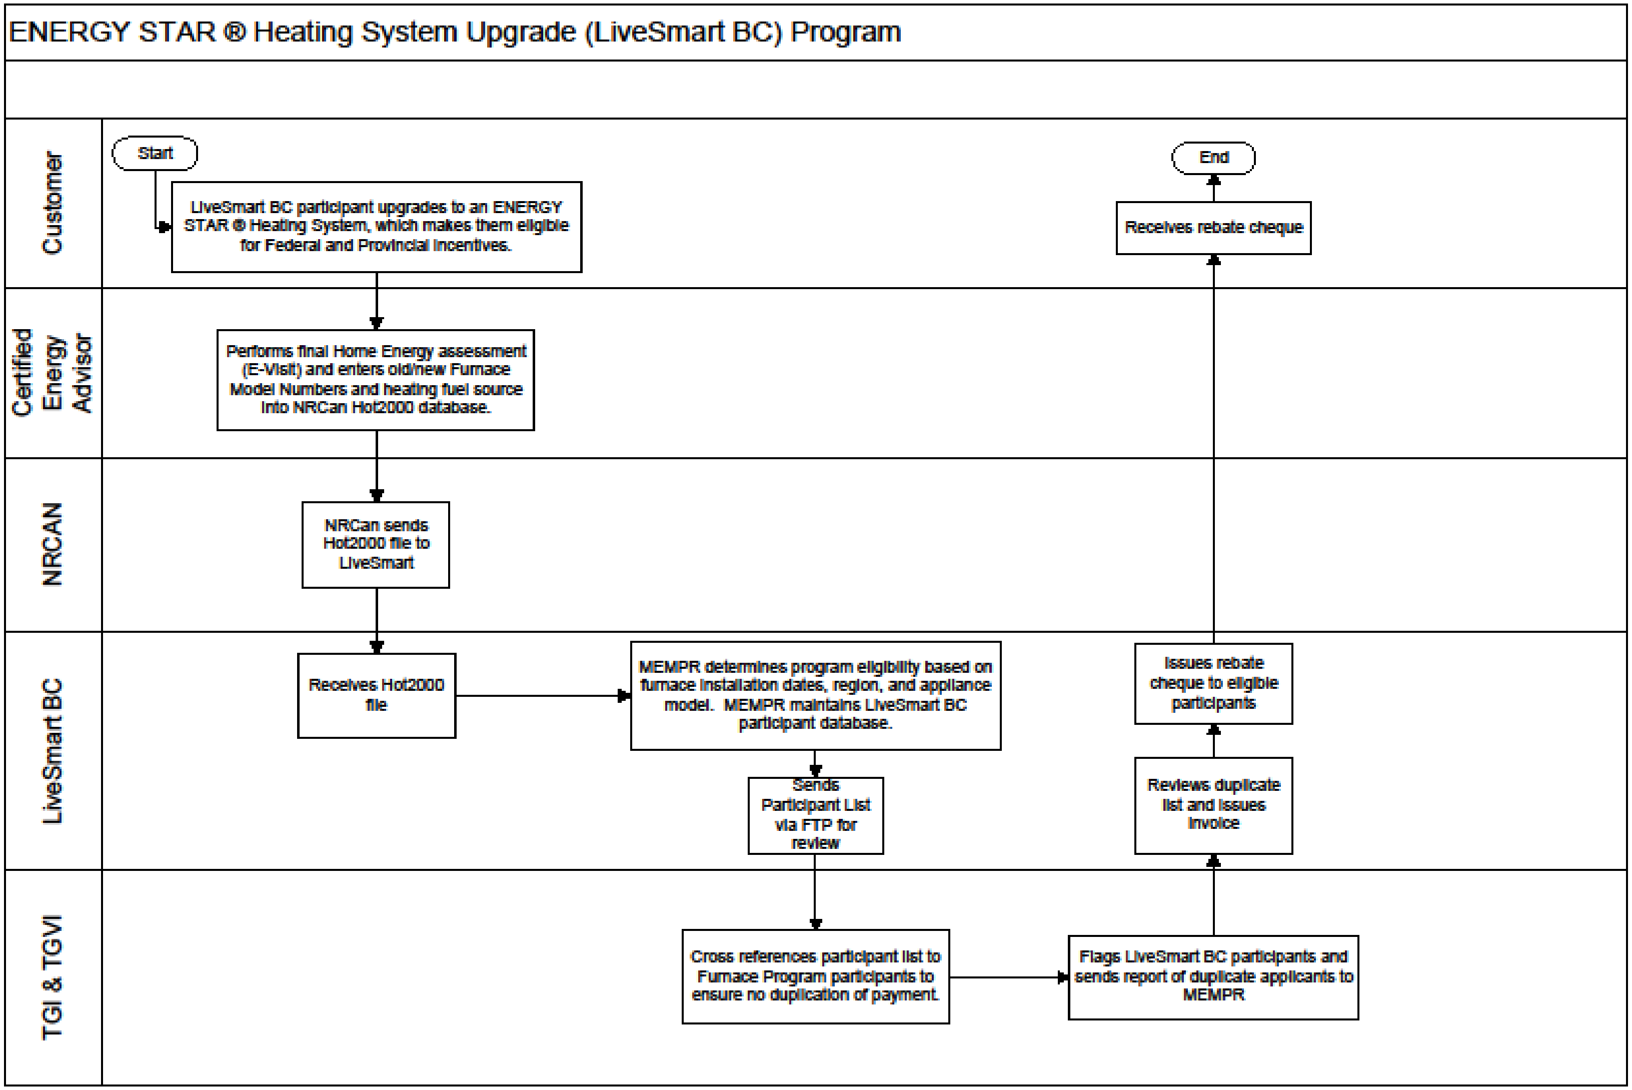
The LiveSmart BC portfolio matched or exceeded federal incentives with the inclusion of funding from BC utility partners, TGI, TGVI, BC Hydro and FortisBC. LiveSmart BC participants who upgraded their heating systems could receive up to $790 in federal funding and $1130 in provincial funding for select ENERGY STAR® heating systems. Of the $1130 in provincial funding, $250 was provided by the Companies, through an August 2008 agreement with MEMPR to include the $250 ENERGY STAR® Heating System incentive within the LiveSmart BC portfolio.

To ensure that customers received only one $250 furnace incentive payment, the Companies developed a cross-checking process between LiveSmart BC participants and the Companies' Heating System Upgrade participants. LiveSmart BC participant lists were sent bi-monthly via a secure file transfer protocol. The LiveSmart BC list was cross-referenced with program to date participants prior to authorizing payment by LiveSmart BC. LiveSmart BC participants were then flagged within the Companies' customer database to eliminate duplicate payment through the bill credit process.

[1] Home Energy Assessments for existing homes are provided by NRCan-certified Home Energy Advisors. The initial assessment is referred to as the D-visit and includes a detailed evaluation of the home's energy efficiency levels, as well as various tests to determine air leaks and recommendations for retrofits that will improve the home's energy efficiency rating. The second visit, referred to as the E-visit, measures energy performance after the recommended retrofits have been completed.



ENERGY STAR ® Heating System Upgrade Program
Customer
ABSU Call Centre
TGI & TGVI
Start
Installs Energy Star Heating System
Applies for Rebate. Mails in Application Form, Gas Safety Permit, Invoice, and Old & New Furnace Model Numbers to ABSU Call Centre.
ABSU Call Centre processes documentation, validating application, program eligibility dates, and appliance eligibility
Appliance eligibility determined by cross referencing Furnace Model Numbers against NRCan ENERGY STAR ® rated appliance database
Eligible?
Pending
Revises application and resubmits
No
Yes
Sends rejection letter to customer explaining reason for decline
Receives notification that application rejected
Determines that applicant has not previously been paid through LiveSmart BC program and is therefore eligible
Eligible?
No
Yes
Sends invoice and reports to Evaluation team
ABSU runs bill credit batch process
Receives $250 credit on bill
End



ENERGY STAR ® Heating System Upgrade (LiveSmart BC) Program
Customer
Certified Energy Advisor
NRCAN
LiveSmart BC
TGI & TGVI
Start
LiveSmart BC participant upgrades to an ENERGY STAR ® Heating System, which makes them eligible for Federal and Provincial incentives.
Performs final Home Energy assessment (E-Visit) and enters old/new Furnace Model Numbers and heating fuel source into NRCan Hot2000 database.
NRCan sends Hot2000 file to LiveSmart
Receives Hot2000 file
MEMPR determines program eligibility based on furnace installation dates, region, and appliance model. MEMPR maintains LiveSmart BC participant database.
Sends Participant List via FTP for review
Cross references participant list to Furnace Program participants to ensure no duplication of payment.
Flags LiveSmart BC participants and sends report of duplicate applicants to MEMPR
Reviews duplicate list and issues invoice
Issues rebate cheque to eligible participants
Receives rebate cheque
End

PROGRAM: ENERCHOICE FIREPLACE PROGRAM

Program Area: Residential Energy Efficiency

Target Market: Retrofit

Duration: TGI and TGVI: Sep 1, 2009 through Dec 31, 2009

Incentive:
- Dealer - $50 SPIFF for each fireplace sold
- Manufacturer Coupons

Program Objectives:

- Encourage the sale and installation of energy efficient heater style fireplaces to reap the associated energy savings.
- Further the education and awareness of the EnerChoice label to consumers and industry.
- Further relationships with manufacturers and distributors of natural gas fireplaces, through the Hearth, Patio & Barbecue Association of Canada.
- Engage manufacturers by distributing coupons for EnerChoice fireplaces
- Develop a cost effective program with TRC > 1.0 and optimize the proportion of incentives over administration and marketing costs

Partner: Hearth Patio and Barbecue Association of Canada ("HPBAC")

Communications Plan:

The 2009 EnerChoice Fireplace program had two marketing components:

- promoting manufacturer coupons to residential customers,
- providing a $50 SPIFF to retail sales personnel for each EnerChoice Fireplace they sold between September 1, 2009 and December 31, 2009.

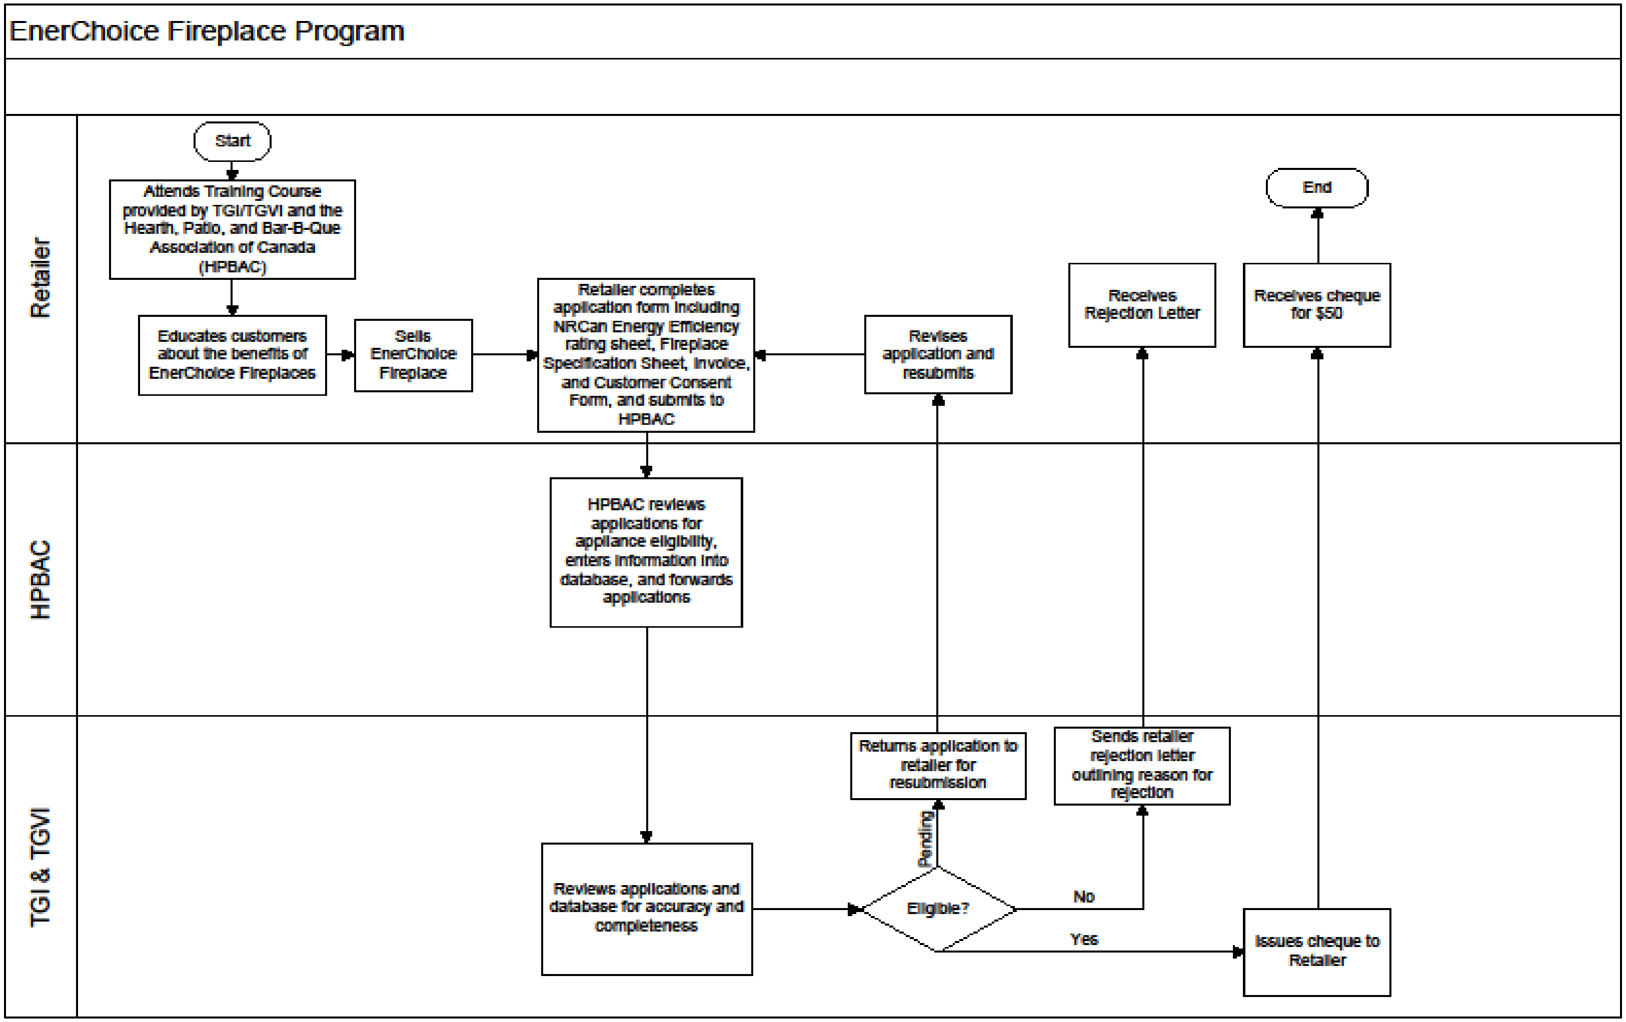
The following initiatives were implemented to provide consumer awareness and engagement by fireplace dealers and manufacturers.

- www.terasengas.com – The site included manufacturer coupons for download from September through October 2008 and September through October 2009
- Bill inserts with program information and instructions for downloading coupons
- Contractor brochures, Point of Sale information, distributed to HPBAC members
- Information distributed to all customer touch points including call centres and sales and service staff
- Community newspaper ads for x weeks in September
- Program information was distributed at all trade shows and Team Terasen events

Program Administration:

The HPBAC provided program administration services for SPIFFS including data entry and validation of supporting documentation including Natural Resource Canada Energy Efficiency Ratings for the fireplace model sold. The EEC team reviewed all documentation and approved applicants for payment.

To be eligible for the $50 SPIFF, retailers were required to attend an online training course on EnerChoice fireplaces, provided by the Companies. In addition, breakfast meetings for fireplace dealers were held on TGVI in August 2009.



EnerChoice Fireplace Program
Retailer
HPBAC
TGI & TGVI
Start
Attends Training Course provided by TGI/TGVI and the Hearth, Patio, and Bar-B-Que Association of Canada (HPBAC)
Educates customers about the benefits of EnerChoice Fireplaces
Sells EnerChoice Fireplace
Retailer completes application form including NRCan Energy Efficiency rating sheet, Fireplace Specification Sheet, Invoice, and Customer Consent Form, and submits to HPBAC
Revises application and resubmits
Receives Rejection Letter
Receives cheque for $50
End
HPBAC reviews applications for appliance eligibility, enters information into database, and forwards applications
Reviews applications and database for accuracy and completeness
Eligible?
Pending
No
Yes
Returns application to retailer for resubmission
Sends retailer rejection letter outlining reason for rejection
Issues cheque to Retailer

PROGRAM: ENERGY STAR® DOMESTIC HOT WATER HEATERS PROGRAM

Program Area: Residential Energy Efficiency

Target Market: Retrofit

Duration: TGI & TGVI: May 1, 2010 through April 1, 2011

Incentive:
- $50 rebate cheque for consumer
- $50 rebate cheque for contractor

Program Objectives:

- Educate the market about the introduction of provincial regulations on September 1, 2010
- Educate consumers about ENERGY STAR® water heaters and the importance of hot water conservation
- Upgrade a minimum of 3600 Hot Water Heaters
- Promote contractor relations between the Companies and contractors, as well as between contractors and customers
- Engage manufacturers and distributors through co-marketing opportunities
- Engage manufacturers in labeling tanks for Efficiency Factor

Communications Plan:

The following initiatives will be implemented to provide consumer awareness and engagement by the trades community and manufacturers.

- www.terasengas.com – will include tile ads and program information, application form for downloading, and program terms and conditions
- Online Manufacturer-driven directory of eligible ENERGY STAR® (or equivalent) hot water tank models
- Bill inserts with program information and instructions for downloading application forms
- Brochure: 3 panel brochure with application form/terms and conditions
- Contractor brochures, point of sale information, distributed to BC Safety Authority registered contractors
- Information distributed to all customer touch points including call centres and sales and service staff
- Tile ads for third party websites and other online opportunities
- Rebate cheque insert with energy saving tips.

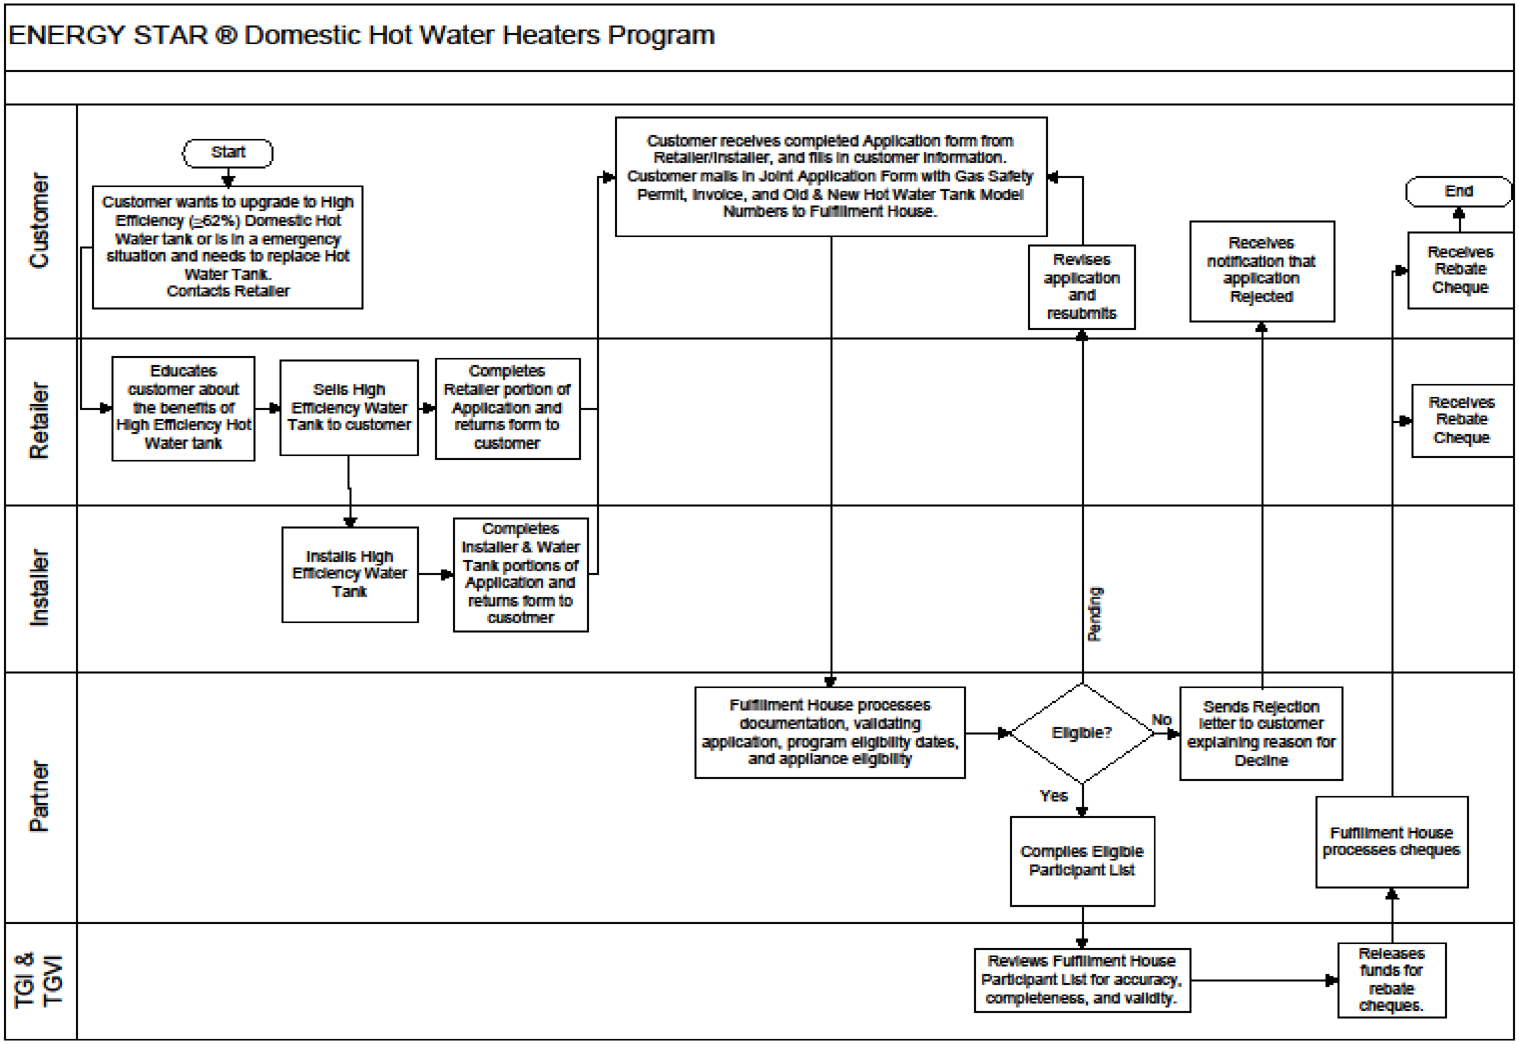
Program Administration:

Program administration will be handled by Consumer-Response Marketing Ltd (CRM). CRM will complete data entry for applications, validation of ENERGY STAR® (or equivalent) hot water tanks, cheque cutting, customer support, and reporting.

The $100 rebate will be split into two incentives:

- a $50 direct to consumer incentive
- a $50 Point of Sale Incentive Fund ("SPIFF") distributed to the sales person who has had contact with the customer to influence the purchase of High Efficiency water tanks

Using a combined incentive application form, consumers will apply for the $50 consumer incentive and at the same time the point of sale contact can apply for their $50. This will help drive the relationship between consumers, trades and retailers. The combined incentive will help streamline the administrative process and eliminate fraud from SPIFF applications.



ENERGY STAR ® Domestic Hot Water Heaters Program
Customer
Retailer
Installer
Partner
TGI & TGVI
Start
Customer wants to upgrade to High Efficiency (≥62%) Domestic Hot Water tank or is in a emergency situation and needs to replace Hot Water Tank. Contacts Retailer
Educates customer about the benefits of High Efficiency Hot Water tank
Sells High Efficiency Water Tank to customer
Completes Retailer portion of Application and returns form to customer
Installs High Efficiency Water Tank
Completes Installer & Water Tank portions of Application and returns form to cusotmer
Customer receives completed Application form from Retailer/Installer, and fills in customer information. Customer mails in Joint Application Form with Gas Safety Permit, Invoice, and Old & New Hot Water Tank Model Numbers to Fulfillment House.
Fulfillment House processes documentation, validating application, program eligibility dates, and appliance eligibility
Eligible?

HIGH CARBON FUEL SWITCHING PROGRAM

Details of the High Carbon Fuel Switching Program is described in this section. This includes:

- Switch 'N' Shrink Program

PROGRAM: SWITCH 'N' SHRINK PROGRAM – OIL CONVERSIONS TO NATURAL GAS ENERGY STAR® HEATING SYSTEM UPGRADES

Program Area: Residential Energy Efficiency Program

Target Market: Retrofit

Duration: January 1, 2010 to December 31, 2010 with possible extension

Consumer Incentive:

- $1,000 rebate cheque for oil or propane conversion
- $50 rebate cheque for Electronically Commutated Motors ("ECM") from BC Hydro or FortisBC

Objectives:

Provide a $1,000 incentive to encourage homeowners to convert their primary heating system from higher carbon oil or propane to a high efficiency natural gas heating system
Upgrade a minimum of 750 homes
Develop relationships with associations for co-marketing opportunities, for example; BC Insurance Brokers Association, real estate associations, environmental groups
Work with MEMPR to include this program as part of the provincial greenhouse gas reduction strategy
Develop a cost effective program with TRC > 1 and maximize the proportion of incentives over administration and marketing costs

Communications Plan:

Promotional initiatives and budget will be focused on the TGVI service area, representing 70 per cent of the projected conversions. The Companies will adopt an integrated marketing approach with program-specific media communications initiatives, contractor communications, co-marketing, and promotion by internal stakeholders such as the customer service centre and TGI/TGVI sales and service staff. Media initiatives include print ads in select trade publications in early 2010 with a summer launch prior to the fall furnace installation peak period.
The following initiatives were implemented to provide consumer awareness and engagement by the trades community and manufacturers.

- www.terasengas.com – included program information, application forms and program terms and conditions.
- Contractor Frequently Asked Questions "FAQ's" and application forms were distributed to BC Safety Authority registered gas contractors.
- Information distributed to all customer touch points including call centres and sales and service staff.
- Program information will be distributed at all trade shows and Team Terasen events.

- TGVI Print and radio ads in the summer of 2010 to coincide with conversions prior to the fall peak furnace installation period.
- Print and online ads in trade magazines and building association newsletters.

Co-marketing opportunities with associations include reaching out to associations that are affected by the environmental hazards associated with oil tanks. TGVI is working on developing a promotion with Vancouver Island Insurance Brokers Association to brokers and a DM piece to their customers who heat with oil. Real estate associations and environmental organizations will be contacted to help promote this program.

Program Administration:

Program administration is being outsourced to Consumer Response Marketing (“CRM”), a Surrey-based fulfillment house with extensive experience in rebate administration for DSM programs. CRM will manage data entry of applications, validation of ENERGY STAR® rated heating systems and eligibility for the $50 ECM program (BC Hydro / FortisBC), cheque fulfillment, customer support, and monthly program performance reporting. To receive the incentive, customers are required to submit their completed rebate application, and a photocopy of the furnace invoice, including the installation date, the contractor’s BC Safety Authority registration number, and the gas permit installation number.

Reviews and approves Participant List

COMMERCIAL ENERGY EFFICIENCY PROGRAMS

Details of the Commercial Energy Efficiency Programs are described in this section. These programs include:

- Efficient Boiler Program
- Light Commercial ENERGY STAR® Boiler Program
- Energy Assessment Program
- Efficient Water Heater Program

PROGRAM: EFFICIENT BOILER PROGRAM

Program Area: Commercial Energy Efficiency

Target Market: New Construction / Retrofit

Duration: TGI: 2005 – December 31, 2011
TGVI: 2005 – December 31, 2011

Incentive:

Participants are incented to purchase high efficiency boilers by a purchase price rebate. This rebate is designed to offset a significant portion of the incremental cost premium associated with purchasing high vs. standard efficiency equipment. Purchase price incentives are:

- Near-condensing boilers: $4,000 per boiler plus $3 per MBH[2] plant input
- Condensing boilers: $6,000 per boiler plus $9 per MBH plant input

For new construction participants the program offers:

1. A maximum incentive payment (calculated as noted above) of up to 75 per cent of the incremental purchase price of higher efficiency boilers. The purchase price of a standard-efficiency boiler is estimated using $7 per MBH of input.
2. An incentive payment of 50 per cent of a consultant's fees to a maximum $1500 to offset the cost of analyzing the annual gas usage for space heating using a standard-efficiency boiler system versus a higher efficiency boiler system.

For retrofit participants the program offers:

1. A maximum incentive payment (calculated as noted above) of up to 50 per cent of the incremental purchase price of higher efficiency boilers. The purchase price of a standard-efficiency boiler is estimated using $7 per MBH of input.
2. An incentive payment of $400 to help offset the cost of engaging a contractor to accurately estimate the peak space-heating load.
3. Where stainless steel venting is installed, an incentive of 50 per cent of the cost up to $2000.
4. For participants who so choose, a monitoring incentive of $1,500 plus $1 per gigajoule (GJ) of energy saved for closely monitoring and reporting on boiler operation and efficiency during the first year of operation.

Program Objectives:

- Reduce commercial sector gas consumption by encouraging the installation and use of high as opposed to standard efficiency boilers for space heating.
- Increase year over year participation rates in view of maximizing gas savings.
- Educate medium to large commercial customers about the advantages of high efficiency boilers and provide an incentive to facilitate the purchase of high efficiency technology.

[2] Note: 1 MBH = 1000 BTU/hr (BTU = British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit)

- Maintain a program TRC > 1.0 and optimize the proportion of incentives over administration and marketing costs.
- Support and prepare the way for any provincial regulation requiring increased boiler efficiency.

Communications Plan:

2009 saw the following communications initiatives aimed at raising customer awareness and encouraging program participation.

- www.terasengas.com – All program information, application forms and program terms and conditions were maintained on the Efficient Boiler Program web page.
- Program brochures describing the program specifics and how to apply were handed out at tradeshows.
- Contractor information / presentation sessions put on in August of 2009 in Victoria, Nanaimo and Courtney on Vancouver Island. The EBP was presented and program collateral made available.
- Speaking engagements / presentations describing the program at events such as:
  - BC Apartment Owners and Managers Association Semi-Annual trade show
  - Two (2) NRCan “Spot the energy savings” workshops
  - BC Hydro Power Smart forum
  - BH Hydro Energy managers training session
  - Vancouver Coastal Health and Fraser Valley Health Authority session on energy efficiency and incentive opportunities
- Information distributed to all customer touch points including call centres and sales and service staff.

The communications plan for 2010 will reflect what the Companies have learned in 2009, specifically, that additional effort must be expended on both Vancouver Island and in the New Construction arena. The Companies plan on holding a stakeholder focus group and feedback session in late April or early May to gain insight as to how the program may be updated to serve the market better. A full scale communications plan for the Efficient Boiler Program will be developed subsequently.

Program Administration:

Administration of the Efficient Boiler Program is handled entirely in-house by the Companies’ EEC Staff as of January 1, 2010.

For new participants, the Companies’ EEC staff receive applications, input data for program tracking, validate submitted information, ensure all boilers listed on applications are eligible for an incentive, prepare an incentive estimate, process and forward incentive cheques, and guide participants through the application process via on-going telephone support where / when necessary.

Additionally the Companies’ EEC staff responds to all phone or email enquires about the program from potential applicants.

PROGRAM: LIGHT COMMERCIAL ENERGY STAR® BOILER PROGRAM

Program Area: Commercial Energy Efficiency

Target Market: New Construction / Retrofit

Duration: TGI: August, 2009 – December 31, 2011
TGVI: August, 2009 – December 31, 2011

Consumer Incentive:

Boilers must be ENERGY STAR® rated near-condensing or condensing gas boilers sized up to a maximum size of 299 MBH input, and be used primarily for hydronic space and water heating. The incentive is calculated based on the quantity, size and type of boiler as follows:

- Condensing boilers: $5 per MBH, provided that the condensing boiler is used for radiant heat, fan coils and/or domestic water heating (in combination with space heating)
- Near condensing boilers: $3 per MBH
- Sample calculation: 1 MBH is equal to 1,000 BTU's per hour, therefore a 299 MBH or 299,000 Btu/hr condensing boiler would be eligible for a $1495 rebate (299 MBH x $5 = $1,495)

The incentive is independent of the price of boilers or the total cost of the mechanical system. The program does not include any additional rebate or incentive for labour, vent modifications, piping changes, design calculations, or other equipment.

Program Objectives:

- Reduce commercial sector gas consumption by encouraging the installation and use of high efficiency (ENERGY STAR® rated) as opposed to standard efficiency boilers for space heating.
- Increase year over year participation rates in view of maximizing gas savings.
- Educate small to medium commercial customers about the advantages of energy efficient appliances and provide incentives for their adoption when necessary.
- Engage the trades community and manufacturers by supporting new, energy efficient technologies.
- Maintain a program TRC > 1.0 and optimize the proportion of incentives over administration and marketing costs.
- Support and prepare the way for any provincial regulation requiring increased boiler efficiency.

Communications Plan:

2009 saw the following communications initiatives aimed at raising customer awareness and encouraging program participation.

- www.terasengas.com – All program information, application forms and program terms and conditions were maintained on the Light Commercial ENERGY STAR® Boiler Program web page.
- Program brochures describing the program specifics and how to apply were handed out at tradeshows.
- Program brochures and cards describing the program specifics and how to apply were distributed to regional sales / operations centres and sales and service staff.
- Approximate combined total of 2000 pieces of cardstock / brochures distributed.
- Contractor information / presentation sessions put on in August of 2009 in Victoria, Nanaimo and Courtney on Vancouver Island. The Light Commercial ENERGY STAR® Boiler Program was presented and program collateral made available.
- Speaking engagements / presentations describing the program at events such as:
    - BC Apartment Owners and Managers Association Semi-Annual trade show
    - Two (2) NRCan "Spot the energy savings" workshops
    - BC Hydro Power Smart forum
    - BC Hydro Energy managers training session
    - Vancouver Coastal Health and Fraser Valley Health Authority session on energy efficiency and incentive opportunities
- The program was advertised in ASHRAE BC's November 2009 edition of its "Totem" magazine.

2010 will see a sustained and enhanced effort at program promotion. The Companies are currently in the process of developing a strategic communication plan for the Light Commercial ENERGY STAR® Boiler Program which, over and above the activities of 2009, should include:

- Direct email advertising
- Additional, targeted magazine/newsletter advertising
- On-bill advertising to rate 2 and rate 3 customers
- Contractor and engineer information sessions
- Additional information sessions on Vancouver Island.
- More leveraging of industry partner relationships
- A program feedback session with key stakeholders

Program Administration:

Administration of the Light Commercial ENERGY STAR® Boiler Program is handled entirely in-house by the Companies' DSM Staff.

For new participants, the Companies' DSM staff receive applications, input data for program tracking, validate submitted information, ensure all boilers listed on applications are ENERGY STAR® rated, process and forward incentive cheques, and guide participants through the application process via on-going telephone support where / when necessary.

Additionally the Companies' DSM staff also responds to all phone or email enquires about the program from potential applicants.

PROGRAM: ENERGY ASSESSMENT PROGRAM

Program Area: Commercial Energy Efficiency

Target Market: Retrofit

Duration: TGI: 2001 – December 31, 2011
TGVI: 2001 – December 31, 2011

Incentive:

For customers who consume in excess of 2000 GJ per year the Companies, will provide a free, walkthrough energy assessment – a $1200 value.

The walkthrough assessment is performed by a third party energy efficiency consultant retained by Terasen Gas. The consultant visits the participant's facility in order to review current sources of energy consumption and propose measures to reduce consumption. Results are provided to the participant and Terasen Gas in report form, and generally include the following information:

- Historic annual gas usage breakdown by type, i.e., space heating, water heating, process heat
- Readily implemented recommendations such as: using electronic controls to operate boilers and ventilation fans only when needed; insulating all bare heating pipes, valves and flanges in mechanical rooms and unheated areas
- Recommendations regarding upgrades to space, domestic water and process equipment
- Tables to illustrate monthly gas consumption over a one-year period, against monthly gas consumption projections if recommended upgrades are implemented
- Estimated payback periods for each implemented measure
- Information about available rebates or incentives

Program Objectives:

- Enable and encourage commercial customers to reduce gas consumption by identifying sources of high gas consumption within their facilities and proposing measures to reduce consumption.
- Educate commercial customers about gas use within their own facilities and the steps they can take to minimize consumption.
- Foster a culture of conservation among commercial sector customers (including MURBs, institutional and manufacturing customers) by assisting them to review their energy consumption critically.
- Where applicable, direct participants to available incentive programs including Terasen's existing boiler programs.
- Maintain a program TRC > 1.0 and optimize the proportion of incentives over administration and marketing costs

Communications Plan:

2009 saw the following communications initiatives:

- www.terasengas.com – The Companies maintained a webpage dedicated to the program which included program information, application forms and program terms and conditions.
- Brochure: 3 panel brochure with program information and terms and conditions for hand out at tradeshows, and use by the Companies' sales and Key Accounts staff.
- Direct promotion of the program by the Companies' Key Accounts staff.

Program Administration:

Administration of the Energy Assessment Program is handled entirely in-house by the Companies' DSM Staff as of November 2009.

For new participants, the Companies' DSM staff receive applications, input data for program tracking, validate submitted information, ensure all boilers listed on applications are eligible for an incentive, prepare an incentive estimate, process and forward incentive cheques, and guide participants through the application process via on-going telephone support where / when necessary.

Additionally the Companies' DSM staff also responds to all phone or email enquires about the program from potential applicants.

PROGRAM: EFFICIENT COMMERCIAL WATER HEATER PROGRAM

Program Area: Commercial Energy Efficiency

Target Market: New Construction / Retrofit

Duration: TGI: April, 2010 – December 31, 2011
TGVI: April, 2010 – December 31, 2011

Incentive:

The incentive amount is calculated based on the quantity, size and type of water heating appliance installed, which must have a thermal efficiency rating great than 84 per cent for storage or hot water supply boilers, or 90 per cent for On-demand water heaters.

The structure for this program is similar to that of the Light Commercial ENERGY STAR® Boiler Program, with identical incentive amounts per input MBH for storage and boiler type water heaters. On-demand water heaters are provided with a reduced incentive due to a generally lower purchase price.

Rebates are available for multiple water heaters in a single facility and will be calculated per water heater as follows:

Storage water heaters / Hot water supply boilers
- $5 per MBH for water heaters with a thermal efficiency of 90 per cent or higher
- $3 per MBH for water heaters with a thermal efficiency of 84 per cent to 89.9 per cent

On-demand water heaters
- $2.50 per MBH for water heaters with a thermal efficiency of 90 per cent or higher

Sample calculation: 1 MBH is equal to 1,000 BTU's per hour, therefore a 199 MBH or 199,000 Btu/hr storage water heater, rated at 96 per cent thermal efficiency would be eligible for a 5 $/MBH x 199 MBH = $995 rebate.

The rebate is independent of the price of water heaters or the total cost of the water heating system. The program does not include any additional rebate or incentive for labour, vent modifications, piping changes, design calculations, or other equipment.

Program Objectives:

- Reduce commercial sector gas consumption by encouraging the installation and use of high as opposed to standard efficiency water heaters for domestic hot water heating.
- Increase year over year participation rates in view of maximizing gas savings.
- Educate commercial customers about the advantages of high efficiency water heaters and provide an incentive to facilitate the purchase of high efficiency technology.
- Maintain a program TRC > 1.0 and optimize the proportion of incentives over administration and marketing costs.

- Prepare the way for and support any provincial regulation requiring increased water heater efficiency.

Communications Plan:

The following initiatives will be implemented to generate consumer awareness and engagement by the trades community and manufacturers.

- www.terasengas.com – will include a web page with program information, application form for downloading, and program terms and conditions.
- Web tile ads will be developed for use on partner (industry association, municipalities, advocacy groups, etc) websites.
- Online directory of qualifying hot water heaters to make selection of a high efficiency water heater as simple as possible.
- Brochure: 3 panel brochure with application form/terms and conditions for hand out at tradeshows, and delivery to the Companies sales staff.
- Engagement of suppliers and manufacturer's representatives via information sessions designed to instill awareness of, and answer questions about the program.
- Lunch and learn sessions with relevant engineering firms, plumbers and gas fitters. Relevant being those who deal most often with the target customer groups.
- Speaking engagements and web page advertisements with target organizations such as:
    - British Columbia Restaurant and Food Services Association
    - British Columbia Hotel Association
    - Tourism Vancouver
    - Vancouver Hotel Association
    - Mechanical Contractor's Association of British Columbia
    - Building Operators and Managers Association
    - BC Appartment Owners and Managers Association
- Magazine Advertisement with publications such as:
    - HPAC Magazine
    - APEGBC / Innovation magazine
    - ASHRAE Newsletter
- Direct contact with target customer, as well as their attendant suppliers, engineers and O&M service providers is essential in the initial stages of the program.
- Information distributed to all customer touch points including call centres and sales and service staff

Program Administration:

Administration of the Efficient Water Heater Program will be handled entirely in-house by the Companies' EEC Staff.

For new participants, the Companies' EEC staff will receive applications, input data for program tracking, validate submitted information, ensure all water heaters listed on applications are eligible for an incentive, process and forward incentive cheques, and guide participants through the application process via on-going telephone support where / when necessary.

Additionally the Companies' EEC staff will also respond to all phone or email enquires about the program from potential applicants.

CONSERVATION, EDUCATION, AND OUTREACH (CEO) PROGRAMS

Details of the Conservation, Education, and Outreach programs are described in this section. These programs include:

- Ethnic Outreach
- Trade Shows and Events
- Students and School Outreach
  - Destination Conservation
  - Beyond Recycling school program
  - BC Green Games
- School Assembly Presentations
- Energy Champion
- Team Terasen

PROGRAM ACTIVITY: ETHNIC OUTREACH

Program Area: Conservation, Education, and Outreach

Target Market: Punjabi and Chinese audiences, residential and small commercial customers

Duration: Begins March 2010

Program Objectives: The objective is to ensure conservation information is accessible and understood by all customers.

Methodology/Communication Plan:

The Companies are planning to conduct a qualitative and quantitative research study within the Punjabi, Cantonese, and Mandarin speaking audiences, which are the top visible minority ethnic groups in the Lower Mainland, to identify their attitudes and behaviours as they relate to conservation. Some proposed initiatives for the ethnic outreach campaign include print and online translations of the printed “Hot Tips” booklet, and event sponsorships, such as S.U.C.C.E.S.S. Foundation’s Walk with the Dragon fundraising event.

PROGRAM ACTIVITY: TRADE SHOWS AND EVENTS - HOME SHOWS, INDUSTRY TRADE SHOWS, AND OTHER SPECIAL EVENTS

Program Area: Conservation, Education, and Outreach

Target Market: residential and commercial

Duration: year round

Program Objectives:

The objective is to reach out to customers that are more inclined to home/business renovations and/or equipment upgrades and seeking information on methods to reduce energy costs.

Methodology/Communication Plan:

The Companies usually participate with a booth exhibit and/or sponsorship of a section or specific show at the event.

List of Home and Trade Show Activities for 2009

PROGRAM ACTIVITY: STUDENTS AND SCHOOL OUTREACH - DESTINATION CONSERVATION

Program Area: Conservation, Education, and Outreach

Target Market: elementary and high schools throughout BC

Duration: September to June (school year

Program Objectives:

The goal of the program is to bring in additional school districts that would not have otherwise participated had funding not been available.

Methodology/Communication Plan:

Destination Conservation delivers education programs to students and building operators on energy, waste, and water, and assist in developing student projects for the school.

Funding:

The Companies fund the first year, and for most districts, years 2 and 3 are funded by the school district from energy savings generated from changes in facility operations prompted by the program. The exceptions to this are Okanagan Skaha and Kootenay Lake School Districts, where year 2 is funded by FortisBC, and North Vancouver School District, where years 2 and 3 are funded by the City of North Vancouver.

Destination Conservation School Sponsorship 2007 - 2009

Year	School District	Number of Sponsored Schools
2007 - 2008	Central Okanagan	7
	Okanagan Skaha	9
	Vancouver	12
2008 - 2009	Kootenay Lake	11
	Fraser Cascade	7
2009 - 2010	North Vancouver	11
	Sooke	16
	Powell River	7
	Total Schools:	**80**

For the 2010-2011 school year, Destination Conservation is currently in discussion with 5 new school districts, and 2 renewals (Kelowna and Vancouver).

PROGRAM ACTIVITY: STUDENTS AND SCHOOL OUTREACH - BEYOND RECYCLING SCHOOL PROGRAM

Program Area: Conservation, Education, and Outreach

Target Market: elementary schools in the West and East Kootenays region

Duration: September to June (school year)

Program Objectives:

The goal is to ensure conservation outreach to schools that may not have been able to participate had funding not been available.

Results:

For the 2009-2010 school year, 10 schools had signed on, reaching at least 3000 students. See table below for the list of schools.

Funding:

Additional funders of the program include Environment Canada's EcoAction Community Funding Program and FortisBC.

Schools Participating in Beyond Recycling Program 2009-2010

School	Location
Erickson Elementary School	Erickson
Canyon-Lister Elementary School	Lister
Winlaw Elementary School	Winlaw
Rosemont Elementary School	Nelson
JV Humphries School	Kaslo
Twin Rivers School	Castlegar
Glenmerry Elementary School	Trail
McKim Middle School	Kimberley
Gordon Terrace Elementary	Cranbrook
Jaffray Elementary School	Jaffray
Isabella Dicken Elementary	Fernie

PROGRAM ACTIVITY: STUDENTS AND SCHOOL OUTREACH - BC GREEN GAMES

Program Area: Conservation, Education, and Outreach

Target Market: elementary and high schools throughout BC

Duration: September 2009-June 2012

Methodology/Communication Plan:

The goal of the Companies' involvement in BC Green Games is to introduce the concept of natural gas as a resource and the need for energy conservation into the students' environmental projects. The competition allows students to learn about sustainable initiatives in other schools, learn from their peers, and build on their existing or new projects for the next year. The program is hosted by Science World who has hired a project coordinator to promote the contest to schools, organize the submissions, recruit and train the judging panel, and organize prizing.

Results:

To date, for the 2009-2010 school year, at least 94 teams have registered from 32 school districts

Funding:

The program is being co-funded with BC Hydro for 3 school years.

PROGRAM ACTIVITY: 2009 SCHOOL ASSEMBLY PRESENTATIONS

Program Area: Conservation, Education, and Outreach

Target Market: students and teachers

Duration: Spring 2009 of 2008-2009 (school year)

Program Objectives:

The goal of this initiative was to launch a program that interacted with students and brought conservation education directly into the schools. See below for a list of schools attended.

Methodology/Communication Plan:

The assembly presentation featured B.C. Lions players talking to students about environmental responsibility and then engaging with them in competitive games that focused on recycling, water, and energy conservation. After the assembly, the players visited a Grade 5 class for a more in-depth lesson.

Funding:

The program was co-funded with Livesmart BC, including both the Ministry of Education and the Ministry of the Environment, and Plutonic Power.

Walter Moberly Elementary	Vancouver

PROGRAM ACTIVITY: ENERGY CHAMPION

Program Area: Conservation, Education and Outreach

Target Market: kids, youth, and families

Duration: varies with the specific sports teams' season

Program Objectives:

The goal of the program is to educate children and youth on energy conservation behaviour in a fun and rewarding manner.

Methodology/Communication Plan:

The Energy Champion program is usually implemented in the form of a contest. An example of a contest would require kids under 12 years of age to answer the following question, "What are 3 things you can do around your home to conserve energy?" Where they would then be entered into a draw to win tickets to a game. With each sports club partnership, there are slight modifications to the program to be able to adapt to each team's delivery, but where possible, the program includes a combination of print advertising, web banner advertising, an online contest, use of social media, electronic newsletters, in-game announcements, concourse activity, and in-game activity, all to promote energy conservation.

PROGRAM ACTIVITY: TEAM TERASEN - OUTREACH TEAM AT VARIOUS COMMUNITY AND BUSINESS EVENTS

Program Area: Conservation, Education and Outreach

Target Market: residential and commercial customers

Duration: year round

Program Objectives:

The objective is to reach out to customers in their own communities (or workplace) to educate on energy conservation.

Methodology/Communication Plan:

Outreach team will usually setup a table of literature, bring an interactive game (eg. Spinning wheel) to quiz participants, and also hold a prize draw.

ENABLING ACTIVITIES

Details of the enabling activities programs are described in this section. These activities include:

- Research and Evaluation
  - Residential End Use Study (REUS)
  - Sustainability and Social Responsibility Attitudes Study Report
  - Residential Retrofit Market Evaluation for Terasen Gas
  - ENERGY STAR® Heating System Upgrade Evaluation
  - Efficient Boiler Program Evaluation
  - Okanagan Spray Saver Pilot Program Evaluation
  - Conservation Education and Outreach 2010 Evaluation

- Efficiency Partners Program
  - Contractor Program (2009)
  - New Contractor Program (2010)

- Pilot Programs (2009)
  - Okanagan Spray Saver Pilot Program
  - Furnace Servicing Pilot – "Give Your Furnace Some TLC" Campaign
- Pilot Programs (2010)
  - Behaviour Change - Vancouver Coastal Health Authority and Providence Health Care staff engagement
  - Behaviour Change - Destination Conservation for Public Buildings Pilot Program
  - Domestic Hot Water Tier Three Technologies pilot
  - EnerGuide 80 Program

RESEARCH & EVALUATION: RESIDENTIAL END USE STUDY (REUS)

Program Area: Residential Energy Efficiency Programs

Methodology:

Due to complexity of the REUS, the final results were completed and compiled towards the end of 2009. Prior to the 2008 REUS, two REUS studies were conducted by TGI (formally BC Gas), one in 1993 and a second one in 2002. Neither of these prior studies included TGVI. The 2008 REUS study sought to understand what factors impacted residential gas usage across TGI *and* TGVI. These included appliance efficiency, changes in housing construction and customer behaviours and attitudes. The study was jointly funded by several departments within the Companies, including the EEC group. The overall cost of the project was $213,000 which included EEC's contribution of $20,000.

Planning for the study was started in spring 2008 with an RFP issued in summer 2008. Sampson Research was selected to conduct the research in conjunction with Habart & Associates Consulting Inc., NRG Research Group, InterVISTAS Consulting Inc. and Innes Hood Consulting Inc. The fieldwork was undertaken in December 2008, and it took about twelve months to complete the research due to the complexity of the project. The study included TGI and TGVI residential customers from each of the following five regions: Lower Mainland, Interior, Vancouver Island/Sunshine Coast, Whistler and Fort Nelson. The fieldwork consisted of a survey questionnaire which was mailed to respondents; however, they had the option of completing and mailing the paper survey or completing online. Over 2,200 surveys were completed. The analysis was completed by May 2009 and the final report was completed by November 2009. In addition a Conditional Demand Analysis and a Segmentation Analysis were completed to complement the REUS. The highlights of this extensive study are outlined in the below.

Findings:

Trend Analysis

Declines in weather normalized use rates (i.e., gas consumption per household) have been experienced in four of the five Terasen Gas Inc regions between 1999 and 2008. Overall, the Companies' use rates are down 15.5 per cent since 2002 and 20.7 per cent since 1999. Whistler was the only region experiencing an increase in its residential use rate since 2002 (+6.4 per cent).

Declines in natural gas use rates are primarily attributed to the following factors and trends:

- Construction of smaller, less energy-intensive multifamily dwellings including townhouses, and apartments.
- Improvements in the thermal envelope of homes (improved insulation, energy efficient windows, etc.).

- Improvements in the efficiency of gas end uses including furnaces, water heaters, and fireplaces.
- Improvements in the efficiency of hot water-using appliances, including front loading clothes washers, and dishwashers.
- The long-term decline in the average number of people per-household.
- Reduced hot water demand stemming from the aging of the population and proportionately fewer households with young families.
- Increases in the price of natural gas. The inflation-adjusted variable rate portion of natural gas prices in the Lower Mainland region, for example, increased by 10 per cent between January 2002 and December 2002, and 78 per cent since January 1999.

Trends countering the decline in use rates include:

- Increased space heating requirements of newer single family detached homes due to increased interior volumes (increased ceiling height and increased floor area), i.e. takes more energy to heat houses with high ceilings (10 or 12 feet) as opposed to regular height of 9 feet)

Building Envelope & Renovations

- Eighty-three percent (83 per cent) of respondents to the 2008 REUS live in single family detached (SFD) dwellings, 13 per cent in duplexes or townhouses, one per cent in apartments or condominiums, and 3 per cent in mobile homes or other dwelling type.
- Individually metered suites within a multi-storey building, also described as vertical sub-divisions (VSDs), are home to higher proportion of younger residents (under the age of 44) compared to SFDs and other multifamily dwellings (MFDs).
- The average length of residence (years living in the same premise) is increasing, presently 15 years, up from 10 years in 1993. The frequency of changes in residence decreases as people age.
- Average size (floor space) varies by building type and dwelling vintage. SFDs averaged 2,263 ft2, compared to 1,672 ft2 for MFDs, and 1,291 ft2 for VSDs. SFDs built after 1985 tend to be larger (up to 24 per cent larger), on average, that those built earlier.
- The incidence of partially or completely finished basements is increasing, up from 62 per cent in 1993 to 68 per cent in 2008.
- Nearly three quarters (74 per cent) of basements and crawlspaces are heated during the winter season.
- Homes built after 1985 are increasingly likely to have nine or ten foot ceilings, compared to the traditional eight foot ceiling of homes of older homes. VSDs are more likely than SFDs and MFDs to have nine or ten foot ceilings (average of 60 per cent versus 23 per cent and 35 per cent respectively). The majority (81 per cent) of VSDs were built since 1995.
- Consistent with trends in housing construction and changes in building codes, newer homes are more likely to have average or above average insulation, high efficiency windows, and insulated outside doors.

Renovation Activities – Past and Planned

- The top three renovations undertaken in the last five years include purchasing energy efficient appliances (37 per cent of customers), installing weather stripping or caulking (21 per cent), and installing a low flow showerhead (19 per cent). These are also the top three activities expected to be occur during the next two years. A comparison of stated intentions from the 2002 REUS with renovations undertaken during the past five years by 2008 REUS respondents suggests that, with a few exceptions, stated intentions are a good predictor of future actions.

- Eleven percent (11 per cent) of customers made changes involving fireplaces or heating stoves during the last five years, and 8 per cent plan to undertake similar renovations in the next two years.

Space Heating

- Nine-in-every-ten customers use natural gas as their primary space heating fuel; a proportion that has remained stable since 1993.
- Fifty-six percent (56 per cent) of customers use a supplementary fuel to heat their home. Electricity is the predominant supplementary space heating fuel, used by 67per cent of these customers. Wood is the second most common supplementary space heating fuel (14 per cent).
- Compared to 2002, the use of electricity as a supplementary space heating fuel has increased from 58 per cent to 73 per cent of TGI households that use supplementary space heating fuel.
- Three percent (3 per cent) of customers switched their main space heating fuel in the last five years, with a net shift being from natural gas to electricity. This shift is most evident in the Lower Mainland, Interior and TGVI regions.
- Regardless of main heating method, gas fireplaces are the most commonly used secondary method of heating among customers (29 per cent of TG customers). Wired-in and portable electric heaters are the second and third most common methods (11 per cent and 10 per cent respectively).
- VSDs are significantly more likely than SFDs or MFDs to use a gas fireplace as either the main or secondary heating method.
- Interior and Fort Nelson customers are significantly more likely than households in other regions to use a wood stove as their secondary heating method.
- On average, 22 per cent of customers have installed a new gas furnace or boiler in the last five years, primarily because of equipment failure (anticipated or actual). High efficiency furnaces were chosen by 40 per cent of those installing a furnace.
- Seventy-three percent (73 per cent) of customers with a standard efficiency furnace leave their furnace’s pilot light on for 12 months of the year.

Fireplaces and Heating Stoves

- Eighty-five percent (85 per cent) of customers have at least one fireplace and/or free standing heating stove.
- The top three most popular fireplace types are heater type gas fireplaces (50 per cent of customers), wood burning fireplaces (28 per cent), and decorative gas fireplaces (22 per cent).
- Penetration of fireplaces and heating stoves is highest in TGW (98 per cent of customers) and TGVI (90 per cent), and lowest in the Fort Nelson region (47 per cent).
- Twenty-eight percent (28 per cent) of respondents with a gas fireplace that uses a pilot light, never turn off the pilot light.
- Fireplace operating hours are highest in the Fort Nelson and TGVI regions (766 and 702 hours per year, respectively), and lowest in the Lower Mainland region (393 hours). Average wintertime usage by region is correlated with the regional climate (e.g., number of heating degree days).
- Average annual use of fireplaces and heating stoves is significantly higher for VSDs (697 hours per year) than SFDs (459 hours) and MFDs (387 hours). This is consistent with the greater tendency of customers living in VSDs to use their fireplace as either a primary or secondary space heating method.

Water Heating

- The penetration rate of gas-fired hot water tanks among Companies' customers is 89 per cent, up from 85 per cent in 2002.
- Whistler households are significantly more likely than any other region to have two or more hot water heaters. This is consistent with the high incidence of secondary suites in the resort community.
- Storage-type hot water tanks (any fuel) continue to make up the vast majority of hot water heaters. One percent (1 per cent) of customers have condensing style hot water heaters and 3 per cent have an instantaneous hot water heater.
- Thirty-eight percent (38 per cent) of customers have replaced their hot water heater during the last five years. This is on par with the findings from the 2002 REUS.
- The penetration of hot water heater blankets is 6 per cent of households, down from 15 per cent in 2002. Improvements in the tank wall insulation of new hot water heaters has reduced the cost-effectiveness of hot water heater blankets.
- Eighty-one percent (81per cent) of customers use either piped gas or propane for both their main space heating fuel and their water heating fuel.
- Only one percent (1per cent) of respondents use solar energy to pre-warm or supplement water heating.

Appliances

- The penetration of gas ranges has increased from 9 per cent of TGI households in 1993, to 17per cent of households in 2008.
- Front loading clothes washers have increased their penetration from 9 per cent of TGI households in 2002 to 27 per cent in 2008, largely at the expense of the lesser-efficient top-loading models.
- The proportion of home appliances rated ENERGY STAR® varies from a low of 2 per cent for air conditioners to a high of 53 per cent for refrigerators.

Pools and Hot Tubs

- Six percent (6 per cent) of households have a swimming pool that is for their exclusive use only (i.e., not shared with other residences, as is the case in multifamily complexes).
- Forty-three percent (43 per cent) of swimming pools are heated with natural gas. The next most commonly used fuels are solar (15 per cent) and electricity (5 per cent). Thirty-six percent (36 per cent) of pools are not heated.
- Thirteen percent (13 per cent) of households have an exclusive use only hot tub.
- Electricity is the predominant fuel used to heat hot tubs (83 per cent of all households with an exclusive use hot tub). Only 15 per cent of households with a hot tub use piped gas or propane to heat the water.
- Ninety-five percent (95 per cent) of hot tub owners use a hot tub cover. Sixty-nine percent (69 per cent) of pool owners use a pool cover.

Behaviours

- Fifty-five percent (55 per cent) of Companies' customers use at least one programmable thermostat to control temperature in their home.
- Eighty-three percent (83 per cent) of customers with thermostats (programmable or otherwise) always or usually set back the temperature at night, and 70 per cent of them so during the day when no one is at home.
- Customers in electrically heated homes are more likely than those in gas heated homes to keep unoccupied parts of the house cooler than the rest of the home (77 per cent versus 64 per cent, respectively). Customers living in VSDs have a lower share of their rooms that are always heated than do those living in SFDs (52 per cent versus 79 per cent respectively).
- Forty-one percent (41per cent) of respondents said their home is either always or somewhat drafty. Efforts at draft proofing were unsuccessful for 26 per cent of respondents.
- The use of window coverings (storm windows or plastic sheeting) is highest in the Fort Nelson region, and is more common among rental properties and homes with single pane windows.

- The number of showers, laundry loads, dishwashing loads, and baths decrease as the number of people in the home decrease. A household that decreases in size from four members to two (e.g., the typical situation when grown-up children leave home) will see, on average, a 36 per cent decline in the number of dishwasher loads, a 43 per cent decline in the number of laundry loads, a 30 per cent decline in the number of baths, and a 53 per cent drop in the number of showers.
- Thirty percent (30 per cent) of respondents, on average, turn down, turn off, or use the vacation setting on their hot water heater when away from home for more than a few days.
- On average, 58 per cent of laundry is washed using cold water.

Programs and Services

- Eleven percent (11 per cent) of respondents have participated in a program to reduce energy use in the last five years, with the program sponsored by either Terasen, a government agency, or some other organization or company.
- Interest was highest for a furnace tune-up program, home energy audits, and a do-it-yourself online energy audit.
- Eighty-five percent (85 per cent) of customers claimed they were at least somewhat knowledgeable about ways to save energy. Only 13 per cent categorized themselves as very knowledgeable.
- Seventy-eight percent (78 per cent) of respondents to the 2008 REUS agreed that natural gas is a clean and efficient energy source, unchanged from the 2002 REUS.
- Seventy-four percent (74 per cent) agreed with the statement “natural gas is a safe energy source”. Regional results did not differ significantly with the exception of Interior residents who were somewhat more in agreement with the statement than residents in the other regions.

Conditional Demand Analysis

A conditional demand analysis (“CDA”) was conducted using data from the 2008 REUS, billing records, and regional weather stations to estimate unit energy consumption (“UEC”) estimates for each of the major gas end uses including main and secondary space heating, water heaters, fireplaces, cook tops, pools, hot tubs, and barbeques. Estimates were generated for the five TG regions and TGI. Highlights include:

- Primary and secondary space heating are the two largest gas end uses, consuming 58 GJ/year and 23 GJ/year, respectively.
- Other major gas end uses are water heating (20 GJ/year), decorative fireplaces (21 GJ/year), and heater type fireplaces (17 GJ/year).
- Consistent with their tendency towards smaller household sizes (i.e., number of people per home), UECs for gas water heating for VSDs and MFDs are lower than SFDs.

RESEARCH & EVALUATION: SUSTAINABILITY AND SOCIAL RESPONSIBILITY ATTITUDES STUDY REPORT

Program Area: Residential Energy Efficiency Programs

Methodology:

Produced by Conscientious Innovation ("CI"), a Vancouver-based market research firm, the Sustainability and Social Responsibility Attitudes Study ("SHIFT") report is a market research tool comprised of qualitative and quantitative research, cultural reporting and trend analysis. Since Companies' financial commitment to the report was made before the research went into the field, the Companies were offered an opportunity to insert a number of questions related to media brands, lifestyle activities and consumption behavior.

The methodology of the SHIFT report includes both qualitative and quantitative data. The former is based on the results of over 32 focus groups conducted in Canada and the US as well as secondary market research analysis. The latter is based on 5,000 responses from the general North American population conducted through an online panel. Terasen Gas provided input specific to home energy and energy efficiency in mid-2009 during the design stage of the study. The analysis was completed by December 2009 and the final report was completed by January 2010.

Findings:

The results of the SHIFT report home energy consumer study is a resource for Terasen Gas staff to assist them in designing and implementing EEC programs. It summarizes detailed findings on consumers who are making sustainable choices related to home energy. The key findings of the report are:

- 60 per cent of North Americans say they have already made sustainable and socially responsible choices related to Home Energy
- 69 per cent of Canadians say they have already made sustainable and socially responsible choices related to Home Energy
- 64 per cent of Home owners versus 56 per cent of Home Renters say they have made sustainable and socially responsible choices related to Home Energy
- Food, Home Cleaning and Gardening/Yard Work are the top three other areas they say they have made sustainable lifestyle choices & purchase decisions
- Lighting and Home Heating are the top two areas they say they have made sustainable lifestyle choices & purchase decisions related to Home Energy
- 65 per cent are concerned about the health and environmental toxins in products today
- 61per cent rate Global Warming as important
- 33 per cent rate Organic Products as important

The top 5 sustainability issues (in terms of importance) are:

- Feeling connected to my friends, family & community (90 per cent)
- Balanced life (90 per cent)
- Being paid a living wage (88 per cent)
- How employees are treated at companies (86 per cent)
- Nurtured personal relationships versus material possessions (83 per cent)

RESEARCH & EVALUATION: RESIDENTIAL RETROFIT MARKET EVALUATION FOR TERASEN GAS

Program Area: Residential Energy Efficiency Programs

Methodology:

The LiveSmart BC Residential Retrofit Incentive Initiative launched in May 2008, by the Provincial government, provided incentives to reward residential retrofits that saved energy and reduced GHGs. As part of the Energy Efficient Buildings Strategy, the goal was to create a one-stop shop to provide homeowners with coordinated, easy access to utility, provincial, and federal incentives Data-gathering for the LiveSmart partnership was done through NRCan ecoENERGY Home Renovation program. The first phase of the LiveSmart BC Residential Retrofit Incentive Initiative was initially set for a three-year period, however it was fully subscribed with over 40,000 participants within the first 15 months. With the provincial funding fully utilized, the first phase of LiveSmart BC expired on August 16, 2009.

With the end of this first phase, the utility partners in LiveSmart BC (the Companies, BC Hydro and Fortis BC) are actively working on rolling out a new version of a collaborative residential retrofit incentive program. Utilities-driven DSM programs are required to adhere to strict cost-benefit analysis that is focused on the overall societal benefits and have an established outreach and cost-effective channels for their target customers. Government-driven programs can contribute by supporting new technologies and providing subsidies for measures such as home energy audit assessments where there is zero savings.

In November 2009, Terasen commissioned Angus Reid Strategies to evaluate awareness levels among members of the general population regarding energy efficiency programs, rebates and incentives. The study was designed to provide insight into the various factors that motivate homeowners to participate in incentive programs, as well as to determine awareness of existing programs and brands.

The fieldwork was undertaken in December 2009; the cost of the study ($17,800) was covered by The Companies[3]. The sample size consists of over 840 of BC homeowners who are responsible for directly paying their utility bills. The analysis was completed in early January 2010, and the final report was delivered in late January 2010.

Findings:

- The type of energy used to heat the home has a significant impact on the monthly energy bill. Those using natural gas as their primary heating source report paying a higher monthly bill. Those with higher monthly bills are more likely to participate in energy efficiency incentive programs.

[3] Note that the final report was delivered in January 2010, and the full payment was made then; therefore, the cost of the study is not reflected in the 2009 budget but rather in 2010.

- BC homeowners say it is important to reduce their energy use, the majority because it will save money. Of the one-third of homeowners have participated in an energy efficiency incentive program, the most common reasons are to save money, take advantage of incentives and to improve the comfort of their home.

- Eight brands were evaluated for awareness and participation. As to be expected due to budget levels and time-to-market, BC Hydro's Power Smart program has the highest awareness and participation among homeowners, followed by ENERGY STAR®. LiveSmart BC is in the middle of the pack with three-in-five homeowners aware of the program but only one-in-five participating in the program.

RESEARCH & EVALUATION: 2005-2007 ENERGY STAR® HEATING SYSTEM UPGRADE EVALUATION

Program Area: Residential Energy Efficiency Programs

Methodology:

The ENERGY STAR® Heating System Upgrade Evaluation was commissioned in the summer of 2007; the first phase was completed in early 2008. The second phase was completed in late 2008 with final results delivered in early 2009. The ENERGY STAR® Heating System Upgrade Evaluation was performed by Sampson Research, a BC-based market research firm, with Habart serving as advisors to the study.

The Program offered residential customers a financial incentive of $250 towards the purchase of an ENERGY STAR® qualified High Efficiency Natural Gas Furnace (“HEF”) or boiler. There was an additional incentive when the qualifying furnace was equipped with a Variable Speed Motor (“VSM”). The primary objectives of the program were to reduce energy consumption, peak demand, and GHGs for residential customers by increasing the energy efficiency of their home heating systems. A total of 8,652 residential customers participated in the program for the timeframe of September 2005 to March 2007. Rebates and incentives totalled $2.73 million. Funding for the incentives was provided by Terasen, with co-funding from MEMPR, BC Hydro, FortisBC, and NRCan.

The objectives for the first phase of the study were:

- Assessing factors influencing program participation, the effectiveness of program marketing / advertising, free ridership, reasons for non-participation, and overall customer and trade ally satisfaction with the program.
- Assessing program impact on sales of qualifying HEF’s, and VSM, for both participating and non-participating customers
- Documenting and assessing program impact on furnace and secondary heating operating behaviours that affect energy use, with particular emphasis on hours of operation
- Determining the status of market transformation for HEF’s, and furnaces with variable speed drive blower motors in the British Columbia market
- Developing preliminary estimates of program impact on natural gas sales and carbon dioxide emissions.

The completed report of phase one of this study was filed in the response to EEC Application BCUC IR 1.71.2.1, filed on July 11, 2008.

The primary objective of the second phase of the evaluation was to update estimates of program energy and demand savings using a comparison of weather normalized billing histories for participants, and a comparative sample of non-participants (billing analysis). The estimate of gross program savings derived from the billing analysis would be adjusted for free riders and program spillover to determine net program energy and peak demand savings.

Findings:

First Phase

- 57 per cent of participants in the Terasen program credited the program with influencing their decision to purchase a high efficiency furnace, meaning that 43 per cent of participants were free-riders and would have selected a high efficiency furnace without the incentive.

Second Phase (Including updated first phase results):

- Based on net 9.6 GJ per annum savings per high efficiency furnace, the program generated 78.8 terajoules ("TJ") in annual savings for the first 2.3 years and 47.4 TJ of annual savings in subsequent years.

- The gross energy savings per-participant from retrofitting to a high efficiency furnace were estimated at 9.6 GJ per year—this number is lower than the Phase I engineering estimate of 13.4 GJ per year.
  - One possible explanation for the decrease in estimated savings for retrofitting with a high efficiency furnace is that non-participants tended to replace furnaces that had a lower AFUE rating relative to that of participants.

- Based on the evaluation results, Terasen's 2005-07 Heating System Upgrade Program will reduce Carbon Dioxide ("CO2") emissions by 3.940 kilotonnes annually for the first 2.3 years and 2.370 kilotonnes annually for subsequent years.
  - CO2 reduction estimates are based on Terasen's emissions reduction factor of 50 tonnes carbon dioxide per TJ of energy saved.

The Table below summarizes the energy savings attributable to Terasen's 2005-07 residential Heating System Upgrade Program based upon billing analysis results, a net-to-gross ratio of 0.57 and a spillover of 2.3 years.

Energy Savings Estimates – September 2005-March 2007

Impact Component	Unit Savings (GJ)	Gross Participants	Gross Savings (TG)	Net to Gross Ratio	Net Savings (TJ)
Direct	9.6	8,652	83.1	0.57	47.4
Spillover	12.1	2,596	31.4	-	31.4
Annual - first 2.3 years	-	-	-	-	78.8
Annual - subsequent years	-	-	-	-	47.4

RESEARCH & EVALUATION: EFFICIENT BOILER PROGRAM EVALUATION

Program Area: Commercial Energy Efficiency Programs

Methodology:

TGI and TGVI will select a sample of approximately 30 previous participants who have successfully installed high efficiency boilers in order to perform a billing analysis. TGI and TGVI will compare the participating buildings' weather normalized, pre-installation gas consumption, to its weather normalized post installation gas consumption in order assess the impact of the boiler installation. The difference between the two, absent the presence of any other measure significantly impacting gas consumption, will be attributable to the boilers. Other measures which may have impacted gas consumption will be identified via an interview with the building owner/participant.

The sample group selected for the billing analysis will be from those participants who have successfully completed their boiler installation prior to 2009. Thus the new boilers will have operated for at least one (1) full heating season prior to the analysis of the consumption data.

Note that while the billing analysis will necessarily focus on participants with a previous billing history (ie retrofits as opposed to new construction) the findings will be applicable to both retrofit and new construction participants for the purposes of tracking energy savings. This is because the end result of the analysis will be a percentage reduction factor to energy consumption attributable to high efficiency versus standard efficiency boilers. Thus the reduction factor applies to new construction participants since the baseline case against which their high efficiency boiler(s) derives energy savings is a standard efficiency boiler.

RESEARCH & EVALUATION: EVALUATION OF OKANAGAN SPRAY N' SAVE PILOT PROGRAM

Program Area: Commercial Energy Efficiency Programs

Methodology:

The following methodology is proposed for the second round of the Okanagan Spray N' Save Pilot Program Evaluation

Further to the initial arithmetic analysis, a number of participants will be included for metering of their actual hot water consumption in order to empirically confirm the gas savings associated with the spray valves. First a sample consisting of approximately 30 willing participants will be identified. TGI will then have water meters will be installed by a licensed plumber as follows:

1. Flow meters for the hot water line serving the spray valve.
2. Temperature meters on the inlet and outlet water pipes of the hot water heaters.
3. A data logger will be installed to record the water flow and temperature information for the length of the metering period.

Usage data will be collected from the data logger at 2 week intervals for a period of 1 month. Subsequently the new low flow spray valve will be removed and the old, standard flow rate spray valve will be reinstalled. Once again usage data will be collected from the data logger at 2 week intervals for a period of 1 month. After completion of the data collection the new, low flow spray valve will be reinstalled. The collected data will be reviewed to establish actual energy savings.

Subsequent to all data collection/processing the results will be compared and used to establish a reasonable and prudent estimate of the gas savings attributable to the program.

RESEARCH & EVALUATION: CONSERVATION EDUCATION AND OUTREACH 2010 EVALUATION

Program Area: Conservation Education and Outreach Programs

The benefits of CEO initiatives are also not currently translated directly into energy savings; however, the costs are included in the Portfolio Level analysis, and the overall portfolio TRC test results still have to be greater than 1.0. Historically, CEO initiatives were limited to print and online publications, trade shows, and limited school programs.

Advertising Tracking

Advertising tracking, as discussed in the Companies' response to EEC Application's BCUC IR 1.47.1, can be used to investigate the effectiveness of specific commercials or ad campaigns in terms of the recall of specific messages, changes in people's perceptions, and behavioural changes in the target audience. Tracking research generally consists of telephone interviews with homeowners (gas and non-gas customers). This would be conducted with a representative sample of target-audience consumers from the TGI and TGVI service areas. It can investigate the effectiveness of specific commercials or campaigns in terms of the recall of specific messages, changes in people's perceptions, and behavioural changes in the target audience. It answers questions like the following:

- What messages and ideas from the advertising do consumers remember?
- Do the remembered messages correspond to the advertising messages that the advertising was intended to communicate?
- Did the messages and ideas translate into action?

Process Evaluations

Process evaluations typically measure the effectiveness of the program by assessing how well the program met a set of goals or metrics defined by the program administrators. This method has been used by other utilities and American state agencies, such as Southern California Edison, and Pacific Gas & Electric.

Examples of goals/metrics for educational and communication programs include:

- What messages and ideas from the advertising do consumers remember?
- Do the remembered messages correspond to the advertising messages that the advertising was intended to communicate?
- Did the messages and ideas translate into action?

Process evaluations typically measure the effectiveness of the program by assessing how well the program met a set of goals or metrics defined by the program administrators. This method has been used by other utilities and American state agencies, such as Southern California Edison, and Pacific Gas & Electric.

Examples of goals/metrics for educational and communication programs include:

- Increase awareness of the relationship between energy and the environment among students
- Deliver at least two special events annually during which the public is exposed to specific key messages and provide with information and materials

Examples of techniques used to assess whether goals/metrics are met include:

- In-depth interviews with program staff
- Survey of program participants, and qualitative analysis of responses
- Focus groups of program participants

Web Analytics

Web analytics is the measurement of the behaviour of visitors to a website. Simply put, web analytics is the process of understanding the Companies' online presence so that it can be optimized. The Companies work with Omniture SiteCatalyst, a remotely hosted, subscription-based solution for real-time web site reporting and analysis. Codes are placed on the Companies' webpages that execute when the page loads. As the page loads and the code on the page executes, it sends a request to the SiteCatalyst server for a web beacon, a two-by-two transparent pixel image. Along with this image request, the code collects and sends additional information to Omniture data centres. The data centres then populate a report with the collected data, which can be accessed by the Companies' web team, to allow them analyze the web activity related to a specific CEO initiative.

EFFICIENCY PARTNERS PROGRAM: CONTRACTOR PROGRAM (2009)

Program Area(s): Commercial and Residential Energy Efficiency Programs

Target Market: Majority Residential & Minority Commercial

Duration: Summer 2007 through April 30th 2010

Objectives:

- Provide customers with accurate energy efficiency cost versus benefit options through industry partner groups.
- Encourage contractors to educate and nurture a change in customers' daily energy use habits by providing EEC program information, general efficiency advice and supporting collateral publications such as Hot Tips.
- Through the partner groups, promote EEC programs utilizing energy efficient appliances and services such as ENERGY STAR® and Enerchoice.
- Promote the best use of Provincial energy resources.
- Help to provide contractors with education on new energy efficient technologies
- Achieve a higher level of customer confidence in the quality of services rendered by contractors (safe and fairly priced).
- Improve the overall quality of installers through cooperative BC Safety Authority and supplier workshops educating the methods to properly install and maintain more complex energy systems.
- Improve communication between Terasen's EEC department and the Energy Efficiency Industry stakeholder groups through quarterly information news letters.

Background:

In 2007, TGVI's Qualified Dealer Program ("QDP") was reintroduced in the TGVI service territory, with an emphasis on further upgrading the quality of the participating gas contractors, in order to ensure that customers had access to highly qualified gas contractors. Contractors were required to re-register for the QDP which now had more stringent guidelines as follows:

- Better Business Bureau reference
- BC Safety Authority Registration
- Business supplier referral
- Customer referral
- Business license
- Worksafe BC coverage
- Two million dollar minimum liability insurance
- Business credit check

Since the re-launch of the program in 2007, and until the increased EEC funding was approved in April of 2009, limited resources were devoted to the QDP and essentially no incentive program offers for the TGVI market area were provided. There are currently only about 75 QDs registered in the TGVI area out of a total market of approximately 350 gas contractors located in the TGVI service area.

The marketplace has changed significantly since the QDP was first launched. Since the QDP was focused on TGVI, customers were looking primarily for a gas contractor to convert them to natural gas and service their natural gas products. Today's energy consumer is looking for a wide range of services that include reliable information sources and manufacturers, installers and service contractors who will provide energy efficiency recommendations for their entire house. This will require expanding the scope of the QDP to eventually include additional groups such as A and C ticket contractors. The QDP will also need to include new Energy Efficiency service groups such as EcoEnergy Home Assessment auditors and draft-proofers. The large number of gas contractors located in the Lower Mainland, the Interior, and Vancouver Island represent an excellent opportunity for Terasen to promote a "whole-house" energy concept to customers. A whole-house system approach considers the interaction between the building site, regional climate, energy consumption habits, appliance efficiency and other elements or components in the home. Reduction of appliance energy utilization alone will not achieve the total provincial BC Energy Plan targets. The B-ticket gas contractors are one of the largest industry groups that influence end use customers. Domestic/commercial BC Safety Authority licensed B-ticket gasfitters install, test, maintain and repair propane and/or natural gas lines, appliances, equipment and accessories in residential and commercial premises up to 75,000 BTU. Industrial A-Ticket gasfitters perform the same tasks as B plus unlimited BTU range in industrial settings. They may work in new construction, or be installing systems in existing buildings that are being upgraded. C-tickets are limited to residential gas appliance servicing only. The company's overall objective for this market sector is to expand and rebrand the existing TGVI Qualified Dealer Program (B-ticket contractors) in breadth and scope and to open the new contractor program to include the Lower Mainland and the Interior.

The new contractor program will also eventually include efficiency service groups that have been previously excluded from the QDP. The program should be structured to be able to eventually include the following Efficiency Partners over time:

- appliance installation contractor (A&B ticket)
- gas appliance service groups (C ticket)
- suppliers & distributors
- big box retailers
- residential and commercial energy auditors
- weatherization services (draft proofers)
- support groups, i.e. regulators, colleges
- associations

The rationale behind this expansion is that the current QDP has limited capabilities with the majority of the participating TGVI contractors being small, "mom and pop" types of businesses. With an expansion to the Lower Mainland and Interior service areas, there is a concentration of much larger companies that will involve working with supplier and distribution groups. This will be especially true with big box stores. With the inclusion of a comprehensive group of service providers in a Terasen contractor program, customers will have access to a reliable network of energy efficient service providers with the ability to assist them with a wider range of efficiency services.

New Contractor Program Development Milestones:

In the third quarter of 2009 the efficiency partners program was established with a focus on evaluating and expanding the existing contractor program. The following is a list of the 2009 contractor program development milestones:

- Internal QDP program review of existing procedures and participation (complete)
- Connect with industry stakeholders for feedback and opportunities for collaboration (complete)
    i. Representatives of existing Qualified dealers on TGVI
    ii. Contractor supplier groups
    iii. Manufacturers and Distributors
    iv. Contractor Associations
    v. Trades Training Groups
    vi. BC Safety Authority
    vii. Thermal Environmental Comfort Association (TECA)
    viii. Mechanical Contractors Association (MCA)
- Conduct TGVI gas contractor survey (complete)
- Facilitate three contractor focus groups on Vancouver Island (complete)
- Initiate the rebranding of the program (ongoing)

Feedback from all groups surveyed was very positive. All groups are looking forward to participating in the new Efficiency Partner Contractor program and recognize the need for Companies' participation to achieve transformation of the energy efficient equipment marketplace. A summary of feedback specifically from the Vancouver Island Contractor Focus Groups can be found below:

- The face of the contractor is changing and many are moving away from mail and fax machines to e-mail communication.
- The concept of quarterly newsletters and cooperative workshops with supplier groups was well received.
- Emphasis was placed on the timing of introducing programs with the fall and spring being the busy periods for contractors. There were many requests to have advance notice of new programs and information on new emerging efficiency technologies.
- 75 per cent of water heater replacements take place in emergency situations, after the appliance fails and the rest are planed replacement units. Ninety five per cent responded positively to promoting ENERGY STAR® furnaces. As well, most agreed that customers were asking about high efficiency.
- Keep programs simple avoiding extra paperwork for Contractors feel the utility needs more face to face connection with customers. The EEC department should attend smaller home shows alongside local gas contractors and suppliers.

The findings from the Vancouver Island Contractor Focus Group informed the Companies that customers are asking about energy efficiency and contractors can only work with the information they have from specific suppliers. The focus groups were very well attended and contractors were positive and looking forward to participating in the new program. Focus Groups will be held in the Lower Mainland and Interior in 2010. Results from the TGVI focus groups will allow for a possible link up with BC Safety Authority B-149 Training sessions.

Co-Op Advertising:

To help promote energy efficient natural gas products and services, a Co-op Advertising program is available for existing Qualified Dealers on TGVI, for those that choose to participate. Co-op Advertising dollars are provided for the following media:

- Print (**Note: Print ads in the Yellow Pages of a telephone directory are not eligible for co-op advertising.)*
- Radio
- Television
- Direct mail (i.e. flyers)
- Home show displays *(promoting natural gas fired equipment only)*

In order to qualify for co-op advertising dollars, the advertisement produced must include the following:

- Qualified Dealer logo (if print ad or flyer)
- Promotion of natural gas and natural gas operated equipment only

Once all required conditions are satisfied, reimbursement is provided to the applicant for 50 per cent of the media insertion costs of advertising. Home Show booths are reimbursed for 50 per cent of their cost up to a maximum of $100.

There was a moderate uptake of participation in 2009 for the Co-op advertising program. The Companies are currently reviewing the structure and effectiveness of this program and will be making adjustments in 2010.

EFFICIENCY PARTNERS PROGRAM: NEW CONTRACTOR PROGRAM (2010)

Program Area(s): Residential and Commercial Energy Efficiency Programs

Target Market: Majority Residential & Minority Commercial

Duration: May 1st 2010 through April 1st 2011 (likely to be extended)

Objectives:

- Focus on the core of the contractor work force: licensed Gas Safety Branch B-ticket contractors serving residential and commercial end users
- TGI contractor Focus groups
- Develop new program

Program Details:

The first and second quarter program tasks include:

- Organize meetings in Vancouver, North Vancouver, Burnaby, Surrey, Kelowna, Kamloops and Prince George
- Compile feedback
- Plan program framework
- Determine qualification process
- Develop application forms
- Develop logo and brand
- Develop collateral such as brochures, advertisements, and web tile
- Facilitate outreach such as lunch and learns, speaking engagements and web ads
- Start New program registration

The third and fourth quarter program tasks include:

- Continue outreach to contractor associations
- Complete contractor registration
- EEC contractor workshops with Suppliers

Contractor program promotional activities will include:

- Direct contact with key individuals among target stakeholder groups (e.g. manufacturers, BC Safety Authority, etc).
- Engagement of suppliers and manufacturer's representatives via information sessions designed to instill awareness of, and answer questions about equipment options and our EEC programs.
- Lunch and learn sessions with plumbers and gas fitters.
- Speaking engagements and web page advertisements with target organizations such as:
    - BC Safety Authority (BCSA)

  - Thermal Environmental Comfort Association (TECA)
  - Mechanical Contractors Association (MCA)
- Magazine Advertisement with publications such as:
  - Hearth Patio Barbeque Association Canada (HPBAC) Magazine
  - Association of Professional Engineers and Geoscientists of British Columbia (APEGBC) Innovation magazine
  - American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Newsletter
- Upgrade the Terasen WEB search tool to enable customers to connect with service contractors in their service area.
- Bill insert promoting the new program service group

As identified in the contractor focus groups sessions of 2009, quarterly newsletters and cooperative supplier workshops will be the first steps taken to educating contractors about EEC program offers and the benefits of promoting energy efficiency.

PILOT STUDIES (2009)

Details of the 2009 Pilot Studies are described in this section. This includes:

- Okanagan Spray N' Save Pilot Program
- Furnace Servicing Pilot – "Give Your Furnace Some TLC" Campaign

PILOT PROGRAM: OKANAGAN SPRAY N' SAVE PILOT PROGRAM

Program Area: Commercial Energy Efficiency Program

Target Market: Commercial Retrofit

Duration: May - August 2009

Objective:

Run throughout summer 2009, in the Okanagan region, the Spray N' Save Pilot Program sought to achieve a reduction in natural gas consumption associated with the production of hot water by reducing hot water use in commercial kitchens.

Methodology:

TGI installed free of charge, new low-flow pre-rinse spray valves in willing food service facilities (i.e. restaurants, coffee shops, delis, groceries, etc.) in order to reduce the volume of hot water used in dishwashing.

TGI's program operator contacted food service operations, either by letter, in person or by telephone. Appointments were set up for the program operator to visit the establishment, and directly install, free of charge a new, low flow pre-rinse spray valve. The existing spray valve (s) were tagged and stored for six months, in case the establishment was not ultimately happy with the new valve. While on site, the program operator recorded site information such as flow rates before and after the installation, the water supply temperatures, business hours and the fuel source.

The program operator followed up with the food service operation after a certain period of time to determine the level of satisfaction with the new low flow pre-rinse spray valve. All recorded data was collected by TGI and a final report detailing the program operator's observations was produced.

PILOT PROGRAM: FURNACE SERVICING PILOT – "GIVE YOUR FURNACE SOME TLC" CAMPAIGN

Program Area: Residential Energy Efficiency Program

Target Market: TGVI Residential Retrofit

Duration: January 15, 2010 to June 30, 2010

Objectives:

- Educate customers about the importance of annual furnace servicing in terms of energy savings and reduced gas bills
- Promote contractor relations between TGVI and contractors, as well as between contractors and customers
- Promote appliance and equipment maintenance
- Determine how many participants require a furnace upgrade
- Provide an opportunity for contractors to identify further energy savings opportunities that customer could take advantage of
- Increase awareness of provincial and federal regulations regarding furnaces
- Determine the effectiveness of furnace servicing programs as a tool for educating residential customers about the need for maintaining appliances for optimal efficiency. Also engages contractors in dialogues about safety and the need to upgrade to high efficiency models.

Methodology/Communications Plan

Consumer-Response Marketing ("CRM") is handling program administration for the Furnace Servicing pilot. To receive the gift card, customers are required to submit their completed application, including the contractor's BC Safety Authority registration number and pertinent information about the furnace, along with a photocopy of the furnace servicing invoice.

Data gathered for the pilot is based on application form responses, and will be entered into the CRM database as applications are processed. CRM will provide bi-weekly program status reports, and will present a full report at the close of the program.

The TGVI furnace servicing pilot was promoted through the Terasen Gas website, bill inserts, radio, print advertisements in community newspapers, trade publications and contractor communications. The program was announced at the TGVI Contractors breakfast meetings in the first week of December 2010.

PILOT STUDIES (2010)

Details of the 2010 Pilot Studies are described in this section. This includes:

- Behaviour Change – Vancouver Coastal Health Authority and Providence Health Care staff engagement
- Behaviour Change – Destination Conservation for Public Buildings Pilot Program
- Domestic Hot Water Tier Three Technologies pilot
- Furnace Servicing Pilot – "Give Your Furnace Some TLC" Campaign
- EnerGuide 80 Pilot (Program in Development)

PILOT PROGRAM: BEHAVIOUR CHANGE - VANCOUVER COASTAL HEALTH AUTHORITY AND PROVIDENCE HEALTH CARE STAFF ENGAGEMENT

Program Area: Conservation Education and Outreach

Target Market: Approximately 28,000 staff members

Duration: September 2010 – August 2011

Program Objectives:

The goal of the program will be to pilot an online community site and develop an extensive employee engagement strategy that can eventually be implemented to other health authorities and/or large institutional customers. The focus of the campaign will be to promote and lead VCHA/PHC staff to participate in an online community site where opportunities will be available to learn about energy conservation, and make social commitments towards behavioural changes and GHG reducing actions. With this tool, the Companies hope to be able to investigate the attribution of energy savings to this behavioural program thus potentially providing a benchmark for capturing energy savings from our other education and outreach activities.

Methodology/Communication Plan:

The online tool will allow for staff to share ideas, compare usage with other coworkers, and focus on commitments at home and work, and will be promoted through lunch and learns, posters, contests both within and between facilities, e-newsletters and other methods. Costs associated with the initiative include the tool's licensing fees, consultant fees for development of the website, energy-related content and an engagement plan, and contest prizes. The website, content and engagement plan costs are a "one-time" cost, and once developed, the Companies intend to promote the program to additional Health Authorities and other large institutional clients, as well as our own employees.

PILOT PROGRAM: BEHAVIOUR CHANGE - DESTINATION CONSERVATION FOR PUBLIC BUILDINGS PILOT PROGRAM

Program Area: Conservation Education and Outreach

Target Market: Regional District Okanagan Similkameen, City of Penticton, District of Summerland, Town of Oliver, and Okanagan College Penticton Campus

Duration: March 2010 to February 2011

Program Objectives:

The goal of the project will be to find out if the combination of both low cost/no cost efficiency improvements and staff engagement in behavioural change will bring about energy reductions in municipal office facilities, and if energy saving reductions is achieved, the Companies will implement this program in other municipal customers.

Methodology/Communication Plan:

The project will include a strategy and training session, attitudinal and behavioural surveys of the staff before the project is implemented, energy assessments of the participating facilities, development of baseline energy consumption data for each facility, and a review of the empirical savings data at the end of the project.

Funding:

Project is jointly co-funded with FortisBC.

PILOT PROGRAM: DOMESTIC HOT WATER TIER THREE TECHNOLOGIES PILOT

Program Area: Residential Energy Efficiency Program

Target Market: Residential

Duration: April 1, 2010 through April 1, 2011

Objectives:

- Verify the actual energy savings associated with the Tier 3 technologies, as applicable to the Companies' service territory,
- Gather exhaust emission data and inlet gas flow rates,
- Determine GJ consumption relative to heated water volume,
- Identify water usage difference and introduce behaviour changes, while documenting results,
- Identify barriers to the installation and marketing of Tier 3 Technologies,
- Determine actual costs associated with the installation of condensing hot water tanks,
- Obtain feedback from a variety of stakeholders, including manufacturers, installers and end users, regarding the performance of Tier 3 Technologies,
- Determine if Meter changes are required with the higher demand loads, and
- Determine if incentive programs would be viable

The budget for the Tier 3 technologies pilot program is expected to be approximately $250,000 to cover the purchase and installation of 20 Tier 3 tanks, the purchase and installation of sub-metering devices for gas and water flow, and pilot program evaluation.

Background:

Tier 3 technologies are varied, but two important methods for achieving Tier 3 efficiency levels (EF 0.80 or greater) are condensing hot water tanks and tankless water heaters.

- A condensing water heater is similar to a standard efficiency gas storage water heater but has an improved heat exchanger that allows thermal efficiency ratings as high as 96 per cent and recovery rates as much as four gallons per minute. Condensing water heaters can deliver continuous hot water in high demand households. There are no residential condensing water heaters currently available for sale to consumers; however, GSW/John Wood has models that are appropriate for residential applications. It is estimated that the condensing water heaters will cost three to four times as much as standard efficiency water heaters.
- On-demand or "tankless" water heaters heat water only as it is needed and used. This equipment may incorporate condensing technology with resulting efficiencies higher than 90 per cent. The reports and supplier testing information in other jurisdictions regarding the energy savings for tankless or On-Demand Domestic Hot water systems are incomplete and lacking in value when comparing benefits over conventional hot water tank use.

Working with a variety of manufacturers, the Companies will measure the gas and water consumption in approximately 20 homes for 6 months, installing the Tier 3 technologies after 3 months, and measure the difference in energy consumption between the 3 months prior to installation and the 3 months following the installation of the Tier 3 tanks. The Tier 3 Technologies pilot program is in the early design stages and the structure of the program is subject to change, based on feedback from industry, manufacturers, and contractors.

PILOT PROGRAM: ENERGUIDE 80 PILOT

Program Area: Residential Energy Efficiency Program

Target Market: Residential Retrofit and New Construction

Duration: January 2010 through April 1, 2011

Objectives:

- Support early adoption of new building code standards which would move the current EnerGuide 77 efficiency rating to a new target of EnerGuide 80 for new home construction
- Provide existing gas heated homeowners with incentives to perform efficiency upgrades that result in EnerGuide rating improvements

Methodology:

The following quarterly milestones outline the pathway to assessing and developing the EnerGuide 80 Retrofit and New Home Construction program.

The following are activities for Q1 & Q2 of 2010:

- Review and evaluation of Home Energy Assessment process with Service Organizations, NRCan and MEMPR.
- Review verification testing of random assessments performed by NRCan.
- Work with Certified Energy Advisors (Service Organizations) to upgrade delivery of Assessment services.
- Work with NRCan and ENERGY STAR® to establish rating levels for BC zones.
- Undertake Hot 2000 Modeling to establish correlations that relate, comparative GJ savings, guidelines for a prescriptive upgrade, and resultant target EnerGuide ratings
- Evaluate results and develop incentive program based upon results of California Standard Practice tests.

The following are activities for Q3 and Q4 of 2010:

- Introduction of Whole Home Labeling and possibly ENERGY STAR® levels.
- Run pilot with that validates EnerGuide rating increments with each step outlined in the prescriptive path guidelines.
- Based on results of modeling, pilot, and stakeholder feedback, rollout Residential EnerGuide Home Retrofit and New Construction Program

Incentives for retrofits in the EnerGuide 80 program will focus on moving older houses up the EnerGuide scale. Each time a home energy assessment is conducted, the home is given an EnerGuide rating. Rebate programs related to home energy assessments, such as Natural

Resource Canada's ecoEnegy program, require an assessment both before and after retrofits have been completed. The EnerGuide 80 program would assign incentives based on the number of points a house moves up the EnerGuide scale. For example, if a home begins at EnerGuide 66 and after the various energy efficient upgrades have been completed it moves to EnerGuide 76, the customer would receive an incentive for having increased their EnerGuide rating by 10 points.

Given that this program is in the early stages of development, it requires discussions with a large number of stakeholders. The Companies are evaluating available market and technical data to establish a sound business case and cost benefit analysis. Therefore, performance metrics for this program are not available at this time

Background:

EnerGuide home efficiency performance levels are determined by performing Home Energy Assessments. The Energy Assessment process, software and quality of audit results are managed by Natural Resources Canada and the Ministry of Energy Mines and Petroleum Resources. A home's energy efficiency level is rated on a scale of 0 to 100. A rating of 0 represents a home with major air leakage, no insulation and extremely high energy consumption. A rating of 100 represents a house that is airtight, well insulated, sufficiently ventilated and requires no purchased energy on an annual basis.

Older homes need periodic renewal of major energy efficiency components including windows, heating, and fresh air ventilation systems, so the actual score of a 20-year-old home will depend in large part on whether these systems have been updated or are original.

As new building codes will not take effect until mid 2011, now is the time to encourage builders and developers, through incentives, to begin building homes to the EnerGuide 80 standards. Ideally, incentives will help builders and developers define the prescriptive measures that will achieve EnerGuide 80 standards, and prepare the market for the new building code changes.

Appendix E

CONSERVATION FOR AFFORDABLE HOUSING

Conservation for Affordable Housing

The following section includes details relating to activities within the Conservation for Affordable Housing programs area. This includes:

- LiveSmart Carry Over Buildings and Measures
- Members of the BC Working Group for Energy Efficiency for Affordable Housing
- Members of the Affordable Energy Conservation Task Force
- Attendees at the 2009 Affordable Energy Conservation Forum

LiveSmart Carry Over Buildings and Measures

The LiveSmart Carry Over project included complete energy efficiency retrofits in five affordable housing complexes throughout Metro Vancouver. The buildings and efficiency measures for this program are shown below.

SOCIAL HOUSING PROVIDER	Address	# of Units	Energy Assess.	Installs	Total	Measures
MVHC Meridian Village town homes	3156 Coast Meridian Rd, PoCo	129	$ 17,415	$ 219,300	$ 236,715	For each unit: showerheads, kitchen aerators, programmable thermostat, weather-stripping, draft-proofing, ventilation and attic insulation
Hoy Creek MURB	2905 Glen Dr V3B6E5 & 1205 Johnson, Coq	97	$ -	$ 150,341	$ 150,341	For each unit: showerheads, kitchen aerators, programmable thermostat, weather-stripping, draft-proofing, ventilation and attic insulation
Collingwood Village Co-op MURB	5398 Tyne Street, Vancouver	79	$ 12,713	$ 134,300	$ 147,013	High-efficiency gas boiler and multiple other measures as funds allow.
Kilarney Gardens Co-op MURB	2998 East 54th Ave, Vancouver	227	$ -	$ 382,021	$ 382,021	For each unit: showerheads, kitchen aerators, programmable thermostat, weather-stripping, draft-proofing, ventilation and attic insulation
Burlington Heights MURB	1865 E 10th Ave, Vancouver, V5N 1X8	25	$ 7,213	$ 42,500	$ 49,713	High-efficiency gas boiler and multiple other measures as funds allow.
Totals		**557**	**$ 37,341**	**$ 928,462**	**$ 965,803**	

Members of the BC Working Group for Energy Efficiency for Affordable Housing

The following is a list of the organizations that are represented on the BC Working Group for Energy Efficiency for Affordable Housing. Each of these organizations have at least one person representing their organization. There are a total of 29 individuals on the Working Group and no more than two people from any one organization.

	Company
1	Active Support Against Poverty
2	BC Housing
3	BC Hydro
4	BC Non-Profit Housing Association
5	BC Public Interest Advocacy Centre
6	BC Sustainable Energy Association
7	City Green Solutions
8	City of Vancouver Sustainability Division
9	CMHC
10	Co-operative Housing Federation of BC
11	EAGA Canada
12	FortisBC
13	Fraser Basin Council
14	Indian and Northern Affairs Canada
15	Ministry of Energy, Mines & Petroleum Resources
16	Northern Resources Canada
17	Tenant Resource & Advisory Centre
18	Terasen Gas
19	TRAC Tenant Resource & Advisory Centre
20	Vancity

Members of the Affordable Energy Conservation Task Force

The following is a list of the organizations that are represented on the Affordable Energy Conservation Task Force. Each of these organizations have at least one person representing their organization. There are a total of 10 individuals on the Task Force and no more than two people from any one organization.

	Organization
1	BC Hydro
2	BC Non-Profit Housing Association
3	BC Public Interest Advocacy Centre
4	City Green Solutions

	Organization
5	Eaga Canada
6	Fraser Basin Council
7	Ministry of Energy, Mines and Petroleum Resources
8	Terasen Gas

Attendees at the 2009 Affordable Energy Conservation Forum

The Affordable Energy Conservation Forum hosted a total of 83 people from the following 47 organizations.

Organization
Active Support Against Poverty
Adams Lake Indian Band
BC Citizens for Public Power
BC Housing
BC Hydro
BC Non-Profit Housing Association
BC Public Interest Advocacy Centre
BCIT student
BCSEA
British Columbia Utilities Commission

Appendix F

EEC STAKEHOLDER GROUP

EEC STAKEHOLDER GROUP

As discussed in Section 4.9, the Companies recognized the need for accountability in the EEC Application and proposed to form and engage an EEC Stakeholder Group. The objectives of the EEC Stakeholder Group are to guide and provide input on EEC activity. The corresponding invitation, agenda, priorities, and minutes from both the December 9, 2009 and March 11, 2010 meetings are included in the Appendix.

LIST OF EEC STAKEHOLDER MEMBERS (AS OF MARCH 11, 2010)

Member	Organization	Title
Marg Gordon	B.C. Apartment Owners and Managers Association	Chief Executive Officer
Steve Hobson	BC Hydro	Director Power Smart
Rob Noel	BC Mechanical Contractors Assoc	Commercial contractors
Eugene Kung	BC Public Interest Advocacy Centre	Barrister & Solicitor
Wayne Lock	BC Safety Authority	Operations Manager
Alison Richter	BC Utilities Commission	Regulatory Analyst - First Nations and Sustainability
Tammy Jackson	Canadian Home Builders' Association Central Okanagan	Executive Officer
Vanessa Joehl	Canadian Home Builders' Association of BC	Built Green™ BC Program Administrator
Marni Vistisen	City of Prince George	Energy Coordinator
Mark Hartman	City of Vancouver	Buildings Energy Programs Manager
David Craig	Consolidated Management Consultants	President
Joan Huzar	Consumers Council of Canada	
Dan Pasacreta	Crosby Property Managements, Ltd	Licensed Strata Agent
Keith Veerman	FortisBC	Manager-Energy Efficiency
Bob Purdy	Fraser Basin Council	Director, External Relations & Corporate Development
Amy Spencer-Chubey	Greater Vancouver Home Builders' Association	Director of Government Relations
Bruce Macgowan	IBC Technologies Inc.	President
Erik Kaye	Ministry of Energy, Mines and Petroleum Resources	Acting Manager, Energy Efficiency Policy
Nir Kushnir	National Energy Equipment	General Manager, Trane
John Cockburn	Natural Resources Canada	Senior Chief, Equipment Standards and Labelling Housing, Building and Regulations
Elizabeth Westbrook	Natural Resources Canada	Senior Officer, Stakeholder Relations
Nina Winham	New Climate Strategies	Consultant and Rate 1 customer
Al Kemp	Rental Owners and Managers Society of BC	CEO
Cindy Stern	Tseshaht First Nation	Chief Operating Officer
Jeff Fischer	Urban Development Institute	Deputy Executive Director

Terasen Gas

www.terasengas.com

November 13, 2009

Dear Stakeholders and Interested Parties:

Re: Terasen Gas - Energy Efficiency & Conservation Stakeholder Group

This year Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc. (collectively "Terasen Gas") received approval from the British Columbia Utilities Commission ("BCUC") for an expanded Energy Efficiency and Conservation ("EEC") portfolio to provide customers with enhanced tools and incentives to manage their natural gas consumption, reduce their energy costs, and lower their greenhouse gas emissions. The newly approved $41.5 million portfolio includes rebates and incentives on a number of energy efficient appliances, equipment and systems, as well as educational and outreach initiatives for residential and commercial customers, and those customers in the affordable housing sector.

Terasen Gas recognizes the need for accountability for the approved funds and believes that engaging an EEC stakeholder group would be beneficial to guide and inform EEC activity. We are seeking representation from the following areas:

- Provincial, municipal, and First Nation governments
- Non-Governmental Organizations
- Consumer advocates, representing residential customers
- Affordable housing advocates
- Commercial customers
- Trade organizations
- Equipment manufacturers
- Other utilities

To add transparency and accountability to our EEC portfolio, we intend to hold bi-annual EEC workshops with stakeholders, at which we will present updates on program progress and monies allocated. The one-day workshops would also act as a forum for stakeholder input on developing new programs and refining existing programs.

The first stakeholder meeting proposed will be either **Tuesday December 8** or **Wednesday December 9, 2009** in Vancouver.

We respectfully invite your participation in Terasen's EEC Stakeholder Group. Please contact me via email at jenny.chia@terasengas.com or via phone 604.592.7645 if you are interested in joining the Terasen EEC Stakeholder Group or if you have any questions. If you require financial and booking assistance with travel arrangements from outside the Lower Mainland, we would be pleased to assist you with those. Please confirm your participation in the Terasen EEC Stakeholder Group by **Monday November 23, 2009.**

Regards,

Jenny Chia

Jenny Chia
Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc.

Agenda
EEC Stakeholder Meeting
December 9, 2009
Sheraton Wall Centre, Port Alberni Room
1088 Burrard St, Vancouver

8.30 – 9.00	***Registration and Breakfast***
9.00 – 9.15	Welcome from Terasen
9.15 – 9.30	Roundtable Introductions of Stakeholder Group
9.30 - 10.00	What is Demand Side Managment (DSM)
10.00 – 10.30	Integrated Resource Planning and DSM
10.30 – 10.45	***Break***
10.45 – 11.30	Terasen's EEC Application
11.30 – 12.00	Terasen's Historical DSM Program Results and DSMS
12.00 – 12.45	***Lunch***
12.45 – 13.15	Government Regulations
13.15 – 13.30	Introduction to New EEC Programs
13.30 – 14.00	Post-EEC Residential Programs
14.00 – 14.30	Post-EEC Commercial Programs
14:30 -14:45	***Break***
14.45 – 15.15	Post-EEC Affordable Housing Programs
15.15 – 15.30	Contractor Program
15.30 – 15.45	Conservation Education and Outreach
15.45 – 16.15	Wrap-up

TERASEN GAS ENERGY EFFICIENCY & CONSERVATION STAKEHOLDER MEETING MINUTES

DECEMBER 9, 2009

Attendees

Alison Richter, British Columbia Utilities Commission, Regulatory Analyst – First Nations and Sustainability

Amy Spencer-Chubey – Greater Vancouver Home Builders' Association, Director of Government Relations

Bridget Macgowan - IBC Technologies, CFO

Casey Edge - CHBA Victoria, Executive Director

Cindy Stern – Tseshaht First Nation, CEO

Dan Pasacreta – Crosby Property Management, Licensed Strata Agent

David Craig- Consolidated Management Consultants, President

Erik Kaye – Ministry of Energy, Mines, and Petroleum Resources, Acting Manager, Energy Efficiency Policy

Jen Richards – City of Vancouver, Sustainability, Program Assistant

Keith Veerman – FortisBC, Manager – Energy Efficiency

Kevin Kwok – City of Vancouver, Manager, Environmental Services

Marni Vistisen, City of Prince George, Energy Manager

Nir Kushnir – National Energy Equipment, General Manager (Trane)

Rob Noel – BC Mechanical Contractors Association, Commercial Contractors

Steve Hobson – BC Hydro, Director Power Smart

Vanessa Joehl – CHBA-BC, Built Green BC Program Administrator

Terasen Gas Staff

Beth Ringdahl

Dave Bennett

Doug Stout

Jenny Chia

Ken Ross

Gary Lengle

Lee Robson

Michelle Petrusevich

Ned Georgy

Negar Ghavami

Paola Blendl

Ramsay Cook

Samuel Nyabando

Sarah Smith

Shawn Hill

Regrets

Al Kemp, Rental Owners and Managers Society of BC

Angela Reid, City of Kelowna, Councillor

Eugene Kung, BC Public Interest Advocacy Centre, Barrister & Solicitor

Jeff Fischer, Urban Development Institute, Deputy Executive Director

John Cockburn, Natural Resources of Canada, Senior Chief, Equipment Standards and Labeling Housing, Building and Regulations

Mark Hartman, City of Vancouver Sustainability, Building Energy Programs Manager

Sharon Slager, CHBA Northern BC, Executive Director

Tammy Jackson, CHBA Central Okanagan, Executive Director

Shawn Hill, Manager Regulatory Affairs

Why is DSM Important

1) Does the recession have an impact on the price?
    a. The supply is there to meet demand
2) Is natural gas priced on a national (Canadian) or global basis?
    a. Historically (early 2000's), oil and natural gas were substitutes→ global and interchangeable
    b. As the price of natural gas decouples from that of oil, gas has become a North American market
    c. AECO is priced on Canadian price for GJs
    d. Long term, resources are there to produce gas
    e. Is there a demand to justify further extraction? It is a very efficient market

---

Ken Ross, Resource Planning Analyst

Integrated Resource Planning

1) How does the Integrated Resource Planning stakeholder group compare and contrast with other stakeholder groups that Terasen might be convening?

a. EEC group is designed to give us feedback about the overall EEC portfolio and input as to whether we are moving in the right direction with the programs we are putting together
b. The Integrated Resource Planning stakeholder group: Are our assumptions in the planning environment the same as what our stakeholders see?

Sarah Smith, Manager, Marketing & Energy Efficiency

EEC Overview

1) Does the EEC Application incorporate LiveSmart BC?
   a. No. We were contributing $250 to the LiveSmart furnace incentive, but we also offer the funace incentive separate from LiveSmart
2) On what basis did the BC Utilities Commission scale back the request?
   a. In regulatory processes, there are a number of people that intervene.
   b. Certain customers do not want their money spent on EEC activities, because the funding comes from rate increases.
3) Innovative technologies and trade relations was denied
   a. There are certain benefit/cost thresholds that have to pass
   b. Innovative technologies have very long paybacks
   c. Trade relations: funding was included in the non-incentive budgets that were put forward
   d. We have incorporated trade relations in other areas of our EEC budget

---

Michelle Petrusevich, DSM Program Development Lead

Historical Program Results and DSMS

1) How were the Destination Conservation savings projected?
   a. Evaluation report conducted by a consultant suggests that each school saves 113 GJs per year
   b. No savings attribution to behavior changes as a result of the program
   c. Behavioural change brought about through education
2) What have you learned about incentives regarding DSM? What motivates/ drives EEC/DSM decisions?
   a. Residential: biggest reason for change in consumption is financial incentive, environment is far down the list (from Residential End Use Study)
   b. Communications is key
   c. Commercial: we don't have a lot of research in that area yet
3) How do you broaden conservation and sustainability and make the messaging appealing to different audiences?
   a. Take other factors into consideration, besides financial
   b. Health and environmental benefits
   c. Have not yet promoted health benefits and used illness to pitch the case

    d. Our experience in commercial efficiency, we concentrate on investment and payback → Reference BC Hydro lighting program
4) Will a new tracking system be able to provide feedback to contractors and manufacturers?
    a. We have the ability to do so today, but need feedback on whether or not to do it share that information with manufacturers (eg. Market share of furnaces by manufacturer)
5) Will there be a financing program for customers (residential?)
    a. We don't have the capability to do it with our current Customer Information System
    b. The new Customer Information System, which we are including in the current Customer Care Enhancement Application, can do it
    c. Terasen asked in application for an extra body to research and design a financing program
    d. Terasen could see that as an extension of our business
        i. E.g. Terasen Energy Systems: we own the system and make them pay back over bills (strata example of extending gas lines into homes)
    e. Government looking at options where homeowners moving can get their home labeled (Prince George labeling pilot)
    f. Recognized need for financing, but the question is whether or not the utility should be involved
    g. Manitoba Hydro example

Erik Kaye, Acting Manager, Energy Efficiency Policy

Government Regulation

1) Post 2012, where is government policy going regarding carbon tax and regulation? Is there room for discussion and negotiation between Terasen and gov't to map that out?
    a. Absolutely. Government meets with utilities frequently to discuss policy initiatives like fuel choice, role of NGVs, DES, etc.
2) What messaging does the government want contractors to convey when talking to homeowners? This is a sensitive question: customers see BC Hydro and Terasen Gas as one bill. Heat pumps are the most common installation, should customers be going electric?
    a. We want to convey energy efficiency and conservation
    b. Reducing greenhouse gas is the imperative, so we don't want people to switch to higher carbon fuels. However, we don't want everyone going electric.
3) There is a concern about increasing the efficiency of homes through retrofits without due diligence (no educational or financial considerations).
    a. Homeowners are taking permits, and not knowing what they're doing
    b. Professional builders sometimes don't have the appropriate training
    c. Renovators are not properly educated or licensed
    d. Government is working on a comprehensive strategy on building capacity to make sure workmanship aligns with code
    e. Terasen also has a concern about training, which is why we're engaging with the housing branch and supporting Energy Efficient Building Strategy, and building capacity
4) There is a shift to electric technology and the government seems to be supporting that.
    a. e.g. LiveSmart heat pump has a larger incentive
    b. Manufacturers are confused on what to recommend to customers

c. Natural gas and electricity markets operate differently and market prices do not normally reflect what is best

---

Beth Ringdahl, EEC Program Manager, Residential

Residential Programs

1) Who is eligible for the furnace scrap it program (e.g. what about firehalls? residential or commercial?)
    a. We may not have to limit it to one market
2) Discuss SPIFF (ie. sales person incentive) process with BC Hydro
    a. Pat Mathot has had success with SPIFF uptakes
3) Dishwasher program:
    a. Similar to Powersmart incentives but for customers with gas hot water

4) Consumer awareness and demand for tankless heaters increasing, so why don't we have an incentive for them?
    a. We have not found any independent third party evidence suggesting they save energy/money
    b. North America is the only place that still sell hot water tanks
    c. Potential for TG to partner up with manufacturers to find conclusive data
5) Audit (Eco-energy) project:
    a. NRCan putting in $225 million for project
    b. Cost of the audit process is unnecessary. Some customers just want to purchase a new appliance and the government is spending all this money on an audit unnecessarily
        i. The idea is that customers get the benefit of a 'whole home' audit. They will maybe upgrade other parts of their home.
6) Furnace scrap it- why do you need incentives?
    a. We want to encourage early retirement.
        i. Need to do market research prior to starting program design – what do folks plan to do in the face of the introduction of the EE regulations
        ii. Anecdotally we are hearing about stock piling of mid efficient furnaces
        iii. Lots of people do not know about the regulation: we need to build awareness
    b. Fundamental economics: to stop them from coming back into the market. Issue→ what is the curve/ resistance look like?
        i. How long are the units going to be there?
        ii. Portfolio level TRC
        iii. Average furnace is in for 13 years
        iv. Can we provide incentive for upgrading the infrastructure since new venting sometimes needs to be put in?
7) Scrap it program
    a. How are the old furnaces disposed? Are they recycled? Will be investigated as part of program design.
    b. Scrap it for boilers as well? Yes
    c. Replace furnace→ very complex process
        i. Need a consumer portal: average customer can get info easily
    d. Many of the program application processes are also too complex and admin heavy for contractors (too much bureaucracy)
    e. Lighting program has been successful but struggled at the beginning

i. There is a balance between simplicity and due diligence (spending money wisely)

Ramsay Cook, EEC Program Manager, Commercial

Commercial Programs

1) What is the market momentum with efficient hot water heaters?
    a. Biggest barrier is the upfront capital cost
    b. Lack of awareness that there is an economic Net Present Value
    c. Tankless water heaters are covered as long as they are energy efficient (94%)
    d. Incentives are significant enough to consider uptake
    e. Working on simplifying process
2) Commissioning- some LEED buildings are using more energy as a result of operations
    a. LEED study- some LEED buildings are using up to 27% more energy than standard buildings
    b. There is a current misconception of what LEEDS is→ LEED ≠ energy efficient. Building may be LEED for proximity to transportation, building materials, etc.
3) What about a Pre Rinse Spray Valve program for restaurants?
    a. Terasen Gas ran a Pilot Program in the Interior and Okanagan in 2009
    b. Best run in geographic pockets
    c. Currently are running some measurement and verification tests for the Okanagan spray valve program

---

Ned Georgy, EEC Program Manager, Conservation for Affordable Housing

Conservation for Affordable Housing Programs

1) What are the opportunities in First Nation new housing?
    a. Terasen's focus has been retrofits in current housing due to high energy savings
    b. Build housing through Canada Mortgage and Housing Corp on tight budgets ($40K)
    c. Usually multiple homes, which has economies of scale
    d. But contractors are forced to choose cheapest routes
2) First Nations talk to each other, work with administrator
3) How do you get program participation in First Nations?
    a. Lots of forums
    b. Lots of social marketing and word-of-mouth
4) Many manufacturers have programs tailored to low income households→ the problem is clarifying what project qualifies
    a. There is a potential for partnership with Terasen
    b. The larger the savings, the more willing manufacturers are to participate
5) Good idea to let administrators know about programs because they hire contractors
6) Criteria for programs
    a. Need regulatory reform on new projects
    b. Gear programs to zoning/regulation change
    c. e.g. Habitat for humanity in Saanich
    d. caution of stepping into world of social policy tools because we are an investor-owned utility
7) Who is the target audience in conservation for affordable housing?
    a. Certain percentage are provided by public housing and social conscience or are renters

b. Energy Savings Kits → not expensive for us to produce
c. Energy Conservation Assistance Program → some mechanisms in place for landlord to sign contract to not increase rent
d. Problem→ slum landlords
    i. Get landlord advisory (residential tenancy branch) involved
    ii. Rent controls provide some incentive (increase margins).
e. There are many associations out there: Rental Owners and Managers Society of BC, BC Hydro split incentives group

---

Gary Lengle, EEC Program Manager, Qualified Dealer Program

Efficiency Partners Program

1) Challenges in up-selling energy efficient appliances:
    a. Consumers feel the contractor is trying to up-sell them
    b. Consumers have more info thanks to the internet and are educated
    c. Customers trust utilities. Having the Terasen brand will give some credibility
2) Can we roll out programs earlier than Q4? Even if it's not perfect?

Jenny Chia, EEC Communications, Education & Outreach Manager

Conservation Education, and Outreach

1) Can Terasen attend Victoria Spring Home Show?
    a. Not this year. Simply a matter of lack of resources and Olympic timing (hard to commute)

EEC Stakeholder Meeting Agenda
March 11, 2010
Hyatt Hotel
655 Burrard St, Vancouver – Stanley Room

9:30 - 9:45	Registration (coffee served)
9:45 - 10:00	Welcome and Agenda
10:00 - 10:15	Roundtable Introduction
10:15 -11:15	Stakeholder Workshop: Sharing goals and priorities
11:15 – 11.30	TG topic: Alternative Energies Solutions
11:30 – 12:00	TG topic: Innovative Technologies
12.00 – 12.45	Lunch
12.45 – 14:00	2009 Annual report review and 2010 Update
14:00 -14:15	Break
14:15-15:00	Stakeholder Dialogue: Setting Action
15:00-15:15	Closing

Terasen Gas Energy Efficiency & Conservation Stakeholder Meeting
March 11, 2010

Attendees

Al Kemp, Rental Owners and Managers Society of BC
Alison Richter, British Columbia Utilities Commission, Regulatory Analyst – First Nations and Sustainability
Amy Spencer-Chubey – Greater Vancouver Home Builders' Association, Director of Government Relations
Bob Purdy, Fraser Basin Council
Bruce Macgowan - IBC Technologies
Cindy Stern – Tseshaht First Nation, CEO
Dan Pasacreta – Crosby Property Management, Licensed Strata Agent
David Craig- Consolidated Management Consultants, President
Elizabeth Westbrook-Trenholm, Natural Resources Canada, Office of Energy Efficiency, Stakeholder Relations
Erik Kaye – Ministry of Energy, Mines, and Petroleum Resources, Acting Manager, Energy Efficiency Policy
Jeff Fischer, Urban Development Institute, Deputy Executive Director
Jen Richards – City of Vancouver, Sustainability, Program Assistant
Joan Huzar, Consumers Council of Canada
Marg Gordon, BC Apartment Owners and Managers' Association
Mark Warren – FortisBC
Nina Winham, New Climate Strategies; Terasen Gas rate 1 customers
Nir Kushnir – National Energy Equipment, General Manager (Trane)
Steve Hobson – BC Hydro, Director Power Smart
Wayne Lock, BC Safety Authority, Gas Operations Manager

Regrets

Eugene Kung, BC Public Interest Advocacy Centre, Barrister & Solicitor
Mark Hartman, City of Vancouver Sustainability, Building Energy Programs Manager
Marni Vistisen, City of Prince George, Energy Manager
Rob Noel – BC Mechanical Contractors Association, Commercial Contractors
Vanessa Joehl – CHBA-BC, Built Green BC Program Administrator

Terasen Gas Staff

Beth Ringdahl	Ned Georgy
Jenny Chia	Ramsay Cook
Ken Ross	Sarah Smith
Gary Lengle	John Turner
Michelle Petrusevich	Doug Tufts
Arvind Ramakrishhnan	Mark Grist
Shawn Hill	

John Turner
Alternative Energy Solutions

(no questions)

Doug Tufts
Arvind Ramakrishhnan
Innovative Technologies

Q: Do programs have to be for upgrading?
: Solar can be for new or retrofit; hydronic, new; NGVs can be converted

Q: Why is there less money for TGVI?
a. Dollars is proportionally based on the # of customers we have on TGVI

Q: Referring to the City of Vancouver example, if I understand correctly, if solar is required in regulation, then Terasen is not going to fund it, is that the position?
a. The new buildings just have to be solar ready (ie. Piping), but don' t have to have the solar system installed
b. Utilities cannot provide incentive if it is regulated

Discussion on free riders
Q: What about municipal regulations?

a. Utilities still might advance adoption of regulation but if customer had to put one in, it would be hard to argue that utility incentive had any help with that.
b. Provincially, government is also trying to raise the bar to meet municipal regulations and not have widely diverse buildings. It's a whole market transformation and not just in isolation.
c. Terasen can comment on municipal policies and how affect programs

---

Michelle Petrusevich
Structure and Overview of EEC report

(no questions)

Beth Ringdahl
Residential Programs

Scrap It Furnace – need to get stakeholder feedback on program and need to see what market is like for mid-efficient furnaces

Switch 'n' Shrink – under Fuel Switching in the report. 70% of the participants are from TGVI

Whole Home program – under joint initiatives in the report.

Hot water tank program – hard to get industry information, such as lit of eligible models from manufacturers. Terasen would like to put on directory on the website of eligible models.

Ministry policy on storage tanks have to be 80%; currently condensing storage tanks do no exist in the market today.
Q: in regulation, is BC unique?

a. First in North America; NRCan will be joining in later on. We have ambitious targets. How do we move manufacturers move this along, so need to work with utilities. We don't have the option of waiting.
b. There is a 6-12 month delay product delay from US to Canada.
c. There is a caution in mixing storage and non storage tank issues (are apples vs. oranges)

Q: What is the definition of residential customer?

a. SFDs, mobile homes, and townhomes; multi-family is considered commercial customer
b. There is multi-family homes on oil in Vancouver Island – can apply for Switch 'n' Shrink?
c. Maybe those home can apply for Efficient Boiler Program

Ramsay Cook
Commercial Programs

Q: Are there any absolute caps on funding on custom design program? How are savings measured?

a. About $3/GJ, but will not pay 100%
b. Each project will have to pass a TRC test
c. Will benchmark against energy study, then look at meter and energy consumption

Q: Will the study capture waste heat?

a. Terasen is open to study, we are just trying to get GJ savings

Q: have you looked at purchasing managers as a key audience, they are very risk adverse people and only look at costs involved?

a. Terasen can do education with purchasing managers.

Ned Georgy
Conservation for Affordable Housing

Q: In regards to ReNEW, is there continued training past 2010?

a. Looking to work with some groups on Vancouver Island.

Q: How do you choose participants for the program?

a. Partners choose because they know their audience.

Q: Who is doing the SEMP study? BC Non Profit or City Green?

a. BC Non Profit Housing Association; City Green is involved in all 3 studies. Studies have partners in sharing the cost.

Gary Lengle
Efficiency Partners Program

(no questions)

Jenny Chia
Conservation Education & Outreach

Q: Co-op on tradeshows?

a. Possibly, Terasen has to look it over.

Q: Is there a possibility of using the Pembina tool to train sales associates (ie. At big box stores)?

a. Yes

Stakeholder Action List (roundtable around the room)

Jeff at UDI – look at educating members on incentives and regulation

Al at ROMS BC – look at manufacturer home parks – they are out of the loops. Possibly have a joint Terasen and BC Hydro info session for ROMS for their board/industry

Marg at BCAMOA – provide info in newsletters to members, and include info at board meeting on Wed Mar 17.

Bob at Fraser Basin Council – get in touch with Terasen manager on NGVs

Joan at Consumers Council of Canada – likes the home (energy) labeling idea because it's a good way of letting consumers know

Amy at GVHBA – get together with Beth, Ned, and Jenny and discuss GVHBA opportunities. GVHBA also has a monthly newsletter where info can be placed.

Cindy at Tseshaht First Nation – go back to the community, communicate about Terasen programs for people that are not in social housing; will be speaking about Terasen at national Aboriginal Housing Forum in Calgary

Wayne at BC Safety Authority – is concerned about contractors not having the skill set to install the new technology/equipment; have to look at training and if need to upgrade training, perhaps suppliers should provide training for installers

Terasen Gas EEC Stakeholder Meeting – Stakeholder 2010 Priorities
March 11, 2010

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Greater Vancouver Home Builders' Association	-protecting interests of new home buyers -housing affordability and choice -education -marketing and networking	700+ members Builders Developers Trades Suppliers Architects & designers →Voice of residential construction industry	-reduce/prevent downloading of chares to the price of new homes -promote voluntary market driven green building -underground economy that do not get a permit for renovations	-programs for new home buyers, specifically first – timers -invest in innovative/alternative energy solutions	-continue green incentive programs -educating trades -reno program -consumer behaviour cultural shift -investment for alternative energy solutions
BC Apartment Owners and Managers' Association	-sector sustainability through offering lobbying, education, partnerships with affiliates and associates (price points) -member strength through retention and grown	3000 members Apartment owners & managers (landlords) + associates (suppliers) + affiliates -sustainability	-member education -member retention -member growth -partnership programs to assist members -energy savings; renovations and greener technology -find landlords and hot to reach them	-partnership in education, affiliation, sponsorship -news posts on web, magazine & newsletter -info on present & future opportunities -incentives/split	-workshops and tailor to high rise members, medium buildings, and low rise members -news blasts -intro of new programs -change behavior → how do we make the new "bling" energy efficiency?

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
National Energy Equipment (distributor of Trane)	-increase market creation of home comfort systems for retrofit market -incorporate “clean air” offering into heating and cooling products	-(52) HVAC dealers -homeowners that purchase Trane equipment	-improve quality of installation of Energy Star products -clarify the energy saving message with homeowners	-Terasen dealer (contractor) program -promotions planned outside of the “high season” (Sept –Nov) because impacts quality of installation	-consider “Terasen partners” program on the distribution level (eg. advertising) -work with the NRCan -align upcoming programs with homeowners’ needs and understand consumer mindset
BC Utilities Commission	-increase stakeholder engagement -increase knowledge and capacity in new areas of responsibility, not just an economic regulator		-build capacity/knowledge in commissioners and staff on DSM/energy efficiency best practices from other jurisdictions	-EEC meetings continue -provide updates, feedback and engage with Commission -keep doing what you’re doing	
Consumers Council of Canada	-consumers more aware of energy efficiency options -consumers knowledgeable about the costs/payback/justification of energy efficient purchases -ensure the consumer voice is at the policy table	-residential consumers of energy	-energy efficiency adopted as an objective in building codes -understand consumer attitude to energy efficiency -consumer protection available + accessible to consumers (remedies)	-perhaps a partnership to enable us to get consumers’ opinion/feedback on energy issues + housing issues -access to info on the residential consumer + their preferences & actions (take up of incentives?) -get info to customers	-meet with appropriate Terasen reps to talk about possible options

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Urban Development Institute	-to connect our industry with governments and the public -improve our industry through professional development and education -having a reasonable cost of & regulatory environment for our members	Developers & professionals that support them. -500 corporate members (architects, engineers, banks)	- housing affordability -reducing cost (fees, charges imposed by government -greenbuilding sustainability	-research/education on cost effective green build, energy efficiency, sustainable tools, technologies (how much customers value/do not value on e.e. to potentially support a salesperson education initiative -need consistent approach; various Lower Mainland municipalities are too diverse in policies on sustainable buildings -incentives for our members (green technologies have high upfront costs)	-information -education
Crosby Property Management	-energy savings -green technology	25,000 residential strata owners	-hold costs or do better -looking for incentives -HRTC did a lot in 2009	-information to customers	-timers for fireplaces for strata owners (program)
IBC Technologies	-expand condensing boiler product offering into commercial sizes/markets -more residential market choices with different price points/affordability	-IBC -Canadian Hydronics Council (BC rep) -CSA TC on energy efficiency	-see goals -evolve commercial boiler efficiency measurement standards	-provide clarity on DSM programs and changes thereto -host local roundtable meeting of stakeholders to commercial boiler efficiency issues to take to the national meeting	

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Natural Resources Canada	-improve Canadians' energy consumption practices in commercial and institutional buildings to the end of reduced GHGs (17% by 2020)	Government of Canada	-encourage energy efficiency retrofits and new building design -commissioning and re-commissioning -update energy code -develop bench marketing-data for buildings (offices and schools) -position for transition to post 2011 (funding ending) -build capacity among energy professionals -update the Model National Energy Code for Buildings for release 2012	-information sharing -partnerships/cooperation on optimizing resources in program design/delivery -liaise with regional stakeholders (oversee all of Western Canada)	-develop working groups?
Consolidated Management Consultants	-fair and cost effective supply	-represent commercial energy consumers	-continue to consult with BC Hydro and Terasen Gas -challenge anything that is less than cost effective -success in meeting government's goals-see utilities in succeeding	-consultation on EEC -interested in alternative energy -long term plan for reducing GHGs (by 2050) -interested in cost effective management in utility -continued engagement	
Rate 1 customer/landlord/ New Climate Strategies consultant	-improve energy efficiency infrastructure in my home	-rate 1 customers across BC	-learn about insulation options (for old home) -improve hot water systems - too much waste	-help me assess opportunities in a comprehensive way (not one-off technologies) -expertise for hire, who can assess my options?	-work with BC Hydro to give me coordinated picture of my energy and GHG issues

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Rental Owners and Managers Society of BC	-continue growth to 2400 members -achieve changes to residential tenancy act -increase recognition of rental industry as provider of homes to 1/3 of British Columbian	-2200 residential owners and managers -50,000 rental homes	-increase awareness of ROMS BC among BC's landlords	-recognize distinctiveness & size of residential rental industry +/- 600,000 rental homes -apartment buildings are different from condos or SFDs	-tenants consume, landlords pay??
City of Vancouver	-reduce GHGs -meet community based action goals	-municipality and Vancouver residents	-MURBs and small – businesses -retrofit program (under consideration, require at least 10% of the cost of any permitted renovation to be allocated to e.e. upgrades using prescriptive measures)	-for SFDs – prescribed measures, or Energuide rating -COV support by having green renovation guides online	-example of laneway house with computer interface that indicated energy usage
Ministry of Energy, Mines and Petroleum Resources	-energy efficiency -reducing GHG emissions -develop a culture of conservation		-Energy Plan -Climate action -Clean energy economy	-support for codes and standards -integration with LivesmartBC -innovation with gas (NG vehicles) -communicate with Energuide 80 -go beyond code, maybe home labeling	

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Tseshaht First Nation	-expand economic development and diversification -expand member employment opportunities -improve quality of life-industry housing -building relationships with Alberni Valley Community	1000 members 750 on reserve	-building 14 new houses (need for 80 families housing—multigenerational, increased growth in community with declining growth in neighbouring community) -7 new RAPS (renovations) -develop partnerships for tourism projects -encourage entrepreneurship -support building of new athletic hall in Port Alberni -new ventures + construction eg. greenhouse	-partnerships for training and mentoring -grants for new athletic hall (gas powered new construction) -seeking appliance bundles for energy efficiency in new houses -cost efficiency and energy efficiency	-do not understand using natural gas on reserve, mainly BC Hydro
Fraser Basin Council	Vision: strong communities, healthy ecosystems and vibrant economies in the Basin and beyond Goals: climate change mitigation/adaptation (reducing GHGs/energy efficiency) -smart planning for communities -regional and sub-regional (local) issue resolution -aboriginal engagement	-all form orders of Canadian government including First Nations + private sector + community/civil society interests	-continue to build on successes: -green fleets BC initiative, transportation -energy solutions for remote communities -supporting community energy planning though BC –demand side management -supply chain Buymost program	-harness power of strategic relationships; facilitate and bring together unlikely parties -multi-interest board	-continuing to build bridges between people, organizations, regions – and action items together

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
City of Prince George	-climate change goals & objectives that relate to participation in the Partners for Climate Protection Program (PCP). -the goal is a 10% reduction in greenhouse gas emissions from 2012, from a benchmark year of 2002. actively involved in meeting a target of carbon neutral operations by 2012 under the Province's Community Action Charter -20% reduction in overall energy intensity (electricity & natural gas) by 2015 (5 years) -5% reduction in overall energy intensity (electricity & natural gas) for each facility in 2010	-citizens of Prince George	-5% reduction in energy intensity for 2010 -carbon neutral by 2012 -10% Reduction in GHG emissions by 2012	-GHG emissions and energy consumption: easily accessible programs to help decrease GHG emissions, and funding that is available to retrofit old equipment, or implement a project that will decrease natural gas consumption would be appreciated.	

Note: priorities missing from BC Hydro, FortisBC, BC Public Interest Advocacy Centre, Canadian Home Builders' Association of BC, BC Mechanical Contractors Association,, and BC Safety Authority.

Appendix G

EFFICIENT BOILER PROGRAM TERMS AND CONDITIONS

Efficient boiler program

Terms and conditions

Table of contents

The incentives

Efficient boiler incentives are made up of two parts: a purchase incentive which is based on the type of boiler purchased, plus either; a new constriction incentive; or a retrofit incentive.

Purchase incentive

For all participants, the incentive applies to the incremental purchase price of a natural gas near-condensing or condensing boiler over the purchase price of a standard-efficiency boiler. The purchase price incentive is based on space heating and ventilating load. They will be calculated as follows:

- near-condensing boilers: $4,000 per boiler plus $3 per MBH plant input
- condensing boilers: $6,000 per boiler plus $9 per MBH plant input

The purchase price of a standard-efficiency boiler will be estimated using $7 per MBH of the input required to meet the space heating load.

In addition to the purchase price incentives above, Terasen Gas will also contribute additional incentives to your upgrade project as outlined below.

New construction

Terasen Gas will contribute 50 per cent of engineering fees to a maximum of $1,500 toward the cost of estimating the annual gas usage for space heating using a standard-efficiency boiler system versus a higher efficiency boiler system. Purchase price incentive payments are limited to a maximum of 75 per cent of the purchase price premium over a standard boiler.

Retrofit of existing buildings

The program will pay your contractor up to a maximum of $400 for performing an estimate of the peak space heating load. It will also pay 50 per cent of the cost of necessary venting modifications up to a maximum of $2,000. During the first year of operation you are also entitled to a monitoring incentive of $1,500 plus $1 per gigajoule of total natural gas saved. Purchase price incentive payments are limited to a maximum of 50 per cent of the purchase price premium over a standard-efficiency boiler.

The benefits

Ongoing savings of up to 40 per cent

- operating savings from lower natural gas expenditures
- greater potential savings if boilers are also used for domestic hot water heating

Higher performance

- improved operating efficiency through correct boiler sizing
- improved reliability if a modular boiler system with multiple boilers is used

Energy efficiency assistance

- assistance in determining your facility's potential for energy improvements
- help in finding ways to save money and improve your facility's operation

Space efficiency and comfort

- requirement for less space in mechanical rooms
- excellent opportunity to increase occupant comfort and reduce building maintenance and operating costs to end buyers

Increased marketability

- improved efficiency appealing to customers who recognize the value it adds to their investment
- increased value of your development
- competitive advantage over other projects

Environmental benefits

- fewer CO, CO_2 and NOx emissions into the atmosphere
- responsible use of a clean burning natural resource

Program terms and conditions

Note: Subject to change without notice.

1.0 Overview

1.1 The Efficient Boiler Program (the program) from Terasen Gas Inc. (Terasen Gas) is designed to stimulate investment in appropriately sized energy-efficient space heating boilers that will reduce natural gas usage and associated operating costs. The program is targeted to both new construction and replacement markets.

1.2 The program offers all market participants an incentive payment to partially offset the higher purchase price of higher efficiency boilers, a contribution to the cost of accurately estimating the building's space heating load.

1.3 In new construction, the program contributes to the engineering fees for estimating the building's annual natural gas usage for space heating with a standard efficiency boiler and comparing it to that with a higher efficiency boiler. It also partially offsets the higher boiler purchase price incurred by a developer, builder or owner. Terasen Gas will also recognize the developer's, builder's or owner's commitment to energy efficiency on behalf of tenants, end users and subsequent owners.

1.4 In the replacement market, the program compensates a mechanical contractor to accurately estimate the peak space-heating load. It also reduces the building owner's higher purchase price for an energy-efficient boiler, including an allowance for required venting upgrade modifications. It also promotes proper ongoing operation and maintenance of the heating plant to reduce annual space heating costs, maintain efficiency and lower life cycle costs by paying building owners a monitoring incentive and a natural gas-saving bonus.

1.5 By taking part in this offer, your boiler may use less natural gas and produce fewer emissions. You agree Terasen Gas Inc. may record any resulting emission reductions you have along with those of other participating customers and credit them to our Greenhouse Gas Management Program.

2.0 Participant eligibility criteria

2.1 The applicant must be a building developer, builder, building owner or owner's designated representative.

2.2 The facility where the boiler is installed must be in the Terasen Gas service territory in the Lower Mainland, Vancouver Island, Sunshine Coast, or the Interior of BC. (Not available in Whistler).

2.3 The facility where the boiler is installed must use natural gas purchased according to one of the following Terasen Gas Rate Schedules: 2, 2U, 3, 3U, 23, 5, 25, AGS, SCS-1, SCS-2, LCS-1, LCS-2 or LCS-3.

2.4 Only eligible boilers under the program qualify for the incentive (see section 4.0 for the boiler eligibility criteria).

2.5 The incentive will only be paid for space heating boilers. When the boiler is used for space heating as well as other applications such as domestic hot water and pool heating, the domestic hot water load and the pool heating load will be subtracted from the boiler input to determine the space heating load for incentive calculations.

2.6 Standby or backup space heating boiler plants will not normally qualify under this program. Standby or backup boilers are defined as boilers that normally only operate during peak heating load. However, a boiler plant that is not the primary source (i.e. does not provide over 50 per cent) of space heating for the facility, can qualify if the facility uses natural gas for domestic hot water and make-up air units.

3.0 Program process

All market participants

3.1 Applicant's contractor or qualified professional determines the capacity of the space heating plant, type of boiler (i.e. condensing or near-condensing), capacity and number of boilers required to meet the space-heating requirements of the building.

3.2 Applicant completes Efficient Boiler Program Application Form and submits it along with required documentation (7.0) to Terasen Gas.

3.3 Terasen Gas reviews application for completeness.

- (i) If application is complete, Terasen Gas estimates the incentive that is payable to the applicant.
- (ii) If application is incomplete, Terasen Gas will ask applicant for additional information.
- (iii) If required documents are not completed and submitted within one month of the application date the application may be cancelled.

3.4 Applicant receives a letter from Terasen Gas stating whether the application was approved or rejected. If approved, an estimate of the incentive(s) payable to the applicant will be attached to the letter.

3.5 Applicant purchases and installs the boiler within 12 months from the date of approval (3.4) by Terasen Gas.

3.6 Applicant submits required documentation to Terasen Gas within one month of boiler installation. (See Section 7.0 for documentation).

3.7 Terasen Gas reviews documents for completeness.

- (i) If all documents are in order and the applicant has met all the requirements of the program and the boiler capacity has not changed from original application, Terasen Gas issues a boiler incentive cheque to the applicant.
- (ii) If all documents are in order and the applicant has met all the requirements of the program, but the installed boiler capacity and/or purchase price has changed since the application was first submitted, Terasen Gas recalculates the incentive and issues a cheque for the revised boiler incentive.

New construction market participants

3.8 The contribution of Terasen Gas to the engineering fees required to estimate annual gas usage will be included in the boiler incentive cheque issued to the applicant.

Replacement market participants

3.9. The contributions of Terasen Gas to the contractor's cost to estimate the peak space heating load, and to the cost of the required venting upgrades, will be included in the boiler incentive cheque issued to the applicant.

3.10 Terasen Gas will send the reporting requirements for the monitoring incentive and gas-saving bonus to the applicant with the incentive cheque.

3.11 Applicant prepares the reports that are required for the monitoring incentive and gas-saving bonus.

3.12 Applicant submits the reports to Terasen Gas. One report is submitted six months after boiler installation; the second report is submitted 12 months after boiler installation.

3.13 Terasen Gas reviews the reports for completeness.

- (i) If applicant meets the reporting requirements, Terasen Gas calculates the monitoring incentive and gas-saving bonus and issues a cheque. Cheque is issued after Terasen Gas receives the two complete sequential six month reports.
- (ii) If applicant has not met the reporting requirements, Terasen Gas advises applicant that reporting requirements have not been met and applicant does not qualify for monitoring incentive and gas-saving bonus.

4.0 Eligible boilers

All boilers

4.1 Must be a natural gas space heating boiler system (propane boilers in Revelstoke can also qualify). Multiple boiler modules housed in a single jacket constitute one boiler.

4.2 The minimum boiler input rating is 300,000 Btu/hr.

4.3 The maximum boiler input rating is 5,000,000 Btu/hr.

4.4 The minimum space heating plant input rating is 300,000 Btu/hr.

4.5 The maximum space heating plant input rating is 10,000,000 Btu/hr.

4.6 The incentive will only be paid for space heating boilers. (see section 2.5 for details).

4.7 Boiler efficiency ratings must be independently tested in accordance with BTS-2000 Testing Standard for Efficiency of Commercial Space Heating Boilers from the Hydronics Institute Division of GAMA (www.gamanet.org) or CSA 4.9 Gas-Fired Low Pressure Steam and Hot Water Boilers.

4.8 Third party documentation of boiler combustion efficiencies must be provided for boiler eligibility. Acceptable documentation includes either

(i) combustion efficiency test reports from testing laboratories accredited by the Canadian Standards Association (CSA International) or the American National Standards Institute or from the Hydronics Institute Division of GAMA;

(ii) a combustion efficiency certification letter from CSA International; or

(iii) inclusion in the I=B=R Ratings for Boilers, Baseboard Radiation and Finned Tube (Commercial) Radiation Directory, January 2008 Edition, with the steady state combustion efficiency rating published in the directory
(www.gamanet.org).

4.9 Boiler must be installed in accordance with the manufacturer's specification and must comply with applicable laws, codes, standards and ordinances.

4.10 The boiler must be new. Used or rebuilt boilers do not qualify for the incentive.

4.11 Boilers must be covered by a standard or optional minimum two-year parts and labour warranty.

Near-condensing boilers

4.12 Definition of near-condensing boiler:

(i) has a minimum steady state combustion efficiency of 85 per cent as tested throughout the turn down range in accordance with BTS-2000[i] or CSA 4.9[ii]

(ii) has a factory installed intermittent ignition

(iii) has a forced draft or induced draft burner that properly controls excess air

(iv) conforming boilers will have continuous capacity modulation (not staged burner output control) to
enable operation at reduced output down to 50 per cent or less of maximum continuous output. This turndown will be achieved by continuously varying fuel and air input quantities

Condensing boilers

4.13 Definition of condensing boiler:

(i) has a minimum steady state combustion efficiency of 88 per cent throughout the turn down range as tested in accordance with BTS-2000[i] or CSA 4.9[ii]

(ii) a Category IV boiler that vents through a Class II Type BH stack or a stack that complies with the manufacturer's recommendations

(iii) conforming boilers will have continuous capacity modulation (not staged burner output control) to enable operation at reduced output down to 50 per cent or less of maximum continuous output. This turndown will be achieved by continuously varying fuel and air input quantities

(iv) the boiler can continuously withstand heating system return water temperatures that do not exceed 49°C

List of eligible boilers

4.14 A list of eligible boilers is available on our website at terasengas.com. This list may be updated during the course of the program.

i - BTS 2000 Testing Standard for Efficiency of Commercial Space Heating Boilers, Hydronics Institute Division of GAMA - 2000

ii - Gas-Fired Low Pressure Steam and Hot Water Boilers, Canadian Standards Association

5.0 Incentives

All market participants

5.1 Boiler purchase price incentives will be calculated as follows:

(i) near-condensing boilers: $4,000 per boiler plus $3.00 per MBH plant input for space heating load

(ii) condensing boilers: $6,000 per boiler plus $9.00 per MBH plant input for space heating load

5.2 The purchase price of a standard efficiency boiler will be estimated using $7.00 per MBH of input for space heating load.

5.3 The boiler purchase price is the applicant's purchase price of the boiler net of any vendor rebates excluding installation labour, venting and accessories.

5.4 Terasen Gas reserves the right to limit the number of incentive payments it provides for the program.

New construction market participants

5.5 In new construction, Terasen Gas will pay 50 per cent of a qualified professional's fees to compare the estimated annual natural gas usage for space heating using a standard efficiency boiler to that with a higher efficiency boiler to a maximum of $1,500. This will be payable to the applicant at the time the boiler purchase price rebate is paid to the applicant and will not be paid unless an eligible boiler is actually installed. Proof of payment must be submitted with the application. The energy modelling must be completed by a qualified professional using DOE, EE4, TRACE, HAP or equivalent program and must compare the space heating energy use of the building using a standard efficiency boiler and a higher efficiency boiler.

5.6 In new construction, boiler purchase price incentive payments are limited to a maximum of 75 per cent of the premium over a standard efficiency boiler.

Replacement market participants

5.7 In replacement applications, Terasen Gas will pay a maximum $400 of the cost incurred to estimate the peak space heating load. This will be payable to the applicant at the time the purchase price incentive is paid and will not be paid unless an eligible boiler is actually installed. Proof of payment must be submitted with the application.

5.8 In replacement applications, boiler purchase price incentive payments are limited to a maximum of 50 per cent of the premium over a standard efficiency boiler.

5.9 In replacement applications, the total amount of the boiler purchase price incentive and the venting replacement incentive is subject to a maximum limit equal to the price of the installed boiler.

5.10 In replacement applications, Terasen Gas will pay a monitoring incentive of $1,500 plus $1/GJ of gas-saving bonus for each GJ of annual weather-normalized reduction in total natural gas consumption. The weather-normalized gas consumption in the 12-month period following the boiler installation will be compared to the weather-normalized gas consumption during the 12-month period prior to the boiler installation. The applicant must report the data from the following inspections:

(i) perform combustion analysis and record combustion efficiency, $\%CO_2$, $\%O_2$, ppm NO_X and flue gas temperature every six months

(ii) perform a diagnostic check of the controls weekly

(iii) perform visual check of system components weekly

(iv) record boiler water outlet temperature weekly

(v) record boiler water inlet temperature weekly

(vi) record boiler room temperature weekly

5.11 Applicant must submit reports that include the data listed above to Terasen Gas six months and 12 months after the boiler installation to qualify for the monitoring incentive and gas-saving bonus.

6.0 Additional terms and conditions

All market participants

6.1 One application form must be submitted per each gas account (gas meter) in your facility, that serves the qualifying boiler plant or plants you want to apply for.

6.2 The building's heat load must be calculated and the heating plant must be sized in accordance with ASHRAE Standard 90.1 to ensure the heating plant is not oversized.

Equipment requirements

6.3 HVAC systems must be sized to meet the needs of the conditioned spaces.

6.4 Equipment installed outdoors or in unconditioned spaces must be designed by the manufacturer for such installation.

6.5 HVAC equipment and components included in the scope of Model National Energy Code for Buildings (MNECB) Table 5.2.13.1 must comply with the relevant local appliance/equipment energy efficiency act or the relevant standard listed.

Hydronic systems

6.6 All hydronic systems must be designed so they can be balanced.

6.7 Multiple boiler systems must prevent heat loss through boilers when they are not in operation through the use of such items as draft dampers or shut-off valves interlocked with burners.

6.8 Pipes containing fluids with design operating temperatures outside the 13°C to 40°C range must be insulated as per MNECB Table 5.4.2.3. Some exemptions apply.

6.9 Boiler hot water distribution piping outside the building envelope must be insulated to the maximum requirements as per MNECB Table 5.4.2.3. Insulation must be protected where it may be subjected to mechanical damage, weathering or condensation.

6.10 Seasonal pumping systems, such as heated and chilled water pumping systems, must have automatic controls or readily accessible and clearly labelled manual controls to shut down the pumps when they are not required.

Additional requirements

6.11 All boiler installations with a maximum rated input of 400,000 BTU/hr or higher must be approved by the BC Safety Authority. (See 7.2 (ii))

6.12 The manufacturer or an authorized factory representative must either perform or supervise equipment start up and provide a written report to Terasen Gas indicating that the installation meets manufacturer's requirements. The report must include:

(i) boiler inlet return water temperature °C

(ii) boiler outlet supply water temperature °C

(iii) boiler room temperature °C

(iv) exhaust gas temperature °C

(v) %CO_2 in the exhaust

(vi) %O_2 in the exhaust

(vii) % steady state combustion efficiency

(viii) boiler clocked firing rate (Btu/hr)

6.13 The applicant agrees to periodic inspections of the applicant's premises by Terasen Gas or its representative to verify that the boiler has been installed and is in operation, and to cooperate with Terasen Gas thereafter to gather information necessary to assess the success of the program.

6.14 Applicant agrees to allow Terasen Gas to publish their business name, a general description of the system upgrade undertaken and resulting energy performance and payback period.

New construction market participants

6.15 In new construction, a qualified professional must be retained to estimate:

(i) the facility's peak space heating load based upon the January 2.5 per cent °C winter design temperature for your location (reference Table C-2 National Building Code)

(ii) a standard efficiency boiler's peak annual gas consumption (GJ)

(iii) the higher efficiency boiler's annual gas consumption (GJ)

Replacement market participants

6.16 In replacement markets, the contractor must prepare an estimate of the facility peak space heating load based upon the January 2.5 per cent °C winter design temperature for your location (reference Table C-2 National Building Code).

Program deadlines

6.17 The program, including the eligible boiler criteria and eligible boiler list, may be amended or modified at any time without notice and the program may be terminated at any time without notice.

6.18 Funding for this program is limited. Terasen Gas may, in its sole discretion, determine how this funding will be shared between the new construction market and the replacement market. This may mean that Terasen Gas will continue to accept new construction market applications after the program has been terminated for the replacement market or the converse.

6.19 Applications must be submitted to Terasen Gas and pre-approved by Terasen Gas prior to the purchase and installation of the boiler.

6.20 Final documents must be submitted within one month of boiler installation.

6.21 If Terasen Gas amends or modifies the program after an application is received and pre-approved by Terasen Gas, the applicant cannot resubmit an application for the same boiler plant under the amended or modified program.

Representations and warranties

6.22 Applicant acknowledges the program eligibility criteria and warrants that it fully qualifies and will comply with such criteria.

6.23 Applicant warrants that all information contained in the application and the information attached thereto is true and correct.

6.24 Applicant covenants that it will notify Terasen Gas immediately if there is any material change in the application and information attached thereto after it is approved by Terasen Gas.

6.25 Applicant acknowledges that by taking part in the program, their boiler may use less natural gas and produce fewer emissions. Applicant agrees that Terasen Gas may record any resulting reductions in emissions along with those of participating customers and credit them to the Terasen Gas Greenhouse Gas Management Program.

Default or fraud

6.26 The incentive approved is based on the information in the application documents. If there are any changes to the information in the application documents after it is approved, Terasen Gas in its sole discretion may void the application documents and Terasen Gas will be released from any and all obligations under the program.

6.27 Applicant agrees to the terms and conditions of the program. If the applicant fails to perform according to these terms and conditions, then upon notice of default from Terasen Gas, the applicant shall refund the full amount of the incentive upon request from Terasen Gas.

Liability

6.28 Terasen Gas shall have no ownership interest in the boiler.

6.29 Terasen Gas, not being the designer or manufacturer of the boiler, makes no representation or warranty, express or implied as to the fitness, design or capability of the material, equipment or workmanship in the boiler, nor any warranty that the boiler will satisfy the requirements of any law, specification, or contract, which may be made against or incurred by Terasen Gas, its contractors, agents and employees in any way relating to, or arising out of, the program.

6.30 Applicant indemnifies and saves harmless Terasen Gas, its contractors, agents, and employees from all liability and all claims, damages, expenses and costs.

6.31 Terasen Gas does not endorse any particular manufacturer, product, system, design, supplier or installer in promoting the program.

Tax implication

6.32 Terasen Gas will not be responsible for any tax liability imposed on the applicant as a result of payments of the incentive. For GST Registrants, incentives received by the applicant include GST which must be remitted by the applicant to the Receiver General of Canada.

7.0 Documentation

All market participants

7.1 Terasen Gas is not responsible for lost, delayed, damaged, illegible or incomplete applications.

7.2 The following documents must be submitted to Terasen Gas:

(i) prior to approval:

- completed application form

(ii) after boiler installation:

- a confirmation letter must be submitted stating that the boiler(s) have been installed
- the following documents must be submitted with the confirmation letter:
- gas permit and, if applicable, an approval certificate with a Certificate of Inspection from the BC Safety Authority
- copy of the start up report by the manufacturer or an authorized factory representative
- copy of boiler and vent material sales invoice

New construction market participants

7.3 The following documents from a qualified professional must also be submitted within one month of the date of application prior to approval otherwise the application may be cancelled.

(i) estimate of the peak space heating load

(ii) report on projected natural gas usage for space heating

(iii) invoice for completing the report on projected natural gas usage for space heating

(iv) proof the invoice has been paid

Replacement market participants

7.4 The following documents from the contractor must also be submitted within one month of the date of application prior to approval otherwise the application may be cancelled.

(i) estimate of the peak space heating load

(ii) invoice for completing the estimate of the peak space heating load

(iii) proof the invoice has been paid

7.5 The following documents must also be submitted after boiler installation:

(i) confirmation letter must be submitted indicating the interest to participate with the monitoring phase of the program

(ii) first report with the data from Section 5.10 above must be submitted 6 months after boiler installation

(ii) second report with the data from Section 5.10 above must be submitted 12 months after boiler installation

INTERNAL AUDIT SERVICES EEC PROCESS AND INTERNAL CONTROL REVIEW

Terasen Gas Inc. & Terasen Gas (Vancouver Island) Inc.
Energy Efficiency and Conservation Program
- Process and Internal Control Review

Distribution to:

- Randy Jespersen, President & Chief Executive Officer
- Scott Thomson, VP, Regulatory Affairs & Chief Financial Officer
- David Bennett, VP, General Counsel & Corporate Secretary
- Doug Stout, VP, Marketing & Business Development

Internal Audit Services
Terasen Inc.

March 1, 2010

Background

Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc. ("The Companies") Energy Efficiency and Conservation Program ("The Program" or "EEC") is designed to provide customers tools and incentives to manage their natural gas consumption, reduce their energy costs, and lower their greenhouse gas emissions.

In April 2009, the British Columbia Utilities Commission ("BCUC" or "Commission") granted the Companies approval for the Program expenditure of $41.5 million for the period 2008 to 2010. This is a significant expansion from the Companies' previous EEC activities which had remained largely unchanged since the late 1990's at the incentives and non-incentive expenses level of approximately $1.50 million and $1.624 million respectively for TGI and $650k and $500k respectively for TGVI. The Program includes rebates and incentives on a number of energy efficient appliances, equipment and systems as well as education and outreach initiatives to increase awareness of the energy efficiency and environmental benefits that can be achieved by using clean burning natural gas in high efficiency appliances.

Review Scope and Objectives

Given the recent expansion of the EEC activities, the review provides a timely opportunity to assess the effectiveness of current processes and controls and to recommend improvements during the transitional period of the Program.

The objective is to evaluate the design effectiveness of the project management processes and controls as established for the facilitation of the Program. The following will be evaluated as part of the review:

- Identify key risks and determine whether risks are appropriately managed;
- Review existing policies, procedures and practices with reference to best practices;
- Review the level of adherence to and compliance with existing policies and procedures;
- Develop recommendations and potential action plans to address any significant issues or opportunities for improvement that are identified; and
- Review for compliance with the BCUC Decision.

Project Risks

IAS developed a risk-based audit approach to review key processes and evaluate internal controls for the Project. The following risks that may result in cost overruns and jeopardize the success of the project were considered:

- *Cost Monitoring:* Program costs are not monitored and analyzed on a timely basis resulting in cost overruns with the amount not recoverable;

- *Scheduling:* Program is not delivered on time; program objectives are not met; changes to schedules are not properly communicated;
- *Authorization:* Improper authorizations resulting in program delays and/or overcharges or improper charges for program costs;
- *Invoice Payments:* Invoice payments are not in accordance with contract terms and do not match contracted deliverables;
- *Program administration:* Administration of various EEC programs are not monitored for accuracy and efficiency as well as adherence to terms and conditions of the program resulting in program cost overruns, administrative inefficiencies and participant ill will; and
- *Reporting:* Project reporting fails to supply appropriate measurement for management of cost, scope and schedule to ensure proper management oversight.

Summary of Observations

The EEC Team has demonstrated good project commitment with the common goal of achieving the Program's objectives in the most cost effective and efficient manner. As this is a significant increase in funding for the EEC program, internal controls need to be robust to ensure the program is managed effectively.

Certain internal controls for the Program were established and implemented but, IAS has determined that there are opportunities to improve processes or internal controls. The details are reported to management in a list of observations and recommendations attached to this report. The summary of the significant opportunities are as follows:

- ***Process and Control Documentation:*** Process and internal control documentation for various EEC programs was not readily available. Timely communication of process and controls is critical to achievement of program objectives, especially given that a significant number of the EEC team consist of new employees.
- ***Third-Party Program Administration:*** Some of the EEC programs are administered by third-parties; however, their performance was not often monitored by Terasen. Based on IAS' sample testing, some instances of exceptions in program administration were noted. A periodic review of the effectiveness of third party administrators is recommended to ensure that quality of the program administration is acceptable. Also noted was that one EEC program did not have a statement of work in place with one third-party program administrator. Each EEC program should have a statement of work in place with any third party administrators prior to program commencement to establish terms and conditions in administering the program.
- ***Internal Program Administration:*** Based on IAS' sample testing, one incident was noted where an application approved did not follow terms and conditions of the program. Also, for one of the EEC programs there was no clear evidence of review performed on applications and the review did not consider all areas of potential risk. Adherence to program terms and conditions, documentation of evidence of review and consideration of all risk areas when performing review are recommended.

- ***Program Status Reporting:*** Currently there is no formal reporting on the EEC program progress in place. It is recommended that regular update of program progress is reported to the appropriate level of management and personnel for timely monitoring of the programs.

Our findings have been presented to management and we are satisfied with their response to improve processes and internal control.

Opinion

In my opinion, the processes and the design of internal controls surrounding the Program receives an assessment of Yellow[1]. We found no major weaknesses in the process and control environment, but there were sufficient minor weaknesses requiring prompt management action to address the recommendations made to adequately mitigate the associated risks being managed.

Andrew Lee CA-CIA
Manager, Internal Audit Services
Terasen Inc.
March 15, 2010
Burnaby, BC

1

Green	We found no/very few weaknesses and we recommended no (or only minor) improvements.
Yellow	We found no major weaknesses in the control environment, but there were sufficient minor weaknesses requiring prompt management action to address the recommendations made.
Red	We found a major weakness (or several minor weaknesses combined) in an operation or process in which the control environment (or lack of) and/or testing results indicate a significant risk or exposure to the company.

Observations and Recommendations

#	Observations	Risk	Recommendations	Management Response
1.	**Process and Control Documentation** Process documentation for various EEC programs was not readily available. The approved business case cannot be relied upon for details of internal control within the process.	Internal controls that are not established may impede achievement of program objectives.	Communication of process and controls prior to the program commencement is critical to achievement of program objectives. This is especially true as a significant number of the EEC team consist of new employees.	Process and control documentation will be updated and provided to personnel. Internal control documentation will be incorporated into the business case for programs on a go forward basis with assistance from IA on a program by program basis. **Management Accountability:** Sarah Smith, Manager, EEC **Estimated Timing:** on-going
2.	**Third-Party Program Administration** A significant number of EEC programs are administered by third-parties. A review of various programs and related applications resulted in the following exceptions: a) Energy Star Heating System Upgrade – Terasen Accenture Business Services for Utilities (ABSU) had the following exceptions: • Of 24 sample application forms requested, 5 were not available • 6 did not contain evidence of review performed by ABSU • Through discussion, it was noted that the Statement of Work (SOW) Agreement expired in 2007 and has not been renewed b) Energy Star Heating System Upgrade – LiveSmart • Ministry of Energy Mines and Petroleum Resources (MEMPR) does	Payments made to ineligible participants	A periodic review of the effectiveness of third party administrators to ensure accurate and efficient program administration should be performed. Terasen is ultimately responsible for all EEC programs and should be diligent in ensuring that quality of third-party program administration is acceptable. A statement of work should be established with each third-party to outline terms and conditions in administering programs. A right to audit clause should be part of the contract.	This will be implemented for all third party administrator contracts entered into on a go forward basis. **Management Accountability:** Sarah Smith, Manager, EEC Beth Ringdahl, EEC Program Manager (Residential) Ramsay Cook, EEC Program Manager (Commercial) **Estimated Timing:** March 15, 2010

#	Observations	Risk	Recommendations	Management Response
	not provide application documentation c) EnerChoice Fireplace • One incident was noted where there were two consecutive application reference numbers assigned to the same participant but only one invoice with one fireplace purchase was available for both applications. Since both applications were approved and paid, duplicate payment is suspected. d) EcoEnergy Home Energy Assessment (D-Visits) Program – LiveSmart BC • MEMPR does not provide application documentation			
3.	**Internal Program Administration** A review of various programs and related applications resulted in the following exceptions: a) Efficient Boiler Program (EBP) • One incident was noted where an applicant had installed a boiler prior to obtaining pre-approval to be eligible for the rebate application. This is not in accordance with the Program's terms and conditions, which states the pre-approval must be obtained prior to boiler installation. Per discussion there have been a few other cases where applicants installed boilers prior to obtaining pre-approval and accepted to the program. Reasons included a need for a new boiler due to an emergency or learning about the program after installing the boilers. b) Light Commercial Energy Star Boiler Program • There was no clear indication a review	Ineffective application evaluation process can result in payments to ineligible participants.	a) Adherence to program terms and conditions should be followed. b) It is recommended that evidence of review should be documented. While the risk of duplicate applications was low based on the small number of participants in 2009, management should consider its implication on a go forward basis as more participants are expected.	a) Terms and conditions for the pre-approval requirement has been modified and eliminated for new applicants b) All internal reviewers are now required to initial applications as evidence of review. **Management Accountability:** Sarah Smith, Manager, EEC Beth Ringdahl, EEC Program Manager (Residential) Ramsay Cook, EEC Program Manager (Commercial) **Estimated Timing:** March 2, 2010

#	Observations	Risk	Recommendations	Management Response
	was performed on the application (e.g. initials). • Based on discussion, it was noted that the current application evaluation process did not include a process to detect any duplicate applications.			
4.	**Participant Database Management – Efficient Boiler Program (EBP)** It was noted that the current participant database contained a number of inactive accounts - some dating back to 2005. Prior to October 2008 the program allowed participants up to 2 years from the application pre-approval date to install boilers. This resulted in administrative difficulties in keeping up-to-date with status of some accounts. The program terms and conditions have been revised since to allow participants 1 year to install boilers. However, the database has not been updated to remove inactive participants.	Database containing inactive participants can result in inaccurate reflection of program performance as well as impede the effectiveness of program management	The program database should be updated to reflect the accurate status of accounts participating in programs.	EBP administration has been re-patriated to the EEC Dept, and the Database will be updated. **Management Accountability:** Sarah Smith, Manager, EEC Ramsay Cook, EEC Program Manager (Commercial) **Estimated Timing:** March 31, 2010
5.	**Demand Side Management (DSM) Cost-Benefit Model** There are two sets of DSM Cost-Benefit models that are used by the EEC team. One is a "program planning" model that is used by EEC Program Managers during program development for scenarios planning and supports the Business Case that is eventually signed by Management in accordance with the Signing Authority protocols established within the Company. The other is the Total Resource Cost (TRC) reporting spreadsheet that is used by the Business Development Analyst to create large-scale spreadsheets that support Annual Reporting to external stakeholders and the BCUC. • In both cases, input cells that are constant formulated cells are not protected • For the "program planning" model, there is no controls process to check accuracy of formula on a regular basis.	There is risk that the Models can be accessed and modified by unauthorized individuals.	Implementation of the following controls into the Models are recommended: • Cells that are constant in the "program planning" model should be protected to prevent unauthorized modifications • Access to the large-scale spreadsheet that is used for external reporting should be password protected and restricted to the Manager, EEC and the Business Development Analyst	Administration of the spreadsheets will incorporate the recommendations. **Management Accountability:** Sarah Smith, Manager, EEC Arvind Ramakrishnan, Business Development Analyst **Estimated Timing:** March 31, 2010

#	Observations	Risk	Recommendations	Management Response
	This is not the case for the large-scale spreadsheet that is used for Annual Reporting, which is checked over by an external consultant prior for use to support Annual Reporting. • All EEC staff have access to shared folders containing the models			
6.	**Approval Process for Research Studies** From the resource allocation perspective, all expenditures (i.e. programs or research studies) are competing against the same pool of finite EEC resources. Therefore, the same level of rigor should be exercised in approving both types of expenditures given significant costs generally associated with such types of expenditures. Currently, the EEC program approval process requires that a business case be submitted and approved prior to the commencement of a new EEC program. However, there is no standard process for the approval of research studies and the evaluation process does not appear to require the same level of rigor.	Inconsistent approval process for EEC programs and research studies can result in ineffective use of EEC resources.	It is recommended that uniform approval processes are applied to both EEC programs and research studies.	Each research study over $10K is now required to have its own business case before proceeding. **Management Accountability:** Sarah Smith, Manager, EEC David Bennett, Director, Resource Planning & Market Development Doug Stout, VP, Marketing & Business Development **Estimated Timing:** Mar 2, 2010
7.	**Program Status Reporting** It was noted that currently there is no regular reporting to management (i.e. Utility Operating Committee (UOC)) on the EEC program including program development and financial information. While the ELT and Board of Directors is informed on a quarterly basis, it is management that is responsible for administrating and managing the program. Also, until program managers implement regular tracking of program information, there is no regular status reporting to Manager of EEC.	Regular monitoring and tracking of program performance can help with more effective use of the EEC resources and assist to achieve program objectives.	It is recommended that regular updates of program progress are reported to the appropriate level of management and personnel for timely monitoring of the programs.	The first regular quarterly report to UOC on EEC activity is scheduled for April 2010 and then subsequent quarters thereafter. The implementation of the Demand Side Management System (DSMS), which will be used to manage various aspects of EEC program administration and performance measurement, will provide regular status reporting to the Manager, EEC. **Management Accountability:** Sarah Smith, Manager, EEC Beth Ringdahl, EEC Program Manager (Residential)

Observations and Recommendations

#	Observations	Risk	Recommendations	Management Response
				Ramsay Cook, EEC Program Manager (Commercial) Ned Georgy, EEC Program Manager (Affordable Housing) Jenny Chia, EEC Program Manager (Community Education & Outreach) Gary Lengle, EEC Program Manager (Enabling & Trades Relations) **Estimated Timing:** April 2010 for reporting to UOC Q4 2010 for implementation of DSMS and regular status reporting to the Manager, EEC

HABART & ASSOCIATES CONSULTING INC.
CONDENSING DOMESTIC HOT WATER HEATERS MARKET TRANSFORMATION

Condensing DHW

Prepared for: Terasen Gas

Prepared by:

abart & Associates Consulting Inc.

March 22 2010

Table of Contents

1. Introduction

1.1 Background

The British Columbia Provincial Government introduced the Energy Plan in 2007 and the BC Climate Action Plan in 2008. The Action Plan set the objective of reducing green house gas emissions by 33% by 2020. Major activities to date have focused on the appliances and the building shell of buildings. Hot water represents the second largest household energy usage (approximately 20% of the total). However this share will increase over time as building envelope construction, space heating appliances and HVAC improve in efficiency.

This has led the Ministry of Energy, Mines and Petroleum Resources (MEMPR) to establish a plan to significantly raise minimum efficiency levels over the next five years. As a result, MEMPR has passed a regulation to increase efficiency levels of residential storage water heaters through a series of steps.

On September 1, 2010, the standard for a 40 USG tank will increase to EF 0.62.

For 2011, the requirement for replacement tanks will increase to EF 0.67 while the requirement for new construction will increase to EF 0.80 for storage water heaters.

For 2013, the requirement will move to EF 0.80 for both new construction and the replacement market.

In the USA the Department of Energy (DOE) sets performance standards for a range of appliances, including Domestic Water Heaters (DWH). The current minimum efficiency level is EF 0.59 which has been in place since 2004. The DOE has now proposed setting the minimum level at EF 0.63 in 2015.

In addition to the minimum energy efficiencies, the ENERGY STAR program defines higher performance levels for water heaters. Prior to August 31, 2010, the standard for a conventional storage water tank is EF 0.62. As of September 1, 2010, this standard will increase to EF 0.67[1]. In addition to the standards for conventional water heaters, ENERGY STAR defines a standard of EF 0.82 for tankless water heaters, and an EF of 0.80 for Condensing water tanks.

At the present time, there are no condensing water tanks specifically for the residential market. Some manufacturers, such as Polaris, do make condensing tanks for Commercial use, but the cost is considered to be too high for widespread residential usage.

Condensing water heaters targeted at the residential sector are expected to be available by mid-2010.

[1] Conversation with DOE staff suggest that this implementation data may be delayed.

1.2 Report Objectives

The purpose of this project is to outline a strategy by which Terasen Gas can support the commercialization of residential condensing water heaters in conjunction with the Ministry of Energy, Mines and Petroleum Resources (MEMPR) of the B C Government.

The paper provides: a conceptual framework for transforming the market; technical information on condensing water heaters; and background on the expected size of the DWH market in B.C.. Then an implementation plan and a business case are provided.

2. Market Transformation

The concept of market transformation gained popularity during the late 1990's in part to respond to a concern that many Demand Side Management programs were dependent on subsidies in order to move more efficient products into the marketplace. The broad thrust of market transformation was to find ways to take advantage of the "natural working" of the market in order to move efficient products from relatively low volume, speciality products into the mainstream so that they displaced the less efficient products. Much of the activity (thought) focused on understanding the barriers that prevent these products from obtaining larger market shares.

2.1 Diffusion theory

The way in which new ideas and technologies are adopted by a society is covered under the broad title of "Diffusion of Innovation" theory. Everett Rogers[2] built on existing thought and wrote the most commonly referenced work on the topic. Briefly, he espoused the concept that, on an individual basis, innovation occurs in a 5 stage process. This includes: awareness; persuasion; decision; implementation; and confirmation.

At the awareness stage, the individual is first exposed to the innovation. In the persuasion stage the individual becomes interested and obtains more information, which leads to the decision point. Once the decision is made (assuming the innovation is not rejected), the implementation stage begins when the innovation is used and experience gained. At the confirmation stage the individual decides either to continue using the innovation or to discard it.

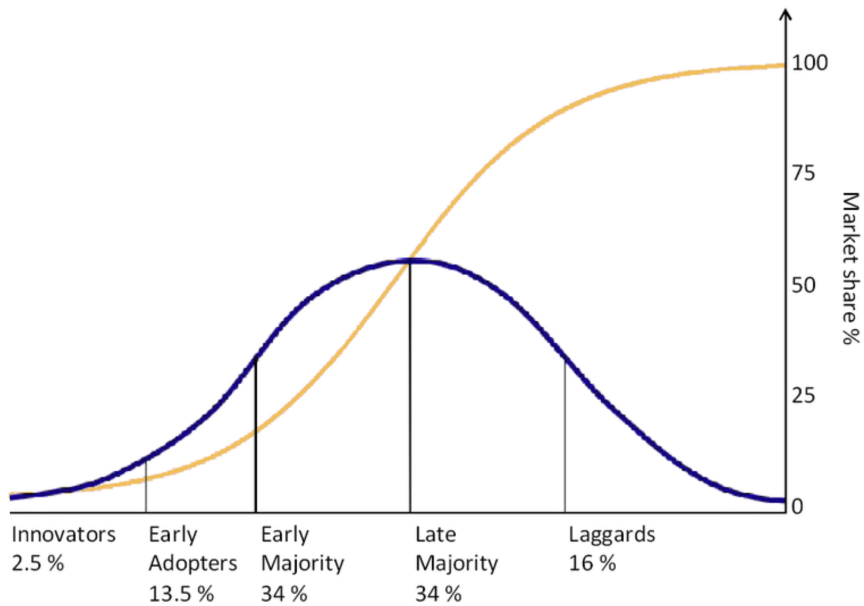
Not all individuals will adopt innovations at the same rate. Rogers defined five categories of individuals based on their tendency to adopt new products. These categories include:

- Innovators. These are the first people to adopt a new product – the first person on the block with the HD TV and Blue Ray disk player. They are willing to take risks, tend to be younger with reasonable incomes.
- Early adopters. These are the second category to adopt new products. They tend to be opinion leaders and again tend to be younger, well educated, have a high social status and reasonable incomes.
- Early majority. These people have a longer time of adoption, and are less of risk takers. Products need to be mature and well proven before this group will adopt them.
- Late majority. These people tend to adopt after the majority of society. They approach new products with a high degree of scepticism. They also tend to have lower social status, less financial flexibility and are followers rather than opinion leaders.
- Laggards. These are the last group to adopt technologies. They tend to be older and high a high resistance to change.

[2] Rogers, E. (1962) *Diffusion of innovations*. Free Press, London, NY, USA

Exhibit 1 shows the approximate size of these five groups. The exhibit also shows the “S” curve of adoption of new technology. The shape of the curve is driven by the relative speed with which each of the five segments adopt new technology.

Exhibit 1: Product Diffusion Curve



The product diffusion curve also provides some insights about the types of marketing program activities that are appropriate at each stage of adoption.

When introducing a new product, the market is primarily the innovators and early adopters. These people need to become aware of the technology, and require good information to help them evaluate and make the decision. Appropriate utility activities include demonstration projects to build experience with the product and to develop credible data on its performance. Utilities also have a strong role to play in raising awareness of the product, especially as they are often considered a more credible source of information than the vendors.

At the early majority stage, incentives are added as a key element to speed the adoption of the technology. The incentives serve to improve the economics of the decision, but they also are a very powerful way to raise awareness of the product, and provide credibility (if the utility is willing to help fund this product, it must perform).

At the late majority, labelling (including “premium labels” such as ENERGY STAR) are important as well as ongoing marketing and public education.

Finally, the laggards are not likely to make decisions to adopt the new technology on their own. Codes and Standards become the most effective tool as they take the older technologies off the market.

2.2 Market Barriers

Diffusion theory provides the "big picture" of the process to transform the market for a specific product, and it also provides general guidance of the types of utility activities that are appropriate at each stage of transformation.

The second conceptual model more specifically addresses market barriers, and again is useful to help in development of utility DSM programs. This approach is referred to as the "Five A's", and has been used by Natural Resources Canada and B.C. Hydro to aid in the development of program strategies and tactics.[3] The Five As are:

Availability. Is the product or technology readily available on the market? This includes not only the availability of the physical product, but also information such as performance, reliability and etc. This should consist of more than just manufacturers information, and includes third party evaluations and case studies, test standards and etc. The utility can play a key role by undertaking demonstration and pilot projects, and providing a third party case study to document the performance of the product under actual conditions.

Awareness. Is the market aware of the product? The market includes both the end users of the technology and the distribution channels. Awareness includes the benefits and costs of the product, Again the utility can play a strong role in the introduction of a new product by providing training for the distribution channels, sales aids such as POP materials, and advertising and promotion to the end user.

Accessibility. Is the product easily accessible to the customer? In the retail distribution channel, is the product and its benefits prominently displayed, and is the product available throughout the province. In the case of the plumber distribution channel, is the product stocked by the plumber and "on the truck". A large component of the replacement market occurs on product failure, and speed of replacement is paramount. For new construction, is the product available in sufficient quantity, and are there sufficient trained trades to install the product.

Affordability. Is the product affordable? Affordability includes not only the payback to the customer, but also the incremental cost, as many customers are "cash strapped" and will choose the lowest cost product regardless of the expected payback on the additional expense.

Acceptability. Does the product meet the needs of both the end user and the distribution channels? For the customer, this includes not only achieving the expected energy savings, but also the performance and reliability of the product. For the distribution channels, acceptability includes meeting the profitability expectations, and well as the ease of installation and a reasonable level of "call-backs" to resolve customer issues.

[3] To the best of the author's knowledge, this framework was developed by the US consulting firm A.D. Little.

2.3 Regulations

Regulations are an important tool in Market Transformation. They are likely the only tool to address the “laggards”, but if regulations can be introduced into the product diffusion process earlier, they can significantly speed the transformation.

In British Columbia, the legislative framework for regulating appliance and water heater efficiency already exists. What is required is the development of new regulations to increase the minimum efficiency level of the product. The Ministry of Energy, Mines and Petroleum Resources (MEMPR) takes the lead and typically forms a Technical Advisory Group (TAG) to assist it in the development of the regulations. The TAG will typically include: representatives of the manufacturers, representatives of the distribution channels and relevant trades, and the affected utilities'.

As this is a consensus process, it is necessary to have all major parties agree with the regulations before MEMPR will move forward. Typically the following conditions must be met before new regulations can be considered:

- All major manufacturers can provide the product;
- The major distributors carry the product;
- All distribution channels have experience delivering the product;
- The necessary trades have experience with the product, and support its sale;
- The product performs to the appropriate level, including providing the expected energy reductions, service levels and reliability; and
- There is a valid benefit for customers.

3. Condensing Water Heaters

3.1 Description

A condensing water heater is similar to a standard efficiency gas storage water heater but has an improved heat exchanger that allows the latent heat to be extracted from the flue gas and provides a thermal “steady state” efficiency of up to 96%. However, as these are storage water tanks, and when stand-by losses, and possible flue losses are included, the effective EF will be lower. As residential condensing water heater products are not yet available on the market, there are no measured EF ratings available. For the purpose of this document, it is assumed that the effective ratings will be EF 0.80, which is the current ENERGY STAR standard for condensing water tanks.

There are condensing water tanks available for Commercial use. They appear to function well, but are relatively expensive for residential usage.

3.2 Benefit / Cost

For the purpose of this study, it has been assumed that the incremental cost to move from a conventional DWH storage tank to a condensing unit will be about $1,750. However it is anticipated that the incremental cost of the condensing tank will decrease as these tanks becomes predominant in the marketplace.

Assuming the baseline water heater has an EF of 0.57, the condensing tank is assumed to reduce natural gas consumption by 7 GJ[4] per year.

At the projected incremental cost this product is not cost effective to the customer. The B / C ratio is about 0.33. Without a decrease in the incremental cost, this technology does not provide a payback for the customer.

However, it is reasonable to expect the incremental cost to decrease. When a new, efficient product appears on the market, it is typically priced as a premium product. There are a number of costs associated with new products that must be recovered. These include:

- R&D and design costs;
- New tooling costs, especially for the heat exchangers;
- More, and more expensive materials for the tank / heat exchanger;
- Lack of manufacturing economies of scale due to low volumes; and
- Lack of distribution channel economies of scale.

As the product moves into volume production, costs tend to drop as the development costs are recovered or amortized over a larger volume of sales. Incremental material costs may remain, but often these will also decrease as product designs are refined with experience. Finally, the manufacturing and distribution costs will drop with volume production.

[4] The savings have been estimated using HOT2000. The archetype is for an EGH80 natural gas heated dwelling.

There is no data available on how the incremental costs might drop over time for the condensing water tanks. However, if we look at the furnace market, some analogies may be possible. At the time mid efficiency furnaces were last sold in B.C., the incremental cost to move from a mid efficiency furnace to a high efficiency furnace was approximately $600. The differences between a mid efficiency furnace and a high efficiency furnace appear to be more complex than for a condensing water heater. For the purpose of this study, it is assumed that the incremental cost will decrease from the current $1,750 to $500. For the business case analysis, it is assumed that the incremental cost declines at a rate of 10% per year until it reaches $500 and then remains constant for the balance of the analysis.

4. DWH Market

There are two major components to the market place for condensing water heaters, the new construction market and the replacement market.

4.1 New Construction Market

The market model for the new construction market is summarized in Exhibit 4.1 below. It is predicated on the assumption than an average level of new construction starts will be about 22,800 per year across B.C. This is the average number of completions per year from 2000 to 2008 as reported by CMHC. The share of starts by detachment is based on the actual shares of completions in 2008. The penetration of natural gas water heaters is based on research undertaken by the author on shares in New Construction. It is assumed that there are no natural gas DWH in the apartment sector. While this is not strictly correct as there may be some in Vertical Subdivisions, the number is small and will not affect the analysis. There was no data on new mobile home installations, and this market has not been included.

Exhibit 4.1: Domestic Water Heater Market – New Construction

Forecast Starts	Detachment	Detachment Shares	Detachment Number	N. G DWH Shares	Est. DWH Sales
22,800	SFD	29%	6,612	83%	5,488
	Duplex	5%	1,140	14%	160
	RH	11%	2,508	1%	25
	Apartment	55%	na	na	na
	Total				5,673

4.2 Replacement Market

The size of the replacement market was estimated by using a capital stock turnover model. A capital stock turnover model works by estimating the population of water heaters in existing customers, and then using the average life of a water heater to estimate how many water heaters are expected to fail each year. A separate estimate was made for TGI and TGVI as the shares of natural gas water heater are different between the two companies. Exhibit 4.2 shows the data used to estimate the eligible population.

Exhibit 4.1: Domestic Water Heater Market – Replacement

Customer Base		TGI		TGVI		Popul-ation
		Det. Shr.	DWH Shr.	Det. Shr.	DWH Shr.	
TGI - 755,660 TGVI - 88,321	SFD	83.7%	90.6%	83.8%	83.0%	634,464
	Duplex	4.8%	89.9%	6.0%	83.8%	37,049
	RH	8.1%	86.2%	6.8%	6.0%	53,122
	Apartment	0.7%	66.9%	1.2%	6.8%	3,661
	Mobile	2.1%	47.0%	2.2%	5.0%	7,556
	Total					735,002

Based on a expected life of 13 years, then about 7% will be replaced each year. The replacement market is expected to be about 49,242 units per year. In total the market is estimated at approximately 55,000 water heaters per year.

5. Implementation Plan

Section 2 of this report outlined the basic concepts of Market Transformation. This section develops a plan to move Condensing Water Heaters from initial introduction through to regulation.

5.1 Pilot / Demonstration Projects and Market Preparation

As condensing residential water heaters are a new product, the first step is to determine and demonstrate the performance of the product in actual use, rather than in laboratory testing conditions. Issues of concern include: installation procedures; energy savings performance; and product reliability.

The approach suggested in this study is to develop 20 test installations. These installations should include metering and recording the natural gas usage for the existing water heater before the condensing tank is installed, and then further metering with the new tank to establish the change in consumption. If the test metering is done for a short period of time, it may also be necessary to meter the hot water usage before and after the tank change. It may be desirable to have a different plumbing firm do each installation so that a range of installation experience can be collected.

Once the pilot demonstration projects are under way, case study materials should be developed. One set of materials should be sales tools that can be used by both plumbers and retail to provide valid information on the performance of the product. Another set should cover off any installation issues to guide plumbers as they install the new technology tanks.

Finally training should be developed for the plumbing community and for retailers. For the plumbing community this may take the form of seminars (often breakfast meetings) to raise awareness, discuss installation, and provide a forum for questions and answers to understand the issues in the trade’s minds about these products. The business case assumes a small “spiff” for sales of these tanks, and this will help to increase enthusiasm.

Training will also be required for the retail distribution channel. This can often be arranged by first getting support from the head offices, and then conducting some training in the stores. It is common for retailers to hold staff meetings before the store opens, and for utility staff to provide updates as part of these meetings. A determination will have to be made if spiff’s will be offered to the retail chain. The key element of using the spiffs is likely to be the existence of dedicated sales staff who are on commission.

In parallel with the development of these pilot / demonstration projects, utility staff should be working with the water tank manufacturers, the major distributors and major plumbing companies to ensure that the product will move smoothly through their organizations. The expectation of promotional advertising and customer rebates provide a strong incentive for these businesses to work with the utility.

The focus of these activities is to prepare the ground for the Innovators and Early Adopters. They address the barriers of: availability and especially the knowledge aspects of availability; awareness in the distribution channels; and accessibility in the distribution channels.

5.2 Product Marketing

Once the basic performance data for the products has been ascertained and the distribution channels have been primed, the next step is to accelerate the marketing of the product. The business case assumes a three pronged approach for the replacement market: advertising likely including bill inserts, home shows, possible mall displays as well as media advertising; sales "spiffs" to encourage sales staff to promote the product and encourage plumbers to have condensing tanks "on the truck" so that they can sell and provide the product when responding to tank failures; and customer incentives to both raise awareness of the product; and to provide a positive benefit / cost ratio to the consumer.

A separate set of initiatives will be required for the new construction market, which is likely much more "first cost" oriented than the replacement market. For the business case, it is assumed that the utility will be operating a new construction program, and the condensing water heaters will be included in that program.

These actions will address the barriers of accessibility awareness and affordability. It is also expected that the market development activities outlined here will ensure that the major water tank manufacturers will have product, that the distribution channels will stock the product, that the trades will know how to sell and install the product, and that customers are both aware of the product and have sufficient valid information to make the decision to adopt it.

5.3 Program Timing

The current schedule from MEMPR envisions regulations for Condensing Water heaters by 2013. This is a very aggressive time-table as condensing residential hot water tanks are not yet available on the market. This study assumes a longer implementation period will be required for two basic reasons:

1. For a product to be regulated, it will require a performance and reliability track record; and
2. With an expected incremental cost of $1,750 and a 10% annual price decrease, the product will not provide a positive payback to the consumer until about 2016.

For these reasons, a 7 year program is used to move the product to Market Transformation.

Following is the schedule anticipated in this study.

Year 1: Program development and twenty pilot / demonstration projects. There is a requirement for some time to perform both "pre" and "post" metering of the tanks and to develop the necessary support material. Support material includes: case studies; installation instructions; and trade training. During this year it will also be necessary to start work with the manufacturers and distribution channels to ensure that product is available.

Year 2: This is the launch and execution of the marketing program, and on-going relations with the manufacturers and distribution channels to resolve any problems. It is assumed that about 300 tanks will be installed during the first year.

Year 3 - 7: This is the continuation of the marketing program. The assumptions are that sales will be ramp up from about 750 to 12,000 in year 7. A volume of 12,000 per year represents about 20% of the total DWH market in BC. It is thought that a 20% market share, whiles still quite low, will be adequate when supporting MEMPR regulations. This level of sales should ensure that the manufacturers and distributors have experience with, and have accepted the product.

It should be noted that, based on the initial cost estimate and the 10% per annum cost reduction, the product will not provide a benefit to the customer until year 8, the year that regulations are assumed to come into force. Prior to this year, the utility incentive is required to make the product financially viable to the customer.

Year 8: It is assumed that the MEMPR regulations come into effect at this year, and that all program activities will cease.

6. Business Case

The business case detail analysis is included in a separate spreadsheet in Appendix 1.

Exhibit 6.1 summarizes the sales ramp up for the condensing water heaters, and summarizes the associated costs. The total cost of the program over the 7 years is $26.1 million. The program is based on an incentive of $1,000 to the customer for each unit sold, and an additional incentive of $50 to the sales person (retail or plumber).

Exhibit 6.1: Program Sales and Costs ($ in'000)

	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7
Sales (units)	10	300	750	1,500	3,000	6,000	12,000
Pgm Dev /Pilot ($)	150						
Train / Retail ($)		25	25	25	25	25	25
Advertising ($)		100	100	100	100	100	100
Incentive admin ($)		6	15	30	60	120	240
Incentive ($)		315	788	1,575	3,150	6,300	12,600
Total ($)	150	446	928	1,730	3,335	6,545	12,965

Exhibit 6.2 summarizes the Benefit / Cost tests associated with the 13 years of the program (7 years of program activity and 6 years of "credit" for the market transformation). With 6 years credit, the program achieves a Total Resource Cost benefit / cost ratio of just over 1. The Utility Cost is strong a 6.8 while the RIM is reasonable for a residential program of 0.71.

Exhibit 6.2: Program B / C

	Benefit / Cost
TRC	1.01
UTC	6.77
RIM	0.71

By way of comparison, Exhibit 6.3 shows the benefit / cost tests if no credit was given for additional savings, and also shows the impact of a 20 year analysis of costs and benefits. The second column shows that, if no credit is provided, or if regulation is not achieved and condensing water heater sales drop, the program fails on all tests. The third column shows the impact of the program over a 20 year period, and shows the foregone benefit from the perspective of condensing water heaters (or an equivalent technology) not taking over during the 20 year period without a program.

Exhibit 6.3: Program B / C

	Benefit / Cost (no credit)	Benefit / Cost (20 yr)
TRC	0.59	1.22
UTC	0.55	12.01
RIM	0.32	0.76

6.1 Critical Assumptions / Success Factors:

Following are the critical assumptions necessary for the success of this program.

- Incremental cost of Condensing Water Heaters decreases. At the projected incremental cost, the product is not cost effective to the end user. The study assumes a 10% per annum cost reduction from the manufacturers / distributors. If this does not materialize, the probability of the program failing the overall benefit cost test increases.
- The business case assumes that the utility can take sole credit for moving regulations forward by 6 years. This was the minimum period that would provide a TRC of greater than 1.0 for the program. This period of credit would seem reasonable when compared instantaneous water heaters. They have been available for at least 20 years, and have major market shares in some European countries. However these products are only now gaining traction in the B.C. market. Moving a new product from commercializing to regulation over a period of 7 years would not be possible without strong support from the utility.

6.2 Business Case Summary

The business case assumes a seven year program by the utility which includes both incentives and marketing. The total cost of the program over 7 years is $26.1 million with a net present value of these costs of approximately $18.25 million. The savings in natural gas over the 13 years of analysis (for which the utility would receive credit) is 32 million GJ of natural gas. The net present value of these savings is $124 million while the net present value of the costs, including both customer costs and utility costs) is $122 million. The TRC Benefit Cost ratio of the program to society is 1.01.

The program will not be cost effective unless the utility receives credit for savings after the regulations are passed. This analysis shows that the TRC would be only 0.59 and the Benefit / Cost to the utility would be 0.55.

7. Summary

This paper outlines a strategy to move a new technology, condensing residential water heaters, from product introduction to regulation.

The strategy includes a preliminary year of pilot projects to obtain actual field experience with the technology, including installation experience, product performance, and energy savings. Data from these pilot projects will be used to develop customer, marketing and trades training materials. The second year will include a full program launch with customer and trade incentives and strong advertising and awareness promotion. It is thought that after 6 years of marketing promotion and incentives, condensing water heaters will have about a 20% market share which will be sufficient to support MEMPR developed regulations to remove less efficient products from the market.

This program will not be cost effective unless Terasen Gas is provided with credit for load reduction that occurs after the water heater regulations come into effect. The business case shows that, without this credit, the TRC is only 0.59, and the Utility Cost benefit is 0.55. This is not a viable investment for Terasen Gas's DSM program.

Further analysis determined that Terasen Gas would need to receive credit for an additional 6 years of savings. This additional savings results in a TRC of 1.01 and a UTC of 6.77, which makes the program viable from the perspective of both the utility and society.

Providing 6 years of post regulation credit for the program appears reasonable. This essentially assumes that, without the support of this marketing program, MEMPR would not be able to pass regulations until some date after year 13. Considering the example of instantaneous water heaters. They have been available for over 20 years, but are just now starting to gain traction in the marketplace. There is no reason to think that condensing water heaters will gain market share any faster without strong utility support.

The total cost of this program to Terasen Gas is estimated at $26.1 million, and it is expected to reduce natural gas requirements by 32 TJ over the 13 year life of this analysis.

The two critical success factors for this program are:

- the incremental cost of the Condensing water heater decreases as forecast in the business case: and
- the utility obtains credit for savings that occur after the enactment of regulations by MEMPR .

DRAFT ORDER

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc.
2009 Annual Energy Efficiency and Conservation Report

BEFORE:

(Date)

WHEREAS:

"Companies")

A. On May 28, 2008, Terasen Gas Inc. ("TGI") and Terasen Gas (Vancouver Island) Inc. ("TGVI") (collectively the "Companies") filed their application for Energy Efficiency and Conservation ("EEC") for 2008-2010; and

B. On April 16, 2009, the Commission issued Order No. G-36-09 and Decision (the "EEC Decision") approving EEC funding for TGI and TGVI for 2009 and 2010; and

C. On November 26, 2009, the Commission issued Order No. G-141-09 approving the TGI 2010-2011 Negotiated Settlement Agreement and Order No. G-140-09 TGVI 2010-2011 Negotiated Settlement Agreement approving further EEC funding for 2011 for both Companies; and

D. The EEC Decision on page 42 directed the Companies to file annual EEC Reports on all EEC initiatives and activities, expenditures and results by the end of the first quarter of the following year-end and for each year of the funding period; and

E. On March 31, 2010, the Companies filed their 2009 EEC Annual Report; and

F. The Companies seek Commission acceptance of their 2009 EEC Annual Report; and

G. The Companies request approval for the attribution of savings from regulation to be on a case-by-case basis; and

H. The Companies also seek approval for the attribution of 6 years of post-regulation savings to a Condensing Water Heater Initiative to support government's proposed minimum efficiency threshold of 0.80 EF for residential water heaters; and

I. The Commission has reviewed the 2009 EEC Annual Report and orders the following.

NOW THEREFORE the Commission orders as follows:

1. The 2009 EEC Report is accepted.

2. The attribution of savings from regulation to be on a case-by-case basis is approved.

3. The attribution of 6 years of post-regulation savings to a Condensing Water Heater Initiative is approved.

DATED at the City of Vancouver, In the Province of British Columbia, this day of <MONTH>, 20XX.

Attention: Ms. Erica M. Hamilton, Commission Secretary

Dear Ms. Hamilton:

Re: FortisBC Energy Inc. ("FEI") and FortisBC Energy (Vancouver Island) Inc. ("FEVI") (collectively the "Companies")
Energy Efficiency and Conservation Program - 2010 Annual Report

British Columbia Utilities Commission (the "Commission") Decision dated April 16, 2009 and Order No. G-36-09 Compliance Filing

---

On April 16, 2009, the Commission issued its Decision and Order No. G-36-09 ("Decision") on the Companies' Energy Efficiency and Conservation ("EEC") Application approving funding for FEI and FEVI for 2009 and 2010 programs.

In the Decision, the Companies were directed to file annual EEC report on all of the EEC initiatives and activities, expenditures, and results by the end of the first quarter following year-end.

Further funding for 2010-2011 was approved for each of the Companies in their respective 2010-2011 Revenue Requirements Application ("RRA") Negotiated Settlement Agreements approved by the Commission on November 26, 2009 for FEI by Order No. G-141-09 and FEVI by Order No. G-140-09.

Pursuant to the Decision, the Companies enclose their second annual report, the EEC Annual Report for 2010 (the "Report"). The Companies respectfully request that the Commission review the majority of the Report and raise any associated inquiries in the regulatory process that will be established for the Companies' upcoming Revenue Requirements Application, which will be filed with the Commission by May 2011. The Companies will file the Report as part of its RRA; therefore, the Companies believe that it is most efficient to consolidate the review of the 2010 EEC activity in the same process where the Companies will be seeking further funding for 2012-2013, as there is bound to be overlap in the substance of any inquiries.

The only exception to this approach to reviewing the Report is with respect to the use of EEC funds to provide an incentive to the customer to offset the cost of buying a natural gas vehicle (e.g. truck) versus the standard diesel or gasoline option. The information with regard to EEC funds being used for Natural Gas Vehicles ("NGV") is contained in the section of the Report relating to Innovative Technologies Program Area funding (Section 10.2). The

Companies wish to have this addressed at the earliest possible date for the reasons discussed below.

In the Decision accompanying Order No. G-6-11, dated January 14, 2011, relating to the interim approval of a Compressed Natural Gas service agreement with Waste Management, the Commission raised an issue about the Companies' provision of incentive funding for NGV initiatives. The Companies are of the view that NGVs are a part of the approved incentive funding for the innovative technologies program area, and the use of incentive funding for NGVs meets the requirements established by the Commission to ensure EEC funding is cost-effective. However, it has been necessary for the Companies to hold up new EEC incentive funding for NGV pending clarification of this issue. It is important that the Companies and the Commission reach concurrence on this issue in a timely manner, so that we can move forward on new projects that provide benefits to existing natural gas customers and fleet owners while helping to meet the energy objectives of the provincial government.

The Report (at page 201) provides additional explanation that was not available in the record of the NGV application proceeding as to why the Companies believe they have acted according to past Commission decisions. In this regard:

- We have made specific reference to past decisions, and have explained how the incentive funding was subjected to a transparent review process to ensure its cost-effectiveness.

- We have also obtained input from stakeholders involved in the EEC review process established to oversee the use of EEC funding that were aware of, and endorse, the use of incentive funding for NGVs. When this issue was discussed at the most recent EEC stakeholder group meeting (March 15, 2011), a number of participants at the meeting again verbally expressed support for the Companies' position and a desire for the Companies to proceed with cost-effective funding for NGV. Members of the EEC stakeholder working group and customer groups have since provided letters contained within the Report supporting the Companies' position that EEC funds for NGV have been used appropriately, within the established guidelines (Please see letters of support included in Appendix F).

It is the hope of the Companies that, with the benefit of this additional information, the Commission will be able to quickly provide confirmation of the Companies' compliance with past orders without additional process. Alternatively, if the Commission is unable to provide this confirmation, the Companies respectfully request that the Commission provide its concurrence for the Companies to proceed with EEC incentive funding to customers to offset the incremental cost of buying an NGV over a standard gasoline or diesel vehicle. The Companies respectfully submit that this concurrence to proceed could also be provided without additional process since the benefits of EEC incentive funding for NGV are clear, accord with Commission-approved EEC principles, exceed the Commission-approved tests for evaluating EEC funding, and have the support of stakeholders.

If you have any questions regarding this submission in general please contact the undersigned or Sarah Smith, Manager, Energy Efficiency and Conservation at (604) 592-7528. For NGV related questions, please contact Mark Grist, Manager, Business Development at (604) 592-7874.

Yours very truly,

FORTISBC ENERGY INC.

1 REPORT OVERVIEW

1.1 Background

FortisBC Energy Inc. ("FortisBC" or "FEI", formally known as "Terasen Gas Inc." or "TGI") and FortisBC Energy (Vancouver Island) Inc. ("FEVI", formally known as "Terasen Gas (Vancouver Island) Inc." or "TGVI") (collectively referred to as "the Companies") have been involved with Energy Efficiency and Conservation ("EEC") since the 1990s. The Companies' earlier EEC activities were referred to in previous regulatory filings with the British Columbia Utilities Commission (the "Commission" or the "BCUC") as Demand Side Management ("DSM") activity. On May 28, 2008, TGI and TGVI collectively filed their Energy Efficiency and Conservation Programs Application (the "EEC Application"), seeking approval of increased funding of EEC programs for the timeframe of 2008-2010. On April 16, 2009, the Commission released its decision on the EEC Application and Order No. G-36-09[1] (the "EEC Decision"), which approved funding in aggregate of $41.5 million ($34.4 million for TGI and $7.1 million for TGVI). A further $32.35 million in EEC expenditure for TGI and $6.1 million for TGVI was approved as part of the Commission Orders G-141-09[2] and G-140-09[3], dated November 26, 2009, approving Negotiated Settlement Agreements ("NSAs") in the 2010 – 2011 Revenue Requirement Applications for TGI and TGVI respectively.

Similar to the Companies' 2009 EEC report, this EEC Annual Report (the "Report") outlines the Companies' actual (for 2010) and planned (for 2011) activities and associated expenditures related to these three Orders. As the Report will describe, the Companies are making prudent and appropriate use of the approved funds to promote EEC activities, which help customers save money and at the same time support the province's energy policy goals.

The following sections outline the purpose of this Report and its content.

1.2 EEC Annual Report: Taking Accountability and Taking Stock of Progress

This Report serves two purposes.

First, this Report demonstrates that the Companies are meeting the accountability mechanisms accepted by the Commission in Order No. G-36-09. One such mechanism was the requirement to file EEC Annual Reports, which states as follows:

> *"A requirement that Terasen submit annually to the Commission, by the end of the first quarter following year-end, for each year of the funding period, a report on all EEC initiatives and activities, expenditures and results for TGI and TGVI."*[4]

The first EEC Annual Report was filed with the Commission on March 31, 2010, outlining the 2009 actual activity results and 2010 planned activities. This Report is the second EEC Annual

[1] Appendix C: DSM Regulation and BCUC Orders
[2] Ibid
[3] Ibid
[4] EEC Decision, page 2

Report since accountability mechanisms were accepted by the Commission as part of Order No. G-36-09.

Second, this Report provides the evaluation and assessment of the Companies' success with activities in each Program Area and on a portfolio level as requested in the EEC Decisions. Specifically, the Commission required the following information be included in the EEC Annual Reports:

> *"The Commission panel accepts Terasen's accountability undertakings, and considers that, while the proposal to evaluate the EEC project using the TRC test at the Portfolio level has been accepted, TRC calculations for each program area, initiative and measure should also be included in the accountability reporting as a means of assessing the components of the Project and their ongoing effectiveness.*
>
> *Commission Panel directs that the annual EEC Report include the following:*
>
> - TRC, RIM, UC, and Participant test calculations of DSM at the Program Area initiative and individual measure levels in addition to the total Portfolio level reporting. Reporting of the Residential & Commercial EE program areas should also be made at the New Construction and Retrofit levels.
> - Any inter and intra Program Area initiative funding transfers, with supporting rationale, and the impact of such transfers on the transferor and transferee Program areas, initiatives, and measures as the case may be.
> - Data for fuel switching programs should be tracked in a manner which allows for reporting types of fuels replaced by natural gas, including estimated GHG impacts.
>
> *The Commission Panel also directs Terasen to include in its annual EEC Report to the Commission a discussion of its internal data gathering, monitoring and reporting control processes. The discussion should include a description of how these processes ensure that funds expended and the statistical results of the programs implemented are completely and accurately recorded and monitored, including any related internal check and audit processes. The report should also discuss how Terasen has measured or estimated the results of the EEC expenditure initiatives."*[5]

The Commission also directed the Companies to redesign and resubmit the Attribution to Regulatory Change with its next EEC Annual Report, "reflecting the provisions of the DSM regulation which come into effect for [the Companies] on June 1, 2009"[6]. In the 2009 EEC Annual Report, the Companies requested Commission approval of attribution of savings from regulation to be on a case-by-case basis. The Companies also sought approval to attribute six years of post-regulation savings to a market transformation initiative for condensing water heaters. The Companies have not received approval from the Commission on attribution matters; therefore, these two requests for approval related to attribution matters have not been implemented. The Companies have not made any requests for approval on any matters related to attribution in this report. Any requests for attribution-related approvals will be incorporated

[5] Ibid, page 42
[6] Ibid, page 40

into the next request for EEC funding approval, to be submitted with the Companies' next Revenue Requirements Application in the spring of 2011.

This Report provides TRC calculations for each program, Program Area, and Portfolio in Section 2. The remaining California Standard Practice Test results (RIM, Participant Cost Test, and Utility Cost Test) are provided in Appendix B.

1.3 Organization of the EEC Annual Report

The Companies believe this EEC Annual Report not only satisfies the requirements of the EEC Decision, but also provides a detailed overview of the Companies' efforts to implement a comprehensive EEC initiative and identifies the Companies' plans for EEC activities in 2011, with a view to giving stakeholders an opportunity to comment on the Companies' planned activity.

This Report is organized in the following sections:

Section 1: Overview

- Provides a high-level background, the reason for the report, and this summary of the organization of the report.

Section 2: EEC Activity Overview

- Provides a summary of actual 2010 expenditures and outcomes, an organizational chart for the EEC team, program area funding transfer information, a forecast for known 2011 expenditures and outcomes, and a discussion of the adequacy requirements in the DSM Regulation

Section 3: Residential Energy Efficiency Programs

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the Residential Program Area

Section 4: Commercial Energy Efficiency Programs

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the Commercial Program Area

Section 5: High Carbon Fuel Switching Programs

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for High Carbon Fuel Switching Programs

Section 6: Conservation for Affordable Housing Programs

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the Conservation for Affordable Housing Program Area

Section 7: Joint Initiatives

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the Joint Initiatives Program Area

Section 8: Conservation Education and Outreach

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the Conservation Education and Outreach Program Area

Section 9: Industrial Sector Programs

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the Conservation Education and Outreach Program Area

Section 10, Parts 1 and 2: Innovative Technologies

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the Innovative Technologies Program Area, including a discussion of the Companies' provision of EEC funding to customers to help them to offset the incremental costs of natural gas vehicles over conventionally fuelled vehicles

Section 11: Enabling Activities

- Provides both summary and detail regarding actual 2010 and forecast known 2011 expenditures and outcomes for the enabling activities that support the work of the EEC portfolio as a whole

Section 12: EEC Stakeholder Group Activities

- Provides information regarding EEC Stakeholder Group activities completed in 2010 and 2011

Section 13: Conservation Potential Review

- Provides information about the methodology and delivery schedule for the Companies' Conservation Potential Review study

Section 14: Data Gathering, Reporting and Internal Control Processes

- Provides an update on the implementation of the Companies' DSM Tracking System, a high level description of the Companies' internal approval process for programs, and a high level summary of the findings of the Companies' Internal Audit Services' annual review of the EEC initiative

Section 15: EEC Principles

- Provides a discussion of how the Companies' 2010 and planned 2011 EEC activity meets the Guiding Principles that were initially laid out in the original EEC Application in 2008 for the EEC initiative

1.4 Summary

This report is intended to meet one of the accountability mechanisms originally put forth by the Companies in the EEC Application. It is intended to detail completed 2010 activity, and planned 2011 activity, in a transparent and open manner. The Companies have laid a good foundation in 2010 for future EEC activity, and look forward to implementing and continuing to grow the EEC initiative through 2011 and beyond.

2 OVERVIEW OF 2010 PROGRAM ACTIVITIES

In this Section, the Companies will describe their EEC activities, associated expenditures, and the Total Resource Cost ("TRC") test results on an overall portfolio level in 2010. This section will also provide the TRC results for both the conventional EEC portfolio (defined as all EEC activity outside the Innovative Technology Program Area), and for the Innovative Technology Program Area, which latter program area, in accordance with Commission Orders No. G-140-09 and G-141-09, must have a standalone TRC that is 1.0 or greater.

2.1 TRC Results on Portfolio Level

For FEI and FEVI, the TRC level for the entire EEC portfolio, including both conventional EEC activities and innovative technologies, is at 1.1, meeting the Commission's order as set forth in Commission Order No. G-36-09.

Table 2-1: 2010 Overall EEC Portfolio Results

Utility	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
FEI	10,548	5,261	15,809	(17,507)	532,929	1.1
FEVI	870	1,022	1,892	22,389	169,030	0.9
Total	**11,418**	**6,283**	**17,701**	**4,882**	**701,959**	**1.1**

The "Annual Energy Savings" number for FEI is negative, meaning from a simple annual perspective, the Companies' 2010 activity resulted in natural gas load growth. This is primarily due to the impact of Natural Gas Vehicles ("NGVs"), which is discussed in some detail in Section 10. It should be noted that NGVs bring load onto the natural gas system, but they displace higher carbon diesel fuel; displaced volumes of diesel fuel are not shown in the table above.

The table below further shows results for each individual program area. One of the program principles put forth in the EEC Application was that of universality; that is, programs should be available to all the Companies' customers. Although the TRC results for the residential and affordable housing program areas are below 1.0, these are crucial areas of activity for the Companies. The Companies have about 850,000 residential customers, which form the bulk of the Companies' approximately 950,000 total number of customers. In creating a culture of conservation in British Columbia, these residential customers are crucial to supporting such a culture. Programs for affordable housing (for low-income customers) are a requirement as outlined in the DSM Regulation for adequacy. These two program areas are discussed in more detail in Sections 6 and 2.7, respectively. Compliance with DSM Regulation requirements for adequacy is discussed below in Section 2.7. Programs for residential customers and customers living in affordable housing are also needed in order the meet the Companies' principle of universality. More discussion of the Companies' EEC program principles can be found in Section 15.

Table 2-2: 2010 Overall EEC Program Area Results

Utility	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC

2.2 TRC Result for the Conventional Program Area

As Table 2-3 demonstrates below, for the conventional EEC portfolio, which includes all program areas except Innovative Technologies, the TRC score is at 1.0.

Table 2-3: 2010 Overall Program Portfolio Results – Conventional EEC Portfolio

Utility	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
FEI	4,732	5,256	9,988	145,404	1,259,325	0.9
FEVI	727	1,022	1,749	20,706	149,185	1.1
Total	**5,459**	**6,278**	**11,737**	**166,110**	**1,408,510**	**1.0**

The reasons why the Conventional EEC portfolio for FEI had a TRC level of 0.9 include the complex environment in which the Companies were operating the EEC initiatives in 2010, the relatively low gas prices, and the increase in enabling activities that do not necessarily contribute to energy saving. Each is explained below respectively.

First, both the financial crisis and the changes in provincial government leadership impacted the customers' focus on EEC activities. The financial crisis that started in 2007 continued to affect the economy in British Columbia in 2010. The Companies' commercial customers were constrained by tighter access to credit, and since the customers' focus was on keeping their businesses going during challenging times, it was more difficult to get them to spend more of their already constrained funds on energy efficiency and conservation. For residential customers, concerns about the impact on their employment from the economic challenges the country was facing, together with the end of the federal Home Renovation Tax Credit, had reduced customer activity in this program area. Moreover, uncertainty about the direction of the provincial government resulting from the changes in the Liberal and NDP leaderships also negatively impacted customer focus on EEC by increasing customer uncertainty about the longevity of government programs such as LiveSmart BC.

Second, relatively low gas prices not only made it harder to get customers' attention focused on energy efficiency and conservation, but was also a significant factor in the slightly negative TRC. The TRC is calculated based on avoided cost of gas resulting from undertaking EEC activity, divided by the cost of undertaking that activity. The avoided cost of gas used to calculate the results of the EEC activity presented in the 2009 EEC Annual Report averaged $13/GJ over the period 2009 to 2040; the 2010 results were based on an average cost of gas of $10.61/GJ over the period 2010 to 2041. Using an avoided cost of $13/GJ, the conventional portfolio returns a TRC result of 1.3, while the combined conventional and innovative technology portfolios return a TRC result of 1.2. This illustrates the challenge of using a market-based avoided cost to analyze the value associated with a utility's DSM activity and reflects a very narrow view of the benefits that accrue from that activity. The Companies' next submission for approval of future EEC activity in the 2012-2013 Revenue Requirements Application intends to address this issue, and should result in calculations of the benefits of future portfolios of EEC activity showing positive results.

With the current climate of low natural gas prices, the price of natural gas cannot be considered a driver of energy efficiency upgrades to any great extent, except in those customers with very high gas consumption or where natural gas is a significant input into some business process. Although the current price of gas can make it a challenge to find cost effective energy saving measures to incent, it reinforces the need for energy efficiency programs in order to achieve the government's energy and climate change objectives. With low natural gas prices, some customers are not motivated to save without utility encouragement. Energy Efficiency and Conservation programs then become necessary to drive long term market transformation towards improved efficiency.

Third, the number of activities to which the Companies do not attribute energy savings, but that are important enablers of energy efficiency activity were stepped up considerably in 2010.[7] For these activities, the Companies include the costs of undertaking them with no accompanying energy savings. For instance, expenditures on Conservation Education and Outreach programs more than doubled in 2010, from approximately $600,000 in 2009 to approximately $1.6 million in 2010. Other enabling portfolio level costs also grew from about $1.56 million in 2009 to $3.2 million in 2010. The Companies will be reaping the benefits of some of these enabling activities, such as the implementation of the DSM Tracking System, for years to come.

Despite these three limiting factors, the Companies are pleased with the results from the year's activities, as these results comply with program principles and meet most of the requirements for adequacy in the DSM Regulation.

2.3 TRC Result for Innovative Technologies

In Orders G-141-09 and G-140-09 regarding the Negotiated Settlement Agreements for the TGI and TGVI 2010-2011 Revenue Requirements respectively, the Commission directed that:

> *"…Innovative Technology Programs will be managed by TGI {TGVI} as a separate segment of the overall portfolio to have a weighted average TRC of 1.0 or more."*

In accordance with this direction, the overall TRC result for the Innovative Technology program area, presented in Table 2-4, shows a positive result of 1.2. This is largely due to the inclusion of avoided high cost diesel purchases arising from NGV activity in the Innovative Technologies program area. This program area is discussed in more detail in Section 10.

7 These activities are further described in the "Enabling" and "Conservation Education and Outreach" sections of this Report.

Table 2-4: Innovative Technology Overall Program Portfolio Results

Utility	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC

FEVI	143	0	143	1,683	19,845	0.3
Total	**5,959**	**5**	**5,964**	**(161,228)**	**(706,551)**	**1.2**

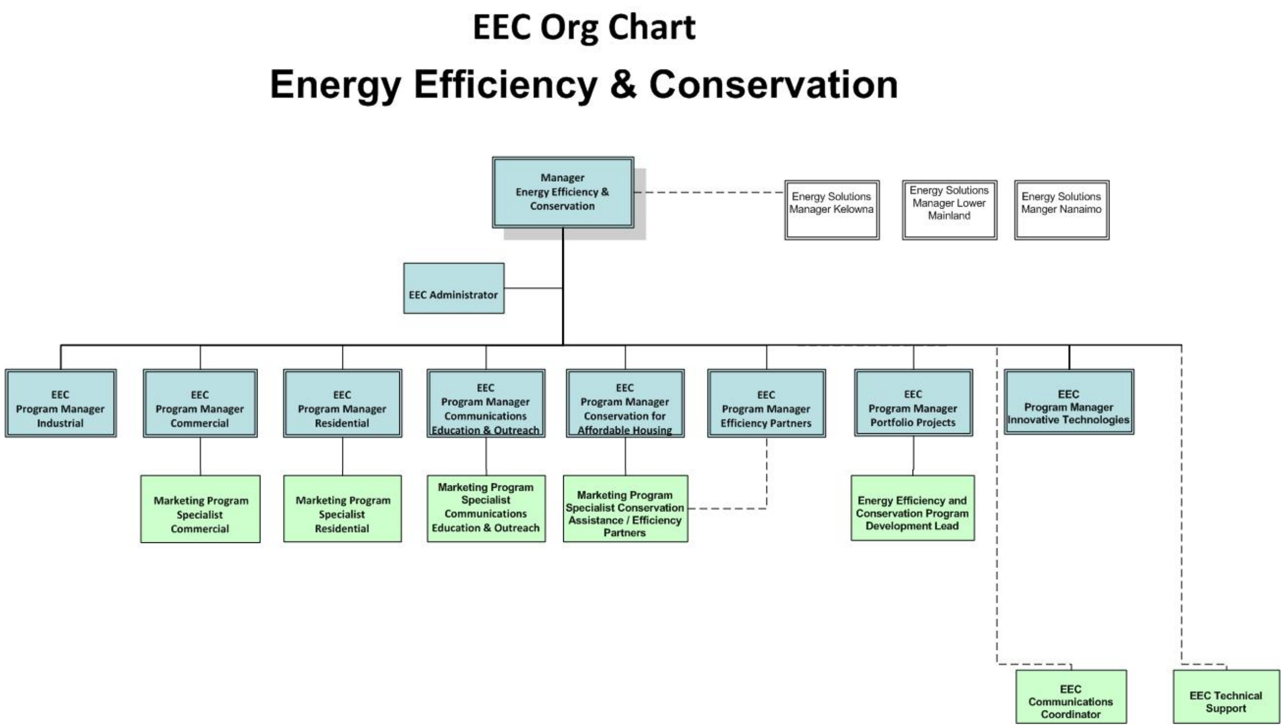
2.4 2010 EEC Activity – EEC Team Structure

The Companies' EEC activities in 2010 built upon the groundwork laid in 2009. In 2010, the Companies moved closer to enjoying a full year of EEC activity; however, it should be stated that a lack of human resources to design and deliver all the EEC initiatives identified by the EEC team as viable activities for the Company is hampering our ability to deliver all potential EEC programs. For instance, there are a number of potential program opportunities, especially in the commercial program area, that existing program staff do not have the time to address and develop. The Companies plan to address this shortage of human resources, which will be implemented in the second quarter of 2011.

However, responding to approvals of EEC funding granted in Orders G-141-09 and G-140-09 for innovative technologies and for interruptible industrial customers, the Companies have added dedicated program managers for these specific program areas, and these human assets were in place by the end of Q2 2010. In addition to the innovative technologies and industrial program managers, the Companies also added three EEC energy solutions managers in the Lower Mainland, Interior, and Vancouver Island service areas with the intent of providing more one-on-one support to commercial customers to encourage them to participate in commercial programs. More information about the activities of these energy solutions mangers can be found in Section 11.

The Companies' expenditures on labour for EEC activities in 2010 were $1.6 million. The Companies' current organization chart for the group primarily responsible for EEC activities is presented in Figure 2-1 below:

Figure 2-1: FEI/FEVI 2010 EEC Organizational Chart



2.5 2010 EEC Activity – Program Area Funding Transfers

FEI has approval for a total of approximately $26 million for EEC activities and programs in 2010. This is outlined in the table below.

Table 2-5: FEI 2010 Approved EEC Expenditures vs Actual EEC Expenditures

FEI - Program Areas	2010 Approved Expenditures ($000's)	2010 Actual Expenditures ($000's)	Variance ($000's)
Conventional EEC Activity	$23,510	$9,959	-$13,551
Innovative Technologies Activity	$2,334	$5,821	$3,487

While FEI under spent quite significantly compared to approved levels in the conventional EEC portfolio, there was more invested in innovative technologies than the Companies had put forward in the 2010-2011 Revenue Requirements Application (“RRA”). In 2010, FEI transferred $3.487 million from the conventional EEC program area to the innovative technologies program area to cover this additional investment. This transfer applies to FEI only. Such transfer is consistent with Commission Order No. G-36-09, which allows:

"…any inter and intra Program Area Initiative funding transfers, with supporting rationale, and the impact of such transfers on the transferor and transferee Program areas, initiatives and measures as the case may be."

There is no impact to the transferor program area from the transfer to innovative technologies as conventional EEC activity was under spent compared to approved levels. However, there is a positive impact to the transferee program area in that the funding transfer allowed an expansion of the innovative technology program area. The detailed rationale for this transfer is described in Section 10.

As indicated in the 2010-2011 RRA, we have a true-up mechanism in place so only actual spend on EEC activities are charged to the EEC deferral account and ultimately get reflected in future delivery rates. The deferral account captures differences between approved budget and actual expenditures. In the upcoming RRA, to be filed with the Commission in May 2011, the Companies will be reviewing the EEC deferral account and may propose changes to the mechanism to address variances that may arise under multiyear RRAs.

2.6 2011 Planned Activities

Tables 2-6, 2-7 and 2-8 below show forecasted results for currently planned 2011 activity. More detail about currently planned 2011 EEC activity and associated expenditures can be found in the section of the report that deals with each individual program area. As it is fairly early in 2011, activity will grow and change over the course of the year as programs are modified to optimize participation and energy savings, and as additional opportunities present themselves to the Companies. The information presented below should be considered preliminary in nature.

Table 2-6: 2011 Overall EEC Program Portfolio Results

Utility	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC

Total	**13,292**	**13,607**	**21,286**	**902,496**	**1.1**

Table 2-8: 2011 Overall Program Portfolio Results – Conventional EEC Portfolio

Utility	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
FEI	7,772	11,262	19,034	222,383	2,053,338	0.7
FEVI	1,590	2,220	3,810	24,831	199,060	0.8
Total	**9,362**	**13,482**	**22,844**	**247,214**	**2,252,398**	**0.7**

In the Companies' next request for EEC funding authorization in the next RRA, it is the intent of the Companies to pursue a methodology for cost-benefit analysis that should see the Companies' EEC portfolio TRC ratio increase to over 1.0. The relatively low cost of gas being used by the Companies to calculate the TRC ratio is negatively affecting TRC results.

Table 2-9: 2011 Innovative Technology Overall Program Portfolio Results

Utility	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Total for Incentive and Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	TRC
FEI	3,926	114	4,040	(225,989)	(1,350,618)	1.8
FEVI	5	10	15	61	718	0.2
Total	**3,931**	**124**	**4,055**	**(225,928)**	**(1,349,900)**	**1.8**

As with 2010 activity, the 2011 Innovative Technologies portfolio includes funding for NGVs.

2.7 Compliance with Adequacy Requirements in the Demand Side Management Regulation

The DSM regulation (attached as Appendix C) has the following requirements for a utility's portfolio of EEC activity to be considered adequate:

"A public utility's plan portfolio is adequate for the purposes of Section 44.1 (8) c of the Act only if the plan portfolio includes all the following:

a) A demand-side measure intended specifically to assist residents of low-income households to reduce their energy consumption;
b) If the plan portfolio is introduced on or after June 1, 2009, a demand-side measure intended specifically to improve the energy efficiency of rental accommodations;
c) An education program for students enrolled in schools in the public utility's service area;
d) If the plan portfolio is submitted on or after June 1, 2009, an education program for students enrolled in post-secondary institutions in the public utility's service area."

The Companies believe that by the end of 2011, when the currently approved funding envelope ends, they will have met all the requirements for adequacy. There are a number of programs for low income customers, which are discussed in their own section (see Section 6). A number of the commercial programs are utilized by owners of rental buildings: the Efficient Boiler program, the Light Commercial Boiler program, and the Efficient Commercial Water Heaters program. The Fireplace Timer Pilot program is also available to rental buildings. More information about these commercial programs available to rental buildings can be found in Section 4. Similarly, all residential programs are available to rental properties. A Multi Unit Residential Building pilot program with the City of Vancouver is underway and if successful it will be expanded across the

Companies' service territories, and would include rental buildings. In terms of education programs, the Companies fund the following initiatives for K-12 students:

- BC Green Games;
- BC Lions Energy Champion School Assembly Presentations;
- Beyond Recycling;
- Destination Conservation;
- BC Sustainable Energy Association Climate Change Showdown; and
- Environmental Mind Grind.

More information about these initiatives can be found in Section 8. The Companies have an initiative for post-secondary student engagement under development and anticipate having a project for post-secondary students in market in September 2011. Thus the requirements in the DSM Regulation for adequacy will be met.

2.8 Conclusion

Although the Companies did not reach the approved levels of expenditure for 2010, significant progress was made toward laying a strong foundation for future growth in EEC activity. The overall portfolio TRC ratio, including both conventional and innovative technologies EEC activity, was 1.1 and therefore was compliant with Commission Order No. G-36-09. The Companies have identified a need to add human resources in order to deliver energy efficiency and conservation programs to approved expenditure levels to our customers, and we look forward to adding those resources in 2011. The Companies' EEC activity will meet all the adequacy requirements in the DSM Regulation by the end of the current funding approval period in 2011.

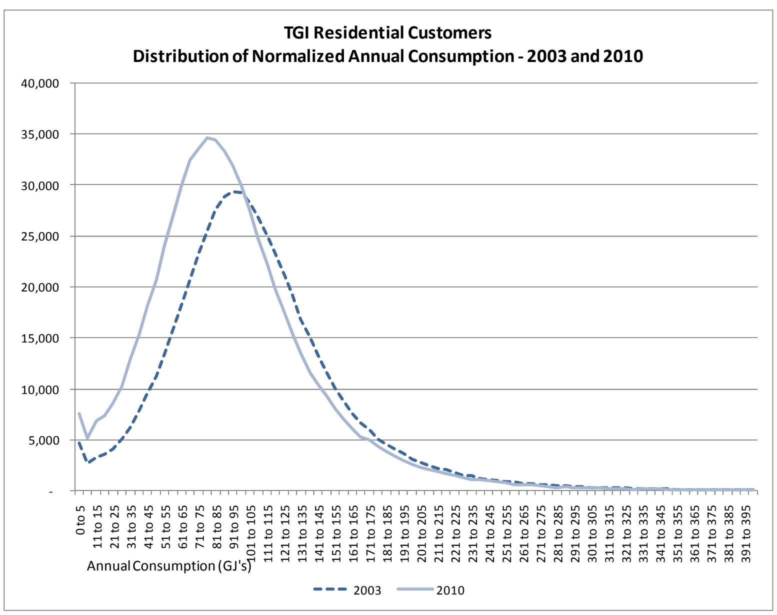
3 RESIDENTIAL ENERGY EFFICIENCY PROGRAM AREA

3.1 Overview

The Residential Energy Efficiency Program Area provides value to customers by encouraging households to reduce their overall consumption of natural gas and manage their energy bills. Residential programs serve over 850,000 households in the FEI and FEVI territories for both retrofit and new construction applications. For EEC purposes, these customers include end-use customers living in a residential single-family home, row house, townhouse or mobile home. Programs for Multifamily Dwellings are included in the Commercial Energy Efficiency Program Area under development for 2011 (please refer to Section 4).

Residential programs, in combination with the Companies' education and outreach activities, are an important component in driving the culture of conservation in the province. A recent survey[8] of BC customers emphasizes the utility's role in providing information on conservation. Three in five (62 percent) respondents would look for information on energy efficiency programs on the Internet, followed by half (50 percent) asking their utility, and about a third asking the provincial government (38 percent) and the federal government (32 percent). The ultimate goal of residential programs is to shift the overall natural gas consumption curve whereby a greater proportion of customers use natural gas more efficiently, as presented in Figure 3-1.

Figure 3-1: FEI Residential Customers Distribution of Normalized Annual Consumption – 2003 and 2010



---

[8] Residential Retrofit Market Evaluation by Angus Reid Strategies, commissioned by the Companies in January 2010.

The Companies' EEC application highlighted the findings in the 2006 CPR in that 70 percent of the Achievable Potential savings were associated with the residential sector. To that end, in Commission Order No. G-36-09 on the Companies' EEC application, the Companies received approval for residential program funding of $9.3 million over the 2008-2010 period. Furthermore, in Order No. G-141-09 approving FEI's 2010-2011 Negotiated Settlement Agreement, the Commission approved FEI's request for an extension of residential program funding to 2011 in the amount of $3.275 million. Similarly, for FEVI, in Order No. G-140-09, the request for EEC funding of $0.3 million for 2011 residential programs was approved. This funding enabled the Companies to further their EEC goals in delivering programs that enable customers to implement measures to reduce their natural gas consumption while supporting the government's GHG emissions reduction strategy.

Sections 3.1 through Section 3.3 outline the Residential Energy Efficiency Program Area goals, the program portfolio in the market to achieve these goals, 2010 program results, and the outlook for 2011. Section 3.4 provides individual program details including individual program goals, 2010 results, and the outlook for 2011.

3.1.1 RESIDENTIAL PROGRAM GOALS

The Residential Energy Efficiency Program Area encourages households to reduce their overall consumption of natural gas and helps to manage their energy bills. Residential programs deliver value through their focus on the following objectives:

- Educate customers about the advantages of energy efficiency and promote the benefits of the culture of conservation;
- Prepare and ultimately transform the market by facilitating the adoption of new energy efficient technologies through incentives and support of government regulations;
- Upgrade low efficiency systems to high efficiency systems in order to capture energy savings associated with reducing the overall consumption of natural gas;
- Support government policy, especially in relation to efficient building strategies[9] and GHG emissions reduction, through incentives and education to customers and other industry stakeholders;
- Assist trades in understanding technical requirements or other barriers associated with new product introductions and support their effective installation;
- Engage manufacturers in developing, producing, and distributing energy efficient equipment through technology support and promotional opportunities to the Companies' customer base; and
- Develop a greater awareness of the non-energy benefits of efficiency systems such as improved comfort, health, safety, property value, and reduced insurance claims. To this

[9] BC Energy Efficient Buildings Strategy: More Action, Less Energy. BC Ministry of Energy and Mines Publication, 2008.

end, promote the concept of "House as a System" or a "Whole Home" approach to efficiency.

- In support of the objectives listed above, the Companies will deliver the following:
- Cost-effective programs that optimize the proportion of incentives over administration and marketing costs while ensuring the overall EEC portfolio is above 1.0; and
- Program evaluation that confirms savings claims, provides participant feedback, and guides future program design.

3.2 2010 Residential Energy Efficiency Program Area Results

Residential programs have encouraged residential customers to reduce their annual natural gas consumption by 62,036 GJs/yr, resulting in nearly 607,000 GJs of savings over the lifetime of the measures and a significant contribution to the reduction of GHG emissions in the province. The FEI TRC was 1.0 while FEVI's equalled 0.7, likely due to lower participant numbers while incurring program deployment costs. Program area objectives were achieved through a $3.2 million investment in incentives, administration, and program communications. Of this investment, 93 percent was incentives that directly offset the customer's cost of appliance upgrade or furnace service. The table below provides program details for incentive and non-incentive expenditures, energy savings, and TRC results.

Table 3-1: 2010 Residential Energy Efficiency Program Area Results

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
2010 Residential Program Activity								
ENERGY STAR® Heating System Upgrade 2010 - FEU + LivesmartBC	2,385	86	2,471	578,285	19,145	597,430	1.1	1.0
Furnace Service "TLC" - 2010	432	79	511	No Direct Savings				
Domestic Hot Water Heaters	67	14	81	1,990	269	2,259	0.3	0.2
EnerChoice Fireplace - 2010	56	15	71	5,746	1,415	7,161	1.0	1.1
Non program specific expenses	74	35	108					
Total	**3,014**	**228**	**3,242**	**586,021**	**20,829**	**606,850**	**1.0**	**0.7**

The 2010 Residential Energy Efficiency Program Area portfolio achieved its EEC program objectives by investing over $3.2 million in energy efficiency projects. In addition to capturing 607,000 GJs of savings over the lifetime of these installed measures, program promotion furthered the culture of conservation by contributing to the market transformation of space and water heating systems through incentives and support for the introduction of government regulations, and promoting natural gas efficiency with contractors, manufacturers, and retailers as outlined below.

3.2.1 CONTRIBUTION TO MARKET TRANSFORMATION

The Companies' contribution to market transformation of space and water heating systems is substantial for both space and water heating as outlined below:

The Companies have maintained ENERGY STAR® Heating System Upgrade programs in the market since 1996, of which the most recent iteration was launched September 1, 2008 in the FEI service territory and April 16, 2009 in the FEVI service territory. This highly successful program, in collaboration with LiveSmart BC, provided incentives for over 17,000 furnaces, a contribution of $4.4 million in incentives and over 1.1 million GJs of energy savings over the lifetime of these systems. This program ended December 31, 2009 to coincide with provincial and federal government regulations requiring that all furnaces sold in Canada meet a minimum standard of 90 percent efficiency.[10] The Companies' significant outreach to consumers, trades, and manufacturers helped facilitate the industry's transition to the new regulation. Please note that although the program ended December 31, 2009, final participation counts were not available at the time of writing the 2009 report. Only applications processed in 2010 are included in the 2010 program energy savings.

The Companies are taking an active role in driving a national Domestic Hot Water ("DHW") market transformation strategy through the 0.8 EF water heater technology pilot outlined in Section 3.4.3.2. An initial step in this strategy was the 2010 launch of the 0.62 EF Efficient Storage Tank Water Heater Program, whose initial objective was compliance engagement for the introduction of provincial gas water heater efficiency act regulations that are the highest standard in Canada.[11] The program was effective in driving some manufacturers to comply with these new regulations, although it will take some time for 100 percent market adoption.

In order to promote energy efficient fireplaces that generate heat rather than being just decorative, the Companies are actively promoting EnerChoice fireplaces in partnership with the western chapter of the Hearth, Patio and Barbecue Association of Canada ("HPBAC") and are among the few North American utilities to have an EnerChoice program. Industry feedback suggests that manufacturers are more conscious of fireplace efficiency through the EnerChoice program and energy efficiency messaging that creates consumer demand.

3.2.2 COLLABORATING WITH INDUSTRY TO PROMOTE THE CULTURE OF CONSERVATION

Industry partnerships with contractors, manufacturers, retailers, and associations are key to driving program participation and fostering the culture of conservation as outlined below:

---

[10] Please refer to Appendix D for a copy of the MEMPR Enforcement Bulletin 09-03. BC Efficiency Act Standards: Gas and Propane-Fired Furnaces.

[11] Please refer to Appendix D for a copy of the MEMPR Enforcement Bulletin 09-05. BC Efficiency Act Standards: *Gas and Propane-Fired Water Heaters*.

Engaging natural gas contractors is a critical component to the success of residential programs. Program evaluation studies[12] suggest that 26 percent of program participants are made aware of programs through contractor communications, which is second only to the 29 percent of participants made aware through the Companies' bill inserts. Program kits are mailed to all contractors in the BC Safety Authority ("BCSA") database. The Companies are furthering their relationship with the trades through their partner program outlined in Section 11.2.2.

Collaboration with manufacturers of energy efficient technologies is also key to program success and market transformation. In 2009, furnace manufacturers were required to meet 0.90 AFUE federal and provincial Efficiency Act standards. In 2010, DHW manufacturers were required to meet 0.62 EF provincial Efficiency Act standards for gas water heaters. The Companies' water tank program drew attention to compliancy by providing a joint incentive to customers and contractors. Anecdotal evidence and rejected applications indicate there are still a large number of non-compliant tanks being sold. The current water heater rebate offer will, therefore, remain in market for 2011 to support the introduction of the 0.67 EF ENERGY STAR® water heaters and new technologies.

The Companies also initiated partnerships with big box retailers that have extensive marketing budgets and the ability to educate customers in a mainstream retail setting. In 2011, the Companies will further strengthen partnerships with retailers and dealer networks to promote energy efficient products and services.

Another key success of 2010 was furthering the Companies partnerships with industry stakeholders. A greater number of programs are being integrated with electric utilities and provincial and municipal governments (please refer to Section 7 Joint Initiatives). The Companies have also forged strong partnerships with industry associations such as the BCSA, Thermal Efficiency Contractors Association ("TECA"), HPBAC and others. Partnerships with associations are fundamental to the development of the contractor's network and key to ensuring the safe and effective installation of high efficiency equipment.

3.2.3 HIGHLIGHTS OF 2010 RESIDENTIAL ENERGY EFFICIENCY PROGRAM AREA

A summary of highlights from 2010 residential programs include the following achievements:

- Investing over $3.2 million in energy efficiency initiatives resulting in 607,000 GJs of savings over the lifetime of the measures;
- Engaging over 31,000 customers in 2010 programs targeting residential customers;
- Collaborating with industry partners including government, electric utilities, contractors, manufacturers, and retailers; and
- Establishing outsourced administration for mass-market residential programs by employing Consumer Response Marketing Ltd. ("CRM"), a BC-based company. With

[12] 2005-2007 Heating System Upgrade Program: Evaluation Results. Sampson Research.

CRM's cost-effective expertise in providing rebate fulfillment and call centre support, the EEC team were able to focus on program delivery.

With this foundation now in place, the Companies will continue to deliver value to residential customers through the 2011 Residential Energy Efficiency Program Area.

3.3 2011 Residential Energy Efficiency Program Area Outlook

The Companies will expand the 2011 residential program offering in support of the EEC program objectives outlined previously by continuing many of the 2010 programs as well as introducing new programs, most notably a new construction program as outlined in Table 3-2. Expenditures from new programs are not included as program design is still in progress. As a result of the introduction of new programs, the Companies expect to spend more than the $2.5 million indicated in Table 3-2.

Table 3-2: 2011 Residential Energy Efficiency Program Area Outlook

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
2011 Programs in Market

Please note that all 2011 programs are undergoing further economic analysis for the validation of savings claims and cost benefit tests. All numbers are estimates that will be validated in the coming months.

3.3.1 CHALLENGES IN DEVELOPING RESIDENTIAL PROGRAMS FOR NATURAL GAS EFFICIENCY

One of the major obstacles in the deployment of residential programs is in identifying measures that pass the traditional TRC cost benefit test. This constraint limits the investment utilities can make in market transformation, or, in the case of new construction programs, limits the role utilities can take in supporting the introduction of new efficiency codes and standards.

Ultimately, traditional DSM rules reduce our ability to support government policy to meet GHG emission reduction targets and limit our ability to invest in programs that serve our customers in managing their energy bills.

There are a number of factors that limit residential program development under traditional DSM environments, some of which are outlined below:

- The low cost of natural gas combined with lower than average consumption in BC's coastal climate limits program options;
- In traditional DSM environments, rebate programs cannot be in market for measures that are regulated. As a prime example, the Companies believe a furnace replacement program is fundamental to driving savings in space heating since heating systems represent 63% of the residential end use of natural gas. The 2008 REUS study suggests that only 16% of our customers have high efficiency furnaces. A furnace replacement program therefore represents an enormous opportunity to save natural gas and reduce GHG emissions;
- With the introduction of regulations for higher efficiency standards, the incremental savings that can be claimed over base technology is diminishing;
- Since new technologies are more expensive than base models, the TRC model hampers market transformation and innovation. Furthermore, when a new product is introduced, there are limited quantities of that product available for mass consumption. This results in further lowering the TRC since initial participation rates are low and the Companies incur significant program costs for program setup and promotion; and
- It will take some time to quantify the non-energy benefits associated with efficiency, such as improved comfort, health, safety, property value, and reduced insurance claims.

All of these examples demonstrate the challenges gas utilities face in driving market transformation and energy savings in the residential sector. The Companies are exploring other possibilities for ensuring new programs are cost-effective and provide value to customers. Discussions with government, other utilities, and regulators are underway to determine a collaborative solution that best meets the GHG emissions reduction targets of the province.

3.3.2 2011 OUTLOOK FOR RESIDENTIAL ENERGY EFFICIENCY PROGRAMS

The 2011, the Residential Energy Efficiency Program Area portfolio will continue to create value for residential customers and the industry, while furthering government policy on climate action. A summary of highlights for 2011 residential program planning include the following:

- Invest over $2.5 million in residential programs resulting in over 200,000 GJs saved over the lifetime of the measures;
- Engage over 30,000 customers in energy efficiency programs and all of our customers in conservation messaging;

- Introduce a new construction program to support new building codes and standards and the installation of efficient appliances; and
- Collaborate with industry partners including government, electric utilities, contractors, manufacturers, and retailers.

With the foundation now in place to introduce programs to the residential sector, the Companies will continue to deliver value to residential customers in 2011 and beyond.

3.4 Residential Program Details

Program descriptions for each of the Companies' residential energy efficiency offerings are outlined in the following section. Program details include background information, goals, 2010 results, future outlook, and an overall summary. Table 3-3 provides an overview of residential programs indicating which programs were completed in 2010, which programs remain active moving into 2011, and which programs are currently under development.

Table 3-3: Residential Energy Efficiency Program Overview

Program	Utility		Description	TRC	
	FEI	FEVI		FEI	FEVI
Completed Programs					
ENERGY STAR® Heating System Upgrade - 2009	X	X	$250 incentive for upgrading heating system to Energy Star rated appliance - FEU and LiveSmart BC Total	1.1	1.0
Furnace Service Campaign - "Give your furnace some TLC" - 2010	X	X	Educate the market about the importance of appliance maintenance and create opportunities to upgrade appliances for efficiency	No Direct Savings	
Active Programs				**Projected TRC**	
Domestic Hot Water 0.62 EF & ENERGY STAR® Tanks	X	X	$50 consumer incentive and $50 contractor's incentive to educate customersabout proactive replacement of efficient water heaters. Additional tiers to be added in Q2	0.6	0.6

Furnace - "Scrap-It" Program	X	X	Re-educate market about high efficiency furnaces and urge customers to upgrade early	Under Development	
EnerGuide 80 - New Construction Program - PILOT	X	X	Educate builders about new proposed BC Building Codes and provide incentives for adoption. Educate consumers about the benefits of purchasing energy efficient homes	Under Development	
"84 Developments" EGH80 Townhome - PILOT	X		Work with builder to understand prescriptive and performance path to reaching EGH80 in townhomes. Create case study for other builders	1.4	

3.4.1 COMPLETED PROGRAMS

3.4.1.1 ENERGY STAR® Heating System Upgrade Program

3.4.1.1.1 Program Overview

2008-2009 ENERGY STAR® Heating System Upgrade Program	
Target Audience	Residential Retrofit Customers
Duration	FEI: Sep 1, 2008 through Dec 31, 2009 FEVI: Apr 16, 2009 through Dec 31, 2009 Note: Because the application deadline was March 31, 2010, final program numbers were not available for the 2009 EEC report and savings from applications processed in 2010 are included in the 2010 portfolio.
Incentive	$250 rebate per heating system upgrade
Partner	LiveSmart BC / Ministry of Energy and Mines
Overview	
Background	The primary program objective was to reap the energy savings associated with upgrading low or mid-efficiency heating systems to ENERGY STAR®. The Companies have maintained ENERGY STAR® Heating Upgrade programs in the market since 1996. These programs were initiated to benefit customers by saving them energy and to participate in transforming the furnace market. The most recent iteration was launched September 1, 2008 in the FEI service territory and April 16, 2009 in the FEVI service territory. In addition to energy savings, the program focused on preparing the market for January 1, 2010 changes to the BC Energy Efficiency Act Standards for gas furnaces outlined in the Ministry of Energy Mines and Petroleum Resources (“MEMPR”) Enforcement Bulletin 09-03[13]. The regulated energy efficiency standard for these products is an Annual Fuel Utilization Efficiency (“AFUE”) equal to or greater than 90%. These regulations took effect for new residential construction on January 1, 2008 and for replacement furnaces in existing dwellings on December 31, 2009. The BC provincial regulation changes align with Natural Resources Canada (“NRCan”) regulations for new and existing buildings across Canada. The Companies’ significant outreach to consumers, trades, and manufacturers helped facilitate the industry’s transition to the new regulation. In September 2008, the Companies partnered with the LiveSmart BC Residential Retrofit Incentive Initiative in order to extend market reach and program awareness and initiate collaborations between government and utility partners. Please refer to Section 7.4.2.1 for further information about the LiveSmart BC partnership.

[13] Please refer to Appendix D for a copy of the MEMPR Enforcement Bulletin 09-03.

Goals	• Upgrade a minimum of 8,180 heating systems. • Prepare market for adoption of ENERGY STAR® provincial furnace regulations for retrofit market, January 1, 2010. • Educate consumers about the advantages of energy efficient furnaces and boilers and provide an incentive that promotes a proactive replacement decision. • Educate the trades about upcoming regulations. • Engage manufacturers by distributing coupons for ENERGY STAR® furnaces and boilers and providing funds for co-marketing opportunities.
Description	In order to educate customers and the trades about the benefits of ENERGY STAR® heating system upgrades, the Companies offered a $250 bill credit to partially offset the estimated $850 incremental cost of purchasing ENERGY STAR® furnaces or boilers over mid-efficiency models. In addition to the $250 incentive, from September to December 2008 and 2009, furnace and boiler manufacturers provided coupons for discounts and extended warranties for ENERGY STAR® heating systems.
Implementation	
Administration	Accenture Utilities Business Process Outsourcing Services("ABSU"), a subsidiary of Accenture Inc., through a subcontracting arrangement with CustomerWorks LP, processed the bill credit rebate process for the Companies' applications. The Ministry of Energy processed LiveSmart BC applications. De-duplication was performed to ensure customers were only awarded a single $250 rebate.
Communications	Promotions included website prominence, bill inserts, advertisements in community newspapers and trade publications, and events. In the fall of 2008 and 2009, manufacturers provided coupons for additional savings on furnace replacements.
Evaluation Strategy	An extensive evaluation of natural gas consumption after installation of an ENERGY STAR® furnace or boiler on 2005-2007 program participants confirmed energy savings estimates of over 11 GJs per participant (Sampson and Associates). The study provided in-depth feedback for future program development.

	FEVI	**446**	**112**	**25**	**2,826**	**28,986**	**43%**	**1.0**
Total		**17,566**	**4,392**	**184**	**111,315**	**1,127,752**	**43%**	**1.1**
LiveSmart BC Participant Counts based on January 25, 2011 invoice and estimation of final program countsthat are forthcoming from the Minstry of Energy.								

This program was extremely successful with double the anticipated program participation of 8,180 participants outlined in the 2007 EEC Application. Through this program over $4.4 million in incentives were distributed to customers across the province with downstream benefits of revenues, job creation, and installation experience to contractors, dealers, and manufacturers. Table 3-4 provides performance metrics for 2009 and 2010 including number of participants, incentives to non-incentives spending, net annual energy savings, and the savings over the lifetime of the measure. The free rider rate suggests that 43 percent of participants may have upgraded their appliance without the incentive, so this proportion of participants has been backed out of the energy savings. This free rider rate was obtained from consumer and contractor feedback as presented in the 2005-2007 Furnace Program Evaluation (Please refer to Appendix D in the 2009 EEC report).

The positive TRC indicates that despite a relatively high free rider rate there remains substantial energy savings within a cost-effective program. TRC results were 1.1 for FEI and 1.0 for FEVI. The FEVI TRC is slightly lower due to lower participant numbers as the program was introduced over seven months later than the FEI program. Also, natural gas service was first introduced to Vancouver Island in 1990, so the FEVI opportunity for furnace replacement is lower because furnace stock is newer.

In addition to the Companies' rebate, other key drivers that positively influenced furnace replacement during this timeframe were provincial incentives through LiveSmart BC, federal incentives through the NRCan EcoAction program, and the Home Renovation Tax Credit.

The 2008 REUS suggests that only 16 percent of the Companies' residential customers have high efficiency furnaces (90 percent AFUE and higher), 39 percent have mid-efficiency furnaces (78 - 85 percent AFUE), and 45 percent have standard efficiency furnaces (less than 78 percent AFUE). This indicates that 84 percent of the Companies' customers have either a need to upgrade their standard efficiency furnaces or have mid-efficiency furnaces that are close to the end of their useful lives. There is a substantial need for incentives or financing options that would help remove financial barriers for proactive furnace replacement and a huge opportunity for energy savings and GHG emissions reductions through such initiatives.

3.4.1.1.3 Overall Summary

The most recent iteration of the ENERGY STAR® Heating System Upgrade Program far surpassed its original program target and contributed to the replacement of over 17,500 heating systems. In addition, the program achieved its objective of preparing the market for the introduction of provincial and federal regulations requiring the installation of ENERGY STAR® furnaces. Broader market impacts are evident through the Companies' contribution of $4.4 million in funding for 17,500 heating system upgrades since September 2008. Downstream economic benefits to the economy are estimated to be $102 million[14] in consumer spending with a significant positive impact on employment in energy efficient upgrades. Energy savings impacts of 1.1 million GJs over the lifetime of these installations and the associated GHG emissions reduction impacts are significant. The partnership with the LiveSmart BC program represented about half the participants. Encouraging homeowners to take a whole home approach to renovations have resulted in even greater energy savings for our customers and GHG emissions reductions for the province.

3.4.1.2 "Give Your Furnace Some TLC" – Furnace Service Campaign

3.4.1.2.1 Program Overview

"GIVE YOUR FURNACE SOME TLC"- FURNACE SERVICE CAMPAIGN	
Target Audience	Residential Retrofit Customers
Duration	FEVI: Jan 15 - Oct 31, 2010 FEI: June 1- Oct 31, 2010

[14] $102 million consumer spending estimate based on 17,566 program participants multiplied by $5,800, which is the average heating system installation expenditure in the 2010 Switch 'N' Shrink program.

Incentive	$25 Grocery Gift Card
Partner	None
Overview	
Background	The primary objective of the furnace service campaign was to develop an offer that was relevant to a broad base of customers and engage them in energy efficiency dialogues with gas contractors. Customers were educated about the importance of annual furnace servicing while the long-term benefits of appliance efficiency and the cost savings associated with upgrading to high efficiency heating systems was promoted. In addition, the program reinforced the Companies' relationship with the trades, given that the promotion reminded customers to have their furnace serviced and contractors were able to identify furnaces/boilers needing replacement. The program was first piloted in FEVI where over 300 applications were received within eight weeks of launching the program, demonstrating that customers respond well to a $25 gift card incentive. Due to the success of the pilot, the Companies rolled out the program across the province in June 2010.
Description	The program offered a $25 grocery gift card to the Companies' residential customers who had their furnaces serviced by a qualified contractor within the program eligibility dates.
Goals	• Provide education and awareness about energy efficient appliances and their maintenance. • Engage customers and contractors in conversations about efficiency, safety, and the opportunity to upgrade existing mid-efficiency appliances to high efficiency appliances.
Implementation	
Administration	Consumer Response Marketing Ltd.
Communications	Promotions included website prominence, a June stand-alone bill insert, an August bill insert program listing, and handouts at summer and fall events. The program did not require a major advertising investment given that the trades promoted the campaign on our behalf.
Evaluation Strategy	A total of 375 telephone surveys were completed by customers who participated in the TLC Furnace Program. The survey reported high customer satisfaction with a large majority of participants being extremely satisfied with the outcome of their overall service visit Furthermore, it is important to note that the research company reported an unexpected willingness of applicants to complete the survey.

3.4.1.2.2 2010 Results

Table 3-5: 2010 "Give Your Furnace Some TLC"- Furnace Service Campaign Results

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	13,911	320	112	No Direct Savings			
FEVI	1,550	36	42				
TOTAL	15,461	357	154				

* Incentive expenditure accounts for a the fact that FEI gift cards received an 8% discount while the FEVI gift cards received a 6% discount.

The campaign was extremely successful with 15,500 participants and $357,000 in incentives distributed. It was even more successful in light of the fact that these program participation numbers were achieved without major advertising investment since the trades promoted the campaign on our behalf.

Although other utilities have claimed energy savings in the past, we were not able to find definitive evaluation studies that confirmed decreased consumption including past programs that were conducted by the Companies. Intuitively, a heating system that is well-maintained will run more smoothly and consume less energy. Program evaluation[15] determined that 4 percent of customers identified gas leaks and 15 percent of customers were advised to either upgrade or replace their appliance. This demonstrates that the goal of furnace replacements and supporting public safety were achieved.

3.4.1.2.3 2011 Performance Outlook

Table 3-6: 2011 "Give Your Furnace Some TLC" - Furnace Service Campaign Performance Forecast

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	16,000	368	120	No Direct Savings			
FEVI	4,000	92	26				
TOTAL	20,000	460	146				

The 2010 participant survey determined that the campaign in its current form had a high degree of customer satisfaction; however, there are a number of areas that will be improved for the 2011 campaign rollout to enable the Companies to drive even higher participation rates. In the

15 "TLC Furnace Servicing Study" A Participant Survey by TNS, commissioned by the Companies in November, 2010. Final report delivered January 18, 2011.

2011 iteration, communications with gas contractors will be improved and marketing materials will focus on the benefits of annual appliance maintenance. The addition of a fireplace servicing offer is under consideration.

3.4.1.2.4 Overall Summary

The "Give Your Furnace Some TLC" furnace service campaign's broad based appeal makes it a cornerstone program in engaging customers and contractors in conversations about natural gas efficiency, appliance safety, and the need to replace old heating systems with new high efficiency models. At this time, we are not capturing direct savings from this program; however, educating customers about the benefits of efficient equipment maintenance, while creating opportunities to further educate customers about energy saving behaviours and programs opens the door to future natural gas savings.

3.4.2 ACTIVE PROGRAMS

3.4.2.1 Energy Efficient Residential Hot Water Storage Tank Program

3.4.2.1.1 Program Overview

ENERGY EFFICIENT RESIDENTIAL HOT WATER STORAGE TANK PROGRAM	
Target Audience	Residential Retrofit Customers
Duration	FEI & FEVI: July 1, 2010 - Dec 31, 2011
Incentive	$50 rebate cheque for consumer $50 rebate cheque for contractor/dealer
Partners	Retailers (Rona, Sears) and manufacturers (Giant, A.O. Smith, Bradford-White)
Overview	
Background	A Domestic Hot Water ("DHW") strategy is a key component in the Companies' EEC program portfolio since water heating accounts for 21% of residential natural gas consumption. The CPR[16] states that DHW accounts for 21% of residential natural gas consumption and notes a 2% annual energy improvement as hot water systems are upgraded. Even greater savings will be realized as water heating appliances become more efficient. In 2010, the primary program objective was to educate the market about September 1, 2010 changes to the BC Energy Efficiency Act Standards for gas and propane fired water heaters outlined in MEMPR Information Bulletin 09-05[17]. BC provincial regulations require that all water tanks manufactured after September 1, 2010 have an efficiency rating ("EF") of at least 0.62 depending on tank size. The secondary program objective was to capture the energy savings associated with upgrading water heating systems. Additional program benefits include outreach to consumers,

[16] 2006 Terasen Gas Conservation Potential Review.
[17] Please refer to Appendix D for a copy of the MEMPR Enforcement Bulletin 09-05. BC Energy Efficiency Act Standards: *Gas and Propane-Fired Water Heaters.*

<table>
<tr><td></td><td>trades, distributors, big box and small retailers, and manufacturers. One program challenge is the fact that manufacturers do not label water heaters with efficiency ratings. Manufacturer engagement will be a key component of the program.

Based on estimates from the Canadian Institute of Plumbing and Heating (“CIPH”), approximately 120,000 hot water tanks are sold annually in BC. The market share for gas water heaters is in the range of 40-60%. According to water tank statistics from the 2008 REUS, 38% of water tanks were replaced over the past five years, which by calculation represents a 7.6% annual churn rate. Of those that were replaced, 83% were only done at the time of failure or imminent failure and 9% were undertaken for the purpose of increasing energy efficiency.</td></tr>
<tr><td>Description</td><td>The 2010 program included the following base offer that will remain in market for 2011.

A $50 consumer incentive drives public awareness about the importance of water tank efficiency, urges customers to not only replace their hot water tanks as an emergency purchase decision at the end of useful life but to be proactive prior to tank failure, and provides an opportunity to raise awareness about the importance of hot water conservation.

A $50 dealer incentive urges contractors and distributors to promote efficient water tanks. Since the large majority of purchase decisions are completed out of necessity due to tank failure, customers are reliant on independent contractors to provide energy efficient appliances and advise them of their benefits.</td></tr>
<tr><td>Goals</td><td>Short term goals:
Educate the market about the introduction of provincial regulations on September 1, 2010;
Educate consumers about choosing energy efficient water heaters and the importance of hot water conservation;
Upgrade a minimum of 3,600 hot water heaters to 0.62 EF or higher;
Promote contractor relations between the Companies and contractors, as well as between contractors and customers;
Engage manufacturers and distributors though co-marketing opportunities;
Engage retailers in the program; and
Engage the home insurance industry in early retirement messaging.
Long term goals:
Engage manufacturers in labeling tanks with an efficiency factor;
Promote the adoption of the next generation of ENERGY STAR® eligible models (0.67 EF or beyond);
Introduce a tankless and condensing water heater tier within the existing program; and
Lay the foundation for the national hot water market transformation strategy as outlined in Section 3.4.3.2.</td></tr>
</table>

Implementation	
Administration	Consumer Response Marketing Ltd.
Communications	FEI and FEVI engaged contractors, manufacturers, and big box retailers to co-promote the program. Contractor packs were mailed out to the BCSA database, and A.O. Smith, one of the largest water tank manufacturers, delivered program materials to their distribution network. Further promotions includeFortisBC.com, bill inserts, advertisements in community newspapers and trade publications, and retailer POP materials that were provided to both Rona and Sears. The following is a summary of the communications for this program: • FortisBC.com/efficientwaterheater; • Contractor packs mailed out to BCSA database; • Contractor packs included MEMPR's updated B.C Energy Efficiency Act Standards brochure to assist the province with compliance engagement; • John Woods distributed contractor packs to their dealer network; • Aug EEC "newsletter" bill insert with program highlighted; • Sept bill insert (one side); • Sept contractor program bulletin highlight; • Big box merchandising – Rona (launched Sept) & Sears (launched Oct); • Nov – Blackpress - ¼ page ads; • Dec EEC "newsletter" bill insert with program highlighted; and • Program collateral distributed at all CEO trade shows and street team events.
Evaluation Strategy	Program evaluation will include billing analysis in 2012 and potential surveys of distributors and contractors to monitor the trends in market penetration of high efficient and ENERGY STAR® eligible models.

3.4.2.1.2 2010 Program Results

Table 3-7: 2010 Efficient Hot Water Heater Storage Tank Results

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	152	15	52	243	1,990	20%	0.3
FEVI	20	2	12	32	269	20%	0.5
TOTAL	172	17	63	275	2,259	20%	0.3

The program's TRC is low when total program spending is compared to the avoided cost of natural gas. With the free rider rate estimated to be approximately 20 percent, the annual net energy savings derived from the program's participants is 275 GJs. However, the actual savings that should be attributed to this program are under-estimated by participation counts for the following reasons.

While developing the program, the Companies made contact with all major manufacturers in order to create an online directory of compliant tanks eligible for a rebate. Without the program, these stakeholders were less motivated to comply, since enforcement does not carry major penalties or ramifications. Because our customers were asking about a rebate, stakeholders such as manufacturers, dealers, contractors, and big box retailers were driven to comply. At least one manufacturer, who supplies a major big box retailer, re-designed their tanks in order to participate in our program. While 187 eligible models are listed on the NRCan directory, only a small portion of tanks can be purchased within BC. At the time of writing, only 10 different models have been approved for rebates. We continue to receive applications for non-compliant tanks, indicating they are still prevalent in the market.

Anecdotal feedback from the industry suggests that low participation rates are most likely due to the need for a gas permit, since there was a lot of initial excitement about the $50 dealer incentive. Our source estimates that only 20 percent of water tank installations are conducted with a permit. The EEC team is meeting with the BC Safety Authority ("BCSA") to determine if there are any ways that permit avoidance issues can be addressed.

3.4.2.1.3 2011 Program Performance Forecast

Table 3-8: 2011 Efficient Hot Water Heater Storage Tank Performance Forecast

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	2,980	429	138	5,722	47,415	20%	0.6
FEVI	745	107	34	1,430	12,043	20%	0.6
TOTAL	3,725	536	172	7,152	59,458	20%	0.6

The 2010 0.62 EF water heater program was introduced primarily as a compliance engagement program to be in the market until December 31, 2010; however, with lower than anticipated participation rates and anecdotal evidence of a large number of non-compliant tanks in market, the Companies are extending the existing base offer for the 2011 calendar year. This extension enables the Companies to promote hot water efficiency to manufacturers, contractors, retailers, and customers. The ongoing program also provides the opportunity to urge customers to not only replace their hot water tanks as an emergency purchase decision at the end of useful life, but to be proactive prior to tank failure. Partnerships with the home insurance industry are the best avenue to co-promote this message.

Most importantly, the base offer is the foundation for maintaining relationships with the supply chain required for the next stages of the DHW market transformation strategy. As we collaboratively work with stakeholders on a national strategy aimed at raising the bar on efficiency, it is important to have programs in place to guide the market and policy decisions. In addition to the $50 base offer for 0.62 EF tanks, the Companies are running a cost benefit analysis to introduce rebates for ENERGY STAR® models (0.67 EF and beyond), condensing water heaters, and tankless technologies. To date there are very few ENERGY STAR® water storage tank models that qualify and that are available in BC. In parallel to the 0.80 EF water heater pilot, the Companies will introduce rebates for condensing water tanks and tankless technologies. Although the TRC's on these new technologies are less than one, these programs are essential for market transformation.

Anecdotal evidence provided mixed reviews of tankless technology and therefore the Companies conducted an independent research study[18] to gather feedback on experience with early adopters of tankless technology. The results were very favourable and provide the Companies with confidence to proceed with promoting these products if energy savings estimates are validated.

The combination of financial incentives, contractor training, and effective marketing is key to the continued success of efficient water heater programs. The relationships developed to date in the 0.62 EF base offer are invaluable to furthering this work. In addition to energy efficient appliances, the opportunity to educate customers about the importance of water and hot water conservation adds additional societal benefits to this program.

3.4.2.1.4 Overall Summary

Although participation rates were lower than forecasted, the program was very successful in achieving its goals of compliance engagement, developing relationships with manufacturers, and gaining exposure for energy efficient water tanks in retail settings. The program confirmed that there is a great need for energy efficiency education across the hot water equipment supply chain – from manufacturers and distributors through to consumer education. This education will also help to ensure that customers who are replacing their tanks in an emergency situation will choose to install energy efficient tanks and will have access to energy efficient tanks through their installers.

This program is an important component in the overall strategy to help manufacturers, distributors, installers, and customers adopt the new provincial regulations that went into effect on September 1, 2010, which require all hot water tanks manufactured after that date to be 0.62 EF. The Companies will be actively evaluating tier three technologies (>0.8 EF) and developing a collaborative national hot water heater market transformation strategy as outlined in Section 3.4.3.2.

[18] Tankless Water Heater Study, National Survey to Homeowners, by TNS, commissioned by the Companies in October, 2010. Final report delivered December 14, 2010.

3.4.2.2 EnerChoice Fireplace Program

3.4.2.2.1 EnerChoice Fireplace Program Overview

ENERCHOICE FIREPLACE PROGRAM	
Target Audience	Residential Retrofit Customers
Duration	July 1, 2010 - Dec 31, 2011
Incentive	$150 for any EnerChoice fireplace with additional tiers to be introduced in 2011
Partner	Hearth Patio and Barbecue Association of Canada ("HPBAC")
Background	
Background	The EnerChoice fireplace program is an important program offering since natural gas fireplaces account for 13% of residential natural gas consumption based on 2010 CPR findings. In addition, 85% of customers have at least one fireplace or heating stove according to the 2008 Residential End Use Study ("REUS"). Consumer preferences for fireplaces can be categorized as those shopping for ambience versus those shopping for zone heat. Those focused on ambience often select decorative design features such as the flame, the rock or log set, and mantel design. Those focused on zone heat are more engaged in energy saving features such as electronic ignition switches or programmable remote controls, which allow users to turn off the fireplace and pilot light when the home is unoccupied. Through the evolution of EnerChoice fireplace programs, manufacturers are supplying more models that combine the attributes of ambience and energy efficiency. The Enerchoice program educates consumers to include energy efficiency as part of their fireplace purchase decision. The Enerchoice Fireplace label is a Canadian label reserved for products that meet or exceed efficiency levels as determined by an independent committee managed by HPBAC. Since there is currently no ENERGY STAR® rating for natural gas fireplaces, and there are no pending standards from the U.S. Department of Energy, the Canadian fireplace industry has developed its own efficiency label branded EnerChoice. The EnerChoice designation can only be applied to **free-standing stoves** with Fireplace Efficiency ("FE") 66% or higher, **fireplaces** that are 62.4% or higher, and **inserts** that are 61% and higher.
Description	In order to further educate consumers about the merits of energy efficient fireplaces, the 2010 EnerChoice program provides a $150 consumer rebate for EnerChoice purchases. The Companies are encouraging their customers to adopt energy efficient gas fireplaces designed for heating rather than simply decorative fireplaces for ambience.
Goals	• Encourage the sale and installation of energy efficient heater style fireplaces to reap the associated energy savings. • Further the education and awareness of the EnerChoice label to consumers and industry. • Further relationships with manufacturers and distributors of natural gas fireplaces through the HPBAC.
Implementation	
Administration	Consumer Response Marketing Ltd.

Communications	FEI and FEVI engaged HPBAC members to co-promote the offer through retailer and manufacturer channels. Promotions included online information, bill inserts, advertisements in community newspapers and trade publications, and events. Co-op advertising was introduced in Q4 2010 as requested by the industry.
Evaluation Strategy	EnerChoice Fireplace consumption data analysis on the 2008 and 2009 programs will be conducted in 2011 to validate energy savings claims for EnerChoice appliances. EnerChoice awareness surveys to consumers and dealers are being proposed to determine the market penetration of EnerChoice awareness and gain feedback for future program requirements.

3.4.2.2.2 2010 Program Results

Table 3-9: 2010 EnerChoice Fireplace Program Results

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	109	16	40	646	5,746	24%	1.0
FEVI	26	4	11	154	1,415	24%	1.1
TOTAL	135	20	51	800	7,161	24%	1.0

As outlined in Table 3-9, the program's TRC is positive. With free rider rate estimated to be 24 percent, the net energy savings over the lifetime of these measures is 7,161 GJs. Since program start-up costs are relatively expensive for marketing and administration, the TRC is expected to increase in 2011.

Program participation was lower than expected for a number of reasons. Firstly, it takes time to build awareness of a program for both customers and dealers. The program was launched to dealers in August and participation numbers are increasing over time. Secondly, 2010 sales were down as much as 25 percent over 2009 based on anecdotal feedback from the industry. Government incentive programs drove 2009 sales and 2010 sales were down by comparison. The 2010 program forecast was based on 2009 participation levels for dealer incentives. Many HPBAC members found the paperwork onerous and we felt that a consumer driven incentive would be more successful; however, there may be a need for further customer and dealer education about the benefits of EnerChoice. The Companies are developing a dealer and consumer survey to gain feedback on ways to make the program more effective for the 2011 iteration expected to be in market in the second quarter.

3.4.2.2.3 2011 Program Performance Forecast

Table 3-10: 2011 EnerChoice Fireplace Program Performance Forecast

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	1,920	576	117	11,309	102,031	24%	2.2
FEVI	480	144	29	2,827	25,963	24%	2.3
TOTAL	2,400	720	146	14,136	127,994	24%	2.2

In consultation with industry, the Companies are considering increasing the rebate from $150 to $300 in order to draw more attention to the benefits of EnerChoice and encourage customers to select even more efficient models. Since pilot lights consume substantial energy, another energy saving feature is an electronic ignition switch or a handheld fireplace remote-control that can be programmed to turn off the fireplace and the pilot light when the home is unoccupied. Therefore, a $50 incentive for these features is under consideration. Since a number of customers requested rebates for fireplace service as part of the "Give Your Furnace Some TLC" furnace service campaign, fireplace servicing may be included in the 2011 TLC campaign.

Given that higher program numbers were achieved with a dealer incentive, this may be re-introduced in the next iteration. HPBAC currently provides a $25 incentive for the first quarter of 2011. Response to this incentive will determine if the Companies will re-introduce a dealer incentive in the next iteration of the program. A number of dealers took advantage of co-op advertising, so this will also be considered in the 2011 re-launch.

Other partnerships may help promote the EnerChoice program. The Companies have been asked to partner with municipalities in the provincial Woodstove Exchange program. The EnerChoice offer is also listed in the LiveSmart BC program brochure to help raise awareness for customers who are doing whole home retrofits.

The combination of financial incentives, contractor training, and effective marketing is key to the continued success of the EnerChoice fireplace program. The relationship with HPBAC is fundamental to the continued success in order to actively engage dealers in promoting efficiency. By introducing program improvements, the program will provide significant energy savings and will remain an integral part of EEC programs in the future.

3.4.2.2.4 Overall EnerChoice Program Summary

With fireplaces accounting for 13 percent of residential natural gas consumption, it is critical to educate homeowners about the importance of choosing energy efficient models that are designed for zone heating rather than ambience. As more models become available the minimum efficiency standard can be increased over time. The Companies will continue to foster their relationship with HPBAC to drive program awareness and to assist in driving fireplace efficiency in the industry.

3.4.3 PROGRAMS IN DEVELOPMENT

3.4.3.1 Home Efficiency Measures Program

3.4.3.1.1 Home Efficiency Measures Program Overview

HOME EFFICIENCY MEASURES	
Target Audience	Residential Retrofit Customers
Duration	Proposed launch date of Q2 2011 and ongoing
Incentive	Coupon books and giveaways by promotional teams
Partners	Retail partners, distributors of energy savings equipment, utility partners, municipalities, and non-profits
Overview	
Background	There is an extensive list of low cost energy savings measures that, in combination with behaviour change initiatives, will result in substantial energy savings in the residential sector. Often these are homeowner “do-it-yourself” installations and many of these measures are contained in the Energy Saving Kits provided for low income households. Opportunities include the following: • Measures to reduce domestic hot water energy costs include ultra-low flow shower heads (please refer to Section 7.4.2.3 for information about the Water Saver pilot program), faucet aerators, hot water tank insulation, and pipe insulation; and • Measures to reduce home heating energy costs include programmable thermostats, weather-stripping, insulation, caulking, electrical outlet gaskets, and more.
Description	Build on opportunities for homeowners to self-install low-cost hot water and heat saving energy measures through community engagement programs, partner programs, retailer coupons, and distribution of the units at events.
Goals	• Develop a list of measures and their associated savings for inclusion in marketing materials, outreach activities, and conservation partnerships. • Capture energy savings associated with the installation of these measures • Develop partnerships to extend awareness and drive participant counts for these measures.
Implementation	
Administration	To be determined based on measure and activity.
Communications	Integrated marketing plan utilizing the Companies’ internal marketing opportunities and partnerships with retailers, distributors, government, and other utilities.
Evaluation Strategy	Evaluation will include the best approach to measure program effectiveness and capture energy savings estimates.

3.4.3.2 (0.80 EF) Hot Water Heater - PILOT PROGRAM

(0.80 EF) Hot Water Heater – PILOT PROGRAM	
Market	Retrofit and New Construction
Audience	FEI/FEVI Residential Homes
Duration	To be determined
Incentive	To be determined
Partner	Canadian Gas Association ("CGA")
Background	
Program Description	The purpose of the program is to obtain installation, performance, and customer acceptance information regarding residential Domestic Hot Water ("DHW") technologies with an Efficiency Factor ("EF") of 0.80 or better. The increasing importance of the water heating load has led the Ministry of Energy and Mines, in conjunction with Natural Resources Canada ("NRCan") to establish a plan to significantly raise minimum efficiency levels over the next 10 years. The Companies support these regulations since water heating is an important end use as it provides a "base load" throughout the year and helps keep the annual cost of natural gas purchases lower than it would be without the load. Water heating provides a relatively constant load over the year and hence provides revenue while not contributing incrementally to peak load. Peak gas is more expensive to acquire and as such, water heating load reduces the annual cost of natural gas to customers.
Technology Description	The main (0.80 EF) systems identified to date are: • On-demand or tankless water heaters; • Condensing tank water heaters; • Hybrid systems (on-demand heater mounted on or beside a small buffer tank); and • Combination systems (DHW and air/heat exchanger in one unit; may also include additional HRV or other functions).
Goals	• Replace existing low efficiency hot water tanks with (0.80 EF) hot water tanks to capture energy savings associated with reducing the overall consumption of natural gas. • Coordinate measurement solutions with stakeholders and/or third party companies to monitor systems performance and achieved energy savings. This data will be used to confirm savings claims and guide the development of future programs. • Engage the trades community and manufacturers by supporting (0.80 EF) hot water tank technologies. • Educate residential customers about the advantages of (0.80 EF) hot water tank technologies and provide incentives for their adoption when necessary. • Identify market barriers for adoption such as poor system performance, low product availability, lack of skilled contractors, low participant uptake numbers, and lack of awareness.

Status	A (0.80 EF) hot water heater pilot taskforce has been established with the CGA and Local Distribution Companies ("LDC") to discuss pilot rollout options and contributions on a national scale. An initial study, funded by the Companies, focused on the market transformation plan for DWHs prepared by Habart & Associates Consulting Inc. This study has been used as supporting documentation for the pilot program and includes a market transformation plan as well as performance estimates and installation costs for each selected (0.80 EF) hot water technology. This study revealed that there is a large technology gap between level two (0.67 EF) and level three (0.80 EF) equipment technologies. Level three technologies are just now emerging into residential applications and lack performance data, contractor familiarity, best installation practices, and product availability. The Companies conveyed those barriers to the stakeholders and all agreed that it would limit the success of reaching NRCan's 2016 regulation of (0.80 EF) hot water tanks. In late September, the CGA convened with NRCan and was successful in delaying those regulations from 2016 to 2020. Currently the Companies and stakeholders are establishing program design and monitoring solutions and incentive amounts for delivering the pilot program.
Implementation	
Administration	To be determined
Communications	To be determined
Evaluation Strategy	A proposal for handling administration, measurement, and evaluation for the (0.80 EF) hot water pilot program has been received from Natural Gas Technology Center ("NGTC") and is currently under review.

3.4.3.3 Furnace Scrap-it Program (Rebates and Financing Option Under Development)

3.4.3.3.1 <u>2012 Furnace Scrap-It Program Overview</u>

2012 FURNACE SCRAP-IT PROGRAM	
Target Audience	Residential Retrofit Customers
Duration	Proposed launch date of Q2 2012 and ongoing
Incentive	Combination of rebate and financing option being proposed
Partners	Ministry of Energy and Mines, financial institutions, and furnace manufacturers
Overview	
Background	Although the latest iteration of the ENERGY STAR® Heating System Upgrade Program was highly successful, there is much evidence that transformation of this market is not complete. The 2008 REUS suggests that only 16% of the Companies' residential customers have high efficiency furnaces (90% AFUE and higher), 39% have mid-efficiency furnaces (78% to 85% AFUE), and 45% have standard efficiency furnaces (less than 78% AFUE). This indicates that 84% of the Companies' customers have either a need to upgrade their standard efficiency furnaces or have mid-efficiency furnaces that are close to the end of their useful lives. There is a substantial need for incentives or financing options that would help remove financial barriers for proactive

	furnace replacement and a huge opportunity for energy savings and GHG emissions reductions through such initiatives. Furnace replacement was identified as a huge energy savings opportunity in the development of the Technical Potential of the 2010 CPR. There is enormous opportunity to significantly impact the age distribution profile of existing furnace stock. The Ministry of Energy and City of Vancouver are evaluating opportunities for financing programs for home efficiency upgrades. The EEC team will also investigate different financing models for home renovation loans that promote efficiency upgrades. There are challenges that need to be overcome in launching a Furnace Scrap-It program: • In traditional DSM environments, rebate programs cannot be in market for measures that are regulated. It would be essential that government stakeholders and regulators support this initiative in order to take it to market; • If the Companies were to actively promote early retirement it is important to include product stewardship as one of the program requirements to ensure that old furnaces are recycled safely; • Contractors, distributors, and manufacturers would be key to the successful rollout of this program. Adequate inventory would have to be in place and an assurance that no fraudulent mid-efficiency replacements took advantage of the offer; and • With the low cost of gas, it is difficult to convince customers that a new furnace has a direct pay-back with the full capital cost of the investment top of mind for the consumer. It would be beneficial to educate consumers about the additional benefits such as comfort, improved air quality, and furnace reliability. The national market penetration of high efficiency furnaces in Canada is reported to be 40%, while the Wisconsin Energy Conservation Corporation reports the market share of high efficiency furnaces in Illinois, Michigan and Ohio range from 52% to 73%. Wisconsin has achieved a 92% penetration. Market intelligence is difficult to obtain but an exact estimate for the province of BC would be beneficial. The enforcement of federal efficiency regulations apply only to the manufacturing of high efficiency models, but mid-efficiency models can still be sold. Therefore it appears that a sizeable inventory of mid-efficiency furnaces remain in the market. From time to time we see advertisements promoting the merits of mid-efficiency over high efficiency furnace replacement. The Companies are also gathering anecdotal evidence of lower efficiency furnaces that are due for replacement remaining in place and having repairs “jerry rigged” as a way to avoid some of the venting issues that British Columbians may face with the introduction of the government’s 90% efficient furnace regulation. The “Give Your Furnace Some TLC” furnace service campaign is one way of engaging customers in dialogues with contractors to promote replacement. In fact, program evaluation suggested that about 15% of participants required upgrades or replacements and participants cited financial considerations as the major barrier. Although we use 18 years as the measure of life for furnace upgrade, our 2010 programs indicate that customers are keeping their furnaces for a much longer timeframe. Participants in the Switch N Shrink oil conversion program report that replaced furnaces are 36 years old on average. while the furnace upgrade program participants report that replaced furnaces are 27 years old on average.
Goals	• Actively promote proactive furnace replacement with high efficiency furnaces to reap the associated energy savings of ENERGY STAR® heating systems, thereby substantially reducing GHG emissions in the residential sector. • Reinforce the compliance and market penetration of high efficiency furnaces with installers, distributors, and manufacturers.

	• In driving the market, further relationships with manufacturers, distributors, and installers of natural gas heating systems.
Description	This Furnace Scrap-it program, if implemented, will help remove financial barriers preventing homeowners from upgrading to ENERGY STAR® furnaces. This program is in the early stages of development and still requires discussions with a large number of stakeholders. The Companies are evaluating available market and technical data to establish a sound business case and cost benefit analysis before proceeding. If research suggests the program is viable, the Companies will consider launching a Furnace Scrap-It program in Q2 2012.
Implementation	
Administration	To be determined based on program direction.
Communications	Integrated marketing plan with financial partners and other stakeholders will be proposed during business case development.
Evaluation Strategy	TBD

3.4.3.4 EnerGuide 80 New Construction Program

ENERGUIDE 80 NEW CONSTRUCTION PROGRAM	
Target Audience	Builders and developers
Duration	Proposed launch date of Q2 2011 and ongoing
Incentive	Under development
Partners	BC Hydro, Ministry of Energy and Mines, Ministry of Housing, and CHBA Built Green
Overview	
Background	The Province of British Columbia is in the process of evaluating and developing new building code standards that would move the current EnerGuide 77 efficiency rating to a new target of EnerGuide 80 for new home construction. There is potential for the Companies to provide incentives to encourage the early adoption of EnerGuide 80 ratings for new home construction. FortisBC is working with internal and external stakeholders to understand the implications of the transition from the current BC Building Code to new EnerGuide 80 (EGH80) regulations scheduled for the fall of 2012. As new building codes will not take effect until 2012, now is the time to encourage builders and developers, through incentives, to begin building homes to the EnerGuide 80 standards. Ideally, incentives will help builders and developers define the prescriptive measures that will achieve EnerGuide 80 standards and prepare the market for the new building code changes. Through program implementation, FortisBC will gain a greater understanding about recommended measures, their costs and benefits, and how to build the larger strategic vision of lifecycle costs of natural gas heated homes versus electric. Through financial support, training programs for builders, and outreach to residential customers about the merits of efficient homes, FortisBC will support builders and developers in the transition to EGH80. Beyond EEC's New Construction Program, participation in the introduction of new building codes and standards are key to positioning natural gas attachments and the introduction of alternative energy systems. With the provincial mandate of Net Zero Ready homes by 2020, FortisBC must be positioned to play a role in these fundamental shifts in energy usage for

	the residential sector. For further discussion of building codes and standards please refer to Section 11.2.3.
Description	Extensive energy modelling and economic modelling has been conducted with the result that based on information available at the time of writing, the program does not pass the TRC. The Companies are working with the provincial government to determine the next steps for program implementation. The Companies intend to be involved in educating builders and guiding policy. A new construction program is essential to the Utility's role in the province's Energy Efficient Building Strategy[19].
Goals	• Develop a Residential New Construction Program to promote energy efficiency in new home construction and prepare the market for the introduction of the EnerGuide 80 building code for early 2012. • Through training and financial support, assist builders and developers in the move to more efficient construction practices to achieve EnerGuide 80 (i.e. building envelope measures, heating and hot water systems, and ENERGY STAR® appliance packages). • Understand the implications of EnerGuide 80 building code standards and beyond as they relate to gas heated homes. • Understand our role in developing or supporting the Ministry's prescriptive path for gas heated homes and recommend a strategy. • Strengthen relationships with developers, CHBA, BC Hydro New Homes program, and the trades community in relation to new construction. • Position our role as a gas supplier in ongoing codes and standards and Net Zero Ready homes. • Be vigilant about how changes to the EnerGuide rating system will affect future program planning. • Through program research develop a life cycle cost analysis for natural gas versus electric homes.
Implementation	
Administration	The Companies – internal accounting.
Communications	Develop an integrated marketing plan utilizing the Companies' internal marketing opportunities and partnerships with CHBA, other utilities, and trade publications. Target builders and educate consumers about the merits of EnerGuide 80 homes.
Evaluation Strategy	Evaluation will include the best approach to measure program effectiveness and capture energy savings estimates.

3.5 Summary

Overall the 2010 Residential Energy Efficiency Program Area was successful. The various programs and initiatives engaged customers in upgrading appliances to capture energy savings, supported the introduction of new provincial regulations, and reached out to the trades community for education and program awareness. The combination of financial incentives,

[19] BC Energy Efficient Buildings Strategy: More Action, Less Energy. BC Ministry of Energy and Mines Publication, 2008.

policy support, contractor outreach, and effective marketing is key to the ongoing success of these programs in generating natural gas savings and the culture of conservation in BC.

Programs in 2011 will focus on energy savings associated with re-launching improved iterations of the "Give Your Furnace Some TLC" furnace service program, efficient hot water heater storage tank program, and EnerChoice fireplaces. The Companies are also assessing opportunities for the new construction market and introducing initiatives for low-cost energy measures for homeowners. Feasibility studies and program implementation plans will be put in place for the launch of a Furnace Scrap-It program in 2012. In addition to energy and GHG emissions savings, the programs will assist the provincial government in engaging industry in regulation compliance and promote energy conservation messaging in all promotional materials. By engaging customers, trades, suppliers, and manufacturers in dialogues about energy efficiency, these programs propagate the conservation culture. The integration of EEC program goals is critical to the Companies' role in driving market transformation of energy efficient technologies for the residential sector.

4 COMMERCIAL ENERGY EFFICIENCY PROGRAM AREA

4.1 Overview

Commercial Energy Efficiency programs are aimed at encouraging commercial customers to reduce their overall consumption of natural gas and their energy costs. These programs are offered to both new construction and retrofit applications in FEI and FEVI service areas.

While residential programs focus entirely on single family dwellings, rowhouses, and townhomes (Rate Schedule 1 customers), commercial programs focus on a broader range of customer groups. The Companies serve over 80,000 commercial accounts, representing a wide variety of organizations, both private and public in nature. Commercial customers consume anywhere from 100 to over 40,000 GJ/yr, and are provided services through various customer rate schedules. Typical examples include small and large multi residential buildings, small businesses, food services such as restaurants, retail stores, large commercial office space, schools and universities, government buildings, hospitals, and manufacturing facilities.

Energy efficiency in the commercial sector represents a considerable opportunity to achieve natural gas savings and GHG emissions reductions. According to the Companies' latest Conservation Potential Review, in 2010 commercial customers consumed nearly 57 million GJs of natural gas and represent achievable potential natural gas savings of approximately 4.5 million GJ/yr by 2030. Notably, regulation of natural gas burning equipment is less prevalent for the commercial sector compared to the residential sector, even though higher efficiency options exist. This means there are a great number of cost effective opportunities available to the Companies to encourage reduced natural gas consumption in the commercial sector via demand side management ("DSM") programs; however, reaching out effectively to commercial customers presents challenges. Most importantly, the great diversity of natural gas burning equipment and systems and associated solutions imposes significant resource requirements on program development, delivery, and administration. Ultimately, capturing the considerable natural gas savings offered by the commercial sector requires the dedication of correspondingly significant resources in order to effectively target the diverse needs of the commercial sector.

Overall, the Companies believe the commercial energy efficiency and conservation programs deliver value by effectively encouraging commercial customers to implement measures that reduce their natural gas consumption, helping keep energy costs low and contributing to the realization of the government's energy and climate objectives.

4.1.1 PROGRAM AREA GOALS

The Commercial Energy Efficiency programs pursue a number of objectives in order to deliver value. More specifically, they focus on:

- Reducing natural gas consumption and GHG emissions by encouraging commercial customers to upgrade from low efficiency to high efficiency systems and/or change their behaviour;
- Precipitating market transformation by educating commercial customers, tradespeople, and design professionals about the advantages of energy efficient options, as well as building capacity among suppliers/manufacturers and the trades community; and
- Prudently investing in supporting customer capital asset upgrades.

In support of the objectives outlined above, the Companies also strive to:

- Develop cost effective programs with a Total Resources Cost ("TRC") score greater than 1.0 that optimize the proportion of incentives over administration and marketing costs; and
- Conduct program evaluations that confirm savings claims and guide the development of program enhancements and future programs.

4.2 2010 Commercial Program Area Results

Table 4-1 provides a summary of the commercial program area's performance in 2010. The commercial program area has delivered natural gas reductions while maintaining a very healthy overall cost benefit (TRC) score of 1.7 for FEI and 1.8 for FEVI; however, overall investment remains below budget levels, indicating additional work and resources are required to ramp up to the approved spending limits and maximize natural gas savings.

Table 4-1: Value from Commercial Energy Efficiency Programs in 2010

Program	New Const / Retrofit	Incentives & Non-Incentive			NPV Energy Savings (GJ)			TRC	
		FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
Efficient Boiler Program	New Const	75	6	81	27	1	28	1.6	1.3

The Commercial Energy Efficiency programs have encouraged commercial customers to reduce their annual natural gas consumption by approximately 104,000 GJ/yr, equivalent to over 817,000 GJs over the lifetime of the energy saving measures. This is equivalent to providing natural gas to nearly 1,100 single family homes or taking over 1,050 cars off the road[20] over the same period. As a result, approximately 5,260 tons of annual GHG emissions will be avoided.

Within the current climate of low natural gas prices, this represents a remarkable success as the price of natural gas cannot be considered a driver of energy efficiency upgrades to any great extent, except in those customers with very high gas consumption or where natural gas is an input into some business process. Although the current price of gas can make it a challenge to find cost effective energy saving measures to incent, it reinforces the need for energy efficiency programs in order to achieve the government's energy and climate change objectives. With low natural gas prices, some customers are not motivated to save without utility encouragement. Energy Efficiency and Conservation programs then become necessary to drive long term market transformation towards improved efficiency.

A few additional highlights from 2010 include:

- Over $2.4 million committed as incentives to energy efficiency projects;
- A 58% increase year over year in Efficient Boiler program participation;
- The launch of the Efficient Commercial Water Heater program;
- Participation in the Public Sector Energy Conservation Agreement in partnership with the Climate Action Secretariat and BC Hydro; and
- Work with BC Hydro to develop joint program offerings (Refer to 4.4.3.2 Commercial Custom Design Program).

While the commercial programs have done well on a number of counts, the Companies have also faced challenges and identified areas for improvement. With just over $2.5 million expended in this program area, the commercial programs have ultimately underinvested when compared to the approved amounts. This underinvestment represents opportunities to reduce natural gas consumption that have not been capitalized upon. This situation is a result of the considerable diversity of needs among commercial customers and a requirement for sufficient EEC resources to address those needs. When it comes to commercial area DSM programs, one size does not fit all. While the Companies' initial focus has been to develop and operate DSM programs around technologies with broad applicability to the commercial sector, investing more and obtaining greater savings requires a more focused approach, with programs tailored to meet the needs of specific subsectors. This approach will necessarily require resources to be able to focus more specifically on the needs of the various subsectors. Beyond program design, relationships with outside organizations and associations are crucial to program success and these must be cultivated. The Companies must have the resources in place to invest the required time and effort to build trust and confidence with partners in order to help assure program success.

[20] Based on five tons of carbon dioxide per year for a typical mid-sized car driven 20,000 kilometres per year. Source: Statistics Canada, accessible at: http://www.statcan.gc.ca/pub/16-251-x/2006000/findings-resultats/greenhouse-serre/4156371-eng.htm .

Additionally, with the absence of program operations personnel or an outsourcing solution, the commercial EEC team spends a considerable amount of time on program administration as opposed to program design and roll out, thereby slowing the introduction of new programs and hindering the ability to invest in commercial EEC program development activity. Receiving and processing applications, contacting customers for missing documentation, responding to enquiries, and issuing incentive payments are all handled by the program design staff, who should be otherwise focused on developing and promoting new programs. The Efficient Boiler program process, in particular, is complex and requires much support from EEC staff in order to see participants successfully through the program and to ensure rebates are ultimately issued. A revision to the program is currently under development and designed to simplify the process to free up many hours that can be redirected towards more valuable work. Administrative work is central to ensuring predictability, consistency, and continuity of the commercial area programs, however, and cannot be neglected. Commercial customers must view the programs as being reliable if they are to be encouraged make decisions that will have an impact in the medium term based on the availability of an incentive from the Companies.

Despite these challenges, the Companies consider this first full year of operation under the EEC project to have been a foundation year for the Commercial Energy Efficiency programs. Valuable experience has been developed while relationships with partners in utilities, government, and industry have been fostered. The Companies now intend to build upon this foundation to deliver even greater value in 2011.

4.3 2011 Commercial Program Area Outlook

The Companies intend to broaden their commitment to Commercial Energy Efficiency programs in 2011. Table 4-2 provides an overview of some of the expected program spending, and a glimpse of the new program offerings the Companies' have under development. In addition to retaining many of the existing commercial programs the Companies intend to bring several new programs to market. Most notably, the Commercial Custom Design Program will begin providing incentives in tandem with BC Hydro's incentive programs. The outlook for these programs is outlined below.

Table 4-2: Broader Offering for Commercial Energy Efficiency Programs in 2011

	TOTALS	2,805	412	3,217	1,023	124	1,146	1.2	1.2

Expenditures from new programs (indicated in grey shade) are not included in the table above as work on business cases or detailed program design is in progress, thus preliminary spending estimates are not yet available. As a result of the introduction of new programs in 2011, the Companies expect to spend significantly more than the approximately $3 million indicated above.

Collectively, this portfolio will continue to create value in 2011 with the important stakeholder group of commercial customers, while laying a foundation for continued EEC efforts in 2012 and beyond.

4.4 Commercial Program Details

Program descriptions for each of the Companies' commercial energy efficiency offerings follow below. Table 4-3 provides an overview of the commercial incentive programs, indicating which programs were completed in 2010, which programs remain active moving into 2011, and which programs are currently under development.

The commercial programs generally maintain very strong TRC test scores. With more limited regulation, higher natural gas use intensities, and most importantly a greater diversity of gas burning systems and equipment than for residential customers, finding cost effective opportunities for investment is generally easier for the commercial program area. Capitalizing upon those opportunities, however, requires greater time, effort, and resources.

Table 4-3: Commercial Program Overview

4.4.1 COMPLETED PROGRAMS

4.4.1.1 Spray N' Save 2010 Program

4.4.1.1.1 Program Overview

Spray N' Save 2010 Program	
Market	New Construction / Retrofit
Duration	FEI: Not available FEVI: May 2010 to Aug 2010
Incentive	Direct install of low flow pre rinse spray valves funded entirely by the Companies
Partner	BC Hydro

Overview	
Background	Low flow pre rinse spray valves use approximately 50% less water than standard models[21], significantly reducing the volume of heated water used in dishwashing operations. This, in turn, reduces the energy demands placed on the hot water system, and thereby the overall energy consumption of a given facility. Pre-rinse Spray Valves ("PRSVs") are commonly used in restaurants, hotels, schools, grocery stores, and hospitals to rinse down plates, pots, and pans.
Description	A direct install program for low flow pre rinse spray valves offered in partnership with BC Hydro, focusing on an as yet underserved population centre: southern Vancouver Island. FEVI installed, free of charge, new low flow pre rinse spray valves in willing food service facilities (i.e. restaurants, coffee shops, delis, groceries, and so on) in order to reduce the volume of hot water used in dishwashing. The program focused on southern Vancouver Island, specifically: the Capital Regional District, Cowichan Valley Regional District, and the Nanaimo Regional District. Similar to the Okanagan program offered in the summer of 2009, it achieved a reduction in natural gas consumption associated with the production of hot water by reducing hot water use in commercial kitchens.
Goals	• Reduce natural gas consumption associated with dishwashing by installing low flow pre rinse spray valves in food service establishments. • To install 250 to 300 spray valves in southern Vancouver Island over the course of the summer. • To achieve gas savings of approximately 2,200 GJ/year and save our FEVI customers approximately $28,000 in annual gas expenditures. • To raise awareness of energy efficiency, especially as it pertains to water heating, among FEVI's commercial cooking customers, with a view to increasing participation in FortisBC commercial programs. • To pursue a commercial cooking equipment program and use the information from this pilot to gather lists of potential participants.
Implementation	
Administration	The program was implemented by a program operator working out of the FEVI offices in Victoria, reporting to the EEC commercial program manager in Surrey. The program operator was responsible for seeking out and making contact with potential program participants, answering questions about the program and the valves, scheduling appointments, installing the valves at all participant locations, recording field data, and producing a final report on the findings.
Communications	The program's requirement for communications material or collateral was relatively light. Program promotions and participant uptake was driven primarily by the program operator. As such, communications / collateral requirements were limited to: 1. Participant consent form; 2. Information card to hand out to participants or potential participants; and 3. A website to inform potential participants about the program and allow them to request the installation of a low flow spray valve.

[21] FortisBC 2010 Spray 'n' Save Victoria Program Results.

Evaluation Strategy	The program evaluation relies upon site specific data collected during the valve install and the application of engineering analysis to establish the energy savings. For each valve installed the program operator measured: • The hot water supply temperature; • The cold water supply temperature; • The old valve flow rate; and • The new valve flow rate. The operator also recorded the time of usage as reported by the restaurant staff. These data were then used to establish the natural gas savings for each valve. All savings data was then statistically analyzed to produce an average savings value per valve. The program made use of collected data pertaining to every installation and analytical methods to quantify the energy savings. The results of the program were presented in a report format and were used as a baseline for the 2011 Low Flow Spray Valve Program (section 4.4.3.1).

4.4.1.1.2 2010 Spray N' Save Program Results

Low flow pre rinse spray valves continue to generate a strong cost benefit ratio and save significant amounts of natural gas among commercial food service establishments. The 2010 program focused on southern Vancouver Island and delivered a TRC score of 4.0, as indicated in Table 4-4 below.

Table 4-4: 2010 Spray N' Save Program Actuals

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	FEI	-	-	-	-	-	12%	0.0
	FEVI	194	12	4	1,529	6,322	12%	3.9
	TOTALS	194	12	4	1,529	6,322	12%	3.9

With a total of 263 low flow pre rinse spray valves installed, the 2010 Spray N' Save program successfully surpassed its target of 255 valves. Using data collected during the installation of the new valves, the total natural gas savings are estimated to be 2,073 GJ/yr; enough to provide natural gas to approximately 20 single family homes for a year. This figure may well be conservative as it assumes a 50/50 mix of hot and cold water (i.e. 98° F supply temp) at the spray valve. Mixed water temperatures are often more in the range of 105° F. Additionally, the measured water temperature differential between hot and cold water is based on summertime cold water temperatures. In winter, when the ground temperature falls, so too will the cold water supply temperature, thereby increasing the savings of the spray valves. Overall, the program invested over $20,000 in natural gas efficiency over the course of the summer.

The program displays a very positive cost/benefit ratio of 4.0. In fact, it is estimated that, given the maximum installed cost of approximately $130 per valve, the average full service commercial food service establishment would recoup the full cost of the valves in approximately one year from the date of installation. With a five year measure life, participants enjoy the financial net benefit of lower gas consumption every year thereafter. One may question why a utility supported DSM program is required, given the strong value proposition low flow pre rinse spray valves represent. The Companies believe that despite the value proposition, the dynamics of the food service industry make it unlikely this measure would be widely adopted without the support of a program. The commercial food service business sector tends to be exposed to significant volatility, making “cheapest first cost” a critical purchase decision criteria for items not critical to customer service. Food service establishments typically lack the time or resources to research energy saving options or understand the benefits provided. Though low flow spray valves pay for themselves relatively quickly, the ultimate magnitude of the dollar savings per any single valve is unlikely to move most potential beneficiaries to action. A utility funded DSM program makes it easy and straight forward for participants to save natural gas by effectively eliminating both the effort and risk potential participants would normally associate with the selection of high efficiency options.

The spray valve program also plays an important role in introducing a new concept to the food service industry, namely that energy is a variable cost. The Companies believe most food service establishments consider energy to be a fixed cost and that changing this mindset is essential to ultimately bringing about market transformation. In this light, the Companies believe low flow pre rinse spray valve programs are an essential first step that will lead to greater energy savings down the road.

4.4.1.1.3 2011 Spray N’ Save Program Performance Forecast

The Spray N’ Save 2010 program was set up as a small program, limited to the southern end of Vancouver Island. The Companies plan to offer another low flow pre rinse spray valve install program in 2011; however, a number of significant changes to the program operation are proposed. As such the 2011 program is discussed in section 4.4.3.1.

4.4.1.1.4 Spray N’ Save Program Summary

The program installed 263 low flow pre rinse spray valves in locations that had previously used standard flow rate sprayers, generating significant natural gas savings as a result. Commercial food service operators have become aware of the low flow option and in nearly every case have indicated they are satisfied with the performance. In fact, of the original 265 valves installed, only two were uninstalled due to dissatisfaction. The Companies believe the program has successfully generated tangible GJ savings benefits, as well as non-tangible benefits derived from raising energy awareness in the commercial food service sector.

4.4.2 ACTIVE PROGRAMS

4.4.2.1 Efficient Boiler Program

4.4.2.1.1 <u>Program Overview</u>

Efficient Boiler Program	
Market	New Construction / Retrofit
Duration	FEI: 2005 – Dec 31, 2011 FEVI: 2005 – Dec 31, 2011
Incentive	Purchase price incentives (rebates): • Near-condensing boilers: $4,000 per boiler plus $3 per MBH plant input; and • Condensing boilers: $6,000 per boiler plus $9 per MBH plant input. For new construction participants the program offers: 1. A maximum incentive payment (calculated as noted above) of up to 75% of the incremental purchase price of higher efficiency boilers. The purchase price of a standard-efficiency boiler is estimated using $7 per MBH of input; and 2. An incentive payment of 50% of a consultant's fees to a maximum $1,500 to offset the cost of analyzing the annual gas usage for space heating using a standard-efficiency boiler system versus a higher efficiency boiler system. For retrofit participants the program offers: A maximum incentive payment (calculated as noted above) of up to 50% of the incremental purchase price of higher efficiency boilers. The purchase price of a standard-efficiency boiler is estimated using $7 per MBH of input; 1. An incentive payment of $400 to help offset the cost of engaging a contractor to accurately estimate the peak space-heating load; 2. Where stainless steel venting is installed, an incentive of 50% of the cost up to $2,000; and 3. For participants who so choose, a monitoring incentive of $1,500 plus $1 per GJ of energy saved for closely monitoring and reporting on boiler operation and efficiency during the first year of operation.
Partner	None
Overview	
Background	Approximately 60% of commercial gas consumption in BC is used for space heating. High efficiency boiler technology, when used as part of a properly designed heating system, generates significant annual energy savings over a comparatively long estimated measure life. In fact, high efficiency boilers represent one of the most significant sources of achievable savings for the commercial sector in BC[22]. Fully 19% of such savings is attributable to high efficiency boilers. Minimum required boiler efficiencies are regulated within the province by the British Columbia Energy Efficiency Act and the Energy Efficiency Standards Regulation. Similarly, minimum boiler efficiencies are regulated in Canada as a whole by the

[22] FortisBC 2010 Conservation Potential Review, Commercial Sector Report, Marbek Resource Consultants, 2011, pg 55.

	federal Energy Efficiency Act. These acts regulate products manufactured in or imported to Canada and BC for domestic sale. Current regulation generally requires boilers to have a minimum efficiency of 80%. A proposed amendment to Canada's energy efficiency regulations would see the minimum required combustion efficiency of large boilers climb to 90% over the same period. The Efficient Boiler program is helping ease implementation of this proposed regulation by familiarizing market participants with high efficiency technology prior to the implementation of more stringent regulation.
Description	In operation since 2005, the Efficient Boiler program is FEI and FEVI's flagship Commercial Energy Efficiency program aimed at reducing gas consumption associated with space heating. By encouraging the use of high efficiency boilers, the Efficient Boiler program directly targets the commercial sector's most significant source of gas consumption (space heating) via one of its most widely used and longest lasting gas burning appliances (boilers). Installing such boilers today has a lasting impact by reducing gas consumption now, while paving the way for market transformation and ultimately more stringent regulation of commercial boilers.
Goals	• Reduce commercial sector gas consumption by encouraging the installation and use of high as opposed to standard efficiency boilers for space heating. • Increase year over year participation rates in view of maximizing gas savings. • Educate medium to large commercial customers about the advantages of high efficiency boilers and provide an incentive to facilitate the purchase of high efficiency technology. Support and prepare the way for any provincial or federal regulation requiring increased boiler efficiency. • Advance the level of skill, capacity, and understanding within trades/mechanical contractors on the correct installation practices and requirements of modern high efficiency commercial boilers. • Maintain a program TRC score greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.
Implementation	
Administration	Program administration is handled entirely in-house by the Companies' EEC Staff. Shifting program administration to an outside service provider or dedicated program operations personnel is a requirement in 2011 in order to free up internal resources to be redirected towards new commercial program development and roll out.
Communications	• www.fortisbc.com – All program information, application forms, and program terms and conditions were maintained on the Efficient Boiler program webpage. • Commercial customer outreach initiative that saw the Companies call over 80,000 commercial customers to provide information on the Efficient Boiler program, among others. • Advertisements in American Society of Heating Refrigeration and Air Conditioning Engineers (ASHRAE) newsletters and the Association of Professional Engineers and Geoscientists of British Columbia's ("APEGBC") magazine. • Stakeholder focus group/feedback session in June 2010 with suppliers, contractors, engineers, participants and potential customers, energy managers, and safety officials. • Speaking engagements / presentations describing the program at events such as: BC Apartment Owners and Managers Association semi-annual tradeshows, Rental Owners and Managers Society of BC tradeshow, NRCan "Spot the

	energy savings" workshop on Vancouver Island, BC Hydro PowerSmart forum, BC Hydro energy managers training session, FortisBC energy specialist training session, Vancouver Home Show, Union of BC Municipalities Whistler 2010, Business Improvement Association meetings in Victoria, Kamloops, and Kelowna, and Council of Education Facilities Planners International conference. • Tradeshow booth/presence at: BC Agriculture tradeshow, BC Food and Restaurant Association tradeshow, Buildex tradeshow, BC Apartment Owners and Managers Association semi-annual general tradeshows, and Rental Owners and Managers Society of BC tradeshow. • Program brochures describing the program specifics and how to apply were handed out at the presentations and tradeshows mentioned above. • Information distributed to all customer touch points including call centres, sales and service staff, and commercial account managers.
Evaluation Strategy	In 2010 the Companies: 1. Completed a focus group session with program stakeholders to find out how various stakeholder groups view the program and to seek input on a revised program structure aimed at better serving stakeholder interests; and 2. Began an evaluation study (performed by a third party consultant) of natural gas savings using actual metered data and statistical methods to better quantify the savings of the program. These two initiatives will serve as an evaluation of the Efficient Boiler program from both the quantitative and qualitative perspectives.

4.4.2.1.2 <u>2010 Efficient Boiler Program Results</u>

With a solid net benefit-to-cost ratio, high efficiency boilers continue to generate a respectable TRC ratio of 1.4. Given a 58 percent increase in participation versus 2009, the Efficient Boiler program has ramped up its presence in the market and delivered significant natural gas and GHG emissions savings in 2010, as indicated in Table 4-5 below

Table 4-5: Efficient Boiler Program Actuals

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	3	74	1	2,630	27,055	18%	1.6
	FEVI	1	6	1	103	1,097	18%	1.3
Retrofit	FEI	88	1,189	23	36,802	378,622	18%	1.4
	FEVI	8	97	5	2,919	29,642	18%	1.2
	TOTALS	100	1,367	30	42,453	436,416	18%	1.4

In 2010, a record number of customers applied to the Efficient Boiler program, choosing high efficiency boilers over standard models. The program significantly outperformed expectations in this regard. As of the writing of this report, the program had officially recorded 100 approved participants with another 15 pending a review of their submitted documentation. By comparison, 2009 saw only 67 applicants in total, 63 of which were accepted into the program as approved participants. The next closest year in terms of participation was 2006, which saw a total of 100 applications received. The Companies believe the increased participation is a result of sustained efforts at promoting both the program itself and the Energy Efficiency and Conservation project more generally, at all available opportunities. The Companies also believe stability and consistency in the program offering (i.e. staying in market over the long term) contributes significantly to encouraging adoption of the high efficiency alternative. The decision to purchase high efficiency boilers is much influenced when the market's awareness of the program is reinforced by its time in market, and when the accepted view of the program is as a reliable source of incentives for high efficiency options.

As indicated in the "Background" section of the Table above, new efficiency regulations are currently being considered by the Government of Canada (Natural Resources Canada). The proposed regulation would see the required minimum efficiency standard of larger gas fired boilers rise from 80 percent to 90 percent by 2018. Successful installation and commissioning of high efficiency boilers requires a knowledge level beyond that of standard efficiency boilers. The Companies believe the program sends a strong signal to the market that the selection of high efficiency options should be adopted as standard practice. By encouraging the installation of high efficiency boilers today, the program is contributing to the development of the required knowledge and capacity within the market, significantly easing the implementation of new regulation over the coming years.

By year end, the efficient boiler program had committed to pay as much as $1,367,000 (not including pending applications) to participants who successfully complete their boiler installation within one year of submitting their program application. This exceeds the previous largest ever annual commitment of $1,075,455 from 2006. As in 2009, the objective moving forward is to build upon the current market momentum and the relationships that have been built with market participants to drive the rate of participation in the program in order to maximize commercial sector gas savings.

When total program spending is compared to the avoided cost of the gas, the program turns in a respectable TRC ratio of 1.4. With the free rider rate estimated to be approximately 18 percent, the annual net energy savings derived from the program's 2010 participants is over 42,000 GJs, or over 2,000 tons of GHG emissions reductions. This represents a volume of gas equivalent to the annual consumption of approximately 450 typical single family homes.

That said, room for improvement in the program remains. While the program largely met its objectives for participation on Vancouver Island, participants from the new construction market remain sparse. According to the available Major Projects Inventory quarterly publications, the value of building permits remains well below the peak activity level observed in 2007 and 2008, indicating new construction activity remained generally subdued in 2010. Still, 55 projects of $15 million or more completed construction between January and September, while 65 began construction. Having garnered only nine new construction participants in 2010, it seems evident that raising the program's profile and generating participation in the new construction market remains a priority. This is despite the Companies' efforts at promoting the program to design professionals via advertisements in both ASHRAE BC and APEGBC's regular publications. More work at promoting the program to decision makers in the new construction marketplace is a must. The Companies' new energy solutions manager positions (see Section 11) will play a central role in this effort by communicating directly with design professionals around the province. The Companies also still believe there is room for participation growth on Vancouver Island and maintaining promotional activity on the Island is critical to developing momentum and uptake.

4.4.2.1.3 *2011 Efficient Boiler Program Performance Forecast*

No significant changes to the cost benefit relationship of high efficiency boilers are foreseen, thus the Companies anticipate the program will continue to generate a TRC ratio of approximately 1.4. The Companies further expect the Efficient Boiler program to build incrementally upon its 2010 participation as reflected in the table below.

Table 4-6: Efficient Boiler Program Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	8	197	2	7,013	73,434	18%	1.6
	FEVI	2	12	1	205	2,190	18%	1.2
Retrofit	FEI	97	1,308	25	40,482	424,785	18%	1.4
	FEVI	9	107	6	3,211	35,091	18%	1.4
	TOTALS	116	1,625	35	50,911	535,500	18%	1.4

Two key initiatives were undertaken in 2010 that will guide activity around the Efficient Boiler program in 2011. First, in June 2010 the Companies conducted a stakeholder focus group to help raise awareness of the program and provide needed and direct insight from industry participants on the program's structure and operation. Second, in September 2010 the Companies began an in-depth, quantitative evaluation study of the program's performance in reducing natural gas consumption. The initial results suggest the natural gas savings are very much in line with what the Companies are currently claiming (approximately 15 percent reduction). The findings of these two initiatives will be used to restructure the program's processes, verify the savings assumptions, and readjust the incentive levels if the cost benefit analysis allows.

As a result of this work and experience gained throughout 2010, the Companies are undertaking revisions to the Efficient Boiler program with program elements designed to focus on three distinct markets:

1. Simple retrofits and new construction;
2. Detailed complex retrofits and new construction; and
3. Operations and maintenance.

The first program element, targeting simple retrofits and new construction, is expected to be operational in 2011. Based on feedback from program participants, this component of the program seeks to

- Make the incentives clear and straightforward to simplify the purchase decision; and
- Reduce the program's administrative burden / overhead for the Companies.

The second and third program elements, focusing on more detailed system design and boiler plant operations and maintenance, will likely be operational in 2012.

In addition, the program will expand the end uses that are eligible for an incentive. Currently, the program only provides incentives for boilers used for space heating. Different end uses are precluded from incentives due to the difficulty in establishing reasonable natural gas savings estimates. Commercial pool and water heating, however, may reasonably be included for incentives moving forward. Commercial pool heating, in particular, is a significant and unaddressed consumer of natural gas and, especially in the case of municipalities, represents an area where program incentive money can make a tangible difference to energy consumption and GHG emissions

It is believed these proposed changes, combined with sustained promotion of the program, will allow the Companies to further the penetration of high efficiency boiler technology in both the retrofit and new construction markets by making the program more visible and accessible to potential participants. Increasing the program's participant numbers furthers the Companies' goal of reducing the commercial sector's gas consumption and bringing about market transformation.

At present, participation is forecasted to grow at a reasonable 10 percent for the key FEI retrofit market; however, the Companies believe additional growth can be expected in the new construction and Vancouver Island markets. Central to this will be the role played by the Companies' new energy solutions managers. The energy solutions managers will be increasing awareness of and participation in Energy Efficiency and Conservation programs by actively participating in industry associations, hosting workshops for commercial customers and seminars for energy managers, and educating small commercial customers through the Service Line newsletter. They will also work one-on-one with current and future commercial customers to increase participation and ease the program's application process.

4.4.2.1.4 Efficient Boiler Program Summary

The Efficient Boiler program effectively encourages program participants to adopt high efficiency boilers in a market where standard efficiency alternatives remain prevalent. The program is helping pave the way for more stringent regulation by encouraging the market to develop the required competency and capacity to deal with high efficiency boilers now. Incremental increases in participation, in conjunction with the benefits derived from a program overhaul, will add significantly to the natural gas savings and dollar investment potential of the program by making it more accessible to a broader range of market participants.

4.4.2.2 Light Commercial ENERGY STAR® Boiler Program

4.4.2.2.1 Program Overview

Light Commercial ENERGY STAR® Boiler Program	
Market	New Construction / Retrofit
Duration	FEI: Aug 2009 – Dec 31, 2011 FEVI: Aug 2009 – Dec 31, 2011
Incentive	Providing that the boiler is used for space heating and/or domestic water heating in combination with space heating: • Condensing boilers: $5 per MBH; and • Near condensing boilers: $3 per MBH. Incentives are available for ENERGY STAR® rated boilers ranging in size up to 299 MBH. Beyond 299 MBH no ENERGY STAR® rating is available, and boilers are covered by the Efficient Boiler program.
Partner	None
Overview	
Background	Approximately 60% of commercial gas consumption in BC is used for space heating. High efficiency boiler technology, when used as part of a properly designed heating system, generates significant annual energy savings over a comparatively long estimated measure life. In fact, high efficiency boilers represent one of the most significant sources of achievable savings for the commercial sector in British BC[23]. Fully 19% of such savings is attributable to high efficiency boilers. Minimum required boiler efficiencies for small boilers are regulated within the province by the British Columbia Energy Efficiency Act and the Energy Efficiency Standards Regulation. Similarly, minimum boiler efficiencies are regulated in Canada as a whole by the federal Energy Efficiency Act. These acts regulate products manufactured in or imported to Canada and BC for domestic sale. Current regulation generally requires boilers to have a minimum efficiency of 80%. A proposed amendment to Canada's energy efficiency regulations would see the minimum required thermal efficiency of small boilers climb to 88% by 2018. The Light Commercial ENERGY STAR® Boiler program is helping ease implementation of this proposed regulation by familiarizing market participants with high efficiency technology prior to the implementation of more stringent regulation.
Description	Launched in August 2009, the Light Commercial ENERGY STAR® Boiler program is FEI and FEVI's most recent offering aimed at reducing energy consumption associated with commercial space heating. In contrast to the Efficient Boiler program this program focuses on smaller boilers with a gas input rating of 299 MBH or less. The program is designed to encourage small to medium commercial customers to install energy efficient boilers by offering a cash incentive that is calculated based on the quantity, size, and type of boiler. Typical facilities that see the installation of small boilers include:

[23] FortisBC 2010 Conservation Potential Review, Commercial Sector Report, Marbek Resource Consultants, 2011, pg 55.

<table>
<tr><td></td><td>Small to medium apartment buildings;
Small to medium office buildings; and
Schools / universities.
By encouraging the use of high efficiency boilers, the Light Commercial ENERGY STAR® Boiler program directly targets the commercial sector's most significant source of gas consumption (space heating) via one of its most widely used and longest lasting gas burning appliances (boilers). Installing such boilers today has a lasting impact by reducing gas consumption now, while paving the way for market transformation and ultimately more stringent regulation of commercial boilers. See background above for a brief review of the current regulatory context and proposed amendments.</td></tr>
<tr><td>Goals</td><td>Reduce commercial sector gas consumption by encouraging the installation and use of high efficiency (ENERGY STAR® rated) as opposed to standard efficiency boilers for space heating.
Increase year over year participation rates in view of maximizing gas savings.
Educate small to medium sized commercial customers about the advantages of energy efficient appliances and provide incentives for their adoption when necessary.
Engage the trades community and manufacturers by supporting new, energy efficient technologies.
Advance the level of skill, capacity, and understanding within trades/mechanical contractors on the correct installation practices and requirements of modern high efficiency commercial boilers. Maintain a program TRC score greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.
Support and prepare the way for any provincial or federal regulation requiring increased boiler efficiency.</td></tr>
<tr><td colspan="2">Implementation</td></tr>
<tr><td>Administration</td><td>Program administration is handled entirely in-house by the Companies' EEC staff.
Shifting program administration to an outside service provider or dedicated program operations personnel is a requirement in 2011 in order to free up internal resources to be redirected towards new commercial program development and roll out.</td></tr>
<tr><td>Communications</td><td>www.fortisbc.com – All program information, application forms, and program terms and conditions were maintained on the Light Commercial ENERGY STAR® Boiler program webpage.
Commercial customer outreach initiative that saw the Companies call over 80,000 commercial customers to provide information on the Light Commercial ENERGY STAR® Boiler program, among others.
Program brochures describing the program specifics and how to apply were handed out at tradeshows.
Program brochures and cards describing the program specifics and how to apply were distributed to regional sales / operations centres and sales and service staff.

</table>

	distributed. • Speaking engagements / presentations describing the program at events such as: BC Apartment Owners and Managers Association semi-annual tradeshows, Rental Owners and Managers Society of BC tradeshow, NRCan "Spot the energy savings" workshop on Vancouver Island, BC Hydro PowerSmart forum, BC Hydro energy managers training session, FortisBC energy specialist training session, Vancouver Home Show, Union of BC Municipalities Whistler 2010, Business Improvement Association meetings in Victoria, Kamloops, and Kelowna, Council of Education Facilities Planners international conference. The Companies are developing a strategic communications plan for the Light Commercial ENERGY STAR® Boiler program. The plan should include: • Direct email advertising; • Additional, targeted magazine/newsletter advertising; • On-bill advertising to Rate 2 (Small Commercial) and Rate 3 (Large Commercial) customers; • Contractor and engineer information sessions; • Additional information sessions on Vancouver Island; • More leveraging of industry partner relationships; and • A program feedback session with key stakeholders.
Evaluation Strategy	The Companies believe it is too early to consider performing an in-depth analysis of the energy savings of the Light Commercial ENERGY STAR® Boiler program. Performing such an analysis requires enough participants with new boilers installed for at least one full heating season to generate statistically significant results. A study similar to that conducted on the Efficient Boiler program could be conducted after a sufficient number of program participants have had their new boilers in operation for at least one full heating season. The Companies estimate that such an evaluation could take place as early as the summer of 2012, though 2013 is more likely. Based on the final cost of the Efficient Boiler program evaluation, it is expected that an evaluation of the Light Commercial ENERGY STAR® Boiler program should cost approximately $50,000.

4.4.2.2.2 2010 Light Commercial ENERGY STAR® Boiler Program Results

As with the Efficient Boiler program, the solid net benefit-to-cost ratio of high efficiency boilers continues to generate a respectable TRC ratio, in this case of 1.6. NOTE: the TRC score for FEI new construction is based on the data from a single participant and cannot be considered representative for this segment.

Table 4-7: Light Commercial ENERGY STAR® Boiler Program Actuals

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	1			91	936	18%	4.8
	FEVI	-	-	-	-	-	18%	0.0
Retrofit	FEI	26	90	5	6,311	64,926	18%	1.6
	FEVI	4	12	1	646	6,915	18%	1.2
	TOTALS	31	102	6	7,048	72,777	18%	1.6

As of August 2010, the Light Commercial ENERGY STAR® Boiler program has been in market for one full year. The program garnered 56 applicants by the end of 2010, largely fulfilling expectations. Ten applications were rejected, however, as they were based on non-qualifying products (not ENERGY STAR® rated) or end uses (not space or combination space/domestic hot water heating). The rate of participation in 2010 at approximately three per month exceeds that of 2009 at two per month, suggesting time in market is essential to improving awareness, influencing the purchase decision, and increasing program participation. Forty six successful participants should be recorded once the remaining 15 applicants with pending applications submit their final documentation (i.e. proof of purchase and copy of gas permit). As with the Efficient Boiler program, all these participants have made the decision to use high efficiency boilers, thereby reducing natural gas consumption and GHG emissions. With the 31 participants who had successfully completed their application by the end of the year, the program should be responsible for a reduction of over 7,000 GJ/yr or nearly 73,000 GJs over the lifetime of the installed boilers. The annual GJ savings represent enough volume to provide gas to approximately 74 single family homes for one year. The remaining 15 applications should bring an additional savings of 3,700 GJ/yr or the equivalent of enough volume to provide gas to 40 homes. While the total incentive amount stood at just over $100,000 by year end, inclusion of all pending applications should increase the figure to approximately $140,000.

While the Companies believe the program largely achieved its overall objective (56 applicants versus 58 forecasted participants), it is clear that the Light Commercial ENERGY STAR® Boiler program suffers to a certain extent from cannibalization of participants by the Efficient Boiler program. The comparatively larger incentive combined with the availability of relatively small size boilers (down to 399 MBH input) makes the Efficient Boiler program more attractive to a certain proportion of participants. The Companies intend to revise the Efficient Boiler program during the course of 2011. At that time, consideration will be given to establishing comparative equality between the two programs' incentive structures.

As indicated in the background section above, new efficiency regulations are currently being considered by the Government of Canada (Natural Resources Canada). The proposed regulations would see the required minimum efficiency standard of smaller gas fired boiler rise from 80 percent to 88 percent by 2018. Successful installation and commissioning of high efficiency boilers requires a knowledge level beyond that of standard efficiency boilers. The Companies believe the program sends a strong signal to the market that the selection of high efficiency options should be adopted as standard practice. By encouraging the installation of high efficiency boilers today, the program is contributing to the development of the required knowledge and capacity within the market, significantly easing the implementation of new regulation over the coming years.

The simplicity of the program's structure continues to work well, requiring significantly fewer hours of administration time than the Efficient Boiler program and leading to faster turnaround times on rebate processing.

No special attempt was made in 2010 to evaluate the claimed energy savings associated with the program. The Companies believe that as most program participants had not had their boilers installed for at least one full heating season, comparative consumption data does not exist to any great extent, and any attempt to independently evaluate the natural gas savings would be futile at this time.

4.4.2.2.3 2011 Light Commercial ENERGY STAR® Boiler Program Performance Forecast

No significant changes to the cost benefit relationship of high efficiency boilers is foreseen, thus the Companies anticipate the program will continue to generate a TRC ratio in the neighbourhood of 1.6. As with the Efficient Boiler program, the Companies expect to build incrementally upon its 2010 participation as reflected in the table below.

Table 4-8: Light Commercial ENERGY STAR® Boiler Program Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	4	14	1	971	10,167	18%	1.6
	FEVI	-	-	-	-		18%	0.0
Retrofit	FEI	45	156	9	10,922	114,375	18%	1.6
	FEVI	10	29	3	1,615	17,261	18%	1.2
	TOTALS	59	199	13	13,509	141,803	18%	1.6

The Light Commercial ENERGY STAR® Boiler program is expected to build upon the results to 2010 and encourage even more customers to choose high efficiency boilers in 2011. While participant numbers and total natural gas savings are expected to see incremental increases over the course of the upcoming year, the underlying cost/benefit relationship of high efficiency boilers is not expected to change significantly. As such, the Companies expect the program generate a TRC score in 2011 more or less in line with what has been seen in 2010.

Raising the program's profile among the target customer groups is essential to ensuring the decision to purchase high efficiency boilers is made as often as possible. While the Companies plan to continue standard promotional efforts, a key component of this effort will be the role played by the Companies' new energy solutions managers. The energy solutions managers will be increasing awareness of and participation in Energy Efficiency and Conservation programs by actively participating in industry associations, hosting workshops for commercial customers and seminars for energy managers, and educating small commercial customers through the Service Line newsletter. They will also work one to one with current and future commercial customers to increase participation and ease the programs application process.

4.4.2.2.4 Light Commercial ENERGY STAR® Boiler Program Summary

As with its older sibling, the Efficient Boiler program, the Light Commercial ENERGY STAR® Boiler program is expected to generate reliable value in 2011. With standard efficiency options widely available and stringent new required minimum efficiency standards on the horizon, the Companies believe it makes sense to operate the Light Commercial ENERGY STAR® Boiler program.

4.4.2.3 Efficient Commercial Water Heater Program

4.4.2.3.1 Program Overview

Efficient Commercial Water Heater Program	
Market	New Construction / Retrofit
Duration	FEI: Jul 2010 – Dec 31, 2011 FEVI: Jul 2010 – Dec 31, 2011
Incentive	<u>Storage water heaters / hot water supply boilers</u> $5 per MBH for water heaters with a thermal efficiency of 90% or higher $3 per MBH for water heaters with a thermal efficiency of 84% to 89.9% <u>On-demand water heaters</u> $2.50 per MBH for water heaters with a thermal efficiency of 90% or higher Maximum incentive is $15,000 per water heater
Partner	None
Overview	
Background	The 2006 and 2010 Conservation Potential reviews identify water heating as the commercial sector's second greatest source of natural gas consumption by volume, yet few water heaters are as efficient as they could be. Data from the Air-Conditioning, Heating, and Refrigeration Institute ("AHRI")[24] and the Consortium for Energy Efficiency ("CEE")[25], and discussions with manufacturer's reps indicate a

[24] *AHRI Database of Certified Product Performance, Water Heaters*, available at: http://www.ahridirectory.org/.
[25] "Market and Technology Characterization for Commercial Gas Water Heaters", CEE, June 2008.

	maximum combustion efficiency of approximately 80% prevails in the market. High efficiency water heating equipment with thermal efficiencies exceeding approximately 90% is available; however, the penetration rate of high efficiency technologies in the DHW market is low[26], especially for stand-alone DHW plants. Minimum required water heater efficiency is governed in BC by the British Columbia Energy Efficiency Act and the Energy Efficiency Standards Regulation, which require a minimum thermal efficiency of 80%. At present, the federal government does not regulate minimum required thermal efficiency for commercial gas water heaters. NRCan has, however, proposed implementing federal regulation of a variety of water heater types including commercial gas fired water heaters. Some proposed changes would coincide with future requirements in the United States and would see the required thermal efficiency of commercial gas fired storage type water tanks climb to 92% by 2016.
Description	The program captures energy savings associated with the heating of domestic hot water, identified in both the 2006 and 2010 Conservation Potential Reviews ("CPRs") as the second largest end use consumer of natural gas, after space heating. The program offers a financial incentive paid to the builder/developer (new construction) or account holder (retrofits or new construction) to encourage the use of high efficiency appliances in standalone DHW heating applications. Such sources include dedicated DHW high efficiency boilers and storage type water heaters. FortisBC's current boiler programs provide an incentive to generate hot water from a high efficiency source in combination Heat / DHW applications; however, a significant gap in market coverage existed prior to the launch of the Efficient Commercial Water Heater program in the case of "stand-alone" DHW systems. The program primarily appeals to commercial customers that typically exhibit high domestic hot water usage such as: • Commercial kitchens; • Multi-unit residential buildings; • Hotels/motels; and • Laundries.
Goals	• Reduce commercial sector gas consumption by encouraging the installation and use of high as opposed to standard efficiency water heaters for domestic hot water heating in commercial buildings. • Increase year over year participation rates in view of maximizing gas savings and bringing about market transformation. • Educate commercial customers about the advantages of high efficiency water heaters and provide an incentive to facilitate the purchase of high efficiency technology. • Maintain a program TRC score greater than 1.0 and optimize the proportion of incentives over administration and marketing costs. • Prepare the way for and support any provincial or federal regulation requiring increased water heater efficiency. • Given that one of the targets for this program is multifamily residential buildings, this program will help to satisfy clause 3(a) of the DSM Regulation,

[26] "Measures and Assumptions for Demand Side Management (DSM) Planning", Navigant Consulting, April 16, 2009.

	which states that in order to be considered adequate, a utility's plan portfolio must include measures for rental accommodation.
Implementation	
Administration	Program administration is handled entirely in-house by the Companies' EEC staff. Shifting program administration to an outside service provider or dedicated program operations personnel is a requirement in 2011 in order to free up internal resources potential to be redirected towards new commercial program development and roll out.

Communications	• www.fortisbc.com – includes a webpage with program information, application form for downloading, and program terms and conditions.
	• Commercial customer outreach initiative that saw the Companies call over 80,000 commercial customers to provide information on the Light Commercial ENERGY STAR® Boiler program, among others.
	• FortisBC Service Line newsletter containing a story outlining one participant's experience with the program and a new high efficiency water heater.
	• Web tile ads for use on partner websites (industry associations, municipalities, advocacy groups, and so on).
	• Online directory of qualifying hot water heaters to make selection of a high efficiency water heater as simple as possible.
	• Brochure: three panel brochure with application form and terms and conditions for hand out at tradeshows and delivery to the Companies' sales staff.
	• Engagement of suppliers' and manufacturers' representatives via information sessions designed to instill awareness of, and answer questions about the program.
	• Lunch and learn sessions with relevant engineering firms, plumbers. and gas fitters. The most relevant being those who deal most often with the target customer groups.
	• Speaking engagements and webpage advertisements with target organizations such as:
	    o British Columbia Restaurant and Food Services Association;
	    o British Columbia Hotel Association;
	    o Tourism Vancouver;
	    o Vancouver Hotel Association;
	    o Mechanical Contractor's Association of British Columbia;
	    o Building Operators and Managers Association;
	    o BC Apartment Owners and Managers Association; and
	    o Magazine advertisement with publications such as: HPAC Engineering magazine, APEGBC / Innovation magazine, and ASHRAE-BC Totem newsletter.
	• Direct contact with target customers, as well as their attendant suppliers, engineers, and O&M service providers is essential in the initial stages of the program.
	• Information distributed to all customer touch points including call centres and sales and service staff.

	The Companies are developing a strategic communications plan for the Efficient Commercial Water Heater program. The plan includes: • Direct email advertising; • Additional, targeted magazine/newsletter advertising; • On-bill advertising to Rate 2 and Rate 3 customers; • Contractor and engineer information sessions; • Additional information sessions on Vancouver Island; • More leveraging of industry partner relationships; and • A program feedback session with key stakeholders.
Evaluation Strategy	The Companies are currently in discussions with a restaurant chain to have condensing water heaters along with meters measuring water flow, temperature, and gas installed in several locations. The Companies will use the data gathered to confirm its savings assumptions vis-a-vis high efficiency water heaters for one of the program's key target customer groups - restaurants. The Companies would also like to perform similar evaluations in a multi-unit residential building and a hotel. A study similar to that conducted on the Efficient Boiler program could be conducted after a sufficient number of program participants have had their new water heaters in operation for a sufficient period of time. Based on the final cost of the Efficient Boiler program evaluation, it is expected that an evaluation of the water heater program should cost approximately $50,000.

4.4.2.3.2 2010 Efficient Commercial Water Heater Program Results

Thus far the overall TRC ratio of 1.1 has lined up fairly well with the expected result, though time and increased participation will confirm this as additional data becomes available. Overall participation was low in the first year, though this is a reflection of the program being launched midyear and efforts at promoting the program having not yet taken place. The program results are reflected in the table below.

Table 4-9: Efficient Commercial Water Heater Program Actuals

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	-	-	-	-	-	5%	-
	FEVI	-	-	-	-	-	5%	-
Retrofit	FEI	7	15	3	592	4,607	5%	1.1
	FEVI	2	3	1	144	1,155	5%	0.9
	TOTALS	9	18	4	736	5,762	5%	1.1

The Companies rolled out the Efficient Commercial Water Heater program in late July 2010. Overall program participation in 2010 was modest, though the Companies believe this is to be expected. The program went live comparatively late in the year, and it generally takes at least one year in market for new programs to gain traction. Moreover, encouraging the program's key target customers (restaurants, hotels, and multi unit residential buildings or "MURBs") to choose high efficiency options for water heating will involve a significant amount of working one-on-one with prominent customers to obtain buy-in and generate success stories that may be used to convince others to adopt high efficient technology. The Companies simply did not have the opportunity to begin this work in 2010. Even so, greater participant numbers are expected in 2011, the first month of which saw eight applicants; nearly as many participants as the program had in 2010.

The minimum required water heater efficiency in BC for commercial water heaters is currently at 80 percent. NRCan has, however, proposed implementing a new federal regulation that would impact commercial gas fired water heaters. The proposed changes would see the required thermal efficiency of commercial gas fired storage type water tanks climb to 92 percent by 2016. Though the regulation is as yet only a proposal, it is clear regulation is being actively considered. The Efficient Commercial Water Heater program is in operation today, helping to build awareness and capacity in the marketplace and pave the way for future regulation when implemented. The Companies believe the program will provide invaluable assistance to the government's objectives in this regard.

The program turns in TRC scores generally above 1.0, indicating that participants are cost effectively reducing their natural gas consumption; however, caution must as yet be used when interpreting the values indicated in the table above. The number of participants and the resultant amount of data collected does not yet allow the Companies to generate results with any degree of statistical significance. Further, the TRC score for the initial year is burdened by program development expenses such as website and program collateral development.

4.4.2.3.3 2011 Efficient Commercial Water Heater Program Performance Forecast

As can be seen in the table below, the Companies expect increased participation in 2011 as the market becomes aware of the program and more customers are effectively encouraged to choose high efficiency water heaters. The primary driver of this increased awareness and program uptake must be the Companies' outreach and promotions activities. Thus far, only a limited effort has been made to promote the technology and program to market participants. The program's TRC score should benefit slightly as program development costs are not incurred in 2011 and increased participation helps cover general program administration costs. Program performance forecasts for 2011 are provided in the table below.

Table 4-10: Efficient Commercial Water Heater Program Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	3	7	2	254	2,656	5%	1.2
	FEVI	1	2		85	676	5%	1.3
Retrofit	FEI	45	99	9	3,805	39,842	5%	1.2
	FEVI	5	7	2	361	2,884	5%	1.0
	TOTALS	54	116	13	4,504	46,058	5%	1.2

Central to the promotion of the program will be the role played by the Companies' new energy solutions managers. The energy solutions managers will be increasing awareness of and participation in Energy Efficiency and Conservation programs by actively participating in industry associations, hosting workshops for commercial customers and seminars for energy managers, and educating small commercial customers through the Service Line newsletter. They will also work one-on-one with current and future commercial customers to increase participation and ease the program's application process.

Currently, the Companies are actively collaborating with a restaurant chain and are seeking hotels and MURBs to work with to install new high efficiency water heaters, monitor the results, and produce success stories to be used to promote the high efficiency appliances to other potential program participants. The Companies believe working directly with restaurant and hotel chains, as well as apartment and condo associations to reinforce the positive benefit of high efficiency water heaters will be key to the program's success. High efficiency water heaters are relatively new compared to boilers and many who could benefit from their use either don't know they exist or have concerns about their operation. Working with several high profile customers and promoting their success is expected to change this mindset. Several MURBs opt for indirect water heaters and the Companies are looking to include these in the program to help the market.

The Companies are also eager to leverage the relationship currently being built with the Green Table Network Society (see Spray Valve program, Section 4.4.3.1) to encourage the use of high efficiency water heaters and generate program participants from the commercial food service industry.

4.4.2.3.4 Efficient Commercial Water Heater Program Summary

As the marketplace becomes more aware of the program, the Companies expect this awareness to effectively encourage more customers to install high efficiency in place of standard efficiency water heaters, leading to increased participation in 2011. The program's simple structure should help to keep administrative spending low over the long run and also contribute to an overall positive TRC score, similar to the Light Commercial ENERGY STAR® Boiler program.

4.4.2.4 Energy Assessment Program

4.4.2.4.1 Program Overview

Energy Assessment Program	
Market	Retrofit
Duration	FEI: 2001 – Dec 31, 2011 FEVI: May 2009 – Dec 31, 2011
Incentive	A walkthrough energy assessment and written report – a $1,200 value, funded entirely by the Companies
Partner	None
Overview	
Background	N/A
Description	The Energy Assessment program has been in operation since 2001 with minor modifications made over the years. This program is designed to identify inefficiencies in natural gas energy consumption and provide recommended solutions in the following sectors: condominiums and apartments, food processors, greenhouses, hospitals, hotels, industry, offices, recreation centres, restaurants, schools, warehouses, and wood products. Inefficiencies are identified at the participant's facilities via an onsite walkthrough assessment by an energy efficiency consultant. The consultant then produces a report, describing the observed inefficiencies and outlining proposed energy savings measures that may be implemented to reduce gas consumption. The Companies then forward the report to the participant.
Goals	• Enable and encourage commercial customers to reduce gas consumption by identifying sources of high gas consumption within their facilities and proposing implementable measures aimed at reducing consumption. • Educate commercial customers about gas use within their own facilities and the steps they can take to minimize consumption. • Foster a culture of conservation among commercial sector customers, including MURBs and institutional and manufacturing customers, by assisting them with reviewing their energy consumption. • Where applicable, direct participants to available incentive programs including FortisBC's existing boiler programs. • Maintain a program TRC ratio greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.
Implementation	
Administration	Administration of the Energy Assessment program is handled in-house by the Companies' DSM staff as well as the external service provider Environ.
Communications	• www.fortisbc.com – the Companies maintained a webpage dedicated to the program that included program information, application forms, and program terms and conditions. • Brochure: three panel brochure with program information and terms and

	conditions for hand out at tradeshows and use by the Companies' sales and key accounts staff. • Speaking engagements / presentations describing the program at events such as: NRCan "Spot the energy savings" workshop on Vancouver Island, BC Hydro PowerSmart forum, BC Hydro energy managers training session, FortisBC energy specialist training session, Business Improvement Association meetings in Victoria, Kamloops, and Kelowna, and the Council of Education Facilities Planners international conference. • Direct promotion of the program by the Companies' key accounts staff.
Evaluation Strategy	An initial evaluation study was completed in 2008. The Companies completed a second evaluation study in early 2010 based on participation from July 2007 through July 2009. This study provided additional insight into the program's performance and allowed the Companies to refine the data underlying the savings assumptions. The study compared expected gas usage of program participants to actual usage post assessment to quantify energy savings. Phone interviews where then carried out to account for changes in occupancy or business activity that may have had a bearing on the observed post assessment energy consumption. Data from the latest evaluation study suggests participants save on average 688 GJ/yr after participating in the program. This is a significant increase over the previous study that suggested 299 GJ/yr of savings. It must be noted that the average savings in any particular round of evaluation is heavily influenced by the number and size of manufacturing sector participants, who account for the majority of the natural gas savings. For this reason, the Companies believe using the average of the two studies represents a prudent estimation of the natural gas savings in any particular period. Furthermore, the Companies have reviewed participants in the Energy Assessment Program over a 2 year period versus participants in the Companies' other incentive programs to eliminate any possible double counting of savings.

4.4.2.4.2 2010 Energy Assessment Program Results

The Energy Assessment program maintains a solid TRC ratio of 2.5 overall, thanks largely to the ultimate implementation of recommended measures by manufacturing companies. Program results for 2010 are provided in the following table.

Table 4-11: Energy Assessment Program Actuals

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	FEI	55	66	25	17,446	17,446	35%	2.4
	FEVI	13	16	2	4,124	4,124	35%	2.9
	TOTALS	68	82	26	21,569	21,570	35%	2.5

The Companies continued to operate the Energy Assessment program in 2010 as it had been operated in previous years and the program exceeded expectations in terms of participation. Vancouver Island especially saw a significant increase in assessments performed, jumping from zero in 2009 to 13 in 2010. The program has effectively delivered facility specific energy assessments to all participants, encouraging them thereby to reduce their natural gas consumption. The latest program evaluation study demonstrates that participants do in fact implement recommended measures post assessment, though the proportion of implementation varies among the commercial market segments.

The program maintains a strong TRC score, largely due to the significant energy savings of the manufacturing sector participants who implement energy saving measures after receiving their Energy Assessment. The latest evaluation study asserts that:

> *"…this program was most effective amongst manufacturing companies. These respondents were responsible for 92 percent of the total GJs reduced in this study while representing only 23 percent of the total program participant premises. In conclusion, these findings clearly indicate that the program was most effective amongst manufacturing clients."*

While the evaluation study suggests the Companies should focus on offering energy assessments primarily to manufacturing companies and large institutional customers who are responsible for most of the savings, the Companies believe that for the time being it is important to offer the program to as many potential participants as possible. The Energy Assessment program allows the Companies to help foster a culture of conservation among commercial customers by visiting their facilities directly and helping educate them on their gas use. The program is also an important "first contact" that can lead to subsequent participation in the Companies' other incentive programs where applicable.

4.4.2.4.3 2011 Energy Assessment Program Performance Forecast

The Energy Assessment program is expected to perform in 2011 much as it did in 2010, though the TRC ratio will benefit somewhat as program evaluation costs will not be incurred in the new year. Program performance forecasts for 2011 are provided in the following table.

Table 4-12: Energy Assessment Program Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	FEI	61	73	27	19,190	19,190	35%	2.7
	FEVI	14	17	2	4,536	4,536	35%	3.3
	TOTALS	75	90	29	23,726	23,726	35%	2.8

It is expected the program will perform in 2011 much the same as in 2010, while building incrementally on participation numbers and educating additional customers on their energy use and the benefits of energy efficiency. Additional promotion of the program to light industrial and manufacturing customers will take place. Central to this will be the role played by the Companies' new energy solutions managers. The energy solutions managers will be increasing awareness of and participation in Energy Efficiency and Conservation programs by actively participating in industry associations, hosting workshops for commercial customers and seminars for energy managers, and educating small commercial customers through the Service Line newsletter. They will also work one-on-one with current and future commercial customers to increase participation and ease the programs application process.

4.4.2.4.4 Energy Assessment Program Summary

The Companies believe the Energy Assessment program is a valuable tool that is, and continues to be, used to foster an awareness of energy use and energy efficiency issues among commercial customers, raise awareness of and participation in other incentive programs, and effectively encourages participants to reduce energy consumption. As such, the program remains an important component in helping to lay the foundation for longer term market transformation.

4.4.2.5 Public Sector Energy Conservation Agreement ("PSECA") Initiative

4.4.2.5.1 Program Overview

Public Sector Energy Conservation Agreement ("PSECA") Initiative	
Market	Public Sector Retrofit
Duration	FEI: Jul, 2010 – Jul, 2012 FEVI: Jul, 2010 – Jul, 2012
Incentive	The Companies made use of several existing funding models to provide incentives tailored to each project's specific situation, with all incentives falling under the umbrella of the PSECA initiative. Thus, while incentives where determined using the most appropriate program model, participants are counted under the PSECA initiative, not in the programs whose funding model was applied. Refer to: Efficient Boiler Program Efficient Commercial Water Heater Program Commercial Custom Design Program
Partner	Ministry of Environment, BC Hydro, Solar BC

<table>
<tr><th colspan="2">Overview</th></tr>
<tr><td>Background</td><td>The first PSECA was created in 2007 as a partnership between BC Hydro and the Government of BC. Budget 2008 committed $75 million over three years to help public sector organizations reduce provincial GHG emissions, energy consumption, and operating costs, as well as support government in achieving its goal of carbon neutrality. The first two rounds of PSECA's have achieved annual energy cost savings of close to $7.4 million, GHG emissions reductions of over 18,700 tons, and conservation of 38.6 GWh of electricity. The latest iteration of PSECA is the third round and marks the first time the Companies have been involved.

Eligible public sector organizations include all organizations listed in the Government Reporting Entity ("GRE"):
Ministries and agencies;
Boards of Education;
Universities and colleges;
Health authorities; and
Crown corporations.</td></tr>
<tr><td>Description</td><td>In 2010, the Companies participated in the Public Sector Energy Conservation Agreement, operated by the Climate Action Secretariat, a division of the Ministry of Environment. The PSECA initiative represents a major undertaking for the commercial program area staff during the second half of 2010. The Companies worked in partnership with the Climate Action Secretariat, BC Hydro, and Solar BC to encourage public sector organizations to reduce energy consumption and GHG emissions by offering incentives for the completion of qualifying projects.

Typical projects included:
Boiler upgrades;
Building automation controls;
Water heater upgrades; and
Heat recovery measures.</td></tr>
<tr><td>Goals</td><td>To contribute to the Province's objective of a 33% reduction in GHG emissions from 2007 levels by 2020.
To encourage public sector organizations to reduce natural gas consumption.</td></tr>
<tr><th colspan="2">Implementation</th></tr>
<tr><td>Administration</td><td>Administration was primarily handled in-house by FortisBC staff, including receipt and review of energy studies and communication with the Climate Action Secretariat and program partner BC Hydro.</td></tr>
<tr><td>Communications</td><td>External communications were managed by the provincial government. Refer to http://www.env.gov.bc.ca/cas/mitigation/pseca.html.</td></tr>
<tr><td>Evaluation Strategy</td><td>All projects are reviewed both before and after completion. Initially, the Companies reviewed all submitted energy studies to assess the validity of the claimed natural gas savings. On completion of a project, the participant must submit the required installation documentation. Prior to paying the incentive, the Companies perform an on-site audit of all projects to ensure equipment has been installed and is functioning</td></tr>
</table>

	as initially proposed. At the Companies' discretion, some projects may be subjected to a measurement and verification ("M&V") protocol, whereby metering equipment is installed to measure and verify the energy savings.

4.4.2.5.2 *2010 PSECA Initiative Results*

The Companies' involvement with the Public Sector Energy Conservation Agreement afforded an excellent opportunity to invest in high quality, long term energy saving measures, as well as demonstrate the leverage advantage of working with partners. While the effort consumed much time that would otherwise have been devoted to new program development and roll out, the trade-off generated a program with a TRC score of 2.3 for incentive dollars committed in 2010. Program results for 2010 are provided in the table below.

Table 4-13: PSECA Initiative Program Actuals

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	-	-		-		-	
	FEVI	-	-		-		-	
Retrofit	FEI	15	531	11	18,222	163,420	0%	2.4
	FEVI	13	297	5	11,706	107,935	0%	2.2
	TOTALS	28	827	15	29,928	271,355	0%	2.3

As noted above, the PSECA initiative represents a major undertaking during the second half of 2010. The Companies believe, however, that the results to date were well worth the effort. By the end of the year the Companies committed to providing nearly $830,000 for energy saving measures at 28 locations to program participants who successfully complete the approved measures. When complete, these measures are expected to reduce natural gas consumption by approximately 30,000 GJ/yr, or enough to provide natural gas to 315 single family homes during the same time period.

The TRC score for the PSECA initiative is quite robust, which the Companies take as an indication of the high quality of the energy saving projects approved for funding.

4.4.2.5.3 *2011 PSECA Initiative Performance Forecast*

In 2011 the Companies expect to provide additional EEC incentive dollars to successful participants in a second round of PSECA funding. This second tranche consists of projects designed to reduce natural gas consumption and greenhouse gas emissions of K through 12 schools.

Table 4-14: PSECA Initiative Program Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	-	-		-		-	
	FEVI	-	-		-		-	
Retrofit	FEI	12	800	24	30,830	322,840	0%	0.7
	FEVI	2	208	9	5,497	58,745	0%	1.0
	TOTALS	14	1,008	33	36,327	381,585	0%	0.7

Among this second group of projects are 12 central thermal plant upgrade projects, 4 of which consist of conversions to open loop type geoexchange heat pump systems with gas boiler backup. These will significantly reduce natural gas consumption and greenhouse gas emissions at each of the affected facilities.

Throughout 2011 and into 2012 FortisBC staff will expend a considerable amount of time and effort to inspect completed PSECA projects to ensure the approved energy saving measures have been built as described and are fully complete and operational prior to issuing payment. This will ensure incentives are only paid out where warranted.

Further to this, in 2013, after all the approved energy saving measures have been installed for a minimum of one full heating season, FortisBC staff will review the program's actual energy savings versus the claims of the energy studies. The results of the review will be used to refine the custom design program.

4.4.2.5.4 PSECA Initiative Summary

The combined 2010 and 2011 PSECA program activity will generate an overall TRC result above 1.4 by the time work in the program is finalized in late 2011 or early 2012. The Companies believe the PSECA initiative, offered in collaboration with the Climate Action Secretariat and BC Hydro, will successfully encourage public sector organizations to significantly reduce natural gas consumption and GHG emissions.

4.4.2.6 Fireplace Timers Pilot Program

4.4.2.6.1 Program Overview

Fireplace Timers Pilot Program	
Market	Retrofit
Duration	FEI: Nov 1, 2009 – Dec 31, 2011 FEVI: N/A
Incentive	Provision of fireplace timer at no charge, plus $30 per timer towards the cost of installation.

<table>
<tr><td>Partner</td><td>None</td></tr>
<tr><th colspan="2">Overview</th></tr>
<tr><td>Background</td><td>According to a 2005 report done by Habart & Associates called Impact of Terasen Gas* Pilot Fireplace Program (2004), a decorative gas fireplace consumes approximately 14.9 GJ/yr of natural gas.
Based on information contained in the Terasen Gas* 2008 REUS, only 12% of decorative fireplaces are used for heating purposes and 55% of these units are used for ambiance. This would seem to indicate that a significant amount of energy could be saved by encouraging consumer use of a fireplace timer to turn off their fireplace after a specified period of time.
In a 2003 study completed by FEI at Strata Plan LMS 1685 located at 8420 Jellicoe Street in Vancouver, it was found the installation of the fireplace timer significantly reduced the gas consumed by the strata. The strata embarked on a retrofit project in 2002 as a means to reduce their gas consumption. In this study, it was determined that by installing a fireplace timer in suites, gas savings of 6 GJ/yr were achieved. A testimonial by Strata Plan LMS 1685 was later released in June 2003 validating these results.
*At this time the Company operated under the name Terasen Gas.</td></tr>
<tr><td>Description</td><td>The purpose of this pilot program is to study the effect on gas consumption of installing electronic programmable timers on decorative gas fireplaces in MURBs. It is believed the timers will reduce instances of customers leaving gas fireplaces burning longer than is actually needed. The pilot is offered in FEI’s Lower Mainland service territory. The timers are only installed in units where the fireplace is not the primary heating source.</td></tr>
<tr><td>Goals</td><td>The main purpose of this pilot program is to determine what the actual energy savings are from fireplace timers. Additionally, the pilot seeks to evaluate:
• Potential difficulties with offering a full program in the awkward legal context of strata corporations;
• Whether or not the market has sufficient installation capacity to run a full program; and
• To enroll 1,000 participants, each saving 3 GJ/yr for a total of 3,000 gross annual savings for the program.</td></tr>
<tr><th colspan="2">Implementation</th></tr>
<tr><td>Administration</td><td>Program administration entirely in-house by the commercial EEC team.</td></tr>
<tr><td>Communications</td><td>For the pilot, communications is achieved by a webpage on the Company’s website in addition to being promoted in person to applicable customers.</td></tr>
<tr><td>Evaluation Strategy</td><td>FEI will review the gas consumption of the participating buildings prior to the installation of fireplace timers. This data, obtained from the FEI billing system, will establish the baseline gas consumption.
After the pilot is completed and reviewed, a larger program running over multiple years will be considered and offered throughout the Companies’ service territories.</td></tr>
</table>

4.4.2.6.2 Fireplace Timers Pilot Program Results

The Fireplace Timer Pilot program has garnered some participation, though the requirements of the pilot study make gaining participants among strata properties a challenge; however, the

Companies continue to expect the pilot program will confirm a positive cost benefit ratio for the measure as indicated in the table below.

Table 4-15: Fireplace Timers Pilot Program Results

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	-	-		-	-	0%	-
	FEVI	-	-		-	-	0%	-
Retrofit	FEI	195	10		585	2,374	0%	2.3
	FEVI	-	-		-	-	0%	-
	TOTALS	195	10	-	585	2,374	0%	2.3

This pilot program was launched in late 2009 and operated throughout 2010. While the Companies ultimately anticipate the measure will deliver a strong TRC performance[27], participation in the pilot program is not currently at the desired level of 1,000 timers installed; however, the Companies do not consider this to be a critical issue. There are two items that hinder program uptake. First, in order to ultimately quantify the impact of the fireplace timers on the overall building consumption, and thereby determine the natural gas savings per timer, the pilot program requires essentially all of any given building's decorative fireplaces to be equipped with timers. It is difficult for strata corporations to achieve this requirement, as each individual dwelling unit holder legally decides what happens within each unit. Thus essentially all of the unit holders must agree to participate in the program and have timers installed in their units before a strata can be accepted into the program. Secondly, as this is a pilot program, comparatively little effort has been expended on promoting this pilot program in 2010. The Companies have sought assistance from industry partners but to date additional participants have not been forthcoming.

It must be noted that once the savings of the fireplace timers have been established, and the positive cost benefit ratio has been confirmed, a full program will not require all of the units in the building to be equipped with fireplace timers in order to participate. Any such full scale program will not face the same difficulties in generating participation.

4.4.2.6.3 Fireplace Timers Pilot Program Performance Forecast

Based on current applicants to the program (those who have submitted an application but have not finalized the remainder of the requirements) the Fireplace Timer Pilot program will increase its participation in 2011 to a level that may allow the Companies to proceed with the savings evaluation. The performance forecast for the program is provided in the following table.

[27] NOTE: The TRC ratio presented in the table is based on the cost benefit assumptions underlying the pilot program business case.

Table 4-16: Fireplace Timers Pilot Program Performance Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	-	-	-	-		0%	
	FEVI	-	-	-	-		0%	
Retrofit	FEI	400	20		1,200	4,901	0%	2.5
	FEVI	30	2		90	370	0%	2.0
	TOTALS	430	22	193	1,290	5,271	0%	2.5

It is expected that the greater part of the target number of installations will be installed by the end of 2011. As of January 2011 the Companies had an additional 247 potential timer installations recorded. The Companies require only that the participants accept the full terms and conditions and ensure a sufficient number of dwelling unit holders agree to participate in order to include these as participants.

After a sufficient number of timers have been installed the Companies believe analysis work can begin and may generate meaningful results as to the savings per timer. If such results are reasonably consistent it may not be required to have all of the originally projected 1,000 timers installed as part of the pilot program. Analysis of the results could begin after the winter of 2011 / 2012, when a sufficient number of fireplace timers have been installed for a least one full heating season.

4.4.2.6.4 Fireplace Timers Pilot Program Summary

The aim of this program is to reduce the amount of natural gas used for decorative fireplaces and ultimately change the behaviour of the end user. By encouraging them to control the amount of time the fireplace is on, they are also becoming more aware of their energy use and ultimately their building’s energy use. The timers provide options for running times of 30 minutes, 60 minutes, or 120 minutes before the fireplace turns off automatically. If by implementing this measure a building can save approximately three GJs per unit, that would add up to significant financial savings over several years.

4.4.2.7 Radiant Tube Heaters Pilot Program

4.4.2.7.1 Program Overview

Radiant Tube Heaters Pilot Program	
Market	Retrofit
Duration	FEI: To be determined FEVI: To be determined

Incentive	Established independently for each participant and governed by the cost benefit ratios specific to each site.
Partner	None
Overview	
Background	Radiant tube heaters use infrared energy to heat buildings. Infrared energy is a form of electromagnetic radiation, and heats objects directly, instead of indirectly via the medium of heated air. Occupants feel comfortable without the need to heat all the air in the space to 24° C. In comparison, unit heaters heat air and comfort is maintained by keeping the air warm to avoid heat loss of occupants. Warm air is difficult to control in many commercial settings such as manufacturing facilities, warehouses, garages, workshops, barns and sheds, and so on. The warm air rises to the ceiling or gets blown out the door, resulting in significant inefficiencies and increased gas use as occupants turn up the thermostat to compensate.
Description	The purpose of this pilot study is to assess the gas savings potential of radiant tube heaters versus unit heaters used for space heating in commercial facilities. The data gathered via this study will contribute to the development of a full scale program offering should radiant tube heaters return a positive TRC ratio. It is suspected that radiant tube heaters could achieve significant energy savings when used in place of unit heaters in manufacturing, warehousing, or similar applications.
Goals	• To study the effectiveness of infrared heating technology and validate or modify the energy savings assumptions used in this business case. • Similarly, to validate or modify the measure cost assumptions used in this business case. • To gain insight into additional benefits (i.e. occupant comfort, reduced noise, and so on) that accrue to users of radiant tubes.
Implementation	
Administration	To be determined
Communications	None
Evaluation Strategy	The results of the pilot study shall be evaluated as follows: A pre/post comparison of gas consumption will be used to establish the energy savings. The facility's weather normalized pre-installation gas consumption will define the baseline consumption to which the new system's performance will be compared. Gas sub meters will be installed to independently collect consumption data for the truck bays and the office/administrative areas over the course of at least one full heating season. This data will then be compared to the baseline to establish the actual energy savings. Additional benefits such as increased occupant comfort will be assessed via a brief interview with the owner/occupants after one full heating season.

4.4.2.7.2 Radiant Tube Heaters Pilot Program Results

In 2010, the Companies set up a pilot program to study the effectiveness of radiant tube heaters at reducing natural gas consumption due to space heating. Several other natural gas utilities in North America provide incentives to encourage the use of radiant tube heating instead of more conventional forced air unit heaters. It is believed radiant tube heaters would work well in BC's climate, though preliminary results from the pilot will not be available before January 2012

4.4.2.7.3 Radiant Tube Heaters Pilot Program Performance Forecast

As of the writing of this report, the pilot program has one active participant, located in the Interior of British Columbia. The Companies are actively seeking additional participants in the interior and coastal regions of the province. The table below presents the estimated data[28] associated with the initial participant. Additional estimates can be made as suitable potential participants are identified.

Table 4-17: Radiant Tube Heaters Pilot Program Performance Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
Retrofit	FEI	1	3	7	275	2,880	0%	1.5
	FEVI	-	-	-	-	-	0%	0.0
	TOTALS	1	3	7	275	2,880	0%	1.5

In 2011, radiant tube heaters will be installed in up to five locations in the province. Data will then be collected over the winter of 2011 / 2012 and used as support for launching a full scale program, should the cost benefit results prove positive.

4.4.2.7.4 Radiant Tube Heaters Pilot Program Summary

The Companies suspect radiant tube heaters may be an effective way to reduce natural gas consumption for space heating in applicable locations. The Radiant Tube Heaters Pilot program will allow the Companies to gather empirical data specific to the climate zones in BC, while investigating available research from other jurisdictions. Should the results prove positive the Companies will proceed with a full scale prescriptive program development.

4.4.3 PROGRAMS IN DEVELOPMENT

4.4.3.1 Spray Valve Program

4.4.3.1.1 Program Overview

Spray Valve Program	
Market	Retrofit
Duration	FEI: Jan 31, 2011 – Dec 31, 2011

[28] NOTE: The TRC ratio and energy savings presented in the table are based on the estimates underlying the acceptance of the initial location into the pilot program.

	FEVI: Jan 31, 2011 – Dec 31, 2011
Incentive	Direct install of low flow pre rinse spray valves
Partner	Green Table Network Society ("GTNS"): Founded in 2007, GTNS is based in Vancouver, BC. GTNS is a group of restaurant professionals, joined by the people who supply and support them, who are making a conscious commitment to sustainability in commercial food service establishments.
Overview	
Description	The Companies are currently developing another low flow pre rinse spray valve install program. Similar to previous pre rinse spray valve programs, the proposed program is designed to achieve energy savings by directly installing new, low flow pre rinse spray valves in food service establishments ("FSEs") within the Companies' service territories. These pre rinse spray valves will be installed in FSEs that consume domestic hot water from gas-fired water heaters only. Unlike previous spray valve programs, the Companies propose to partner with an external program operator (GTNS) for program outreach and delivery. The partner will install all spray valves on behalf of FortisBC and will be responsible for data collection, the inventory of spray valves, and general administration of the program.
Goals	• To install up to 300 spray valves province wide over the course of one year or to a maximum of $25,000. • To achieve gas savings of approximately 2,650 GJs/yr and save our customers approximately $24,000 in annual gas expenditures.[29] • To raise awareness of energy efficiency, especially as it pertains to water heating, among FEI and FEVI's commercial cooking customers, with a view of increasing participation in the Companies' commercial programs. • To establish and evaluate a working relationship with GTNS with a view to partnering with them again on future incentive programs targeted at commercial FSEs.
Background	Low flow pre rinse spray valves use approximately 50% less water than standard models[30], significantly reducing the volume of heated water used in dishwashing operations. This in turn reduces the energy demands placed on the hot water system, and thereby the overall energy consumption of a given facility. Pre-rinse spray valves ("PRSVs") are commonly used in restaurants, hotels, schools, grocery stores, and hospitals to rinse down plates, pots, and pans.
Implementation	
Administration	GTNS will be administering the program and keeping track of all participants. They will then submit all information on the participants back to FortisBC. • The customer will contact GTNS directly to request a new valve. GTNS will set up appointments to visit the establishment and directly install a pre rinse spray valve. • GTNS will be required to record hot and cold water temperatures, pre- and post-installation flow rates, and estimate usage hours, amongst other data points, and enter this data into a database and calculate energy savings on a per-establishment basis. • GTNS will provide weekly updates on participants and program information as outlined in the agreement.

[29] $24,000 is based on an average of FEVI & FEI Rate 2 and Rate 3 customers as of January, 2011.
[30] FortisBC 2010 Spray 'n' Save Victoria Program Results.

	• GTNS will submit invoices to FortisBC as outlined in the agreement between FortisBC and GTNS. FortisBC will then reimburse GTNS for each valve installed in establishments using natural gas to generate hot water, to a maximum of $85 per valve, enough to cover the cost of the valve. GTNS is responsible for the installation cost of the measure.
Communications	The program's requirement for communications material or collateral is relatively light. Program promotions and participant uptake is driven primarily by GTNS. As such communications / collateral requirements were limited to: 1. Participant consent form; 2. Information card to hand out to participants or potential participants; and 3. A website to inform potential participants about the program and allow them to request the installation of low flow spray valve(s) by directing them towards the GTNS contact page.
Evaluation Strategy	GTNS will provide to FortisBC brief weekly updates via email on the number of new valves installed and advise if any issues have arisen with the program in the interim period since the last update. No later than four months after the completion of the program, GTNS will compile a final written report identifying any challenges or barriers to FSE participation and GTNS' perspective on any aspects of the program that worked especially well and any aspects that can be improved. These results will be compared to those of the Okanagan Spray Saver evaluation and the Victoria Spray Saver program for confirmation and verification of savings.

4.4.3.1.2 2011 Spray Valve Program Performance Forecast

Based on the very solid TRC performance noted in the previous iterations of the low flow pre rinse spray valve program, the Companies expect this version of the program will be a strong performer as well. Note the TRC score presented in the table below is not as strong as presented in section 4.4.1.1. Under this version of the program the Companies are working with a partner and are not in control of all costs. To be conservative, the maximum estimated measure cost of $130 per installed valve has been used in the TRC analysis until such time as the actual installation cost incurred by the partner is determined.

Table 4-18: Spray Valve Program Forecast

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
New Const	FEI	4			32	2,252	12%	1.9
	FEVI	-	-	-	-	-	12%	0.0
Retrofit	FEI	235	20	3	1,861	7,554	12%	2.4
	FEVI	55	5	1	434	1,792	12%	2.4
	TOTALS	294	25	3	2,327	11,598	12%	2.3

The Companies intend to offer a direct install, low flow pre rinse spray program once again in 2011. The program will have several key differences in comparison to its predecessor initiatives, which the Companies believe could improve performance and extend the reach of the energy efficiency message within the commercial food service market segment. The Companies propose to partner with GTNS that will be responsible for the program operations, including overseeing the provision and installation of the pre rinse spray valves in qualifying locations. GTNS will use its network of contacts in the food service industry to generate program participants throughout the province. Further, GTNS will promote FortisBC's other commercial incentive programs wherever applicable. In practice, this will mean significant additional customer direct promotions of the Efficient Commercial Water Heater program to one of its key target groups. For their part, the Companies will pay for the new spray valves and provide promotional materials and exposure for the program at all relevant opportunities.

While the initial forecast is for approximately 300 new spray valves to be installed, the Companies will extend the agreement to allow for the installation of additional valves should the initial collaboration prove to be positive and productive. The initial run of the program should allow the Companies to invest approximately $25,000 in natural gas efficiency among commercial food service establishments.

The Companies believe that despite the strong value proposition of low flow pre rinse spray valves, the dynamics of the food service industry make it necessary to operate a DSM program in order to capture the potential natural gas savings. The commercial food service business tends to be exposed to significant volatility, making "cheapest first cost" a critical purchase decision criteria for any item that is not critical to customer service. Food service establishments typically lack the time or resources to research energy saving options or understand the benefits provided. Though low flow spray valves pay for themselves relatively quickly, the ultimate magnitude of the dollar savings per any single valve is unlikely to move most potential beneficiaries to action. A utility funded DSM program makes it easy and straight forward for participants to save natural gas by effectively eliminating both the effort and risk that potential participants would normally associate with the selection of high efficiency options.

The spray valve program will also play an important role in introducing a new concept to the food service industry, namely that energy is a variable cost. The Companies believe most food service establishments consider energy to be a fixed cost and that changing this mindset is essential to ultimately bringing about market transformation. In this light, the Companies believe low flow pre rinse spray valve programs are an essential first step that will lead to greater energy savings down the road.

4.4.3.1.3 Spray Valve Program Summary

The program is initially expected to install approximately 300 low flow pre rinse spray valves in locations that would otherwise be using standard flow rate sprayers, generating significant natural gas savings as a result. The Companies thus believe the program will successfully deliver tangible natural gas GJ savings, as well as the non-tangible benefit of raising energy awareness in the commercial food service sector. Furthermore, the program will allow the Companies to develop and evaluate a business relationship with a potentially valuable partner in the effort to achieve market transformation in the commercial food service sector. Finally, the proposed program and partnership with GTNS represents an excellent opportunity to raise awareness and encourage greater uptake of the Efficient Commercial Water Heater program and subsequent program offerings within this sector.

4.4.3.2 Commercial Custom Design Program

4.4.3.2.1 Program Overview

Commercial Custom Design Program	
Market	New Construction / Retrofit
Duration	FEI: To be determined FEVI: To be determined
Incentive	• All energy conserving measures must exceed a TRC score of 1.0 to be eligible for an incentive • Incentives calculated as $5/GJ saved on the net present value of the natural gas savings over 50% of the estimated measure life to a maximum of 10 years • Incentives not to exceed 100% of the measure's incremental cost
Partner	BC Hydro
Overview	
Background	The Companies have historically offered incentives to commercial customers via prescriptive programs only. The prescriptive method assigns energy savings and incentive amounts to specified energy savings measures based on a generalization of how the measure will perform when installed. Many commercial customers have potential energy saving projects that are bigger and more complex than can be addressed in a prescriptive program due to the complexity and custom designed nature of their mechanical systems. A program to allow the Companies to encourage the implementation of these projects is necessary to capitalize on the natural gas saving opportunity they represent. The Commercial Custom Design program will meet this need by providing incentives tailored to suit the energy saving measures specific to each individual participant's project.
Description	The program seeks to capture energy savings associated with measures (i.e. technologies, systems, or operational strategies) that are otherwise difficult to incent as part of a prescriptive program because they are complex, and may include multiple measures with interactive effects in one project. This custom program will capitalize upon the creative potential of the marketplace, and help foster expertise in advanced energy efficiency design in BC. It is expected that most participants will be from sectors such as: 1. Large commercial facilities; 2. Large multifamily residential buildings; 3. Institutional and government; 4. Agriculture; and 5. Manufacturing (where measures address space or water heating). For such groups, the potential to achieve gas consumption savings by incorporating measures specifically engineered to suit their particular situation and needs is

<table>
<tr><td></td><td>expected to significantly surpass what can be accomplished via a prescriptive program. These may include measures that will:
• Make use of alternative energies, with gas backup
• improve building envelope performance;
• use more efficient gas burning equipment or systems;
• recover and reuse energy that is currently lost;
• capture and use solar energy for heating air or water;
• reduce the rate of energy consumption by systems or equipment in low occupancy periods; and
• eliminate unnecessary energy usage by shutting off idling or unneeded equipment
Energy saving measures will be presented to the Companies for review, in an energy study format prepared by a qualified consultant. Qualified consultants are engineering professionals, retained by the program participants, who meet the technical proficiency and experience requirements of the Companies.</td></tr>
<tr><td>Goals</td><td>• To capture energy savings from otherwise difficult to incent measures including whole building measures.
• To foster additional capacity and design expertise with custom energy savings measures in BC.
• Maintain a program TRC score greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.</td></tr>
<tr><td colspan="2">Implementation</td></tr>
<tr><td>Administration</td><td>Handled by in-house EEC staff, BC Hydro Power Smart staff, and outside service providers where necessary.</td></tr>
<tr><td>Communications</td><td>Promotion of the custom program will be driven primarily via direct contact with target participants by the Companies’ staff or the program’s qualified consultants. Target customers should include:
o Health care administrators;
o Education administrators;
o Large institutional property managers (i.e. Nexacor, Profac, and so on);
o Municipalities – facilities and/or energy managers as well as municipal planners;
o Provincial government - facilities and/or energy managers; and
o Builders and developers.
Additional promotion via:
▪ Speaking engagements, where ever possible, to the target audience;
▪ Lunch and learn sessions with relevant professionals such as: energy managers, architects, engineering consultants, property developers.
Potential magazine and webpage advertisements with publications and organizations such as: AIBC / ArchitectureBC magazine, APEGBC / Innovation magazine, BOMA BC eNews, ASHRAE-BC Totem newsletter, Agriculture Climate Action Initiative funding catalogue, and BC Greenhouse Growers Association.</td></tr>
</table>

Evaluation Strategy	Simple deemed savings cannot be used due to the custom nature of the measures. The savings must be individually established for each and every participant. For new construction: the actual gas consumption will be compared to: a. Consumption prescribed per ASHRAE 90.1; and b. Qualified consultant's estimated consumption. For retrofits: Post retrofit, the actual gas consumption will be compared to: a. Weather normalized pre-retrofit gas consumption; and b. Qualified consultant's estimated consumption. Evaluation of the program savings and performance is assured by comparing pre construction data to post construction data. A thorough review could occur after approximately 30 participants have had their energy saving measures in place for at least one full year.

4.4.3.2.2 2010 Commercial Custom Design Program Results

The Companies have worked throughout 2010 on the development of the Commercial Custom Design program, in preparation for a phased roll out of the program in 2011. The Companies have completed the following items:

- Business case development and approval;
- Development of qualified consultant eligibility criteria and application;
- Development of joint Energy Study Guide for retrofit projects with program partner BC Hydro; and
- Development of Capital Cost Agreement, including approval letter, application form, and program general terms and conditions.
- Collaboration with School District No 23 (Central Okanagan) on a pilot study of a geo exchange heating system in a school setting.

The Companies have also worked with BC Hydro to develop the framework of a program specific partnership agreement that will allow the two utilities to operate the Commercial Custom Design program in tandem with BC Hydro's High Performance New Construction program and Power Smart Partners Retrofit program.

Significantly, the Companies have been using the proposed program's process flow and funding model within the PSECA initiative discussed above. As such the Companies have gained a great deal of experience working collaboratively with BC Hydro, as well as insight into the results that may be expected from the application of the funding model. Given that all energy saving measures must exceed the TRC hurdle to be eligible for funding, the Companies also expect a strong cost benefit ratio from the program, indicating cost effective energy saving measures are being incented.

4.4.3.2.3 2011 Commercial Custom Design Program Performance Forecast

Rolling out the Commercial Custom Design program will be a primary focus of the commercial programs team in 2011. Several items remain to be completed before the program can officially begin providing incentives. These include:

- Contribution agreement with BC Hydro to be finalized and signed;
- Program operations / process flow to be worked out with BC Hydro; and
- Energy Study agreement for natural gas only retrofit projects to be developed.

The Companies foresee adopting a phased roll out of the program. The new construction version of the program will be launched first and will begin providing incentives in collaboration with BC Hydro's High Performance New Construction program. Natural gas only projects for the retrofit market will be the next market segment served. Finally, retrofit projects touching on both electricity and natural gas will be provided with incentives. This will allow the utilities the opportunity to roll out the new construction program early in the new year while working through how to collaborate on retrofit projects. Meanwhile the Companies will be able to encourage retrofit projects that focus on natural gas reductions only. It should be noted that the Companies also intent to pursue a similar arrangement with FortisBC Inc. The program is complex, however, requiring a great deal of collaboration, well organized and detailed program processes, and ultimately dedicated administrative resources in order to ensure smooth operation. For this reason, the Companies are focusing on building the program with one partner at a time, beginning with BC Hydro.

4.4.3.2.4 Commercial Custom Design Program Summary

The Companies believe that, similar to the PSECA initiative, the new Commercial Custom Design program will encourage participants to implement energy saving measures that would not otherwise be installed without the incentive. The program will fill a role that is currently void within the Companies' commercial program offerings: providing incentives for non-prescriptive, custom designed and built measures to reduce natural gas consumption at the participant's facility. The program will leverage the reach of BC Hydro PowerSmart's current programs, to encourage the participation of more projects that the Companies could achieve by themselves. The Companies believe the proposed program will be a strong generator of value and successfully contribute to reduced natural gas consumption.

4.4.3.3 Continuous Optimization Program

4.4.3.3.1 Program Overview

Continuous Optimization Program	
Market	Retrofit
Duration	FEI: To be determined

	FEVI: To be determined
Incentive	Financial incentives based on implementation of commissioning measures
Partner	FortisBC Inc / BC Hydro
Overview	
Background	In most commercial buildings, operational problems such as duct leakage, unbalanced airflow, and poor scheduling are not always obvious and tend to be ignored or simply missed, resulting in inefficiencies and increased natural gas consumption. Building commissioning and real time energy consumption monitoring identifies otherwise virtually undetectable building faults/deficiencies that otherwise tend to go unnoticed by building designers, operators, and owners. In a continuous optimization program, problems are more easily detected, evaluated, and solved. Moreover, building commissioning represents one of the most cost effective sources of energy savings and GHG emissions reductions. Monitoring based commissioning ("MBCx") helps ensure the benefits of building commissioning are not lost over time by providing support for real time energy monitoring.
Description	The Continuous Optimization program will capture gas savings by ensuring participating facilities / buildings are operated in the most efficient and effective manner possible. Beyond reducing natural gas consumption, the program is also aimed at entrenching a culture of conservation. This will be accomplished by providing incentives for: 1. Commissioning: Utility funded commissioning studies and a concomitant obligation on the part of the participants to implement any measures identified therein with a two year payback or less. 2. Real-time monitoring: Utility funded installation of pulse meters and monitoring software for natural gas. Target participants will generally include government, medium to large commercial, large multi-residential, health care, education, and institutional organizations. The program will likely be delivered in the form of a performance based incentive, wherein participants will be given a certain dollar amount per GJ actually saved. The Companies are looking to partner with FortisBC Inc. on a new program and BC Hydro on its currently operating Continuous Optimization program.
Goals	• Reduce gas consumption among the commercial sector's existing building stock by providing an incentive to help commercial customers maximize their facilities operating performance. • Educate commercial sector customers about the impacts of poorly maintained / operated building systems and provide an incentive to facilitate both the maintenance of existing equipment, as well as the implementation of proper operating strategies. • Maintain a program TRC score greater than 1.0 and optimize the proportion of incentives over administration and marketing costs. • Increase year over year participation rates in view of maximizing gas savings.
Implementation	
Administration	Administration to be handled by the program partners: FortisBC Inc. and BC Hydro.
Communications	To be determined

Evaluation Strategy	Evaluation of the program savings and performance is inherent to the program. The digital Energy Management Information System will provide real time energy consumption monitoring allowing for extremely granular data collection and reporting. The information could be used as a baseline for other projects and as a leading example for other campuses and buildings around the province.

4.4.3.3.2 2010 Continuous Optimization Program Results

In 2010, the program was not yet launched, but extensive research was undertaken in order to lay the foundation for the program. Based on the available data from BC Hydro's current program, as well as the conclusions of various research papers, the potential natural gas savings are significant. The Companies' own work to assess the costs associated with the measure strongly suggests the cost benefit ratio for commercial facilities of sufficient size will be generally positive.

In order to further validate the Companies' conclusions and gain experience with this potentially large program the Companies have completed a business case and set up a pilot program in partnership with FortisBC Inc. to be launched in 2011. The Companies expect this program will lead to reduced natural gas consumption and assist in driving behaviour change by highlighting the performance and efficiency of a well operated facility. Increased awareness and emphasis on building operations will thereby be achieved.

4.4.3.3.3 2011 Continuous Optimization Program Performance Forecast

The Companies will launch a pilot version of the Continuous Optimization program in partnership with FortisBC Inc., as of March 28. This limited scale pilot will allow the Companies to become familiar with the details of a Continuous Optimization program and use the insight gained to develop a full scale program.

This pilot program will provide funding towards the implementation of a Continuous Optimization program at nine buildings on the UBC Okanagan campus. The pilot program's objectives are:

1. To save approximately 19,000 GJs over a three year period;
2. To gain expertise with the design, operation, and savings potential of a Continuous Optimization program; and
3. To further inter-utility cooperation on DSM initiatives by working with FortisBC Inc. with a view of eventually implementing a full scale Continuous Optimization program.

Also in 2011, the Companies will be working with BC Hydro to develop a business case for the remainder of FEI and FEVI's service territories. Providing the necessary tools to industry, the program will help bring about behaviour change, encouraging applicants to reduce natural gas consumption. BC Hydro has indicated the financial commitment is considerable.

Continuous Optimization Program Summary

The Companies believe the program will effectively encourage reduced natural gas consumption by providing building operators with greater insight into the ongoing, day-to-day operations of their facilities. The role of building commissioning will especially be highlighted while capacity and expertise will be developed within the industry in BC. Overall, the Companies believe a Continuous Optimization program has a genuine potential to raise the profile of building operations within discussions on energy efficiency and lead to improved building management practices, and thereby reduced natural gas consumption in the long term.

4.4.3.4 Commercial Kitchen Program

4.4.3.4.1 Program Overview

Commercial Kitchen Program	
Market	New Construction / Retrofit
Duration	FEI: To be determined FEVI: To be determined
Incentive	To be determined
Partner	To be determined
Overview	
Background	According to the preliminary results of the 2011 Commercial Sector Conservation Potential Review, commercial cooking represents the third greatest consumer of gas by volume. Cooking operations are estimated to consume 9.2% of total commercial natural gas consumption in the province. In fact, commercial food service establishments are the most intensive users of natural gas, on a per square foot basis, of all commercial sector market participants. The Companies are not aware of any current regulation establishing minimum required efficiency standards for commercial cooking appliances; however, higher efficiency options exist and their use is commonly encouraged by utilities in the United States.
Description	The Commercial Kitchen program will capture gas savings by encouraging the use of high efficiency (i.e. generally ENERGY STAR® rated or equivalent) cooking appliances in commercial kitchens. Typical appliances include fryers, ovens, boilers, steamers, and ranges. Target participants will include restaurants, health care facilities, care homes, education facilities, and institutional organizations. The program will likely be delivered in the form of an appliance purchase rebate.
Goals	• Reduce gas consumption in commercial cooking operations by encouraging the installation and use of high as opposed to standard efficiency cooking appliances. • Increase year over year participation rates in view of maximizing gas savings and bringing about market transformation. • Educate commercial kitchen customers about the advantages of reducing gas consumption and provide an incentive to facilitate the purchase of high efficiency technology. • Maintain a program TRC score greater than 1.0 and optimize the proportion

	of incentives over administration and marketing costs. • Prepare the way for and support any provincial regulation requiring increased commercial cooking appliance efficiency.
Implementation	
Administration	To be determined
Communications	To be determined
Evaluation Strategy	To be determined

4.4.3.4.2 2011 Commercial Kitchen Program Performance Forecast

The Companies are currently in the process of engaging an external consultant to develop an outline of a commercial cooking natural gas efficiency program for FortisBC.

As with the low flow pre rinse spray valve programs, the Companies believe the dynamics of the food service industry make it necessary to operate a DSM program in order to capture the potential natural gas savings offered by higher efficiency cooking equipment. The commercial food service sector tends to be exposed to significant volatility, making "cheapest first cost" a critical purchase decision criteria for any item not critical to customer service. Food service establishments typically lack the time or resources to research energy saving options or understand the benefits provided. A utility funded DSM program would make it easy for participants to save natural gas by largely eliminating both the effort and risk that potential participants would normally associate with the selection of high efficiency options.

The Commercial Kitchen program will also help to introduce a new concept to the food service industry, namely that energy is a variable cost. The Companies believe most food service establishments consider energy to be a fixed cost, and believe that changing this mindset is essential to ultimately bringing about market transformation.

The remaining development work preceding the program roll out is significant; however, the Companies' hope to launch the program towards the end of 2011. BC Hydro has recently launched a new program aimed at encouraging energy efficiency in commercial food service establishments. The Companies and BC Hydro have expressed interest in working together to promote greater energy efficiency among commercial food service establishments.

4.4.3.4.3 Commercial Kitchen Program Summary

The Companies believe commercial cooking operations represent a significant consumer of natural gas that is underserved by the current program offerings. Providing incentives to significantly reduce the incremental cost of higher efficiency cooking equipment is expected to encourage customers who would normally purchase and install standard efficiency equipment to purchase high efficiency options instead and reduce natural gas use as a result.

4.4.3.5 Process Heat Program

4.4.3.5.1 Program Overview

Process Heat Program	
Market	Retrofit
Duration	FEI: To be determined FEVI: To be determined
Incentive	To be determined
Partner	To be determined
Overview	
Background	Process loads can be defined as the consumption of natural gas for purposes other than space and/or domestic water heating for human comfort and sanitation. For process loads the consumption of natural gas is directly related to the production of some good or product of economic value. Process loads are a major driver of natural gas consumption among industrial customers, both large and small. According to the Companies' 2010 Conservation potential review industrial accounts consume over 39,846,000 GJ/yr of natural gas in 2010. Non-interruptible consumption in 2010 is approximately 11,466,000 GJ. This consumption is largely driven by process loads such as food and beverage processing, agricultural processes and wood product processing and drying. Currently the Companies do not offer any programs designed specifically to encourage capital upgrades or behaviour change to reduce natural gas consumption for light/small scale industrial processes. According to the process heat program development undertaken thus far, higher efficiency options do exist however; technologies such as high efficiency boilers, water heaters, ovens, steam boiler upgrades and direct fired equipment can be used to substantially reduce the natural gas consumption of manufacturing processes.
Description	The Process Heat program will capture gas savings by directly addressing inefficient equipment or operations in manufacturing processes. This may include items such as old boilers, piping insulation, process controls, and so on. Target participants will include organizations in agriculture, food processing, and manufacturing (i.e. asphalt production). The program is likely to include a capital cost incentive and may include an additional monitoring and performance incentive.
Goals	• Reduce gas consumption among manufacturing / light industrial customers by encouraging the installation and use of high as opposed to standard efficiency water appliances in manufacturing processes. • Increase year over year participation rates in view of maximizing gas savings. • Educate manufacturing / light industrial customers about the advantages of reducing gas consumption and provide an incentive to facilitate the purchase of high efficiency technology. • Maintain a program TRC score greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.

Implementation	
Administration	To be determined
Communications	To be determined
Evaluation Strategy	To be determined

4.4.3.5.2 2011 Process Heat Program Performance Forecast

The Companies have been working with a consultant to outline an incentive program designed to reduce the natural gas consumption of light industrial processes. It is expected that in 2011 work will be complete on the initial research and the Companies will be able to finalize a program design and launch the initiative in the second half of the year.

4.4.3.5.3 Process Heat Program Summary

Process heating in manufacturing and light industrial businesses represents a considerable consumption of natural gas that is not currently addressed by the Companies' existing incentive program. The Companies' experience with the Energy Assessment Program, however, suggests these customers represent a considerable energy savings potential. It is comparatively easy to encourage these customers to choose high efficiency options as they are predisposed to consider carefully the costs of all inputs to their business processes. The Companies expect that making incentives available to such customers will tip the balance of investment decisions in favour of high efficiency options by helping eliminate the risk of a higher capital investment in sometimes uncertain business climates.

4.4.3.6 Multi Unit Residential Building Program

4.4.3.6.1 Program Overview

Multi Unit Residential Building Program	
Market	New Construction / Retrofit
Duration	FEI: To be determined FEVI: To be determined
Incentive	To be determined
Partner	To be determined
Background	
Background	The 2005 Conservation Potential Review has indicated that MURBs represent one of the most significant sources for energy savings in the commercial sector. Although several of the current commercial programs can be applied to MURBs, there are several other smaller measures the Companies can implement for this sector that reflect rather large savings potentials.

Description	A suite of rebates targeted primarily at "in-suite" energy saving measures for MURBs. This may include measures such as low flow fixtures, fireplace programs, natural gas appliance upgrades, and/or building envelope upgrades. With large potential savings, this program will be targeting both new construction and retrofit applications.
Goals	• Educate builders and developers about installing energy efficient appliances and fixtures to drive market transformation. • Reduce natural gas consumption in the MURB sector by encouraging the installation and use of high efficiency options as opposed to standard efficiency models. • Maintain a program TRC score greater than 1.0 and optimize the proportion of incentives over administration and marketing costs.
Implementation	
Administration	To be determined
Communications	To be determined
Evaluation Strategy	To be determined

4.4.3.6.2 2011 Multi Unit Residential Building Program Performance Forecast

The Companies began their involvement in 2010 by participating in a MURB remediation study and reviewing energy consumption (among other items) in strata properties throughout the year. A cross functional team was established in early 2011 to start developing the MURB program. For resources, the commercial team is drawing on experience from the residential team, the sales team, and an energy specialist working in industry funded by the Companies. Initial talks are looking at the measures that show the most potential energy savings. The savings projections for low flow fixtures are very positive, as are fireplace programs and building envelope and domestic natural gas appliances upgrades.

The team is looking towards providing FortisBC Energy packaged options for MURBs for both new construction and retrofit applications – each targeting different groups. The 'package of measures' idea would work well in new construction when targeting developers. Working with the developer in the early stages and providing enticing financial incentives would ensure more MURBs were built from the ground up with energy efficient appliances and fixtures.

In retrofit applications, the program will primarily target apartment building owners and strata corporations. The program will look at several measures these target groups can take advantage of for upgrading to more energy efficient options in their buildings and will allow them to participate whether they are upgrading to low flow fixtures or replacing the decorative fireplaces with EnerChoice models. By allowing a broad range of options for the buildings, the program will hopefully increase participation levels and provide the target groups that represent buildings of different sizes, age, and 'green status' with the flexibility to choose what works for them.

4.4.3.6.3 *Multi Unit Residential Building Program Summary*

This program is targeted at overall behavioural change in the MURB sector. By providing substantial incentives to developers, there will start to be a shift in the industry that will help drive market transformation. As more MURBs undergo retrofits using energy efficient measures, there will not only be substantial energy savings, but also increased capacity and industry experience. With such a range of upgrade options and financial incentives, more target groups will choose to take advantage of these incentives than normally would if no such program was in place. The program development team is currently researching the measures and implementation options to best decide how to proceed to the next steps for a 2011 program launch.

4.4.4 ON FARM ENERGY ASSESSMENTS

Throughout 2010 and into 2011 the Companies have provided support to the On Farm Energy Assessment program managed by the BC Agriculture Research and Development Council ("ARDCorp"). The aim of participation in this initiative is to gain a clear understanding of how farms use natural gas, and what an appropriate incentive program may be for this customer segment. While the provincial utility companies do offer some energy efficiency support to agri-food operations, the Companies believe a specialized approach is ultimately required for agriculture because of the sector's specific production systems and technologies.

Project Objectives

- To determine the sector's key energy efficiency needs and to identify gaps in current programming and incentives.
- To determine the potential for cost savings and GHG emissions reductions through on farm energy efficiency assessments in BC.
- To identify opportunities associated with recovery/recycling of wasted energy and/or on farm energy production.

Upon completion of the initiative the Companies will be provided with the findings in a report format. These findings will be used to develop incentive programs designed for the specific needs of the agriculture sector. The preliminary findings suggest that significant savings potential exists among greenhouse operations first and foremost and poultry operations next. Field crops represent limited savings potential for natural gas.

4.5 Summary

Energy efficiency in the commercial sector represents a considerable opportunity to achieve natural gas savings and GHG emissions reductions. With more options available for investment and fewer minimum equipment efficiency standards than in the residential sector, at least in the short to medium term, sizeable cost effective investments can be made to help commercial sector customers reduce their energy consumption, as demonstrated by the PSECA initiative.

The challenge to achieving these savings is having the right programs, designed to suit the myriad of commercial sector needs, in place and effectively delivered to potential participants.

The commercial energy efficiency and conservation programs have delivered value and will continue to do so by effectively encouraging commercial customers to implement measures that reduce their natural gas consumption. Encouraging reduced consumption today paves the way for market transformation and the achievement of the government's energy and climate change objectives over the long run.

5 HIGH CARBON FUEL SWITCHING PROGRAMS

5.1 Overview

The High Carbon Fuel Switching program area initiatives are designed to result in lower overall GHG emissions by using natural gas in place of higher emissions carbon fuels such as coal, oil, diesel, or propane. In addition, further GJ savings are recovered by replacing older, less efficient high-carbon appliances with high efficiency natural gas technologies. The first fuel switching program is the residential retrofit program, focused on converting oil or propane heating systems to ENERGY STAR® natural gas appliances. This program, called the Switch N' Shrink program, saves money and energy and results in significant GHG emissions reductions.

In Order No. G-36-09, the Companies received approval for residential fuel switching program funding for fuel switching from fossil fuels with higher carbon content than that of natural gas. In the residential sector, this applies to the installation of ENERGY STAR® and EnerChoice equipment for customers choosing to convert to natural gas. FEVI received approval for the extension of 2010 high carbon fuel conversion funding amounting to $1.5 million for 2011 in Order No. G-140-09, as part of the 2010-2011 Revenue Requirements Application's Negotiated Settlement Agreement. This funding is in place to develop EEC programs that benefit customers transitioning from higher carbon fuels such as coal, oil, diesel, or propane to natural gas.

This principle of moving customers from higher carbon fuel to natural gas also applies in other sectors, including the transportation sector. As described in the Innovative Technologies program area, heavy duty vehicles fuelled by lower carbon Compressed Natural Gas ("CNG") can displace higher carbon diesel to achieve significant environmental benefits. The Companies' target market includes operators of commercial, return-to-base heavy duty fleet vehicles such as garbage trucks, waste haulers, and buses. Improvements in engine technology, combined with an attractive price differential between natural gas and diesel have stimulated renewed interest in CNG NGVs in recent years.

5.1.1 RESIDENTIAL HIGH CARBON FUEL SWITCHING PROGRAM GOALS

Residential fuel switching programs encourage households to replace their higher carbon heating systems with lower carbon natural gas. These programs add value to new and existing customers through reduced fuel costs, minimizing the environmental hazards associated with oil storage tanks, decreasing the need to import fuel from other provinces, and improved air quality in the home. Residential fuel switching programs support the following objectives:

- Educate customers about the advantages of replacing higher carbon heating systems with lower carbon natural gas in terms of lower fuel cost, GHG emissions reductions, and other benefits;
- Upgrade low efficiency systems to high efficiency systems in order to capture energy savings associated with reducing the overall consumption of fuel; and

- Support government policy on energy efficiency and GHG emissions reductions, especially in relation to efficient building strategies[31] through incentives and education to customers and other industry stakeholders.

5.2 2010 Residential High Carbon Fuel Switching Program Area Results

The 2010 High Carbon Fuel Switching program, Switch N' Shrink, resulted in the replacement of 178 heating systems through a cost effective program with a TRC score over 1.2, as outlined in Table 5-1. Further analysis based on the amount of oil displaced reveals that customers reduced their fuel costs by $596,000[32] over the lifetime of the measure, thereby reducing over 1,170 tons of GHG emissions. Please note natural gas savings are negative for this program since the addition of these customers is building load.

Table 5-1: High Carbon Fuel Switching 2010 Results

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
Swtich 'N' Shrink	75	225	299	(6,103)	(32,529)	(38,632)	1.2	1.4

In addition to appliance replacement, this program met EEC program objectives by educating customers and trades about the benefits of replacing higher carbon heating systems with energy efficient appliances. These benefits include the reduction of ongoing fuel costs, improved air quality, and decreased environmental risk associated with oil tanks and fuel transport. The primary program benefit was supporting government policy initiatives to reduce GHG emissions.

5.3 2011 Residential High Carbon Fuel Switching Program Area Outlook

The 2011 outlook for the High Carbon Fuel Switching program area at this time consists only of the residential Switch N' Shrink program although. The Companies are assessing other opportunities for this program area in the coming months. By building on 2010 program awareness, program participation is expected to more than double for a total of 420 participants as outlined in Table 5-2 for the 2011 forecast. The 2011 program cost effectiveness is higher than 2010 due to decreased marketing expenditures required in the second year and the higher avoided cost of oil that is forecasted to increase from $22 per GJ in 2010 economic models, to $25 per GJ in 2011 based on Vancouver, BC pricing.[33]

---

[31] BC Energy Efficient Buildings Strategy: More Action, Less Energy. BC Ministry of Energy and Mines Publication, 2008.

[32] www.kentmarketingservices.com Prepared by MJ Ervin, Kent Marketing Services, for source of Vancouver fuel oil prices. For economic modeling, 2010 cost of oil was assumed to be $22.01 and 2011 cost of oil was assumed to be $25.39.

5.4 Residential High Carbon Fuel Switching Program Details

5.4.1 ACTIVE PROGRAMS

5.4.1.1 Switch N' Shrink Program

5.4.1.1.1 Program Overview

Switch N' Shrink Program	
Target Audience	Residential retrofit households with oil or propane as primary fuel source FEVI is the primary market where oil heating is prevalent
Duration	Jan 1, 2010 - Dec 31, 2011
Incentive	$1,000 for upgrading an oil/propane primary heating system to an ENERGY STAR® natural gas primary heating system. An additional $50 for Electronically Commutated Motors ("ECM") incentive is funded by BC Hydro and FortisBC Inc
Partners	BCHydro and FortisBC Inc. for ECM motors
Overview	
Background	The Switch N' Shrink program is offered to all BC residents; however, the primary focus will be on Vancouver Island where the use of oil is more prevalent than in the rest of the Companies' service territories. Furthermore, the program will engage residents near a gas main who are more likely to participate and take advantage of this program. On-Main market potential for FEVI oil and propane conversions is difficult to estimate, but could range from 20,000 to 40,000 households. According to 2005 data from Statistics Canada, 21% of households within the Victoria market still used oil as their primary heating fuel while only 19% used natural gas[34]. This market potential demonstrates a significant opportunity to reduce GHG emissions through natural gas conversions for Vancouver Island communities. There are also opportunities for conversion projects in the Interior, as well as the opportunity for customers in regions such as Revelstoke, which are serviced by propane, to switch from higher carbon oil to propane. In addition to the benefit of GHG emissions reductions, participants will lower

[34] 2005 Statistics Canada - Table 203-0019 - Survey of household spending (SHS), dwelling characteristics at the time of interview by province, territory, and selected metropolitan areas, annual (1,2,3,9,11). Survey or program details: Victoria, British Columbia [59935], Survey of Household Spending – 3508.

	their energy bills, increase their property values, and reduce the potential of an environmental hazard associated with oil tank leaks.
Description	The Switch N' Shrink program offers a $1,000 incentive to new or existing customers who upgrade their primary home heating system (furnace or boiler) from oil/propane to a high efficiency ENERGY STAR® natural gas heating system. An additional $50 rebate, funded by BC Hydro and FortisBC Inc., will be provided to those participants who purchase a model with an ECM motor.
Goals	• Provide a $1,000 incentive to encourage homeowners to convert their primary heating system from higher carbon oil or propane to a high efficiency natural gas heating system. • Work with the Ministry of Energy to include this program as part of the provincial GHG emissions reduction strategy. • Develop a cost effective program with a TRC score greater than 1.0 that achieves significant energy savings, cost savings, and GHG emissions reduction benefits.
Implementation	
Administration	Consumer Response Marketing Ltd.
Communications	The Companies adopted an integrated marketing approach with print ads and radio to drive program awareness, contractor communications, co-marketing with furnace manufacturers, and educating internal stakeholders such as the customer service installation centre and sales and service staff who can help promote higher carbon to lower carbon conversions.
Evaluation Strategy	The Companies will be conducting a survey with participating contractors to determine how to drive program participation and other ideas to improve the program.

5.4.1.1.2 2010 Results

Table 5-3: 2010 Switch N' Shrink Program Results

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)*	NPV Energy Savings (GJ)*	Free Rider Rate	TRC
	FEI	29	29	46	(624)	(6,103)	50%	1.2
	FEVI	149	149	76	(3,204)	(32,529)	50%	1.4
	Total	178	178	121	(3,827)	(38,632)	50%	1.5

* Note: Energy savings in a fuel switching program are negative since this is a load building program from higher carbon fuel sources (oil and propane) to lower carbon natural gas.

The Switch N' Shrink program provided EEC funding for 178 conversions from oil to natural gas. Table 5-4 demonstrates the program is cost effective with a TRC score of 1.4. Approximately $100,000 was invested in print and radio advertising in the fall of 2010 to drive program awareness and educate homeowners about the benefits of replacing higher carbon fuels with lower carbon fuels.

Table 5-4: 2010 Switch N' Shrink Program Benefits

Utility	NPV Natural Gas Incurred (GJ)	NPV Oil Displaced (GJ)	NPV Energy Savings (GJ)	NPV Costs to Purchase Natural Gas ($000s)	NPV Costs to Purchase Oil ($000s)	NPV Cost Savings upon Conversion ($000s)	GHG Savings (Ton CO2 equivalents)
FEI	6,103	7,222	1,119	61	159	98	200
FEVI	32,529	37,106	4,577	337	835	498	971
Total	**38,632**	**44,328**	**5,696**	**398**	**994**	**596**	**1,171**

Table 5-5 provides insight into the considerable program benefits over the lifetime of the measure. For 178 conversions, there were 5,696 net GJs of energy saved, $596,000[35] in net cost savings for these customers, and 1,171 net tons of CO2e reductions.

5.4.1.1.3 2011 Performance Outlook

Table 5-5: 2011 Switch N' Shrink Program Performance Forecast

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditures ($000s)	Annual Energy Savings (GJ/yr)*	NPV Energy Savings (GJ)*	Free Rider Rate	TRC
FEI	100	100	21	(1,720)	(17,116)	50%	1.7
FEVI	320	320	83	(6,880)	(69,861)	50%	1.8
Total	420	420	104	(8,600)	(86,976)	50%	1.8

* Note: Energy savings in a fuel switching program are negative since this is a load building program from higher carbon fuel sources (oil and propane) to lower carbon natural gas.

The Switch N' Shrink program will remain in market for 2011 and 2012 subject to BCUC funding approval for fuel switching activities. By leveraging program awareness from the fall 2010

35 www.kentmarketingservices.com Prepared by MJ Ervin, Kent Marketing Services, for source of Vancouver fuel oil prices. For economic modeling, 2010 cost of oil was assumed to be $22.01 and 2011 cost of oil was assumed to be $25.39.

advertising campaign, the Companies anticipate doubling participation from 178 to 420 participants. A fall 2011 advertising campaign is under consideration, with a decision to be made based on contractor feedback and program participation trends.

Table 5-6: 2011 Switch N' Shrink Forecasted Program Benefits

Utility	NPV Natural Gas Incurred (GJ)	NPV Oil Displaced (GJ)	NPV Energy Savings (GJ)	NPV Costs to Purchase Natural Gas ($000s)	NPV Costs to Purchase Oil ($000s)	NPV Cost Savings upon Conversion ($000s)	GHG Savings (Ton CO2 equivalents)
FEI	17,116	19,923	2,807	178	506	328	539
FEVI	69,861	79,691	9,831	741	2,023	1,283	2,085
Total	**86,976**	**99,614**	**12,637**	**918**	**2,529**	**1,611**	**2,624**

Table 5-6 provides insight into the considerable program benefits over the lifetime of the measure. For the forecasted 420 conversions, there are 12,637 net GJs of energy saved, $1,611,000[36] in net cost savings for these customers, and 2,624 net tons of CO2e reductions.

5.5 Summary

The overall program benefits are captured by avoiding higher carbon fuel costs while incurring lower natural gas fuel costs for an overall reduction in net GHG emissions. The net benefit for the participant is in reduced energy costs while helping BC meet its provincial GHG emissions reduction targets. From a utility standpoint, the benefit is in adding more customers to the distribution system, especially where a gas service already exists in close proximity, keeping the overall system costs per customer down. The 2011 performance outlook illustrates these points and the significant energy, cost, and GHG emissions savings that are obtained based on 420 heating systems converted from oil to natural gas.

The Companies will be assessing other opportunities to utilize this funding for high carbon to lower carbon initiatives. As the price of oil appears to be rising, there will be even greater cost benefits to customers to define programs for this program area.

[36] Ibid.

6 CONSERVATION FOR AFFORDABLE HOUSING PROGRAMS

6.1 Overview

The Conservation for Affordable Housing program area is the Companies' area of DSM programming specifically created to meet the needs of our low income customers. One of the EEC program principles is that "programs will have a goal of being universal, offering access to energy efficiency and conservation for all residential and commercial customers, including low income customers through the DSM for Affordable Housing initiative" (Energy Efficiency and Conservation Programs Application, May 28, 2008, pg 47). The Companies are staying true to this principle by developing and implementing programs that are of no cost or low cost to low income participants. Further, as per the Demand-Side Measures Regulation, a utilities' DSM portfolio is considered adequate (by the authorities) when there is "a demand-side measure intended specifically to assist residents of low income households to reduce their energy consumption" (November 7, 2008, Regulation of the Minister of Energy, Mines and Petroleum Resources, Ministerial Order No. M 271, Section 3[a]). In order to recognize its importance, the Companies created a discrete program area for Conservation for Affordable Housing in 2009, which focuses on assisting our low income customers to reduce their energy consumption, which in turn reduces their energy costs.

In line with the Commission's encouragement to "re-allocate funding from other approved areas" (EEC Decision, Order No. G-36-09), the Companies requested and were approved for an annual total budget of $3 million for 2010 and 2011, encompassing both FEI and FEVI in this program area (as part of Orders G-141-09 and G-140-09 approving negotiated settlement agreements in FEI's and FEVI's 2010 - 2011 Revenue Requirements Applications). With energy rates generally increasing, it will remain important for the Companies to create energy conservation opportunities for this segment in a manner that allows customers to participate without having to spend a significant amount of their limited income.

Low income customers are known to be difficult to reach and be integrated into utilities' DSM programs; therefore, this program area is especially well suited to working collaboratively with FortisBC Inc. and BC Hydro in order to simplify the application processes for the customer and share administration and outreach activities and costs. This streamlined approach allows the Companies to maximize every contact to ensure that once a low-income customer is engaged, an optimal amount of energy savings can be realized.

It should be noted that providing conservation and energy efficiency programs for low income customers can be challenged in terms of achieving a positive TRC score, both at the program area and individual program levels, despite the 30 percent benefits adder provided for in the DSM regulation. This is because of the relatively high cost of providing conservation services to this important customer segment. Recognizing that the provision of conservation services to low income customers is a requirement for adequacy of utility DSM activity, the Companies intend to work with government to explore amending the DSM regulation to ensure conservation activity serving this customer segment is able to continue.

6.2 2010 Conservation for Affordable Housing Program Area Results

While 2009 laid some good foundations in research, facilitation, and planning, 2010 saw the launch of two significant Conservation for Affordable Housing programs, the completion of an insightful study, and investments made under the Ministry of Energy and Mines Low Income Partnership grant. We also laid further groundwork on a much expanded program offering for 2011.

Despite the added time required to effectively collaborate with partnering utilities, the Companies successfully launched two Conservation for Affordable Housing programs in 2010: the Residential Energy and Efficiency Works ("REnEW") program and the Energy Saving Kit ("ESK") program. The REnEW program is an innovative approach to energy efficiency trades training that simultaneously provides support to individuals facing barriers to employment. The ESK program provides a bundle of easy-to-install energy saving measures to low income customers.

In 2010, the Companies also saw the completion of the Strategic Energy Management Plan, a study that provided insight into the energy performance of over 900 buildings in the non-profit housing sector. Amongst many insightful findings, the study highlighted the importance of educational and engagement programs in the non-profit housing sector, as well as the need for dedicated energy professionals working in non-profit housing organizations.

The Companies continue to work collaboratively and in partnership with the Ministry of Energy and Mines on programs and projects focused on low income customers. This partnership involves a $5.155 million grant that was awarded to the Companies in March 2009. The work completed in 2010 under this grant was specific to a new initiative, the Super Efficient New Construction ("SENC") project, which seeks to incent both new construction that is far more efficient than current building code requirements and new housing units for low-income tenants. It's important to note that activities associated with the Low Income Partnership grant are described within this report; however, they are incremental to the EEC portfolio and thus are not included in the EEC portfolio TRC calculations, or the Conservation for Affordable Housing program area TRC calculations.

Further, the Companies have laid the groundwork for greatly expanded programming in the low income sector for 2011. The Companies have made good progress in a partnership with BC Hydro on the Energy Conservation Assistance ("ECAP") program, which will be the first program to provide deep energy savings for low income gas customers through the direct installation of measures such as furnaces, draft-proofing, and insulation. Work also continued on a study that focuses on the opportunities within the complex co-operative housing sector of BC and a study that explores energy efficiency opportunities within the mobile home sector.

As demonstrated in the table below, the Companies have invested a total of $324,000 in 2010 and achieved a program area TRC score of 0.7 in FEI and 1.6 in FEVI. The main reason for the variance between FEI and FEVI is that the Companies have not implemented a REnEW session in the FEVI territory. In 2011, the intent is to expand the REnEW program into the FEVI territory. The Companies endeavoured to deliver the REnEW program in the FEVI territory in 2010;

however, the delivery partner on Vancouver Island experienced some organizational restructuring that conflicted with their ability to deliver the program. The delivery partner will be offered the opportunity to deliver the REnEW program in 2011.

The TRC score of 0.7 in FEI is due to the REnEW program's influence on the TRC. The REnEW program is a good example of a program that is hindered by conventional approaches to DSM program evaluation as there are no direct energy savings attributable to the program. In this sense, it can be considered an enabling activity. Further, because the REnEW program ran for a full year, while the ESK program (which had a very favourable TRC) was only available for the second half of the year, the REnEW program had a disproportional impact on the TRC. In other words, had both the REnEW program and the ESK program been available for the entire year, the portfolio TRC would have been improved.

Table 6-1: 2010 Conservation for Affordable Housing Investments

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
Strategic Energy Management Plan (Study)	$14	$3	$17	N/A	N/A	N/A	N/A	N/A
REnEW	$148	N/A	$148	N/A	N/A	N/A	N/A	N/A
Energy Savings Kit	$83	$21	$104	15,520	3,959	19,479	2.3	2.4
Mobile Homes (Study)	$8	$2	$10	N/A	N/A	N/A	N/A	N/A
Non-Program Specific Expenditures	$43	$2	$45	N/A	N/A	N/A	N/A	N/A
Total	$296	$28	$324	15,520	3,959	19,479	0.7	1.6

Notable achievements through in 2010 in the Conservation for Affordable Housing program area are:

- The completion of the Strategic Energy Management Plan, a study focusing on the opportunities and best approaches for achieving energy efficiency and conservation within the non-profit housing sector;
- Investment of $148,000 in the REnEW program, which brought about the development of a robust course curriculum, strong partnerships with social agencies that serve various sub-segments of the low income sector, 59 REnEW participants, and participant satisfaction scores of 85%;
- Investment of $104,000 in the ESK program resulting from over 5,000 participants in the first six months of the program. The resultant savings from the ESK program is 19,479 GJs (NPV) and we are well positioned to reach an even greater breadth of the market in 2011; and
- Of the $5.155 million the Ministry of Energy and Mines granted to the Companies through the Low Income Partnership Grant, $515,000 was invested in SENC in 2010 and the Companies are well positioned to invest $1.5 million in collaboration with BC Hydro on the ECAP program in 2011. Note that this investment is not shown in the table above because the Ministry of Energy and Mines Low Income Partnership grant is incremental to the EEC funds.

- Overall, including both EEC funds shown in the table above, and the Ministry of Energy and Mines Low Income Partnership grant, the Companies have been successful in investing $839,000 in 2010.

6.3 2011 Conservation for Affordable Housing Program Area Outlook

Considerably expanded investment in the Conservation for Affordable Housing program area is expected in 2011. The most significant enhancement will be the launch of the partnership with BC Hydro on the ECAP. This program will see investments from both EEC funds and from the Ministry of Energy and Mines Low Income Partnership grant. The Companies will continue with their commitment to build expertise in this program area through additional research specifically in the co-operative housing sector and the mobile housing sector. The REnEW program and the ESK program will also continue throughout 2011. Table 6-2 provides an estimate of 2011 investment in the Conservation for Affordable Housing program area.

Table 6-2: 2011 Conservation for Affordable Housing Investment Forecast

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
REnEW	$150	$35	$185	N/A	N/A	N/A	N/A	N/A
Energy Savings Kit	$186	$47	$233	31,271	7,903	39,174	2.2	2.3
Energy Conservation Assistance Program	$1,694	$424	$2,118	53,242	13,089	66,331	0.6	0.6
Mobile Homes (Study)	$8	$2	$10	N/A	N/A	N/A	N/A	N/A
CHF Co-ops (Study)	$12	$3	$15	N/A	N/A	N/A	N/A	N/A
Non-Program Specific Expenditures	$7	$3	$10	N/A	N/A	N/A	N/A	N/A
Total	$2,058	$513	$2,571	84,514	20,992	105,505	0.7	0.7

Note that wherever a TRC result is presented in the Conservation for Affordable Housing program area, it includes a deemed benefit that includes a 30 percent "adder" in accordance with clause 4.2.b of the Demand Side Measures Regulation, attached as Appendix C. It should also be noted that there is a challenge in meeting a TRC score of 1.0 (even after applying the low income adder) for programs that seek to achieve a deeper level of savings (i.e. ECAP program) for the following reasons:

- Direct install low income programs will incur higher costs for administration and implementation. The Companies will need to hire skilled contractors and ensure they are trained in the sensitivities of working in low income households. They will also need to ensure these contractors are very familiar with the utilities' safety requirements and are trained to assess potential problem situations such as mould; and
- It is difficult to reach and integrate low income customers in programs that involve some effort on behalf of the customer to provide sufficient documentation of their household income. To overcome these barriers additional investments are required to support the customer through the application process.

To address these challenges, the Companies are working with government to explore alternatives to evaluating low income programs that better recognize the higher costs required to perform this type of work, as well as recognize the extensive benefits in performing this work that extend well beyond energy efficiency.

6.4 Conservation for Affordable Housing Program Details

As the Companies progress and enhance their program offerings and partnerships, the Companies continue to meet the regulatory requirement of designing programs that specifically "assist low income households to reduce their energy consumption." (November 7, 2008, Regulation of the Minister of Energy, Mines and Petroleum Resources, Ministerial Order No. M 271, Section 3[a]). We will continue to also stay true to our EEC program principle of "offering access to energy efficiency and conservation for all residential and commercial customers, including low income customers." (Energy Efficiency and Conservation Programs Application, May 28, 2008, pg 47).

The Companies have made good progress in 2010 with the successful launch of two solid EEC programs geared specifically to low income customers. These programs will both continue in 2011. Through studies performed in 2010, relationships that have been built with non-profit housing providers, and collaborations with other BC utilities, 2011 is set to be a year of much expanded investment in the Conservation for Affordable Housing program area.

Conservation for Affordable Housing programs are outlined in Table 6-3 and described in further detail below.

Table 6-3: Conservation for Affordable Housing Initiatives for TGI and TGVI

Program	Utility		Description	TRC

6.4.1 COMPLETED PROGRAMS

6.4.1.1 Strategic Energy Management Plan ("SEMP") Study

6.4.1.1.1 SEMP Study Overview

SEMP (Study)	
Target Audience	Non-profit Housing Sector in BC
Duration	Completed in October 2010
Financial Contribution	$16,984 of the Companies' contribution

Partners	The Strategic Energy Management Plan ("SEMP") was commissioned by the Companies and BC Hydro.
Overview	
Research Goals	This study was specifically focused on the non-profit housing sector and involved an analysis of energy data (consumption and behavioural habits) to create the benchmarking of building energy performance. A related goal of the study was to use the information to start to prioritize energy efficiency upgrades based on cost effectiveness, energy savings, and GHG emissions reduction potential.
Implementation	
Administration	The study was administered jointly by City Green Solutions and the BC Non-Profit Housing Association.
Key Findings	**Key Finding:** The average energy intensity of buildings where the society pays the utility charges was more than double the intensity of buildings where the tenants pay the utility charges; and, every one percent of energy reduction in the non-profit housing sector would result in $500,000 in energy savings annually. Study recommendations: • Prioritize energy efficiency retrofits in buildings where societies pay the utility charges; • Implement educational programs in buildings where societies pay the utility charges to bridge the gap between tenant behaviour and the cost to societies; and • Where feasible, explore sub-metering structures that draw a better correlation between tenant behaviour and the resultant benefits to the tenant. **Key Finding:** Non-profit buildings in the Lower Mainland are both the largest consumers of energy and the most energy intensive. Study recommendation: • Prioritize energy efficiency programming in the Lower Mainland. **Key Finding:** The range and depth of responsibilities required to manage energy use in non-profit housing is extensive. From the initial budgeting of capital costs and organizing energy assessments, to project oversight of building retrofits and tracking and monitoring energy performance, the capacity required for housing providers is beyond the existing organizational resources of most societies. Study recommendation: • A key recommendation to managing the responsibilities of energy efficiency within the non-profit sector is to add an energy manager(s) designated to the sector. The energy manager would provide the necessary link between government and utility programs and services and the buildings that could benefit from these services.

Actions	In alignment with the study recommendations, the Companies have undertaken the following initiatives: • In 2010, the Companies funded an energy specialist at BC Housing who will work closely with the Companies to spearhead energy efficiency programming in the sector. The Companies will encourage the prioritization of buildings that have the highest energy intensity; and • In 2011, the Companies will be collaborating with BC Housing on a tenant engagement pilot program that will educate on, and encourage, energy efficiency behaviours. The intention is to develop a successful engagement program that can be rolled out on a larger scale and on a more permanent basis.

6.4.2 ACTIVE PROGRAMS

6.4.2.1 Residential Energy and Efficiency Works Program ("REnEW")

6.4.2.1.1 REnEW Program Overview

Residential Energy and Efficiency Works Program ("REnEW")	
Target Audience	Participants trying to overcome barriers to employment and poverty who also have a desire to work in the energy efficiency retrofitting industry
Duration	Jan 1, 2010 - Dec 31, 2011
Incentive	Energy efficiency trade training at no cost to participant including course materials, first aid, Workplace Hazardous Materials Information System ("WHMIS") and other trade industry certifications, a set of tools and a tool belt, and two nutritious meals per day during training
Partners	BC Hydro, FortisBC Inc.
Overview	
Background	In recognition that BC has a shortage of skilled tradespeople that are well versed in energy efficiency, this program was launched with the objective of building capacity within the industry while simultaneously providing opportunities for a segment of our society that faces barriers to employment. This FortisBC Energy Inc. led training program provides an overview of the energy efficiency industry and its many associated trades. The training includes both entry-level trade skills, with respect to the installation of energy efficiency measures (i.e. showerheads, faucet aerators, and pipe insulation), and an introduction to more technical trade skills (i.e. installing energy efficient windows and insulation). This training program is targeted to participants with barriers to employment and has been designed with the following parameters: **Accessibility** – minimal experience/educational prerequisites. **Efficiency** – minimize the number of weeks of training (class and practical)

	needed to gain the required skills. **Quality** – provide sufficient training and experience so graduates can confidently install energy efficiency devices and educate others on behaviours that encourage energy conservation. The Companies, in collaboration with funding partners and delivery agents, has created a student manual and instructor manual for the REnEW program and is actively involved in helping the delivery agents find industry professionals to train the participants. In all four REnEW training sessions held in 2010, the energy efficiency component of the training was rounded out with training that the delivery agents recommended. This additional training typically included topics such as job readiness (i.e. expectations in the workplace), life skills training (i.e. healthy eating, budgeting, and so on), and third party trade certifications (i.e. first aid, WHMIS, fall protection, working in confined spaces, and the Construction Safety Training System). When a participant graduates from the program they are equipped with energy efficiency retrofit skills, industry certifications, renewed self-confidence, and a full set of tools. Graduates are job-ready.
Description	This training program is a full-time course that typically takes four to five weeks to complete. Half of the time is spent in the classroom and half is spent learning and practicing trade skills with a team of energy efficiency trade experts.
Goals	• Increase market capacity in the energy efficiency retrofit industry. • Increase the quality of energy efficiency retrofitting installations. • By increasing the supply of skilled energy efficiency tradespeople, the cost of having these retrofits implemented will ultimately decrease for both customers and utilities.
Implementation	
Administration	In 2010, the Companies worked with three non-profit delivery agents including: • John Howard Society of the Central and South Okanogan; • A.C.C.E.S.S. (Aboriginal Community Career Employment Services Society); and • Sto:Lo Nation. Each of these delivery agents were able to leverage their networks and relationships to create greater sharing of financial costs. Some of the additional funding that came through the delivery agents included contributions from BladeRunners, Service Canada, Province of British Columbia, Community Living, and the Ministry of Advanced Education and Labour Market Development.
Communications	The REnEW program is a highly targeted program, so very little marketing of the program has been necessary other than direct contact with delivery agents by the Conservation for Affordable Housing program manager. The Companies created posters that delivery agents use to inform and recruit participants to the program.

Evaluation	The REnEW program's success is predicated on providing a high quality and engaging training experience to participants in communities across BC. To measure this, participants are surveyed to gauge the Companies' success in providing a positive training experience; and, their satisfaction with the program is our indicator of how positive the training experience was. For the goal of increasing energy efficiency expertise in the trade industry, employment after graduating from the program is used as a gauge to measure direct impact on the industry. To this end, employment within two months of graduating from the REnEW program is tracked through our delivery agents.

6.4.2.1.2 2010 REnEW Program Results

In 2010, the Companies saw the launch of this innovative approach to creating capacity in the energy efficiency trade industry. Table 6-4 below shows the Companies invested $148,000 in the REnEW program in 2010. This investment was spread across the four REnEW sessions and the three delivery agents mentioned above, and resulted in 59 participants in the program.

Table 6-4: 2010 Program Actuals

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	59	N/A	$148	N/A	N/A	N/A	N/A
FEVI	0	N/A	$0	N/A	N/A	N/A	N/A

During the first implementation of this program, the Companies learned that smaller size classes are crucial to meeting the needs of the clientele who participate in this training program. Consequently, even though there were 59 participants within the four sessions we implemented in 2010, in 2011 we will set the maximum class size to 12 participants per session. By working with a very proficient group of non-profit delivery agents, using highly skilled trainers, and creating an engaging training experience, 95 percent of registered participants completed the course. At the end of every session, the participants completed a satisfaction survey and were asked to rate their satisfaction on a scale of one to five, with one representing poor satisfaction and five representing excellent satisfaction, and the average score for all four sessions was 4.2 or 85 percent.

In terms of direct impact on the energy efficiency trade, the Companies also tracked how many of the graduates were employed within two months of graduating from the program. The last two sessions were completed in December; therefore, at the time of writing this report, final results of employment from the last two sessions has not yet been determined. From the first two sessions, an average of 38 percent of participants were employed within two months of completing the program. Given that many of the participants were disconnected from the workforce entirely before completing this program, this is a very respectable result. Another favourable result is that the REnEW program had such a positive effect on participants' confidence that an average of 12 percent from the first two sessions went on to further their education. For example, one graduate went on to enrol in a GateWay to the Trades for Women course at Okanagan College. REnEW program results are summarized below in Table 6-5.

Table 6-5: 2010 REnEW Program Success Indicators

Indicator	2010 Performance
Participants in the program	59
Course completion rate	95%
Number of participants employed or furthering their education within two months of graduating	50%
Satisfaction of participants	85%

From the very early stages of program design, the Companies have worked collaboratively with other utilities and non-profit social agencies, and this approach has led to very efficient use of our investment in this program. The four sessions that were implemented in 2010 had a total cost of $489,031. By leveraging our relationships with FortisBC Inc. and BC Hydro, and leveraging funding that many non-profit organizations have in place, the Companies have invested $147,691 (30 percent of total costs). See Table 6-6 for REnEW cost sharing.

Table 6-6: 2010 REnEW Program Cost Sharing

Administrator	Total
Number of Participants	59
Total Cost of Program	$ 489,031
Contributions from Delivery Agents	$ 129,120
Contributions from Other Utilities	$ 212,219
Contribution from the Companies	$ 147,691

6.4.2.1.3 2011 REnEW Program Performance Forecast

Table 6-7: REnEW Program Performance Forecast for 2011

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	44	N/A	$150	N/A	N/A	N/A	N/A
FEVI	11	N/A	$35	N/A	N/A	N/A	N/A
Total	55	N/A	$185	N/A	N/A	N/A	N/A

In 2010, the Companies implemented four sessions of the REnEW program throughout communities in the FEI territory. In 2011, the intention is to implement an additional four sessions of the REnEW program in FEI's territory and extend the reach to the FEVI service territory as well. As additional programs are rolled out in 2011 under the Conservation for Affordable Housing program area, the Companies envision the opportunities for the graduates of the REnEW program to also evolve.

6.4.2.1.4 REnEW Program Overall Summary

The REnEW program is a great example of the holistic approach the Companies have taken in their activities that serve British Columbia's low income sector. By working with non-profit social agencies and skilled trade experts we are not only having a positive impact on the capacity within the energy efficiency trade sector, but also providing opportunities for individuals that are facing barriers to employment to overcome their barriers. Further, by collaborating and partnering with utilities and non-profit social agencies, we are able to lead this initiative in a very cost efficient manner.

6.4.2.2 Energy Saving Kit Program

6.4.2.2.1 Energy Saving Kit Program Overview

Energy Saving Kit Program	
Target Audience	Low Income Residential Retrofit Customers
Duration	Jul 1, 2010 - Dec 31, 2011
Incentive	Kits delivered at no cost to program participants Approximate retail value of the kit is $75
Partners	BC Hydro FortisBC Inc. will be added in 2011
Overview	
Background	The Energy Saving Kit ("ESK") program is the first widely available low income program for the Companies. By partnering with other utilities, the process is simplified and administration and marketing costs are reduced. The ESK offer is a broadly marketed and easily accessed program available to customers in all utility partners' regions, regardless of their fuel type. Based on the qualification of a customer's application, instructions are sent to a supplier to send out the kit. The eligibility criterion is consistent across utilities and is based on the participants' household income. The definition of low income customer for this program is based upon Statistics Canada low income cut-offs ("LICOs"). The kit is delivered at no cost to the participants and includes several easy to install energy savings measures, such as water heater pipe wrap, low flow showerheads, faucet aerators, weather stripping, foam tape for door draft-proofing, and other measures. The ESK also includes educational brochures that will help customers reduce their energy consumption through simple behavioural

	changes. Although ESKs are most often mailed to individual participants, there are also options that allow non-profit housing societies and First Nation bands to apply on behalf of their tenants and receive a bursary. The bursary (currently administered through BC Hydro) allows the society or band to hire an individual to install the kits for their tenants. Currently, customers must call to apply for the program. In 2011, an online form will be created that is expected to enhance the application process and reduce administration costs associated with the telephone application channel.
Description	The ESK is a bundle of easy to install energy saving measures and is delivered to the participants' home free of charge.
Goals	• Make energy efficiency more accessible to low income customers by addressing the key barriers to energy efficiency in this sector (including affordability, availability, and awareness). • Provide low income customers with the opportunity to reduce their energy consumption, which will also reduce their energy bills and GHG emissions. • Enable low income participants to self-install energy efficiency measures in their homes. • Create a culture of conservation through increased knowledge and awareness of conservation behaviours. • Provide energy savings for the Companies.
Implementation	
Administration	BC Hydro, Consumer Response Marketing
Communications	The main communication channels used in 2010 were bill inserts and print ads in free community newspapers. Through BC Hydro, we are also reaching participants through food banks and a promotional letter to the clientele of the Ministry of Housing and Social Development.
Evaluation Strategy	Evaluation of the savings of the gas measures within the ESK is based on engineering calculations and third party studies. Further, we are able to leverage BC Hydro's evaluation of the ESK, which includes surveys to participants to confirm assumptions with respect to installation rates, free-ridership, and the popularity of various measures.

6.4.2.2.2 2010 ESK Program Results

In the first six months of the ESK program, over 5,200 participants have qualified for the program and received ESKs. This is a very strong response and reinforces that there are great opportunities for providing meaningful programs to our low income customers. Because this program has a very simple process and most of the administration of the program is performed by BC Hydro, the Companies' costs are low and the energy savings are high overall. This resulted in a high TRC score of 2.3.

Table 6-8: 2010 ESK Program Actuals

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	4,206	$39	$44	2,637	15,520	27%	2.3
FEVI	1,052	$10	$11	660	3,959	27%	2.4
Total	5,258	$49	$55	3,297	19,479	27%	2.3

The Companies partner with other utilities in this program. One of the benefits in partnering with other utilities to administer EEC programs is the cost efficiencies of shared program evaluations. In 2010, BC Hydro performed an evaluation of the Energy Saving Kit program and there were two significant findings that impacted the above results. First, due to higher than expected installation rates of various measures that reduce gas consumption, the energy savings per kit is higher than what was anticipated at the onset of the program (0.86 GJ/kit vs. 0.46 GJ/kit). Second, free-ridership in the program was greater than anticipated at 27 percent. Some of the reasons suspected for high free-ridership include the low cost of some of the individual items in the kit, general familiarity with the energy savings benefits of items in the kit, and a desire by the surveyed population to be seen as socially responsible by the interviewer (i.e. reporting bias). In spite of the deemed free-ridership, by virtue of participating in this program, low income customers are exhibiting socially desirable energy efficiency behaviours, which fits with the Companies' overall objectives as well as the objectives of British Columbia's social and environmental policies.

6.4.2.2.3 2011 ESK Program Performance Forecast

The successful enrolment of low income participants in the ESK program in 2010 is expected to continue throughout 2011. We will make adjustments to the measures in the kits based on the evaluation performed in 2010 in order to supply more of the measures that are being utilized and remove measures that are not being utilized adequately. In 2011, we will be able to offer all our low income customers an internet-based application process, which is expected to expand our reach while also reducing call centre costs.

The following table shows the forecast result of the continuation of the program in 2011, continuing with a positive TRC ratio of 2.2 for the program.

Table 6-9: 2011 ESK Program Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	8,400	$88	$98	5,267	31,271	27%	2.2
FEVI	2,100	$22	$25	1,317	7,903	27%	2.3
Total	10,500	$110	$123	6,584	39,174	27%	2.2

6.4.2.2.4 ESK Program Overall Summary

The ESK program is the Companies' first broadly available EEC program in the Conservation for Affordable Housing category and the program has received outstanding response from our customers. In half a year over 5,000 customers have participated in the program. In 2011, we will continue to collaborate with our utility partners on our marketing and communication efforts, thereby achieving further cost efficiencies and greater reach. By partnering with BC Hydro in 2010 and FortisBC Inc. in 2011, we are ensuring that through this program our low income customers are served in a streamlined fashion that minimizes the customer's effort and the utilities' administration costs.

6.4.2.3 Ministry of Energy and Mines Low Income Partnership Grant Program

6.4.2.3.1 Ministry of Energy and Mines Low Income Partnership Grant Program Overview

Ministry of Energy and Mines Low Income Partnership Grant Program	
Target Audience	New Construction / Retrofit
Duration	To be invested by Mar 31, 2012
Incentive	Varies
Partner	Ministry of Energy and Mines

Overview	
Background	On March 31, 2009, through the Low Income Partnership Grant agreement, the Ministry of Energy and Mines awarded FEI and FEVI a grant of $5.155 million to support and develop DSM programs for low income individuals in BC. These funds are incremental to the funds approved in the EEC Decision. This grant stipulates that: • $1 million is to be used to deliver the Super Efficient New Construction program; • $1.5 million is to be used to support BC Hydro's low income programs; • $954,189 is to be used to fund retrofits under the LiveSmart BC Carry Over project; and • $1,700,811 is to be used to develop new programs for low income customers.
Goals	• Encourage energy efficient new construction that far exceeds the current building codes. • Achieve deep energy savings in low income units. • Reduce GHG emissions.
Implementation	
Administration	The Companies
Communications	The intention is to issue press releases at various milestones in the project. In 2011, we will issue a press release when the SENC project is fully committed.
Evaluation Strategy	The SENC project's energy performance will be measured over time to validate the savings expected. The $1.5 million used to support BC Hydro's low income programs will be specifically contributed to BC Hydro's Energy Conservation Assistance program and will be evaluated alongside the general evaluation of that program. The Livesmart BC Carry Over project was evaluated based on modelled energy savings. (Note: TRC calculations were not required by the Ministry of Energy and Mines for this project and the evaluation was carried out by the delivery agent that was contracted to complete the work.) The new energy efficiency programs the $1,700,811 is to be invested in are still under development.

6.4.2.3.2 <u>2010 Ministry of Energy and Mines Low Income Partnership Grant Program Results</u>

In 2010, the SENC component of the Low Income Partnership Grant program made good progress. Through the SENC program, four projects have received a total of $515,000 to advance their developments, and these four projects will each receive an additional 20 percent contribution at completion of their projects. The Livesmart BC Carry Over project was completed in 2009. This project involved energy efficiency retrofits in six building complexes (557 units) throughout the Lower Mainland. Total modeled energy savings from the project was 5,026 GJs (as reported by Eaga Canada).

The table below shows the funding amount and the investments already made.

Table 6-10: 2009-2010 Program Investments

Funding Components	Funding Agreement Amounts	Funds Invested at Dec 31, 2010
SENC	$ 1,000,000	$ 515,000
BC Hydro	$ 1,500,000	$ -
LiveSmart CarryOver	$ 954,189	$ 954,189
New DSM Projects	$ 1,700,811	$ -
Total	**$ 5,155,000**	**$ 1,469,189**

The SENC Program Oversight and Evaluation Committee, chaired by the Ministry of Energy and Mines, includes representatives from the Companies, BC Hydro, and FortisBC Inc. This committee is currently exploring other projects to invest the remaining $353,000 of uncommitted funds in the SENC project.

6.4.2.3.3 2011 Ministry of Energy and Mines Low Income Partnership Grant Program Forecast

In 2011, the Companies intend to form a partnership with BC Hydro on their Energy Conservation Assistance program. Substantial progress towards forming this partnership has already been achieved. The Companies intend to invest both grant funds and EEC funds in this program in 2011. The Energy Conservation Assistance program is described in the following section of this report.

Several avenues are being explored and researched to develop new DSM projects to invest the remaining $1,700,811. One avenue of research is with respect to opportunities within the mobile home segment of BC. The research is described further in Section 6.4.3.3. Also, information is being gathered on specific low income buildings in the Okanagan corridor to assess opportunities for deep retrofits in buildings that are not currently being served by any utilities' DSM programs.

6.4.2.3.4 Ministry of Energy and Mines Low Income Partnership Grant Program Summary

The Companies continue to facilitate the investment of the Ministry of Energy and Mines Low Income Partnership Grant in low income units across BC. In 2010, investments in the SENC program were achieved and some research is being conducted on opportunities for investing the remaining unallocated funds. As well, the Companies expect to be able to invest $1.5 million in a partnership with BC Hydro on the Energy Conservation Assistance program, which will see investments from this grant as well as the Companies EEC funds.

6.4.3 PROGRAMS IN DEVELOPMENT

6.4.3.1 Energy Conservation Assistance Program ("ECAP")

6.4.3.1.1 ECAP Overview

Energy Conservation Assistance Program ("ECAP")	
Target Audience	Low income residential retrofit customers Applies to renters (with landlords consent) or homeowners in single family dwellings or row housing
Duration	One year to confirm business case assumptions with the intention of extending the program indefinitely
Incentive	The average incentive per participant is $1,765 worth of installed measures in their home
Partner	BC Hydro
Overview	
Background	The Energy Conservation Assistance Program ("ECAP") is positioned to be the Companies' flagship program that achieves the deepest levels of energy savings in low income homes. ECAP is a targeted program that, in its current state, is offered only by BC Hydro to low income electricity customers. The Companies intend to participate in this program and broaden the program's reach and impact to include low income natural gas customers. The Companies also intend to eventually expand the types of retrofits that are performed through this program to include items such as furnace filters and new high efficiency furnaces. Due to the fact that low income customers often have priorities other than learning about or implementing energy efficiency in their homes, this program takes a unique approach to making it easy for customers to participate. This involves a straightforward, single application process, which is used by both BC Hydro and the Companies to qualify the participants, and, once the participants qualify, they are fully serviced by the ECAP program's delivery agents. All the participant needs to do is receive the calls from the delivery agents and be home at an agreed upon time to start receiving the benefits of the program's services. Quality assurance of the retrofits will be performed through an independent third party contractor and is performed on 10 percent of the homes that receive basic measures (i.e. low flow showerheads and light bulbs) and 20 percent of the homes that receive more advanced measures (i.e. insulation, draft proofing, and furnaces).
Description	The program involves a visit to the participant's home, an assessment of the energy savings opportunities, and the installation of a host of energy efficiency measures. Education on energy conservation behaviour is also delivered during the initial visit to the customer's home.
Goals	• Enable approximately 2,400 low income participants annually to receive comprehensive energy evaluations in their homes and have

	a suite of energy efficiency measures installed. • Make energy efficiency more accessible to low income customers by addressing the key barriers to energy efficiency in this sector (i.e. affordability, availability, and awareness). • Provide energy savings for FEI/FEVI. • Provide low income customers with the opportunity to reduce their energy consumption, energy bills, and GHG emissions. • Create a culture of conservation through increased knowledge and awareness of conservation behaviours.
Implementation	
Administration	The primary administrator from the utility perspective is BC Hydro; however, the Companies will qualify participants that are the Companies' customers. The visits to customers' homes to perform energy assessments and retrofits are performed by independent delivery agents.
Communications	Prospects for the program are identified and engaged through working collaboratively with social housing providers and program delivery agents. Recipients of the ESKs are also prospects for participation in this program if they meet the minimum energy consumption criteria.
Evaluation Strategy	The intention is to perform a billing analysis of participants in the ECAP program once there are enough participants with minimum of one year post-installation consumption.

6.4.3.1.2 2011 ECAP Forecasted Program Results

The ECAP program is expected to launch by the end of Q2 2011; thus, figures shown below in Table 6-11 are estimates based on six months of the program being available in the market. The TRC score of 0.6 includes the full costs of the program including enabling costs such as carbon monoxide detectors, ventilation fans, and many costs that are unique to delivering a direct install low income program. These unique costs include such items as hiring contractors to perform the retrofitting work, costs of training the contractors on working in low income homes (sensitivity training), and ensuring contractors are well educated on the utilities' safety procedures and policies. These enabling costs and unique program costs have a detrimental effect on the programs TRC; however, they are critical to implementing this important program. This program is another example of work that needs to be performed in order to reach our province's carbon reduction goals, but is ineffectively evaluated using conventional TRC requirements.

The Ministry of Energy and Mines Low Income Partnership funding, described in the previous section, specifically directs the Companies to contribute $1.5 million towards BC Hydro's low income programming by March 2012 and this contribution is exempt from TRC requirements as agreed by the government. Therefore, in 2011, the Companies will apply at least a portion of the Low Income Partnership funding against the ECAP program costs. The program forecast shown below is reflective of the full costs of the program as this best illustrates the actual expected costs of the program.

Table 6-11: 2011 ECAP Program Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	960	$1,082	$613	5,548	53,242	4%	0.6
FEVI	240	$270	$153	1,387	13,089	4%	0.6
Total	1200	$1,352	$766	6,935	66,331	4%	0.6

6.4.3.1.3 ECAP Program Overall Summary

A program of this magnitude and complexity takes a considerable amount of coordination and administration. With much of the ground work laid in 2010, the Companies expect to be able to launch a joint ECAP program by Q2 2011 with BC Hydro. This program will represent an excellent opportunity for the Companies to achieve deep energy savings for our low income customers.

6.4.3.2 Co-operative Housing Federation of BC – Energy Performance Housing Inventory (Study)

Co-operative Housing Federation of BC (CHF BC) – Energy Performance Housing Inventory (Study)	
Target Audience	Retrofit, Co-operative Housing in BC
Duration	To be completed in 2011
Financial Contribution	$15,000
Partners	BC Hydro, BC Housing
Overview	
Research Goals	• Create a better understanding of current building stock conditions. • Provide an analysis of baseline building energy performance indicators. • Obtain the necessary information to develop comprehensive programs tailored specifically to the conditions of the co-operative housing sector. • Create a framework for determining buildings most in need of retrofit work. • Identify opportunities to achieve cost-effective energy savings.
Implementation	
Administration	CHF BC with sub-contracted services to City Green and Eaga Canada.
Background	The CHF's BC Energy Performance Housing Inventory is a first step towards addressing the complex nature of working within the co-operative housing

	sector. Co-operative housing is a challenge to engage in energy efficiency programming because of the following: 1) most co-operative housing complexes are separately governed (i.e. owned and operated independently), thereby requiring buy-in from the majority of tenants in each individual housing complex; 2) tenants in co-operative housing cannot all be assumed to have a low household income; and 3) the financial situation of each housing co-operative varies significantly. The one item that is most likely to be consistent across the co-operative housing sector is that energy efficiency is very rarely on their list of priorities. Since no comprehensive housing energy-use inventory exists for the co-operative housing sector in BC, the energy use characteristics of co-operative housing are largely unknown. This makes it very challenging to design programs for the sector. This inventory will allow for a strategic approach to be designed that will ultimately allow for the prioritization of energy retrofits in housing co-ops in BC.

6.4.3.3 Mobile Homes (Study)

Mobile Homes (Study)	
Target Audience	Retrofit, Mobile Homes in BC
Duration	To be completed in Q1 2011
Financial Contribution	$20,000
Partners	None
Overview	
Research Goals	• Identify the energy saving opportunities in mobile homes. • Create a better understanding of current building stock conditions. • Perform exploratory research to gauge attitudes and potential participation of mobile home owners in energy efficiency programs. • Determine the potential for upgrading mobile home furnaces to high efficiency furnaces, and the potential for converting oil furnaces to high efficiency natural gas furnaces. • Identify differences in income among those living in mobile homes. • Outline appropriate communication methods that will effectively reach individuals who live in mobile homes.
Implementation	
Administration	The Companies
Background	Mobile home owners are expected to be a segment of the population that are: • underserved by traditional DSM programming;

	• likely have lower than average income; and • likely to have higher than average elderly people. For the above reasons, the Companies have commissioned a survey to further explore opportunities that may exist in the mobile home sector.

6.5 Conservation for Affordable Housing Summary

The Conservation for Affordable Housing program area has been a priority for the Companies since the initial creation of our EEC Program principles. Our goal of creating programs that are accessible to all has already been achieved through the launch of our Energy Saving Kit program and the REnEW program in 2010. In the coming years, with energy prices generally increasing, the program area will become even more important. In 2011, the anticipated partnership with BC Hydro on the Energy Conservation Assistance program will see greatly expanded investment and a deeper level of savings for our low income customers. In 2011, the Companies will also be working with government to explore alternatives to TRC evaluation, and/or additional methods of measuring success of programs that serve our low income customers to ensure we can continue to create programs that achieve deep energy savings within the low income segment of BC.

7 JOINT INITIATIVES

7.1 Overview

Joint Initiatives are EEC programs that facilitate mutually beneficial partnerships between utilities and government partners or utilities and other utilities. These partnerships enhance EEC goals and provide value to customers through shared costs and efficiencies, streamlined communications, extended market reach across shared service territories, and a collaborative business model that incorporates a holistic view of the provincial energy landscape. Each utility and government partner has strong brand recognition and cost-effective marketing channels. Working together creates synergies that drive program participation and energy savings while optimizing administration and marketing resources. By sharing resources, a greater number of programs can be launched to serve the energy needs of our customers and the province as a whole.

As outlined in the 2009 EEC Annual Report, to further such Joint Initiatives programs, in July 2009 the Companies signed a Memorandum of Understanding ("MOU") with BC Hydro to facilitate increased utility collaboration on DSM. The purpose of the MOU is to drive efficiencies in program promotion and administration, thereby bringing education and incentive programs to residents and the trades across BC. The Companies are currently looking at the alignment of the Companies' EEC activities with sister company FortisBC Inc.'s PowerSense initiative with a view to achieving the same efficiencies and number of combined activities that the BC Hydro MOU has driven forward.

In Order No. G-36-09 on the Companies' EEC Application, the Companies received approval for $1 million in annual spending for Joint Initiatives as opportunities arose. Furthermore, in Commission Order No. G-141-09, as part of the FEI's 2010-2011 Revenue Requirements Application's Negotiated Settlement Agreement, the 2011 request for extension of 2010 residential joint initiatives program funding amounting to $1.346 million was approved. Similarly for FEVI, in Commission Order No. G-140-09, as part of FEVI's 2010-2011 Revenue Requirements Application's Negotiated Settlement Agreement, the 2011 request for extension of 2010 residential program funding amounting to $0.302 million was approved.

Program initiatives that were outlined and approved in the EEC Application included home energy assessments, home labelling, affordable housing, and Community Action on Energy Efficiency ("CAEE"). The Companies' contributions to home energy assessments and home labelling are implemented within the LiveSmart BC partnership with the Province of British Columbia. The affordable housing initiatives are deemed high priority and as such are referenced within their own program area (Refer to Section 6). In addition to the Joint Initiatives described within this section, the Companies have also engaged in significant collaboration with the Province on PSECA (Refer to Section 4.4.2.5) and with BC Hydro on the Energy Specialist program (Refer to Section 11.2.4). Although CAEE is now complete, the Companies collaborated on a number of additional initiatives with communities. In 2010, community programs included working with the City of Vancouver on a solar thermal water heating pilot, a weatherization pilot, and water savers in the Interior. In 2011, we are working with the City of Saanich and other municipalities on a weatherization and hot water conservation pilot. Other community outreach activities are highlighted in Tablex.7-1

Throughout 2010 program implementation and 2011 program planning, the integrated efforts of utilities, governments, and communities touched all EEC program areas. Table 7-1 outlines the extent of Joint Initiatives that are currently being undertaken across the program areas, with greater detail in their respective sections.

Table 7-1: Joint Initiatives Portfolio Across Program Areas

In the Companies' 2009 EEC Application, the Joint Initiatives program area was primarily focused on the residential market and as such only residential joint initiatives have remained distinct from their program area. Only residential joint initiatives will be described in detail in Section 7.4, while joint initiatives in other program areas are contained within their respective sections as indicated in Table 7-1. The following sections provide information about individual programs including an overview of the 2010 program results and the outlook for 2011.

7.2 2010 Joint Initiatives Results

Table 7-2 provides a summary of the results of 2010 residential joint initiatives programs. Since a large portion of 2010 overall spending is attributed to LiveSmart BC home energy assessments for which we have not captured direct savings, it is difficult to present the program area in terms of TRC; rather these costs are rolled up into portfolio level expenses. The true measure of success is in the collaborative approach to program deployment that results in extended reach and reduced costs through shared resources as utilities and governments offer programs to BC residents.

Table 7-2: 2010 Residential Joint Initiatives Summary

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
LiveSmart BC - Home Energy Assessments (D-Visits) through LiveSmart BC - 2009-2010	349	16	365	No Direct Savings				
LiveSmart BC - 2010 -2011 Home Retrofit	No invoices were received in 2010 so energy savings not calculated							
Energy and Water Efficient Appliance Programs	7		7	2,801		2,801	0.8	
Water Savers Pilot	14		14	2,899		2,899	2.0	
City of Vancouver Weatherization Pilot	15		15	No Savings Claimed at this Time				
Non Program Specific Admin & Studies	48	8	56	N/A				
Total	**433**	**24**	**456**	**5,700**	**N/A**	**5,700**	**N/A**	

The highlights of 2010 residential joint initiatives programs are as follows:

The LiveSmart BC Efficiency Incentives program, a partnership with the Ministry of Energy and Mines and utility partners, is a key collaborative venture for home retrofits. The program illustrates the Companies' commitment to "whole home performance" and "house as a system" home energy management. The Companies have supported a variety of incentives upon each iteration of the program.

- From August 2009 through March 31, 2010 the Companies provided $75 for partial funding of home energy assessments, contributing to over 10,000 assessments and a total contribution of over $760,000.

- From April 2010 through March 31, 2011 the Companies have contributed partial funding to building envelope measures with a forecasted contribution of $657,000 and an estimate of 246,000 GJs saved over the lifetime of these measures. Since we did not receive invoices for the 2010 iteration until January 2011 neither costs nor savings were captured in the 2010 EEC portfolio and all forecasted savings will be reported in 2011.

In 2009 and 2010, FEI collaborated with FortisBC Inc. on programs for energy and hot water efficient washing machines. In addition, the Companies collaborated on the Water Saver's pilot that distributed ultra low flow showerheads to rural customers. FEI's participation extended the program's reach to customers heating water with natural gas.

The City of Vancouver Weatherization pilot was co-funded by the City of Vancouver, BC Hydro, and FEI to take an initial look at capacity building for the weatherization industry in both creating customer demand and servicing this demand with skilled practitioners. The program was also conducted in collaboration with EMBERS, a non-profit employment and self-employment development organization in the Downtown Eastside of Vancouver. The program combines the benefits of energy savings, green jobs, and training for individuals who may face barriers to employment.

7.3 2011 Joint Initiatives Outlook

For the purpose of consistency, in the 2011 outlook, the Joint Initiatives program area will continue to focus on the residential market, with some limited discussion of a commercial area joint initiative that is in a preliminary design stage. Table 7-3 provides an overview of 2011 residential joint initiatives programs that include LiveSmart BC and ENERGY STAR® washer programs with utility partners.

Table 7-3: 2011 Joint Initiatives Outlook

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
LiveSmart BC - 2010 -2011 Home Retrofits	616	42	657	234,273	11,731	246,004	1.1	1.0
LiveSmart BC - 2011 -2012 Home Retrofits	1,758	178	1,935	431,354	43,367	474,721	1.0	1.0
LiveSmart BC - 2011 - 2012 for Small Business	Under Development

Energy and Water Efficient Appliance Programs - BCHydro & FortisBC Inc	359	71	430	149,200	31,613	180,813	1.0	1.0
Non Program Specific Admin & Studies	160	40	200					
Total	**2,942**	**340**	**3,282**	**814,827**	**86,711**	**901,538**	**0.9**	**0.9**

Joint initiatives under development in 2011 will continue to provide value to customers through shared resources and communications channels.

Activity for LiveSmart BC in 2011 includes:

- Completing the April 1, 2010 through March 31, 2011 iteration in which we forecast $657,000 in spending and 246,000GJs in savings;
- Launching the April 1, 2011 through March 31, 2012 iteration (currently under development), which will focus on enhancing building envelope measures from the 2010 iteration;
- Developing and launching a Home Energy Efficiency online portal that will provide a One Stop Rebate shop, and information and tools that promote home energy efficiency retrofits; and
- Assessing the opportunity to participate in the LiveSmart BC small business program in the Commercial Program Area. Please see Section 1.4.2.1.4 for information on LiveSmart BC for small business.

We are launching a high efficiency washer rebate program with electric utilities in each of their service territories. Section 7.4 provides further detail about individual programs including goals, 2010 results, and the outlook for 2011.

7.4 Joint Initiatives Program Details

7.4.1 COMPLETED PROGRAMS

7.4.1.1 City of Vancouver Weatherization Pilot

7.4.1.1.1 City of Vancouver Weatherization Pilot Overview

City of Vancouver Weatherization Pilot	
Target Audience	Residential Retrofit Customers
Duration	Fall 2010
Support	$15,000 contribution to provide training and weatherization services to about 50 homes in the City of Vancouver
Partners	City of Vancouver, BC Hydro, FEI, and EMBERS, a non-profit employment and self-employment development organization in the Downtown Eastside of Vancouver

<table>
<tr><th colspan="2">Background</th></tr>
<tr><td>Description</td><td>The City of Vancouver, BC Hydro, FEI, and EMBERS are piloting a weatherization/air-sealing business model. The program will train unemployed, bondable Vancouver residents to undertake air-sealing work in homes. The service will include a before and after blower door test to track performance improvements in each home.</td></tr>
<tr><td>Goals</td><td>The primary objectives of the pilot program were to:
Create local capacity in energy efficiency for basic air sealing and draft proofing, also known as home weatherization. Currently there are very few trained providers of these services and an opportunity exists to develop this industry and educate consumers about the benefits of this service;
Prove the energy savings that result from weatherisation (or air-sealing) in homes as inputs to utilities' cost/benefit models for development of DSM programs;
Identify a business model for providing these services to determine the following: what tasks are involved in air sealing, amount of time it takes, the market potential, the potential cost of the services, and to what extent homeowners are willing to pay for air sealing services; and
Work with a social enterprise to determine if these skills can be readily taught to those facing employment barriers such as REnEW graduates.
The longer term goal for the City of Vancouver was to prove the effectiveness (energy efficiency/savings) and the economic viability of a weatherization/air-sealing business, and to seed a stand-alone business that will offer job opportunities and career development for inner-city residents. The longer term goal of the Utilities was to determine if this training model can be used in other communities across the province.</td></tr>
<tr><th colspan="2">Implementation</th></tr>
<tr><td>Administration</td><td>City of Vancouver</td></tr>
<tr><td>Communications</td><td>Community marketing and earned media was used to attract participants and increase program awareness.</td></tr>
<tr><td>Evaluation Strategy</td><td>Program results are being analyzed to understand the energy savings associated with draft proofing. The Companies will be conducting consumption data analysis in the future.</td></tr>
</table>

7.4.1.1.2 Program results and future outlook

The pilot was successful in defining what the weatherization process entailed, average length of the job, and energy savings potential. A core staff was trained and experience was gained through the completion of air sealing approximately 50 homes. City of Vancouver and Downtown Eastside funding has been obtained to launch a stand-alone business for weatherization that employs individuals facing barriers to employment.

The utility partners and the Ministry of Energy and Mines are discussing ways these results can be used to support training for the industry and ways the intelligence gained from the pilot can be used in other communities across the province.

7.4.2 ACTIVE PROGRAMS

7.4.2.1 LiveSmart BC Efficiency Incentives Program (Home Retrofit Program)

The LiveSmart BC Efficiency Incentives program section presents the background, the Companies contributions to date, and the 2011 outlook for LiveSmart BC yearly iterations.

7.4.2.1.1 LiveSmart BC Background

LiveSmart BC Efficiency Incentives – Home Renovation Program	
Target Audience	Residential Retrofit Customers
Incentive	September 2008 through December 2009 - $250 incentive for ENERGY STAR® heating system upgrade – Please refer to Section 3.4.1.1 for details August 16, 2009 through March 31, 2010: Home Energy Assessments (D-visits) $75 subsidy from utility partner (based on fuel source) and $75 subsidy from Ministry of Energy and Mines April 1, 2010 through March 31, 2011: Utility partner contributions for air sealing, insulation, and windows (supplemented by the Ministry of Energy and Mines) April 1, 2011 through March 31 2012 – under development
Partners	FEI, FEVI, BC Hydro, FortisBC Inc., and Ministry of Energy and Mines
Background	
Background	The utility partners, FEI, FEVI, BC Hydro, and FortisBC, are collaborating on a BC Home Retrofit project through the Ministry of Energy and Mines' LiveSmart BC Efficiency Incentive program. The primary objective of the collaboration is to develop a platform that is sustainable and can remain in the market for many years without relying on the contribution of any one partner, including the provincial or federal government. In addition to consumer incentives, the utility partners are developing a longer term vision to jointly fund education and outreach, working to engage consumers and the trades in energy efficient retrofits.
Goals	• To develop a platform that is sustainable and will remain in the market for many years without being reliant on the contribution of any one partner. A key component of the sustainable platform is to develop a common back-end for program administration and customer support. • To utilize the cost-effective marketing channels of individual utilities and the government while developing an integrated marketing plan that optimizes outreach and drives program participation. Consumer education and outreach will be a key component in addition to the incentive offering. • Through education, create consumer demand for energy efficient retrofits, thereby driving the industry in the process.

	• A longer term strategy is to engage the trades in education and outreach that will support the promotion of energy efficiency. • To create a Home Energy Efficiency online web portal and One Stop Rebate shop that will centralize offers from utilities, provincial, municipal and federal governments, and associations.
Implementation	
Administration	Ministry of Energy and Mines – LiveSmart BC
Communications	Through individual partners' communications channels – FEI, FEVI, Ministry of Energy and Mines, BC Hydro and FortisBC Inc.

7.4.2.1.2 <u>The Companies' Contribution for EcoEnergy Home Energy Assessments Through LiveSmart BC</u>

As a result of the success of the original LiveSmart BC offer in 2008, the program was oversubscribed as of August 2009. At that time, the Companies joined the electric utilities, BC Hydro and FortisBC, in providing a $75 subsidy for EcoEnergy Home Energy Assessments. The Companies subsidized a total of 10,236 assessments for a contribution of $768,000 from August 16, 2009 through March 31, 2010, which is the provincial fiscal year end. Table 7-4 provides an overview of participation for FEI and FEVI. Due to the nature of this project, in that the assessment is an evaluation step only, the Companies recognize that no energy savings can be claimed directly as a result of this program. Rather, the home energy assessment is an avenue into other retrofit incentives that result in energy savings.

The following Table 7-4 shows the Companies subsidized over 10,000 home energy assessments for a $768,000 contribution to customers participating in the LiveSmart BC program.

Table 7-4: 2009-2010 Overview of Home Energy Assessment Contributions for LiveSmart BC

	Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)
2009 Invoices - *	FEI	5,182	389	-
	FEVI	263	20	-
2010 Invoices - *	FEI	4,596	345	4
	FEVI	195	15	1
Total	FEI	9,778	733	
	FEVI	458	34	
Program Total		10,236	768	5

* Participant counts from Ministry of Energy and Mines' invoices based on NRCan D- visit data

7.4.2.1.3 LiveSmart BC 2010 Results for Building Envelope Incentives

In the LiveSmart BC program iteration that launched April 2010, the Companies, in collaboration with BC Hydro and FortisBC, provided partial payment of the building envelope rebates including air sealing, insulation, and windows. There were no invoices in 2010 and therefore no energy savings or costs were claimed. Based on information available at the time of writing this report, a $657,000 contribution is forecasted, which should result in approximately 246,000 GJs of savings over the lifetime of these measures as outlined in Table 7-5.

Table 7-5: LiveSmart BC 2010 Forecasted Program Results

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	2,156	531	85	21,463	234,273	12%	1.1
FEVI	108	27	15	1,075	11,731	12%	1.0
TOTAL	2,264	557	100	25,609	246,004	12%	1.1
Note: The forecasted participant counts and savings are an estimate since there is a time lag between data transfer from service organizations, NRCan and the Ministry invoicing utilities. Only one invoice has been received to date for an estimated 25% of the activity. This invoice amount was multiplied by 4 to provide the above forecast.							

7.4.2.1.4 2011 Outlook

The LiveSmart BC iteration launching April 2011 is under development, with the prospect of remaining in market for two years depending on BCUC funding approval for the 2012 Joint Initiatives program area. Based on information available at the time of writing this Report, we forecast a $1.8 million incentive expenditure which would result in approximately 475,000 GJs of savings over the lifetime of these measures as outlined in Table 7-6. Please note these are very preliminary forecasts and the final offer is still under discussion with the Ministry of Energy and Mines, BC Hydro and FortisBC Inc.

Table 7-6: LiveSmart BC 2011 Outlook

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	5,097	1,596	162	40,503	431,354	12%	1.0
FEVI	510	160	18	4,070	43,367	12%	1.0
TOTAL	5,607	1,755	180	44,573	474,721	12%	1.0
Note: The forecasted participant counts and savings are an estimate at the time of writing.							

To complement the LiveSmart BC partnership, the Companies are also working with BC Hydro and FortisBC Inc. to develop a Home Energy Efficiency online portal that will provide a One Stop Rebate shop, information, and online tools that promote home energy efficiency retrofits.

LiveSmart BC partners are also jointly funding energy modeling studies to support the residential retrofit market. These studies include energy modeling to ensure common archetypes were used in LiveSmart BC cost benefit tests, a survey of existing residential housing stock to determine energy usage for various segments of electric and gas heated homes, research into Hot 2000 modeling to provide NRCan with verified energy savings based on regional consumption data, and initiatives to define Hot 2000 standard operating conditions for the province. LiveSmart BC partners are also working collaboratively to develop programs to train and engage contractors in promoting energy efficiency (Please refer to Section 11.2.2).

In February 2011, the LiveSmart BC program also began encouraging reduced energy consumption among small commercial customers. The Companies are working with the Ministry of Energy and Mines to elaborate a framework for collaboration on the delivery of incentives to reduce natural gas consumption. Program design is in the initial stages and has not yet been completed, nor have specific objectives been established. The initial proposal is centred on the Ministry providing "Top-up" incentives to the Companies' current product rebate offerings. The Companies will continue to work with the Ministry of Energy and Mines to finalize a detailed strategy to encourage reduced natural gas consumption among small businesses.

The LiveSmart BC program, which is a collaboration between the Ministry of Energy and Mines, FEI, FEVI, FortisBC, and BC Hydro, provides significant customer value in engaging BC households and small businesses in energy efficient retrofits. Through shared resources and administrative support by the Ministry of Energy and Mines, British Columbians can participate in a cost-effective program that serve the greater good of the energy needs of the province by supporting retrofits and their associated GHG emissions reductions.

7.4.2.2 Water and Energy Efficient Appliance Programs

7.4.2.2.1 ENERGYSTAR® Elite Tier 4 Washer Program Overview

Water and Energy Efficient Appliance Programs	
Target Audience	Residential Retrofit Customers
Duration	2010 - FortisBC Inc.: June 15 - Aug 15, 2010 2011 - FortisBC Inc.: Apr 1 - Dec 31, 2011 2011 - BC Hydro: Apr 1 - Dec 31, 2011
Incentive	2010 - FortisBC Inc.: $50 rebate per Tier 3 ENERGY STAR® clothes washer 2011 - BC Hydro and FortisBC Inc: $75 rebate per Tier 4 ENERGY STAR® clothes washer

Partners	FortisBC Inc. and BC Hydro
Background	
Background	Promoting the most energy and water efficient appliances is an important part of the EEC domestic hot water strategy. To do so most effectively, we are partnering with electric utilities, BC Hydro and FortisBC Inc., to extend the reach of the 2011 ENERGY STAR® appliance program to homes with natural gas water heaters. Clothes washers consume as much as 5-7 GJs/yr, representing 22% of residential DHW use (CPR, 2010). Qualifying ENERGY STAR® clothes washers use less energy and consume 35% to 50% less water than qualified washers made before January 1, 2007[37]. To encourage the most energy and water efficient models, the ENERGY STAR® brand has continuously improved their guidelines. The Modified Energy Factor ("MEF") is the current energy efficiency measure for all clothes washers, while the Water Factor ("WF") measures the water efficiency in gallons. The most energy and water efficient models will have the highest MEF value and the lowest WF rating. As a result of the 2011 ENERGY STAR® requirements, the majority of qualifying models will be front loading, which use less hot water, less mechanical energy, and result in dryer energy savings due to faster spin cycle speeds (CPR, 2010). Tier 4 is the Consortium of Energy Efficiency's highest energy efficiency designation for the most energy and water efficient models available in the marketplace. Qualifying Tier 4 clothes washers must have a minimum MEF $\geq$ 2.4 and a maximum WF < 4.0. Tier 4 models far exceed the 2011 ENERGY STAR® guidelines. Federal regulations do not require maximum WF ratings for appliances. By effectively educating consumers about the advantages of ENERGY STAR® appliances, the program will provide an opportunity to transform the market and encourage manufacturers to produce energy and water efficient clothes washers that meet or exceed the 2011 ENERGY STAR® requirements. In partnership with the electric utilities, the Companies are able to provide an increased incentive for Tier 4 ENERGY STAR® clothes washers while sharing marketing and administration costs to provide a cost effective program.
Description	In 2009 and 2010 FEI partnered with FortisBC Inc. to provide incentives for Tier 3 ENERGY STAR® clothes washers to extend the reach of their program to homes with natural gas water heaters. As the washing machine market is transforming and ENERGY STAR® base levels are increasing, the 2011 program provides rebates for an elite selection of Tier 4 models with a MEF $\geq$ 2.4 and a maximum WF < 4.0, to continue to positively impact efficiency standards with manufacturers. In 2011, FEI will partner with FortisBC Inc. and BC Hydro in their respective territories to provide a $75 consumer rebate. FEI and FEVI will provide $50 of this rebate for all residents with natural gas water heating.
Goals	• Capture the energy savings associated with promoting the most energy and water efficient ENERGY STAR® clothes washers. • Through utility collaboration, provide a province-wide program for 2011.

[37] 2010 EnerGuide Appliance Directory, NRCan Office of Energy Efficiency as part of ecoENERGY, an ecoACTION initiative.

	• Increase residential customers' knowledge and awareness about energy efficiency and conservation regarding laundry such as: o ENERGY STAR® washers are energy and water efficient; o Cold water wash decreases DHW energy use; and o Hanging clothes to dry decreases electrical energy use.
Implementation	
Administration	Electric utilities - FortisBC Inc. / BC Hydro
Communications	Program promotion through appliance retailers, community events, an online contest, and the Companies' marketing channels.
Evaluation Strategy	Research will be conducted to confirm energy savings claims for natural gas water heating.

7.4.2.2.2 2010 Program Results

As outlined in Table 7-7, based on 130 participants, the program achieved annual gas savings of 210 GJs and a projected 2801 GJs of savings over the lifetime of the measure. The TRC is marginal based on the estimated natural gas savings associated with the Tier 3 washers and relatively low participant numbers.

Table 7-7: FortisBC Inc 2010 ENERGY STAR® Washers Program Summary

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	130	7		210	2,801	10%	0.8

7.4.2.2.3 2011 Program Performance Forecast

In addition to partnering with FortisBC Inc., the Companies will collaborate with BC Hydro's province-wide 2011 ENERGY STAR® appliance program. The program will support the new 2011 ENERGY STAR® requirements through incentives for elite Tier 4 ENERGY STAR® clothes washers with MEF $\geq$ 2.4 and a maximum WF < 4.0. Regardless of the fuel type for DHW, Tier 4 ENERGY STAR® clothes washers will provide both electric and gas savings. FEI and FEVI will contribute $50 of the total $75 incentive for those homes with gas water heaters and the electric utilities will provide the remaining incentives.

Based on the BC Hydro forecast, the Companies expect to contribute to 6,300 residential incentives. Based on the FortisBC Inc. forecast, we expect 1,000 residential incentives. As illustrated in Table 7-8, the program is expected to achieve 20,805 GJs of annual energy savings given a 5 percent free rider rate. The free rider rate is lower for this program compared to the 2010 FortisBC Inc. laundry campaign since the 2011 appliance program supports a higher tier of ENERGY STAR® clothes washers with a lower market penetration.

Table 7-8: 2011 Tier 4 ENERGY STAR® Clothes Washer Program Forecast

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
BC Hydro Partnership							
FEI	5,040	$252,000	$42,000	14,364	124,498	5%	1.0
FEVI	1,260	$63,000	$8,000	3,591	31,124	5%	1.0
FortisBC Inc. Partnership							
FEI	1,000	$50,000	$15,000	2,850	24,702	5%	0.9
Total	7,300	$365,000	$65,000	20,805	180,324	5%	1.0

7.4.2.2.4 Overall Summary

Energy efficient appliances will result in both electric and gas savings regardless of the fuel type of a domestic hot water heater. These front load washers also result in 35-50 percent water savings as a non-energy benefit to the program. Therefore, partnering with FortisBC Inc. and BC Hydro enables the Companies to provide a province-wide program that will effectively educate consumers about the importance of water and energy efficient appliances, while sharing marketing and administration costs for a cost-effective program. With the overall TRC of 1.0, the Companies believe washer efficiency is an important component to the EEC domestic hot water strategy. In addition to natural gas savings, the opportunity to educate customers about hot water conservation and efficient laundry practices provides many benefits to our customers.

7.4.2.3 FortisBC. Water Saver Pilot Program

7.4.2.3.1 Water Saver Pilot Program Overview

FortisBC Water Saver Pilot	
Target Audience	Residential Retrofit Customers
Duration	FEI: Sept 15 – Oct 31, 2010
Incentive	The distribution of free low flow showerheads
Partners	FortisBC Inc, FEI and ClimateSense

Background	
Background	As part of the EEC domestic hot water strategy, FEI collaborated with FortisBC Inc. to distribute free water saving kits within the communities of Castlegar and Kaleden to extend the reach of the Water Saver campaign to those homes with gas water heaters. According to the 2009 FortisBC Inc REUS Study, 37% of FortisBC Inc.'s customers do not have a low flow showerhead and would like to upgrade. The 2010 Conservation Potential Review ("CPR") has identified ultra low flow showerheads as being an important measure for our DSM programs. The showerheads within the water saving kits are not ultra low flow; however, their 1.5 GPM flow rate is comparable to the 1.25 GPM flow rate of an ultra low flow showerhead[38]. We will claim 1.0 GJ of gas savings per installation, a conservative estimate compared to the 2.0 GJ savings of an ultra low flow showerhead as outlined in the 2010 CPR. Both Castlegar and Kaleden were chosen based on their current vulnerability to water shortages due to low snow packs.
Goals	• Distribute 500 low flow showerheads to capture the associated energy savings for homes with gas hot water heaters. • Determine program participation rates and logistics for a 2011 province-wide program. • Increase the presence of EEC programs within rural service territories.
Implementation	
Administration	FortisBC Inc. and ClimateSense
Communications	Promotions included radio advertisements, print ads in community newspapers, the use of social networking sites, and online. Marketing collateral directed applicants to an online survey that captured the participant's space and hot water heating fuel type, number of CFL bulbs within the home, and the current number of low flow showerheads and ENERGY STAR® appliances.
Evaluation Strategy	Energy savings estimates to be confirmed through sub-metering projects.

7.4.2.3.2 2010 Results

Based on post survey results, the Water Saver program was well received within the small communities of Castlegar and Kaleden, and achieved a TRC ratio of 2.0. In total, both utilities distributed 1,000 low flow showerheads to promote hot water conservation while capturing significant energy savings.

[38] 2010 FEI/ FEVI Conservation Potential Review.

Table 7-9: 2010 Water Saver Program Results

Utility	Participants	Incentive Expenditure ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/Yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	500	7	7	420	2,899	16%	2.0

The program was successful in achieving its main objectives to distribute free low flow showerheads and to capture the associated energy savings. As outlined in Table 7-9 above, the program is expected to capture 420 GJs of annual energy savings and 2,899 GJs of savings over the lifetime of the measure. Based on post program survey results, 20 percent of participants had at least one low flow showerhead; however, these may be traditional low flow showerheads, which are less efficient fixtures than provided within the water saver kit[39]. As a result, a free rider rate of 16 percent was used for economic analysis. In 2011, the low flow showerhead measure will be incorporated into the Simple Home Efficiency Measures program for easy to install energy efficient upgrades within the home (Please refer to Section 3.4.3.1).

7.4.2.3.3 Overall Summary

The Water Saver campaign achieved its objectives in offering EEC activities within rural service territories while capturing the energy savings associated with low flow showerheads. In total, 1,000 water saver kits were distributed to residents within two communities that are particularly vulnerable to water shortages. The program was well received by the public since the showerheads were easy to install and the online application procedure was simple. In 2011, ultra low flow showerheads will be one of the measures in the Simple Home Efficiency Measures program since there are significant energy and water conservation benefits associated with this measure.

7.5 Summary

Joint Initiative programs provide numerous mutually beneficial advantages to all partners in the collaboration, and their customers. In working together, utilities and government partners can engage in more programs, extend the reach of incentives, provide cost-effective education and outreach, and generate even greater energy savings and GHG emissions reductions. Based on 2010 successes, the Companies are expanding their Joint Initiative projects in 2011 across all program areas, and in so doing, will provide a more robust energy efficiency program offering to the residents of British Columbia.

[39] 2010 FEI / FEVI Conservation Potential Review.

8 CONSERVATION, EDUCATION & OUTREACH (“CEO”) PROGRAMS

8.1 Overview

The Conservation Education and Outreach (“CEO”) program was designed to include general conservation and non-program specific communications. CEO initiatives support the EEC’s portfolio goals of energy conservation and GHG emissions reduction established by the Government of BC. This program area is also intended to foster and develop a culture of conservation within the province by educating customers about changing their mindset and behaviours in regards to conserving energy. The goal of these initiatives is to ensure customers learn about taking small steps towards energy conservation and that customers will be receptive to incentive programs when they are proposed. This section describes the principles behind the CEO initiatives, evaluation methods, 2010 initiatives by customer group, and programs in development for 2011.

8.1.1 DEVELOPING ENGAGING CEO INITIATIVES

In designing the CEO program area, the Companies were, according to the EEC Decision and Order G-36-09 (see page 21) in Appendix C, directed to review the CEO program area with a view to “altering the program to allocate funds away from the mass media campaign and to include other initiatives, with particular attention paid to conservation education within the school system and affordable housing initiatives.” In addition, as per section 44.1 (8) (c) of the *Utilities Commission Act*, R.S.B.C 1996, c.473, s.125.1 (4) (e), a public utility’s plan portfolio is adequate only if it includes an education program for students enrolled in the public utility’s service area. Furthermore, CEO initiatives follow many of the same program principles that were put forth in the EEC application, in particular:

- Programs will have a goal of universality; offering access to energy efficiency and conservation for all residential and commercial customers, including low income customers through the Conservation for Affordable Housing initiative;
- Where possible, programs will be uniform across the service territories of the Companies, so customers will have equal participation opportunity; and
- Programs will be multi-year to create a sense of funding certainty necessary to effectively implement them in the marketplace.

Lastly, CEO activities include a diverse range of initiatives targeting various customer groups. The Companies consider many factors before settling on the right initiatives to pursue. These include, but are not limited to:

- Potential participant reach;
- Geographic spread across FEI and FEVI service territories;
- Demographics of event attendees;

- Media involvement such as print, online, radio, in-person, cooperative advertising, social media, or a combination thereof;
- Engagement level with customers that is activity-based vs. partnerships with third parties; and
- Reaching various customer groups such as children/students, residential customers, small businesses, large commercial/institutional customers, property managers for multifamily homes, low income customers, municipalities, and the general public.

The CEO initiatives undertaken in 2010 include very little mass media; instead, they target individual customer groups in consideration of that group's specific needs and include direct engagement and interaction with residential and commercial customers and students. Many of the initiatives are a continuation from 2009 since the development of several initiatives began that year. Table 8-1 provides a summary of the 2010 CEO initiatives that are active and in development in FEI and FEVI by customer groups. Table 8-2 summarizes the 2010 costs for the CEO program area. Much of the CEO funds in 2010 were spent on developing programs and messages to engage with residential customers and the general public. Conservation education programs are still in development stages for commercial and low income customers, and additional CEO programs are being developed for students and schools.

Table 8-1: Summary of 2010 CEO Initiatives

Program	Utility		Description	TRC	
	FEI	FEVI		FEI	FEVI
Active Programs					
Residential and General Public	X	X	Energy conservation education promoted through bill inserts, newspaper and magazine advertising, trade show guides, newsletters, directories, home shows, regional Canadian Home Builders' Association programs, ethnic material development, sports energy savings promotions, EEC Community Outreach, and employee outreach.	N/A	N/A
Commercial Customers	X	X	Energy conservation education promoted through newspaper and magazine advertising, trade show guides, newsletters, directories, trade shows, and seminars.	N/A	N/A
Conservation for Affordable Housing	X	X	Energy conservation education promoted through partnership with CHBA BC for Housing Affordability Symposium.	N/A	N/A
School Outreach	X	X	Various K-12 programs, competitions, and curriculum development educating students on energy conservation and providing resource materials to teachers.	N/A	N/A
Programs in Development					
Residential and Conservation for Affordable Housing Customers: Ethnic Outreach	X	X	Development of print and online materials for ethnic markets and develop partnerships with third party service providers for distribution and promotional channels.	N/A	N/A
Residential and General Public: Home Efficiency Measures Partnerships (Pilot Programs)	X	X	Efficient low-cost fixtures for programs for residential and multifamily customers leveraging on channels such as school programs, property management associations, and partnerships with municipalities, regional districts, and big box retailers.	N/A	N/A
Residential and General Public: New Construction Industry	X	X	Education, training sessions, and collateral development for builders/developers, showroom staff and salespeople, real estate, and home appraisal industries on high efficient gas appliances and home efficiency measures.	N/A	N/A
Commercial: Small Commercial Businesses Education Sessions	X	X	Education sessions with small businesses on energy conservation measures and related available resources.	N/A	N/A
Commercial: Health Authority Staff Engagement Pilot Program	X	X	Development of an online community site for health authority staff to learn about energy conservation actions they can take at work and home.	N/A	N/A
Conservation for Affordable Housing: BC Housing Tenant Engagement Pilot Program	X		Engage with BC Housing tenants in two Metro Vancouver sites through education on conservation behaviour relating to heat and hot water reductions.	N/A	N/A
School Outreach: BC Sustainable Energy Association	X	X	Educational workshops for elementary students on reducing C02 emissions and saving energy in the home and at school around the province.	N/A	N/A
School Outreach: Environmental Mind Grind	X	X	Student trivia competition on energy and environmental conservation for K-12 students around the province.	N/A	N/A
School Outreach: Post Secondary Program	X	X	Reviewing proposals from vendors such as GoBeyond, and looking into hiring an external consultant to develop and implement a CEO program.	N/A	N/A

Table 8-2: Summary of 2010 CEO Costs

	Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
CEO Portfolio Administration	$28	$4	$32	N/A	N/A	N/A	N/A	N/A
Residential and General Public Education and Outreach	$975	$143	$1,118	N/A	N/A	N/A	N/A	N/A
Commercial Customers Education and Outreach	$285	$28	$313	N/A	N/A	N/A	N/A	N/A
Conservation for Affordable Housing Education and Outreach	$8	$2	$10	N/A	N/A	N/A	N/A	N/A
School Outreach	$119	$24	$143	N/A	N/A	N/A	N/A	N/A
Total	$1,415	$201	$1,616	N/A	N/A	N/A	N/A	N/A

8.1.2 EVALUATION OF CEO INITIATIVES

CEO initiatives are not individually run through the California Standards Tests at a program level and do not have any energy savings directly associated with them; however, costs are included at the portfolio level in the overall EEC portfolio TRC. As several new CEO initiatives have been introduced into the portfolio, it has become increasingly important to evaluate the cost effectiveness of CEO initiatives in order to justify the expenditures associated with these activities. Possible methods to evaluate the effectiveness of CEO initiatives include advertising tracking, process evaluation, and web analytics; however, the specific method will be dependent on the type of CEO initiative implemented.

Advertising tracking can investigate the effectiveness of particular commercials or campaigns in terms of the recall of specific messages, changes in people's perceptions, and behavioural changes in the target audience.

Process evaluations measure the effectiveness of the program by assessing how well the program met a set of goals or metrics defined by the program administrators. This method has been used by other utilities and American state agencies such as Southern California Edison and Pacific Gas & Electric.

Examples of goals/metrics for educational and communication programs include:

- Increase student awareness of the relationship between energy and the environment; and
- Deliver at least two special events annually, during which the public is exposed to specific key messages and provided with information and materials.

Example of techniques used to assess whether goals/metrics are met include:

- Interviews with program staff;
- Survey of program participants and qualitative analysis of responses; and
- Focus groups of program participants.

Web analytics is the quantitative measurement of the relationship between visitors and a website. Simply put, web analytics is the process of understanding the Companies' online presence so that it can be optimized. The Companies work with Adobe Online Marketing Suite

Sitecatalyst, a remotely hosted, subscription-based solution for real-time website reporting and analysis. Codes are placed on web pages that execute when the page loads. As the page loads and the code on the page executes, a request is sent to the Sitecatalyst server for a web beacon, which is a two-by-two transparent pixel image. Along with this image request, the code collects and sends additional information to Adobe Online Marketing data centres. The data centres then populate a report with the collected data, which can be accessed by the Companies' web team, to allow them to analyze the web activity related to a specific CEO initiative.

For certain initiatives, such as event surveying, the Companies will hire an external research firm, relying on their particular methodology to complete the analysis. The Companies will also rely on the method recommended by an independent research firm depending on the CEO initiative. Modifications to improve the initiatives can take place after one or more of these forms of evaluation have been completed.

8.2 2010 CEO Initiatives by Customer Group

The activities that make up the CEO initiatives are designed to create and promote awareness, and educate the public on energy conservation. By encouraging customers to take small steps towards energy conservation with simple and low-cost behaviours, the Companies hope customers will later adopt or adjust their own conservation beliefs and install high efficient equipment through participation in our other EEC incentive programs. The CEO activities for 2010 are described in further detail below and grouped according to the following customer groups: residential customers, commercial customers, conservation for affordable housing customers, and schools.

8.2.1 RESIDENTIAL CUSTOMERS

With over 850,000 residential customers, it is vital for the Companies to provide them with energy saving information. This section outlines how CEO initiatives educate residential customers on conservation behaviours. It is the Companies' view that by providing education on behavioural changes, including low cost and no cost actions, this knowledge will assist customers to reduce their consumption and encourage them to pursue further efficiencies by participating in EEC incentive programs. According to the 2010 Customer Satisfaction Study conducted by TNS, three attributes were found to be key drivers of customer satisfaction with the conservation education provided by the Companies. These key drivers received an average or below average rating from participants.

- Provides information that helps customers use natural gas efficiently;
- Offers rebates for energy efficiency upgrades; and
- Is environmentally responsible.

Through the various EEC initiatives, the Companies will be able to meet customers' expectations about keeping energy costs within their budget through energy conservation education. It is important for the Companies to consider several diverse media channels in an attempt to reach the majority of residential customers. Energy conservation education is promoted through a variety of means, which have been grouped into five methods: print and online channels, home shows and events, the Energy Champion program, community outreach at community events, and via the Companies' employees. Below is a detailed description of each method.

8.2.1.1 Print and Online

Print and online publications are a cost-effective communications channel for delivery of information when compared to other communication channels such as television and mass media. The goal of the CEO program's print and online publications is to continually inform customers about various low-cost and no-cost behaviour changes they can adopt at home to reduce their energy consumption. In 2010, the Companies continued to provide information through customer bill inserts, print and online advertising in The Vancouver Sun's At Home section and community newspapers, and the Canadian Home Builders' Association's ("CHBA") publications, brochures, and ethnic material. The CEO program is also funding half the cost of a bill insert and bill message research study conducted by TNS Canadian Facts, with other departments in the Companies funding the other half. The purpose of this study is to determine readership levels, understand if certain messages garner more attention from readers than other messages, and the type of information desired by our customers. The primary targets for the study are residential and small commercial (i.e. Rates 2 and 3) customers, which are key audiences for EEC programs. The research firm, TNS, will test three waves of bill inserts through phone surveys. The study began in Q4 2010 and will be completed by Q2 2011.

8.2.1.2 Home Shows

Home shows remain an effective way to reach customers by creating opportunities for dialogue with customers on energy conservation. Based on the increasing number of customer inquiries regarding conservation, efficient technologies, and retrofit incentive programs from these events, the Companies strongly believe participation in home shows is an essential channel for educating customers about CEO initiatives and EEC programs.

The Companies have exhibited in home shows since 2006 and continued home show activity in 2010 by participating in home shows and CHBA events. The CHBA's regional branches represent the BC residential construction industry, and they liaise with local governments, promote the interests of housing and renovation consumers, and work to ensure a fair marketplace. In 2010, the Companies attended generally the same shows as the previous year and were in direct contact with over 35,000 residential attendees. The majority of the attendees at these home shows are homeowners specifically looking for home renovation and equipment upgrade information. Depending on the size, each show's total attendance can range from 5,000 to 45,000. For a complete list of 2010 home shows, please refer to Appendix E.

8.2.1.3 Energy Champion Program

The Energy Champion Program is a new initiative launched in Q4 2009 that continued into 2010, and is executed through partnerships with local sports teams such as the BC Lions, Vancouver Giants, BC Hockey League, and the Vancouver Canucks. The goal of this program is to educate children, youth, and the general public on energy conservation behaviour in a fun and rewarding manner, through a variety of methods including online competitions, face-to-face interactions, and pre and in-game activities. The activities with each sports team will differ slightly due to their own regulations and game formats. These activities are summarized in Table 8-3.

Table 8-3: Summary of CEO Energy Champion Promotions

Partnership	Description	Channel
BC Lions	Kids answer an energy conservation related question on bclions.com to enter to win tickets to a home game. One prize per BC Lions home game.	Online promotion on bclions.com
	Participants complete a race; they put on a sweater and run through a challenge course.	In game promotion
Vancouver Canucks	Individuals enter pictures of their ugliest sweater to win a pair of tickets to a Canucks game.	Online promotion on canucks.com
	Kids answer an energy conservation related question on canucks.com to enter to win a prize pack, including four tickets to Canucks Superskills.	Online promotion on canucks.com
	Sponsored in-game activation skill challenge - "Breakaway Relay."	In game promotion
Vancouver Giants	Kids answer an energy conservation related question on vancouvergiants.com to enter to win tickets to a Vancouver Giants home game.	Online promotion on vancouvergiants.com
BC Hockey League	In game and on-ice intermission activities and giveaways to promote energy conservation.	In game promotion

Partnering with regional sports clubs is an excellent way to reach out to families and the general public by raising the profile of our EEC programs and building up the Companies' conservation messaging. Sports fans are generally loyal and highly engaged with teams they identify with and support. These partnerships enable the Companies to leverage traditional media channels, such as television and radio, as well as the sports teams' online and social media channels. Because these channels are well developed in the market and have the ability to reach out to a large number of the teams' fans, they provide the Companies with easy and immediate access to an already engaged public audience. For instance, the Vancouver Canucks website obtained an average of 935,454 unique visitors per month over the course of 12 months; furthermore, they have over 154,016 Facebook fans and 26,365 Twitter followers.

As the Energy Champion program is still in progress, the Companies are in various stages of evaluating the program with the various sports teams. As summarized in Table 8-3, the Energy Champion program generally includes both in game and online web promotions. Web promotions can be easily tracked through web analytics on page views and contest signups via the sport team's website and the Companies' website. For a list of web analytics from the first year promotions with the sports teams, refer to Table 8-4. Since this was the first year for the Energy Champion program, there are opportunities to improve promotions in 2011.

Table 8-4: Web Analytics Comparing Various 2010 Energy Champion Promotions

BC Lions 2010 Season	Month	# Entries/Month	Lions Contest Page Views	Companies' Energy Champion # Page Views
Energy Champion Kids Promotion	Jun	15	282	38
	Jul	40	238	72
	Aug	35	141	56
	Sept	35	154	54

	Oct	35	125	119
	Nov	20	110	305
	Dec	14	10	262

In 2010, the Companies also conducted a field intercept survey on our partnership with the BC Lions. Although the study had a small sample size, it provided insight into improvements that can be made to the program for delivery in 2011. The survey recommends employing a multi-channel approach to reinforce the Companies' messaging that includes the use of a media relations campaign, pre-game radio spots, video screen airtime, and a physical takeaway linked back to a website with contests that can be promoted through social media. Also, the results suggest the activities should engage in the crowd mentality and that taking advantage of the family section of the stadium would be beneficial. These insights are useful for the Energy Champion program as a whole, as many of the elements can be applied to activities with the other sports teams.

8.2.1.4 EEC Community Outreach

The EEC Community Outreach group was first launched in 2007, and similar to BC Hydro's PowerSmart Outreach Team, it is a grassroots channel for delivering the Companies' EEC messages. It connects with the Companies' customers through educational and interactive activities based at local community events. In 2010, the Companies attended additional events when compared to 2009 such as the Lonsdale Party on the Pier in North Vancouver, Sapperton Day in New Westminster, and several sporting events through the Vancouver Canucks and various BCHL games, and were in direct contact with at least 36,000 residential customers and the general public.

These community events generally attract a large audience as most of the events are free for the public to attend and take place in urban centres, with close proximity to residential neighbourhoods. These outreach activities have proven to be a cost-effective method of engaging a large group of the Companies' customers through a simple trivia activity and by distributing information and tools to further educate them about conservation in the home. Also, these attendees would not normally attend home shows and sporting events, so these community events allow more customers to put a "face" to the Companies and learn about energy conservation. Additional opportunities existed for the Community Outreach group to bring energy education right into several large organizations, in particular those with a staff of over 200 during lunchtime "energy fairs", as many of the employees are also residential customers. Some of the organizations visited include the City of Coquitlam, SAP Canada, and WorkSafe BC. Both the community events and the energy fairs contribute to the Companies' goal of building a culture of conservation. Refer to Appendix E for a complete list of events and organizations attended in 2010.

8.2.1.5 Employee Education

The Companies employ approximately 1,500 individuals, many of whom are themselves customers and many of whom regularly interact with customers. The goal of the Employee Education program is to create a large group of "EEC ambassadors" within the Companies who promote EEC programs and initiatives by discussing them during their dealings with the public and when interacting with their personal network.

The EEC department has traditionally communicated EEC initiatives and incentive programs to employees via the Companies' intranet and newsletters, and specific training for the call centre and field staff. In 2010, an outreach team also visited 12 office and muster locations to introduce the new EEC initiatives and programs, identify key communication channels, and identify "green ambassadors". With the rapid expansion of the EEC initiatives, it is necessary to provide the Companies' employees with continual education on all EEC programs, incentives, and local

CEO activities being implemented. In 2011, the EEC team will continue to liaise with the "green ambassadors" to inform them of new programs and initiatives.

In summary, educating residential customers and the general public on energy conservation is strongly aligned with the CEO program area's goal of building a culture of conservation in BC and it is vital to promote the related programs and initiatives through a variety of communication methods including print, interactive, and face-to-face.

8.2.2 COMMERCIAL CUSTOMERS

It is imperative that the Companies provide energy saving information to commercial customers, as they have a great potential to reduce their energy consumption. This section outlines how CEO programs educate commercial customers on conservation behaviours. It is the Companies' view that providing education on behavioural changes helps commercial customers reduce their organization's energy consumption and encourages them to pursue additional efficiencies by participating in EEC incentive programs. The commercial sector is made up of small and large businesses in a variety of industries, such as retail, offices, multifamily residences, schools, hospitals, and shopping malls, to name a few.

According to the 2010 Customer Satisfaction Study conducted by TNS, the corporate image attribute of being "committed to helping customers" is an important driver of satisfaction for small and large commercial customers. Through the various EEC initiatives, the Companies will be able to meet customers' expectations by providing increased EEC education and program information to help them reduce their organization's energy costs. This may have the potential to indirectly impact future customer satisfaction studies.

It is important for the Companies to consider a variety of media communication tools and distribution channels, and it is a goal of the CEO program to reach the diverse group of businesses in the Companies' commercial sector. In this section, energy conservation education is grouped and described according to three communication channels: print and online publications, industry trade shows and association events, and corporate behaviour change pilot programs.

8.2.2.1 Print and Online

Print and online publications are a cost-effective communications channel for delivery of industry targeted information when compared to other communication channels such as television and mass media. The goal of the CEO print and online publications is to provide ongoing communication to commercial customers about the Companies' energy conservation initiatives. In 2010, the Companies continued to provide information through energy saving handouts and bill inserts for small commercial customers and various print and directory advertising such as show guides and property management directories. In addition, the CEO program area is co-funding, along with other departments in the Companies, a bill insert and bill messaging research study conducted by TNS. The purpose of this study is to determine readership levels, understand if certain messages garner more attention from readers than other messages, and the type of information desired by our customers. The primary targets for the study are residential and small commercial (i.e. Rates 2 and 3) customers who are also the key audiences for EEC programs. The research firm, TNS, are testing three waves of bill inserts through phone surveys. The study began in Q4 2010 and will be completed by Q2 2011.

8.2.2.2 Trade Shows and Association Events

Industry trade shows and association events remain an effective way to reach commercial customers by targeting key decision makers and identifying energy savings opportunities they can consider for the businesses they represent. Based on the increasing number of customer inquiries and requests for funding, the Companies strongly believe that participation in trade shows is an essential channel for educating key decision makers about available CEO educational, behavioural, and incentive programs. Participation in association events, such as the Business Improvement Association of BC's regional meetings, Rental Owners and Managers Society of BC tradeshow, and BC Hydro PowerSmart Forum, provides the Companies with an opportunity to promote CEO education and EEC incentive programs to both small businesses and large commercial customers. In 2010, the Companies attended generally the same shows as the previous year and were in direct contact with over 1,500 key decision makers. For a complete list of 2010 trade shows, please refer to Appendix E.

8.2.2.3 Behaviour Change Programs

Under the BC Climate Action Charter, several municipalities (i.e. the Companies' commercial customers) have committed to becoming carbon neutral by 2012. In their dealings with some commercial, institutional, and municipal customers, the Companies have received anecdotal indications that since these customers are strapped for financial resources, they have to focus on low cost behaviour adjustments in their efforts to reduce energy costs within their facilities. As a result, the Companies are currently piloting behaviour change programs for commercial and municipal customers, due in large part to customer demand. The goal of the behaviour change pilot programs is to develop a successful program design and then expand to other large commercial and public organizations. Behavioural changes are currently not incorporated into the Companies' savings portfolio because of the difficulty tracking results from individual actions; however, in the two pilot programs described below, they have both included a benchmark in an attempt to measure any changes in behaviour.

Behaviour change programs, also known as community based social marketing, look to identify the barriers to behaviour change, design a strategy utilizing behaviour change tools, and then implement that strategy. The benefits of implementing a behaviour change program include understanding the psychological and motivational aspects of human behaviour in decision-making, and the power of community and peer influence to develop an engagement strategy that may have a longer-lasting impact than traditional mass media campaigns. Another foundational element of behaviour change is that people tend to adjust their behaviours so as to create consistency through all aspects of their lifestyle. For instance, an individual who learns through CEO programs to conserve energy at work is plausibly more likely to transfer those energy saving behaviours to the home (or vice versa). Below is a description of two behaviour pilot programs that began in 2010: Destination Conservation for Public Buildings and Health Authority Staff Engagement.

8.2.2.3.1 Destination Conservation for Public Buildings Pilot Program

In 2010, a behaviour change pilot program was launched to a group of five South Okanagan organizations: the Regional District Okanagan Similkameen, City of Penticton, District of Summerland, Town of Oliver, and Okanagan College Penticton Campus. The goal of the one year pilot program is to test the program with public buildings. If energy savings reductions are achieved through benchmarking and tracking surveys, the Companies will provide this program as an additional EEC service offering to other municipalities and public organizations. MVS Consulting will first work with various municipal staff, such as senior administration, facilities, community outreach coordinators, and other peer leaders, to perform energy audits of the facilities for benchmarking purposes. Second, MVS Consulting will develop an employee engagement strategy to determine if both low cost/no cost efficiency improvements and behavioural changes from staff will bring about energy reductions in municipal office facilities. The Companies co-funded the program with FortisBC Inc.

8.2.2.3.2 Health Authority Staff Engagement Pilot Program

The development of an online community site for health authority employees that promotes energy conservation actions for work and home began in 2010. The goal of this initiative is to pilot an online community site and develop an extensive employee engagement strategy that can eventually be implemented by other health authorities and/or large institutional customers. With this tool, the Companies hope to investigate the attribution of energy savings to this behavioural program thus potentially providing a benchmark for capturing energy savings from other education and outreach activities.

The target audience for this program began with the Vancouver Coastal Health Authority and Providence Health Care with a combined total of approximately 28,000 employees; however, it has now been extended to include Fraser Health Authority, Providence Health Care, and Provincial Health Services Authority, which could bring on an additional audience of 32,000 full time employees, part-time employees, volunteers, and contracted employees. The program for the four health authorities is set to launch in March 2011. As the Companies have minimal experience in developing a large scale employee engagement program, an external consultant, Resilient Group, has been hired to build capacity and knowledge within the EEC group about social marketing and its role in large-scale employee engagement initiatives. Much of the costs of the program, in particular the site development and engagement plan are one-time costs. The ongoing marketing campaigns will encourage participants to learn about energy conservation, make social commitments towards behavioural changes, and take action to reduce GHG emissions at work and in the home.

By providing education to commercial customers, these pilot programs are aligned with the CEO program area's goal of building a culture of conservation in BC. Behaviour change programs are difficult to measure through traditional economic tests; however, it is vital to include them and devise a benchmarking method in the CEO program area as a result of customer demand.

8.2.3 CONSERVATION FOR AFFORDABLE HOUSING

As indicated in the EEC Decision, the Companies were directed to review the CEO program area with a view to "altering the program to allocate funds away from the mass media campaign, and to include other initiatives, with particular attention paid to... affordable housing initiatives." With approximately 20 percent of the Companies' customers coming from the low income sector, support within the CEO program area for the Conservation for Affordable Housing program started developing in late 2010. The Companies supported the first BC Housing Affordability Symposium with funding. Education, including print and online advertising, ethnic material development, and outreach and engagement efforts, will be further developed in 2011 to complement the initiatives in the Conservation for Affordable Housing program area.

8.2.4 SCHOOL OUTREACH

The EEC portfolio is aligned with section 44.1 (8) (c) of the Utilities Commission Act, R.S.B.C 1996, c.473, s.125.1 (4) (e), a public utility's plan portfolio is adequate only if it includes an education program for students enrolled in schools in the Companies' service area. This section outlines how the CEO program area supported various school programs in 2010. It is the Companies' view that funding multi-year school programs will build a strong foundation for a culture of conservation in BC through consistent curricula. The goal of the Companies' school outreach activities is to educate K-12 students on natural gas and how gas fits into the province's energy picture as a first step in informing students about energy conservation. By reaching out to students, the Companies are instilling conservation knowledge early in the life of our future customers. As school programs generally run over the September to June time period, some programs in 2010 started the year previous, while others are continuing into 2011.

Table 8-5 summarizes the school programs that the Companies are currently supporting:

Table 8-5: Summary of School Programs, 2009-2010 and 2010-2011 School Years

School Program	School Year
BC Green Games	2009-2010 and 2010-2011
BC Lions Energy Champion School Assembly Presentations	2009-2010 and 2010-2011
Beyond Recycling	2009-2010 and 2010-2011
Destination Conservation	2009-2010 and 2010-2011

Below describes in detail the four school programs that address the regulation and were directed to elementary and secondary students: BC Green Games, BC Lions Energy Champion School Assembly Presentations, Beyond Recycling, and Destination Conservation.

8.2.4.1 BC Green Games

BC Green Games is a province-wide competition hosted by Science World. The Companies have been co-sponsoring this initiative with BC Hydro since the 2009-2010 school year. By co-sponsoring this initiative, the Companies are able to introduce the concept of natural gas as a resource and the need for energy conservation into the environmental projects developed by students. The Green Games competition requires student teams to submit digital entries of their environmental projects for prizes.

BC Green Games ties into other initiatives such as Destination Conservation and Beyond Recycling by providing a means to showcase team projects that were developed in those programs. Where Destination Conservation and Beyond Recycling successes have been limited to the school or community, BC Green Games provides the social network channel to allow students to learn about initiatives in other schools, learn from their peers, and build on their existing, or new, projects for the next school year.

The 2009-2010 school year saw 94 submissions to the BC Green Games competition from 32 school districts across the province; furthermore, 3,981 votes were cast and over 24,400 website visitors were reached between August 31, 2009 and April 15, 2010. For the 2010-2011 school year, new goals have been set to increase the profile of the BC Green Games across the province, as well as increase the number of energy related projects (20 percent of the total amount) that are submitted. These goals will be achieved through a communication strategy that emphasizes the simplicity of the contest and focuses on strengthening the relationship with local school district champions and mentors. BC Green Games will provide the Companies with a full report at the completion of the competition, including, but not limited to: number of submissions, number and location of schools involved, types of projects, and web analytics.

8.2.4.2 BC Lions Energy Champion School Assembly Presentations

Since the 2008-2009 school year, the Companies have partnered with the BC Lions school program division to deliver interactive and informative presentations on energy and water conservation to elementary schools throughout BC. The goal of this initiative is to develop a program that interacts with students and brings conservation education directly into the schools.

In the 2009-2010 school year, presentations were delivered to 75 elementary schools, successfully reaching over 21,000 students, which is an increase from 50 schools and approximately 14,000 students reached the previous year. Partnering with the BC Lions has been beneficial as the players act as role models in promoting energy conservation and teamwork. Post-presentation surveys with the principals have all shown fairly strong satisfaction with the presentation, players, and props.

The Companies are a title sponsor of the program, with minimal funding provided from Plutonic Power for the 2009-2010 school year. The Companies and BC Lions will continue to partner and deliver this program in the 2010-2011 school year. Refer to Appendix E for a list of the schools that received the presentations.

To summarize the Companies' school outreach initiatives, multi-year school programs have proven beneficial for both teachers and program planners to plan consistent curricula, as well as for students who can work with peers to build on previous project successes; therefore, the CEO program area will continue to fund and expand on the number of initiatives for schools in 2011.

8.2.4.3 Beyond Recycling

The Beyond Recycling program is delivered by Wildsight, a non-profit organization that focuses on biodiversity and healthy human communities in the Columbia region. Beyond Recycling provides students with an understanding of the connection between consumption patterns and environmental impacts. The goal of the Companies' funding of this program is to ensure conservation outreach to schools that may not have otherwise been able to participate in the program.

The program contains lessons in reducing waste and GHG emissions, and the role of natural gas in BC. The lessons also include actions such as students performing home energy audits and conservation pledges. The Companies co-fund the program with Environment Canada's EcoAction Community Funding Program and FortisBC Inc. Feedback on the program has been collected from teachers, students, and program educators and has been incorporated into the 2010-2011 curricula to improve the program. Refer to Appendix E for a list of participating schools in the 2009-2010 and 2010-2011 school years.

8.2.4.4 Destination Conservation

The Pacific Resource Conservation Society's Destination Conservation ("DC") program is a three-year K-12 school program involving students, teachers, and school facilities management staff. The main purpose of the program is to educate schools on ways to reduce the consumption of energy and water and the creation of waste, and motivate schools to participate in energy conservation projects. The Companies' support of a multi-year school program provides stability in planning for teachers and students, allowing them to build upon previous lessons and projects. Feedback has been collected on the program from teachers, students, and program educators and has been incorporated into the 2010-2011 curricula to improve the program. Refer to Appendix E for a list of participating schools in the 2009-2010 and 2010-2011 school years.

8.2.5 SUMMARY OF 2010 CEO INITIATIVES

The CEO initiatives follow many of the same program principles that were put forth in the EEC application. These initiatives are designed to be accessible to all customers, uniformly across FEI and FEVI territories, and are multi-year programs to ensure effective implementation and stability in the marketplace. The objective of CEO initiatives is to support the development of a culture of conservation within British Columbia.

All of the initiatives described throughout this section are continuing into 2011, and are vital in promoting and educating the public on energy conservation behaviours and keeping the Companies' conservation message "top of mind" among customers. The result will be fostering a culture of conservation, which will benefit communities, increase participation in EEC incentive programs, and ultimately support shared goals of the Companies and province.

8.3 2011 CEO Programs and Initiatives

All of the initiatives described in the previous section are continuing into 2011 in the proposed budget shown in Table 8-6, as they have proven to be vital in promoting and educating the public on energy conservation behaviours and in fostering a culture of conservation.

Table 8-6: Summary of CEO 2011 Proposed Budget

	Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
CEO Portfolio Administration	$100	$38	$138	N/A	N/A	N/A	N/A	N/A
Residential and General Public Education and Outreach	$1,500	$275	$1,775	N/A	N/A	N/A	N/A	N/A
Commercial Customers Education and Outreach	$700	$200	$900	N/A	N/A	N/A	N/A	N/A
Conservation for Affordable Housing Education and Outreach	$200	$55	$255	N/A	N/A	N/A	N/A	N/A
School Outreach	$390	$80	$470	N/A	N/A	N/A	N/A	N/A
Total	$2,890	$648	$3,538	N/A	N/A	N/A	N/A	N/A

However, as the CEO program area is still developing, there are several new projects to develop and launch among the different customer groups. This section describes the new, or expanded, opportunities in 2011 such as ethnic outreach, community outreach expansion, home efficiency measures partnerships, Pacific National Exhibition prize home showcase, construction and real estate industry education, education seminars for small businesses, conservation for affordable housing outreach, and post secondary programs.

8.3.1 RESIDENTIAL AND GENERAL PUBLIC EDUCATION

8.3.1.1 Long Term and Event Tracking Research Studies

As indicated in Section 8.2.1, the various EEC initiatives have the potential to raise the Companies' level of customer satisfaction by meeting customers' expectations of keeping energy costs within their budget. In 2011, the CEO program area is developing two research studies for long term tracking and event tracking. The purpose of the Long Term Tracking Study is to track awareness levels for EEC messaging and programs over time among the general public and ethnic audiences, as well as to measure message retention and determine which campaigns/initiatives are most effective at reaching broad audiences. The study will also provide recommendations on opportunities to increase awareness of EEC initiatives. The purpose of the Event Tracking Study is to determine the success of the overall approach (event attendance and/or sports team partnerships along with an online contest) for raising awareness about energy conservation. This study will help the CEO program area ensure effective event and sponsorship selection, as well as indicate how the Companies can increase participation, awareness, and conservation while building positive brand recognition when developing future programs and initiatives. The studies will begin in Q2 2011.

8.3.1.2 Ethnic Outreach

British Columbia is a culturally diverse province, and a successful EEC portfolio will be aware of the unique needs of ethnic groups. The ethnic marketing and communications outreach campaign that began development in 2010 will grow further in 2011. To ensure conservation education is accessible to all customers, the Companies will create print and online materials for ethnic markets and develop partnerships with third party service providers for distribution and promotional channels. New Canadians – primarily coming from China (23 percent), India, the Philippines and South Korea[40] – are a main source of population growth and housing demand in British Columbia. Within six months of arrival, 17 percent of new immigrants in the Metro Vancouver region are homeowners, while more than half are homeowners after four years. Statistics show that 17 percent of British Columbians do not speak English in their homes as a primary language and approximately 27 percent have knowledge of a mother tongue other than English[41]. Thus, it is important to communicate conservation information that is relevant and easily understood by these ethnic audiences.

8.3.1.3 Community Outreach Expansion

As described in Section 8.2.1.4, most community events are free to the public and are a cost effective method for the Companies to reach out to a large number of customers. In 2011, the goal for the Outreach Team is to increase the number of events attended in the service territories of FEI and FEVI and expand the geographic scope of events attended beyond the Lower Mainland.

8.3.1.4 Home Efficiency Measures Partnerships

As discussed in Section 3 Residential Energy Efficiency Programs, the CPR has identified some efficient, low-cost fixtures that homeowners can easily take advantage of in order to achieve energy savings. One of the 2011 goals for the CEO program area is to identify outreach opportunities for delivering a program to residential and multifamily customers that allows them to learn about and take advantage of these energy savings measures. There may be the potential to leverage opportunities for program dissemination through property management associations and students in secondary and post secondary schools, and partnerships with municipalities (i.e. the District of Saanich pilot program) and big box retailers (i.e. the Sears audit program).

---

[40] http://www.cmhc-schl.gc.ca/odpub/pdf/65319.pdf?fr=1296674608594
[41] http://www.bcstats.gov.bc.ca/data/cen06/facts/cff0604.pdf

8.3.1.4.1 *District of Saanich Low Flow Water and Weatherization Pilot Program*

This program is an opportunity to partner with the District of Saanich and the Capital Regional District in delivering a low flow water and weatherization pilot program for residential customers that are hooked up to natural gas. The goal of this program is to pilot direct installations of low flow showerheads, kitchen faucet aerators, and bathroom faucet aerators in partnership with a municipality and/or the regional district to promote both hot and municipal water savings and energy savings. If successful, the program will be extended to other municipalities. City Green is the service provider and will be administering, marketing, and delivering the program to the residents of Saanich, as well as reporting on the resulting energy savings. City Green will also be liaising with other municipalities to gauge interest in the program and has already been in discussions with Abbotsford, Qualicum Beach, Chilliwack, and Coquitlam.

8.3.1.4.2 *Sears Home Energy Tune-up Pilot Program*

An opportunity exists with Sears Canada and BC Hydro to pilot a program on a modified home energy audit, product change-out, and consumer education for approximately 500 homes in the Lower Mainland. The goal of this program will be to determine if a simplified home energy evaluation can be used as an effective starting point to encourage the adoption of further and more advanced energy efficiency upgrades and participation in other energy efficiency programs. Partnering with a province-wide big box retailer is also a great opportunity to utilize their communication and distribution channels to reach out to the Companies' customers. Sears will be the service provider for signing up customers, administering, delivering, and reporting on the program. The in-home tune-up will document the statistics of the home, including the approximate efficiency of the appliances, and will include the installation of basic energy saving products such as: low flow faucet aerators, low flow showerheads, pipe insulation, compact fluorescent light bulbs, and electrical power bars. If this program is successful, it can be delivered to other communities within the Companies' service territories.

8.3.1.5 Pacific National Exhibition Prize Home Showcase

An opportunity exists with the Pacific National Exhibition Prize Home at the 17 day summer fair in Vancouver to showcase and provide education regarding high efficient equipment and conservation to the 100,000+ attendees from the Lower Mainland that walk through the prize home annually. The opportunity includes on and off-site presence such as; website promotion, print advertising in newspapers and show guides, signage with efficiency ratings within the prize home, and an onsite presence with the Outreach Team interacting with the attendees.

8.3.1.6 New Construction and Real Estate Industry

As discussed in Section 3 Residential Energy Efficiency Programs, the residential new construction industry is a key influencer group to educate on EEC messages since the installation and end-use of efficient technologies go hand-in-hand. This includes education and training sessions for not only new development showroom staff and salespeople, but also the real estate and home appraisal industries on appliance efficiency ratings, the benefits of efficient natural gas appliances, and other home conservation measures such as low flow showerheads. Marketing materials such as appliance stickers with efficiency ratings, sticker reminders and homeowner packages will also be developed to educate the end user.

The Companies will also continue to support the regional CHBA branches. In 2011, the Companies entered into an agreement with CHBA BC to fund the BC Housing Affordability Symposium as a keynote presentation partner and the Second Annual Built Green™ BC Awards as co-presenter. The main goals of supporting these events are to enhance the Companies' profile in the residential construction industry and increase knowledge of the energy efficiency and conservation rebates and programs available to builders/developers and homeowners.

8.3.2 COMMERCIAL

8.3.2.1 Small Commercial Businesses Education Sessions

Small business customers represent approximately 80,000 customers in the Companies' service territories. As small businesses, they generally have limited financial resources to invest in efficient technologies; however, they are still keen on implementing energy saving measures and behaviours in their businesses. A program is in development to hold education sessions with small businesses that is expected to launch in Q3 and Q4 2011.

8.3.3 CONSERVATION FOR AFFORDABLE HOUSING

8.3.3.1 BC Housing Tenant Engagement Pilot Program

This BC Housing Tenant Engagement pilot program provides the Companies with an education and outreach opportunity to engage with BC Housing tenants in two sites in the Metro Vancouver region. The pilot program design is based on the recognition that significant energy savings can be realised through behaviour-based energy education programs aimed at reducing heat and hot water usage. BC Healthy Communities will be preparing the educational material and implementing the pilot with four main objectives: savings (energy, money, and GHG emissions), community economic development, tenant satisfaction improvement, and development of best practices.

8.3.4 SCHOOL OUTREACH

8.3.4.1 BC Sustainable Energy Association Climate Change Showdown

For the 2010-2011 school year, the Companies' entered into an agreement to support the BC Sustainable Energy Association's ("BCSEA") Climate Change Showdown program with funding. The goal of the program is to educate elementary school students and their parents about how to reducing $C0_2$ emissions and save energy in the home and at school. These free workshops will be offered to 29 schools across British Columbia starting in spring 2011. The workshops are interactive and include videos, board games, contests, and group discussions. The Companies are co-funding this program along with a number of partners including FortisBC Inc., LiveSmart BC, and BC Hydro.

8.3.4.2 Environmental Mind Grind Challenge

For the 2010-2011 school year, the Companies are supporting two Environmental Mind Grind Challenges taking place in four communities in BC, including: Kelowna (in partnership with FortisBC Inc. and the City of Kelowna), Kamloops, Penticton, and Nanaimo. The Environmental Mind Grind Challenge is a student trivia competition on energy and environmental conservation. The goal of supporting this initiative is to encourage conservation education through a fun and competitive game that allows students to interact with their peers from neighbouring schools. The Companies have supported this initiative previously and found it to be a valuable event for the students and communities involved. The competition will take place in spring 2011.

8.3.4.3 Post Secondary Program

The Companies are currently evaluating how we will move forward and expand our education and outreach activities to include greater involvement in post secondary institutions. We are in the process of reviewing proposals from vendors such as GoBeyond and looking into the possibility of hiring an external consultant to develop and implement a program on our behalf.

8.3.5 SUMMARY OF 2011 CEO INITIATIVES

Several of the CEO initiatives from 2010 will continue into 2011 because multi-year programs ensure effective implementation and stability in the marketplace. In addition, many of the programs and pilots will expand. Continuing conservation education is key to keeping the Companies' conservation message "top of mind" among customers. The result will be fostering a culture of conservation, which will benefit communities, increase participation in EEC incentive programs, and ultimately support shared goals of the Companies and the province.

9 INDUSTRIAL SECTOR PROGRAMS

9.1 Overview

Starting in late 2007 and continuing throughout 2009, BC's economy was impacted by the global financial crisis. "British Columbia's economy shrank by 2.3 percent in 2009, as the province, together with most other regions of Canada and around the world, felt the effects of the global recession"[42]. The economic recession had a negative effect on most industries, including the construction, forestry, manufacturing, pulp and paper, oil and gas, and mining sectors, resulting in an overall reduction in natural gas load from the Companies' industrial natural gas customers.

The province's large manufacturing sector includes a significant number of very large energy-intensive industrial operations such as mines, refineries, smelters, oil and gas operations, and pulp and paper mills. The industrial sector in BC is a large consumer of energy and accounts for approximately 35 to 40 percent of the total energy used in the province and roughly 38 percent of the GHG emissions generated[43]. As well, emissions reported under the industrial process category increased by 2.8 percent between 2007 and 2008[44], thus offering significant opportunities for continuous improvement to reduce and eliminate waste of all forms and especially for energy savings and GHG emissions reductions through improved energy efficiency.

9.1.1 INDUSTRIAL CUSTOMERS DEFINITION

The Companies' industrial natural gas customers have delivery service contracts with FEI that are interruptible, interruptible/firm, or firm. In a broad sense, the interruptible and interruptible/firm industrial sector are typically the largest natural gas users by volume due to large process heat applications in their facilities. These customers, which have an interruptible component to their delivery contract with FEI, have the flexibility to switch to an alternative fuel for short durations to free up pipeline capacity for firm gas customers as conditions approach design day conditions. The interruptible industry customers are offered lower delivery rates in comparison to non-interruptible, or what has been referred to as "firm" industry customers. The firm (non-interruptible) customers pay slightly higher fees for their delivery rates and the Companies do not have the flexibility to switch off their gas during peak times. In addition, some customers fall under both rate schedules. For example, some customers may prefer to be under the interruptible contract only for a certain portion of their gas consumption. Usually, they are

September 2010.Retrieved from http://www.env.gov.bc.ca/cas/mitigation/ghg_inventory/pdf/pir-2008-full-report.pdf and http://www.livesmartbc.ca/learn/emissions.html#Sector (emissions include oil & gas, pulp & paper and chemical manufacturing industries).

[44] BC Ministry of Environment. "British Columbia Greenhouse Gas Inventory Report 2008". September 2010.Retrieved from http://www.env.gov.bc.ca/cas/mitigation/ghg_inventory/pdf/pir-2008-full-report.pdf.

under firm contracts and treated as firm customers until their consumption amount goes beyond the limits provided to them. In the event these customers exceed their limits they are then considered as interruptible customers and are treated accordingly.

FEI's interruptible industry customers are usually categorized in groups of different rate schedules such as Rate Schedules 7, 22, and 27, whereas firm or non-interruptible customers are under Rate Schedules 2, 3, 5, 23, and 25. As discussed in the 2009 EEC Annual Report, FEI sought funding approval for EEC programs for interruptible industrial customers in the 2010-2011 RRA and it was approved as per Order No. G-141-09. With respect to the development of EEC programs for the manufacturing sector, the Companies had already received approval through BCUC Order No. G-36-09 for the firm industrial customers. Thus, this section of the Report will discuss both firm and interruptible industrial customers.

9.1.2 INDUSTRIAL SECTOR END USES

The major end use technologies in this sector are for steam/hot water generation for process use and direct fired drying processes. For instance, the largest energy consumption for the softwood lumber industry would result from the wood drying process in our customers' kilns. The drying kiln dries the cut lumber to selected moisture content (eight -18 percent dependent on the product and service conditions) before it is shipped offsite and sold to customers. The process is quite slow, requiring over 28 to 40 hours for spruce/pine/fir commodity products and weeks for thick and high value coastal products. Coastal products describe wood products manufactured in the coastal region of British Columbia. Areas of activity would include production of a wide range of solid wood products including high quality appearance/decorative products, structural lumber for housing and general construction, special sizes and grades for remanufacturing, as well as utility and lower grade products suitable for pallets, packaging, and other industrial uses. These products are produced in the five softwood species that grow in the coastal region: Western hemlock - Western red cedar, Yellow cedar, and Sitka spruce. The drying schedule employs temperatures in the range of 80 -105° C. Other high energy use systems for the industrial sector would include hot water and steam boilers, ovens, lime and ceramic kilns, direct fired material heaters, veneer dryers, and dryers of other products such as minerals, pulp, and paper.

9.1.3 BACKGROUND

The 2009 EEC Annual Report stated that there were three additional program areas to be introduced to market in 2010, one of these being the Interruptible Industrial program area. The intention behind interruptible industrial sector programs was to engage FEI with its interruptible industrial customers, as well as firm customers operating in British Columbia, to create energy efficiency programs, integrate energy efficiency into their ongoing business practices, and instill a conservation ethic. FEI believes there is significant potential for a reduction in industrial consumption including both firm and interruptible customers. For example, in the 2006 Conservation Potential Review, filed as Appendix 1 of the Companies' Energy Efficiency and Conservation Programs Application in 2008, it was stated that the majority of lumber dry kilns in

BC use natural gas and there are a number of upgrades possible to convert an average kiln into an energy efficient kiln. These upgrades include automatic venting, improved insulation, and heat recovery. Opportunities for improvement also exist in the chemicals, non-metallic minerals, paper, and other manufacturing sectors where boilers are used. Energy efficiency opportunities for boilers include near condensing and condensing boilers, boiler economizers, boiler combustion air-preheating, boiler condensation heat recovery, and advance boiler controls such as boiler reset controls. Thus, the Companies' Industrial Sector program area offers opportunities for energy efficiency and conservation activities for these customers, while at the same time managing the risk associated with large financial investments in energy efficiency for industrial customers and the resulting magnitude of the anticipated energy savings.

9.1.4 PROGRAM OBJECTIVES

The Companies' approved budget for 2010 and 2011 is only for FEI customers. Thus, discussion is limited to FEI. FEI's EEC programs in the industrial area are intended to provide financial incentives and tools to qualified projects to: (a) create energy-efficient plant(s) by utilizing energy efficient machinery and equipment, and (b) if the energy saving measures in the customers' new plant (facility) design involves added costs, use financial incentives to help qualified projects implement these upgrades. The industrial portfolio will help large customers to reduce their gas load and become more efficient, productive, and competitive, while also managing the risk to the Companies and ratepayers associated with large financial investments on infrastructure. In general, the EEC Industrial Sector program area is aiming to introduce initiatives and programs that seek to engage industrial customers to become more efficient in their process heating applications. Section 9.1.5 details FEI's strategy for the industrial sector.

9.1.5 INDUSTRIAL SECTOR PROGRAM AREA STRATEGY

The first step in developing the program framework for industrial programs was to create a specific strategy for the Company's firm and interruptible industrial customers. The following are determined to be the goals of the strategy:

- Identify energy management measures and develop an action plan in order to implement these measures specific to each customer. It has been observed that due to the diversity of the industrial sector in BC, no single program will meet the total needs of industry;
- Identify potential program partners (i.e. BC Hydro, Pacific Carbon Trust, Ministry of Energy and Mines and Natural Resources Canada);
- Reduce energy consumption in terms of GJs;
- Reduce environmental impacts, including GHG emissions reduction;
- Improve operational optimization and financial performance; and
- Create reliability and reduce maintenance.

After conducting research based upon other utilities' accomplishments in energy savings and GHG emissions reduction initiatives to date, as well as the use of articles published by organizations such as Natural Resources Canada ("NR Can"), Canadian Industry Program for Energy Conservation ("CIPEC"), e-Source, International Energy Agency ("IEA"), U.S. Department of Energy, internet and media news, webinars and conferences, and through meetings with counterparts from the provincial government and other utilities, significant input was garnered on the creation and development of the strategy.

As noted above, the primary objective of the Companies' industrial strategy is to identify energy management measures and to develop energy efficiency programs to optimize energy use and reduce consumption. The implementation of the strategy would include the following steps:

- Identify eligible projects through customers, engineering consultants, equipment vendor references, or through the Conservation Potential Review;
- Customer submits feasibility study, if available, or conducts an initial assessment;
- If historical natural gas consumption data is not available, the facility's manager will perform a historical analysis to determine natural gas usage patterns and performance of major natural gas equipment. In case of a situation where the customer is unable to provide data for the facility's natural gas consumption, FEI will provide this data;
- A site walk-through with the facility's energy coordinator along with FEI's industrial program manager will be completed in order to discuss natural gas savings opportunities at the site;
- If the customer does not already have one, a detailed study will be completed by an independent third party engineering firm selected/provided by the customer to determine possible opportunities for natural gas savings at the site (i.e. 'pinch technology studies' for refineries or large pulp and paper mills). The cost of the study may be partly/wholly subsidized by FEI. The basic process for obtaining the study would be as follows:
    - Applicant hires qualified engineering consultant to complete the study;
    - Engineering consultant completes the study within a reasonable time frame (i.e. 45 - 60 days);
    - The study will reflect the findings and verify their impact (i.e. verification of operational optimization such as reduced maintenance and cost/benefit analysis);
    - Applicant pays engineering consultant and obtains proof of payment;
    - Applicant submits the study and proof of payment to FEI;
    - FEI reviews and makes a decision either to approve or reject the study. In case the study is rejected, FEI will provide the reasons and at this point it is entirely up to the customer to have the study re-done if they wish to proceed; and
    - Upon approval, FEI will reimburse a certain portion of the cost of the study if:

    - The project is agreed to be implemented by the customer as a whole (i.e. partially completed projects are not eligible for any incentives); and
    - The study must promise long term savings. The amount of savings that will be revealed by the study should be greater than what is required to cover the incremental cost.
- A business case analysis for the project will be created by the Companies. The main business items that will be covered in the business case are as follows: objective and description of the project including benefits of doing the project, project outline, cost/benefit analysis, project risks, and risk mitigation strategies, along with a project budget;
- Potential program partners may be identified (i.e. BC Hydro, FortisBC Inc. Ministry of Energy and Mines and NR Can). If there is any existing potential partner, an incentive based on a cost sharing program or solution will be developed with the potential program partner;
- Senior FEI management signs off on the FEI business case;
- A preliminary legal agreement will be developed to cover off business items between the customer and FEI;
- Project roll out; and
- Ongoing project tracking and evaluation.

9.2 2010 Industrial Program Area Results

2010 was spent developing the industrial program area strategy described in Section 9.1.5 above and with site visits to customers' facilities. No industrial programs were launched in 2010; therefore, no results are presented here.

9.3 2011 Industrial Program Area Outlook

In 2011, the Companies intend to initiate a pilot program called the Pulp and Paper Industry Heat Exchanger program, as well as broaden their commitment to the energy audit funding program. Table 9-1 represents FEI's initial, high level estimate of the expenditures that will be required to support these activities for the industrial sector. It includes funding for:

- Heat exchanger pilot program and forecasted funding for other pulp mills;
- Burner management control;
- Stakeholder activity related to workshops and customer meetings; and
- A series of in-depth energy savings potential studies, or mini-CPRs, with individual customers in the food processing, manufacturing, and forest products sectors.

FEI expects the learning from programs in 2010 and 2011 will help form the basis for expanded programs in 2012 and beyond.

Table 9-1: 2011 Industrial Program Area Outlook

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
Energy Audit Funding Program	$200	N/A	$200	N/A	N/A	N/A	N/A	N/A
Heat Exchanger - Pilot*	$550	N/A	$550	483,130	N/A	483,130	2.4	N/A
Heat Exchanger Pulp and Paper Mills*	$1,000	N/A	$1,000	TBD	N/A	TBD	TBD	N/A

9.4 Industrial Program Details

9.4.1 ACTIVE PROGRAMS

9.4.1.1 Energy Audit Funding Agreement

9.4.1.1.1 Program Overview

Energy Audit Funding Agreement	
Market	Retrofit
Audience	Industrial customers
Duration	Undefined
Incentive	Up to $20,000 per audit The program will fund up to 50% of the cost of the audits for eligible customers up to a maximum of $20,000
Partner	None
Overview	
Description	The purpose of this program is to determine if there are any opportunities in customers' industrial manufacturing processes that could help reduce the amount of natural gas used at their facilities, as well as to look for opportunities for customer projects to be pilot projects for each industrial sector. The Companies' financial support will help customers hire an engineering firm/contractor to conduct an energy efficiency audit at their facilities/plants, which will investigate specific natural gas savings opportunities. Audits will include an inventory of the equipment and related infrastructure including steam distribution networks. The current operating efficiencies, and the age and condition of the equipment will be determined. Energy audits will also include drawings, process diagrams, current energy use, and operating and

	maintenance costs, and will make recommendations on possible efficiency upgrades and/or technology replacements with a deep focus on natural gas savings opportunities. They will also contain incremental costs for implementation of the natural gas savings measures. The reports will clearly indicate the net savings amounts in terms of gigajoules per each measure identified in the audits. Should the energy saving measures uncovered in the audits involve additional costs, the eventual intention is for the Companies to provide additional financial incentives to help qualified projects implement these upgrades. Although the incentive amount is still under development, it will heavily link to the amount of savings and will vary on each project. The greater the amount of savings, the greater the incentives will be. The Companies believe the industrial energy audit funding program will deliver value by encouraging industrial customers to implement the measures that will be disclosed as a result of these audits. There has been strong customer interest in our industrial program energy audits that are used to determine the potential energy savings opportunities in the industrial sector.
Goals	• Support customers with financial incentives to hire an engineering firm/contractor to conduct an energy efficiency audit at their facilities/plants. • Uncover any existing natural gas savings opportunities within these facilities. • Identify energy efficiency pilot project opportunities for further advancement that may be applicable to BC's industrial sector as a whole. Determine the current operating efficiencies, age, and condition of the equipment/machinery at different facilities in terms of energy efficiency and upgrade this machinery.
Status	Active
Implementation	
Administration	The Companies' EEC industrial programs staff
Communications	One-on-one by the EEC industrial program manager and the Companies' industrial account management staff
Evaluation Strategy	The evaluation of the program will be based on the customers' implementation of the savings measures uncovered through the audits, and the amount of energy savings that result from the implementation of those measures.

9.4.1.1.2 2011 Program Performance Forecast

In 2011, the industrial program area has committed to providing incentives for an energy audit funding program. As discussed above in the strategy section, a detailed study will be completed by an independent third party engineering firm/contractor selected/provided by the customer to determine possible opportunities for natural gas savings at their site. The key objective for this initiative is to support industrial customers in conducting energy studies. The incentives are geared to uncover energy savings opportunities within industrial processes to reduce natural gas usage and lower GHG emissions. The Companies believe the industrial energy audit funding program will deliver value by encouraging industrial customers to implement the measures that will be transparent as a result of these audits.

Table 9-2: 2011 Energy Audit Funding Performance Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	10	$200	$3	N/A	N/A	N/A	N/A
FEVI	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Total	10	$200	$3	N/A	N/A	N/A	N/A

9.4.2 PROGRAMS IN DEVELOPMENT

9.4.2.1 Heat Exchanger Program - PILOT

The Industrial Sector program area is currently working on potential funding opportunities for a pilot referred to as the Pulp and Paper Industry Heat Exchanger (“HEX”) pilot program. The key objective for this pilot is to replace pulp and paper industry customers’ outdated heat exchangers with new energy efficient ones. In the pulp and paper industry, natural gas is extensively used for pulp drying and there are about 32 pulp and paper mills in BC. Gas savings will come from the heat exchanger process running hotter water, which means the final pulp stock in a liquid form will enter the mechanical dewatering process at a higher temperature. This makes the presses perform better so the pulp will contain less water when it enters the flash drying stage after the dewatering presses. Initial estimates of natural gas savings for this specific upgrade are estimated to be around 70,000 GJ/yr. If the pilot is successful, one of the other key objectives for this program will be to support the pulp and paper industry with new efficient heat exchangers. The potential uptake for all the pulp mills in BC, just for the heat exchangers, could yield savings of 1,500,000 GJ/yr. The scope and measurement and evaluation strategy for this pilot are currently being established. The following table provides the performance forecast for this pilot.

Table 9-3: HEX Program (Pilot) Performance Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI*	1	$500	$50	70,000	483,130	N/A	2.4
FEVI	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Total	1	$500	$50	N/A	N/A	N/A	2.4

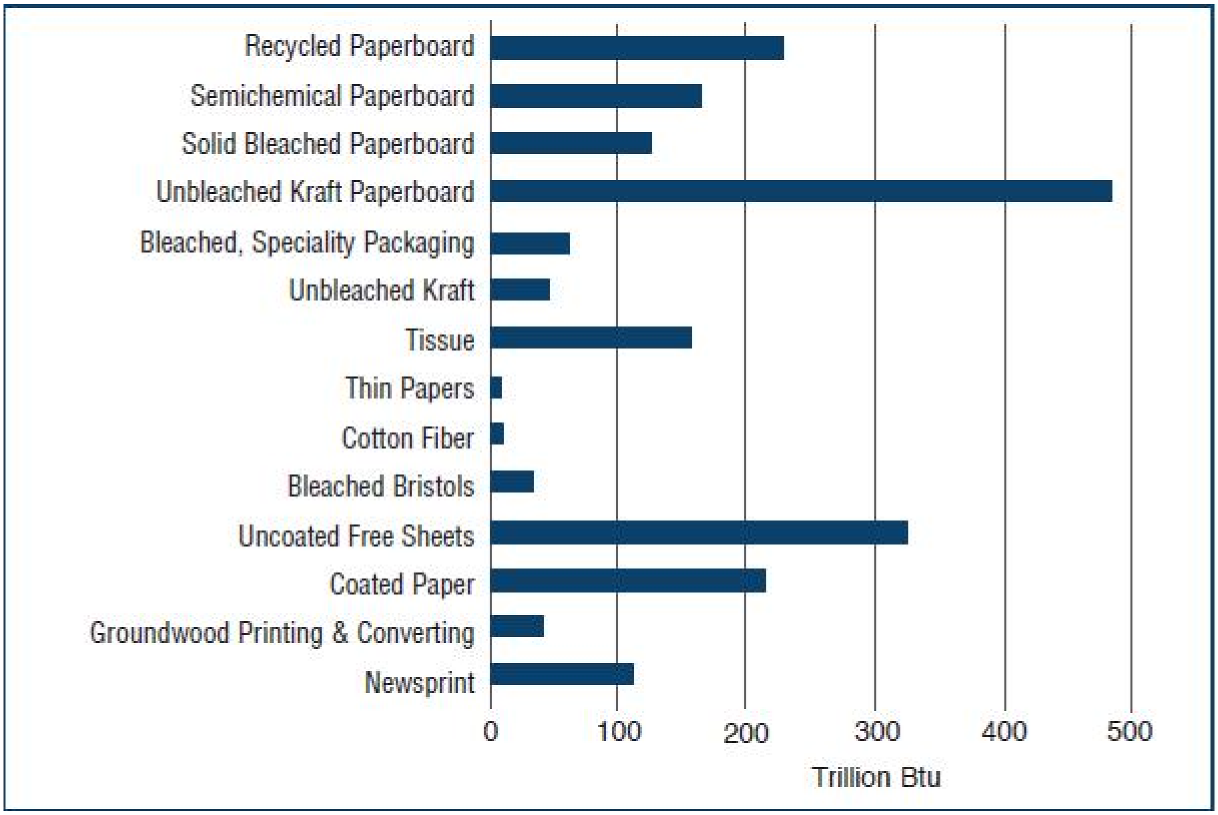
* Note: Preliminary TRC calculation. Measure life and alternative energy impact have not been verified.

9.4.3 FUTURE INDUSTRIAL PROGRAM OPPORTUNITIES

It should be noted that key industrial EEC opportunities exist in the area of waste heat. Waste heat, in the form of hot gases or fluids, is the primary source of losses from fluid heating and boiling. Fluid heating and boiling is a critical component of many of the most energy intensive processes used in the manufacture of chemicals, refined petroleum products, food and beverage, and mining and forest products including the pulp and paper industry. The energy systems utilized for fluid heating and boiling include fired systems such as furnaces, evaporators, dryers, condensers, and other direct-fuelled systems and steam generators, mostly boilers. The auxiliary equipment used to transfer and deliver steam and heat, such as heat exchangers and steam injectors, is also an integral component of industrial energy systems; therefore, the projected industry energy efficiency programs will focus both on these energy systems and on the auxiliary equipment utilized in the industry. The intelligence acquired from the pilot heat exchanger program described in Section 9.4.2.1 above would apply to other sectors where fluid heating and boiling is crucial in the customers' process.

In pulp and paper manufacturing, waste steam, hot water, and evaporation of spent liquors are the primary source of energy loss from fluid heating and drying. The two most energy intensive processes are paper drying and black liquor concentration (both being evaporation processes). The processes contributing the most energy loss are paper drying, evaporation, pulping, chemical recovery, and bleaching. These processes are heavily dependent upon steam as an energy source. For example, the Table 9-4 below shows the amount of steam energy used at different stages for a pulp and paper industry when producing different products.

Table 9-4: Estimated Steam Energy Use for Major Pulp and Paper Products[45]



In the food processing industry, significant energy is lost from fluid heating and boiling. Most of the waste energy is in the form of waste steam, exhaust gases, and radiative heat losses from evaporators, dryers, and other key processes.

In metal melting and heating, the primary sources of energy loss in fired systems are hot gases (both contaminated and clean), warm water, and hot products that must be cooled or quenched. In iron and steel making, for example, energy is lost when hot products such as coke, molten iron, hot slabs, and process gases are cooled. Smelting, which produces molten metal, generates energy losses in the form of furnace exit gases. Major sources of energy loss from calcining processes are exhaust gases such as evaporated water, combustion gases, and carbon dioxide from calcinations.

During process heating, the energy is mainly lost as waste gases from boilers and due to fouling that impedes heat transfer. The energy lost due to these inefficiencies must be supplied by burning additional natural gas or other types of fuels. Opportunities for improvement exist in the chemicals, non-metallic minerals, paper, and other manufacturing sectors where boilers are

[45] A Report prepared by Resource Dynamic Corporation for the U.S. Department of Energy. "Steam System Opportunity Assessment for the Pulp and Paper, Chemical Manufacturing, and Petroleum Refining Industries". October 2009. Retrieved from http://www1.eere.energy.gov/industry/bestpractices/pdfs/steam_assess_mainreport.pdf.

used. Energy efficiency opportunities for boilers include near condensing and condensing boilers, boiler economizers (with condensing economizers, the overall boiler efficiencies can exceed 90 percent), boiler combustion air-preheating, boiler condensation heat recovery, and advance boiler controls such as boiler reset controls. For example, the automatic control of excess air (oxygen trim) increases the boiler efficiency by one to two percent. A general rule accepted by the industry is that a one percent reduction in excess oxygen will reduce fuel usage by one percent. For very large boilers, efficiency gains of 0.1 percent mean significant annual savings and these controls usually measure carbon monoxide as well. Even with well-adjusted burners providing the minimum flue gas temperatures while achieving complete fuel combustion, there is ample room to recover some of this heat that would otherwise “go up the stack”. Heat exchangers can be used for preheating boiler feed water or combustion air. A 20° C (36° F) reduction in flue gas temperature will improve boiler efficiency by about one percent. The following cross-industry technology matrix provides a summary of savings opportunities vs. for each different industry. Blue shading indicates an opportunity available in that industry. One of the key objectives for the Industrial Sector program area is to focus on these opportunities when developing energy efficiency and conservation programs.

9.5 Summary

The Industrial Sector program area represents a crucial component of the Companies' overall commitment to EEC activities. Since being staffed with a program manager at the end of Q2 2010, the industrial program area has initiated its own strategy and established relationships with key industry stakeholders. An Energy Audit Funding Agreement program has also been initiated in order to provide customers with financial contributions for conducting energy studies intended to uncover energy saving measures customers could implement.

In 2011, the Industrial Sector program area will focus on developing programs for those customers (both firm and interruptible) where fluid heating and boiling is being used as an energy intensive process in the manufacture of pulp and paper products, chemicals, refined petroleum products, food and beverage, and forest products. The Companies believe these customers offer opportunities for energy efficiency and conservation.

[46] Technology Roadmap: "Energy Loss Reduction and Recovery in Industrial Energy Systems". November 2004.

10 INNOVATIVE TECHNOLOGIES PROGRAM AREA

The Innovative Technologies Program Area overview is divided into two parts. Part 1 reports on 2010 and 2011 programs within the Innovative Technologies Program Area as a whole, while Part 2 specifically addresses the use of EEC funds for Natural Gas Vehicle ("NGV") reimbursements.

10.1 2010 and 2011 Programs

10.1.1 INTRODUCTION

10.1.1.1 Definition

Innovative technologies are best described as market ready technologies that have little or no market penetration in BC. They can be defined as emerging and/or enabling technologies. Some of these technologies include, but are not limited to, solar thermal domestic hot water systems, solar air systems, ground source heat pumps ("GSHPs"), hydronic systems, sterling engines, micro co-generation, NGVs, and fuel cells. Hydronic systems can be classified as enabling technologies as they have the flexibility and potential to receive future energy from District Energy Systems ("DES"). Innovative technologies are solutions the Companies can support through programs delivering energy reductions and savings to their customers for now and into the future. All programs within this program area are to "foster and further the deployment of forward-looking low carbon technologies."[47] The non-NGV programs within the Innovative Technologies Program Area attempt to achieve this objective by encouraging residential, commercial, and industrial customers to reduce their overall consumption of natural gas, while the NGV programs within the Innovative Technologies Program Area encourage the adoption of NGVs. The use of NGV engines, which run on liquefied natural gas ("LNG") or compressed natural gas ("CNG") as a heavy duty vehicle fuel are considered part of the Innovative Technologies Program Area for two reasons. First, technologies used in NGV applications can be classified as emerging technologies in the BC context as they have minimal market penetration in BC. Second, the Commercial NGV Demonstration program (described as "NGV for Commercial Vehicles" in the 2009 EEC Annual Report) achieves GHG emissions reductions by displacing high-carbon diesel fuel.

The Companies' target market for CNG includes operators of commercial, return-to-base heavy duty fleet vehicles such as garbage trucks, waste haulers, and buses, while the LNG focus is on long-haul, return-to-base fleet vehicles such as Class 8 tractors. In both cases, the alternative fuel source is diesel, which is a higher carbon fuel.

[47] EEC Application, at page 69.

Innovative technologies programs, including the Commercial NGV Demonstration program, are to be run as pilots and/or demonstration projects that would subsequently provide data to enable the Companies to establish the appropriate timelines, key milestones, and completion dates for full-scale program activity in the innovative technologies area.

10.1.1.2 Background

On April 16, 2009, the Commission issued the EEC Decision approving funding for FEI and FEVI for 2009 and 2010 programs. While the Companies did not receive approval for expenditures for the Innovative Technologies Program Area as part of that application, the Commission directed the Companies to bring forward projects for consideration as they became more fully developed.[48]

FEI and FEVI submitted their respective applications for 2010 – 2011 Revenue Requirements and Delivery Rates on June 15, 2009 and June 29, 2009, respectively, which proposed innovative technologies programs and expenditures in order to meet the Commission's directives in Order No. G-36-09. On November 26, 2009, the Commission issued Order No. G-141-09, approving the Negotiated Settlement Agreement ("NSA") for FEI. This EEC budget that was approved as part of that NSA included the requested FEI innovative technologies program budget of $2.334 million in 2010 and $4.669 million for 2011, for a total budget of $7.003 million.[49] FEVI's NSA, which was also approved, included an EEC envelope that encompassed the requested $478,000 in 2010 and $956,000 for 2011, for a total FEVI budget of $1.435 million.[50]

As part of their respective NSAs, the parties explicitly agreed that the Innovative Technologies Program Area will be managed by FEI and FEVI as a separate segment of the overall EEC portfolio and have a weighted total resource cost ("TRC") of 1.0 or more. FEI's NSA provided as follows in this regard, with FEVI's NSA being identical but for the name of the company and dollar amounts.

Item 12.1 of the FEI's NSA states:

> *"(d) <u>EEC funding for innovative technologies will be $4.669 million for 2011, which is the amount requested by TGI in the Application.</u>*

---

[48] EEC Decision, at page 41.

[49] The FEI NSA provides in section 11(c): "EEC funding for innovative technologies will be $2.3 million for 2010, which is the amount requested by TGI in the Application," and in section 12.1(d): "EEC funding for innovative technologies will be $4.669 million for 2011, which is the amount requested by TGI in the Application."

[50] The FEVI NSA provides in section 6(b): "EEC funding for innovative technologies will be $0.478 million for 2010, which is the amount requested by TGVI in the Application," and section 7.1(c): "EEC funding for innovative technologies will be $0.956 million for 2011, which is the amount requested by TGVI in the Application."

(e) All agreed to EEC expenditures will be considered and evaluated within the existing EEC portfolio, and will be subject to the same financial treatment, as per the Commission's EEC Decision dated April 16, 2009 (Application, page 514, Item 6).

However, Innovative Technology programs will be managed by TGI as a separate segment of the overall portfolio to have a weighted average TRC of 1.0 or more. TGI will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee.

(f) TGI will report to the Commission on industrial interruptible and innovative technology programs as part of TGI's annual report on EEC activities required under the EEC Decision." [Emphasis added.]

10.1.1.3 Innovative Technologies Program Area Incentives

10.1.1.3.1 Level of Incentives

It is too soon for the Companies to be able to determine the appropriate level of financial incentives necessary to make innovative technologies in general attractive to customers in the long-term; thus, there is a need to conduct pilot programs and demonstration projects to test the effect differing levels of incentives have on adoption rates, such as the pilot programs currently underway for the solar thermal residential pilot. NGV programs necessitate incentive funding due to the high upfront capital cost of NGVs versus conventional fuelled vehicles. At present, original equipment manufacturer ("OEM") CNG vehicles command a price premium of 20 – 30 percent over their conventionally fueled equivalents. The price premium of LNG vehicles ranges from 50 – 65 percent. In the case of the Commercial NGV Demonstration program, which provides an incentive of up to 100 percent of the incremental capital cost for heavy duty vehicles, there have already been contractual commitments from customers. This demonstrates there is a strong correlation between the level of incentives and adoption for NGVs. The use of EEC Innovative Technologies funding for the Commercial NGV Demonstration program is discussed in Part 2 below. In general, the Companies believe the required level of incentives can be expected to decline as the innovative technologies gain a greater share of the market, but determining exact values and timing is challenging at this time because predicting market share for emerging technologies can be difficult and subjective.

10.1.1.4 Funding Transfers

As described in Section 2 of the Report, the Companies identify the transfer of funds from one program area to another. The transfer involves funding from the Conventional EEC Program Area to the Innovative Technologies Program Area in the amount of $3.487 million. In compliance with requirements set forth in Order G-36-09, the transfer amount, the rationale supporting the transfer, and the impact of the transfer are described below.

10.1.1.4.1 Funding Amount

In the 2010-2011 Revenue Requirements Application NSA, FEI received approval for EEC funding of $2.334 million in 2010 for the Innovative Technologies Program Area. While FEI was under spent in the Conventional EEC Portfolio compared to approved levels, there was more invested in innovative technologies in FEI than was identified in the Revenue Requirements Application. For FEI, actual expenditures in 2010 were approximately $5.821 million, and approximately $3.487 million was transferred from the Conventional EEC Program Area to the Innovative Technologies Program Area.

10.1.1.4.2 Rationale

The two rationales that support the reallocating of funding are: (1) reaching a favourable TRC score for the Innovative Technologies Program Area; and (2) obtaining GHG emissions reduction benefits associated with switching the transport industry from higher carbon fuel sources.

1. The TRC score for the Innovative Technologies Program Area has met the TRC threshold of 1.0 or greater.

The Innovative Technologies Program Area has a weighted average TRC score of 1.2. Without the transfer of funds, the programs within the program area would have not been able to reach the participant levels cited in the Report.

The TRC test "is the ratio of discounted total program benefits to discounted total program costs over a specified period of time. A benefit-cost ratio greater than one indicates the program is beneficial, on the basis of the TRC test."[51] The TRC test does not consider societal benefits - which can be defined as "effects of externalities, such as environmental implications" – such as GHG emissions reductions benefits or positive impacts on delivery rates for existing customers as a result of load building facilitated by the EEC funding. As the Commission stated in the EEC Decision,

> *"While recognizing that societal factors have significance, the Commission Panel views many of these factors as being rather subjective and difficult to measure. …The Commission Panel does consider the TRC test to be appropriate and adequate for the purposes of this Application and accepts it as such."*[52]

Although GHG emissions reductions are not considered as part of the TRC test, one of the objectives of the Innovative Technologies Program Area is to reduce GHG emissions, making its GHG emissions reductions important in context of the overall evaluation.

[51] EEC Decision, at page 34.
[52] EEC Decision, at page 33.

2. The Innovative Technologies Program Area promotes fuel switching from a higher carbon fuel (diesel) to a lower carbon fuel (natural gas).

The Companies believe the EEC expenditures in the Commercial NGV Demonstration program, which encourages switching from using diesel trucks to the use of natural gas, conforms to the principle in the EEC Decision that promotes high to lower carbon fuel switching. While non-NGV programs in the Innovative Technologies Program Area reduce GHG emissions by encouraging residential, commercial, and industrial customers to reduce their overall consumption of natural gas, the Commercial NGV Demonstration program reduces GHG emissions by encouraging the adoption of NGVs in place of vehicles that use a higher carbon fuel. The end result is the same – GHG emissions reduction – in both types of programs.

10.1.1.4.3 Program Area Impacts

Each program area is impacted by the funding transfer in the following ways:

1) Conventional EEC Program Area (transferor)

- The funding transfer did not displace or discourage other potential program participants or initiatives, as the Conventional EEC expenditures did not reach the approved funding amounts available.

2) Innovative Technologies Program Area (transferee)

- The funding transfer did not displace or discourage other potential program participants or initiatives but rather supported and developed more innovative technologies program areas. This transfer also created a favourable TRC score of 1.2, which met the defined threshold for the Innovative Technologies Program Area as a whole.
- The Innovative Technologies Program Area provided incentive funding to four large fleet operators (for 82 vehicles in total) under the Commercial NGV Demonstration program. In the absence of a funding transfer, approximately only 32 NGVs would have been incented.

Impacting both program areas and all natural gas customers:

- The Companies' overall EEC portfolio level TRC, which includes both the conventional and innovative technologies program areas, is above the weighted average threshold of 1.0;
- Benefits are created for existing and future natural gas customers from increased natural gas throughput, which produces lower delivery rates, all else being equal,

through the Commercial NGV Demonstration program.[53] While load building benefits are not considered in the TRC test, they represent a positive impact to all natural gas customers; and

- As a result of the Commercial NGV Demonstration program, customers also benefit from estimated GHG emissions reductions of 20 – 30% due to fuel switching from higher-carbon diesel to lower-carbon natural gas. While GHG emissions savings are not considered in the TRC test, they represent a positive impact to all existing and future natural gas customers and the province.

Overall, the Companies believe its funding transfer has addressed the reporting obligations set in the EEC Decision and furthers overall EEC initiatives while benefiting new and existing customers.

10.1.1.5 Innovative Technologies Program Area Goals

The innovative technology programs pursue a number of objectives in order to support, review, and validate market-ready technologies. More specifically they focus on:

- Supporting local, provincial, and federal governments with climate action goals and policies and regulations focused on market-ready technologies; and
- Evaluating market-ready technologies and conducting pilot studies to validate manufacturer's claims about equipment and system performance and energy efficiency.

In support of the objectives outlined above, the Companies also strive to seek out new market-ready technologies as well as improving the awareness of existing ones. More specifically, their focus is to:

- Establish "proof of concept" projects based on certain methods, ideas, or market-ready technologies to demonstrate energy savings. This data will be used to confirm savings claims and guide the development of future programs;
- Conduct pre-feasibility studies to gauge the energy savings potential for market-ready technologies within the residential, commercial, and industrial sector;
- Initiate market assessments for technologies, methods, or ideas to gauge their conservation potential and market barriers within BC's climate;
- Coordinate measurement solutions with internal departments and/or third party companies to monitor systems performance and prospective energy savings. This data will be used to confirm savings claims and guide the development of future programs;

[53] The analysis of this benefit, for example, from the Commercial NGV Demonstration program, is discussed in Section 3 of FEI's Application for Approval of CNG and LNG Service submitted to the Commission on December 1, 2010.

- Replace existing low efficiency systems with innovative technologies to capture energy savings associated with reducing the overall consumption of natural gas and reduce GHG emissions and other air contaminants;
- Engage the trades community and manufacturers by supporting new, energy efficient technologies and installation protocols;
- Educate residential, commercial, and industrial customers about the advantages of innovative technologies and provide incentives for their adoption when necessary. The education channel may include demonstration projects as well as partner collaborations; and
- Develop cost effective programs within the Innovative Technologies Program Area to achieve a TRC ratio of greater than 1.0.

Objectives specific to the Commercial NGV Demonstration program focus on:

- Displacing diesel fuel consumption in the heavy duty transportation sector and replacing it with low carbon natural gas; and
- Reducing upfront capital cost barriers of NGVs for heavy duty trucking fleet operators to encourage the use of LNG and CNG as a transportation fuel.

10.1.1.6 Innovative Technologies Program Area Summary Status

Program descriptions for each of the Companies' Innovative Technologies Program Area offerings follow below. This table provides an overview of the innovative technology incentive programs, indicating which programs were completed in 2010, which programs remain active moving into 2011, and which programs are currently under development.

As can be seen in Table 10-1 below, the strong TRC result for the Commercial NGV demonstration program balances the lower TRC results for some of the other, pilot programs. Lower TRC results can be expected for many of the Innovative Technologies initiatives, reflecting the relatively high incremental cost for these initiatives which in turn is due to the low market penetration of the technologies at which the initiatives are aimed.

Table 10-1: Summary Status of Innovative Technology Programs

Program	Utility		Description	TRC	
	FEI	FEVI		FEI	FEVI
Completed Programs					
Solar Water Heating PSECA Program	X	X	Rebate program to encourage the adoption of solar water heating systems in provincial sector buildings to reduce natural gas consumption.	0.2	0.3
Active Programs					
Commercial NGV Demonstration Program	X		Rebate program to encourage the adoption of liquefied natural gas (LNG) and compressed natural gas (CNG) as a heavy duty vehicle fuel and to achieve environmental benefits to displacing diesel fuel.	1.4	N/A
Solar Air Heating PSECA Program	X		Rebate program to encourage the adoption of solar air heating systems in provincial sector buildings to reduce natural gas consumption.	0.4	N/A
SolarBC Schools Incentive Program	X	X	Rebate program to encourage the adoption of solar water heating systems in schools to reduce natural gas consumption and increase awareness.	0.2	0.2
Programs in Development					
Solar Residential Hot Water - PILOT PROGRAM	X		Rebate pilot program to assess the performance and energy savings for solar thermal hot water systems within the City of Vancouver.	0.2	N/A
City of Vancouver MURB - PILOT PROGRAM	X		Rebate pilot program to assess the viability of solar DHW, ventilation controls, and piping insulation for MURBs.	In Development	

10.1.2 2010 INNOVATIVE TECHNOLOGIES PROGRAM AREA RESULTS

As described in the 2009 EEC Annual Report, the Innovative Technologies Program Area includes funding categories for Solar Thermal Hot Water, NGV for Commercial Vehicles, Hydronic and Combination Space Heating Systems, Residential Ground Source Heat Pump ("GSHP") Systems, and Commercial and Industrial GSHP Systems.

The following table shows the program results from the innovative technologies programs currently in place.

Table 10-2: Innovative Technologies Portfolio Program Cost Breakdown - 2010 Program Area Results FEI/FEVI

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
Solar Water Heating PSECA Program	$229	$143	$372	29,053	19,845	48,898	0.2	0.3
Commercial NGV Demonstration Program	$5,589	N/A	$5,589	(755,449)	N/A	(755,449)	1.4	-
Non-Program Specific Expenditures	$3	-	$3	N/A	N/A	N/A	N/A	N/A
Total	$5,821	$143	$5,964	(726,396)	19,845	(706,551)	1.2	

As program design progressed in Q3 2010, the Companies focused efforts on offering incentives for solar thermal hot water through the Public Sector Energy Conservation Agreement (PSECA) Funding program. The Solar Water Heating PSECA initiative is considered a program instead of a pilot since it was developed through the province and the Companies only served as a funding partner. Furthermore, the funds were necessary to support local, provincial, and federal governments through the PSECA Agreement in reducing greenhouse gas emissions as well as validating performance and energy efficiency claims. The data will be used to guide the development and feasibility of future Solar Thermal Hot Water programs.

The Solar Water Heating PSECA program, together with the Commercial NGV Demonstration program has a weighted TRC score of 1.0 or more on a program area level, thereby meeting the Commission's directive in Order No. G-141-09.

Within the Commercial NGV Demonstration program, two different fuel types have been pursued that reflect the two existing service offerings that FEI has for supplying natural gas for NGVs.[54] First, FEI has historically provided natural gas delivery service (or transportation) destined for the CNG transportation customers through Rate Schedules 6, 22, 23, 25, 26, and 27. Since FEI does not provide compression and dispensing service through these rates, customers must seek out fueling service providers to receive a complete end-to-end service offering. Commission Order No. G-65-09 issued on June 4, 2009, approved Rate Schedule 16 Interruptible Liquefied Natural Gas Sales and Dispensing Service ("Rate Schedule 16") as a five year pilot. Rate Schedule 16 gives the Company the ability to provide LNG supply in tank truck quantities from the Tilbury LNG bulk storage facility.

LNG as a transportation fuel is considered an emerging technology in BC and presently has no market penetration outside of small demonstration projects. Similarly, CNG has minimal market penetration as a heavy duty transportation fuel (except for approximately 50 transit buses), but was used in light duty vehicle applications in BC in the 1980s and 90s. Improvements in engine technology, combined with an attractive price differential between natural gas and diesel, have stimulated a new interest in CNG from heavy duty fleet operators in recent years. The Companies' CNG and LNG initiatives encourage heavy duty fleet operators of garbage trucks, waste haulers, buses, and Class 8 tractors to switch from high-carbon diesel to low carbon natural gas. Since the use of natural gas in heavy duty commercial vehicles has not been widely adopted in BC, the Companies' NGV initiatives are presently considered demonstration projects. While these technologies are well proven in other jurisdictions, it is important to assess performance under a BC context in a scalable manner. Projects using both CNG and LNG have been selected to demonstrate a complete fuelling solution for potential fleet customers (municipal and highway respectively). Limited experience with heavy duty NGVs exists in BC and the Companies believe it is appropriate to gain experience and data with its NGV initiatives through successful, demonstrable applications; therefore, NGV initiatives are deemed demonstration programs until data such as fuel consumption, fuel efficiency, and vehicle performance have been quantified in a BC context.

[54] At this time, NGV transportation Rate Schedules and proposed fueling service offerings have only been developed for FEI.

On December 1, 2010, FEI submitted an Application for Approval of General Terms and Conditions for CNG and LNG Service to the Commission, which, if approved, would provide NGV customers with a complete end-to-end service offering. The NGV incentives from EEC funds are not tied to fueling infrastructure installed by the Company, and fleets that self-supply the compression service and fueling station or procure it from another supplier are still eligible for EEC incentives. Thus, from the perspective of EEC funding, the effect of the NGV Application before the Commission is really that it makes it possible for more fleets to consider using NGV, and thereby increases the number of potential applicants for EEC incentives.

Work has not yet commenced in determining the viability of pilot programs for hydronic and combination heating systems or GSHPs.

10.1.3 2011 INNOVATIVE TECHNOLOGIES PROGRAM AREA OUTLOOK

In 2011, the TRC ratio for the entire Innovative Technologies Program Area is estimated at 1.8, which will meet the Commission's directives in Order No 141-09 for innovative technologies to have a weighted TRC score of 1.0 or more on a portfolio level. The relatively high TRC scores for NGV serve to balance the lower scores for some of the other Innovative Technologies initiatives.

Table 10-3: Innovative Technologies Portfolio Program Cost Breakdown – 2011 Program Area Outlook FEI/FEVI

Program	Incentives & Non-Incentive Expenditure ($000s)			NPV Energy Savings (GJ)			TRC	
	FEI	FEVI	Total	FEI	FEVI	Total	FEI	FEVI
Programs								
Commercial NGV Demonstration Program	$3,780	-	$3,780	(1,376,306)	-	(1,376,306)	1.9	-
SolarBC Schools Incentive Program	$22	$5	$27	3,046	716	3,762	0.2	0.2

Total	$3,979	$5	$3,956	(1,350,614)	716	(1,349,898)	1.8	

10.1.4 2011 PROGRAMS

In 2011, the Innovative Technologies Program Area has allocated incentives for three programs including the Commercial NGV Demonstration program, SolarBC Schools Incentive program and the Solar Air Heating PSECA program. As shown in Table 10-3 above, the solar heating measures don't pass the TRC on an individual program level; but, together with other programs within the program area, the overall TRC ratio is over 1.0. The Companies feel programs and demonstration projects in the Innovative Technologies Program Area are necessary to support the climate action goals of local, provincial, and federal governments, as well as to displace diesel fuel consumption in the heavy duty transportation sector and replace it with low carbon natural gas.

Although innovative technologies are to be run as pilots and demonstration projects, the SolarBC Schools and Solar Air Heating PSECA initiatives are considered programs since they were developed through the province and SolarBC, and the Companies only served as a funding partner. Commercial NGV initiatives are presently considered demonstration projects for the reasons previously stated.

Fuel consumption data will be tracked and reviewed annually to determine fuel switching benefits and program roll-out approaches.

10.1.4.1.1 2011 Pilots

Funding from the Innovative Technologies Program Area has been committed to support and develop two pilot programs known as the Solar Residential Hot Water pilot and the City of Vancouver MURB pilot. The key objectives for those pilots are to support local, provincial, and federal governments with climate action goals, policies, and regulations, as well as gathering data and associated program savings for solar thermal technologies. The scope, measurement, and marketing plans for those pilots are currently being established.

10.1.4.1.2 2011 Studies, Memberships, and Demonstration Projects

In order to evaluate market-ready technologies, it is important for FEI and FEVI to participate in technology performance studies and industry memberships. The main objectives of these initiatives are to help validate energy savings claims and stay abreast with additional market available technologies, while collaborating and sharing costs amongst other gas and electric utilities. In 2011, the Companies committed $12,000 for a Geoexchange Energy Performance Evaluation Study and $4,000 for a membership to participate in The Centre for Energy Advancement through Technological Innovation ("CEATI") Gas Utilization working group. Additionally, the demonstration projects are important to not only experiment and confirm the energy savings potential of technologies but also to increase the awareness of the benefits of some of these technologies among the Companies' customers. Thus, the Companies committed $12,000 for the Westhouse Solar Demonstration project.

10.1.4.1.2.1 Geoexchange Energy Performance Evaluation Project

Phase 1 Geoexchange Energy Performance Evaluation Project	
Audience	Commercial, institutional, and multi unit residential buildings ("MURBs") that have an existing geoexchange system operational within BC's coastal and interior climates
Duration	Q2 2010 - Q2 2011
Commitment	$12,000

Partners	GeoExchange BC, FortisBC Inc., BC Hydro
Overview	
Description	The Companies have committed EEC funds for a Geoexchange Energy Performance Evaluation project initiated through GeoExchange BC. The goal is to evaluate the energy savings attributable to installed geoexchange systems in MURBs and commercial and institutional buildings. This research project will evaluate the electrical and natural gas consumption in existing buildings that have been equipped with geoexchange systems for at least three years. The study will report on the performance of a number of buildings of various types in both coastal and interior climates. The matrix of selected buildings will be designed to determine if the effectiveness of geoexchange technology is significantly influenced by (i) building type and (ii) heating dominant versus load-balanced systems.
Goals	• Evaluate and monitor systems performance and prospective energy savings for geoexchange systems. This data will be used to confirm savings claims and guide the development of future programs. • Strengthen relationships with program partners.
Deliverables	A concise, professionally written report summarizing the results supported by building descriptions and energy consumption data in an appendix. The consultant will also prepare a PowerPoint presentation for use by GeoExchange BC and the project's funding partners.
Implementation	
Administration	GeoExchange BC

10.1.4.1.2.2 Westhouse Solar Demonstration Project

Westhouse Solar Demonstration Project	
Audience	FEI and FEVI customers
Commitment	$12,000
Partners	City of Vancouver ("COV"), Simon Fraser University ("SFU")
Overview	
Description	The project is a collaboration between COV, SFU and FEI to demonstrate alternative energy in a high visibility collaboration and to gain information on the operation and energy performance of the solar thermal hot water system.
Goals	• Evaluate and monitor systems performance and prospective energy savings for geoexchange systems. This data will be used to confirm savings claims and guide the development of future programs. • Strengthen relationships with program partners.

	• To demonstrate alternative energy in a high visibility collaboration and to gain information on the operation and energy performance of the solar thermal hot water system.
Deliverables	City of Vancouver along with Smallworks will provide the house and property. FEIis to provide gas service along with solar equipment; SFU is to provide monitoring for the water and energy use.
Implementation	
Evaluation Strategy	Evaluation of the commitment will be determined from the number of visitors to the site and the usefulness of data collected from the system.

10.1.4.1.2.3 CEATI's Gas Utilization Working Group Membership

CEATI's Gas Utilization Working Group Membership	
Audience	Collaboration amongst gas utilities
Duration	Q2 2010 - Q2 2011
Commitment	$4,250
Members	Manitoba Hydro, Enbridge, ATCO Gas, NRCan
Overview	
Description	The Centre for Energy Advancement through Technological Innovation ("CEATI") is an international organization of utilities (predominantly electrical) that facilitates cooperation through focused interest groups and collaborative projects. Typically, CEATI projects and topics are forward looking at developing technologies that are not mainstream to the member utilities. The overarching principle is that through collaboration, member's dollars can be leveraged to involvement in a much greater number of projects and subject areas than would otherwise be available. CEATI operates on a paid fee basis for each of the interest groups ($8,500 per interest group). Value is obtained by the members through CEATI-sponsored projects, which are funded by the member utilities on a project basis, as well as an opportunity for networking, information sharing, and unofficial collaboration on projects that members may be undertaking. In 2010, CEATI created a new working group, the Gas Utilization Working Group under the Customer Energy Solutions Interest Group. The group has identified possible areas for collaboration that include: • Solar thermal • Motion sensor thermostats • Combined heat and power ("CHP") • Gasification of biomass • Water heater technology

Goals	• Investigate the market potential and energy savings for different market-ready technologies. • Collaborate with utilities and stakeholders on potential studies, pilots, and demonstration projects. This data will be used to confirm savings claims and guide the development of future programs. • Strengthen relationships with program partners.
Implementation	
Administration	The Centre for Energy Advancement through Technological Innovation

10.1.5 INNOVATIVE TECHNOLOGIES PROGRAM AREA DETAILS

10.1.5.1 Completed Programs

10.1.5.1.1 Solar Water Heating PSECA Program

Solar Water Heating PSECA Program	
Market	Retrofit
Audience	The program applied to provincial sector buildings including schools, universities, colleges, hospitals, and crown corporations
Duration	Q2 2010 – Q4 2010
Incentive	The Companies matched the incentive offered by NRCan, which was calculated by Performance Factor x Incentive Rate x Area of Collector x Number of Collectors. The incentives offered by SolarBC, NRCan and the Companies are used towards reducing the total solar hot water project cost for the participants.
Partners	SolarBC, BC Government SolarBC worked in partnership with the province to review and recommend projects for funding qualified solar thermal systems.
Background	
Description	The BC Government and the Companies entered into a Public Sector Energy Conservation Agreement (“PSECA”) to significantly increase energy conservation and, where feasible, expand the use of alternative energy options across more than 6,500 public sector buildings in British Columbia including Crown corporations, education and health care facilities, office buildings, social housing, and other government operations. A few alternative energy options were identified as solar thermal hot water and solar air heating. The BC Government through the PSECA is working with SolarBC to fund solar thermal water and air heating systems in provincial public sector buildings including schools, universities, colleges, hospitals, and Crown corporations. To support the province with the goals listed in the PSECA, the Companies provided $372,000 for 31 solar thermal hot water systems to be installed in those public sector buildings.

Goals	• Support local, provincial, and federal governments with climate action goals, policies, and regulations. • Evaluate market-ready technologies and conduct pilot studies to validate manufacture's claims about systems performance and energy efficiency. • Monitor systems performance and prospective energy savings. This data will be used to confirm savings claims and guide the development of future programs. • Develop cost effective programs with the Innovative Technologies portfolio with a TRC greater than 1.0 that optimize the proportion of incentives over administration and marketing costs.
Controls	• Eligible solar technologies must be CSA listed. • Finished projects must be commissioned by a P. Eng.
Implementation	
Administration	SolarBC and NRCan managed applications
Communications	FEI and FEVI submitted media releases, updated web content, and program promotion through Twitter.
Evaluation Strategy	Solar water heating consumption data analysis on the 2010 programs will be conducted one year from when all systems have been installed. A user acceptance survey will be sent to applicants to gauge challenges and successes of the technology. Sub metering solutions are also being discussed to measure the actual energy saving numbers.

10.1.5.1.1.1 2010 Actuals

Table 10-4: Innovative Technologies Solar Water Heating PSECA Program 2010 Actuals

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	20	$231	$0	2,579	29,053	0%	0.2
FEVI	11	$144	$0	1,683	19,845	0%	0.3
Total	31	$375	$0	4,262	48,898	0%	0.2

10.1.5.1.1.2 Discussion of Results

The Companies have committed incentive funding in 2010 to encourage the installation of 31 solar thermal hot water projects. Since the program is administered through SolarBC and there are minimal participants, both FEI and FEVI assumed a small non-incentive expenditure. As shown above, the solar heating measures do not pass the TRC on an individual program level but, together with other programs, the program area's TRC level passes the required threshold of 1.0 as shown under the 2010 Innovative Technologies Program Area results.

10.1.5.1.1.3 2011 Forecast

Funding offered under PSECA and NRCan's ecoENERGY for Renewable Heat are no longer available; therefore, the program is closed to further applications.

10.1.5.2 Active Programs

10.1.5.2.1 Commercial NGV Demonstration Program

Commercial NGV Demonstration Program	
Market	Original Equipment Manufacturer ("OEM") vehicles
Audience	Commercial, return-to-base fleet operators such as garbage trucks, waste haulers, buses, and Class 8 tractors
Duration	Q1 2010 - Q4 2011
Incentive	Incremental vehicle cost difference between an NGV vehicle compared to its diesel equivalent, up to a maximum of 100%
Partners	N/A
Overview	
Description	To encourage the adoption of CNG and LNG as a transportation fuel. Incremental vehicle cost incentive funding up to 100% is provided to qualified fleet operators of commercial, return-to-base heavy duty vehicles. This reduces the upfront capital barrier and initiates market adoption of NGVs, while achieving environmental benefits for the Companies' customers. CNG and LNG are low carbon fuels that offer economic benefits for fleet operators when compared to high carbon diesel. Other benefits include improved air quality and reduced noise in the communities and municipalities where such fleets operate. Finally, existing and future customers benefit from the increased natural gas throughput, which produces lower delivery rates, all else being equal. This increased load helps to offset the reductions from programs in the Conventional EEC Program Area and non-NGV programs in the Innovative Technologies Program Area.
Goals	• Displace diesel fuel consumption in the heavy duty transportation sector and replace with low carbon natural gas. • Reduce upfront capital cost barriers of NGVs for heavy duty trucking fleet operators to encourage the use of CNG and LNG as transportation fuels. • Encourage market adoption of CNG and LNG as transportation fuels in BC.
Controls	• The program must conform to the portfolio requirement of a TRC score of greater than 1.0. • A Contribution Agreement must be executed between the participant and the Companies detailing the terms and conditions of the incentive payment. • 50% of the funds will be advanced upon evidence of execution of a purchase order for the vehicles. This evidence is defined as an executed purchase order sent from the customer (or lesser) to the dealer, and copied to

	FEI/FEVI. The balance of the funds will be advanced when the vehicle is placed in regular service. These funds are advanced upon the receipt of a completed document from the customer stating the vehicle has entered regular fleet service. • The Companies reserve the right to demand repayment from the customer of any or all of the incentive amounts paid to the customer, if any of the natural gas fuel system components are removed from the NGV or if the NGV is removed from operation, or is relocated outside of the Companies' service territories within a negotiated period of time. • Successful applicants must undergo a confidential credit assessment conducted by the Companies. Only applicants with an "Approved Unsecured" rating will be considered.
Status	Round one "Calls for Expression of Interest" closed Q4 2010. Round two runs from Q1 2011 through Q4 2011.
Implementation	
Administration	The Companies' staff
Communications	Narrow business-to-business focus leveraged through industry associations and heavy duty truck dealers.
Evaluation Strategy	The Companies will monitor data provided by the participants on an ongoing basis. This includes data on kilometres driven, amount of natural gas consumed, and hours of usage (if available). This data will also be used to calculate and monitor GHG emissions reductions.

10.1.5.2.1.1 2010 Actuals

Table: 10-5: Innovative Technologies Commercial NGV Demonstration Program 2010 Actuals

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	82	$5,587	$2	(162,911)	(726,396)	0%	1.4
FEVI	Not Applicable						
Total	82	$5,587	$2	(162,911)	(726,396)	0%	1.4

10.1.5.2.1.2 Discussion of Results

In 2010, the Companies provided funding from the Innovative Technologies Program Area in the amount of approximately $5.6 million for 82 NGVs. This expenditure included approximately $4.4 million for 50 LNG vehicles and $1.2 million for 32 CNG vehicles. Incentive provisions have generated significant interest from the heavy duty transportation market and the Companies successfully provided funding to four fleet operators through this program. Non-incentive expenditures realized in 2010 were minimal as the means used to attract market participants did not involve incremental labour outside of the innovative technologies manager. Sales and marketing costs associated with the development of NGV initiatives are included in existing O&M budgets as approved in the NSA resulting from the 2010 - 2011 RRA.

A free rider rate of zero percent for 2010 was used as fleet operators would not switch to NGVs without an incentive. This is primarily due to the NGV price premium of 20 to 65 percent, which creates a high upfront capital cost for the operator in comparison to diesel vehicles.

The Commercial NGV Demonstration program is different from other EEC program areas in the sense that NGVs consume incremental volumes of natural gas, rather than conserve it; however, the fuel switching from high carbon diesel to low carbon natural gas generates an overall environmental benefit through a 20 – 30 percent reduction in GHG emissions just like other innovative technology programs.[55] The net benefit to the overall economy is fewer diesel litres of fuel being consumed by the transportation sector. As a result, a load building estimate of 162,911 GJ per year was calculated for 2010.

The Commercial NGV Demonstration program has not yet attracted participants within FEVI for two main reasons. Firstly, most high mileage fleet operators are based in the Lower Mainland and central regions of BC. Secondly, the higher delivery rate of natural gas within FEVI reduces the price differential between diesel and natural gas, and the overall attractiveness of CNG and LNG as a transportation fuel.

10.1.5.2.1.3 2011 Forecast

Table 10-6: Innovative Technologies Commercial NGV Demonstration Program 2011 Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	54	$3,780	$1	(228,131)	(1,376,306)	0%	1.9
FEVI	Not Applicable						
Total	54	$3,780	$1	(228,131)	(1,376,306)	0%	1.9

10.1.5.2.1.4 Summary

The Companies have entered into contractual commitments with three new fleet operators in 2011, for a total incentive expenditure of approximately $3.8 million for 54 vehicles. This includes approximately $3 million for 34 LNG vehicles and $803,000 for 20 CNG vehicles. These operators submitted applications for EEC funding and were subsequently approved by FEI. Furthermore, these operators are reputable leaders within the transportation industry, which is an important characteristic in selecting participants who can transform the industry and promote NGV adoption. The forecast expenditures of these commitments were calculated at a level of 100 percent of the incremental vehicle cost; however, FEI expects to decrease the level

[55] GHGenius.

of the incentive over time. As more NGVs are introduced to the market, the cost premium for NGVs and the risk perception associated with NGVs should both decline accordingly.

Later in 2011, subject to the successful resolution of the uncertainty surrounding the use of EEC funding for NGV incentive, the Companies intend to initiate a 'call for expressions of interest', whereby qualified fleet operators may submit an application for NGV incentive funding. This process would be communicated through industry associations such as the British Columbia Truckers Association and OEM truck dealers such as Inland Kenworth and Peterbilt. Depending upon the number and quality of applicants, the number of participants and incentive expenditures in the Commercial NGV Demonstration program could increase from the figures in Table 10-6 above; however, the Companies may contemplate lowering its 100 percent incremental incentive amount to a lesser percentage depending upon the number of participants in 2011. The actual percentage of funding to be provided in subsequent rounds of incentive awards has not been finalized at this point in time and will be determined in consideration of how effective the program has been in initiating market transformation. The Companies may also contemplate increasing non-incentive expenditures in 2011 as the number of applicants and approved operators may increase as a second round of calls takes place, creating further administrative costs. Further, since NGV initiatives have been developed through narrow, business-to-business channels, the Companies have not yet made a request for communications plan expenditures. Depending on the number of interested applicants, the Companies may contemplate additional communication channels in the future depending upon participant levels.

10.1.5.3 Programs in Development

10.1.5.3.1 Solar Air Heating PSECA Program

Solar Air Heating PSECA Program	
Market	Retrofit
Audience	The program will apply to provincial sector buildings including schools, universities, colleges, hospitals, and Crown corporations
Duration	Q4 2010 – Q2 2011
Incentive	The Companies will match the incentive offered by NRCan, which is calculated by Performance Factor x Incentive Rate x Area of Collector. The incentives offered by PSECA and the Companies are used towards reducing the total buildings' preheating cost for the participant.
Partner	SolarBC, BC Government SolarBC works in partnership with the province to review and recommend projects for funding qualified solar thermal systems
Background	
Program Description	The BC Government and the Companies entered into a Public Sector Energy

	Conservation Agreement ("PSECA") to significantly increase energy conservation and, where feasible, expand the use of alternative energy options across more than 6,500 public sector buildings in British Columbia including Crown corporations, education and health care facilities, office buildings, social housing, and other government operations. A few alternative energy options were identified as solar thermal hot water and solar air heating. The BC Government through the PSECA is working with SolarBC to fund solar thermal water and air heating systems in provincial public sector buildings including schools, universities, colleges, hospitals, and Crown corporations. To support the province with the goals listed in the PSECA, the Companies provided $73,000 for six solar air heating systems to be installed in those public sector buildings.
Technology Description	The solar air heating ("SAH") system preheats outdoor air that is required for ventilation. This reduces the heating demand for the conventional natural gas-fired heating section in the existing rooftop air-handling unit. The SAH system cladding is installed on the south facing building wall. The solar heated outdoor air rises through the collectors to a plenum at roof level. From the plenum, the air is ducted to the intake of an existing air handler where it is further conditioned (if required) and supplied to the building through the existing supply ductwork. Modulating dampers were included in the design to balance the temperature of the air during warmer weather. During summer months, when the outdoor air does not require heating, the SAH system is bypassed.
Goals	• Support local, provincial, and federal governments with climate action goals, policies, and regulations. • Evaluate market-ready technologies and conduct pilot studies to validate manufacturer's claims about systems performance and energy efficiency. • Coordinate measurement solutions with internal departments and/or third party companies to monitor systems performance and actual energy savings. This data will be used to validate energy savings claims and guide the development of future programs to a larger group of customers. • Strengthen relationships with program partners.
Controls	• Eligible solar technologies must be CSA listed. • Finished projects must be commissioned by a P. Eng. • Applicants that have the system installed after April 30, 2011 will not receive the incentive.
Implementation	
Administration	Program participation was facilitated through SolarBC and the BC Government. Applications were administered through NRCan and SolarBC.
Communications	Communications strategy initiated by SolarBC and the BC Government.

Evaluation Strategy	Consumption data analysis on the 2011 programs will be conducted one year from when all systems have been installed. A user acceptance survey will be sent to applicants to gauge challenges and successes of the technology. Sub metering solutions are also being discussed to measure the actual energy saving numbers.

As referenced in the 2009 Annual Report, the innovative technologies portfolio is not limited to developing programs for the preselected list of technologies such as solar thermal DHW systems, GSHPs, hydronic systems, sterling engines, or micro co-generation. The innovative technologies portfolio can include and evaluate additional technologies that have the potential for natural gas energy savings. One of the technologies that surfaced later in 2010 was dolar air heat through the Solar Air Heating PSECA program, and was therefore not forecasted in 2010. Solar air heat can be considered an emerging technology as there has been minimal exposure within British Columbia, but it is available commercially and can offer substantial natural gas energy savings.

10.1.5.3.1.1 2010 Actuals

The Solar Air Heating PSECA program was established in Q4 2010; therefore, no incentives were issued in 2010. Program incentives for the Solar Air Heating PSECA program are committed for 2011.

10.1.5.3.2 2011 Forecast

Table 10-7: Innovative Technologies Solar Air Heating PSECA Program 2011 Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	6	$73	$5	1,458	17,817	0%	0.4
FEVI	Not Applicable						
Total	6	$73	$5	1,458	17,817	0%	0.4

10.1.5.3.2.1 Summary

Solar air heat is included in the Innovative Technologies Program Area as there has been minimal exposure within British Columbia, but it is available commercially and may offer substantial natural gas energy savings. Since solar air technology is an emerging technology, there is a lack of information on system performance and energy savings within BC's climate. The baseline information provided through NRCans' RETScreen simulation tool supports the energy savings potential with this technology and manufacturer's claims. Further evaluation and sub-metering solutions are being discussed to measure the actual energy savings numbers and to support further program development.

The Companies have committed incentive funding in 2011 to encourage the installation of six solar air projects. Since the program is administered through SolarBC, the Companies did not assume a large non-incentive expenditure.

10.1.5.3.3 SolarBC Schools Incentive Program

SolarBC Schools Incentive Program	
Market	Retrofit
Audience	The program will apply to selected solar thermal hot water school projects administered by SolarBC with natural gas as a backup
Duration	Q4 2010 – Q1 2011
Incentive	The Companies will match the incentive offered by NRCan, which is calculated by Performance Factor x Incentive Rate x Area of Collector x Number of Collectors; therefore, the incentives vary per applicant. The incentives offered by SolarBC, NRCan, and the Companies are used towards reducing the total solar hot water project cost for the participant.
Partner	SolarBC
Overview	
Description	SolarBC, in collaboration with the Province of British Columbia, has initiated a Solar for Schools program to help reduce the carbon footprint and energy costs for schools, as well as providing a teaching opportunity about the possibilities for renewable energy usage and employment opportunities in the renewable energy sector. The Province of British Columbia provided $950,000 to encourage the installation of solar projects in schools through the SolarBC Program. Funding through SolarBC can be up to 90% of a project to a maximum of $20,000 per school across the province. The projects are approved via an application process through SolarBC. To support the province with those goals, the Companies committed $27,000 for eight solar thermal hot water systems to be installed in those schools.
Goals	• Increase the awareness of conservation as well as educating students and teachers on the benefits of solar hot water for domestic water heating within British Columbia's climate. • Support local, provincial, and federal governments with climate action goals, policies, and regulations. • Evaluate market-ready technologies and conduct pilot studies to validate manufacturer's claims about systems performance and energy efficiency. • Promote the continued growth and availability of local certified solar contractors throughout BC. • Encourage best installation practices to improve the quality and performance of the solar thermal hot water systems.

	• Strengthen relationships with program partners.
Controls	• Schools outside of FEI and FEVI's service territories are not eligible. • All systems require installation completed by a certified Canadian Solar Industries Association ("CanSIA") installer. • All collectors installed must be on the list of accepted solar collectors found at http://www.ecoaction.gc.ca/ecoenergy-ecoenergie/heat-chauffage/v2008/collectors-capteurs-eng.cfm. • 100% of the approved incentive will be advanced upon the receipt of an eco energy commissioning report, which is proof the solar hot water system has been successfully installed. • Consumption Analysis Test – the applicant's DHW assumptions need to be less than or equal to 5% of total GJ consumption to qualify for incentive. (*Based on Natural Resources Canada, Educational Services total natural gas [GJ] the average % DHW is 20% of the total natural gas consumption*.) For schools, since the average solar thermal system handles up to 20% of DHW load, the Companies felt it was conservative to add a control as a way to ratify GJ energy savings provided by the applicant. If the savings are stated to be greater than 5%, further analysis is required to determine building size and end use.
Implementation	
Administration	All applicants were administered through SolarBC and incentives approved through FEI and FEVI.
Communications	Communications to drive participation was facilitated through SolarBC.
Evaluation Strategy	Consumption data analysis on the 2010 programs will be conducted one year from when all systems have been installed.

10.1.5.3.3.1 2010 Actuals

The SolarBC Schools Incentive program was established in Q4 2010; therefore, no incentives were issued in 2010. Program incentives for the SolarBC Schools Incentive program are committed for 2011.

10.1.5.3.3.2 2011 Forecast

Table 10-8: Innovative Technologies SolarBC Schools Incentive Program 2011 Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	6	$22	$0	265	3,042	0%	0.2
FEVI	2	$5	$0	61	716	0%	0.2
Total	8	$27	$0	326	3,758	0%	0.2

10.1.5.3.3.3 Summary

FEI and FEVI have committed incentive funding in 2011 to encourage the installation of eight solar thermal hot water projects for schools. Since the program is administered through SolarBC and there are minimal participants, neither FEI nor FEVI assumed a large non-incentive expenditure.

10.1.5.3.4 Solar Residential Hot Water – PILOT PROGRAM

Solar Residential Hot Water – PILOT PROGRAM	
Market	Retrofit and new construction
Audience	The program will apply to residential applications within FEI's natural gas service area in Vancouver
Duration	Q1 2010 – Q4 2011
Incentive	$1,666 per approved application The level of incentives per participant works out to $1,666 each. This amount, along with $1,333 in partnership incentives, brings the total incentives for solar thermal hot water to $3,000 per system, which offsets approximately 43% of the installation costs.
Partner	City of Vancouver, Offsetters
Background	
Description	The City of Vancouver ("COV") has set in motion a solar hot water pilot program geared to prove the viability of solar energy in our climate for 30 residential applications. Their goals are to increase the adoption of solar hot water ("SHW"), reduce the city's carbon footprint, and create new green jobs. FEI, SolarBC, and Offsetters have partnered with the COV on this pilot initiative to gather real data on the performance and energy savings of SHW systems within this climate. The data will be used to confirm the viability of offering an EEC SHW residential program within British Columbia.
Goals	• Support local, provincial, and federal governments with climate action goals, policies, and regulations. • Measure and verify manufacturer's claims about systems performance and energy savings for selected residential homes within the City of Vancouver. This data will be used as the baseline to confirm savings claims and guide the development of future programs throughout BC. • Increase the awareness of and educate homeowners on the benefits of SHW for domestic water heating within BC's climate. • Promote the continued growth and availability of local certified solar contractors throughout BC. • Encourage best installation practices to improve the quality and performance of the solar systems. • Strengthen relationships with program partners.

Implementation	
Administration	Program participation and application processing is administered through Eaga and financed through SolarBC until March 31, 2011. After March 31, 2011 continued Eaga support will be financed through the COV.
Communications	FEI submitted media releases, updated web content, and promoted this pilot through Twitter.
Evaluation Strategy	Consumption data analysis on the 2010 programs will be conducted one year from when all systems have been installed. A user acceptance survey will be sent to applicants to gauge challenges and successes of the technology. Sub metering solutions are also being discussed to measure the actual energy saving numbers.

10.1.5.3.4.1 2011 Forecast

Table 10-9: Innovative Technologies Solar Residential Hot Water Pilot Program 2011 Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	30	$50	$26	420	4,829	0%	0.2
FEVI	Not Applicable						
Total	30	$50	$26	420	4,829	0%	0.2

10.1.5.3.4.2 Summary

FEI have committed $50,000 in 2011 to encourage the installation of 30 solar thermal hot water projects for residential homes within the City of Vancouver area. FEI also committed $26,000 for monitoring four of those solar thermal systems in order to measure and verify manufacturer's claims about systems performance and energy savings.

10.1.5.3.5 City of Vancouver ("COV") Multi Unit Residential Building ("MURB") – PILOT PROGRAM

COV MURB – PILOT PROGRAM	
Market	Retrofit
Audience	FEI Multi Unit Residential Buildings
Duration	Q2 2011 – Q4 2012
Incentive	To be determined
Partner	City of Vancouver

Background	
Description	The COV has set in motion a MURB pilot program intended to prove the viability of solar hot water ("SHW") along with ventilation controls and piping insulation in our climate for 15 MURBs. Their goals are to increase the adoption of SHW, reduce the city's carbon footprint, and create new green jobs. FEI has partnered with the COV on this pilot initiative to gather real data on the performance and energy savings of SHW systems for multi unit residential buildings within this climate. The data will be used to confirm the viability of offering an EEC SHW MURB program within British Columbia.
Goals	• Support local, provincial, and federal governments with climate action goals, policies, and regulations. • Evaluate market-ready technologies and conduct pilot studies to validate manufacture's claims about systems performance and energy efficiency. • Coordinate measurement solutions with internal departments and/or third party companies to monitor systems performance and prospective energy savings. This data will be used to confirm savings claims and guide the development of future programs. • Strengthen relationships with program partners.
Implementation	
Administration	City of Vancouver
Communications	To be determined.
Evaluation Strategy	Consumption data analysis on the 2010 programs will be conducted one year from when all systems have been installed. A user acceptance survey will be sent to applicants to gauge challenges and successes of the technology.

10.1.6 SUMMARY

Innovative technologies represent an important component of the Companies' overall commitment to EEC activities. Since being staffed with a manager at the end of Q2 2010, the Companies have enhanced the program's framework, established relationships with key industry stakeholders, and evaluated market-ready technologies. Approximately $5.9 million of the EEC funds were committed in 2010 to support local, provincial, and federal governments with climate action goals, policies, and regulations, as well as establishing evaluation best practices to monitor systems performance and prospective energy savings. The Companies will further evaluate program design and continue to investigate, evaluate, and pilot market-ready technologies such as solar thermal hot water, solar air heating, and others in 2011. Subject to the successful resolution of the uncertainty surrounding NGV incentive funding arising as a result of the Commission's recent commentary on this issue, the Companies also intend to initiate a 'call for expressions of interest' whereby qualified fleet operators can submit applications for 2011 CNG and LNG incentive funding. The weighted TRC ratio for the entire

Innovative Technologies Program Area for both 2010 and 2011 is positive and meets the Commission's directives in Order No. 141-09 for innovative technologies to have a weighted TRC score of 1.0 or more on a portfolio level.

10.2 Funding for NGV Initiatives

10.2.1 DEFINITION

NGVs represent an important element of the Innovative Technology Program Area, and the favourable TRC of NGV related incentives has contributed in a large measure to the favourable TRC of the overall Innovative Technology portfolio. This Section specifically deals with the Commission's recent comments regarding whether FEI has approval to proceed with NGV related programs. It provides additional information regarding why the Companies believe that they are compliant with past Commission orders, and also provides further information about the benefits associated with the funding which have contributed to stakeholder support for these initiatives. It is the hope of the Companies that the Commission will be able to quickly provide confirmation of the Companies' compliance with past orders without additional process. Alternatively, if the Commission is unable to provide this confirmation, the Companies respectfully request that the Commission provide its concurrence for the Companies to proceed with EEC incentive funding to customers to offset the incremental cost of buying an NGV over a standard gasoline or diesel vehicle. The Companies respectfully submit that this concurrence to proceed could also be provided without additional process since the benefits of EEC incentive funding for NGV are clear, accord with Commission-approved EEC principles, exceed the Commission-approved tests for evaluating EEC funding, and have the support of stakeholders.

This section is organized as follows:

- The Companies first set out the Commission's comments that gave rise to this issue, and provide their views as to why this matter is most appropriately resolved in the context of this Report; and
- The Companies then outline the key elements of past decisions that support the Companies' actions to date, and support the continued use of cost effective NGV incentives.

10.2.2 COMMISSION'S COMMENTS ON FUNDING FOR NGVS AND NEED FOR QUICK RESOLUTION

On January 14, 2011, the Commission released its Order No. G-6-11 and decision ("Interim Decision"), which approved a CNG Fueling Station Installation and Operating Agreement between FEI and Waste Management of Canada Corporation on an interim basis, subject to certain conditions. In this Interim Decision, the Commission raised a potential issue with respect to the use of EEC incentives for NGV vehicle reimbursement. The Commission's Interim Decision, Appendix A, page 5, stated:

> *"The Commission Panel is not presently persuaded that Terasen has Commission approval for the incentive grant to Waste Management that is described under Vehicle Reimbursement in the WM Agreement. Directive 2 of Order G-36-09 explicitly rejected expenditures for Natural Gas Vehicles. The Negotiated Settlement approved by Order G-141-09 approved Rate Schedule 26 – NGV Transportation Service and marketing costs in support of NGV. Terasen withdrew its other requests related to NGV. Rate Schedules 6 and 26 provide for NGV incentive grants, but it seems unlikely that Waste Management will use these Rate Schedules. Therefore, the Commission Panel believes that Terasen is at risk of not being able to recover incentive payments to Waste Management in its rates."*

As FEI outlined in its response to BCUC CONFIDENTIAL IR 1.4.1, contained in the Application for Approval for a Service Agreement for Compressed Natural Gas Service and for Approval of General Terms and Conditions for Compressed Natural Gas Liquefied Natural Gas Service, dated December 20, 2010, that TGI intended "to continue meeting its reporting commitments by reporting in the next annual EEC report on the WM funding, and any matters relating to TGI's use of EEC funding should be addressed at that time…". The Commission did not have the benefit of a complete background and analysis when it made its comments regarding EEC funding for NGVs, and recognized that "the incentive payments are outside the scope of the review of the WM Agreement"[56] in its Interim Decision.

What follows below is our commitment to provide all information related to why we believe we have acted within the guidelines and approvals of past regulatory decisions related to EEC, specifically to the use of EEC incentives for NGVs. The information included in this Report adds to the information available on the record in the proceeding where the Commission made its comment about EEC funding. As such, there is now a complete record on which the Commission can determine this issue.

The Companies submit that this Report is the most appropriate forum to seek concurrence on this issue, rather than deferring the matter to the upcoming revenue requirements application, for four reasons:

1. The first expenditures from the EEC funding envelope for NGV occurred in 2010, to which this Report speaks. The individual spend by program areas is contained within this Report along with the individual and portfolio level TRC to which EEC incentives for NGV contribute.
2. The EEC Annual Report was established to ensure the Companies are operating within the guidelines and approvals established in Order No. G-36-09 and sequence Orders G-140-09 and 141-09.
3. The Companies have put further EEC incentive awards for NGVs on hold until the uncertainty is resolved. Prolonged delays in resolving this matter will likely delay the delivery rate benefits obtained by existing non-bypass customers associated with building cost-effective load, delay the benefits achieved by new NGV customers from reduced

[56] Order No. G-6-11 Appendix A page 5.

transportation costs, and delay GHG emissions reductions in BC. These delays could potentially derail NGV initiatives (and its associated benefits) completely if fleet operators adopt conventional or viable alternative technologies.

4. The Companies' position for why we believe we have approvals to use EEC funds for NGVs is contained below and this makes for an efficient and less costly process to resolve this issue for all parties involved.

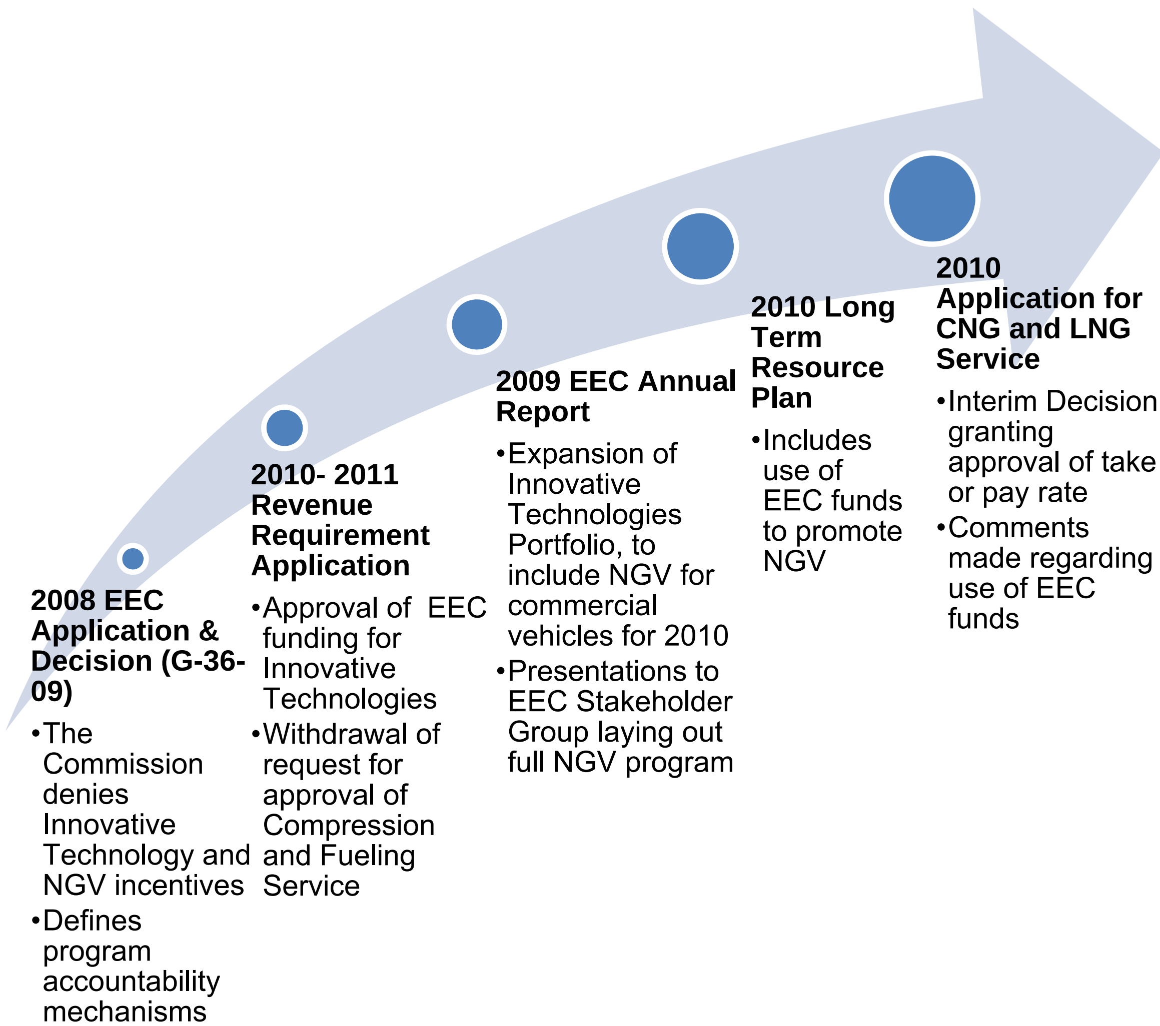
The Companies have support from key stakeholders for the quick resolution of this uncertainty resulting from the Commission's interim order on Waste Management, and the re-initiation of NGV incentive programs. As a result of a recent EEC Stakeholder Group held March 15, 2011, FEI has received letters from multiple members of the Stakeholders Group supporting FEI has followed the established process in the use of EEC funding (Please see Appendix F for copies of these letters). The Companies thus submit that the necessary information is now available to address this issue in a meaningful way.

10.2.3 RELEVANT COMMISSION APPROVALS

There have been a number of regulatory events that led up to the Companies providing NGV funding. In this section the Companies outline the key aspects of past Commission orders that support NGV funding. As explained in detail below, FEI believes that the use of Innovative Technologies Program Area EEC funding for NGV initiatives is consistent with previous Commission decisions (Orders G-36-09, G-141-09, and G-140-09), and that FEI has been open and transparent with stakeholders about EEC activities and expenditures, including the use of EEC incentives for NGV.

The following diagram summarizes the sequence of regulatory proceedings and events that touch on EEC funding.

Figure 10-1: Timeline of Regulatory Proceedings Related to EEC Funds and NGV



Each of these regulatory events and how they impact the Companies' use of EEC funds for NGVs is discussed in detail in the remainder of this Section, which is structured as follows:

1. EEC Application and Decision (Order No. G-36-09, dated April 16, 2009)
    a) Rejecting EEC funding for the Innovative Technology Portfolio, including Natural Gas Vehicles
    b) Recognizing and establishing principles applicable for developing further programs within the Innovative Technologies Program Area, including that
        i. Programs on a portfolio level must meet an established threshold

ii. Innovative Technologies Program Area brings forward the benefit of lower GHG emissions by promoting low carbon technologies

c) Setting up mechanisms for introducing new programs and making refinements to existing programs through the Commission approved accountability and oversight measures, including

i. Stakeholder Input and Reporting
ii. The Company's ability to transfer funds between program areas within the EEC funding envelope.

2. The 2010/2011 Revenue Requirements Application ("RRA") and Negotiated Settlement Agreement ("NSA") (Order No. G-141-09 and G-140-09, dated November 26, 2009)

a) Two Distinct Proposals Presented in the 2010/2011 RRAs for EEC and NGV fuelling station infrastructure, and the one that was withdrawn in the NSA did not relate to EEC

- Items 11 and 12 of the NSA for FEI are for EEC initiatives and programs. Items 6 and 7 of the NSA for FEVI are for EEC initiatives and programs

- Item 14 of the NSA for FEI, which the Commission has alluded to in its recent Decision accompanying Order No. G-6-11 as having been withdrawn, is NGV for fuelling and transportation service (delivery on the FEI system), not EEC funds for NGV. Also, item 9 of the NSA for FEVI is NGV for fuelling and transportation service (delivery on the FEI system), not EEC funds for NGV.

i. Increased EEC Funding Approvals for 2010 and 2011, including Innovative Technology and Industrial Programs and Innovative Technology programs are to be evaluated as a separate portfolio

ii. Withdrawal of NGV Rate Offering, not related to EEC funds

3. Adhering to the principles and framework established by Commission Decisions with regard to the use of EEC funds for NGVs

a) Favourable TRC Ratio
b) GHG emissions reductions benefits
c) Broad support from EEC Stakeholder Group Consultation
d) Openness and transparency in the 2009 EEC Annual Report and 2010 Long Term Resource Plan

Each of these topic areas are discussed in detail below.

10.2.3.1 EEC Application and Decision

The Companies filed an EEC Application on May 28, 2008. On April 16, 2009, the Commission issued Commission Order No. G-36-09 (the "EEC Decision"). While the specific request for

Innovative Technology funding was denied, the Decision established important principles and framework as to how FEI should evaluate EEC programs (primarily the TRC test, on a portfolio basis), and established a specific regulatory mechanism for overseeing the Company's use of EEC funding (the EEC stakeholder committee). These approvals become important later in the chronology, as the NGV funding meets the approved test for evaluating EEC funding, and the use of EEC funding for incentives was presented to, vetted by, and generally supported by, the stakeholder committee as confirmed by the letters of support filed with this Report.

10.2.3.1.1 Rejection of the Innovative Technology Portfolio Including Natural Gas Vehicles

In the EEC Application, funding for NGV initiatives was sought under the umbrella of "Innovative Technologies, NGV and Measurement", because all these programs aim "to foster and further the deployment of forward-looking low carbon technologies" (Page 69 of the EEC Application). In the EEC Decision, the Commission rejected funding for the Innovative Technology, NGV and Measurement Program Area based on "insufficient evidence" at that time. In particular, the EEC Decision (on Page 26) states:

> *…Terasen acknowledges that further refinement of this program is required and indicates uncertainty as to whether an effective program can be developed over the funding timeframe. The Commission Panel finds that there is insufficient evidence with respect to the nature and scope of the proposed program, and accordingly rejects the Innovative Technologies, NGV and Measurement program expenditures at this time. Terasen may wish to bring forward projects in this program area for consideration as they become more fully developed.*

Thus, although the Commission rejected the funding "at this time," it did not reject the possibilities that NGV programs be developed. Additionally, there are two other relevant parts of the EEC Decision, discussed in the following paragraphs: (1) the approval of the TRC test for evaluating programs by adopting the portfolio approach, and (2) the EEC stakeholder group being established as the means of efficiently reviewing EEC program spending.

10.2.3.1.2 Recognition and Establishment of Certain Principles

The Commission granted a number of other approvals, significant among which for the current issue was the approval of a method for evaluating EEC initiatives. The EEC incentives for NGVs meet the approved tests.

10.2.3.1.2.1 TRC Meets the Established Threshold

FEI assesses all EEC funding according to the framework established in the EEC Decision, which involves, among other things, the application of TRC test, which measures the cost-effectiveness of the EEC programs.

The Commission discussed the application of a TRC at page 34 of the EEC Decision:

> *The Commission Panel also takes note of the DSM Regulation which will apply to Terasen as of June 01, 2009 requiring the Commission to use, in addition to any other test it considers appropriate, the TRC test in determining whether a demand-side measure is cost-effective. While the DSM Regulation is not in effect for the purposes of this EEC Decision, the Commission Panel does consider the TRC test to be appropriate and adequate for the purposes of this Application and accepts it as such.*

Furthermore, the Commission accepted a portfolio level approach when considering the TRC ratio. That is, all EEC programs, on an overall combined level, rather than on individual initiatives or programs, should achieve a portfolio TRC level of 1.0 or greater.

Thus, the cost effectiveness of EEC expenditure is evaluated as a whole, on the portfolio level, which must have a TRC test of one or greater.

Please refer to Table 10-2 which shows the TRC for the Innovative Technologies portfolio as a whole including the Commercial NGV Demonstration program for 2010.

10.2.3.1.2.2 GHG Emissions Reduction by Promoting Fuel Switching From Higher Carbon Fuel to a Lower Carbon Fuel

In the EEC Application, FEI and FEVI had applied for approval of funding to encourage the adoption of natural gas as a fuel instead of both higher carbon fuels and electricity in the residential sector. The Commission accepted the former, and rejected the latter. As per page 18 of the EEC Decision:

> *The Commission Panel accepts EEC expenditures directed at fuel switching from fossil fuels with a higher carbon content than that of natural gas.*

We acknowledge that fuel switching was addressed in the EEC Application in the context of the residential sector, and that this statement did not represent Commission approval to pursue fuel switching in the transportation sector. (The Companies submit that the approval to do so came later, following upon the Commission's approval of the 2010-2011 Revenue Requirements Application Negotiated Settlement Agreement.) However, this recognition of the benefits of high to low carbon fuel switching speaks to the Companies' rationale for pursuing NGV incentives. Not only does using NGV technologies in the transportation section move customers from higher carbon fuel such as diesel to low carbon natural gas, but also the principles underlying the fuel switching and underlying all the Innovative Technologies Program Area are consistent – reduction of the GHG emissions. Please refer to Section 10.2.3.3.2, which outlines the GHG emissions reduction in 2010 from providing EEC incentives to NGVs.

Since the EEC Decision was issued, Government enacted the *Clean Energy Act ("CEA").* Reducing GHG emissions in BC is one of the main objectives of the provincial government, as outlined in the *CEA*. In fact, the *CEA* includes as one of "British Columbia's energy objectives"

GHG emissions reduction by high-to-low carbon fuel switching, which is directly applicable to NGVs.[57]

This, too, speaks to FEI's rationale for looking to the transportation sector as a potential target for EEC incentives.

10.2.3.1.3 Commission Approved Accountability Mechanisms for Introducing New Programs, and Refining Existing programs

The EEC Decision also included approvals of mechanisms that would ensure accountability for EEC expenditures. The approval for accountability mechanisms is more efficient than the Companies seeking Commission approvals each time funding was redirected, while, similar to the approval of inter and intra program area funding transfers, providing flexibility to the Companies in managing and developing EEC programs.

These approvals are important in the current context, not because they approved spending on NGV incentives, but because the Companies followed this framework once funding for Innovative Technologies incentives was approved in the 2010-2011 RRA NSA. By following this framework, the Companies have kept stakeholders fully apprised of our intentions regarding NGV incentives, and stakeholders have had input in to how it was done.

10.2.3.1.3.1 Stakeholder Input and Reporting

In the EEC Application, the Companies proposed accountability mechanisms for managing the funds approved for EEC programs. Specifically, the EEC Decision, at page 41, summarizes what was proposed:

> *In this Application the Companies have recognized the need for accountability for the funds approved for EEC programs. First, any funds not spent will not be charged to the regulatory asset deferral account. Second, the Companies intend to monitor the portfolio TRC on a monthly basis, and have proposed to file an Annual EEC Report with the Commission by the end of the first quarter every year. The Report will detail program activity, expenditures, and cost-benefit results for the previous year, as well as describe program activity and provide forecasts for the upcoming year. Third, in the event that the relief sought is granted, the Companies would form and engage an EEC stakeholder group with membership representing a broad cross section of stakeholders identified in the Application. Fourth, the Companies have indicated their intention to hold annual EEC workshops with stakeholders, at which the Companies would present updates on program progress and obtain stakeholder input on new programs and refinements to existing programs. [Emphasis added]*

Interveners supported this funding approach, as stated on page 41 of the EEC Decision:

> *BCSEA-BCSC states that they: ". . . support this [funding] approach, noting that the proposed accountability mechanisms are designed to be more effective and efficient than*

[57] Clean Energy Act, section 2, "British Columbia's energy objectives"

> *having on-going Commission involvement in decision-making within the portfolio during the Funding Period" and "BCSEA-SCBC acknowledge and support the additional accountability mechanisms proposed by Terasen in [Terasen Argument] paragraph 112." (BCSEA-SCBC Argument, pp. 5, 20)*

The Commission accepted these accountability mechanisms on page 42 of the EEC Decision:

> *The Commission Panel accepts Terasen's accountability undertakings, and considers that, while the proposal to evaluate the EEC project using the TRC test at the Portfolio level has been accepted, TRC calculations for each program area, initiative and measure should also be included in the accountability reporting as a means of assessing the components of the Project and their ongoing effectiveness.*

Once the 2010-2011 RRA NSA was in place, with its recognition of funding for Innovative Technologies, the Companies employed the accountability mechanisms approved in the EEC Decision for Innovative Technologies in the same manner as with all other EEC spending. For the Commercial NGV Demonstration program, the EEC Stakeholder Group was consulted on three occasions, as outlined below in Section 10.2.3.3.2.1.

10.2.3.1.3.2 Flexibility to Manage Funds for Approved Program Areas

With accountability mechanisms in place, FEI believes that the Companies should be provided the flexibility in managing the approved funds to further achieve efficiency. In the EEC Application, the Companies state:[58]

> *…that it is most efficient for the Commission to approve the overall expenditure level, by utility, for the Funding Period, rather than approving the funding by program area, or by individual program initiative. <u>This approach will allow the Companies' to respond quickly to changes within initiatives and to new opportunities that might arise.</u> For example, if a particular initiative within the commercial energy efficiency program area has a higher than expected number of participants, and a strong cost-benefit ratio, the Companies would like to have the ability to shift funds from another, underutilized program area to that commercial energy efficiency initiative, without coming back to the Commission for approval to do so. Not only will this allow the Companies' to respond quickly to opportunities, <u>it will also reduce the Companies' administrative burden related to EEC activity, and both the speed of response and reduced administrative burden will increase the value to customers of the Companies' EEC activity.</u>* [Emphasis Added]

The EEC expenditures approved in the EEC Decision are part of a funding envelope to develop and implement programs that conform to meeting the portfolio TRC of one or greater than one, and FEI has the ability to transfer funds to where it makes the most sense provided it can be

---

[58] EEC Application, at pages 50 and 51

justified after the fact in a Report. FEI requires the flexibility to move funds to programs like the EEC expenditures for natural gas vehicles so that programs can be designed and implemented efficiently within an approved funding envelope. The measure for determining whether or not the expenditure was made appropriately is the TRC test, and FEI's reporting obligations permit the regular assessment of FEI's expenditures. The Commission addressed reporting obligations on page 42 of the EEC Decision, and expressly anticipated that shift in funding within the overall approved envelope would be allowed provided that such a transfer is transparent and supported with reasons:

> *Commission Panel directs that the annual EEC Report include the following:*
>
> *• TRC, RIM, UC, and Participant test calculations of DSM at the Program Area initiative and individual measure levels in addition to the total Portfolio level reporting. Reporting of the Residential & Commercial EE program areas should also be made at the New Construction and Retrofit levels.*
>
> *• <u>any inter and intra Program Area initiative funding transfers, with supporting rationale, and the impact of such transfers on the transferor and transferee Program areas, initiatives, and measures as the case may be</u>.* [Emphasis Added]
>
> *• data for fuel switching programs should be tracked in a manner which allows for reporting types of fuels replaced by natural gas, including estimated GHG impacts.*

While this direction does not authorize spending outside of Commission-approved Program Areas, it does speak to the use of funds within those approved areas being managed by the Companies, with accountability to the EEC Stakeholder Group regarding the funding decisions as part of the annual reporting. Once the 2010-2011 RRA NSA was in place, with its recognition of funding for Innovative Technologies, FEI proceeded to design incentive programs and used EEC incentives in line with the approved tests. The oversight of those decisions occurred in the context of the EEC Stakeholder Group, in the same manner as with all other EEC spending. For the Commercial NGV Demonstration program, the EEC Stakeholder Group was consulted on three occasions, as outlined below in Section 10.2.3.3.2.1.

As described in the Evaluation Strategy of the Commercial NGV Demonstration program (in Section 10.1.5.2), fuel consumption data will be tracked and reviewed annually to determine fuel switching benefits and program roll-out approaches. This data will be used to calculate and monitor the estimated GHG emission reduction benefits.

10.2.3.1.4 <u>Summary: Providing EEC Incentives to Natural Gas Vehicles is Consistent with the Principles Contained in the EEC Decision</u>

While the EEC Decision rejected specific funding for the Innovative Technologies Program Area, the Decision establishes certain principles and provides framework for the Company to consider when developing and bringing forward programs in this Program Area. Specifically, the Commission:

- Recognized the benefits of high to low carbon fuel switching in the residential context;

- Adopted the use of TRC test on a portfolio level to assess the cost-effectiveness of the EEC programs;
- Approved the proposed accountability mechanisms to oversee the use of funds for approved Program Areas, including annual report to the Commission and consultation with Stakeholder groups, for development of new programs and refinement to existing programs; and
- Accorded the Companies flexibility to manage the funds subject to the accountability mechanisms.

Following the approval of the EEC funding for Innovative Technologies Program Area in the 2010-2011 Revenue Requirement Application proceeding, the Company developed the NGV programs using EEC funding consistent with these principles and the framework.

10.2.3.2 2010-2011 Revenue Requirements Application and Negotiated Settlement Agreements

Subsequent to Commission's Order No. G-36-09 in which the Commission left it open to the Companies to propose Innovative Technology programs, FEI and FEVI sought increased EEC funding approval to add specific programs under Innovative Technologies and Industrial Program Area in their respective 2010-2011 Revenue Requirements Applications. As discussed below, the settlement agreements that resolved these Revenue Requirements Applications included Innovative Technology funding envelope based on the Companies' proposal.

In several responses to Information Requests issued in the Revenue Requirements Applications regarding NGVs, the Companies expressed its intent to use different sources of incentive funding to overcome the high fleet conversion costs and limited number of OEM vehicles, including grants already available and "all available funding opportunities", a reference to using EEC funding that had been proposed. For example, in response to BCUC IR 1.34.2 in the RRA proceeding, FEI stated:

> *TGI intends to meet the other potential obstacles by providing grants, and ensuring that all available funding opportunities are used.*

Both applications were subject to Negotiated Settlement Agreements. On November 26, 2009, the Commission released Order No. G-141-09 and G-140-09 approving NSAs for FEI and FEVI respectively. Thus, the total funding envelope for EEC increased with these two decisions; however, the underlying principle contained in Order No. G-36-09 must be adhered to in order to make use of these funds.

The Commission's approved the NSA's included the approval of EEC funding for Innovative Technologies for FEI and FEVI for 2010 and 2011. These approvals are explicitly described in Items 11 and 12 in the FEI's NSA and Items 6 and 7 in the FEVI's NSA.

Associated with these approvals, both NSAs state that:

> *…the Innovative Technologies Programs will be managed by [the Companies] as a separate segment of the overall portfolio to have a weighted average Total Resource*

> *Cost ("TRC") of 1.0 or more. [The Companies] will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee.*

The last sentence suggests that the Companies will continue to work with the EEC stakeholders to develop or refine programs/applications to achieve the established TRC threshold. This conforms to the principle and framework provided under the EEC Decision. NGV incentives, because of having a TRC well above 1.0, make a significant contribution to ensuring that the Innovative Technologies portfolio maintains a portfolio TRC greater than 1.0.

10.2.3.2.1 Two Distinct proposals presented in the 2010-2011 RRA for EEC Funding and NGV Rate Offerings

In its Reasons for Decision, accompanying Order No. G-6-11, the Commission commented that in the 2010-2011 RRA proceedings, the Companies "withdrew its other requests related to NGV" besides incentive grants under Rate Schedules 6 and 26.[59] The Companies respectfully submit that the Commission's comments reflect that it mixes two distinct issues addressed in separate sections of the NSAs: EEC funding and NGV rate offerings. The NSA granted express approval of the EEC funding requests.

In their respective Revenue Requirement Applications, the Companies made two distinct requests for approval: (1) EEC funding for Innovative Technologies Program Area, and (2) NGV Rate Offerings. For instance, in FEI's RRA (dated June 15, 2009 at page 227), FEI submitted six separate proposals in the context of its EEC and Alternative Energy Solutions initiatives. Two of these distinct proposals are:

> *" 1. Increase EEC funding for 2010 over the currently-approved EEC funding to add interruptible Industrial customer programs and Innovative Technologies programs to the EEC portfolio, with all funding subject to the same financial treatment as approved in the EEC Decision;*
>
> *5. Approval of Tariffs for Rate Schedule 6C – Natural Gas Compression and Refuelling Service and Rate Schedule 26 – Natural Gas Vehicle Transportation Service, and subsequently the cancellation of Rate Schedule 6A – General Service – Vehicle Refuelling Service."*

Item 5 listed above pertains to "Natural Gas Vehicle Rate Offerings", which FEI further described in its 2010-2011 RRA.[60] Specifically, FEI sought approval of Rate Schedule 6C – Compression and Refuelling Service, Rate Schedule 26 – NGV Transportation Service, and their supporting activities - Compression Service ("CS") test parameters and a NGV non-rate base deferral account. The requests for EEC funding and for natural gas vehicle rate offers are independent of each other in the context of the RRA.

---

[59] Order No. G-6-11, at page 5.
[60] FEI 2010-2011 RRA at pages 238 to 249.

10.2.3.2.1.1 EEC Funding Increase Request

The EEC funding request was approved in FEI's NSA, as Item 11 and Item 12 for FEI's NSA as Items 6 and 7. For example, Item 11 of the NSA is outlined here:

11. Energy Efficiency and Conservation ("EEC") Funding for 2010

The Parties agree as follows in respect of the EEC funding sought by TGI for 2010:

(a) TGI will reallocate from residential and commercial EEC programs an additional $1.6 million from the amount approved for 2010 in the EEC Decision[61] to low income and rental housing programs. This brings the total for low income and rental housing programs to $2.4 million for 2010.

(b) EEC funding for industrial interruptible programs for 2010 will be $435,000, which is the amount requested by TGI in the Application.

(c) EEC funding for innovative technologies will be $2.3 million for 2010, which is the amount requested by TGI in the Application.

(d) All agreed to EEC expenditures will be considered and evaluated within the existing portfolio, and be subject to the same financial treatment, as per the Commission's EEC Decision dated April 16, 2009 (Application, page 514, Item 6). However, Innovative Technology programs will be managed by TGI as a separate segment of the overall portfolio to have a weighted average Total Resource Cost ("TRC") of 1.0 or more. TGI will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee. [Emphasis added.]

Thus, the Innovative Technology funding was approved.

10.2.3.2.1.2 Withdrawal of NGV Rate Offering Request

With respect to natural gas vehicle rate offerings for FEI, Rate Schedule 26 was approved as filed; however, the other items related to the NGV Rate Offerings were subsequently withdrawn. To reach a settlement on requests in the RRA as a whole, FEI withdrew its request for NGV Rate Offerings, as described in the excerpt below. However, this was treated as distinct from the approval of EEC funding.

Relating to FEI, Item 14 from Page 10 of the NSA approved in Order No. G-141-09 states:

14. Natural Gas for Vehicles ("NGV")

The Commission Issue No. 2 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

[61] Decision and Order No. G-36-09 dated April 16, 2009 in the TGI-TGVI Energy Efficiency and Conservation Application

"Natural Gas Vehicles ("NGV") – if NGV is to proceed why should the natural gas ratepayer fund this initiative rather than Terasen's non-regulated businesses or the competitive market?"

The Parties agree:

(a) NGV Rate Schedule 26 - NGV Transportation Service should be approved as filed.

(b) The marketing costs in support of NGV that are included in the revenue requirements Application are appropriately recoverable in 2010 and 2011 rates.

(c) Upon acceptance of this Agreement by the Commission, TGI withdraws its request in this Application for the following:

i. <u>Rate Schedule 6C NGV Compression and Refueling Service and 6A NGV</u>

<u>Refueling Service; and</u>

<u>ii. the Compression Service ("CS") Test; and</u>

<u>iii. NGV non-rate base deferral account.</u>

The Parties acknowledge that these requests are being withdrawn by TGI to facilitate a settlement on other issues presented in this Application. The Parties agree that TGI's withdrawal of its requests regarding NGV is without prejudice to TGI's right to bring forward similar requests in 2010 or 2011 or otherwise in the future. The Parties acknowledge that TGI intends to develop this area of business and that TGI anticipates it will bring forward applications on NGV projects to the Commission on a case-by-case basis during the term of this Agreement and in future years. The Parties agree that TGI is at liberty to do so. [Emphasis added.]

Thus, what was withdrawn by FEI only related to natural gas vehicle rate offerings (compression and fueling service). However, the use of EEC funds for NGVs was not withdrawn as part of the NSA; FEI was given express approval to pursue initiatives targeted at Innovative Technologies. When developing the Innovative Technologies programs, which the Companies believe that NGVs are to be part of, and have expressly stated so in 2008 EEC Application and the 2009 EEC Annual Report, the Companies would still have to adhere to the principles contained in Order No. G-36-09 as outlined above to use EEC funds for NGVs.

FEI has also received support for this interpretation of the NSA from a member of the EEC Stakeholder Group who was also a registered intervener during the RRA proceeding. In a March 22, 2011 letter[62] to FEI, the Commercial Energy Consumers Association of BC ("CEC") stated the following:

…The CEC is precluded (as a consequence of confidentiality provisions) from discussing the specific content of discussion in a Negotiated Settlement Process ("NSP") but may disclose its own positions at any time. The CEC believes that its sign off with respect to the RRA NSA carried the weight of its support for FEI providing funding for its NGV

[62] Please see Appendix F for a copy of the letter from CEC

initiatives. Specifically the CEC believes that item 14 of the NSA supports the fuelling and transportation services to be provided and that item 11 of the NSA supports the funding envelope for the Innovative technologies for 2010-2011.

The Companies agree with CEC's characterization of the agreement.

10.2.3.3 The Companies Have Adhered to the Principles Established By Commission Decisions with regard to the use of EEC funds for Natural Gas Vehicles

The Companies' use of the EEC funding for the Innovative Technologies Program Area to develop NGV programs, subsequent to the RRA NSAs, has met the principles and framework established in the EEC Decision and further developed in the NSAs approved by Commission Orders G-141-09 and G-140-09, as described in Section 10.2.3.1.3 in terms of evaluation, oversight and accountability. The factors relevant to the evaluation, oversight and accountability are discussed below.

10.2.3.3.1 Favourable TRC Ratio

Pursuant to the approved NSAs, the Companies must manage the Innovative Technologies Program Area as a separate segment of the overall portfolio and the TRC ratio for this segment must have a weighted average TRC of 1.0 or more.

The Innovative Technologies Program Area described in this Report has met this threshold with a weighted average TRC of 1.2. As summarized earlier, see Table 10-10 below for the Innovative Technologies Program Area TRC for 2010.

Table 10-10: Innovative Technologies Program Area TRC for 2010

Program	TRC	
	FEI	FEVI
Solar Water Heating PSECA Program	0.2	0.3
Commercial NGV Demonstration Program	1.4	-
Total	1.2	

The Commercial NGV Demonstration program has made a significant contribution to ensuring that the overall TRC for the Innovative Technologies portfolio has exceeded 1.0.

10.2.3.3.2 GHG Emissions Reductions Benefits

As the Commission recognized, the Innovative Technologies programs can be effective tools for achieving GHG emission reductions. Similar to the residential fuel-switching program, the Companies have tracked and demonstrated that the Commercial NGV Demonstration program creates GHG emissions reduction benefits. The NGVs incented in the 2010 Innovative

Technologies Program Area are expected to produce between 20 - 30% fewer GHG emissions than their diesel counterparts.[63] At this time, FEI estimates that the vehicles under the 2010 program expenditures represent annual GHG savings of approximately 4,100 tonnes of CO2e per year, which is the equivalent to taking 800 passenger vehicles off the road.[64] As these NGVs enter regular operations FEI will track and monitor fuel consumption and distance traveled, which is used to calculate GHG emissions.

10.2.3.3.2.1 Broad Support from EEC Stakeholder Group Consultation

As stated above, one of the key principles developed through the EEC Decisions and the subsequent approved NSAs is the accountability mechanism that allows for oversight by the stakeholder groups. In accordance with this principle, an EEC Stakeholder Group was formed in December of 2009 (Please see Section 12: EEC Stakeholder Group Activities). The members of the EEC Stakeholder Group were solicited through regulatory stakeholders (those that have historically intervened in the Companies' regulatory proceedings), from industry groups with whom the Companies interact, and from key contacts from the Companies' Energy Solution and Community Relations departments. Additionally, the Companies have also done the following:

- On March 11, 2010, the proposed Innovative Technologies portfolio was presented to the EEC Stakeholders meeting (Please see Appendix H for a copy of this presentation and a copy of the attendees list). In particular, at the meeting, the Companies provided estimates of funds to be applied to various Innovative Technologies Program Area, including NGVs (see slides 5 and 6). The meeting also achieved several important goals, such as:[65]
  a) Providing an opportunity to discuss details of how the weighted average TRC is applied to the Innovative Technologies portfolio.
  b) Allowing the EEC stakeholder group to discuss proposed Innovative Technologies program portfolio and program costs.
  c) Introducing the group to the feedback mechanism that affords them an opportunity to voice any concerns on the approach to Innovative Technologies, and to provide ongoing dialogue.
- Following the March 11, 2010 meeting, all members of the Stakeholder Group were contacted to provide FEI and FEVI with feedback. The goal was to ensure any concerns they may have with the practical application of the weighted average TRC or with the portfolio of proposed activity for Innovative Technologies have been brought forward and noted. The Companies did not receive any opposition from the Stakeholder Group through its request for feedback.

---

[63] Based on BC emissions factors from Natural Resources Canada's GHGenius model 3.18 available at www.ghgenius.com
[64] Calculation based on US EPA Greenhouse Gas Equivalencies Calculator
[65] See page 114 of the EEC 2009 Annual Report

- On November 24, 2010, the EEC Stakeholder Group was further informed of the Commercial NGV Demonstration program through a 17-page presentation that focused exclusively on this topic. (Please see Appendix H for a copy of this presentation and a copy of the meeting minutes and attendees list).
- On March 15, 2011, the EEC Stakeholder Group was informed that the Companies are seeking confirmation from the Commission regarding the use of EEC funding for NGVs. (Please see Appendix H for a copy of this presentation and a copy of the EEC Stakeholder Group membership list). The timeline of regulatory proceedings,[66] as outlined in this section, was presented to the Group and several participants voiced their support for the Companies, and voiced their opinion that the Companies have been transparent on this matter and that the uncertainty should be removed as soon as possible to allow further funding to proceed.

The Companies asked those parties that spoke to this issue during the stakeholder group to provide a written comment for inclusion in this Report. FEI received letters in support of our approach to the funding approvals process from the following Stakeholder Groups:

a) BC Apartment Owners & Managers Association ("BCAOMA")
b) BC Sustainable Energy Association ("BCSEA")[67]
c) City of Vancouver ("COV")
d) Commercial Energy Consumers Association of BC ("CEC")
e) Fraser Basin Council ("Fraser Basin")

FEI has included these letters in Appendix F. Although all members of the EEC stakeholder group have been invited to comment, FEI has not received any specific letter of opposition to date.

Below, FEI has provided excerpts from these letters directed to FEI from Stakeholder Groups who attended these sessions:

From the BCAOMA letter:

> *The BCAOMA participated in stakeholder review sessions organized by FortisBC and had the opportunity to review and comment on the planned use of incentives to encourage the adoption of NGVs. During the November 24, 2010 session FortisBC provided a detailed presentation on the NGV program for BC, including the proposed use of EEC funding under the Innovative Technologies program. This presentation was favourably received by the stakeholder group. The BCAOMA believes that this consultation process meets the "Accountability Measures" defined in the Commission EEC Approval Decision G-36-09 and supports FortisBC's view that it has the necessary approvals to proceed with the NGV incentive program.*

[66] See Figure 10-1 in Section 10.2.3
[67] The BCSEA only attended the March 15, 2011 meeting. The other parties who provided letters attended both 2010 Stakeholder Group meetings.

From the BCSEA letter:

> *…as an active participant in the 2009 Energy Efficiency and Conservation Application of Terasen Gas, and a current member of FortisBC's EEC Stakeholder Group, the BC Sustainable Energy Association supports the use of FortisBC's EEC program to incent the purchase of heavy duty NGVs in place of diesel powered vehicles where cost effective, primarily because of the greenhouse gas emissions reductions benefits.*

From the COV letter:

> *We confirm that two stakeholder review sessions were held in 2010 (March and November) and that NGV programs were presented and discussed at these sessions. The City of Vancouver supports the continuation of the program to provide NGV incentives for heavy duty vehicle applications as adoption of NGVs in these markets provides GHG reductions and fuel cost savings to operators of NGVs.*

From the CEC letter:

> *The CEC would characterize the FEI approach with respect to its NGV initiatives as having been and continuing to be nothing but open and transparent. The CEC believes that FEI has worked diligently to build understanding and support for its NGV initiatives. The CEC has directly been involved in the regulatory processes, in which the CEC believed that FEI was being provided the CEC support and consent to both pursue these NGV initiatives and to fund these initiatives from EEC funds.*

From the Fraser Basin Council letter:

> *Through our involvement in the EEC Stakeholder group over the past two years, we have been informed of Fortis BC's ongoing plans to provide incentives for natural gas vehicles (NGVs) ... We are supportive of this effort by Fortis BC to provide incentives for NGV purchase...We also know that incentives are required to assist in overcoming the barrier of increased capital cost for NGVs.*

The Companies agree with the views expressed in these letters with respect to our approach to the funding approvals process.

10.2.3.3.3 Openness and Transparency of Innovative Technologies funding for NGVs in the 2009 EEC Annual Report and the 2010 Long Term Resource Plan

The Companies have been transparent about the use of Innovative Technologies Program Area funding for NGVs in two of its recent regulatory filings and proceedings.

Firstly, the 2009 EEC Annual Report, filed on March 31, 2010, states the Innovative Technologies Program Area includes NGVs. The suggested framework of the Innovative Technologies Program Area was described on Page 115:

> *TGI and TGVI restructured the existing portfolio list of Innovative Technologies to include Solar Thermal Hot Water, <u>NGV for Commercial Vehicles</u>, Hydronic and Combination Space Heating Systems, Residential GSHP and Commercial and Industrial GSHP Systems. <u>TGI and TGVI will treat NGV fuel switching from diesel as part of or normal course of EEC activities</u>. [Emphasis Added]*

Secondly, the 2010 Long Term Resource Plan ("LTRP"), filed on July 15, 2010, describes the Companies' plan to pursue NGV initiatives utilizing incentive funding from the Innovative Technologies Program Area.

The following is an excerpt from page 61 of the 2010 LTRP:

> *Since the Innovative Technologies portfolio was formulated, TGI has made progress with some of the technologies, particularly to support implementation of NGV technology.*
>
> *…TGI has initiated a pilot incentive program to encourage operators of heavy duty fleets such as garbage trucks and waste haulers to switch to natural gas from higher-carbon diesel. TGI has received expressions of interest from the City of Vancouver, City of Surrey, City of Port Coquitlam, and other third party partner* to use the EEC *funding to purchase new natural gas vehicles for garbage collection and transfer operations.*
>
> *Under the provisions of the pilot program, the fleet operators would be reimbursed for the incremental cost of the NGVs over conventional vehicles.*

No issues about the proposed use of EEC incentive funding for NGVs were raised in information requests filed in the LTRP.

As a result of the transparency of the Companies' NGV initiatives during 2009 and 2010, the support of stakeholders, and the fact that there were no issues raised during the LTRP information requests, the Companies were, with respect, surprised when the issue was raised by the Commission in the context of our Application for approval of the WM Agreement. The Companies are hopeful that the uncertainty can now be resolved.

10.2.4 SUMMARY

NGVs represent an important element of the Innovative Technologies Program Area, and the favourable TRC of NGV related incentives has contributed to a large measure to the favourable TRC of the overall Innovative Technologies Program Area portfolio. The Companies understand the Commission's desire to ensure that EEC funding is undertaken appropriately, and we have thus endeavoured to provide a more complete picture than was available to the Commission in the context of considering the Waste Management agreement as to why the Companies' initiatives are compliant with past Commission orders. Even if the Commission is unable to provide this confirmation, the Companies respectfully request that the Commission acknowledge the benefits of the Commercial NGV Demonstration program and the broad stakeholder support, and provide its concurrence for the Companies to proceed.

11 ENABLING ACTIVITIES

11.1 Introduction

Enabling Activities are activities that support the Companies' EEC program development and delivery. Although these activities do not have energy savings directly associated with them, they play a very important role because they provide resources common to the support and ultimately, the delivery, of all program area activities. Expenditures in these areas are part of the overall overhead of EEC program delivery, and are included at the portfolio level in the overall EEC portfolio TRC score.

In 2010, Enabling Activities fall into four major categories, including research and evaluation, Efficiency Partners program, codes and standards, and energy management funding.

11.1.1 RESEARCH AND EVALUATION

Two general areas of activity are included: market research and program evaluation. Market research provides invaluable background information used for planning and implementing effective programs, and program evaluation helps to measure the effectiveness of a particular program and/or initiative.

11.1.2 EFFICIENCY PARTNERS PROGRAM

The Companies identify efficiency partners as equipment manufacturers, service contractors, distributors, and retailers, and recognize the influence these various industry groups have with the end use residential and commercial customers who make energy efficiency decisions. Providing a targeted focus through investment in these industry groups is essential in order to consolidate and enhance existing service and supplier relationships, and through these efficiency partners, provide a delivery pathway for all EEC programs to customers.

The EEC Decision (Order G-36-09) did not approve the discrete Trade Relations program area funding that supports these activities as it was identified as a duplication of commercial and residential program delivery expenditure. The expenditures in this area are part of the overall overhead of EEC program delivery and are included in the overall EEC TRC score. The EEC Stakeholder Group has not identified any objection to this approach.

11.1.3 CODES AND STANDARDS

Utilities play an important role in energy efficiency market transformation through support for the development of codes and standards. Government and regulating bodies are constantly seeking the participation and input of stakeholder groups, such as utilities, which have a unique understanding of energy supply and customer demand cycles, as well as the ability to support market transformation with financial incentives for efficient equipment and systems. The province's target levels and implementation of the *Greenhouse Gas Reduction Targets Act* are directly connected to effective market transformation in all EEC program areas. Utilities also play a role in keeping industry informed of developing codes and in alerting stakeholder groups of any unintended consequences that may arise out of proposed codes and standards.

11.1.4 ENERGY MANAGEMENT FUNDING

A key challenge to achieving customer adoption of DSM programs in the commercial sector has been a lack of resources at the customer end to source these opportunities and administer implementation of the appropriate energy efficiency measures. In response to this issue, the Companies have established human resources to assist customers with facilitating participation in their DSM programs. This includes the employment of energy solutions managers in each major service territory to focus on commercial customer outreach activities dedicated to increasing participation in the EEC programs. In addition, the Companies have developed a new major pilot initiative with the Energy Specialist program. For the Energy Specialist program, positions are created within large commercial customers that are funded by the Companies. The role of these Energy Specialist positions is to identify opportunities for DSM program participation for the customer as well as other projects that will result in more efficient use of natural gas.

11.2 2010 Enabling Activities

2010 Enabling Activities expenditures totalled $787,000 for FEI and $124,000 for FEVI. A bulk of these costs came from the Conservation Potential Review study, energy solutions managers, and the Energy Specialist program. Table 11-1 provides an overview of the 2010 expenditures for the Enabling Activities.

Table 11-1: 2010 Enabling Activities – Expenditures

Program	Description	Expenditure (000s)		
		FEI	FEVI	Total
Research and Evaluation	Market research and evaluation that support the overall EEC portfolio	$272	$68	$340
Efficiency Partners Program	Delivering EEC programs through B-ticket contractor companies	$55	$38	$93
Codes and Standards	Codes and standards related to EEC program areas	$15	$3	$18
Energy Management Funding	Providing assistance to customers for energy efficiency initiatives	$445	$15	$460
Total		$787	$124	$911

Further information on each of the four areas of the 2010 Enabling Activities is provided below.

11.2.1 RESEARCH AND EVALUATION

The Companies engage primarily in two activities within this category: market research and program evaluation. Both activities are important. Market research provides invaluable information used for planning and implementing effective programs, while program evaluation helps to measure the effectiveness of a particular program and/or initiative. This section provides a description of the research and evaluation activities undertaken in 2010.

11.2.1.1 Research Overview

Market research is defined as the systematic, objective collection and analysis of data about a particular target market, competition, and/or environment. It incorporates some form of data collection, which, in some instances, means primary research (i.e. collected directly from a respondent), while in others it can mean secondary research (i.e. collected from additional sources including related literature, the Internet, and media sources). It is important to conduct both primary and secondary research because together they allow the researchers to gain valuable insight about energy efficiency and conservation. Armed with this knowledge, the Companies are better able to develop, implement, and evaluate programs and activities.

11.2.1.2 Evaluation Overview

Evaluation of EEC programs and activities allows EEC staff to measure the effectiveness of the programs. Historically, the Companies have been conducting evaluation studies for DSM programs since the late 1990s. In general, program evaluations are designed in two stages. During the program design phase, the program evaluation concept is determined. The primary purpose of this is to understand the metrics for the evaluation and the data that will be required to understand those metrics, and to determine how much of this can be collected during program operation (i.e. as part of the incentive application). By doing this development prior to program launch, better quality data can be collected, potentially at a lower cost than if evaluation design was left until the time the evaluation was taking place. Once the program has operated for a sufficient period of time, an impact evaluation can be. In the past, the evaluations conducted on behalf of the Companies have been conducted by outside consultants who have been selected based on relevant experience and cost. Once selected, the consultant then further develops a detailed evaluation plan for review and discussion with the Companies. When the plan has been approved, the consultant typically begins the field research that includes, but is not limited to, field research (i.e. with participants and the relevant trade allies), billing analysis, and sub metering. Once field research is completed, the study moves into the analysis phase, which results in a final report developed by the consultant.

11.2.1.3 Research and Evaluation Studies Conducted In 2010

The various EEC program areas administer their own research and evaluation studies and apply those costs to their respective program area TRC benefit/cost test results. Descriptions and budgets for those studies have been captured in the respective program area sections in this Report. Those research and evaluation activities that are part of enabling activities and/or the overall EEC portfolio are described in this section. These expenditures are included in the overall portfolio-level EEC TRC benefit/cost test results. Each of the research and evaluation activities the Companies undertook in 2010 are listed in Table 11-2 below along with a reference to where their respective description and attributed costs can be found in the Report.

Table 11-2: 2010 EEC Research and Evaluation Activities

Study	Description	Expenditure (000s)	Reference
Tankless Water Heater Consumer Feedback	To gain insight about user experience of tankless water heaters to inform program development.	$18	Residential - 3.4.2.1
TLC Program Participant Survey	Provide customer feedback on program satisfaction and understand prevalence of furnace upgrades through servicing.	$15	Residential - 3.4.1.2
Condensing DHW Market Transformation	Develop market transformation strategy for the introduction of 0.80 EF DHW technologies.	$20	Residential - 3.4.3.2
Efficient Boiler Program Evaluation	Analysis of the natural gas savings of the Efficient Boiler program.	$43	Commercial - 4.4.2.1
On-farm Energy Assessments	Energy assessments at 25 separate sites to establish how agricultural producers use energy.	$55	Commercial - 4.4.4
MURB Remediation Study	A comprehensive rehabilitation study of problem strata buildings including an analysis of energy use and conservation strategies.	$10	Commercial - 4.4.3.6
EnerGuide Home Retrofit Study	Develop home performance overview of existing residential housing stock based on aggregate EnerGuide data from LiveSmart BC.	$20	Joint Initiatives - 7.4.2.1
Energy Modeling	Develop common archetype for utilities to develop economic models for LiveSmart BC offer development.	$3	Joint Initiatives - 7.4.2.1
Retrofit Energy Modelling in support of LiveSmart BC project	Common model for FEI and electric utilities for cost benefit analysis for LiveSmart BC offer development.	$5	Joint Initiatives - 7.4.2.1
Bill Insert and Bill Messaging Research Study	Determine readership level and understand if certain messages garner more attention from readers than other messages by our residential customers. Will finish study in 2011.	$10	Conservation Education and Outreach - 8.2.1.1
Contractor Qualitative Report	To gain insights around energy efficiency program awareness, preferred communication methods, and training needs.	$14	Enabling Activities - 11.2.1.3
Conservation Potential Review	Examines available technologies and determines their conservation potential.	$326	Enabling Activities - 11.2.1.3
Residential Retrofit Market Evaluation	Examines consumer awareness and brand awareness of retrofit rebate programs in the province of BC.	$19	2009 EEC Report Appendix D. P 50
Total		$558	

The costs associated with enabling activities and EEC portfolio level research studies are listed in Table 11-3 below. This is followed by a short description of each of these studies.

Table 11-3: 2010 Research and Evaluation Expenditures

Name of Study	Description	Expenditure (000s)		
		FEI	FEVI	Total
Contractor Qualitative Report	To gain insights around energy efficiency program awareness, preferred communication methods, and training needs.	$11	$3	$14
Conservation Potential Review	Examines available technologies and determines their conservation potential.	$261	$65	$326
Total		$272	$68	$340

11.2.1.4 Contractor Study

The Contractor study[68] (see Appendix F) was undertaken to enhance both the development of the Companies' EEC Efficiency Partners program and the LiveSmart BC program. This study was conducted in partnership with BC Hydro, FortisBC Inc., and the Ministry of Energy and Mines to identify the ideal communication channels for reaching contractors in BC, and to determine preferences regarding incentives and options in the Efficiency Partners program and the LiveSmart BC program. The study as a whole was budgeted at $40,000, with FortisBC Energy Inc. contributing $18,000, BC Hydro contributing $18,000, and FortisBC Inc. contributing $4,000. The specific objectives for this study fall into three main areas:

Training:

- To measure the level of awareness and understanding of Heating, Ventilating, and Air-Conditioning ("HVAC") contractors about energy efficiency ("EE") programs;
- Identify real and perceived barriers to promotion and participation in EE programs by contractors; and
- Determine the major challenges contractors have had in using the LiveSmart BC and other utility-led incentive programs.

EEC / LiveSmart BC incentive programs:

- To identify incentives and/or educational programs that will encourage contractors and tradespeople to participate in efficiency or utility-partner programs; and
- Use views and feedback from industry professionals for program development.

Communication channels:

- Identify the preferred communication channels for receiving information concerning EE programs for contractors and the trades;
- Determine preferred communication channels that will facilitate contractors and tradespeople in passing on the information to their customers;

[68] Contractor Study Qualitative Report, compiled by TNS for FortisBC Inc., BC Hydro, and Ministry of Energy and Mines.

- Determine which trade association's communications (i.e. newsletters) and/or trade publications are most accessible to contractors; and
- Determine the best avenues for advertising that will reach contractors.

The study involves two components: the qualitative component, which was completed in December 2010 (see Appendix F) and the quantitative component, with findings expected to be compiled by the end of March 2011. The final report is then delivered after the quantitative component is completed. The following observations surfaced from the initial qualitative phase of research. While they are not meant to serve as conclusive findings about all contractors, these observations provide a number of insights.

Contractors' Involvement in EE Incentive Programs

The qualitative work discovered that current EE incentive programs are not compelling enough for contractors to become fully engaged. Participants suggest that programs need to offer a greater value proposition for contractors to get involved. A key barrier to contractors' participation in EE incentive programs appears to be that the rewards do not compensate sufficiently for the time and energy invested – both the added un-billable time with the customer and extra time doing unpopular program application paperwork. Strategies that lower the time required to participate in a program will be very important to gaining contractors' full involvement. This could amount to simplified paperwork or simplified programs that are easier for contractors to learn and communicate.

A second key barrier to contractors' full involvement is their reluctance to promote something that is constantly changing for fear they will disclose the wrong information. Because of this, the contractors tend to avoid giving their input altogether, often advising customers to learn more from the program website directly. Given the importance of contractors' added opinions and advice, it seems creating a more stable, enduring program would have a positive impact on gaining contractors' involvement.

Customers' Involvement in EE Incentive Programs

Contractors feel current programs do not offer enough value to customers for the time required. They feel EE incentive programs *can* be of significant value to the customer if the programs offer enough of a financial incentive.

Contractors suggest effective EE incentive programs should specify a deadline that motivates action. Some suggest a reward in the form of money deducted from customers' monthly utility bills would be the most sought-after reward for an EE incentive program. They also feel the number of program requirements can discourage customer involvement, as well as the hassles associated with paperwork.

Communications

To learn about EE incentive programs, contractors would appreciate a forum where they could meet face-to-face with the Companies' program staff and ask questions. The easier these programs are to communicate, the more likely it is to gain contractors' involvement in promoting them. Time (in educating customers) is money to these contractors. Materials that expedite the communications process would be desired, such as brochures. Websites seem to be an expectation and serve as an important tool for contractors to redirect questions from customers. Contractors do have an advertising budget, although word of mouth is very strong in their industries.

Training and Upgrading

While some contractors would like opportunities to upgrade their skills, they seem opposed to training sessions that focus on marketing and sales of products or programs. Training programs that offer genuine and relevant skills would be of interest to some of the contractors.

Barriers to Contractor Participation

Many contractors feel these programs are not relevant to their businesses. For example, insulation professionals generally feel that once customers are ready for their service, they have already assessed these programs and included them in the work they request.

11.2.1.5 Conservation Potential Review Study

Please see Section 13 of this Report for a description and update on the Conservation Potential Review ("CPR") study.

11.2.2 EFFICIENCY PARTNERS PROGRAM

As described in Section 11.1.2, the Companies identify efficiency partners as being equipment manufacturers, service contractors, distributors, and retailers, and recognize the influence these various industry groups have with the end use residential and commercial customers who make energy efficiency decisions.

11.2.2.1 Background

In 2007, FEVI's Qualified Dealer program ("QDP") was reintroduced in the FEVI service territory, with an emphasis on further upgrading the quality of the participating gas contractors to ensure customers had access to highly qualified gas contractors. Contractors were required to re-register for the QDP that had new, more stringent guidelines such as: Better Business Bureau reference, BC Safety Authority ("BCSA") registration, business supplier referrals, customer referrals, business license, WorkSafeBC coverage, $2 million minimum liability insurance, and a business credit check.

Since the re-launch of the program in 2007, and until the increased EEC funding was approved in April 2009, limited resources were devoted to the QDP and essentially no incentive program offers for the FEVI market area were provided. There are currently only about 75 qualified dealers registered in the FEVI area out of a total market of approximately 350 gas contractors located in the FEVI service area. The marketplace has changed significantly since the QDP was first launched. Since the QDP was focused on FEVI, customers were looking primarily for a gas contractor (typically with a B-ticket) to convert them to natural gas and service their natural gas products. Today's energy consumer is looking for a wide range of services that include reliable information sources and manufacturers, installers, and service contractors that will provide energy efficiency recommendations for their entire house. The large number of gas contractors located in the Lower Mainland, the Interior, and on Vancouver Island represent an excellent opportunity for the Companies to promote a "whole-house" energy concept to customers. A whole-house system approach considers the interaction between the building site, regional climate, energy consumption habits, appliance efficiency, building envelope, and other elements or components in the home.

B-ticket gas contractors are one of the largest industry groups that influence end use customers. Domestic/commercial BCSA licensed B-ticket gasfitters install, test, maintain, and repair propane and/or natural gas lines, appliances, equipment, and accessories in residential and commercial premises up to 750,000 BTU. Industrial A-ticket gasfitters perform the same tasks as B-ticket gasfitters, plus an unlimited BTU range in industrial settings. They may work in new construction, or install systems in existing buildings that are being upgraded. C-ticket fitters are limited to residential gas appliance servicing only.

The Companies' overall objective for this market sector is to expand and rebrand the existing FEVI Qualified Dealer program (B-ticket contractors) in breadth and scope, and to open the new contractor program to include the Lower Mainland and the Interior.

While the Companies are starting with contractors as a first step in the Efficiency Partners initiative, the Efficiency Partners program will also eventually include efficiency service groups that have been previously excluded from the QDP. The Efficiency Partners program should be structured to be able to eventually include the following efficiency partners over time:

- Appliance installation contractor (A and B ticket);
- Gas appliance service groups (C ticket);
- Manufacturers and distributors;
- Big box retailers;
- Residential and commercial energy auditors;
- Weatherization services (draft proofers);
- Support groups (i.e. regulators and colleges); and
- Associations.

The rationale behind this expansion is that the current QDP has limited capabilities since the majority of the participating FEVI contractors are small "mom and pop" type of businesses. With an expansion to the Lower Mainland and Interior service areas, there is a concentration of much larger companies that will involve working with supplier and distribution groups. This will especially be true with big box stores. With the inclusion of a comprehensive group of service providers in the expanded Efficiency Partners program, customers will have access to a reliable network of highly qualified service providers with the ability to assist them with a wider range of efficiency services.

11.2.2.2 Efficiency Partners Program 2010 Activity Overview

In 2010, the Efficiency Partners program focus remained on continued evaluation and development of a new gas contractor program, reaching out to the gas contractor community through mail-outs and advertising communications, conducting focus groups, attending events and tradeshows, and maintaining the qualified dealer co-op advertising activities in the FEVI service area. Activity highlights of the Efficiency Partners program for 2010 are provided below.

11.2.2.3 Communication and Outreach Activity Milestones

Communication and outreach activities are essential in order to gain the support of, and deliver energy efficiency and conservation activities through the Companies' efficiency partners. These activities differ from those described in Section 8, which focus on general conservation and non-program specific communication that targets the general public. The following lists the communication and outreach activity milestones achieved in 2010:

- Contractor focus group sessions conducted in 2009 suggested the concept of establishing a quarterly newsletter containing value-added content of interest to the natural gas contractor community would be well received. With this feedback in mind, the first issue of the contractor newsletter was mailed in winter 2010 to over 2,400 contractor companies province-wide. As well, an incentive program update was mailed in fall 2010;
- Contractor focus group sessions held in FEI and FEVI service territories were completed in the first and second quarters of 2010, with insights collected used to support the development of new residential programs. Sessions were well attended, with feedback supporting the expanded program. These focus group sessions were in addition to the contractor study research discussed in Section 11.2.1.4. Below are some of the feedback highlights:
    - Contractors felt they did not have enough support and/or information about how changes to codes and standards would impact their business;
    - Concerns exist about the impact of new technologies (i.e. receiving products with no training support);

  - Contractors want to be 'in the know' about innovative technologies and understand how they might need to prepare to embrace these technologies;
  - Courses currently offered by colleges and associations are outdated;
  - Contractors would like to work more closely with the Companies in order to expedite requests for service connections; and
  - One of the main benefits of supporting an expansion of the contractor program was noted to be the contractor company listing on the Companies' website. Connecting customers with contractors who have been vetted through the contractor program lends credibility to these companies, and is therefore seen as a value-added benefit to the contractor.

- Three consultation workshops were conducted in partnership with the Ministry of Energy and Mines, FortisBC Inc., and BC Hydro, and included the greater contractor and energy audit communities in order gather insights and feedback to support program development for the 2011 iteration of LiveSmart BC. These sessions, held in Burnaby and Victoria, were conducted in the latter part of Q4. Below are some of the feedback highlights:
  - Need more focus on educating all stakeholders (i.e. homeowners, contractors, and suppliers) on the house-as-a-system ("HAAS") concept;
  - Improved communication (and more lead-time) on timing of changes to, and launches and closures of programs is required;
  - Energy advisors must take the lead and identify specific needs as there is very little contact, if any, between the contractor and the energy advisor. These two groups need to establish a closer relationship;
  - Contractors have more credibility in the eyes of homeowners than any other party so the Companies need them to be onside;
  - Manufacturers and distributors are key to communications with contractors; and
  - Contractor training is needed for ventilation and HAAS.
- Established direct contact and continued to develop relationships with energy efficiency equipment manufacturers and suppliers, and enhanced the Companies' involvement with contractor stakeholder groups such as associations and regulatory organizations. The Companies currently sit on the Thermal Environmental Comfort Association ("TECA") Board (non-voting member); and
- In 2010, association publications, magazines, and other promotional opportunities like web linking were identified in order to create an Efficiency Partners communication strategy for 2011. Trade publications and magazines provide an excellent opportunity to relay EEC initiatives and activities, including providing updates on activities related to the contractor program.

11.2.2.4 Co-op Advertising Activity

Participation in the existing Co-op Advertising program for gas contractors in FEVI remained steady throughout 2010. Development of the existing guidelines for expansion of the Co-op Advertising program to FEI continues, and will incorporate an increased focus on energy efficiency messaging. Related documents for the expanded Co-op Advertising program are in the final stages of review.

Expenditures in this area are part of the overall overhead of EEC program delivery and are funded at the portfolio level.

Table 11-4 identifies areas of operation and annual expenditures.

Table 11-4: 2010 Efficiency Partners Expenditures

Contractor Program	Expenditure ($000s)				
	Q1	Q2	Q3	Q4	Total
FEI	$12	$16	$10	$17	$55
FEVI	$15	$2	$2	$5	$24
FEVI Co-op Advertising	$1	$4	$3	$6	$14
Total	$28	$22	$15	$28	$93

11.2.3 CODES AND STANDARDS

11.2.3.1 Overview

Industry, regulating bodies, code development agencies, and user groups rely on the participation and input of stakeholder groups, such as utilities, that have a unique understanding of energy supply and customer demand cycles to assist in the development of codes and standards. The content and timing of code implementation directly affects market transformation in all program areas. Through the Efficiency Partners program, industry will be informed of developing codes and possible impacts to the marketplace.

It is important for the Companies to stay abreast of changing regulations; however, the Companies' *participation* in the development phase of regulation allows for more effective EEC program delivery and successful market transformation. This requires various levels of involvement. Codes and standards are established at a national level and adopted with or without changes at the federal and/or provincial level. The Companies' level of regulatory involvement is indicated by one of three involvement classifications:

Monitoring: To keep current with and informed about all existing and new codes and standards developments. These activities assist the Companies with the development of strategies to protect ratepayers and shareholders.

Stakeholder: For select provincial and federal code initiatives, the Companies participate at a *stakeholder* level, actively attending meetings and submitting written responses through the consultation phase. These activities, in conjunction with those of other key stakeholders, provide guidance to the final objectives.

Developing Regulations: Direct involvement with strategic steering committees, technical committees, and technical subcommittees for developing regulations and standards, as well as supporting studies and projects that provide information to help develop codes and standards. These activities directly enable standards development.

Table 11-5 identifies areas of operation and expenditures for 2010.

Table 11-5: 2010 Codes and Standards Expenditures

Codes and Standards	Expenditure ($000s)				
	Q1	Q2	Q3	Q4	Total
FEI	$10	$3	$3	-$1	$15
FEVI	$2	$0	$1	$0	$3
Total	$12	$3	$4	-$1	$18

Note: The surplus in FEI expenditures in Q4 represents an EnerGuide participation reimbursement of costs related to the Companies' involvement on the National EnerGuide Evaluation Committee.

It should be noted that EEC funds are only utilized to support the Companies' work on codes and standards in relation to areas that directly affect EEC programs and program development. Other work performed on codes and standards is covered by the Companies' Energy Products and Services department.

The following sections highlight codes and standards as they apply to EEC program areas for 2010 and are presented in the order of the Companies' involvement levels as outlined above - monitor, influence, and participate.

11.2.3.2 Standards and Company Involvement: Monitoring Level

Commercial Water Heater and Boiler Regulations

There were discussions for regulation changes to commercial water heater or commercial boiler standards to try to standardize units of energy. The United States uses American Standard units and official Canadian codes and standards use Scientific International (SI) units. Codes and standards are usually written with one set of units prescribed and the other set of units in brackets for information only. There are differences in how efficiency is calculated and there are differences in how energy input is reported. There was no resolution to this issue although there is more clarity since the discussions took place.

Residential Furnace Regulations

For new construction, gas furnaces manufactured on or after January 1 2008 must have a minimum Annual Fuel Utilization Efficiency ("AFUE") level of 90 percent. For existing dwelling retrofits, gas furnaces manufactured on or after December 31, 2009 must have a minimum

AFUE rating of 90 percent. As in-stock furnaces manufactured before the cut-off date can still be retailed, customers continue have a mid-efficiency choice.

Although these furnace regulations are in place, according to the Companies' 2008 Residential End Use Survey ("REUS"), almost 80 percent of the furnaces in the Companies' service territories were standard and mid-efficiency models. This represents a very significant area of potential for natural gas savings. Conventional DSM protocols only allow utilities to incent savings based on the regulated baseline. Also, utilities can only count savings beyond the regulated baseline that are generated as a result of the difference in efficiency between the in-situ technology and the replacement technology for those years that replacement is being moved up. For example, conventional DSM protocols would indicate that should a program incent a customer to early-replace an existing 80 percent efficient furnace five years before the end of its life with a 95 percent efficient furnace, the utility would only be able to count the energy savings from 80 percent to 95 percent efficiency for the five years of life remaining on the furnace. The rest of the savings would be calculated based on a change from 90 percent to 95 percent since 90 percent is the regulated minimum efficiency level. These conventional DSM protocols significantly limit a utility's ability to offer effective incentives on products with regulated minimum efficiency levels, as the energy savings on which incentives are based are small.

This is one of the reasons the Companies have under spent compared to approved expenditure levels: the residential furnace upgrade program had been a flagship program for FEI prior to the introduction of the 90 percent minimum efficiency standard. Yet limiting a utility's ability to offer effective incentives ignores marketplace realities. For example, data from the Companies' 2008 REUS indicates some customers are keeping their furnaces well beyond the end of equipment life – in some cases for 30 to 40 years. Not only do these older furnaces offer significant energy savings opportunities when replaced with higher efficiency models, they pose possible safety and human health hazards due to the potential for component failure that should be addressed, preferably through an incentive program to encourage customers to replace these older, inefficient units (i.e. a furnace scrap-it program). It is the Companies' intention to pursue such a program as part of the suite of EEC offerings for 2012 and 2013 that will be brought forward in the Revenue Requirements Application to be filed in May 2011.

Monitoring of trends in this area was considered a high priority as there were new technologies introduced that affected adoption, trades training, new installation requirements, and pricing. There were also unintended consequences from new venting requirements. For instance, since standard efficiency gas-fired furnaces and boilers usually share a metal vent with the gas-fired hot water tank, one unintended consequence of the new venting requirements was a trend towards electric hot water tanks in new construction. This is because new high efficiency condensing furnaces and boilers require a dedicated vent, quite often through the side wall of the building. This means the entire cost of a metal vent up through the roof is now associated with the gas-fired hot water tank only, instead of being shared by the furnace and hot water tank, which can discourage the installation of an energy efficient gas-fired hot water tank.

11.2.3.3 Standards and Company Involvement: Stakeholder Level

BC Building Codes for New Construction

In 2010, the Companies were involved at a stakeholder level in the development of the new provincial building codes. This required the development and analysis of multiple modelling scenarios to determine the impact of higher efficiency target levels. Modelling variables included fuel source, location, construction techniques, and materials. The stakeholder committee agreed to take the approach of concentrating on the thermal efficiency of the building enclosure. Industry will need to recognize the diversity of design and construction techniques that will be required for gas or electric applications.

The overall impact on construction costs to achieve higher efficiency ratings are under review. Once the building code is adopted, support for implementation will need to be provided. This will primarily involve educational support with industry stakeholders on energy specific changes to appliances, materials, and construction techniques.

Residential Boiler Regulations (Still in Proposal Stage)

Canada's energy efficiency regulations for residential boilers have remained unchanged since 1998. A regulation review is underway. When the new regulations are enacted, they will apply to any boiler manufactured after September 2010 and will mandate a Minimum Efficiency Performance Standard ("MEPS") of 82 percent with no standing pilot. Comments for review were accepted up to June 1, 2010. The Companies' involvement included written responses to NRCan's Office of Energy Efficiency ("OEE") during the consultation period.

The Companies will be monitoring the impact of these new regulations. Increases to appliance costs and technical challenges to retrofitting existing systems could have market impact. Technical challenges include possible increases to venting requirements and additional drainage requirements. Existing lower efficiency inventory appliances will still be available and will slow the integration of higher efficiency options into the marketplace. The customers for these appliances are homeowners for retrofit applications and homebuilders or developers for new residential construction.

Hearth Product Regulations

The Companies were involved with industry stakeholders to develop the EnerChoice top tier labelling system to help customers identify efficiency levels. The EnerChoice labelling system was introduced a few years ago, but the work of helping customers recognize the label and associated benefits is ongoing.

There is currently no regulation for minimum efficiency of hearth products; however, NRCan requires fireplaces to have a Fireplace Efficiency ("FE") rating label. Ratings for models currently available range from 20 percent to 70 percent FE.

Integration of some of these products into the ENERGY STAR® program would be a good start to raising awareness of the benefits of energy efficiency.

Solar Thermal Systems

The Companies have been involved with regulations pertaining to solar thermal installations and periphery areas like plumbing requirements, hybrid gas and solar systems, and monitoring technologies.

11.2.3.4 Standards and Company Involvement: Developing Regulations Level

Performance Standards

The Companies have staff actively participating on the Canadian Standards Association's ("CSA") "Energy Efficiency and Related Performance of Fuel-burning Appliances and Equipment" technical committee. This committee oversees the following performance standards: P.2 (residential gas-fired furnaces and boilers), P.3 (gas-fired storage water heaters), P.4 (fireplaces), P.5 (gas clothes dryers), P.6 (gas-fired pool heaters), P.7 (gas-fired instantaneous water heaters), P.8 (commercial gas-fired package furnaces), P.9 (combined space and water heating systems), P.10 (integrated mechanical systems for residential heating and ventilation), P.11 (gas-fired unit heaters), P.12 (gas-fired infra-red heaters), and the Plus 1200 compliance verification and rating system.

The CSA technical committee on Energy Efficiency and Related Performance of Fuel-burning Appliances and Equipment is a newly formed committee that had its inaugural meeting January 21, 2010 in Mississauga. The committee met again in person in June 2010 and communicated by teleconference and email throughout the year. The 2010 activities included:

- Merging the CSA P.2 (gas-fired residential furnaces and boilers) standard with the B212 (oil-fired residential furnace and boiler) standard;
- Merging the CSA P.3 (gas-fired storage water heaters) standard with the B211 (oil-fired storage water heater) standard;
- Submitting a proposal to open up the existing P.3 (gas-fired storage water heaters) standard to strengthen repeatability of the testing and ensure water draw patterns are more reflective of actual usage patterns; and
- Submitting a proposal to expand the PLUS 1200 document (guide to energy efficiency compliance, verification, and ratings for water heaters) to become a consensus document and include compliance testing for other key appliance categories.

Residential Domestic Hot Water Heater Regulations

Water heating represents about 20 percent of household energy use in Canada. Water heating will account for an ever increasing share of natural gas use as envelope construction, appliances, and HVAC continue to improve in efficiency, while conventional water heating equipment has changed little. The minimum efficiency of natural gas storage-type water heaters in BC is measured by an Energy Factor ("EF"), which is a volume adjusted factor. For the most common size, a 151 litre (40 US gal) tank, the minimum EF is 0.62 for water heaters manufactured after September 1, 2010. Customers will still have a choice until existing inventories are exhausted. This first tier of provincial change has not incurred adverse market effects. BC is moving alone without collaboration from federal agencies on this 0.62 efficiency level for residential gas-fired storage tanks.

There has been collaboration between NRCan and the BC Ministry of Energy and Mines along with the Canadian Gas Association ("CGA") and Canadian Institute of Plumbing and Heating ("CIPH") regarding future implementation of efficiency regulations. The different efficiency levels are often referred to as: Tier 1 0.62 EF, Tier 2 0.67 EF, and Tier 3 0.80 EF or condensing. These three tiers represent three different technologies needed to achieve the prescribed efficiency level for residential storage tanks. There are different efficiency levels and timelines for tankless units and storage units over 75,000 BTUH (British thermal units per hour) input. As described in the case of furnaces in Section 11.2.3.2 above, any changes to timelines or efficiency levels will impact the Companies' ability to offer effective incentives. Manufacturers have indicated they have concerns with the second and third tiers of the proposed water heater regulations. Some suppliers and distributors are not complying with Tier 1 requirements, citing supply problems. This is a provincial enforcement issue and highlights the hazards of regulation being out of step with supply. The second tier specifies an EF rating of 0.67 proposed for 2016 and the third tier is 0.80 or condensing technology proposed for 2020. The second tier would require retooling of equipment by manufacturers for a short time period and then retooling again for the third tier. There is uncertainty among manufacturers with regard to market share as the new tiers will require significant new investment with associated higher costs per unit production. Due to the short transition framework outlined by regulators, it is likely manufacturers will move to completely skip Tier 2. This will create additional problems for the gas industry as Tier 3 equipment can cost three times as much as Tier 1 equipment. This will affect new construction somewhat but will result in an energy shift to electric for retrofits. Utilities continue to try to bring stakeholders together to determine the appropriate market transformation plan.

A CGA partner 0.80 EF domestic hot water pilot program is currently in the development phase. Information on this pilot can be found in Section 3.

11.2.3.5 Summary

The Companies believe their codes and standards activities are aligned with and support the federal and provincial governments' energy and climate change objectives.

There are a number of product areas where regulations are connected to effective market development with the assistance of EEC programs including: commercial water heaters and boilers, residential furnaces, boilers, and domestic hot water heaters, hearth products, and BC building codes with particular attention to EnerGuide 80 ratings for houses and eventually net zero buildings in 2020. The Companies need to ensure codes are developed in conjunction with market dynamics and equipment manufacturers' ability to provide specified products in order to ensure their customers have appropriate choice in the marketplace.

If regulations are used to lead market change and force behavioural changes, instead of their traditional role of following the market curve and bringing along the slow starters, the Companies will lose their opportunity to help shift the marketplace with incentives and risk significant fuel switching. Residential hot water heater regulations and the 2011 implementation of the BC building codes, in particular, will continue to require a partnership with government and manufacturers to achieve a market transformation plan.

The Companies' EEC team will remain active with codes and standards committees as they pertain to EEC program and market development, and this will continue to be an important activity area.

11.2.4 ENERGY MANAGEMENT FUNDING

11.2.4.1 Overview

In the past, a major barrier to program adoption has been facilitation of equipment installation and application administration on the customer side. Potential program participants are often lost because they do not have the resources available to implement the measures required for program participation, nor the time to go through the application process. In these instances, the potential participant has the desire and financial means to implement the required measure but not the human resources to make it happen.

The Companies believe there is vast opportunity available for increased DSM program participation and energy efficiency implementation by providing resources to commercial customers to assist with program facilitation and energy efficiency projects. In 2010, three separate initiatives were launched to support this approach. This included hiring three EEC energy solutions managers, implementing a pilot program to fund the placement of energy specialists at key commercial customer accounts, and co-funding a community energy manager to support the community of Prince George. Expenditures for these initiatives in 2010 are listed in Table 11-6.

Table 11-6: 2010 Energy Management Funding – Expenditures

Name of Program/Initiative	Description	Expenditure (000s)		
		FEI	FEVI	Total
Energy Solutions Managers	Sales activities dedicated to increasing participation in the EEC programs	$204	$0	$204
Energy Specialist Program	Funding of energy management positions within select organizations	$241	$15	$256
Prince George Community Energy Manager	Funding of an energy management position for the community of Prince George	$0	$0	$0
Total		$445	$15	$460

11.2.4.2 Energy Solutions Managers

In spring 2010, the Companies recognized the need to proactively pursue energy efficiency and conservation opportunities directly with existing and potential commercial and institutional customers. In response to this need, the Companies took the initiative to develop three new roles within the sales department in May 2010 to focus specifically on energy efficiency and conservation. Recruitment began in June and all three positions were filled by December 2010. The three positions were stationed in the Lower Mainland, the Interior and on Vancouver Island. The position on Vancouver Island was the last one filled and, therefore, no expenditures appear in 2010 for FEVI. Approximately $200,000 was spent to fund these positions in 2010.

The EEC energy solutions managers ("ESM") are focused on sales activities dedicated to increasing participation in the EEC programs, including multifamily residential buildings and High-carbon Fuel Switching program areas. As part of their duties, the ESMs assist commercial customers with eligibility criteria and the requirements of applicable EEC programs, as well as support customers in the coordination and implementation of the necessary changes to equipment. These positions also offer valuable input to existing and future EEC programs based on customer feedback and market intelligence.

Each ESM has specific EEC program participation targets focused on commercial and institutional customers. They identify and work one-on-one with existing small and medium sized commercial customers that could benefit from current EEC programs. The ESMs also work closely with operations and other sales team members to uncover EEC opportunities such as potential high carbon fuel switching opportunities. They also provide support to the Companies' efficiency partners in the regions to maximize participation in the current EEC programs.

ESMs also attend and participate in trade shows and home shows, and deliver presentations to boards, municipal governments, service groups, and industry associations to promote the features and benefits of the current EEC programs. The regional energy solutions manager manages progress towards targets on a monthly basis.

11.2.4.3 Energy Specialist Program - PILOT

11.2.4.3.1 Energy Specialist Program Overview

Energy Specialist Program - Pilot	
Target Audience	Retrofit – Large Commercial and Institutional Customers
Duration	May 2010 - Dec 2011
Incentive	$60,000 per Energy Specialist
Partners	BC Hydro
Overview	
Background	BC Hydro and the Companies entered into a Memorandum of Understanding in July 2009 that established a set of principles for an enhanced coordinated approach to demand side management initiatives. This included plans to fund energy specialist positions with selected natural gas customers that already have an established BC Hydro-funded energy manager. Participants in the program were selected by reviewing the list of organizations that

	currently have a BC Hydro energy manager and determining, through a consultative process with BC Hydro and the Companies' commercial account managers, which would have the best chance at bringing in new energy efficiency projects.
Description	The energy specialist reports to and supports the energy manager on holistic energy reduction projects while also focusing on identifying opportunities to use natural gas more efficiently. Funded as an enabling program, a key priority for the energy specialist is to identify opportunities for their organization to participate in the Companies' EEC programs. Energy specialist positions are funded by the Companies up to $60,000 for a period of one year. Energy specialists are required to submit a quarterly report outlining their projects that are completed, in progress, and planned. To qualify to be an energy specialist, candidates for these positions must be either a graduate from the BCIT Sustainable Energy Management Associate Certificate program or have a master's degree in Clean Energy from UBC.
Goals	• Increase participation in the Companies' EEC programs. • Develop and execute other projects that result in natural gas savings. • Work with the energy manager on projects that result in holistic energy savings.
Implementation	
Administration	Administered internally within the Companies' EEC group.
Communications	As a pilot initiative, the energy specialist program is not being actively promoted at this time.
Evaluation Strategy	This pilot program will be evaluated in Q3 2011 to determine its overall viability, assess program delivery and reporting mechanisms, and full program roll-out options. This evaluation will be conducted through analysis of energy specialists' quarterly reports and qualitative feedback from participating organizations and the Companies' account managers.

11.2.4.3.2 2010 Energy Specialist Program Results

Table 11-7: 2010 Energy Specialist Program Expenditures

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	13	$240	$1	N/A	N/A	N/A	N/A
FEVI	1	$15	$0	N/A	N/A	N/A	N/A
Total	14	$255	$1	N/A	N/A	N/A	N/A

Twenty separate organizations were approved by the Companies to hire energy specialists in 2010 as part of the pilot launch of the Energy Specialist program. Of these organizations, six were still working through the hiring process at the end of 2010 to fill their respective energy specialist positions.

To date, anecdotal feedback on the program from the participating organizations has been very positive. Participating organizations have been able to make a lot of progress on their energy efficiency projects with the addition of the energy specialist position. In addition, there have been observed efficiencies in pairing the energy specialist with the BC Hydro-funded energy manager in that the energy specialist has been able to step in immediately to begin working on projects and reporting results based on the models and tools already established by the BC Hydro-funded energy manager.

11.2.4.4 Prince George Community Energy Manager – PILOT

11.2.4.4.1 <u>Prince George Community Energy Manager Overview</u>

Prince George Community Energy Manager - Pilot	
Target Audience	Retrofit and New Construction - Prince George Community (all types of customers)
Duration	Nov 2010 - Nov 2011
Incentive	$25,000
Partners	BC Hydro, NRCan
Overview	
Background	After discussions with the City of Prince George in mid-2010, the Companies agreed to co-fund a community energy manager to focus on the community of Prince George. BC Hydro has funded similar positions in the past, which helped establish the framework for this position. The City of Prince George has shown a keen commitment to promoting energy efficiency and green initiatives for its community. This also contributed to the decision to select this opportunity as a pilot program for funding a community energy manager. Establishing the funding agreement and identifying a suitable candidate took several months but was finalized in November 2010.
Description	Working for the City of Prince George and reporting to the environment manager, the Prince George community energy manager (“CEM”) is responsible for identifying and facilitating the implementation of energy efficiency opportunities for the community of Prince George in order to reduce grid-supplied energy use and fossil fuels use, including natural gas, and to meet target GHG emissions reductions by 2012. The Companies have split the funding of this position with BC Hydro and NRCan. The Companies’ contribution is in the amount of $25,000 for one year. Funded as an enabling program, a key priority for the CEM is to identify opportunities for natural gas customers in Prince George to participate in the Companies’ DSM programs. The CEM is required to submit a quarterly report outlining their natural gas related projects that are completed, in progress, and planned.
Goals	The following deliverables from the CEM have been requested by the Companies: • Promote the Companies’ energy efficiency programs, information, and incentives;

	• Work to increase the Companies' program participation by residents and businesses in Prince George; and • Explore and develop projects that result in more efficient use of natural gas in the Prince George area.
Implementation	
Administration	Administered internally within the Companies' EEC group.
Communications	As a pilot initiative, the community energy manager program is not being actively promoted at this time.
Evaluation Strategy	At the time of writing this report, the plan for this pilot program is to fund only this one CEM position until the end of the initial one year term. Towards the end of this term, the pilot program will be evaluated to determine its overall viability, the benefits of extending this position to a second year, and the possibility of opening it up to include funding for CEMs in other communities. This evaluation will be conducted through an analysis of the CEM's quarterly reports.

11.2.4.4.2 2010 Prince George Community Energy Manager Results

The Prince George CEM was hired in November 2010. While the CEM position started in November 2010, the first funding payment is not due until February 2011; therefore, no dollars are shown to be committed to this pilot program in 2010. In November and December of 2010, the CEM established priorities for the position, worked to become familiar with the Prince George market, and began work on a strategic energy management plan.

11.2.5 SUMMARY

Enabling Activities provide important support for effective EEC program development, delivery, and evaluation. Most EEC programs work on the principal of market transformation with eventual mandate by regulation as the end goal.

Research and evaluation provides the information required to create a market development plan. The Efficiency Partners program aids in efficient delivery of EEC programs and provides the vital industry feedback for program adjustments. Regulation target levels and implementation timeframes require guidance from industry stakeholders.

Given the aggressive provincial GHG emissions reduction targets, participation on the various codes and standards committees is critical. Poorly constructed or timed regulations could result in a void of products and services and disrupt market transformation processes. Unsuccessful market area transformation could result in an unbalanced shift to one energy source, creating a supply and demand problem that could in turn result in rate increases for customers.

Energy management funding enables customers, who might otherwise not enter into energy efficiency and conservation projects due to lack of resources, to get involved in initiatives that will decrease their energy consumption.

The Companies believe the results of Enabling Activities in 2010 demonstrate their value and intend to continue to refine and improve such activities in 2011.

11.3 2011 Planned Enabling Activities

As discussed in Section 11.1, in 2010 the Companies pursued Enabling Activities in support of broader EEC activities and programs. These activities fall into four major categories: research and evaluation, Efficiency Partners program, codes and standards, and energy management funding. In 2011 these four areas of focus will remain the same and the Companies will increase and broaden their planned activities in each.

The expenditures in this area are part of the overall overhead of EEC program delivery and are included in the overall portfolio level expenditures.

As the Companies' EEC initiative continues to expand through 2011 and beyond, the efficiency partners and codes and standards areas have the potential to consume significant resources. As these areas develop, it may be necessary to reassess the need to establish a separate program area for these activities in the future, with their own budgets.

Table 11-8 below shows the budgeted amount for 2011 Enabling Activities. Note, however, that not all research and evaluation studies have been determined for 2011 and so the total planned expenditures for this area are yet to be determined.

Table 11-8: 2011 Enabling Activities - Forecast Expenditures

Program	Description	Expenditure ($000s)		
		FEI	FEVI	Total
Research and Evaluation*	Market research and evaluation that support the overall EEC portfolio	$190	$48	$238
Efficiency Partners Program	Delivering EEC programs through B-ticket contractor companies	$317	$105	$422
Codes and Standards	Codes and standards related to EEC program areas	$60	$15	$75
Energy Management	Providing assistance to customers for energy efficiency initiatives	$1,391	$293	$1,684
Total		$1,958	$461	$2,419

* Only includes the CPR and Contractor studies. Does not include any additional research studies that may be undertaken in 2011.

Further information on each of the four areas of the 2011 Enabling Activities is listed below.

11.3.1 RESEARCH AND EVALUATION

11.3.1.1 2011 Overview

Each of the research and evaluation activities the Companies plan to undertake in 2011 are listed in Table 11-9 below, along with a reference as to where their respective description and attributed costs can be found in this report.

Table 11-9: 2011 EEC Research and Evaluation Activities

Study	Description	Expenditure (000s)	Reference
Getting to EnerGuide 80 and Beyond - New Home Construction	Determine energy savings, costs, and lifecycle costs for natural gas and electic heated homes for EnerGuide 80 through to EnerGuide 86 (this study is jointly funded by BC Hydro).	$34	Residential - 3.4.3.2
EnerChoice Efficient Fireplace Brand Awareness	Determine awareness of EnerChoice efficient fireplaces in both consumers and dealers to inform program development and outreach.	$15	Residential - 3.4.2.2
On-farm Energy Assessments	Energy assessments at an additional 25 separate sites to establish how agricultural producers use energy.	$28	Commercial - 4.4.4
MURB Remediation Study	A comprehensive rehabilitation study of problem strata buildings including an analysis of energy use and conservation strategies.	$10	Commercial - 4.4.3.6
Field verification of Hot 2000 base modeling and with consumption data	Compare energy savings estimates in Hot 2000 to consumption data to inform NRCan as to more accurate savings estimates for BC (gas and electric).	$25	Joint Initiatives - 7.4.2.1
Standard Operating Conditions for Hot 2000 Modeling for BC	Review EnerGuide Standard Operating Conditions (SOC) and provide recommendations to provide consistency across utilities and governments.	$3	Joint Initiatives - 7.4.2.1
Bill Insert and Bill Messaging Research Study	Determine readership level and understand if certain messages garner more attention from readers than other messages by our residential customers. Study began in 2010 and will be completed in 2011.	$12	Conservation Education and Outreach - 8.2.1.1
EEC Event Tracking	To determine the success of the overall approach (event attendance and/or sports team partnerships along with an online contest) for raising awareness of energy conservation.	$15	Conservation Education and Outreach - 8.3.1.1
EEC Long Term Tracking	To track awareness levels for EEC messaging, message retention, and programs overtime among the residential and general public audience.	$60	Conservation Education and Outreach - 8.3.1.1
Geoexchange Energy Performance Study	The Companies have committed EEC funds for a geoexchange energy performance evaluation project initiated through Geoexchange BC. The goal is to evaluate the energy savings attributable to installed geoexchange systems in MURBs and commercial and institutional buildings.	$12	Innovative Technologies - 10.4.1.2
CEATI Gas Utilization Working Group Membership	Participate in this working group to investigate the market potential and energy savings for different market ready technologies and collaborate with utilities and stakeholders on potential studies, pilots, and demonstration projects.	$4	Innovative Technologies - 10.4.1.2
Westhouse Demonstration Project	The project is a collaboration between City of Vancouver, Simon Fraser University, and FEI to demonstrate alternative energy in high visibility collaboration and to gain information on operation and energy performance of the solar thermal system.	$12	Innovative Technologies - 10.4.1.2
Contractor Qualitative Report	To gain insights around energy efficiency program awareness, preferred communication methods, and training needs.	$4	Enabling Activities - 11.2.1.3
Conservation Potential Review	Examines available technologies and determines their conservation potential.	$234	Enabling Activities - 11.2.1.3
Total		$468	

Beyond completion of the Contractor study and the Conservation Potential Review study, research activities at the EEC portfolio level have not been planned out yet for the year. Therefore, the total dollar value listed in Table 11-9 only includes these two studies and does not take into account any other studies that may be required in 2011.

As discussed in Section 11.2.1.4, the Contractor study involves two components: the qualitative component completed in December 2010 (refer to Appendix F to see the report) and the quantitative component, with findings expected to be compiled by the end of March 2011 and the final report delivered thereafter. The Conservation Potential Review study is scheduled to be completed at the end of March 2011. Please refer to Section 13 for more information on this study and the expected results.

Table 11-10 outlines expected research and evaluation expenditures for 2011.

Table 11-10: 2011 Research and Evaluation - Forecast Expenditures

Name of Study	Description	Expenditure (000s)		
		FEI	FEVI	Total
Contractor Qualitative Report	To gain insights around energy efficiency program awareness, preferred communication methods, and training needs.	$3	$1	$4
Conservation Potential Review	Examines available technologies and determines their conservation potential.	$187	$47	$234
Additional Studies		TBD	TBD	TBD
Total*		$190	$48	$238

* Total does not include any additional research studies that may be undertaken in 2011.

11.3.2 EFFICIENCY PARTNERS PROGRAM

11.3.2.1 Overview and Highlights

The 2010 Efficiency Partners program development highlights noted in Section 11.2.2 form a solid foundation from which to further develop this initiative in 2011. Strong uptake of EEC programs through the course of 2011 will require strong Efficiency Partner group support. It is important for industry stakeholders with end-use customer influence to be aligned with the Companies' stance of promoting high efficiency appliances, due to their direct customer contact.

To promote this support, the Companies will broaden their Efficiency Partners program in 2011 beginning with natural gas service providers through the expanded contractor program. As suggested in Section 11.2.2, while the Companies are starting with contractors as a first step in the partner's initiative, the Efficiency Partners program will also eventually include efficiency service groups like suppliers, distributors, and so on. Highlights of the planned 2011 Efficiency Partners program activities are as follows:

- Roll out of the expanded Contractor program to all service territories;
- Province-wide registration drives to encourage participation in the Contractor program to be held during the latter part of the second quarter. The sessions will include an

educational component with guest speaker (i.e. new water heater technology, emerging technologies, and BCSA permitting requirements);

- Focus on outreach through the further development and enhancement of the Companies' website (i.e. customer and efficiency partner portals), developing promotional materials for both customers and efficiency partners, participating in third-party communications through association and stakeholder newsletters, and participating in association events and tradeshows;
- Use Contractor study research findings to guide the development of training opportunities for contractors and work with trade associations to deliver these opportunities; and
- Develop and launch the Contractor program sub-brand name and logo across all service territories.

As noted in section 11.1.2, Order No. G-36-09 did not approve the discrete trade relations budget area put forward as it was considered by the Commission to be a duplication of commercial and residential program delivery expenditure. The expenditures in this area are part of the overall overhead of EEC program delivery and are included in the costs for the overall EEC portfolio.

Table 11-11 is an estimate of the expenditures required to develop and maintain the 2011 Efficiency Partners program.

Table 11-11: 2011 Efficiency Partners Program – Forecast Expenditures

Efficiency Partners Program	Expenditure ($000s)		
	FEI	FEVI	Total
Registration/application administration (Contractor program)	$22	$6	$28
Promotion, brochures, and trade magazine ads	$18	$5	$23
Conferences and trade shows	$12	$3	$15
Quarterly newsletters	$19	$5	$24
Efficiency workshops/training	$64	$16	$80
Website development	$40	$10	$50
Co-op advertising	$20	$30	$50
Program development expenses	$48	$12	$60
Program development labour	$74	$18	$92
Total	$317	$105	$422

11.3.2.2 Expanded Contractor Program Roll Out

Focus during the first and second quarters of 2011 will be to roll out the expanded Contractor program, as described in section 11.3.2.1, to all service territories. There are over 2,400 natural gas contractor companies registered with the BCSA. It is anticipated that registration activity will continue through 2011 and beyond. Registration drives are planned in the latter part of the second quarter to promote the Contractor program and will continue throughout the year.

11.3.2.3 Focus on Outreach and Communication

Relaying the benefits of the Contractor program to both the contractor community and customers seeking products and services from contractor companies is key to the success of the expanded program; therefore, this will be the focus for the latter part of Q2 and will continue through to the end of the year. The continued development and enhancement of the Companies' website will offer one of the major benefits to contractor companies, namely, to have their business listed on the website. For customers, the benefit is the ability to use the website to seek out a local contractor that offers the products and services they require. The contractor portal will include information related to the Companies' EEC initiatives and activities, training opportunities, emerging technical information related to codes and standards, links to the Contractor program application, co-op advertising reimbursement forms, and related terms and conditions, and links to the contractor newsletters. The customer portal will include a listing of the Companies' member contractor companies. Customers seeking a contractor company will be able to search by various fields, including geographic area and services required. Contractor listings will include affiliations, training, and Better Business Bureau accreditation, with a description of each and link back to the organization should the customer wish to learn more about these affiliations. Value-added tips like 'how to find a qualified contractor' and knowing what questions to ask when hiring a contractor will also be featured.

Additional activities to promote the Contractor program include developing promotional materials to support participation in events and tradeshows, placing ads in trade publications, magazines, and e-newsletters, participating in stakeholder events like lunch and learn sessions, and exploring speaking opportunities through associations.

The Companies recognize that direct contact with gas contractor companies, manufacturers, suppliers, and other service groups connected to the gas industry (i.e. home auditors and inspectors) is essential. These stakeholder groups must be educated about the benefits of high efficiency equipment and their concerns about availability and complexity need to be alleviated.

11.3.2.4 Training Development and Promotion

Understanding the training needs of the contractor community will be achieved through research findings that will be available in the first quarter of the year. Based on these findings, the focus for the third and fourth quarters of the year will be on development training opportunities, identifying educational partners, and determining delivery options. At this time, anecdotal evidence suggests the following are training areas to explore:

- How to perform heat-loss calculations to determine optimal sizing of boilers (in particular for commercial applications);
- Taking a whole-home or HAAS approach to identifying energy efficiency opportunities;

- Emerging EEC technologies;
- Understanding the impact of codes and regulations (i.e. release of the new provincial building code in the latter part of 2011);
- Customer service/sales 101; and
- Managing business and finance.

Consulting with experts in these areas and partnering with associations to deliver training opportunities to the contractor community will require a consolidated effort among stakeholders in order to provide the most cost efficient and equitable access to programs for all contractors.

11.3.2.5 Co-op Advertising and Sub-brand

Gas contractors currently registered in the Qualified Dealer program in FEVI will continue to use the existing logo when participating in the Co-op Advertising program through Q1 and Q2. The co-op advertising benefit of the Contractor program will be made available to all remaining service territories in Q3, when it is expected a new contractor sub-brand name and logo will be launched.

The following outlines co-op advertising parameters:

- Gas contractors may receive a reimbursement of up to 50% for an approved marketing piece with a maximum reimbursement of $5,000 per program year, per company;
- Funding is limited and will be dispersed on a first-come, first-serve basis;
- All advertising must be pre-approved by the Companies;
- Advertising must include the program logo;
- Advertising must promote the use of natural gas equipment only; and
- The Companies may require advertising to include messaging around energy efficiency and conservation.

Co-op advertising dollars may be available for the following media:

- Print (excluding print ads in the Yellow Pages);
- Radio;
- Direct mail;
- In-store displays; and
- Other marketing pieces approved by the Companies.

Increased levels of participation in the Co-op Advertising program are expected in the FEI territory as the number of participants increase in the new Contractor program in the third and fourth quarter of 2011 and beyond. The participation levels in FEVI are expected to increase as well, as contractor companies in this region join the new Contractor program.

Table 11-12 below identifies projected quarterly estimates for the co-op advertising reimbursement activity for 2011.

Table 11-12: 2011 Co-op Advertising Reimbursement Estimates

Co-op Advertising	Expenditure ($000s)				
	Q1	Q2	Q3	Q4	Total
FEI	$0	$0	$6	$14	$20
FEVI	$4	$9	$8	$9	$30
Total	$4	$9	$14	$23	$50

11.3.3 CODES AND STANDARDS

11.3.3.1 Overview

Industry, regulating bodies, code development agencies, and user groups rely on the participation and input of stakeholder groups, such as utilities, which have a unique understanding of energy supply and customer demand cycles, to assist in the development of codes and standards. The content and timing of code implementation directly effects market transformation in all program areas. Through the EEC Contractor program, industry will be informed of developing codes and possible impacts to the marketplace.

Keeping current is important, however, the Companies' participation in the development phase of regulations allows for more effective EEC program delivery and successful DSM market transformation. This requires various levels of involvement. Codes and standards are established at a national level and adopted with or without changes at the federal and/or provincial level. The Companies' level of regulatory involvement is indicated by one of three involvement classifications: monitoring, stakeholder engagement, and developing regulations

Table 11-13 below identifies estimated expenditures by activity projected for 2011.

Table 11-13: 2011 Codes and Standards Expenditure Estimates

Code area	Expenditure ($000s)		
	FEI (20%)	FEVI (80%)	Budget
Building Code New Construction	$4.6	$18.4	$23.0
Performance Standards	$2.0	$8.0	$10.0
Commercial Boilers and Water Heaters	$0.8	$3.2	$4.0
Residential Boilers, Furnaces, and DHW	$2.2	$8.8	$11.0
Hearth Products	$0.2	$0.8	$1.0
Solar Thermal Systems	$1.6	$6.4	$8.0
*New initiatives for 2011	$3.6	$14.4	$18.0
Total	$15.0	$60.0	$75.0
* Thermal Metering, NGV, Solar			

The sections that follow offer highlights for new codes and standards as they apply to EEC program areas for 2011 and are presented in order of the Companies' involvement levels, including: monitoring, influencing, and participating. The codes and standards activities that were undertaken in 2010 will continue in 2011, along with new identified subject areas.

11.3.3.2 Codes and Standards, and Company Involvement: Monitoring Level

Residential Furnace Regulations

The Companies had stakeholder involvement in the adoption of this standard and will now monitor any changes that may come out of implementation. Change-out of existing standard and mid-efficiency furnaces would result in large efficiency gains and a Furnace Scrap-it program (see Section 3) is being evaluated to capture these potential gains.

11.3.3.3 Codes and Standards, and Company Involvement: Stakeholder Level

Towards Net Zero Buildings in BC for 2020 (Future Code)

The BC Government has announced it is moving toward a net zero energy or net zero energy capable (the Passive House standard) construction code by 2020. The Companies participate in both the EnerGuide 80 and Net Zero committees.

At a minimum, a net zero home supplies to the power grid an amount equal to the total amount of energy consumed. It combines the amount of energy (electricity and, if applicable, natural gas) used to operate a home and the amount needed to provide an equal amount of self-generated energy back to the grid, when possible. A passive house generates and stores all the energy it requires without connecting to any utility supply. The implementation of a net zero energy capable construction code by 2020 will require the development of an implementation road map to identify the barriers and develop solutions with all stakeholder groups. At this point in the development of the code, the Companies are participating at a stakeholder level.

Thermal Metering

Thermal metering is a technique that measures changes in temperature and the flow rate of a fluid and uses a calculation to derive the amount of thermal energy delivered by that fluid. Thermal metering will be required for district energy systems and solar thermal projects. This metering will be required for accurate billing and should not be confused with metering for pilot studies. To date, Measurement Canada has not recognized any technology for this purpose. Many of these technologies exist in Europe and a task force is being assembled by the CGA to work towards a Canadian solution to this challenge. Many of the existing EEC programs and innovative technologies under assessment will require this type of metering. EEC is planning to participate in this stakeholder project.

11.3.3.4 Codes and Standards, and Company Involvement: Developing Regulations Level

Building Code EnerGuide Rating (Part 9)

The provincial government continues to work toward the implementation of a new BC Building Code to take effect in late 2011. The current rating of 77 and the new 80 rating are stepping stones toward a net zero level set for 2020, and are described above in Section 11.3.3.3. The Province of British Columbia is updating the energy efficiency requirements in the Energy and Water Efficiency section (Part 10) of the BC Building Code for residential buildings.

A study involving the Companies and a number of industry partners was started in 2009 to determine potential combinations of overall building envelope thermal requirements, air tightness, and equipment efficiency in order to meet EnerGuide 80. A number of base cases were modeled using the NRCan Hot 2000 program, using the following variations:

- Various archetypes of detached homes and row homes;
- Primary space heating system: electric, natural gas (water heating is assumed to match); and
- Climate zones in BC: Southern Coastal, Southern Interior, and Northern Interior.

The modeling study was completed in 2010. A stakeholder committee was created to develop the guidelines for changes to the BC Building Code based on the results of the study and input from the representing groups. The Provincial Government is now assessing the impact of these proposals on industry. A new construction program to move industry to an EnerGuide 80 standard is in development and details about this program can be found in Section 11.3.3.3.

Ventilation

The Company is involved with a large collaborative study looking at the effects of building remediation on energy usage and ventilation in multifamily buildings. The Companies expect to be involved with ventilation standards for multifamily residential buildings in the new BC Building Code.

11.3.3.5 Summary

There are a number of product areas where regulations are connected to EEC programs, including: BC Building Code with particular attention to EnerGuide 80 ratings for houses and eventually net zero buildings in 2020, performance standards, commercial water heaters and boilers, residential furnaces, boilers, and domestic hot water heaters, hearth products, solar thermal systems, thermal metering, liquefied natural gas, compressed natural gas, and ventilation

EEC will remain active with codes and standards committees as they pertain to EEC program and market development, and this will continue to be an important activity area. The 2011 implementation of the new BC Building Code for new home construction with EnerGuide 80 efficiency targets will be of particular interest in the near term. The planned budget for this area of activity for 2011 is estimated at $75,000, which is based on a time commitment equivalent to two thirds of a full time position.

11.3.4 ENERGY MANAGEMENT FUNDING

11.3.4.1 Overview

In 2011, the Companies plan to continue with their energy management funding activities that were launched in 2010. A full year of activity in these areas will necessarily result in increased expenditures compared to 2010; however, no new energy management activities are currently planned beyond what was launched in 2010. The Energy Specialist program and the Prince George community energy manager position will be evaluated in 2011 to determine if funding in these areas should be continued and if similar funding should be extended to other customers and communities. Table 11-14 displays planned expenditures for energy management funding in 2011.

Table 11-14: 2011 Energy Management Funding – Forecast Expenditures

Name of Program/Initiative	Description	Expenditure (000s)		
		FEI	FEVI	Total
Energy Solutions Managers	Sales activities dedicated to increasing participation in the EEC programs.	$225	$113	$338
Energy Specialist Program	Funding of energy management positions within select organizations.	$1,141	$180	$1,321
Prince George Community Energy Manager	Funding of an energy management position for the community of Prince George.	$25	$0	$25
Total		$1,391	$293	$1,684

11.3.4.2 Energy Solutions Managers

The three ESM positions will continue as is through 2011. It is estimated that $340,000 will be spent to fund these positions in 2011.

11.3.4.3 Energy Specialist Program – PILOT

By early 2011, the Companies expect all approved pilot program participants to have hired their respective energy specialists. The forecast expenditures listed in Table 11-15 assume they will all be employed for the duration of 2011. This pilot program will be evaluated in Q3 2011 to determine its overall viability and to assess program delivery and reporting mechanisms and full program roll out options. This evaluation will be conducted through analysis of energy specialists' quarterly reports and qualitative feedback from participating organizations and the Companies' account managers.

Table 11-15: 2011 Energy Specialist Program Forecast

Utility	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditure ($000s)	Annual Energy Savings (GJ/yr)	NPV Energy Savings (GJ)	Free Rider Rate	TRC
FEI	19	$1,140	$1	N/A	N/A	N/A	N/A
FEVI	3	$180	$0	N/A	N/A	N/A	N/A
Total	22	$1,320	$1	N/A	N/A	N/A	N/A

11.3.4.4 Prince George Community Energy Manager – PILOT

The full $25,000 funding commitment to the Prince George community energy manager ("CEM") position will be incurred in 2011. As of the writing of this report, the plan for this pilot program is to only fund this one CEM position until the end of the initial one year term. Towards the end of this term, the pilot program will be evaluated to determine its overall viability and the benefits to extending this position to a second year and opening it up to include funding for CEMs in other communities. This evaluation will be conducted through the analysis of the CEM's quarterly reports.

11.3.5 ENERGY EFFICIENCY FINANCING

Background

The Ministry of Energy and Mines has been encouraging BC Hydro and the FortisBC Utilities to jointly implement an energy efficiency financing program that would overcome the "first cost" barrier to existing energy efficiency incentive programs. The Ministry of Energy and Mines has created a working group that also includes other relevant ministries, the BCUC, and the City of Vancouver to explore different energy efficiency financing program options. There are a number of energy efficiency incentive programs currently offered to BC homeowners by the provincial government and energy utilities. Most of these programs require homeowners to pay for energy efficiency improvements up front, and then the homeowner receives a grant or rebate for a portion of the energy efficiency improvement cost. While these programs have been well subscribed, the requirement for homeowners to pay up front for energy efficiency improvements represents a significant participation barrier for many households, particularly given that energy efficiency upgrades are a lower priority investment and viewed more as a necessity in the event of an equipment breakdown or repairs than traditional cosmetic and expansion projects. Many homeowners either do not have the financial resources or access to financing to pay the upfront cost for the energy efficiency improvements or feel the hassles of working with their bank outweigh their desire to become more efficient. To overcome this barrier, the Ministry of Energy and Mines views the utilities as key partners in developing the financing program and believes energy efficiency financing will be a flagship program to meet the aggressive GHG emissions reduction targets set in legislation and promote a culture of conservation in BC.

Financing Options:

In October 2010, the Ministry of Energy and Mines requested that the utilities submit a joint proposal for a pilot energy efficiency financing program. While various financial models and program design principles were reviewed, the Ministry of Energy and Mines has strongly favoured the “Pay As You Save”, or PAYS, model. The PAYS model is designed around the creation of a utility-owned entity that would:

- Borrow funds from market investors to create a capital pool;
- Provide energy efficiency loans to households that would be assured to result in greater utility bill savings than the loan repayment amount, sometimes requiring longer than traditional amortization periods;
- Tie loans to the meter, meaning that when the homeowner sells the house, the new owner can assume the loan;
- Insure the operation and performance of energy efficiency retrofits;
- Provide a guaranteed return to investors; and
- Offer collection of payments through the utility bill.

Market Research

The FortisBC Utilities and BC Hydro (“the Utilities”) conducted focus group sessions in Nov 2010 across the Lower Mainland, Prince George, and Kamloops to test consumer interest in energy efficiency financing and preferences for loan terms and conditions, as well as the best way to engage them. The FortisBC Utilities contributed approximately $12,000 towards conducting this research. Focus group testing found limited interest in an energy efficiency financing program operated by the Utilities. Most participants preferred to self-finance their energy efficiency upgrades and viewed the Utilities as competitors to banks for such an offering. Many participants noted that they already have a relationship with their banks and would be less inclined to take money from a utility and go through the hassle of transferring the payment to the next homeowner.

Program Issues

Although the PAYS model has some merit, the Companies have significant concerns that the PAYS model is overly complex and creates significant legal responsibility around the quality of the energy efficiency retrofits and guaranteeing that energy savings will exceed monthly payments after retrofits are completed. There are also significant concerns that loan payment defaults could be larger than energy bill payment defaults and in the absence of any loan default fund, the Companies would have to recover the defaults from the entire customer base. Additionally, the administrative burden associated with the collection of payments and the transfer of the loan to the next customer through property disclosure statements is complicated and outside the scope of the Utilities’ expertise.

Further discussions revealed that there remain a number of additional challenges and complexities to developing the financing aspect of this type of program, including:

1. A number of financial institutions (i.e. VanCity, Royal Bank of Canada, and Toronto Dominion Bank) already offer financial services specifically targeting energy efficiency

upgrades. A utility-operated program could be viewed as competing with the financial services industry;

2. The Utilities do not have the expertise to implement and operate large-scale loan programs;
3. A province-wide energy efficiency financing program would expose the Utilities to additional financial risk and potentially affect their overall ability/cost to borrow; and
4. The Companies are in the process of transitioning to a new customer billing service provider and will not have the ability to administer a financing program on their billing system for two to three years.

2011 Action Plan

To address some of the concerns identified above, the Companies and BC Hydro have put forward a proposal to explore energy efficiency financing further with the Ministry of Energy and Mines. This includes proposing an offer that focuses on partnering with financial institutions to introduce and expand energy efficiency financing programs. The Utilities would use their market presence to issue criteria (i.e. request of qualification) for financial institutions to become eligible providers of financing for a joint utilities renovation program. The intention would be to drive more favorable terms and conditions for participating customers with all the eligible financing providers. Financial institutions will benefit in a number of ways including enhanced marketing opportunities, lower cost customer generation, and leads into other program offers through their companies. The Companies believe some of the identified concerns about loan default and reputational risk can be partly mitigated through such a mechanism since the banks would provide the required loans and collect the payments through their existing channels, with no promise of savings exceeding monthly payments. In order to proceed with developing this proposed revised approach, the Companies are currently working with the Ministry of Energy and Mines to explore this option and assess the concerns of the Ministry before reaching out to the financial institutions. In the event this program moves forward as a pilot, the Companies would communicate with the Commission staff in the forthcoming stakeholder workshops.

11.4 Summary

Enabling Activities are important initiatives that support broader EEC activities and programs. The Companies initiated these activities in 2009 and continue to expand on them to support EEC activity with the inclusion of Energy Management Funding in 2010 to further create supportive conditions for a successful 2011 EEC portfolio.

Research and evaluation activities will continue to support the overall EEC portfolio and help provide direction to future program areas and enabling activity planning. The Efficiency Partners program will expand to include the FEI service area by potentially adding another 1,000 contractors to deliver EEC programs. Given the aggressive provincial GHG emissions targets, participation in the development of the new construction building code will strengthen the Companies' communication with the building industry. Hot water tank regulations and Tier 3 pilots will be necessary for the development of an effective market transformation plan to help protect the end use customer.

Many of these enabling activities are supportive of the province's Energy Plan. The degree of the Companies' work in Enabling Activities will be evaluated over the course of the year to determine whether the Efficiency Partners program and work on codes and standards require the establishment of a discrete budget.

12 EEC STAKEHOLDER GROUP ACTIVITIES

As one of the accountability measures defined in the EEC Decision, the Companies held two EEC stakeholder meetings in 2010. The objective of the EEC Stakeholder Group is to guide and provide input on EEC activities and programs. The purpose of the biannual workshops is for the Companies to present updates on program progress, act as a forum for dialogue for stakeholders input in developing new programs, and refining existing programs. The members of the EEC Stakeholder Group were solicited through regulatory stakeholders (those that have historically intervened in the Companies' regulatory proceedings) from industry groups with whom the Companies interact, and from key contacts from the Companies' Energy Solution and Community Relations departments. Refer to Appendix G in the meeting minutes for a list detailing membership of the EEC Stakeholder Group.

12.1 Activities and Costs in 2010

Two stakeholder meetings were held in 2010 - March 11 and November 24.

On March 11, 2010 the EEC department reviewed the 2009 EEC Annual Report with program investments and results. In addition, the stakeholders provided written feedback and action items for the Companies to pursue in 2010. On November 24, 2010 the EEC department reviewed programs and initiatives that had launched in 2010, correlating the successes back to many of the priorities from the March meeting, and then held mini-workshops with the stakeholders for program ideas to pursue in 2011. Both sessions have been well attended with positive verbal feedback on much of the EEC programs and initiatives, and active discussions that aid in prioritizing future EEC projects (i.e. programs for multifamily buildings and replacing mid-efficient furnaces that are still in residential homes).The meeting agendas, meeting minutes, lists of attendees, presentations, and stakeholder priorities and action items for the two 2010 meetings can be found in Appendix G.

Table 12-1 summarizes the costs for the stakeholder sessions.

Table 12-1: Cost for 2010 EEC Stakeholder Sessions (March and November)

Item	Actual Costs
Venues and equipment rental	$2,030
Meals	$4,332
Stakeholder travel	$4,456
Total Costs	$10,818

12.2 Planned Activities in 2011

In 2011, the Companies will continue to hold biannual workshops with the EEC Stakeholder Group with the first meeting having already taken place on March 15.

Additionally, the Companies intend to expand the EEC Stakeholder Group to include additional members, in particular representatives from the industrial, innovative technologies, and non-profit sectors, in order to reflect the expanding number of EEC programs available for the marketplace. As the EEC Stakeholder Group is expected to grow, the proposed budget in Table 12-2 below will reflect this growth. Stakeholder travel is expected to increase to encourage participation from representatives outside of the Lower Mainland. For example, industrial customers from northern BC, non-profit association representatives, and other government representatives

Table 12-2: Proposed Budget for 2011 EEC Stakeholder Sessions (Q1 and Q4)

Item	Budgeted Cost
Venues and Equipment Rental	$2,500
Meals	$4,600
Stakeholder travel and administration	$8,500
Budgeted Total	$15,600

The March 15 meeting to the expanded EEC Stakeholder group included presentations on the 2010 program results, highlights from the Conservation Potential Review study, which is still being finalized during the submission of this report, alternatives to the Total Resource Cost test used in program design, and discussion on the upcoming 2012 EEC funding application to the Commission.

The agenda, meeting minutes, presentations, and list of stakeholder prioirites for 2011 from the March 2011 EEC Stakeholder meeting can be found in Appendix G.

13 CONSERVATION POTENTIAL REVIEW ("CPR")

13.1 Introduction

Results of a Conservation Potential Review ("CPR") form the basis for future program development within a comprehensive EEC portfolio. The Companies drew heavily on the 2006 CPR as they moved from the small set of DSM activities to the broader portfolio of EEC initiatives. The Companies initiated a new CPR study in August 2010, hiring Marbek Resource Consultants Ltd. ("Marbek") to conduct the study at a cost of approximately $560,000. This study focused on the Companies' natural gas customers only and was segmented into the residential, commercial, and industrial sectors.

The Companies consider the CPR to be an important tool for use in developing, supporting, and assessing current and future EEC expenditure applications as well as for directional input into program development. The purpose of a CPR study is to examine available technologies and determine their conservation potential, which includes the amount of energy savings that can be achieved through energy efficiency and conservation programs over the study period. The CPR does this by comparing the economic and achievable potential of viable measures to a base case scenario.

13.2 Scope of Work

Overall, the 2010 CPR had the following key objectives/deliverables:

- Characterization of available natural gas and other thermal technologies inclusive of energy efficiency and fuel choice;
- Identification of the size of the potential opportunities over a set study period including opportunities related to equipment, lifestyle, and behaviour;
- Economic modeling of measures, including calculations on GJ output, GHG emissions, and cost/benefit analysis of all identified thermal technology options;
- Proportion of end use energy that could be met by energy systems based on renewable energy as the primary fuel with a natural gas and/or thermal component;
- Determination of how many jobs the Companies' natural gas conservation and efficiency activities would create in British Columbia up to 2021;
- Provision of estimates for the potential natural gas load reduction and GHG emissions reduction volume achievable through EEC programs for input into load forecasts and future integrated resource plans; and
- Provision of a discussion paper that looks beyond the traditional economic focused California Standard Practice tests and how utility energy efficiency and conservation

efforts could support government policy as listed in the 2010 BC Clean Energy Act (Bill 17).

In addition, Marbek was directed to conduct a commercial end use study as part of the 2010 CPR. This study analyzed the energy usage behaviour exhibited by small and large commercial customers by sector, including apartment/condo strata corporations, commercial/office, education, health care, restaurants, and wholesale/retail.

13.3 Results Delivery

The contract to conduct the CPR was awarded in August 2010 with work beginning in September 2010. Field work was conducted through October and November 2010. The draft Reference Case, Technology and Economic Potential chapters were produced in December 2010. Achievable potential workshops were held in January 2011. The final CPR report is expected to be completed at the end of March 2011.

When it is completed, the updated 2010 CPR will form the primary basis of the Companies' EEC funding requests for 2012 and beyond, and will be used as a reference document for program development.

Due to the finalization of the CPR study being so close to the submission date of this Report, it is not possible to include a discussion of the study's results here; however, the final CPR report will be submitted as an appendix to the Companies' upcoming Revenue Requirement Application.

14 DATA GATHERING REPORTING AND INTERNAL CONTROL PROCESSES

14.1 Introduction

In its EEC Decision, the Commission directed the Companies to include a discussion in the EEC Annual Report of the Companies' internal data gathering, monitoring, and reporting control practices. This section addresses that directive. As this section demonstrates, the Companies have business practices in place to ensure EEC activities and associated spending are in compliance with the Commission Orders and internal control processes of the Companies in general.

This section provides general information on data gathering and on the Companies' business practices related to program development and application processing. It also includes comments from the Companies' internal audit group on EEC initiative controls.

14.2 DSM System Project: Update

As was reported in the 2009 EEC Annual Report, the expansion of EEC programs resulting from the EEC Decision has created a need to develop a robust data capture and reporting system. With the increase in the number of programs and participants, the existing Excel-based DSM tracking and reporting methods are not capable of handling the future business needs and requirements of the EEC activities. As a result, the Companies determined that a new tracking system was needed to enable it to:

- Track EEC program participation, costs, and energy savings for incentive-based programs;
- Track information about non-incentive programs and activities;
- Track actual and forecasts vs. budgets;
- Provide reports for internal and external stakeholders including program partners and the Commission;
- Allow for scenario modeling for program planning and design; and
- Support DSM cost-benefit analysis on a program by program basis as well as at the portfolio level (or EEC plan level).

To address the requirement for more robust program data gathering, tracking, and reporting, the DSM System ("DSMS") project was launched in the fall of 2008. The Companies eventually selected a web-based program tracking and reporting system called TrakSmart, and entered into an Agreement with TrakSmart's provider Nexant, to obtain the TrakSmart system.

Project implementation commenced early in 2010 and through the process of implementing TrakSmart, it was identified that more internal resources would be required to integrate the system. Adapting the new system to a natural gas DSM environment also proved to be more challenging than expected. Several software patches, system enhancements, and training sessions were required to configure the system to suit the Companies' needs. As a result, the launch of DSM programs into TrakSmart for production use was delayed. It is now expected the DSMS will be operational for an initial set of programs by April 2011. Assuming the system works as designed and expected, the full set of DSM programs from 2009 to present will be integrated into the TrakSmart system for reporting purposes and program administration.

The costs associated with implementing and maintaining the DSMS have been added to the portfolio level expenditures in 2010. The costs to implement DSMS in 2010 were approximately $645,000. It is estimated that an additional $380,000 will be required to complete the software implementation in 2011.

Once the DSMS is implemented, it will increase the ability of the Companies to capture and report on the following features:

- Program participants' information, costs, and energy savings for EEC programs and activities;
- Forecasting / extrapolation based on estimates and actuals;
- Expenses and budget tracking associated with EEC projects;
- Interface with SAP20 application;
- Costs (program, incentive, and administration) associated with EEC projects; and
- Capture of information on a per participant basis (i.e. equipment models, reasons for rejection and so on).

Once the DSMS is in place and the transition period from the current system to the new system is completed, these features will help the EEC team to make data gathering, tracking, and reporting more efficient and increase the overall efficiency of the workflow.

14.3 Robust Business Case Process Applied to All Programs

Before a new EEC program can be implemented, a program plan or business case must first be developed. The Companies are committed to putting each program through a high level of internal scrutiny before moving ahead with a program, and believe doing so ensures an increased chance of program effectiveness.

The business case developed includes information about program rationale and purpose, as well as a description of the target audience, assumptions, cost-benefit tests, and proposed evaluation methods.

Cost-benefit analysis is performed using the California Standard Tests ("CST") as outlined in the California Standard Practice Manual. In partnership with Willis Energy Services Ltd., the Companies have developed an in-house cost-benefit modeling tool based on CST that provides the following areas of analysis:

- Benefits incurred over measure life of the individual programs, including energy savings over the measure life of the program;
- Total costs incurred in implementing the program, including administrative, incentive, marketing, and evaluation; and
- The four CST tests (Rate Impact Measure ["RIM"], Utility, Participant, and TRC).

The results from this modeling are used as inputs for the business cases, which are approved in accordance with the Companies' policy on financial authorization levels.

14.4 Incentive Applications Vetted for Compliance with Program Requirements

Ensuring all customer applications are compliant with program eligibility requirements as laid out in program terms and conditions is also part of the internal control process. The Companies have a number of mechanisms in place to ensure EEC incentive funding applications are in compliance with program requirements.

The verification process is specific to each program and is dependent on the type of program, its complexity, the financial value of the incentive, and other parameters. The general principles applied are as follows:

1. Each application is reviewed for completeness and accuracy;
2. Applications must meet the criteria outlined in the terms and conditions of the program put forward through the approval process. Please refer to Appendix I for a copy of Efficient Boiler program's terms and conditions as an example;
3. Once approved, incentives are distributed to participants; and
4. Copies of application and supporting documents are filed and stored for seven years in case of an audit.

14.5 Internal Audit Services

The EEC team engaged the Companies' own Internal Audit Services ("IAS") group to review the internal controls associated with the EEC initiative. Generally speaking, IAS found the internal controls established for the EEC initiative were functioning as intended.

The report from the Companies' IAS group can be found in Appendix J.

14.6 Summary

The Companies are committed to strong internal controls in all aspects of the EEC program. As demonstrated in this section, the Companies' business practices related to program development, application processing, and ongoing monitoring are all sound and subject to continuous improvement.

The Companies' EEC team is implementing a robust data gathering and program participation tracking system (the DSMS) in order to accommodate the increased level of EEC activity arising from the funding approval. Expenditures reported through the DSMS will be gathered from SAP, which tracks all of the Companies' financial activity. It is expected this system will be in full production use by mid-2011.

All business case and financial approvals are performed in accordance with the Administrative Policy on the Companies' Authorization Levels. There are solid business practices in place related to EEC activity, such as a requirement for a detailed business case for all new programs and initiatives.

The Companies' IAS group has reviewed the processes of the EEC team and generally speaking, internal controls are functioning as intended.

In 2011 and beyond, the Companies will continue to monitor their internal controls and work with IAS to implement the changes contained in their report, so that all aspects of the EEC program are carried out with appropriate diligence and scrutiny.

15 THE COMPANYS' EEC PRINCIPLES

In the original EEC Application, the Companies laid out a number of EEC principles that are intended to guide our EEC activity. This section revisits those principles and discusses how the Companies' EEC activity completed in 2010 and planned activity for 2011 meets these principles.

1. *Programs will have a goal of being universal, offering access to energy efficiency and conservation for all residential and commercial customers, including low income customers through the DSM for Affordable Housing initiative.*
    - As can be seen by the significant variety of programs described in this report, the Companies have implemented EEC initiatives aimed at all customers including residential, commercial, industrial, and low income.

2. *Wherever possible, programs will be uniform, so that customers in one part of the service territories of the FortisBC Energy Utilities have access to the same programs as customers throughout the service territories.*
    - Programs described in this report are available to customers in all the Companies' service territories, with the following exceptions:
        - The Companies do not currently have funding approval for EEC activity for interruptible industrial customers on Vancouver Island; and
        - The Companies do not currently have funding approval for EEC activity for customers in Whistler.
    - The vast majority of customers, however, have access to all the programs for which their rate class is eligible, and it is the intent of the Companies to include funding for interruptible industrial customers on Vancouver Island and for customers in Whistler in the next EEC funding request in the 2012 – 2013 Revenue Requirements Application.

3. *EEC expenditures will be efficient, with non-incentive costs not exceeding 50% of the expenditure in a given year.*
    - The Companies' expenditures in 2010 are aligned with this principle: incentive expenditures were approximately $11.5 million and non-incentive expenditures were approximately $6.2 million.

4. *Program results will be analyzed on a portfolio-wide basis.*

5. *The Total Resource Cost/Benefit of the Portfolio over the funding period will have a ratio of 1 or higher.*

    - As can be seen in Table 2-1 in Section 2, the portfolio-level TRC results for the Companies' EEC activities in 2010 was 1.1, thus Principles four and five have both been met.

6. *The FortisBC Energy Utilities will submit an Annual EEC Report to the BCUC, by the end of the first quarter of each year, that details the results of the previous year's programs and anticipates program activity and spending for the upcoming (current) year.*

    - This report is that document.

7. *To every extent practical, programs will support the objectives of established government policies.*

    - In the Clean Energy Act (attached as Appendix C), government laid out a number of energy objectives. The Companies' EEC activity supports a number of these objectives including the following:
        - *To take demand-side measures and to conserve energy:*
            - The Companies' EEC initiative in its entirety supports this objective.
        - *To use and foster the development in British Columbia of innovative technologies that support energy conservation and efficiency and the use of clean or renewable resources:*
            - This objective is supported primarily through the Innovative Technologies program area.
        - *To reduce BC greenhouse gas emissions:*
            - Again, the Companies' overall EEC initiative supports this objective.
        - *To encourage the switching from one kind of energy source or use to another that decreases greenhouse gas emission in British Columbia:*
            - This is not only supported by high-carbon fuel switching, but also by the Innovative Technologies program area.
        - *To encourage communities to reduce greenhouse gas emissions and use energy efficiently:*
            - This is supported primarily by Conservation Education and Outreach programs.
        - *To encourage economic development and the creation and retention of jobs:*
            - This is another objective that is supported by the Companies' EEC initiative overall.

8. *The Companies will continue to seek funding for programs from additional sources, such as the provincial and federal governments, other utilities, and equipment suppliers and manufacturers, in order to minimize the cost impacts of EEC programs to ratepayers, and in recognition of the broader societal benefits resulting from successful program development and implementation.*

    - The Companies have been successful in meeting this program principle, primarily through the MEMPR low income grant discussed in Section 6.

9. *Incentives may be directed to the end users of an appliance, to the customer point of contact at the time that an equipment purchase decision is made (for example, to the gas contractor in the case of a furnace), to a system designer or engineer, or to an equipment developer, supplier or manufacturer. The most effective use of incentives will be determined through the program design process.*

    - Although the majority of incentives offered in 2010 were aimed at the end users of appliances, the Companies determined that in the case of the EnerChoice Fireplace program discussed in Section 3, a partial incentive should be paid to the salesperson. In the future, the Companies will explore opportunities to offer incentives to entities other than the end user, should it make sense to do so.

10. *Education and outreach regarding conservation will be part of the Companies' EEC activity.*

    - As discussed in Section 8, the Companies view Conservation Education and Outreach programs to be a crucial component of a successful EEC initiative, and we look forward to expanding these efforts in the coming years.

11. *Programs will be multi-year so as to create a sense of funding certainty necessary to effective implementation in the marketplace – this Application requests funding for a three-year Portfolio of EEC programs.*

    - Most of the programs offered in 2010 were multi-year programs. The Companies recognize that currently-approved EEC funding expires at the end of 2011, and are planning to request an expanded funding envelope for 2012 and 2013 in the Revenue Requirements Application to be filed in May 2011.

12. *Programs will have market transformation as their ultimate goal, and program plans will describe how a program will contribute to market transformation.*

    - One key example of this principle in action is the 0.80 EF Water Heater pilot, described in Section 3, where government has announced its intention to implement a minimum efficiency standard of 0.80 for residential gas water heaters. Led by the Companies, gas utilities across the country will be exploring the installation and performance of 0.80 EF technologies in preparation for the introduction of regulation requiring 0.80 EF as the minimum efficiency.

13. *Programs will aim to develop capacity within the market through manufacturers, distributors, vendors and installers.*

    - Some examples of capacity-building programs include the Energy Specialist program discussed in Section 11, the REnEW program discussed in Section 6, and the Furnace Service Campaign discussed in Section 3.

14. *To ensure value creation and alignment with the market, the Companies will establish and engage an EEC stakeholder group, comprised of governments, industry, trades, manufacturers, NGOs, advocacy groups, other utilities and customers to provide it with advice on effective program design and implementation, as well as some oversight of the Companies' EEC activity and expenditure. Consideration may be given by the Companies to consolidate the Companies' EEC Stakeholder activity with stakeholder activity currently being undertaken by other utilities in order to reduce potential "stakeholder fatigue".*

    - *The Companies are pleased with the interest and input from the stakeholder group established for the EEC* initiative. Stakeholder activity is discussed in Section 12.

In conclusion, the Companies feel the EEC activity in 2010 has complied with the EEC principles laid out in the original EEC Application.

Appendix A

GLOSSARY OF TERMS

GLOSSARY OF TERMS

ABSU – Accenture Utilities Business Process Outsourcing Services

AFUE – Annual Fuel Utilization Efficiency

AHRI – Air-Conditioning, Heating, and Refrigeration Institute

BCAOMA – British Columbia Apartment Owners & Managers Association

BCHL – BC Hockey League

BC Hydro – British Columbia Hydro and Power Authority

BCSEA – British Columbia Sustainable Energy Association

BCUC – British Columbia Utilities Commission, the provincial body regulating utilities in British Columbia.

BTU - British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit

CCE – Consortium for Energy Efficiency

CEA – Clean Energy Act (Bill 17 – 2010)

CEC – Commercial Energy Consumers Association of British Columbia

CEO – Conservation Education and Outreach

CHBA – Canadian Home Builders' Association

CHF – Co-operative Housing Federation

CIPH – Canadian Institute of Plumbing and Heating

CNG – Compressed Natural Gas

Commission – British Columbia Utilities Commission, the provincial body regulating utilities in British Columbia.

Companies – FortisBC Energy Utilities

COV – City of Vancouver

CPR – Conservation Potential Review, a study completed to identify opportunities for energy savings across natural gas delivery infrastructures and improvements to overall energy utilization efficiency.

CS – Compression Service

CST – California Standard Tests

CWHI - Condensing Water Heater Initiative

DC – Pacific Resource Conservation Society's Destination Conservation program

DES - District Energy Systems

DHW – Domestic Hot Water

DSM – Demand-Side Management, defined as "any utility activity that modifies or influences the way in which customers utilize energy services". From FortisBC Energy Utilities' perspective, the primary objectives of DSM are to increase the overall economic efficiency of the energy services it provides to customers and maintain the competitive position of natural gas relative to other energy sources.

DSMS – Demand Side Management System

ECAP - Energy Conservation Assistance Program

ECM - Electronically Commutated Motors

EEC – Energy Efficiency and Conservation

EEC Application – 2008 Energy Efficiency and Conservation Programs Application

EEC Decision – BCUC Order No. G-36-09

EF – Efficiency Factor

ESK - Energy Saving Kit

FE – Fireplace Efficiency

FEI - FortisBC Energy Inc.

FEU - FortisBC Energy Utilities

FEVI - FortisBC Energy (Vancouver Island) Inc.

FortisBC Energy Utilities - FortisBC Energy Inc. and FortisBC Energy (Vancouver Island) Inc.

Fraser Basin – Fraser Basin Council

Free Rider Rate – percent who would have implemented an energy efficiency measure even without the program.

GHGs – Greenhouse Gas Emissions

GJ – Gigajoule – a measure of energy equivalent to one billion joules. One joule of energy is equivalent to the heat needed to raise the temperature of one gram (g) of water by one degree Celsius (ºC) at standard pressure (101.325 kPa) and standard temperature (15ºC).

GSHP – Ground Source Heat Pump

HPBAC – Hearth, Patio & Barbecue Association of Canada

HEX Pilot – Heat Exchanger Pilot Program

IAS – Internal Audit Services

Interim Decision – BCUC Order No. G-6-11

IRs – Information Requests

IT – Information Technology

K – 12 – Kindergarten to Grade 12

LEAP – LiveSmart BC Energy Assistance Program

LiveSmart BC – LiveSmart BC Efficiency Incentive Program

LNG – Liquefied Natural Gas

LTRP – 2010 Long Term Resource Plan

MBH - 1 MBH = 1000 BTU/hr (BTU = British Thermal Unit = the heat energy required to raise 1 pound of water by 1 degree Fahrenheit)

MEM – Ministry of Energy and Mines

MOU – Memorandum of Understanding

MURB – Multi-Unit Residential Buildings

MVHC – Metro Vancouver Housing Corporation

NGV – Natural Gas Vehicle

NPV – Net Present Value

NRCan – Natural Resources Canada

NSA – Negotiated Settlement Agreement

NSP – Negotiated Settlement Process

OEM – Original Equipment Manufacturer

O&M – Operating and Maintenance Costs

Participant Test – is the measure of the quantifiable benefits and costs to the customer due to participation in a program.

PCT – Pacific Carbon Trust

PBR – Performance Based Rate

PBR Settlement Agreement – Multi-Year Performance Based Rate Plan Settlement Agreement

QDP – Qualified Dealers Program

REnEW - Residential Energy and Efficiency Works

Report – EEC Annual Report

REUS – Residential End Use Survey

RIM – Rate Impact Measure test measures what happens to customer bills or rates due to changes in utility revenues and operating costs caused by the program.

RRA – Revenue Requirements Application

SAP - System, Applications and Products - financial tool in which EEC expenditures are captured within

SEMP - Strategic Energy Management Plan

SENC - Super Efficient New Construction

SHIFT - Sustainability and Social Responsibility Attitudes Study

SPIFF – Sales Promotion Incentive Fund

Task Force – Affordable Energy Conservation Task Force

TBD – To be determined after filing of the EEC Annual Report

TJ – Terajoule – equal to 1000 gigajoules.

TRC – Total Resource Cost test measures the net costs of a demand-side management program as a resource option based on the total costs of the program, including both the participants' and the utility's costs.

Utility Cost Test – measures the net costs of demand-side management programs as a resource option based on the costs incurred by the utility (including incentive costs) and exclude the net costs incurred by the participant.

WM – Waste Management of Canada Corporation

WHIMIS - Workplace Hazardous Materials Information System

Appendix C

DSM REGULATION AND BCUC ORDERS

PROVINCE OF BRITISH COLUMBIA

REGULATION OF THE MINISTER OF ENERGY, MINES AND PETROLEUM RESOURCES

Ministerial Order No.

M 271

I, Richard Neufeld, Minister of Energy, Mines and Petroleum Resources, order that the attached regulation is made.

DEPOSITED

NOV 7 2008

B.C. REG. 326/2008

November 6, 2008

Date

Minister of Energy, Mines and Petroleum Resources

(This part is for administrative purposes only and is not part of the Order.)

Authority under which Order is made:

Act and section:- *Utilities Commission Act*, R.S.B.C. 1996, c. 473, s. 125.1 (4) (e)

Other (specify):-

November 3, 2008 R/1175/2008/27

DEMAND-SIDE MEASURES REGULATION

Definitions

1 In this regulation:

"Act" means the *Utilities Commission Act*;

"bulk electricity purchaser" means a public utility that purchases electricity from the authority for resale to the public utility's customers;

"community engagement program" means a program delivered by

(a) a public utility to a public entity either

(i) to increase the public entity's awareness about ways to increase energy conservation and energy efficiency or to encourage the public entity to conserve energy or use energy efficiently, or

(ii) to assist the public entity to increase the public's awareness about ways to increase energy conservation and energy efficiency or to encourage the public to conserve energy or use energy efficiently, or

(b) a public utility in cooperation with a public entity to increase the public's awareness about ways to increase energy conservation and energy efficiency or to encourage the public to conserve energy or use energy efficiently;

"education program" means an education program about energy conservation and efficiency, and includes the funding of the development of such a program;

"energy device" has the same meaning as in the *Energy Efficiency Act*;

"energy efficiency training" means training for persons who

(a) manufacture, sell or install energy-efficient products,

(b) design, construct or act as a real estate broker with respect to energy-efficient buildings,

(c) manage energy systems in buildings, or

(d) conduct energy efficiency audits;

"energy-using product" has the same meaning as in the *Energy Efficiency Act* (Canada);

"expenditure portfolio" means the class of demand-side measures that is composed of all of the demand-side measures proposed by a public utility in an expenditure schedule submitted under section 44.2 of the Act;

"low-income household" means a household whose residents receive service from the public utility and who have, in a taxation year, a before-tax annual household income equal to or less than the low-income cut off established by Statistics Canada for that year for households of that type;

"plan portfolio" means the class of demand-side measures that is composed of all of the demand-side measures proposed by a public utility in a plan submitted under section 44.1 of the Act;

"public awareness program" means a program delivered by a public utility

(a) to increase the awareness of the public, including the public utility's customers, about ways to increase energy conservation and energy efficiency or to encourage the public, including the public utility's customers, to conserve energy or use energy efficiently, or

(b) to increase participation by the public utility's customers in other demand-side measures proposed by the public utility in an expenditure portfolio or a plan portfolio

but does not include a program to increase the amount of energy sold or delivered by the public utility;

"public entity" means a local government, first nation, non-profit society incorporated under the *Society Act* or trade union;

"regulated item" means

(a) an energy device,

(b) an energy-using product,

(c) a building design, or

(d) thermal insulation;

"school" means a school regulated under the *School Act* or the *Independent School Act*;

"specified demand-side measure" means

(a) a demand-side measure referred to in section 3 (c) or (d),

(b) the funding of energy efficiency training,

(c) a community engagement program, or

(d) a technology innovation program;

"specified standard" means a standard in any of the following:

(a) the Energy Efficiency Standards Regulation, B.C. Reg. 389/93;

(b) the Energy Efficiency Regulations S.O.R./94-651;

(c) the British Columbia Building Code, if the standard promotes energy conservation or the efficient use of energy;

"technology innovation program" means a program

(a) to develop a technology, a system of technologies, a building design or an industrial facility design that is

(i) not commonly used in British Columbia, and

(ii) the use of which could directly or indirectly result in significant reductions of energy use or significantly more efficient use of energy,

(b) to do what is described in paragraph (a) and to give demonstrations to the public of any results of doing what is described in paragraph (a), or

(c) to gather information about a technology, a system of technologies, a building design or an industrial design referred to in paragraph (a).

Application

2 (1) This regulation applies only with respect to demand-side measures proposed by the authority.

(2) Effective June 1, 2009,

(a) subsection (1) is repealed, and

(b) section 3 does not apply to a public utility that is owned or operated by a local government or has fewer than 10,000 customers.

Adequacy

3 A public utility's plan portfolio is adequate for the purposes of section 44.1 (8) (c) of the Act only if the plan portfolio includes all of the following:

(a) a demand-side measure intended specifically to assist residents of low-income households to reduce their energy consumption;

(b) if the plan portfolio is submitted on or after June 1, 2009, a demand-side measure intended specifically to improve the energy efficiency of rental accommodations;

(c) an education program for students enrolled in schools in the public utility's service area,

(d) if the plan portfolio is submitted on or after June 1, 2009, an education program for students enrolled in post-secondary institutions in the public utility's service area.

Cost effectiveness

4 (1) Subject to subsections (4) and (5), the commission, in determining for the purposes of section 44.1 (8) (c) or 44.2 (5) (d) of the Act the cost-effectiveness of a demand-side measure proposed in an expenditure portfolio or a plan portfolio, may compare the costs and benefits of

(a) the demand-side measure individually,

(b) the demand-side measure and other demand-side measures in the portfolio, or

(c) the portfolio as a whole.

(2) In determining whether a demand-side measure referred to in section 3 (a) is cost effective, the commission must,

(a) in addition to conducting any other analysis the commission considers appropriate, use the total resource cost test, and

(b) in using the total resource cost test, consider the benefit of the demand-side measure to be 130% of its value when determined without reference to this subsection.

(3) In determining whether a demand-side measure of a bulk electricity purchaser is cost-effective, the commission must consider the benefit of the avoided supply cost to be the authority's long-term marginal cost of acquiring new electricity to replace the electricity sold to the bulk electricity purchaser and not the bulk electricity purchaser's cost of purchasing electricity from the authority.

(4) The commission must determine the cost-effectiveness of a specified demand-side measure proposed in a plan portfolio or an expenditure portfolio by determining whether the portfolio is cost effective as a whole.

(5) If the commission is satisfied that a public awareness program proposed in a plan portfolio or an expenditure portfolio is likely to accomplish the goals set out in paragraph (a) or (b) of the definition of "public awareness program", the commission must determine the cost-effectiveness of the program by determining whether the portfolio is cost-effective as a whole.

(6) The commission may not determine that a proposed demand-side measure is not cost effective on the basis of the result obtained by using a ratepayer impact measure test to assess the demand-side measure.

(7) In considering the benefit of a demand-side measure that, in the commission's opinion, will increase the market share of a regulated item with respect to which there is a specified standard that has not yet commenced, the commission may include in the benefit a proportion of the benefit that, in the commission's opinion, will result from the commencement and application of the specified standard with respect to the regulated item.

2010 Legislative Session: 2nd Session, 39th Parliament
FIRST READING

HONOURABLE BLAIR LEKSTROM
MINISTER OF ENERGY, MINES AND PETROLEUM RESOURCES

BILL 17 — 2010
CLEAN ENERGY ACT

Contents

Explanatory Note

HER MAJESTY, by and with the advice and consent of the Legislative Assembly of the Province of British Columbia, enacts as follows:

Definitions

1 (1) In this Act:

"acquire", used in relation to the authority, means to enter into an energy supply contract;

"authority" has the same meaning as in section 1 of the *Hydro and Power Authority Act*;

"British Columbia's energy objectives" means the objectives set out in section 2;

"Burrard Thermal" means the gas-fired generation asset owned by the authority and located in Port Moody, British Columbia;

"clean or renewable resource" means biomass, biogas, geothermal heat, hydro, solar, ocean, wind or any other prescribed resource;

"demand-side measure" means a rate, measure, action or program undertaken

(a) to conserve energy or promote energy efficiency,

(b) to reduce the energy demand a public utility must serve, or

(c) to shift the use of energy to periods of lower demand,

but does not include

(d) a rate, measure, action or program the main purpose of which is to encourage a switch from the use of one kind of energy to another such that the switch would increase greenhouse gas emissions in British Columbia, or

(e) any rate, measure, action or program prescribed;

"electricity self-sufficiency" means electricity self-sufficiency as described in section 6 (2);

"expenditure for export" means the amount of an expenditure for the construction or extension of a plant or system or for an acquisition of electricity that is in addition to the amount the authority would have had to spend

(a) to achieve electricity self-sufficiency, and

(b) to undertake anything referred to in section 7 (1), except to the extent the expenditure is accounted for in paragraph (a);

"feed-in tariff program" means a program, that may be established under section 16, under which the authority offers to enter into energy supply contracts with persons generating electricity from clean or renewable resources using prescribed technologies in prescribed regions of British Columbia;

"greenhouse gas" has the same meaning as in section 1 of the *Greenhouse Gas Reduction Targets Act*;

"heritage assets" means

(a) any equipment or facilities for the transmission or distribution of electricity in respect of which, on the date on which this Act receives First Reading in the Legislative Assembly, a certificate of public convenience and necessity has been granted, or has been deemed to have been granted, to the authority or the transmission corporation under the *Utilities Commission Act*,

(b) generation and storage assets identified in Schedule 1 of this Act, and

(c) equipment and facilities that are for the transmission or distribution of electricity and that are identified in Schedule 1 of this Act;

"integrated resource plan" means an integrated resource plan required to be submitted under section 3;

"transmission corporation" means British Columbia Transmission Corporation.

(2) Words and expressions used but not defined in this Act or the regulations, unless the context otherwise requires, have the same meanings as in the *Utilities Commission Act*.

PART 1 — BRITISH COLUMBIA'S ENERGY OBJECTIVES

British Columbia's energy objectives

2 The following comprise British Columbia's energy objectives:

(a) to achieve electricity self-sufficiency;

(b) to take demand-side measures and to conserve energy, including the objective of the authority reducing its expected increase in demand for electricity by the year 2020 by at least 66%;

(c) to generate at least 93% of the electricity in British Columbia from clean or renewable resources and to build the infrastructure necessary to transmit that electricity;

(d) to use and foster the development in British Columbia of innovative technologies that support energy conservation and efficiency and the use of clean or renewable resources;

(e) to ensure the authority's ratepayers receive the benefits of the heritage assets and to ensure the benefits of the heritage contract under the *BC Hydro Public Power Legacy and Heritage Contract*

Act continue to accrue to the authority's ratepayers;

(f) to ensure the authority's rates remain among the most competitive of rates charged by public utilities in North America;

(g) to reduce BC greenhouse gas emissions

(i) by 2012 and for each subsequent calendar year to at least 6% less than the level of those emissions in 2007,

(ii) by 2016 and for each subsequent calendar year to at least 18% less than the level of those emissions in 2007,

(iii) by 2020 and for each subsequent calendar year to at least 33% less than the level of those emissions in 2007,

(iv) by 2050 and for each subsequent calendar year to at least 80% less than the level of those emissions in 2007, and

(v) by such other amounts as determined under the *Greenhouse Gas Reduction Targets Act*;

(h) to encourage the switching from one kind of energy source or use to another that decreases greenhouse gas emissions in British Columbia;

(i) to encourage communities to reduce greenhouse gas emissions and use energy efficiently;

(j) to reduce waste by encouraging the use of waste heat, biogas and biomass;

(k) to encourage economic development and the creation and retention of jobs;

(l) to foster the development of first nation and rural communities through the use and development of clean or renewable resources;

(m) to maximize the value, including the incremental value of the resources being clean or renewable resources, of British Columbia's generation and transmission assets for the benefit of British Columbia;

(n) to be a net exporter of electricity from clean or renewable resources with the intention of benefiting all British Columbians and reducing greenhouse gas emissions in regions in which British Columbia trades electricity while protecting the interests of persons who receive or may receive service in British Columbia;

(o) to achieve British Columbia's energy objectives without the use of nuclear power;

(p) to ensure the commission, under the *Utilities Commission Act*, continues to regulate the authority with respect to domestic rates but not with respect to expenditures for export, except as provided by this Act.

Integrated resource plans

3 (1) The authority must submit to the minister, in accordance with subsection (6), an integrated resource plan that is consistent with good utility practice and that includes all of the following:

(a) a description of the authority's forecasts, over a defined period, of its energy and capacity requirements to achieve electricity self-sufficiency;

(b) a description of what the authority plans to do to achieve electricity self-sufficiency and to respond to British Columbia's other energy objectives, including plans respecting

(i) the implementation of demand-side measures,

(ii) the construction or extension of facilities,

(iii) the acquisition of electricity from other persons, and

(iv) the use of rates, including rates to encourage

(A) energy conservation or efficiency,

(B) the use of energy during periods of lower demand,

(C) the reduction of the energy demand the authority must serve, or

(D) the development and use of electricity from clean or renewable resources;

(c) a description of the consultations carried out by the authority respecting the development of the integrated resource plan;

(d) a description of

(i) the expected export demand during a defined period,

(ii) the potential for British Columbia to meet that demand,

(iii) the actions the authority has taken to seek suitable opportunities for the export of electricity from clean or renewable resources, and

(iv) the extent to which the authority has arranged for contracts for the export of electricity and the transmission or other services necessary to facilitate those exports;

(e) if the authority plans to make an expenditure for export, a specification of the amount of the expenditure and a rationale for making it.

(2) In the first integrated resource plan the authority submits to the minister, and in any other integrated resource plan the minister by order specifies, the authority must include a description of the authority's infrastructure and capacity needs for electricity transmission for the period ending 30 years after the date the integrated resource plan is submitted.

(3) The description referred to in subsection (2) must include an assessment of the potential for developing, during the period referred to in subsection (2), grouped by geographic area, electricity generation from clean or renewable resources in British Columbia.

(4) The authority must carry out any consultations required by a regulation under section 35 (g) and submit a report to the minister, within the time prescribed, respecting those consultations.

(5) The authority must plan to rely on no energy and no capacity from Burrard Thermal, except in the case of emergency or as authorized by regulation.

(6) An integrated resource plan must be submitted

(a) within 18 months from the date this Part comes into force, and

(b) once every 5 years after the submission under paragraph (a), unless a submission date is prescribed for the purposes of this subsection, in which case an integrated resource plan must be submitted by the prescribed submission date.

(7) The authority may submit an amendment to an integrated resource plan approved under section 4, and section 4 applies to the submission.

(8) If the Lieutenant Governor in Council approves an amendment submitted under subsection (7), the approved amendment is to be considered a part of the approved integrated resource plan.

Approval and procurement

4 (1) After the minister receives an integrated resource plan, the Lieutenant Governor in Council, for the purposes of sections 44.2 (5.1), 46 (3.3) and 71 (2.21) and (2.51) of the *Utilities Commission Act*, may, by order,

(a) approve or reject the plan, and

(b) if the Lieutenant Governor in Council is satisfied that it is in the interests of British Columbians to pursue opportunities for export, require the authority, its subsidiaries or both to do the following:

(i) begin a process or processes by the time specified in the order to acquire the specified amount per year of energy and capacity from clean or renewable resources;

(ii) acquire the energy and capacity referred to in subparagraph (i) within the time specified in the order;

(iii) secure the necessary transmission capacity;

(iv) submit, for the purposes of subsection (2), a report to the minister respecting the expenditures for export resulting from compliance with subparagraphs (i) to (iii).

(2) In an order under subsection (1) (b) of this section, the Lieutenant Governor in Council may exempt the authority from sections 45 to 47 of the *Utilities Commission Act* with respect to anything to be done under subsection (1) (b) (iii) of this section.

(3) The authority and its subsidiaries and persons and their successors and assigns who enter into an energy supply contract as a result of a process referred to in subsection (1) (b) (i) of this section are exempt from section 71 of the *Utilities Commission Act* with respect to the energy supply contract.

(4) The Lieutenant Governor in Council, for the purposes of subsection (5) (a), may approve a report submitted under subsection (1) (b) (iv).

(5) In setting rates for the authority, the commission must ensure that the rates do not allow the authority to recover

(a) its expenditures for export as set out in a report approved by the Lieutenant Governor in Council under subsection (4), and

(b) any other expenditures for export.

Status report

5 (1) The authority must submit to the minister, by the time the minister requires, a status report respecting the authority's most recently approved integrated resource plan.

(2) The minister must make public a status report submitted under subsection (1) in the same manner and at the same time that the minister makes public a service plan under the *Budget Transparency and Accountability Act*.

Electricity self-sufficiency

6 (1) In this section:

"electricity supply obligations" means

(a) electricity supply obligations for which rates are filed with the commission under section 61 of the *Utilities Commission Act*, and

(b) any other electricity supply obligations that exist at the time this section comes into force,

determined by using the authority's prescribed forecasts of its energy requirements and peak load, taking into account demand-side measures, that are in an integrated resource plan approved under section 4;

"heritage energy capability" means the maximum amount of annual energy that the heritage assets that are hydroelectric facilities can produce under prescribed water conditions.

(2) The authority must achieve electricity self-sufficiency by holding,

(a) by the year 2016 and each year after that, the rights to an amount of electricity that meets the electricity supply obligations, and

(b) by the year 2020 and each year after that, the rights to 3 000 gigawatt hours of energy, in addition to the amount of electricity referred to in paragraph (a), and the capacity required to integrate that energy

solely from electricity generating facilities within the Province,

(c) assuming no more in each year than the heritage energy capability, and

(d) relying on Burrard Thermal for no energy and no capacity, except as authorized by regulation.

(3) The authority must remain capable of meeting its electricity supply obligations from the electricity referred to in subsection (2) (a) and (b), except to the extent the authority may be permitted, by regulation, to enter into contracts in the

prescribed circumstances and on the prescribed terms and conditions.

(4) A public utility, in planning in accordance with section 44.1 of the *Utilities Commission Act* for

(a) the construction or extension of generation facilities, and

(b) energy purchases,

must consider British Columbia's energy objective to achieve electricity self-sufficiency.

Exempt projects, programs, contracts and expenditures

7 (1) The authority is exempt from sections 45 to 47 and 71 of the *Utilities Commission Act* to the extent applicable, and from any other sections of that Act that the minister may specify by regulation, with respect to the following projects, programs, contracts and expenditures of the authority, as they may be further described by regulation:

(a) the Northwest Transmission Line, a 287 kilovolt transmission line between the Skeena substation and Bob Quinn Lake, and related facilities and contracts;

(b) Mica Units 5 and 6, a project to install two additional turbines and related works and equipment at Mica;

(c) Revelstoke Unit 6, a project to install an additional turbine and related works and equipment at Revelstoke;

(d) Site C, a project to build a third dam on the Peace River in northeast British Columbia to provide approximately

(i) 4 600 gigawatt hours of energy each year, and

(ii) 900 megawatts of capacity;

(e) a bio-energy phase 2 call to acquire up to 1 000 gigawatt hours per year of electricity;

(f) one or more agreements with pulp and paper customers eligible for funding under Canada's Green Transformation Program under which agreement or agreements the authority acquires, in aggregate, up to 1 200 gigawatt hours per year of electricity;

(g) the clean power call request for proposals, issued on June 11, 2008, to acquire up to 5 000 gigawatt hours per year of electricity from clean or renewable resources;

(h) the standing offer program described in section 15;

(i) the feed-in tariff program described in section 16;

(j) the actions taken to comply with section 17 (2) and (3);

(k) the program described in section 17 (4).

(2) The persons and their successors and assigns who enter into an energy supply contract with the authority related to anything referred to in subsection (1) are exempt from section 71 of the *Utilities Commission Act* with respect to the energy supply contract.

(3) The commission must not exercise a power under the *Utilities Commission Act* in a way that would directly or indirectly prevent the authority from doing anything referred to in subsection (1).

Rates

8 (1) In setting rates under the *Utilities Commission Act* for the authority, the commission must ensure that the rates allow the authority to collect sufficient revenue in each fiscal year to enable it to recover its costs incurred with respect to

(a) the achievement of electricity self-sufficiency, and

(b) a project, program, contract or expenditure referred to in section 7 (1), except

(i) to the extent the expenditure is accounted for in paragraph (a), and

(ii) for costs, prescribed for the purposes of this section, respecting the feed-in tariff program.

(2) Subject to subsection (1) of this section, the commission must set under the *Utilities Commission Act* a rate proposed by the authority with respect to the project referred to in section 7 (1) (a) of this Act.

(3) The commission must not, except on application by the authority, cancel, suspend or amend a rate set in accordance with subsection (2).

(4) The authority must provide to the minister, in accordance with the regulations, an annual report comparing the electricity rates charged by the authority with electricity rates charged by public utilities in other jurisdictions in North America, including an assessment of the extent to which the authority's electricity rates continue to be competitive with those other rates.

Domestic long-term sales contracts

9 The authority must establish, in accordance with the regulations, a program to develop potential offers respecting domestic long-term sales contracts for availability to prescribed classes of customers on prescribed terms, including terms respecting price, for prescribed volumes of energy over prescribed periods.

PART 2 — PROHIBITIONS

Two-rivers system development

10 In this Part:

"approval" includes a certificate, licence, permit or other authorization;

"prohibited projects" means

(a) a project of the authority, referred to in Schedule 2 of this Act, for electricity generation on a stream, and

(b) a project for electricity generation on a stream with a storage capability in excess of a prescribed storage capability,

but does not include the two-rivers projects;

"stream" has the same meaning as in section 1 of the *Water Act*;

"two-rivers projects" means

(a) the authority's facilities, on the Peace River and the Columbia River System, existing on the date this section comes into force and upgrades or extensions to those facilities, and

(b) the project commonly known as Site C.

Project prohibitions

11 (1) Despite any other enactment, a minister, or an employee or agent of the government or of a municipality or regional district, must not issue an approval under an applicable enactment for a person to

(a) undertake a prohibited project, or

(b) construct all or part of the facilities of a prohibited project.

(2) Despite any other enactment, an approval under another enactment is without effect if it is issued contrary to subsection (1).

Prohibited acquisitions

12 (1) In this section:

"facility" means a facility for the generation of electricity and any transmission or distribution equipment to deliver that electricity to the point of interconnection with the authority's integrated service area;

"protected area" means

(a) a park, recreation area, or conservancy, as defined in section (1) of the *Park Act*,

(b) an area established under the *Environment and Land Use Act* as a park or protected area, or

(c) an area established or continued as an ecological reserve under the *Ecological Reserve Act* or by the *Protected Areas of British Columbia Act*.

(2) The authority must not make an offer to acquire electricity from a person whose proposed facility is to be located, in whole or in part, in a protected area, unless the location is permitted under the enactments referred to in the definition of "protected area" in subsection (1).

(3) A person referred to in subsection (2) must not offer to sell electricity to the authority.

Burrard Thermal

13 The authority must not operate Burrard Thermal, except

(a) in the case of emergency,

(b) to provide transmission support services, or

(c) as authorized by regulation.

PART 3 — PRESERVING HERITAGE ASSETS

Sale of heritage assets prohibited

14 (1) The authority must not sell or otherwise dispose of the heritage assets.

(2) Nothing in subsection (1) prevents the authority from disposing of heritage assets if the assets disposed of are no longer used or useful for their intended purpose, or they are to be replaced with one or more assets that will perform similar functions.

PART 4 — STANDING OFFER AND FEED-IN TARIFF PROGRAMS

Standing offer program

15 (1) In this section:

"eligible facility" means a generation facility that

(a) either

(i) has only one generator and the generator's nameplate capacity is less than or equal to the maximum nameplate capacity or has more than one generator and the total nameplate capacity of all of them is a capacity less than or equal to the maximum nameplate capacity, or

(ii) meets the prescribed requirements, and

(b) either

(i) is a high-efficiency cogeneration facility, or

(ii) generates energy by means of a prescribed technology or from clean or renewable resources,

but does not include a prescribed generation facility or class of generation facilities;

"maximum nameplate capacity" means 10 megawatts or, if another capacity is prescribed for the purposes of this section, the prescribed capacity.

(2) The authority must establish and, except in the prescribed circumstances, maintain a standing offer program to acquire electricity from eligible facilities.

(3) The authority may establish, in accordance with the prescribed requirements, if any, the criteria, terms and conditions on which offers under the standing offer program under subsection (2) are to be made.

Feed-in tariff program

16 (1) To facilitate the achievement of one or more of British Columbia's energy objectives, the Lieutenant Governor in Council, by regulation, may require the authority to establish a feed-in tariff program.

(2) If the authority is required to establish a feed-in tariff program, the authority may establish, in accordance with the prescribed requirements, if any, the criteria, terms and conditions under which offers may be made under the feed-in tariff program.

(3) The authority may not enter into an energy supply contract as a result of an offer made under the feed-in tariff program if the energy supply contract, by itself or in aggregate with other energy supply contracts entered into under the feed-in tariff program, would result in an expenditure that exceeds the prescribed amount in the prescribed period.

(4) Without limiting section 34 (2) (c),

(a) requirements prescribed by the Lieutenant Governor in Council, and

(b) criteria, terms and conditions established by the authority

made for the purpose of subsection (2) may be made with respect to different regions, prices and technologies.

PART 5 — ENERGY EFFICIENCY MEASURES AND GREENHOUSE GAS REDUCTIONS

Smart meters

17 (1) In this section:

"private dwelling" means

(a) a structure that is occupied as a private residence, or

(b) if only part of a structure is occupied as a private residence, that part of the structure;

"smart grid" means the prescribed equipment;

"smart meter" means a meter that meets the prescribed requirements, and includes related components, equipment and metering and communication infrastructure that meet the prescribed requirements.

(2) Subject to subsection (3), the authority must install and put into operation smart meters and related equipment in accordance with and to the extent required by the regulations.

(3) The authority must complete all obligations imposed under subsection (2) by the end of the 2012 calendar year.

(4) The authority must establish a program to install and put into operation a smart grid in accordance with and to the extent required by the regulations.

(5) The authority may, by itself, or by its engineers, surveyors, agents, contractors, subcontractors or employees, enter on any land, other than a private dwelling, without the consent of the owner, for a purpose relating to the use, maintenance, safeguarding, installation, replacement, repair, inspection, calibration or reading of its meters, including smart meters, or of its smart grid.

(6) If a public utility, other than the authority, makes an application under the *Utilities Commission Act* in relation to smart meters, other advanced meters or a smart grid, the commission, in considering the application, must consider the government's goal of having smart meters, other advanced meters and a smart grid in use with respect to customers other than those of the authority.

Greenhouse gas reduction

18 (1) In this section, **"prescribed undertaking"** means a project, program, contract or expenditure that is in a class of projects, programs, contracts or expenditures prescribed for the purpose of reducing greenhouse gas emissions in British Columbia.

(2) In setting rates under the *Utilities Commission Act* for a public utility carrying out a prescribed undertaking, the commission must set rates that allow the public utility to collect sufficient revenue in each fiscal year to enable it to recover its costs incurred with respect to the prescribed undertaking.

(3) The commission must not exercise a power under the *Utilities Commission Act* in a way that would directly or indirectly prevent a public utility referred to in subsection (2) from carrying out a prescribed undertaking.

(4) A public utility referred to in subsection (2) must submit to the minister, on the minister's request, a report respecting the prescribed undertaking.

(5) A report to be submitted under subsection (4) must include the information the minister specifies and be submitted in the form and by the time the minister specifies.

Clean or renewable resources

19 (1) To facilitate the achievement of British Columbia's energy objective set out in section 2 (c), a person to whom this subsection applies

(a) must pursue actions to meet the prescribed targets in relation to clean or renewable resources, and

(b) must use the prescribed guidelines in planning for

(i) the construction or extension of generation facilities, and

(ii) energy purchases.

(2) Subsection (1) applies to

(a) the authority, and

(b) a prescribed public utility, if any, and a public utility in a class of prescribed public utilities, if any.

PART 6 — FIRST NATIONS CLEAN ENERGY BUSINESS FUND

First Nations Clean Energy Business Fund

20 (1) In this section:

"first nation" means

(a) a band, as defined in the *Indian Act* (Canada), and

(b) an aboriginal governing body, however organized and established by aboriginal people;

"power project" means an electricity generation or transmission project

(a) that is in a class of projects prescribed for the purposes of this section, other than a project of any organization in the government reporting entity, as defined in the *Budget Transparency and Accountability Act*,

(b) for which a licence, if applicable, under the *Water Act* for a power purpose, as defined section 1 of that Act, is issued after the date this section comes into force, and

(c) for which a prescribed authorization, if applicable, under an enactment respecting land is granted after this section comes into force;

"special account" means the special account, as defined in section 1 of the *Financial Administration Act*, established under subsection (2) of this section.

(2) A special account, to be known as the First Nations Clean Energy Business Fund special account, is established.

(3) The initial balance of the special account is an amount, not to exceed $5 million, prescribed by Treasury Board.

(4) The balance of the special account is increased by

(a) any other amount received by the government for payment into the account, and

(b) a prescribed percentage of the prescribed land and water revenues the government derives from power projects.

(5) Despite section 21 (3) of the *Financial Administration Act*, the minister, in accordance with a spending plan approved by Treasury Board, may pay an amount of money out of the special account for any of the following purposes:

(a) to share the revenues referred to in subsection (4) (b), up to a prescribed percentage of the revenue, under an agreement or agreements with one or more first nations;

(b) to facilitate the participation of first nations and aboriginal people in the clean energy sector;

(c) to pay the costs of administering the special account.

PART 7 — TRANSMISSION CORPORATION

Division 1 — Transfer of Property, Shares and Obligations

Definitions

21 In this Division:

"excluded contract" means a contract that was entered into, assumed by or assigned to the transmission corporation and that is governed by the law of a jurisdiction other than British Columbia;

"excluded permit" means a permit, approval, registration, authorization, licence, exemption, order or certificate issued, granted or provided to the transmission corporation under the law of a jurisdiction other than British Columbia;

"included contract" includes any contract entered into, assumed by or assigned to the transmission corporation, but does not include an excluded contract;

"included permit" includes a permit, approval, registration, authorization, licence, exemption, order or certificate, including a certificate of public convenience and necessity under the *Utilities Commission Act*, but does not include an excluded permit;

"right", in relation to a right held by the authority or the transmission corporation, includes a right under a trust, a cause of action and a claim.

Transfer of property

22 (1) Subject to subsection (2) and despite any enactment or law to the contrary, on the coming into force of this Part, all of the transmission corporation's rights, property, assets, included contracts and included permits are transferred to and vested in the authority.

(2) Subsection (1) does not apply to excluded contracts and excluded permits.

(3) Despite any enactment or law to the contrary, on the coming into force of this Part, the shares of the transmission corporation are transferred to and vested in the authority.

(4) The shares transferred to and vested in the authority under subsection (3) must not be sold or otherwise disposed of, but may be surrendered for cancellation.

(5) Despite any enactment or law to the contrary,

(a) the transfer and vesting effected by subsections (1) and (3) take effect without

(i) the execution or issue of any record, or

(ii) any registration or filing of this Act or any other record in or with any registry or other office,

(b) the transfer and vesting effected by subsections (1) and (3) take effect despite

(i) any prohibition on all or any part of the transfer and vesting, and

(ii) the absence of any consent or approval that is or may be required for all or any part of the transfer and vesting,

(c) if any right, property, asset, included contract or included permit referred to in subsection (1) is registered or otherwise recorded in the name of the transmission corporation, the registration or record may remain but is deemed, for all purposes of this and all other enactments and law, to reflect that the right, property, asset, included contract or included permit is owned by and vested in or held by the authority, and

(d) in any record in or by which the authority deals with a right, property, asset, included contract or included permit referred to in subsection (1), it is sufficient to cite this Act as effecting and confirming the transfer from the transmission corporation to the authority of the included contract or included permit or of the title to the right, property or asset and the vesting of that title in the authority.

(6) For the purposes of this section, assets that become assets of the authority under this section include records and parts of records, and, without limiting this, all of the records and parts of records of the transmission corporation are transferred to and become the records of the authority on the coming into force of this Part.

(7) Without limiting subsection (5) (c) of this section, or section 383.1 of the *Land Title Act*, if a right, property or asset referred to in subsection (1) of this section is registered or recorded in the name of the transmission corporation,

(a) the authority may, in its own name,

(i) effect a transfer, charge, encumbrance or other dealing with the right, property or asset, and

(ii) execute any record required to give effect to that transfer, charge, encumbrance or other dealing, and

(b) an official

(i) who has authority over a registry or office, including, without limitation, the personal property registry and a land title office, in which title to or interests in the right, property or asset is registered or recorded, and

(ii) to whom a record referred to in paragraph (a) (ii) executed by or on behalf of the authority is submitted in support of the transfer, charge, encumbrance or other dealing

must give the record the same effect as if it had been duly executed by the transmission corporation.

Transfer of obligations and liabilities

23 On the coming into force of this Part, all obligations and liabilities of the transmission corporation, except for obligations and liabilities under an excluded contract or excluded permit,

(a) are transferred to and assumed by the authority,

(b) become the authority's obligations and liabilities,

(c) cease to be obligations and liabilities of the transmission corporation, and

(d) may be enforced against the authority as if the authority had incurred them.

Records of transferred assets and liabilities

24 (1) Subject to subsection (2), a reference to the transmission corporation in any document, including, without limitation, any record, security agreement, lease, included permit, included contract, instrument or certificate that relates to anything transferred to the authority under this Part, is deemed to be a reference to the authority.

(2) If, under this Part, a part of a right, property, asset, obligation or liability is transferred to the authority, any document, including, without limitation, any record, security agreement, lease, included permit, included contract, instrument or certificate that relates to anything transferred to the authority under this Part, is deemed to be amended to reflect the authority's interests in that right, property, asset, obligation or liability.

Transfer is not a default

25 Despite any provision to the contrary in any document, including, without limitation, any record, security agreement, lease, included permit, included contract, instrument or certificate, the transfer to the authority of a right, property, asset, included contract, included permit, share, obligation or liability under sections 22 and 23 does not constitute a breach or contravention of, or an event of default under, or confer a right to terminate the document, and, without limiting this, does not entitle any person who has an interest in the right, property, asset, included contract, included permit, share, obligation or liability to claim any damages, compensation or other remedy.

Legal proceedings

26 (1) Any legal proceeding being prosecuted or pending by or against the transmission corporation on the date this Part comes into force may be prosecuted, or its prosecution may be continued, by or against the authority, and may not be prosecuted or continued against the transmission corporation.

(2) A conviction against the transmission corporation may be enforced against the authority, and may not be enforced against the transmission corporation.

(3) A ruling, order or judgment in favour of or against the transmission corporation may be enforced by or against the authority, and may not be enforced by or against the transmission corporation.

(4) A cause of action or claim against the transmission corporation existing on the date this Part comes into force must be prosecuted against the authority.

(5) Subject to subsections (1) to (4), a cause of action, claim or liability to prosecution existing on the date this Part comes into force is unaffected by anything done under this Part.

Division 2 — Employees

Definitions

27 In this Division:

"adjustment plan" means an adjustment plan under section 54 of the *Labour Relations Code*;

"collective agreement" has the same meaning as in section 1 (1) of the *Labour Relations Code*.

Transfer of employees

28 (1) It is deemed that the persons who were, immediately before the coming into force of this Part, employees of the transmission corporation are, on the coming into force of this Part, transferred to and become employees of the authority.

(2) A question or difference between the authority and

(a) a transferred employee who is a member of a unit of employees for which a trade union has been certified under the *Labour Relations Code*, or

(b) a trade union representing transferred employees,

respecting the application of the *Labour Relations Code*, or the interpretation or application of this Division, may be referred to the Labour Relations Board in accordance with the procedure set out in the *Labour Relations Code* and its regulations.

(3) The Labour Relations Board may decide a question or difference referred to in subsection (2) in any of the ways, and by applying any of the remedies, available under the *Labour Relations Code*.

(4) On the date this Part comes into force, in respect of employees who are members of units of employees for which a trade union has been certified under the *Labour Relations Code*, the authority is the successor employer of those employees for the purposes of section 35 of the *Labour Relations Code*, without prejudice to the authority's right to apply for consolidation or merger of the bargaining units.

(5) If the authority or any trade union representing transferred employees makes an application to the Labour Relations Board to consolidate or merge the bargaining units representing transferred employees into a single bargaining unit for each trade union, the Labour Relations Board must consider that application having regard to the principles of business efficiency and without reference to the labour relations history at the authority or the transmission corporation relating to the presence of more than one bargaining unit for each trade union.

Continuous employment

29 (1) The transfer of a transferred employee does not constitute a termination of the transferred employee's employment for the purposes of

(a) an applicable collective agreement,

(b) any employment contract involving the transferred employee, and

(c) the *Employment Standards Act*.

(2) A transferred employee who is not subject to a collective agreement is deemed to have been employed by the authority without interruption in service.

(3) The service, with the transmission corporation, of a transferred employee who is not subject to a collective agreement is deemed to be service with the authority for the purpose of determining probationary periods and benefits, and any other employment related entitlements, under

(a) the *Employment Standards Act*,

(b) any other enactment, and

(c) any employment contract.

(4) For the purposes of seniority, a transferred employee who is subject to a collective agreement is deemed to have been employed by the authority without interruption in service, unless the authority and the trade union representing the transferred employee have agreed to other seniority terms in an adjustment plan within 60 days after notice under section 54 of the *Labour Relations Code* is given, in which case the applicable terms respecting seniority in the adjustment plan apply.

(5) The service, with the transmission corporation, of a transferred employee who is subject to a collective agreement is deemed to be service with the authority for the purpose of determining probationary periods and benefits, and any other employment related entitlements, under

(a) the *Employment Standards Act*,

(b) any other enactment, and

(c) any collective agreement,

unless the authority and the trade union representing the transferred employee have agreed to other probationary periods, benefits and entitlements in an adjustment plan within 60 days after notice under section 54 of the *Labour Relations Code* is given, in which case the applicable terms respecting probationary periods, benefits and entitlements in the adjustment plan apply.

(6) A transferred employee is deemed not to have been constructively dismissed solely by virtue of the transfer under section 28.

(7) Nothing in this Part

(a) prevents the employment of a transferred employee from being lawfully terminated after the transfer under section 28,

(b) prevents any term or condition of the employment of a transferred employee from being lawfully changed after the transfer under section 28, or

(c) removes any right or remedy of a person who is terminated after the transfer under section 28 or in respect of whom a term or condition of employment has been changed after the transfer under section 28.

Pensions

30 (1) For the purposes of the *Pension Benefits Standards Act*, the transfer of a transferred employee does not constitute a termination of membership in the transmission corporation's registered pension plan, or any other pension arrangement sponsored by the transmission corporation.

(2) Despite section 36 (1) of the *Hydro and Power Authority Act*, the authority does not require the approval of the Lieutenant Governor in Council to amend the authority's registered pension plan to implement the provisions of this Part, including the authority's assumption of all liability for the pension benefits payable under the transmission corporation's registered pension plan.

(3) Despite any enactment or law to the contrary, on the coming into force of this Part, all of the rights, property and assets that comprise

(a) the balance of fund account of the pension fund of the transmission corporation's registered pension plan are transferred to and vested in the balance of fund account of the pension fund of the authority's registered pension plan, and

(b) the index reserve account and past service index reserve account of the pension fund of the transmission corporation's registered pension plan are transferred to and vested in the index reserve account of the pension fund of the authority's registered pension plan,

and the resulting pension fund must be held by the trustee of the pension fund of the authority's registered pension plan.

(4) Section 22 (5) applies to the transfer and vesting effected by subsection (3) of this section.

Division 3 — General

Commission subject to direction

31 (1) The minister, by regulation, may issue a direction to the commission with respect to the exercise of powers and the performance of duties of the commission regarding any matter relating to a transfer made under this Part or to the service or rates referred to in section 32.

(2) The commission must comply with a direction issued under subsection (1) despite

(a) any provision of, or regulation under, the *Utilities Commission Act*, except any direction issued under section 3 of that Act, and

(b) any previous decision of the commission.

(3) This section is repealed on July 1, 2011.

Utilities Commission Act

32 (1) No approval, authorization, permit, certificate, exemption, permission, registration or order is required under the *Utilities Commission Act* with respect to

(a) the transmission corporation's ceasing to provide the service referred to in subsection (2) (a), or

(b) any transfer under this Part.

(2) The authority is deemed to have all the approvals, authorizations, permits, certificates, exemptions, permissions, registrations or orders that, under the *Utilities Commission Act*, are or may be required to continue

(a) to provide the service the transmission corporation provided immediately before the coming into force of this Part, and

(b) to charge, collect and enforce the rates the transmission corporation charged, collected and enforced immediately before the coming into force of this Part.

(3) The commission must not, except on application by the authority, cancel, suspend or amend

(a) any approval, authorization, permit, exemption, permission, registration, order or certificate, except for the certificate issued by commission Order C-4-

08, that, under the *Utilities Commission Act*, the authority requires to provide the service and to charge, collect and enforce the rates referred to in subsection (2), or

(b) the service or rates referred to in subsection (2).

(4) Subsection (3) is repealed on July 1, 2011.

Designated agreements

33 On the coming into force of this Part, the agreements designated under section 3 of the *Transmission Corporation Act* have no force or effect.

Part 8 — Regulations

Division 1 — Regulations by Lieutenant Governor in Council

General

34 (1) The Lieutenant Governor in Council may make regulations referred to in section 41 of the *Interpretation Act*.

(2) In making a regulation under this Act, the Lieutenant Governor in Council may do one or more of the following:

(a) delegate a matter to a person;

(b) confer a discretion on a person;

(c) make different regulations for different persons, places, things, decisions, transactions or activities.

Regulations

35 Without limiting section 34 (1), the Lieutenant Governor in Council may make regulations as follows:

(a) respecting forecasts for the purposes of the definition of "electricity supply obligations" in section 6 (1);

(b) adding a heritage asset to Schedule 1 of this Act;

(c) prescribing water conditions for the purposes of the definition of "heritage energy capability" in section 6 (1);

(d) modifying or adding to British Columbia's energy objectives, except for the objective specified in section 2 (g);

(e) for the purposes of sections 44.1, 44.2, 46 and 71 of the *Utilities Commission Act*, respecting the application of British Columbia's energy objectives to public utilities other than the authority;

(f) establishing factors or guidelines the commission must follow in respect of British Columbia's energy objectives, including guidelines regarding the relative priority of the objectives set out in section 2;

(g) respecting consultations the authority must carry out in relation to

(i) the development of an integrated resource plan and of an amendment to an integrated resource plan,

(ii) an integrated resource plan submitted under section 3 (6), and

(iii) an amendment to an integrated resource plan submitted under section 3 (7);

(h) prescribing submission dates for the purposes of section 3 (6);

(i) respecting the authority's obligation under section 6 (3), including, without limitation, regulations permitting the authority to enter into contracts respecting the electricity referred to in section 6 (2) (a) and (b) and prescribing the terms and conditions on which, and the volume of electricity about which, the contracts may be entered into;

(j) respecting the program referred to in section 9, including prescribing classes of customers and terms;

(k) prescribing storage capability for the purposes of the definition of "prohibited projects" in section 10, including, without limitation, prescribing storage capability in terms of time, impoundment, mechanism or area;

(l) respecting the standing offer program to be established under section 15, including, without limitation, regulations that

(i) prescribe requirements, technologies, generation facilities and classes of generation facilities for the purposes of the definition of "eligible facility" in section 15 (1),

(ii) prescribe a capacity for the purposes of the definition of "maximum nameplate capacity" in section 15 (1),

(iii) prescribe circumstances for the purposes of section 15 (2), and

(iv) prescribe requirements for the purposes of section 15 (3);

(m) respecting the feed-in tariff program that may be established under section 16, including, without limitation, regulations that

(i) prescribe regions and technologies for the purposes of the definition of "feed-in tariff program" in section 1 (1),

(ii) require the authority to establish the feed-in tariff program,

(iii) prescribe requirements for the purposes of section 16 (2),

(iv) prescribe amounts and periods for the purposes of section 16 (3), and

(v) prescribe costs for the purposes of section 8 (1) (b);

(n) for the purposes of the definition of "prescribed undertaking" in section 18, prescribing classes of projects, programs, contracts or expenditures that encourage

(i) the use of

(A) electricity, or

(B) energy directly from a clean or renewable resource

instead of the use of other energy sources that produce higher greenhouse gas emissions, or

(ii) the use of natural gas, hydrogen or electricity in vehicles, and the construction and operation of infrastructure for natural gas or hydrogen fueling or electricity charging.

Division 2 — Regulations by Minister

General

36 (1) In making a regulation under this Act, the minister may do one or more of the following:

(a) delegate a matter to a person;

(b) confer a discretion on a person;

(c) make different regulations for different persons, places, things, decisions, transactions or activities.

(2) The minister may make a regulation defining, for the purposes of this Act, a word or expression used but not defined in this Act.

Regulations

37 The minister may make regulations as follows:

(a) prescribing resources for the purposes of the definition of "clean or renewable resource" in section 1 (1);

(b) prescribing exclusions for the purposes of the definition of "demand-side measure" in section 1 (1);

(c) authorizing the authority for the purposes of sections 3 (5), 6 and 13;

(d) describing the projects, programs, contracts and expenditures referred to in section 7 (1), including, without limitation, by specifying the property, interests, rights, activities, contracts and rates that comprise the projects, programs, contracts and expenditures;

(e) specifying sections of the *Utilities Commission Act* for the purposes of section 7 (1);

(f) respecting reports to be provided to the minister by the authority under section 8 (4), including, without limitation, regulations respecting the jurisdictions with which comparisons are to be made, the rate classes to be considered, the factors to be used in making the comparisons and conducting the assessments, and the meaning to be given to the word "competitive";

(g) for the purposes of section 17, respecting smart meters and smart-grids and their installation, including, without limitation,

(i) prescribing the types of smart meters to be installed, including the features or functions each meter must have or be able to perform,

(ii) prescribing types of smart grids to be installed, including, without limitation, equipment to detect unauthorized use or consumption of electricity, equipment to facilitate distributed generation and associated telecommunication and back-up systems, and

(iii) prescribing the classes of users for whom smart meters must be installed, and, without limiting section 36 (1) (c), requiring the authority to install different types of smart meters for different classes of users;

(h) prescribing targets, guidelines, public utilities and classes of public utilities for the purposes of section 19;

(i) issuing a direction for the purposes of section 31.

Division 3 — Regulations by Treasury Board

Regulations

38 Treasury Board may make regulations as follows:

(a) prescribing classes of projects and authorizations for the purposes of the definition of "power project" in section 20 (1), including, without limitation, prescribing classes of projects by reference to whether, or the extent to which, a project is a project of any organization of the government reporting entity, within the meaning of that definition;

(b) prescribing amounts and percentages for the purposes of section 20 (3), (4) (b) and (5) (a).

PART 9 — TRANSITION

Transition

39 (1) The Lieutenant Governor in Council may make regulations considered appropriate for the purpose of more effectively bringing this Act into operation, and to remedy any transitional difficulties encountered in doing so, and for that purpose, may make regulations disapplying or varying any provision of this Act.

(2) Subject to subsection (3), this section is repealed on the date that is 2 years after the coming into force of this section and, on this section's repeal, any regulations made under it are also repealed.

(3) The Lieutenant Governor in Council, by regulation, may substitute for the date referred to in subsection (2) a date that is no later than 3 years after the coming into force of this section.

PART 10 — CONSEQUENTIAL AMENDMENTS

BC Hydro Public Power Legacy and Heritage Contract Act

40 Section 1 of the BC Hydro Public Power Legacy and Heritage Contract Act, S.B.C. 2003, c. 86, is amended by repealing the definition of* "protected assets"*.

41 Section 2 is repealed.

42 Section 4 (2) (a) is amended by striking out ", the *Hydro and Power Authority Act* and the *Transmission Corporation Act*;***" and substituting "***and the *Hydro and Power Authority Act*;***".***

43 The Schedule is repealed.

Environmental Assessment Act

44 Section 11 (2) (b) of the Environmental Assessment Act, S.B.C. 2002, c. 43, is amended by adding ", including potential cumulative environmental effects***" after "***assessment***".***

Financial Information Act

45 Schedule 1 of the Financial Information Act, R.S.B.C. 1996, c. 140, is amended by striking out "*Transmission Corporation Act****".***

Forest Act

46 Section 47.6 (2.11) (b) of the Forest Act, R.S.B.C. 1996, c. 157, as enacted by section 18 (c) of the Greenhouse Gas Reduction (Emissions Standards) Statutes Amendment Act, 2008, S.B.C. 2008, c. 20, is amended by striking out everything after "has received notification***" and substituting "***under section 79.1.***"***

47 Section 47.7 (f) (ii) is amended by adding "other than a forestry licence to cut issued under section 47.6 (2.11)***" after "***forestry licence to cut***".***

48 Section 47.72, as enacted by section 20 of the Greenhouse Gas Reduction (Emissions Standards) Statutes Amendment Act, 2008, is amended

(a) in subsection (1) (f) by striking out "a regulation made under section 151.6 (2).***" and substituting "***section 79.1.***", and***

(b) in subsection (2) by striking out "of harvest completion***" and substituting "***in accordance with section 79.1***" and by striking out "***a regulation made under section 151.6 (2)***" and substituting "***section 79.1.***"***

49 Section 47.73, as enacted by section 20 of the Greenhouse Gas Reduction (Emissions Standards) Statutes Amendment Act, 2008, is amended by striking out everything after "gave the notification***" and substituting "***in accordance with section 79.1.***"***

50 Section 47.9, as enacted by section 22 of the Greenhouse Gas Reduction (Emissions Standards) Statutes Amendment Act, 2008, is amended by striking out "a regulation made under section 151.6 (2)***" and substituting "***section 79.1***".***

51 The following Division is added after section 79:

Division 4.1 — Miscellaneous

Order respecting notice

79.1 (1) During the term of an agreement under section 12, the minister may order that the agreement holder must notify the minister, in accordance with the requirements specified in the order, whether the agreement holder has abandoned or intends to abandon any rights the agreement holder has in respect of Crown timber that has been cut under the agreement but has not been removed from an area specified in the order.

(2) If an agreement holder referred to in subsection (1) notifies the minister that the agreement holder has abandoned or intends to abandon the rights referred to in subsection (1), the minister may order the agreement holder not to destroy or otherwise deal with the Crown timber referred to in that subsection.

(3) If an agreement holder referred to in subsection (1) notifies the minister that the agreement holder has not abandoned and does not intend to abandon the rights referred to in subsection (1), the minister may order the agreement holder not to destroy the Crown timber referred to in that subsection, if the minister is satisfied that a market exists for that Crown timber.

(4) A person to whom an order under this section has been given must comply with the order.

Freedom of Information and Protection of Privacy Act

52 Schedule 2 of the Freedom of Information and Protection of Privacy Act, R.S.B.C. 1996, c. 165, is amended by striking out the following:

Public Body:	British Columbia Transmission Corporation
Head:	Chair ***.***

Hydro and Power Authority Act

53 Section 1 of the Hydro and Power Authority Act, R.S.B.C. 1996, c. 212, is amended in the definition of "power" by adding ", except in sections 12 (1) and 38 (2),***" before "***includes energy***".***

54 Section 12 (1) is repealed and the following substituted:

(1) Subject to this Act and the regulations, the authority has the capacity and the rights, powers and privileges of an individual of full capacity and, in addition, has

(a) the power to amalgamate in any manner with a firm or person, and

(b) any other power prescribed.

(1.1) The authority's purposes are

(a) to generate, manufacture, conserve, supply, acquire and dispose of power and related products,

(b) to supply and acquire services related to anything in paragraph (a), and

(c) to do other things as may be prescribed.

(1.2) The authority may not engage in activities or classes of activities prescribed for the purposes of this subsection without obtaining an applicable approval as prescribed.

55 Section 32 is amended

(a) in subsection (7) (c) by adding "section 32 and***" before "***Division***",***

(b) in subsection (7) by adding the following paragraph:

(c.01) the *Clean Energy Act*; ***,***

(c) in subsection (7) (x) by adding "44.1,***" after "***sections***", and***

(d) by repealing subsection (8).

56 Section 38 is amended by renumbering the section as section 38 (1) and by adding the following subsection:

(2) Without limiting subsection (1), the Lieutenant Governor in Council may make regulations

(a) prescribing powers for the purposes of section 12 (1),

(b) prescribing purposes of the authority for the purposes of section 12 (1.1), and

(c) for the purposes of section 12 (1.2), prescribing activities, classes of activities and approval requirements.

Transmission Corporation Act

57 The Transmission Corporation Act, S.B.C. 2003, c. 44, is repealed.

Utilities Commission Act

58 Section 1 of the Utilities Commission Act, R.S.B.C. 1996, c. 473, is amended by repealing the definitions of* "demand-side measure" *and* "government's energy objectives" *and substituting the following:

"British Columbia's energy objectives" has the same meaning as in section 1 (1) of the *Clean Energy Act*;

"demand-side measure" has the same meaning as in section 1 (1) of the *Clean Energy Act*; ***.***

59 Section 1 is amended by repealing the definition of* "transmission corporation"*.

60 Section 3 (2) is amended by striking out "*or*" at the end of paragraph (a) and by adding the following paragraph:

(a.1) any provision of the *Clean Energy Act* or the regulations under that Act, or ***.***

61 Section 5 (0.1) and (4) to (9) is repealed.

62 Section 28 is amended

(a) in subsection (1) by striking out "*90*" and substituting "*200*", and

(b) by adding the following subsections:

(2.1) If required to do so by regulation, the commission, in accordance with the prescribed requirements, must set a rate for the authority respecting the service provided under subsection (1).

(2.2) A requirement prescribed for the purposes of subsection (2.1) applies despite

(a) any other provision of this Act or any regulation under this Act, except for a regulation under section 3, or

(b) any previous decision of the commission.

63 Section 29 is amended by striking out "90***" and substituting "***200***".***

64 Section 43 (1.1) is repealed.

65 Section 44.1 is amended

(a) by repealing subsections (1) and (4), and

(b) by repealing subsection (8) (a) and (b) and substituting the following:

(a) the applicable of British Columbia's energy objectives,

(b) the extent to which the plan is consistent with the applicable requirements under sections 6 and 19 of the *Clean Energy Act*, ***.***

66 Section 44.2 is amended

(a) in subsection (3) by striking out "subject to subsections (5) and (6),***" and substituting "***subject to subsections (5), (5.1) and (6),***",***

(b) in subsection (5) by adding "filed by a public utility other than the authority***" after "***expenditure schedule***" and by repealing paragraphs (a) and (c) and substituting the following:***

(a) the applicable of British Columbia's energy objectives,

(c) the extent to which the plan is consistent with the applicable requirements under sections 6 and 19 of the *Clean Energy Act*, , and

(c) by adding the following subsection:

(5.1) In considering whether to accept an expenditure schedule filed by the authority, the commission, in addition to considering the interests of persons in British Columbia who receive or may receive service from the authority, must consider and be guided by

(a) British Columbia's energy objectives,

(b) an applicable integrated resource plan approved under section 4 of the *Clean Energy Act*,

(c) the extent to which the schedule is consistent with the requirements under section 19 of the *Clean Energy Act*, and

(d) if the schedule includes expenditures on demand-side measures, the extent to which the demand-side measures are cost-effective within the meaning prescribed by regulation, if any.

67 Section 46 is amended

(a) in subsection (3) by striking out "Subject to subsections (3.1) and (3.2),***" and substituting "***Subject to subsections (3.1) to (3.3),***",***

(b) in subsection (3.1) by adding "applied for by a public utility other than the authority***" after "***under subsection (3)***" and by repealing paragraphs (a) and (c) and substituting the following:***

(a) the applicable of British Columbia's energy objectives,

(c) the extent to which the application for the certificate is consistent with the applicable requirements under sections 6 and 19 of the *Clean Energy Act*, ***, and***

(c) by adding the following subsection:

(3.3) In deciding whether to issue a certificate under subsection (3) to the authority, the commission, in addition to considering the interests of persons in British Columbia who receive or may receive service from the authority, must consider and be guided by

(a) British Columbia's energy objectives,

(b) an applicable integrated resource plan approved under section 4 of the *Clean Energy Act*, and

(c) the extent to which the application for the certificate is consistent with the requirements under section 19 of the *Clean Energy Act*.

68 Section 58.1 (2) (a) (ii) is amended by striking out "or 125.1 (4) (f)***".***

69 Part 3.1 is repealed.

70 Section 71 is amended

(a) in subsection (2.1) by adding "filed by a public utility other than the authority***" after "***whether an energy supply contract***" and by repealing paragraphs (a) and (c) and substituting the following:***

(a) the applicable of British Columbia's energy objectives,

(c) the extent to which the energy supply contract is consistent with the applicable requirements under sections 6 and 19 of the *Clean Energy Act*, ***,***

(b) by adding the following subsection:

(2.21) In determining under subsection (2) whether an energy supply contract filed by the authority is in the public interest, the commission, in addition to considering the interests of persons in British Columbia who receive or may receive service from the authority, must consider and be guided by

(a) British Columbia's energy objectives,

(b) an applicable integrated resource plan approved under section 4 of the *Clean Energy Act*,

(c) the extent to which the energy supply contract is consistent with the requirements under section 19 of the *Clean Energy Act*,

(d) the quantity of the energy to be supplied under the contract,

(e) the availability of supplies of the energy referred to in paragraph (d),

(f) the price and availability of any other form of energy that could be used instead of the energy referred to in paragraph (d), and

(g) in the case only of an energy supply contract that is entered into by a public utility, the price of the energy referred to in paragraph (d). ***,***

(c) in subsection (2.5) by adding "with respect to a submission by a public utility other than the authority***" after "***under subsection (2.4)***" and by repealing paragraphs (a) and (c) and substituting the following:***

(a) the applicable of British Columbia's energy objectives,

(c) the extent to which the application for the proposed contract is consistent with the applicable requirements under sections 6 and 19 of the *Clean Energy Act*, and ***, and***

(d) by adding the following subsection:

(2.51) In considering the public interest under subsection (2.4) with respect to a submission by the authority, the commission, in addition to considering the interests of persons in British Columbia who receive or may receive service from the authority, must consider and be guided by

(a) British Columbia's energy objectives,

(b) an applicable integrated resource plan approved under section 4 of the *Clean Energy Act*, and

(c) the extent to which the application for the proposed contract is consistent with the requirements under section 19 of the *Clean Energy Act*.

71 Section 125 (2) is amended by adding the following paragraph:

(e) requiring the commission to set a rate for the purposes of section 28 (2.1) and prescribing requirements for the purposes of that section.

72 Section 125.1 is amended

(a) by repealing subsections (2), (3) and (4) (a), (c), (d), (f) and (j) to (n), and

(b) in subsection (4) (e) by adding "and***" at the end of subparagraph (ii), by striking out*** ", and***" at the end of subparagraph (iii) and by repealing subparagraph (iv).***

73 Section 125.2 (3) is amended by striking out "transmission corporation***" and substituting "***authority***".***

Wildfire Act

74 Section 7 of the Wildfire Act, S.B.C. 2004, c. 31, is amended

(a) by adding the following subsections:

(2.1) A person who is in a prescribed class of persons and who carries out an industrial activity or a prescribed activity on an area must, within the prescribed period and to the prescribed extent, abate a fire hazard on the area.

(2.2) A person referred to in subsection (2) is not required to abate a fire hazard on an area if a person referred to in subsection (2.1) is required to abate the fire hazard. ***, and***

(b) in subsection (3) by striking out "subsection (2)***" in both places and substituting "***subsections (2) and (2.1)***" and by adding "***applicable***" before "***person***".***

75 Section 43 (3) is amended by striking out "section 7 (2) or (4),***" and substituting "***section 7 (2), (2.1) or (4),***".***

76 Section 72 (2) (g) is repealed and the following substituted:

(g) respecting the abatement of fire hazards, including, without limitation,

(i) prescribing classes of person, activities and time periods for the purposes of section 7 (2.1), and

(ii) specifying, for the purposes of section 7 (2.1), the extent to which a fire hazard must be abated, .

Commencement

77 The provisions of this Act referred to in column 1 of the following table come into force as set out in column 2 of the table:

Item	Column 1 **Provisions of Act**	Column 2 **Commencement**
1	Anything not elsewhere covered by this table	The date of Royal Assent
2	Section 20	July 5, 2010
3	Section 42	July 5, 2010
4	Section 45	By regulation of the Lieutenant Governor in Council
5	Section 52	By regulation of the Lieutenant Governor in Council
6	Section 55 (d)	July 5, 2010
7	Section 57	July 5, 2010
8	Section 59	July 5, 2010

9	Section 73	July 5, 2010

Schedule 1

Heritage Assets

Those generation and storage assets commonly known as the following:

Aberfeldie

Alouette

Ash River

Bridge River

Buntzen/Coquitlam

Burrard Thermal

Cheakamus

Clowhom

Duncan

Elko

Falls River

Fort Nelson

G. M. Shrum

Hugh Keenleyside Dam (Arrow Reservoir)

John Hart

Jordan

Kootenay Canal

La Joie

Ladore

Mica, including units 1 to 6

Peace Canyon

Prince Rupert

Puntledge

Revelstoke, including units 1 to 6

Ruskin

Site C

Seton

Seven Mile

Shuswap

Spillimacheen

Stave Falls

Strathcona

Waneta

Wahleach

Walter Hardman

Whatshan

Schedule 2

Prohibited Projects

The projects of the authority, as set out in appendix F-8 of the authority's long-term acquisition plan, exhibit B-1-1, filed with the commission on June 12, 2008, are prohibited projects for the purposes of section 10, in particular, the following projects identified in appendix F-8:

(a) Murphy Creek;

(b) Border;

(c) High Site E;

(d) Low Site E;

(e) Elaho;

(f) McGregor Lower Canyon;

(g) Homathko River;

(h) Liard River;

(i) Iskut River;

(j) Cutoff Mountain;

(k) McGregor River Diversion.

Explanatory Note

This Bill sets out British Columbia's energy objectives, requires the British Columbia Hydro and Power Authority to submit an integrated resource plan describing what it plans to do in response to those objectives, and requires the authority to achieve electricity self-sufficiency by the year 2016. The Bill also prohibits certain projects from proceeding, ensures that the benefits of the heritage assets are preserved for British Columbians, provides for the establishment of energy efficiency measures and establishes the First Nations Clean Energy Business Fund. The Transmission Corporation and the authority are also to be unified under this Bill.

IN THE MATTER OF

TERASEN GAS INC.
TERASEN GAS (VANCOUVER ISLAND) INC.

AND

ENERGY EFFICIENCY AND CONSERVATION APPLICATION

DECISION

April 16, 2009

Before:

A.W.K. Anderson, Commissioner
A.A. Rhodes, Commissioner

TABLE OF CONTENTS

Page No.

1.0 BACKGROUND AND REGULATORY PROCESS

1.1 The Application

On May 28, 2008 Terasen Gas Inc. (“TGI”) and Terasen Gas (Vancouver Island) Inc. (“TGVI”) (collectively “Terasen”) filed its Energy Efficiency and Conservation (“EEC”) Programs Application (“Application”) with the British Columbia Utilities Commission (“the Commission”).

In the Application, Terasen requested an order or orders approving the following:

- Increases of EEC expenditures in the period 2008-2010 to $46.944 million for TGI and $9.667 million for TGVI, a combined total of $56.6 million;
- Capitalisation of incremental EEC expenditures as a regulatory asset deferral account on an after tax basis and amortisation of the account over 20 years;
- An increase in the amortisation period to 20 years for incentive amounts that are added to deferral accounts for 2008 and 2009 as part of the 2008-2009 extension of the 2004-2007 TGI PBR Settlement Agreement (“TGI PBR Extended Settlement”) approved by Order G-33-07 and the 2008-2009 extension of the 2006-2007 TGVI Revenue Requirements Settlement Agreement (“TGVI RR Extended Settlement”) approved by Order G-34-07;
- Changes to the benefit-cost analysis undertaken to evaluate EEC measures as outlined below:
    - Implementation of a portfolio approach to benefit-cost analysis such that the Total Resource Cost (“TRC”) test for all programs combined must return an overall combined result of one or more;
    - Elimination of the requirement to include free-riders in benefit-cost tests;
    - Inclusion of the benefits of savings associated with implementation of a regulation as a result of EEC programs aimed at preparing the marketplace for the introduction of regulation of minimum efficiency levels in equipment, buildings or energy systems
    - Inclusion of the impact of carbon-pricing as one of the inputs to the benefit-cost tests;

- A requirement that Terasen submit annually to the Commission, by the end of the first quarter following year-end, for each year of the funding period, a report on all EEC initiatives and activities, expenditures and results for TGI and TGVI.

The Commission directed that the Application would follow a written hearing process after hearing submissions from intervenors and interested parties.

Intervenors registered for the hearing were:

- British Columbia Hydro and Power Authority ("BC Hydro"),
- British Columbia Old Age Pensioners' Organization et. al. ("BCOAPO"),
- B.C. Sustainable Energy Association and the Sierra Club of Canada (British Columbia Chapter) (collectively, "BCSEA-SCBC"),
- The Ministry of Energy, Mines and Petroleum Resources ("MEMPR"),
- The Rental Owners and Managers Society of B.C. ("ROMS"),
- FortisBC Inc.,
- Pacific Northern Gas Ltd. ("PNG"),
- The Commercial Energy Consumers Association of BC ("CEC") and
- Direct Energy Marketing Limited

In addition to parties registering as intervenors, numerous letters of comment were received.

Two rounds of Information Requests were conducted.

Intervenors BC Hydro and BCSEA-SCBC also filed evidence.

The process was complete on December 5, 2008 with the filing of Terasen's reply submission.

1.2 Legal and Regulatory

1.2.1 The Utilities Commission Act

The Application is made pursuant to Section 44.2 of the Act, which states, in part:

> "(1) A public utility may file with the commission an expenditure schedule containing one or more of the following:
>
> > (a) a statement of the expenditures on demand-side measures the public utility has made or anticipates making during the period addressed by the schedule;…"

and:

> "(3) After reviewing an expenditure schedule submitted under subsection (1), the commission, subject to subsections (5) and (6), must
>
> > (a) accept the schedule, if the commission considers that making the expenditures referred to in the schedule would be in the public interest, or
> >
> > (b) reject the schedule.
>
> (4) The commission may accept or reject, under subsection (3), a part of a schedule.
>
> (5) In considering whether to accept an expenditure schedule, the commission must consider
>
> > (a) the government's energy objectives,
> >
> > (b) the most recent long-term resource plan filed by the public utility under section 44.1, if any,
> >
> > (c) whether the schedule is consistent with the requirements under section 64.01 or 64.02, if applicable,
> >
> > (d) if the schedule includes expenditures on demand-side measures, whether the demand-side measures are cost-effective within the meaning prescribed by regulation, if any, and
> >
> > (e) the interests of persons in British Columbia who receive or may receive service from the public utility.
>
> (6) If the commission considers that an expenditure in an expenditure schedule was determined to be in the public interest in the course of determining that a long-term resource plan was in the public interest under section 44.1 (6),

(a) subsection (5) of this section does not apply with respect to that expenditure, and

(b) the commission must accept under subsection (3) the expenditure in the expenditure schedule.”

1.2.2 The Long Term Resource Plan

The Commission Panel notes that, with respect to subsection 44.2 (5) (b) and subsection 44.2(6), Terasen filed its consolidated 2008 Resource Plan (on behalf of TGI, TGVI and Terasen Gas (Whistler) Inc.) on June 27, 2008, which was accepted as described in Order G-194-08 and its accompanying Reasons. As noted in the Reasons, the Commission Panel specifically excluded any consideration or determination with respect to whether the EEC expenditures included in the instant Application were in the public interest. Accordingly, the Commission Panel considers that subsection 5 of s. 44.2 is applicable to the Application, whereas subsection 44.2(6) is not.

1.2.3 ‘Cost effectiveness’ and the Demand Side Measures (DSM) Regulation

Subsection 44.2 (5)(d) requires the Commission to consider whether the EEC expenditures are “. . . cost-effective within the meaning prescribed by regulation, if any, . . .”.

On November 7, 2008, the Government issued Ministerial Order M271/2008 which attached B.C. Reg. 326/2008 - Demand-Side Measures Regulation. Section 3 of the DSM Regulation deals with the “adequacy” of a demand-side measures “plan portfolio” and section 4 of the DSM Regulation sets forth certain requirements with respect to the determination of whether such expenditures are “cost effective”. Section 2 of the DSM Regulation provides that the regulation applies only to ‘the authority’ (BC Hydro) until June 1, 2009, at which time the regulation will become more generally applicable. Accordingly the requirements of sections 3 and 4 are not applicable to Terasen’s current EEC Application.

1.2.4 BC Government's Energy Objectives

Subsection 44.2 (5)(a) of the Act requires the Commission to consider the "government's energy objectives" in considering whether to accept an expenditure schedule. The "government's energy objectives" are defined in section 1 of the Act as follows:

> "(a) to encourage public utilities to reduce greenhouse gas emissions;
>
> (b) to encourage public utilities to take demand-side measures;
>
> (c) to encourage public utilities to produce, generate and acquire electricity from clean or renewable sources;
>
> (d) to encourage public utilities to develop adequate energy transmission infrastructure and capacity in the time required to serve persons who receive or may receive service from the public utility;
>
> (e) to encourage public utilities to use innovative energy technologies
>
>> (i) that facilitate electricity self-sufficiency or the fulfillment of their long-term transmission requirements, or
>>
>> (ii) that support energy conservation or efficiency or the use of clean or renewable sources of energy;
>
> (f) to encourage public utilities to take prescribed actions in support of any other goals prescribed by regulation…"

2.0 TERASEN'S PROPOSED EEC EXPENDITURES

Terasen is applying for approval of an increase in allowed expenditures for EEC activity for TGI and TGVI to a total of approximately $56.6 million over the three year Program Period 2008 to 2010, an increment of $48.062 million over currently approved DSM spending for the two utilities. (Exhibit B-1, p. 8)

The proposed EEC Expenditures, by Program Area, by Utility, are set out in the table below.

Table 1

($000)

Spend by Program Area 2008 -2010	**TGI**	**TGVI**	**Total**
Residential Energy Efficiency	8,552	734	9,286
Commercial Energy Efficiency	19,592	2,199	21,791
Residential Fuel Switching	1,332	2,367	3,699
Conservation Education and Outreach	11,068	2,767	13,835
Joint Initiatives	2,400	600	3,000
Trade Relations	1,200	300	1,500
Conservation Potential Review	400	100	500
Innovative Technologies, NGV and Measurement	2,400	600	3,000
Total	46,944	9,667	56,611

(Source: Exhibit B-1, p. 9)

Terasen states that it is most efficient for the Commission to approve the overall expenditure level, by utility, for the funding period rather than by approving the funding by program area or by individual program initiative. Terasen submits that this approach will allow it to respond quickly to changes within initiatives and to new opportunities that might arise, and will reduce the administrative burden related to EEC activity. (Exhibit B-1, pp. 50-51)

Terasen also submits that the energy savings from the EEC expenditures will result in savings with a present value of almost 10 million gigajoules ("GJs") over the lives of the various measures proposed, while fuel switching activity is estimated to result in approximately 2.3 million GJs of additional load. The anticipated present value of net energy savings is approximately 7.7 million GJs, not including potential savings arising from Conservation Education and Outreach, Joint Initiatives or Innovative Technologies, NGV and Measurement program areas. (Exhibit B-1, p. 10) Terasen further states that DSM expenditures at current levels would result in cumulative annual savings of 1.3 million (nominal, rather than present value) GJs by 2016, whereas the proposed expenditures would result in cumulative annual savings of approximately 6.4 million nominal GJs in the same time period. (Exhibit B-1, p. 11)

2.1 Residential and Commercial Energy Efficiency

Terasen developed its budget estimates for Residential Energy Efficiency, Commercial Energy Efficiency and Residential Fuel Switching based on work done in 2006 in its Conservation Potential Review ("CPR"). Those estimates were refined by Habart and Associates Consulting Inc. ("Habart") as described in Habart's September 2007 Report ("Habart Report") provided in Appendix 9 of the Application. (Exhibit B-1, p. 52) The Habart Report concluded that total DSM funding of approximately $35 million over the three-year period would be required. (Exhibit B-1, Appendix 9, p. 23)

Terasen states that "[t]he key finding of the CPR was the Achievable Potential" which is a measure of savings which could realistically be achieved within the study period. (Exhibit B-1, p. 45) The Achievable Potential from the CPR is outlined in the table below:

Table 2

CPR Findings

By 2015/2016, GJ per year	TGVI	Lower Mainland	Interior	Total
Residential EE	-369,000	-5,298,000	-1,847,000	-7,514,000
Commercial EE	-385,000	-1,396,000	-431,000	-2,212,000
Industrial EE	-32,430	-933,064	-924,210	-1,889,704
Subtotal	**-786,430**	**-7,627,064**	**-3,202,210**	**-11,615,704**
Residential Fuel Subsitution				1,453,000
Potential Annual Impact				**-10,162,704**

(Exhibit B-1, Table 4.1, p. 45)

Terasen states that "[t]he strategies outlined in this Application, and the expenditures for which approval is being sought, are based to a significant degree on the findings of the CPR and the subsequent work undertaken with Habart." (Exhibit B-1, p. E-3)

In discussing estimation of new dwelling heating loads, the 2006 CPR states that: "[d]iscussions with provincial government staff indicated that a number of changes to residential buildings are under consideration that could affect the thermal performance of British Columbia's new housing over the study period." The changes being considered include targets for new construction, including residential buildings and all commercial buildings (including apartments) and strategies to achieve improved thermal performance in related residential equipment and products, including furnaces, fireplaces, and windows. (Exhibit B-1, Appendix 1, p. 33)

2.1.1 Residential Energy Efficiency

Terasen proposes spending $9.286 million on Residential Energy Efficiency for both TGI and TGVI over the Program Period (Exhibit B-1, p. 55, Table 6.2b). The Residential Energy Efficiency program area includes both new construction and retrofit initiatives.

2.1.1.1 New Construction

For new construction, Terasen is proposing EnerChoice Fireplace and Energy Star Appliance initiatives. The EnerChoice Fireplace program will provide an incentive to customers who purchase and install an EnerChoice rated fireplace, insert or free-standing stove. The Energy Star Appliance program provides incentives for customers who use natural gas for domestic hot water ("DHW") heating to install Energy Star clothes washers and/or dishwashers. (Exhibit B-1, p. 59)

Terasen states "[t]he key decision makers in this market for the [new construction] programs . . . are builders and developers who build single family homes and row-houses" and ". . . new construction EEC portfolio in the residential market will include programs that encourage customers, whether they be individuals building a new home, or builders and developers, to install energy efficient appliances." (Exhibit B-1, p. 58) (emphasis in original)

2.1.1.2 Retrofit

For the residential retrofit market Terasen is proposing an Energy Star Heating System Upgrade program that will reprise earlier versions of this program, and will provide customers who install an Energy Star heating system a credit on their Terasen bill for gas service. Terasen's Application is based on funding for incentives for gas furnace upgrades in single family dwellings ("SFDs") and duplexes in the Terasen service territory. Terasen estimates upgrades to 5.3 percent of the stock of pre-1976 SFDs and duplexes or 8,180 furnace upgrades to the end of 2009. Terasen notes that due to expected new Federal government regulations requiring all furnaces sold in Canada to meet a minimum standard of 90 percent efficiency after December 31, 2009, this program will conclude prior to that date. (Exhibit B-1, pp. 59-60)

Terasen is also proposing EnerChoice Fireplace and Energy Star Appliance programs for the retrofit market as for the new construction market. The Hearth, Patio & Barbeque Association of Canada will provide assistance in promotional and educational aspects of the EnerChoice Fireplace program. (Exhibit B-1, p. 60)

The residential sector expenditures proposed by Terasen, by utility and program area are as follows:

Table 3

TGI and TGVI Energy Efficiency ($000)		**2008**	**2009**	**2010**	**Total**
TGI	New Construction	411	566	1,056	2,033
	Retrofit	2,495	2,658	1,367	6,520
	Sub total, TGI	2,906	3,224	2,423	8,553
TGVI	New Construction	130	156	232	518
	Retrofit	53	66	97	216
	Sub total, TGVI	183	222	329	734
	Total	3,089	3,446	2,752	9,287

Source: BCUC IR No. 1 Attach 56.2A

2.1.1.3 Commercial Energy Efficiency

Terasen is proposing to spend $21.7 million on commercial sector new construction and retrofit programs (Exhibit B-1, p. 60). The expenditure proposals were based on refinements of the following initial recommendations from the Habart report:

Table 4

TGI and TGVI Commercial Programs	**Spending 2008-2010 ($000) TGI**	**TGVI**
New Construction		
Efficient New Construction	5,297	727
Boilers	1,928	224
Water Heating	1,118	103
Subtotal - New Construction	**8,343**	**1,055**
Retrofit		
Boilers	7,395	1,074
Building Recommissioning	3,095	354
Next Generation Building Automation Systems	968	95
Demand Control Ventilation	1,795	-
High Efficiency Rooftop Units	239	17
Water Heat	2,032	254
Subtotal - Retrofit	**15,524**	**1,794**
Total Commercial Energy Efficiency	**23,867**	**2,849**

Source: Exhibit B-2, Attachment 56 2A TGVI and 56 2A TGI

2.1.1.4 New Construction

The commercial new construction program is aimed at all new construction "…which might use natural gas space and water heating." Terasen states that "…the immediate opportunities are likely to be Multifamily Dwellings ("MFDs") and Commercial office space" and may also include some institutional buildings. (Exhibit B-1, p. 61) Terasen lists some potential areas for activity in the commercial new construction sector, and notes that program design in this sector is complex, so the program activities listed in the Application are merely summaries.

Terasen states “[t]he key decision makers in this market are owners including: governments; builders/developers; architects; engineers; interior designers; mechanical consultants; and contractors.” (Exhibit B-1, p. 61)

The new construction energy efficiency program areas include initiatives aimed at:

- Efficient New Construction Design and High Insulation Technology for windows;
- Condensing and near condensing boilers; and
- Instantaneous and condensing DHW heaters and drain water heat recovery.

(Exhibit B-1, Table 6.3.2, p. 61)

2.1.2.5 Retrofit

Terasen’s commercial retrofit program is aimed at all commercial and industrial buildings with existing natural gas space and water heating equipment. Terasen again notes that, due to the complexity of programs in this sector, it has merely summarized areas of program activity and states “[m]ore detailed program development work must be completed by [Terasen] in conjunction with industry groups before these programs are rolled out.” (Exhibit B-1, p. 62)
Commercial retrofit energy efficiency program area activity includes initiatives for:

- Condensing and near condensing boilers
- Building Recommissioning
- Next Generation Building Automation Systems (“BAS”)
- High Efficiency (“HE”) Rooftop Units
- Instantaneous and condensing DHW boilers and heaters
- For TGI only, Terasen is proposing to add: demand control ventilation for large and medium commercial buildings and drainwater heat recovery.

(Exhibit B-1, p. 62, Table 6.3.2a)

Terasen states that commercial sector programs are intended to offer qualified customers a menu of programs from which to choose and that Terasen staff will work with participants in selecting the most appropriate program and/or component. (Exhibit B-1, p. 63)

Intervenor Positions

BCOAPO takes issue with the relative allocation of spending as between proposed residential and commercial customer groups. BCOAPO notes that residential customers make up 90 percent of Terasen's total customers and 38 percent of its total volume, whereas commercial customers represent only 9.7 percent of its customer base and 26 percent of its total volume. (BCOAPO Argument, p. 12)

Commission Determination

The Commission Panel notes BCOAPO's comments as well as the CPR evidence indicating that some 70 percent of the Achievable Potential savings are associated with the residential sector. Terasen has included residential market MFDs in its Commercial EE program, which, in the view of the Commission Panel, may also have significant potential for low income housing initiatives. Terasen indicates that it will re-direct funding amongst programs based on customer response, thus enabling funding balancing between Residential and Commercial programs as appropriate.

The Commission Panel finds the design of Terasen's Residential and Commercial EE programs to be reasonable, flexible and in the public interest, and accepts the expenditure proposals for these program areas.

2.2 Residential Fuel Switching

Reduction in Greenhouse Gas ("GHG") emissions is advanced by Terasen as a benefit in support of residential fuel switching for TGI. The stated premise is that the substitution of natural gas for electricity will reduce overall GHG emissions in the short term, by increasing the amount of electricity available to BC Hydro to meet domestic load, thereby reducing its dependence on imported power or, alternatively, allowing it to increase exports of clean power, thus enabling a reduction in the regional use of gas or coal-fired power. Terasen submits, over the longer term, to the extent BC Hydro is able to meet its load requirements, excess clean generation could be exported, displacing the use of gas and/or coal-fired generation in the region (Western Interconnection). (Exhibit B-1, p. 63; Terasen Reply, p. 5)

Terasen states that "[t]he primary objective of the fuel-switching offers is to promote the most optimal balance in energy share between electricity and natural gas, preserving BC Hydro's generation and transmission systems for its [sic] highest value – in running lights, computers and other technology." (Exhibit B-1, p. 64)

Terasen proposes to spend $3.7 million in the residential fuel switching program area. It is proposing that only new construction fuel switching programs be offered in the TGI service area but that both new construction and retrofit fuel switching programs be offered in the TGVI service area.

Terasen proposes to spend the following amounts on fuel switching programs annually, over the Funding Period.

Table 5

Residential Fuel Switching Programs

Program		**Initiatives**	**TGI**	**TGVI**
New Construction				
	Natural Gas Water Heating	NG DHW	319	693
	Natural Gas Appliances	NG Range	1,013	50
		Sub Total	1,332	743
Retrofits		NG Dryer		38
	Natural Gas Appliances	FS Range	-	247
		FS Dryer	-	247
	Furnace Fuel Substitution	Furnace	-	766
	Fireplace Fuel Substitution	EnerChoice Fireplace	-	326
		Sub-total		1624
		Totals	1332	2367

Source: Exhibit B-2, Attachments 56.2A 2 (TGI) and 56.2A 4 TGVI

New Construction

All new construction expenditures involve fuel switching from electricity. Only the Retrofit programs, which are limited to Vancouver Island, involve potential fuel switching from propane, oil or wood in addition to electricity. Terasen states: "[i]t is very challenging to separate out proposed expenditures for fuel switching from electricity to natural gas from vs. [sic] proposed expenditures for fuel switching from non-electric sources to natural gas, as there are a number of potential energy sources for the proposed TGVI residential retrofit program, and …[it] cannot predict the proportion of participants switching from each energy source." (Exhibit B-5, BC Hydro 1.1.1)

Terasen proposes fuel substitution incentive programs to encourage the use of natural gas in new construction projects for installation of natural gas domestic hot water heaters in the TGVI service area and to install a natural gas range and/or dryer in both the TGI and TGVI service areas. (Exhibit B-1, p. 64)

Retrofit

Incentive funding for fuel substitution retrofits is only contemplated for TGVI, as many households in its service territory still use wood, propane or fuel oil for space heating and fireplaces.

The proposed programs include incentive payments for:

- Switching to natural gas for space heating and for installing Energy Star equipment. Terasen states that "the current regulatory regime for TGVI does not allow Terasen to offer customers who switch to natural gas an incentive to install Energy Star equipment." (Terasen proposes that it be able to offer both, but also advises that it would restrict the incentive to furnaces and boilers rated Energy Star.);
- Installation of an EnerChoice-rated fireplace, insert or free-standing stove; and
- Replacement of existing electric or propane ranges and dryers with gas appliances.

(Exhibit B-1, p. 65)

Intervenor Positions

BCOAPO strongly opposes the inclusion of any expenditures associated with fuel switching away from electricity to natural gas in Terasen's EEC portfolio. BCOAPO argues that there is no evidence as to an "optimal balance" as between electricity and natural gas and suggests that a movement away from (clean) electricity to a fossil fuel would not be part of such optimal balance. (BCOAPO Argument, p. 10)

BC Hydro filed the evidence of Randy Reimann, P. Eng., its manager of Resource Planning, wherein he contradicted Terasen's assertion that fuel switching away from electricity to natural gas would reduce the need for BC Hydro to import electricity from other jurisdictions which rely on coal or natural gas for generation. Mr. Reimann stated: "[t]here is no medium to long term linkage between fuel switching from electricity to natural gas and a change in BC Hydro's need for importing electric energy or ability to export such energy." (Exhibit C2-6, Direct Testimony of Randy Reimann, p. 2, Q.7)

BC Hydro also filed the evidence of Patrice Rother, its manager of Environmental Strategy in the Safety, Health and Environmental group. Ms. Rother reviewed recent GHG-related legislative and policy developments including the B.C. Greenhouse Gas Reduction Targets Act ("GGRTA"), the B.C. Climate Action Plan and the joinder of British Columbia into the Western Climate Initiative and highlighted a number of areas of uncertainty surrounding how the WCI GHG trading scheme will align with the GGRTA legislated targets and other Chinook Action Plan action items on a regional basis. (Exhibit C2-6, Direct Testimony of Patrice Rother pp. 2-3, Q. 8, 11)

Commission Determination

While the Commission Panel notes the comments of Terasen regarding potential GHG benefits of fuel switching, particularly away from fossil fuels with a higher carbon content than natural gas, the Commission Panel is not convinced that expenditures on fuel switching and load building away from electricity can be properly considered in a portfolio of EEC programs at this time. The Commission Panel agrees with the comments of the BCOAPO that the "optimal balance" as between natural gas and electricity has not been established. The Commission Panel also finds that the efficiency of other energy sources over and above that of electricity has not been adequately established.

The Commission Panel also notes that natural gas does have a GHG impact which is not present in clean domestic electricity and that one of the government's energy objectives is "to encourage public utilities to reduce GHG emissions." The Commission Panel accepts the evidence of

Ms. Rother that there is considerable uncertainty, at this time, surrounding how various government initiatives will align on a regional basis. The Commission Panel finds that Terasen has not provided sufficient evidence to persuade the Panel, on a balance of probabilities, that a regional approach should be adopted as a justification for EEC expenditures aimed at substituting natural gas as a fuel to replace electricity.

The Commission Panel accepts EEC expenditures directed at fuel switching from fossil fuels with a higher carbon content than that of natural gas. Expenditure programs specifically directed at encouraging fuel switching away from electricity are rejected, as are Incentive payments for appliances for which an Energy Star rating is not available. However, expenditures are accepted for incentives to install Energy Star and EnerChoice equipment and appliances for customers who, at their own initiative, wish to switch to natural gas as the fuel of choice.

2.3 Conservation Education and Outreach

This proposal is in addition to program-specific education and outreach funding, and relates to non-program-specific activities, as set out below.

- Terasen's proposed budget for Conservation Education and Outreach (CEO) was developed in consultation with Wasserman + Partners Advertising ("Wasserman"). Terasen proposes a total CEO expenditure of $13.835 million in the 2008 to 2010 period which is 24 percent of the total EEC proposed expenditures of $56.611 million. The Wasserman proposal states that the planned messaging will educate the public about Terasen's EEC program and related activities.

(Exhibit B-1, Appendix 8)

Terasen was requested to describe the specifics of the CEO programs and responded that these initiatives ". . . have not yet been fully developed, however, as outlined on page 65 of the Application, they are projected to include:

- Stakeholder industry group activities, such as first time homebuyers seminars
- Public outreach by “Team Terasen”
- Support for conservation education within the school system
- Energy Forum
- Conservation communications, as outlined in Appendix 8 in the Application.”

(Exhibit B-2, BCUC 1.28.1)

The entire proposed $13.835 expenditure for the CEO Program Area is taken by the Conservation communications initiative of the CEO Program. $11.550 million or 83 percent of the $13.835 million is allocated to Mass Media Advertising and Production over the three year expenditure period. (Exhibit B-1, Appendix 8)

Terasen did not submit any details or expenditure estimates for the first four program initiatives described above.

Terasen proposes to attribute the CEO expenditures in each year equally between the Residential and Commercial Energy Efficiency programs, with none of the CEO expenditures being attributed to other Program Areas such as Fuel Switching or Trade Relations. (Exhibit B-1, p. 54)

Terasen states: “EEC expenditures will be efficient, with non-incentive costs not exceeding 50% of the expenditure in a given year.” (Exhibit B-1, p. 47, #3) Terasen does not provide any further evidence supporting the implication that, merely by not exceeding 50 percent of the total, non-incentive, expenditures, the balance represents efficiency in expenditures.

<u>Intervenor Positions</u>

BCOAPO submitted that “The Application’s education and outreach component is disproportionately large, and inappropriately treated as an asset to be amorti[s]ed over 20 years.” (BCOAPO Argument, p. 14)

BCSEA-SCBC submitted the evidence of John J. Plunkett of Green Energy Economics Group, Inc. The Commission Panel reviewed Mr. Plunkett's qualifications and experience and accepts him as an expert with respect to the matters his testimony addresses in this Application.

Mr. Plunkett proposes that the CEO should be reduced by 50 percent, and the amount by which the funding is reduced be redirected to the residential and commercial efficiency programs.
Mr. Plunkett notes that while building a conservation 'ethic' in British Columbia is laudable, the primary purpose of the CEO expenditures should be to support the efficiency programs.
(Exhibit C5-5, pp. 18, 19)

Commission Determination

The Commission Panel finds that Terasen has not provided sufficient evidence to support either the $13.835 million total proposed EEC expenditures, or the allocation of some 84 percent of that amount to mass media advertising and production. The Commission Panel notes that the Commercial component comprises some 70 percent of the total expenditures in the combined Residential and Commercial Energy Efficiency program areas, to which the CEO costs have been attributed equally. The Commission Panel also notes Terasen's comments, quoted above, with respect to the key decision makers in both the new and retrofit commercial markets. The Commission Panel considers both these markets to be significantly more narrow and focused than markets which may warrant the use of mass media approaches to communication.

The Commission Panel also notes that Terasen's evidence did not include any discussion of bill stuffers or other communication methods.

The Commission Panel agrees in part with Mr. Plunkett's proposal, and considers that, while public education is an appropriate activity in support of the EEC objectives, the evidence is not sufficient to support either the full amount proposed or the allocation of the proposed CEO expenditures. The Commission panel does not agree with Mr. Plunkett's suggestion that the funding reduction of the CEO expenditures be redirected to the energy efficiency programs. The Commission Panel finds the evidence sufficient to establish that there is a benefit to some CEO expenditures and accepts 50 percent, $6.918 million, as reasonable.

Terasen is directed to review the CEO program with a view to:

- altering the program to allocate funds away from the mass media campaign and to include other initiatives, with particular attention paid to conservation education within the school system and affordable housing initiatives;
- addressing the apparent imbalance of the residential to commercial expenditure ratio, approximately 30:70, in comparison to the ratio of residential to commercial Achievable Potential GJ impact of approximately 77:23 (Exhibit B-1, p. 45);
- reconsidering the apparent lack of communication expenditures directed in a focused manner to the Commercial Energy Efficiency program,
- reconsidering appropriate attribution of CEO costs to Program Areas and initiatives, and any related impact on Total Resource Cost calculations and rate impacts.

2.4 Joint Initiatives, Trade Relations, 2009 CPR, and Innovative Technologies, NGV and Measurement

2.4.1 Joint Initiatives

Terasen is requesting that $1.0 million per year be approved for the development of Joint Initiatives as they arise. Initiatives that Terasen states it will, or may pursue if the funding is approved, include: support for audits for a Provincial Home Retrofit Program, DSM for affordable housing, building labeling, and community action on energy efficiency. (Exhibit B-1, pp. 66-68)

2.4.1.1 Audits

The "audit" joint initiative involves providing financial assistance to customers by paying for the cost of a pre or post upgrade audit, both of which are necessary for participation in the federal government's "Eco-Energy" program. This initiative would support the provincial government's expressed intention to implement a province-wide home retrofit program, "LiveSmartBC", to complement the federal government initiative. The provincial program does not contemplate paying the cost of post-retrofit audits, and Terasen sees an opportunity to provide full or partial funding to enable more of its customers to participate in the programs. (Exhibit B-1, pp. 43, 67)

2.4.1.2 Affordable Housing

Terasen states that "[t]he Ministry of Energy Mines and Petroleum Resources has asked that the Terasen Utilities lead a working group on DSM for Affordable Housing, the goal of which is to find ways and means to deliver Energy Efficiency to the Affordable Housing sector in B.C. and that such group has been convened. Terasen proposes to fund its participation in any resulting DSM incentive program from the Joint Initiatives Program allocation. (Exhibit B-1, p. 67)

2.4.1.3 Labeling

A further joint initiative which Terasen proposes is to co-fund a pilot project to label homes and buildings with an energy consumption/efficiency rating. Terasen states that this will assist in informing the public and promoting energy conservation and will enable comparisons as between different gas-heated homes.

2.4.1.4 Community Action

Terasen also proposes to make a financial contribution to the pool of funds to which municipalities can apply under the "Community Action on Energy Efficiency" initiative for financial and research support to advance energy conservation and efficiency in their areas, through policy action and public outreach. (Exhibit B-1, p. 68; The BC Energy Plan 2007- Policy Action #9)

Intervenor Positions

BC Hydro supports the Joint Initiatives funding requested. (BC Hydro Argument, p. 5)

BCOAPO argues that this area of the EEC is "drastically under-funded if any meaningful [low-income energy efficiency program ("LIEEP")…is to be developed." (BCOAPO Argument, p. 7)

BCSEA-SCBC argues: ". . . while the four initiatives under the Join Initiatives program area may be worthwhile" they do not satisfactorily address the need for better integration of Terasen's programs with electrical DSM programs as identified by the BCSEA-SCBC expert, Mr. Plunkett. (BCSEA-SCBC Argument, pp. 12-13) Mr. Plunkett recommends that Terasen should be directed to redesign programs by streamlining them and better integrating them with electric efficiency programs. (Exhibit C5-5, p. 5)

Commission Determination

The Commission Panel accepts the expenditures requested for the Joint Initiatives Program area. The Commission Panel notes the comments of the BCOAPO and agrees that the Affordable Housing Initiative appears to be under-funded, particularly given that no portion of the requested global amount for Joint Initiatives is specifically dedicated to Affordable Housing. The Commission Panel also notes that the DSM Regulation which does not yet, but will, apply to Terasen requires that a public utility's plan portfolio include "a demand-side measure intended specifically to assist residents of low-income households to reduce their energy consumption". The Commission Panel therefore directs Terasen to proceed with its Joint Initiative relating to Affordable Housing and encourages Terasen to consider re-allocating funding from other approved areas of its overall spending as may be suitable.

The Commission Panel concurs with Mr. Plunkett's recommendation, and considers the Joint Initiatives Program to be an appropriate area from which funds should be used to aggressively pursue integrating Terasen's EEC programs with those of the electric utilities in British Columbia. The Commission Panel's view is that integrating the efforts of gas and electric utilities will better encourage customers to take advantage of the programs by eliminating unnecessary duplication in communication, applications, audits and similar time consuming activities.

2.4.2 Trade Relations

The Trade Relations program area is aimed at the support and education of skilled trades, equipment manufacturers, distributors, suppliers and retailers, appliance and equipment salespeople and Realtors. The $1.5 million in funding being requested for Trade Relations with this Application is to support the activities of a Terasen Utilities staff member focused on Trade Relations as it relates to energy efficiency.

Commission Determination

The Commission Panel takes note of Terasen's descriptions of the key decision makers in each of the Residential and Commercial EE programs, referred to previously, as well as the references to the complexity of the commercial new construction and retrofit sector programs and resulting paucity of detail for those program areas. (Exhibit B-1, p. 61)

The Commission Panel considers that the Trade Relations program area expenditures represent a significant duplication of the Residential and Commercial Energy Efficiency programs' non-incentive costs. As noted in the Application, the Energy Efficiency programs will significantly increase the interactions as between Terasen and its customers, and therefore increase "the opportunities for [Terasen] to communicate general conservation information in addition to program-specific information..." (Exhibit B-1, p. 46) The Commission Panel finds the evidence with respect to the details of the Trade Relations program area to be insufficient, and accordingly, this area of expenditure is rejected.

2.4.3 Innovative Technologies, NGV and Measurement

Terasen states that it is in a unique position to foster and further the deployment of forward-looking low carbon technologies, including measurement technologies, and is therefore seeking funding with this Application, specific to this arena. (Exhibit B-1, p. 69)

Terasen states that "[t]he amount for Innovative Technologies, NGV and measurement will need to be refined – if an effective program in Innovative Technologies, NGV and Measurement can be developed over the funding timeframe, the Companies wish to have the ability to fund such a program over the funding timeframe." (Exhibit B-1, pp. 53, 69) Terasen states that the activity in this area would be in the nature of pilot programs, with limited time frames, geographic areas and numbers of installations. The Companies indicate that they would pursue technologies with the same underlying characteristics:

- Each promotes the efficient use of natural gas through sustainable design;
- None are currently a mainstream technology;
- Each offers the potential for at least a 10 percent GHG benefit.

Energy efficiency technologies the Companies would intend to pursue include:

- Residential
  - hydronic based heating systems;
  - Integrated energy systems providing both space heat and DHW;
  - Solar thermal assisted space or DHW systems;

- Commercial
    - hydronic based heating systems;
    - Solar thermal assisted space or DHW systems.

(Exhibit B-1, p. 73)

Terasen states that it would aim fuel-substitution initiatives at both new construction and retrofit markets in both the TGI and TGVI service areas, and notes that fuel-substitution in this category refers to the displacement of natural gas using cleaner renewable technologies. The Companies state that more detailed program development work must be completed by Terasen in conjunction with industry groups before programs are rolled out or funding is allocated. (Exhibit B-1, p. 74)

Commission Determination

The Commission Panel considers that Innovative Technologies, NGV and Measurement programs can be appropriate vehicles for encouraging commercial development of technologies to reduce or replace natural gas consumption and related GHG emissions.

However, as noted above, Terasen acknowledges that further refinement of this program is required and indicates uncertainty as to whether an effective program can be developed over the funding timeframe. The Commission Panel finds that there is insufficient evidence with respect to the nature and scope of the proposed program, and accordingly rejects the Innovative Technologies, NGV and Measurement program expenditures at this time. Terasen may wish to bring forward projects in this program area for consideration as they become more fully developed.

2.5 Conservation Potential Review Update

The Terasen Gas April 2006 Conservation Potential Review (CPR) was a comprehensive planning document prepared for TGI to use for:

- Developing a long range energy efficiency and fuel choice strategy;
- Designing and implementing energy efficiency and fuel choice programs;
- Assessing the impact of energy efficiency and fuel choice programs on both peak and annual loads; and
- Setting annual efficiency and fuel choice targets and budgets.

(Exhibit B-1, Appendix 1, page E-1)

The 2009 CPR estimate of $0.5 million is based on the cost to perform the previous CPR, approximately $300,000, plus an allowance for the kind of work done by Habart to refine the CPR results into a DSM program. (Exhibit B-1, p. 53) The updated CPR would be received in 2010 and would form the basis for an application to the Commission for EEC funding for the period 2011 to 2014. (Exhibit B-1, p. 69) It also includes an allowance of $100,000 for cost inflation from the last CPR. (Exhibit B-2, BCUC 1.21.1)

The CPR Program is discussed at Section 4 of the Application, including an illustration of the CPR Process Flow, and a table summarising the potential annual impact identified by the 2006 CPR. The 2006 CPR identifies a gross impact [consumption reduction] by 2015/2016 of 11.615 million GJs, and a Potential Annual Impact of 10.163 million GJs after adding back 1.453 million GJs of additional load attributed to the residential fuel switching program. The gross impact number includes 1.890 million GJs for Industrial Energy Efficiency (EE). Separate programs for Industrial EE are not specifically included as part of the Application. (Exhibit B-2, pp. 44-46)

The detailed 2006 CPR report is included in the Application. (Exhibit B-2, Appendix 1)

Intervenor Positions

BCSEA-SCBC supports Terasen's proposal for approval of expenditures for an update of the CPR to form the basis for Terasen's "next tranche of EEC funding for the period 2011 to 2014." (BCSEA-SCBC Argument, p. 15)

BC Hydro supports Terasen's evidence with respect to the CPR and also the program element in the Application for additional funding for a 2009 update of the CPR. (BC Hydro Argument, p. 5)

Commission Determination

The Commission Panel considers the CPR to be an important tool for use in developing, supporting and assessing this and future EEC/DSM expenditure Applications. The Commission Panel accepts the Application's CPR update expenditure proposal.

The Commission Panel anticipates that Terasen will be able to develop a stronger and more transparent linkage between the CPR, the development of programs arising from the CPR and their proposed costs in any future EEC/DSM Applications.

2.6 The Industrial Sector

Terasen has not included energy efficiency (EE) initiatives for industrial customers in the Application. Terasen discusses its rationale for not planning for EE programs specifically for the industrial sector at Section 6.10 of its Application, Exhibit B-1, p. 78.

The CPR study conducted by Marbek Resource Consultants Ltd. and Willis Energy Services Ltd. (Marbek) concluded that:

> "The study findings confirm the existence of significant potential cost-effective natural gas efficiency improvements in B.C.'s manufacturing sector. In the "most likely" and "upper" achievable scenarios those energy efficiency improvements would provide between about 1,900 and 2,600 thousand GJ/yr. of savings in FY 2015/16. The same energy efficiency improvements would also provide reduced GHG emissions of approximately 80,000 to 112,000 tonnes per year as well as peak day load reductions of approximately 20 to 20.5 thousand GJ.
>
> Two particularly significant opportunities are identified in the study results:
>
> - Energy efficient boilers for the greenhouse and food processing facilities in the Lower Mainland.
> - Energy efficient kilns for sawmills and planer mills in the Interior."
>
> (Exhibit B-1, Appendix 1, p. 75)

<u>Intervenor Positions</u>

MEMPR provided a Letter of Comment stating: ". . .the Ministry has an interest in seeing Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc. ("the Companies") expand their demand-side management activities. The Ministry notes the absence of specific demand-side measures for the industrial sector in the Application. The Companies may be missing significant conservation and efficiency gains." (MEMPR Letter of Comment, Exhibit C1-4, p. 1)

The Ministry also submitted that the Commission should include a number of determinations in its Decision with respect to the processes and timing of development of DSM measures for the manufacturing sector.

BCSEA-SCBC concurs with MEMPR's recommendation. (BCSEA-SCBC Argument, p. 16)

Terasen submits that "a cautious approach is warranted in considering delivering incentives to industrial customers at a high enough dollar level to spur participation adequate to ensure a positive TRC. Both of these options expose customers to risk. The Terasen Utilities will continue to explore opportunities for industrial DSM and will bring forward a proposal if they regard expenditures as being warranted and in the interests of customers." (Terasen Reply, p. 17)

Commission Determination

The Commission Panel considers that the omission of an industrial sector program in Terasen's EEC Application is a significant and unfortunate shortcoming in Terasen's stated efforts to support the BC Energy Plan ("Energy Plan") Policy Actions (Exhibit B-1, Appendix 6) with respect to Energy Efficiency in the industrial sector. The Commission Panel takes particular note of Terasen's specific exclusion of EEC Policy Action 8, which addresses the development of an "Industrial Energy Efficiency Program". (Exhibit B-1, p. 40; Energy Plan, p. 39)

The Commission Panel takes note of the MEMPR Letter of Comment, and directs Terasen to commence the planning process for the development of an industrial EE program and to file a report outlining the process contemplated and scheduling of the development plan with the Commission for review within 90 days of this Decision. The matters addressed in the report should include those raised by MEMPR in Exhibit C4-1.

3.0 ASSESSMENT CRITERIA AND ACCOUNTABILITY

Terasen believes that the benefit-cost ". . . results for the proposed EEC expenditure in this Application are under-stated, because the benefits used in the calculations include free-riders, effectively reducing the net energy savings, and exclude attribution effects, as well as excluding savings from the proposed expenditure on Joint Initiatives, Trade Relations, Conservation Education and Outreach and Innovative Technologies, Measurement and NGV. However, even with this approach, which could be considered conservative, the Total Resource Cost test result for the EEC portfolio as a whole is positive, with a ratio of 2.9., and a net financial benefit of $139.4 million. If free rider effects are excluded, as the Companies are proposing, the EEC portfolio has a TRC ratio of 3.1 and a net financial benefit of $165.1 million." (Exhibit B-1, pp. 87, 88)

3.1 Portfolio Approach

Terasen proposes a "portfolio approach" to the benefit-cost analysis which involves assessing the cost effectiveness of the EEC portfolio as a whole, "on an overall combined basis, rather than on individual initiatives or program areas." (Exhibit B-1, p. 82) Terasen proposes that the portfolio as a whole maintain a TRC ratio of 1.0 or better to allow it to include programs which, on an individual basis, may not have such a ratio in the short term, but have longer term potential to achieve the ratio. This approach would also allow Terasen to offer programs to customers in service areas which would otherwise not have sufficient customer usage to support the necessary TRC ratio. (Exhibit B-1, pp. 11-12)

<u>Intervenor Positions</u>

Mr. Plunkett indicates that judging economic performance at the portfolio level only is "problematic". (Exhibit C5-5, p. 14) He recommends that Terasen establish the cost-effectiveness of each measure and project. (Exhibit C5-5, p. 15)

Terasen states in reply that it is not proposing that economic performance be judged only at the portfolio level and that Mr. Plunkett has mischaracterized its proposal.

Terasen states that “[t]he energy efficiency and fuel switching programs would be planned and evaluated on the TRC, the RIM test, the Utility Cost (“UC”) test and the Participant test, and the overall portfolio TRC test results would have to be greater than 1.0 to proceed.” (Exhibit B-1, p. 83)

However, Terasen also states that it is “not proposing any thresholds with respect to the RIM test, the UC test and the Participant test. In the absence of such thresholds, [it is] not comfortable stating that an activity would proceed or not based on RIM, UC and Participant test results.” Rather, Terasen proposes that “the overall portfolio level TRC must be maintained at 1.0 or greater.” (Exhibit B-4, BCUC 2.19.1)

Commission Determination

The Commission Panel accepts the portfolio level approach based on achieving a portfolio TRC level, discussed below, of 1.0 or greater provided that program areas, initiatives or measures with an individual TRC of less than 1.0 are proactively designed and sufficiently support social or environmental objectives. Consequently, it is important for the components of any portfolio to be capable of analysis on an individual basis. The Commission Panel directs that Terasen include in its annual EEC Report to the Commission the results of the RIM, UC, TRC and Participant tests for each proposed DSM in its portfolio, and provide justification for continuing with any measures or groups of measures which have a TRC of less than 1.0.

Total Resource Cost Test

Terasen proposes that the benefit-cost tests be used to evaluate its programs as outlined in the "California Standard Practice Manual: Economic Analysis of Demand-Side Programs and Projects", which is included in Exhibit B-1 as Appendix 12 ("the California Standard Practice Manual"). (Exhibit B-1, p. 82)

The California Standard Practice Manual describes the Total Resource Cost Test as a cost-effectiveness test which "measures the net cost of a demand-side management program as a resource option based on the total costs of the program, including both the participants' and the utility's costs." (Exhibit B-1, Appendix 12, p. 18)

The "benefits" portion of the TRC test is made up of the avoided supply costs, valued at their marginal cost, for periods when a load reduction results. These costs are "calculated using net program savings, savings net of changes in energy use that would have happened in the absence of the program. For fuel substitution programs, benefits include the avoided device costs and avoided supply costs for the energy, using equipment not chosen by the program participant." (Exhibit B-1, Appendix 12, p. 18)

The "costs" portion of the TRC test is made up of the program costs paid by the utility and the participants plus any increase in supply costs for periods when load is increased. This is a broad category, and includes all equipment costs, installation, operation and maintenance costs, cost of removal (less any salvage value), and administration costs, regardless of who pays, less any tax credits. For fuel substitution programs, costs also include any increase in the supply costs of the utility providing the chosen fuel. (Exhibit B-1, Appendix 12, p. 18)

The benefit-cost ratio is the ratio of discounted total program benefits to discounted total program costs over a specified period of time. A benefit-cost ratio greater than one indicates the program is beneficial, on the basis of the TRC test. (Exhibit B-1, Appendix 12, p. 19)

Intervenor Positions

BCOAPO prefers the "Societal test" over other cost-benefit tests which it argues "do not capture the non-economic benefits of DSM programs". (BCOAPO Argument, p. 4)

According to the California Standard Practice Manual, the "Societal test" is a variant of the TRC test. It differs in that it looks at society as a whole as opposed to the utility's service territory and includes the effects of externalities, such as environmental implications. It also excludes tax credit benefits and uses a "societal" discount rate.

Mr. Plunkett notes in his evidence that: "[i]ncluding external social and environmental benefits in calculating DSM cost-effectiveness would be to apply the societal test, not the total resource cost (TRC) test. Other jurisdictions such as Vermont and New York apply the societal test as the threshold determinant of DSM cost-effectiveness. Explicitly valuing social and environmental externalities in DSM cost-effectiveness will lead to more efficient resource allocation – and greater societal net benefits – than the economically inferior policy of pursuing a portfolio benefit/cost ratio under the TRC test of 1.0." (Exhibit C5-7, BCUC 1.5.2)

Commission Determination

The Commission Panel acknowledges the Societal test as one which addresses a broader spectrum of factors not included in the TRC test. While recognising that societal factors have significance, the Commission Panel views many of these factors as being rather subjective and difficult to measure. The Commission Panel also takes note of the DSM Regulation which will apply to Terasen as of June 01, 2009 requiring the Commission to use, in addition to any other test it considers appropriate, the TRC test in determining whether a demand-side measure is cost-effective. While the DSM Regulation is not in effect for the purposes of this Decision, the Commission Panel does consider the TRC test to be appropriate and adequate for the purposes of this Application and accepts it as such.

3.2 Free Riders

Terasen seeks certain changes to the cost-benefit analysis undertaken in respect of EEC expenditures, including a proposal to ". . . eliminate the requirement to include free riders in cost-benefit tests, as the energy and emissions reduction goals of the government are absolute goals and do not consider free ridership effects." (Exhibit B-1, p. 16)

The Application defines free riders as ". . . customers who participate in a program, but would have undertaken the same conservation actions even if the program were not offered". Terasen's proposal with respect to free riders includes two tables illustrating an estimated TRC benefit for the EEC Portfolio of $165.149 million, excluding the effects of free riders, and of $139.448 million, including the effects of free riders, a difference of $27.701 million. Terasen's discussion concludes with the view that ". . . the inclusion of the effects of free riders in the cost-benefit test for EEC programs distorts the value of EEC programs and is counter to the objectives of the energy plan." (Exhibit B-1, pp. 85-86)

Terasen responded in some detail to Information Requests concerning Free Riders, including the statements that "[f]ree riders are one of the most-debated aspects of DSM cost-benefit tests as they are challenging to establish" and "[e]stimating free rider rates . . . is more of an art than a science." (Exhibit B-2, BCUC 1.3.1)

It is Terasen's view that "it should be the outcome [energy consumption reduction] that matters, not the way in which it was achieved." (Exhibit B-1, p. 86) Terasen states: ". . . . [Government] GHG reduction goals make no mention of net-to-gross ratios – in fact they could be considered "gross" GHG reduction goals, and presumably it is gross energy savings that will be counted towards achieving those goals. It makes sense to align gross estimations of energy savings from utility DSM programs with government's gross GHG reduction goals." (Exhibit B-2, BCUC 1.3.1)

Terasen notes that "[w]hile it is possible that estimated free rider rates may be higher than forecast, it is also possible that free rider rates may be lower than forecast." (Exhibit B-2, BCUC 1.46.1)

Intervenor Positions

With respect to the free rider issue, BCSEA-SCBC's expert Mr. Plunkett states:

> "[Terasen's] proposal would depart from well-established Commission practice of accounting for savings from program free riders. This not only distorts economic assessment but is also inconsistent with resource planning, since it will overstate how much Terasen should expect to reduce energy supply requirements. It will also distort program design, especially in appliance and equipment replacement markets where the high-efficiency market penetration can change rapidly. Ignoring free ridership would tend to prevent adjustments in minimum qualifying efficiency levels due to a higher-efficiency market baseline." (Exhibit C5-5, pp.15, 16)

Mr. Plunkett's concluding recommendation included directing Terasen to modify its plan to "[d]evelop market net-to-gross ratios for programs based on estimates of free-ridership and spillover effects incorporated into program planning and design." (Exhibit C5-5, p. 23)

BCSEA-SCBC does, however, agree with Terasen that "the inclusion or exclusion of free riders from the analysis makes no practical difference in evaluating the acceptability of this specific EEC plan on an overall basis" although it notes that "failing to incorporate the free-rider factor can distort program design." (BCSEA-SCBC Argument, p. 19)

BCOAPO expresses the view that ". . . free ridership has the effect of over-crediting EEC programs. BCOAPO agrees that measuring free ridership is difficult, but this difficulty does not mean that it is appropriate to set it to zero." BCOAPO concurs with Mr. Plunkett's views with respect to the free rider issue. (BCOAPO Argument, p. 13)

Commission Determination

The Commission Panel notes the position of Terasen, and the acknowledgements of BCOAPO and BCSEA-SCBC that, in the case of the Application, the free rider issue has no immediate practical impact, as the portfolio level TCR results calculated either with or without inclusion of the free rider effect is well above the 'break-even' threshold of 1.0. However, the Commission Panel does consider that this issue is likely to become a factor as the DSM initiatives of Terasen become more fully developed and refined, and therefore should be addressed in this Decision.

The Commission Panel does not agree with Terasen's position that ". . . the inclusion of the effects of free riders in the cost-benefit test for EEC programs distorts the value of EEC programs and is counter to the objectives of the energy plan." (Exhibit B-1, pp. 85-86) The Commission Panel considers that it would be an unacceptable distortion to measure the effectiveness DSM programs by giving credit to the programs for consumption reductions which, based Terasen's own definition (quoted above), would have taken place absent the incentive program.

The Commission Panel rejects Terasen's proposal to exclude the free rider factor from program effectiveness (TRC) calculations.

3.3 Attribution to Regulatory Changes

Terasen submits that once a proposed regulation and implementation date for minimum efficiency standards for an appliance, building or energy system is announced by a regulating body, it be permitted to attribute savings to market transformation programs for that particular appliance, building or energy system in its cost benefit tests at that time. The proposal involves attributing the savings to the program over a five year span, with adjustment for the level of Terasen's support for the market transformation and the level of financial contribution by others.

Terasen submits that it is reasonable to include attribution savings in a cost-benefit test, particularly in light of the newly issued DSM Regulation. The Regulation permits the Commission to include in the benefit of measures proposed a proportion of the savings resulting from the increased market share of a regulated item because of the commencement and application of a specified standard with respect to the regulated item. (Terasen Argument, p. 39; Exhibit B-1, p. 12; Exhibit B-1, p. 16)

The attribution rates proposed by the Company, for which it is seeks approval with this Application, for any such future regulation are outlined below.

Table 6
Attribution Rates

Regulation Year	Percentage of Savings Attributed to Program
1	50
2	40
3	30
4	20
5	10

Source: Exhibit B-1, p. 87

Intervenor Positions

BCSEA-SCBC's concern with respect to the attribution concept is based on Mr. Plunkett's evidence that it can distort program design. As with the free-rider factor, BCSEA-SCBC favours the use of net-to-gross ratios. (BCSEA-SCBC Argument, p. 20)

BC Hydro submits that "Terasen Utilities' position on attribution of savings from codes and standards to utility DSM programs is arbitrary and will result in an unrepresentative view of the benefits (higher or lower) associated with some programs." BC Hydro further submits that "[a]ttribution of savings from codes and standards should be evaluated on a case-by-case basis" and that "the attribution rate should reflect the level of support for market transformation", arguing that Terasen's "position on attribution goes against this approach." (BC Hydro Argument, p. 17)

BCOAPO states ". . . the DSM regulation 4(7) allows for the Commission to include a proportion of the benefit that, in the Commission's opinion (not the Applicant's) will increase market share only between the time that a specified standard has been announced, and the time that it commences. Any attribution beyond that will, predictably, distort program design." (BCOAPO Argument, p. 13) (emphasis in original)

In its Reply, Terasen notes that "BCOAPO and BCSEA-SCBC have made submissions on attribution of benefits. This issue is not relevant to the assessment of the proposed portfolio, as the assessment does not include any attribution of benefits. With respect to the assessment of future portfolios, the Terasen Utilities repeat and rely on the submissions made in paragraphs 109 to 111 of the Initial Submissions" (which argue for the inclusion of attribution savings.)
(Terasen Reply, p. 20)

Commission Determination

The Commission Panel notes Terasen's comment that the attribution issue is not relevant to this Application as the assessment does not include any attribution of benefits. However, as in the case of free riders, the Commission Panel does consider that this issue is likely to become a factor as the DSM initiatives of Terasen become more fully developed and refined, and therefore should be addressed in this Decision.

The Commission Panel accepts the position of BC Hydro that attribution of savings from codes and standards should be evaluated on a case-by-case basis and that the attribution rate should reflect the level of support for market transformation. The Commission Panel shares the BCSEA-SCBC's concern, as detailed in Mr. Plunkett's evidence, that the attribution concept can distort program design.

The Commission Panel rejects the Attribution to Regulatory Change proposal made in the Application and refers this issue back to Terasen to redesign and resubmit with its next annual EEC report to the Commission, giving consideration to a modified version of the Application's attribution proposal reflecting the provisions of the DSM Regulation which come into effect for Terasen on June 1, 2009. The Commission Panel directs Terasen to address, in the modified version, the matters raised by BC Hydro and BCSEA-SCBC, and also to give consideration to factors such as the length of time a particular program element has been operative at the time any applicable regulation is introduced and how compatible the program initiative is with the new regulation (e.g. if a regulation is introduced with a higher or lower threshold or standard than the program design).

3.4 Carbon Pricing

As part of the Application, Terasen seeks an order approving certain changes to the benefit-cost analysis undertaken in respect of EEC expenditures, including recognizing the impact of carbon pricing as one of the inputs to the benefit-cost tests. (Exhibit B-1, pp. 15-16)

Terasen proposes that additional customer bill savings from the implementation of the tax should be included in the benefit-cost analysis for EEC programs. Terasen proposes that the activities supported by the EEC Application will contribute to consumer education and provide consumers with tools to help them reduce the impact of the proposed carbon tax on their energy expenditures. (Exhibit B-1, p. 41)

Terasen summarises its position with respect to the carbon tax matter in Argument as follows: "The customers will also enjoy a benefit associated with reduced Carbon Tax costs. Customers that install an efficient appliance or design a more efficient building as a result of Terasen's EEC initiatives will use less gas, and will therefore pay less Carbon Tax. Therefore, the avoided Carbon

Tax was included in the participant benefits, as noted in Appendices 11A and 11B of the Application" [Terasen Argument, p. 21)

Commission Determination

The Commission Panel accepts Terasen's proposal for the carbon tax reduction as an appropriate factor to be included in computing the EEC cost-benefit analysis.

3.5 Accountability Mechanisms

Terasen summarises its proposal for accountability mechanisms as follows:

> "In this Application the Companies have recognized the need for accountability for the funds approved for EEC programs. First, any funds not spent will not be charged to the regulatory asset deferral account. Second, the Companies intend to monitor the portfolio TRC on a monthly basis, and have proposed to file an Annual EEC Report with the Commission by the end of the first quarter every year. The Report will detail program activity, expenditures, and cost-benefit results for the previous year, as well as describe program activity and provide forecasts for the upcoming year. Third, in the event that the relief sought is granted, the Companies would form and engage an EEC stakeholder group with membership representing a broad cross section of stakeholders identified in the Application. Fourth, the Companies have indicated their intention to hold annual EEC workshops with stakeholders, at which the Companies would present updates on program progress and obtain stakeholder input on new programs and refinements to existing programs. Fifth, the Companies are proposing to develop many of the programs for the commercial sector and the DSM for Affordable Housing sector in conjunction with stakeholder advisory groups." (Terasen Argument, p. 39)

<u>Intervenor Positions</u>

BCSEA-BCSC states that they: ". . . support this [funding] approach, noting that the proposed accountability mechanisms are designed to be more effective and efficient than having on-going Commission involvement in decision-making within the portfolio during the Funding Period" and "BCSEA-SCBC acknowledge and support the additional accountability mechanisms proposed by Terasen in [Terasen Argument] paragraph 112." (BCSEA-SCBC Argument, pp. 5, 20)

BCOAPO argues that, should the Application be approved, an independent audit process should be required with respect particularly to free ridership, attribution and redirection of funds. (BCOAPO Argument, p. 14)

Commission Determination

The Commission Panel accepts Terasen's accountability undertakings, and considers that, while the proposal to evaluate the EEC project using the TRC test at the Portfolio level has been accepted, TRC calculations for each program area, initiative and measure should also be included in the accountability reporting as a means of assessing the components of the Project and their ongoing effectiveness.

Commission Panel directs that the annual EEC Report include the following:

- TRC, RIM, UC, and Participant test calculations of DSM at the Program Area initiative and individual measure levels in addition to the total Portfolio level reporting. Reporting of the Residential & Commercial EE program areas should also be made at the New Construction and Retrofit levels.
- any inter and intra Program Area initiative funding transfers, with supporting rationale, and the impact of such transfers on the transferor and transferee Program areas, initiatives, and measures as the case may be.
- data for fuel switching programs should be tracked in a manner which allows for reporting types of fuels replaced by natural gas, including estimated GHG impacts.

The Commission Panel also directs Terasen to include in its annual EEC Report to the Commission a discussion of its internal data gathering, monitoring and reporting control processes. The discussion should include a description of how these processes ensure that funds expended and the statistical results of the programs implemented are completely and accurately recorded and monitored, including any related internal check and audit processes. The report should also discuss how Terasen has measured or estimated the results of the EEC expenditure initiatives.

4.0 CAPITALISATION OF INCREMENTAL EEC EXPENDITURES

Terasen's proposed EEC expenditures are summarised and discussed in Section 2.0. Terasen proposes to capitalise the approved incremental expenditures as a regulatory deferral account in the year in which the expenditures are incurred, with amortisation over 20 years commencing the year after the expenditures are made. The proposed amortisation period is addressed in Section 5.0 of this Decision.

Terasen's total EEC expenditures for 2008 to 2010 include operating and maintenance (O&M) expenditures for its previously approved DSM programs for 2008 and 2009. Terasen proposes to charge those O&M costs to operations in those years, with the balance of the total EEC expenditures being added to a new EEC deferral account. This method accounts for the impact of the legacy DSM Operating & Maintenance expenditures having been considered in the PBR and RR Extended Settlements for TGI and TGVI respectively. The reconciliation of the Total EEC expenditures and the amounts expensed and deferred is illustrated in the following table.

Table 7

Deferral Reconciliation	TGI			TGVI		
	2008	2009	2010	2008	2009	2010
Total EEC Expenditures	13,996	15,752	17,196	2,830	3,043	3,793
Expensed per Extended Settlements	1,624	1,624	-	500	500	-
Proposed Deferral Addition	12,372	14,128	17,196	2,330	2,543	3,793

Source: Exhibit B-1, pp. 49, 95, 97

Terasen points out that its proposed accounting treatment to capitalize the EEC expenditures is permitted under current Canadian Institute of Chartered Accountants (CICA) accounting standards. Terasen also notes that, effective 2011, all publicly accountable entities, including it will be required to comply with International Financial Reporting Standards (IFRS). Terasen is of the view that: "... the proposed financial treatment of EEC funding also meets the requirements of IFRS" and goes on to state that "[i]f, however, after further discussion and closer examination in conjunction with auditors and other utilities, the EEC funding failed to pass these [IFRS] tests, then [Terasen] will revisit the program to ensure that it continues in a fashion which maintains an alignment on interests between customers, investors and government policy." (Exhibit B-1, pp. 81-82)

Intervenor Positions

BCSEA-SCBC comments on Terasen's "... proposal to capitalize incremental EEC expenditures amortised over 20 years. BCSEA-SCBC supports this concept, including the 20 year amortisation period due to the life-expectancy of gas DSM measures." (BCSEA-SCBC Argument, p. 17)

Commission Determination

The Commission Panel accepts Terasen's proposal to capitalize the approved EEC expenditure to a regulatory deferral account, and to amortitse the deferral account balances over an appropriate time period. The related issues of the quantum of the expenditures approved and the appropriate amortisation period(s) for the program areas are addressed in other sections of this Decision.

5.0 AMORTISATION OF EEC EXPENDITURES

Terasen proposes to amortise its EEC expenditures, including both program, and incentive and rebate costs, over a 20 year period, based on a calculation of the 22.5 years as the weighted average measurable life of the proposed appliance and energy system installations. Terasen's weighted average calculation is based on achieving estimated volumes, mix and lives of installations for the various measures being proposed. (Exhibit B-1, p. 80, and Appendix 40.2) FortisBC and BC Hydro each use 10 year amortisation periods. (Exhibit B-2, p. 95) Terasen states: "…research failed to uncover any examples where utilities are using or proposing amortisation periods as long as 20 years" for DSM programs. (Exhibit B-2, p. 97)

Commission Determination

The Commission Panel rejects the 20 year amortisation period proposed by Terasen. The Commission panel considers the underlying forecast assumptions on which the Terasen methodology is based to be inherently uncertain, and deserving little weight. The Commission Panel does consider that a ten year amortisation period provides a reasonable balance, considering both the DSM objectives and customer impact. Terasen is directed to base its amortisation of approved EEC expenditures over periods not to exceed 10 years.

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc.
Energy Efficiency and Conservation Programs Application

BEFORE: A.W.K. Anderson, Commissioner April 16, 2009
A.A. Rhodes, Commissioner

O R D E R

WHEREAS:

A. On May 28, 2008 Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc. (collectively "Terasen") filed an application for approval of various concepts and expenditures in support of an expanded energy efficiency and conservation ("EEC") strategy, and to capitalize incremental EEC expenditures by charging the expenditures to a regulatory asset deferral account and amortising the balance over 20 years (the "Application"); and

B. On June 3, 2008 the British Columbia Utilities Commission ("Commission") issued a letter requesting that interested parties register and file comments on Terasen's proposed timetable before June 11, 2008; and

C. By Order G-102-08 dated June 19, 2008, the Commission issued a Preliminary Regulatory Timetable which included two rounds of Commission Information Requests and one round of Intervenor Information Requests, and requested comments from all parties on further process for reviewing the Application; and

D. In response to Order G-102-08, the Commission received replies from Terasen and the following Intervenors: B.C. Ministry of Energy Mines and Petroleum Resources ("MEMPR"), British Columbia Hydro and Power Authority ("BC Hydro"), B.C. Sustainable Energy Association and the Sierra Club of British Columbia ("BCSEA-SCBC"), the Commercial Energy Consumers Association of British Columbia ("CEC"), B.C. Old Age Pensioners' Organization et al. ("BCOAPO"); and

E. Following its review of comments from Terasen and Intervenors, the Commission issued Letter L-39-08 dated September 8, 2008 ordering a second round of Intervenor Information Requests; and

F. By Order G-130-08 dated September 18, 2008 the Commission established a Written Hearing Process and Regulatory Timetable for its review of the Application; and

G. The Written Hearing Process concluded on December 5, 2008 with the filing of Terasen's reply submission; and

H. The Commission has reviewed and considered the evidence and submissions of Terasen and Registered Intervenors.

NOW THEREFORE pursuant to section 44.2 of the Utilities Commission Act, and subject to the specific determinations, qualifications and directions set out in the Decision issued concurrently with this Order, the Commission orders as follows:

1. The following proposed expenditures are accepted:

   (a) $31.077 million for the combined Residential Energy Efficiency and Commercial Energy Efficiency programs;

   (b) Expenditures for programs or initiatives directed at fuel switching away from fossil fuels with a higher carbon content than that of natural gas to natural gas;

   (c) $6.918 million for the Conservation Education and Outreach program;

   (d) $3 million for Joint Initiatives; and

   (e) $0.5 million for Conservation Potential Review.

2. Expenditures in the sum of $3 million for Innovative Technologies, Natural Gas Vehicles and Measurement and $1.5 million for Trade Relations are rejected.

3. The proposed portfolio approach is accepted.

4. The Total Resource Cost test is accepted as the appropriate test for cost effectiveness.

5. The proposal to exclude the free rider factor from benefit-cost analyses is rejected.

6. The proposal for Attribution of Regulatory Changes is rejected.

7. The proposal to include carbon tax reductions in computing benefit-cost analyses is accepted.

8. Terasen is to commence the planning process for development of an Industrial EEC program and file a report with the Commission within 90 days of the date of the Decision.

9. The proposal for accountability mechanisms is accepted and Terasen is to file an annual report on its EEC activities as described in the Commission's Decision.

10. Subject to paragraph 11 below, the proposal to capitalise the approved EEC expenditure to a regulatory deferral account and to amortise the deferral account balances is accepted.

11. The proposal to amortise EEC expenditures over a 20 year period is rejected. Terasen is directed to base its amortisation of approved EEC expenditures over periods not to exceed 10 years.

DATED at the City of Vancouver, in the Province of British Columbia, this 16th day of April 2009.

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

An Application by Terasen Gas (Vancouver Island) Inc.
for Approval of 2010 and 2011 Revenue Requirements, Rates, Cost of Service, Rate Design and
Revenue Deficiency Deferral Account Balance as at December 31, 2008

BEFORE:

A.W.K. Anderson, Panel Chair/Commissioner
D.A. Cote, Commissioner
M.R. Harle, Commissioner

November 26, 2009

O R D E R

WHEREAS:

A. On June 29, 2009, Terasen Gas (Vancouver Island) Inc. ("TGVI") filed an application for approval of interim and permanent delivery rates effective January 1, 2010 (the "Application") pursuant to sections 59 to 61 and 89 of the *Utilities Commission Act* (the "Act") and section 2.1 of the Special Direction to the British Columbia Utilities Commission ("Commission") issued pursuant to Order in Council 1510 ("Special Direction"), requesting (a) no change in 2009 sales service rates and (b) a reduction in rates for firm transportation service, other than for those customers who have specified rates in their transportation service agreements, in the amount of 4.75 percent; and

B. TGVI proposed that the rates established for 2010 should also remain in place for 2011; and

C. TGVI also applied pursuant to sections 59 to 61 of the Act and section 2.10(a)(i) of the Special Direction for interim and permanent approval of TGVI's forecast cost of service for 2010 and 2011, subject to the need to recover any Accumulated Revenue Deficiency in the Revenue Deficiency Deferral Account after December 31, 2009 and any changes in TGVI's return on equity; and

D. TGVI also applied pursuant to section 2.10(f) of the Special Direction for approval of the December 31, 2008 year-end balance in the Revenue Deficiency Deferral Account in the amount of $7,149,210, and for approval of other items identified in the Special Direction; and

E. TGVI sought other approvals in the Application, including orders pursuant to sections 59 to 61 of the Act, approving Tariff changes effective January 1, 2010 for Compression and Refueling and Transportation Services for Natural Gas Vehicles, and economic models for evaluating biogas projects and alternative energy extensions for geo-exchange, solar thermal and district energy systems to complement its core natural gas business; and

F. TGVI proposed a written hearing process to address the Application but was open to a negotiated settlement process ("NSP"); and

G. On July 2, 2009, the Commission Panel issued Order G-84-09, which provided for a Workshop on July 13, 2009 and a first Procedural Conference on July 15, 2009 to hear submissions on the appropriate regulatory process and TGVI's proposed preliminary regulatory timetable attached to that order; and

H. In accordance with Order G-84-09, TGVI held a Workshop to review the Application on Monday, July 13, 2009; and

I. Procedural Conference No. 1 was held on Wednesday, July 15, 2009 at which the Commission Panel heard submissions regarding the Application process and inclusion of Alternative Energy Solution proposals within the process; and

J. The Commission Panel considered the Submissions received at Procedural Conference No. 1, and concluded that a Regulatory Timetable establishing a second Procedural Conference following TGVI's responses to the second round of Information Requests was required. It was also determined that proposed Alternative Energy Solutions included in TGVI's Applications would be reviewed as part of the Revenue Requirements proceedings, that information requests consistent with TGI would be cross referenced to those requests, and that interim rates and the Revenue Surplus Deferral Account were not approved at that time and would be reviewed at the second procedural conference; and

K. Procedural Conference No. 2 was held on Friday, September 25, 2009 at which the Commission Panel heard further submissions regarding the process of the Application, location of the proceedings and other matters that would assist the Commission's efficient review of the Application. Primary issues raised were whether a separate Certificate of Public Convenience and Necessity ("CPCN") review was required for the Alternative Energy Solutions proposed in the Application and whether the regulatory process should be in the form of an oral or written hearing or NSP; and

L. Intervenors did not request a separate CPCN process for the Alternative Energy Solutions and all Intervenors supported an NSP for the review of the Application. The Interveners submitted that in the event the NSP does not successfully resolve all issues, an Oral Public Hearing should be subsequently ordered by the Commission Panel. TGVI requested that if an Oral Public Hearing is established that it be limited in scope; and

M. TGVI proposed a delay in its application for interim rate approval until the end of November. If a Commission decision has been issued on the Terasen Gas allowed return on equity and capital structure and this Application (the "Applications") by the end of November, then it will apply for approval of permanent rates effective January 1, 2010. If a Commission decision has not been issued on the Applications by the end of November, then TGVI will apply for interim rates effective January 1, 2010; and

N. By Order G-120-09 the Commission Panel established a negotiated settlement process for the review of the Application commencing on October 29, 2009; and

O. On November 13, 2009, the Negotiated Settlement Agreement ("NSA"), together with the Letters of Support received from the participants in the NSP ("Settlement Package"), was made public and circulated to the Commission Panel; and

P. The Settlement Package was also distributed to Registered Intervenors who did not participate in the NSP ("Other Intervenors"). The Other Intervenors were requested to provide their comments on the Settlement Package to the Commission by November 20, 2009. The Commission Panel received no comments from Other Intervenors regarding the Settlement Package; and

Q. The Commission Panel, having reviewed the proposed NSA and the comments related thereto and noting the support of all parties to the Proposed Settlement, in which only sections 7.1 (a) and (b) are severable, subject to the provisions of section 7.2, considers that approval is warranted.

NOW THEREFORE pursuant to sections 59 to 61 and 89 of the Act and the Special Direction issued pursuant to Order in Council 1510 the Commission orders as follows:

1. The Negotiated Settlement Agreement attached as Appendix A to this Order is approved.

2. TGVI is to file an amended Summary of Rates and Bill Comparison schedules based on the Negotiated Settlement Agreement.

3. The Commission will accept, subject to timely filing by TGVI, amended permanent Gas Tariff Rate Schedules in accordance with the terms of this Order. TGVI is to provide notice of the permanent rates to customers via a bill message, to be reviewed in advance by Commission Staff to confirm compliance with this Order.

DATED at the City of Vancouver, In the Province of British Columbia, this 26th day of November 2009.

BY ORDER

Registered Intervenors
(*TGVI-2010-11RR-RI*)

Dear Registered Intervenors:

Re: Terasen Gas (Vancouver Island) Inc.
2010-2011 Revenue Requirements and Rate Design Application
Negotiated Settlement

Enclosed with this letter is the proposed settlement package for Terasen Gas (Vancouver Island) Inc.'s 2010-2011 Revenue Requirements and Rate Design Application.

This settlement package is now public and is being submitted to the Commission and all Intervenors. Also enclosed are Letters of Comment received to date from the participants in the negotiated settlement process.

Prior to consideration by the Commission, Intervenors who did not participate in the settlement negotiations are requested to provide to the Commission with their comments on the settlement package by Friday, November 20, 2009. Thereafter, the Commission will consider the settlement package. A public hearing may not be required unless there is significant opposition to the proposed settlement.

Yours truly,

N. Lapierre

Attention: Mr. Philip Nakoneshny, Director, Rates and Finance

Dear Mr. Nakoneshny:

Re: Terasen Gas (Vancouver Island) Inc. ("TGVI")
2010 and 2011 Revenue Requirements and Rate Design Application
Negotiated Settlement Agreement

On June 29, 2009, TGVI filed its 2010 and 2011 Revenue Requirements Application, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account Balance as at December 31, 2008 which was amended by filings on July 23 and September 22, 2009 (the "Application").

In accordance with Commission Order No. G-84-09 issued on July 2, 2009, a Workshop was held on July 13, 2009 for a review of the Application, a Procedural Conference was held on July 15, 2009, and TGVI responded to two rounds of Information Requests. In accordance with Commission Order No. G-90-09 issued on July 20, 2009, a second Procedural Conference was held on September 25, 2009 and on October 2, 2009, the Commission issued Order G-120-09 establishing a Negotiated Settlement Process ("NSP") for the Application. In accordance with Order No. G-120-09, the NSP commenced on Tuesday, November 3, 2009 and concluded on Thursday, November 5, 2009.

TGVI has reviewed the attached settlement documents, including the Negotiated Settlement Agreement and associated financial schedules (collectively the "Negotiated Settlement") arising from the NSP. TGVI recognizes the Negotiated Settlement as being the product of good faith compromises among parties with diverse interests of the issues raised by the Application. In fulfilling their role pursuant to the Commissions NSP Guidelines, Commission Staff made additional information available to the parties which they believed was in the public interest. The parties considered all such information in reaching the compromise Settlement Agreement and Terasen Gas considers the resulting Negotiated Settlement to be fair, just and reasonable. As the Negotiated Settlement represents compromises among the parties and an overall balance of interests, TGVI stresses that the Negotiated Settlement should be considered as a package, with no part being severed unless otherwise stated in the Agreement. On that basis, TGVI accepts the Negotiated Settlement.

TGVI would like to express sincere thanks to Commission Staff and Intervenor representatives for their active participation in achieving this Negotiated Settlement Agreement on the Application. TGVI also wishes to thank the NSP facilitator, Mr. Paul Cassidy, for his leadership, guidance and assistance to all parties throughout the NSP process.

If there are any questions regarding the attached, please contact the undersigned.

Yours very truly,

TERASEN GAS (VANCOUVER ISLAND) INC.

Tom A. Loski

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

An Application by Terasen Gas (Vancouver Island) Inc.
for Approval of 2010 and 2011 Revenue Requirements, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account Balance as at December 31, 2008
Negotiated Settlement Process

WHEREAS:

A. On June 29, 2009, Terasen Gas (Vancouver Island) Inc. ("TGVI") filed its 2010 and 2011 Revenue Requirements Application, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account Balance as at December 31, 2008 which was amended by filings on July 23 and September 22, 2009 (the "Application"); and

B. Amongst other things, the Application sought:

1. An order pursuant to sections 59 to 61 of the *Utilities Commission Act* (the "Act"), section 2.1 of the Vancouver Island Natural Gas Pipeline Special Direction ("Special Direction"), approving permanent rates for Core Market customers, effective January 1, 2010. As set out in Part III, Section B, Tab 3 of the Application, compared to 2009 rates, the service rates for which TGVI seeks approval are the same as 2009 sales service rates; and

2. An order pursuant to sections 59 to 61 of the Act and section 2.1 of the Special Direction, approving permanent rates for transportation customers, other than those transportation customers who have specified rates in their transportation service agreements. As set out in Part III, Section B, Tab 3 of the Application, the rates for which TGVI seeks approval are:

   a. A reduction in rates for firm transportation service in the amount of 5.18% (as compared to 2009), effective January 1, 2010; and

   b. A reduction in rates for summer interruptible transportation service in the amount of 5.18% (as compared to 2009), effective January 1, 2010; and

   c. Winter interruptible rates of $1.384/GJ effective January 1, 2010 and of $1.401/GJ effective January 1, 2011; and

3. These rates are subject to (a) the need to recover any Accumulated Revenue Deficiency in the RDDA after December 31, 2009 as explained in Part III, Section B, Tab 2 and (b) changes in TGVI's allowed return on equity as described in Part III, Section C, Tab 10; and

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

4. An order pursuant to section 2.10(a)(i) of the Special Direction approving TGVI's forecast Cost of Service for 2010 and 2011, as set out in Part III, Section C, Tab 2 of the Application, but subject to (a) the need to recover any Accumulated Revenue Deficiency in the RDDA after December 31, 2009 as explained in Part III, Section B, Tab 2 and (b) changes in TGVI's allowed return on equity as described in Part III, Section C, Tab 10; and

5. An order pursuant to sections 59 to 61 of the Act approving the schedule of demand and commodity charges as set out in Schedule A of Tariff Supplement No. 4 (Storage and Delivery Agreement between TGI and TGVI), as set out in Part III, Section B, Tab 3 of the Application.

6. An order pursuant to sections 59 to 61 of the Act approving the creation of the Rate Stabilization Deferral Account ("RSDA"), effective January 1, 2010, for the purposes of capturing any annual revenue surplus in 2010 and 2011, with any balance at the end of 2011 to be returned to Core Market customers beginning January 1, 2012 in the manner described in Part III, Section D, Tab 1.

7. An order pursuant to sections 59 to 61 of the Act approving the creation of the 2009 Revenue Surplus Account for the purposes of capturing any 2009 revenue surplus in excess of the amount needed to eliminate the debit balance in the RDDA, and its proposed allocation to customers and amortization as set out in Part III, Section D, Tab 1 of the Application.

8. An order pursuant to section 2.10(a)(i) of the Special Direction approving its forecast capital expenditures for 2010 and 2011, as set out in Part III, Section C, Tab 9 of the Application.

9. An order pursuant to section 2.10(a)(ii) of the Special Direction approving its forecast Revenue for 2010 and 2011, based on its proposed rates, as set out in Part III, Section D, Tab 1 of the Application.

10. An order approving the forecast gross O&M expenditures for the forecast period 2010 and 2011, as determined through and supported by Part III, Section C, Tab 6 of the Application of $32,104,700 and $33,650,000 respectively, and to fix those amounts for the purposes of determination of RDDA and/or RSDA balances at the end of each year.

11. An order pursuant to section 2.10 (f) of the Special Direction approving the December 31, 2008 year end balance in the RDDA of $7,149,210, as set out in Part III, Section B, Tab 2 of the Application.

12. An order pursuant to section 44.2 of the Act approving an expenditure schedule for the continuation in 2011 of TGVI's residential and commercial Energy Efficiency and Conservation ("EEC") funding, as well as new EEC funding for 2010 and 2011 for innovative technologies; and

13. New tariff offerings and economic tests for Compression and Refuelling and Transportation Services for Natural Gas Vehicles ("NGV"), geo-exchange, solar thermal and district energy systems and a pilot program for Biogas; and

C. A complete listing of the relief sought by TGVI in the Application was included in Section E (pages 436-443)[1] of the Application; and

D. In accordance with Commission Order No. G-84-09 issued on July 2, 2009, a Workshop was held on July 13, 2009 for a review of the Application, a procedural conference was held on July 15, 2009, and TGVI responded to two rounds of Information Requests; and

E. In accordance with Commission Order No. G-90-09 issued on July 20, 2009, a second procedural conference was held on September 25, 2009; and

F. On October 2, 2009, the Commission issued Order G-120-09 establishing a Negotiated Settlement Process (“NSP”) for the Application; and

G. The Parties to the NSP were TGVI, British Columbia Old Age Pensioners et al. (“BCOAPO”), Commercial Energy Consumers Association of British Columbia (“CEC”) and British Columbia Hydro and Power Authority (“BC Hydro”) (collectively referred to in this Agreement as the “Parties”); and

H. At the outset of the NSP on November 3, 2009, Commission Staff provided the Parties with a document prepared by the Commission Panel titled “Issues of Particular Concern to the Commission Panel”, a copy of which is appended as Appendix 1 to this Agreement; and

I. The NSP was held on November 3-5, 2009; and

J. The Parties have negotiated in good faith to achieve a compromise settlement, reflected in this Agreement, of the issues raised by the Application, and further consider the Agreement reached to be fair, just and reasonable; and

K. This Agreement consists of four sections:

Part I includes general provisions;

Part II includes the items agreed to that differ from what was requested in the Application;

Part III includes the items agreed to that remain as proposed by TGVI in the Application; and

Part IV includes revised financial schedules reflecting all items set out in the Agreement.

---

[1] Pages 436 and 437 of the Application were amended on July 23, 2009 and pages 438 to 443 were amended on September 22, 2009.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

NOW THEREFORE THE PARTIES AGREE AS FOLLOWS

PART I – GENERAL

1. Agreement a Product of Compromise

The Parties recognize and emphasize that this Agreement is the product of compromise on the part of all Parties, yielding an overall package that the Parties consider to be fair, just and reasonable. The Parties agree that any compromises resulting from this Agreement are without prejudice to the Parties' ability to take different positions after 2011 and without prejudice to the Parties right to intervene in any applications contemplated in or resulting from this Agreement.

2. Whole Agreement

The Parties agree that, unless otherwise stated in this Agreement, portions of this Agreement cannot be removed or changed by the Commission without nullifying the whole Agreement.

3. TGVI to Manage Business

The Parties agree that TGVI will have the discretion to manage its business and determine how best to allocate the overall O&M and Capital expenditures stipulated in this Agreement.

4. Final IFRS Rate-regulated Activity Standard

The Parties acknowledge that this Agreement is predicated on the Final IFRS Rate-regulated Activity Standard permitting the financial accounting treatment contemplated in this Agreement in the manner outlined in the current Exposure Draft on Rate-regulated Activities. The Parties agree that if, in TGVI's opinion, the Final IFRS Rate-regulated Activity Standard differs from the current Exposure Draft on Rate-regulated Activities so as not to permit the financial accounting treatment contemplated in this Negotiated Settlement Agreement, which among other things anticipates the recognition of regulatory assets and liabilities for external reporting purposes, then TGVI is at liberty to apply to the Commission during the period of this Agreement for a determination of that issue, and to seek changes in the regulatory treatment contemplated in this Agreement to accord with the Final IFRS Rate-regulated Activity Standard, with the resulting impacts flowed through into rates commencing in 2011.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

PART II – AGREED CHANGES FROM THE APPLICATION

5. Use Per Customer Rates

The Parties agree that the use per customer rates will be as set out in the Application.

6. Energy Efficiency and Conservation ("EEC") Funding for 2010

The Parties agree as follows in respect of the EEC funding sought by TGVI for 2010:

(a) TGVI will reallocate from residential and commercial EEC programs an additional $0.4 million from the amount approved for 2010 in the EEC Decision[2] to low income and rental housing programs. This brings the total for low income and rental housing programs to $0.6 million for 2010 (currently at $0.2 million).

(b) EEC funding for innovative technologies will be $0.478 million for 2010, which is the amount requested by TGVI in the Application.

(c) All agreed to EEC expenditures will be considered and evaluated within the existing portfolio, and be subject to the same financial treatment, as per the Commission's EEC Decision dated April 16, 2009 (Application, page 438, Item 15). However, Innovative Technology programs will be managed by TGVI as a separate segment of the overall portfolio to have a weighted average Total Resource Cost ("TRC") of 1.0 or more. TGVI will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee.

7. EEC Funding for 2011

7.1 The Parties agree as follows in respect of the EEC funding sought by TGVI for 2011:

(a) EEC funding for residential and commercial programs for 2011 will be $4.726 million, which is the amount requested by TGVI in the Application.

(b) TGVI will reallocate from 2011 residential and commercial EEC funding ($4.726 million for 2011) an additional $0.4 million to low income and rental housing programs. This brings the total for low income and rental housing programs to $0.6 million for 2011.

(c) EEC funding for innovative technologies will be $0.956 million for 2011, which is the amount requested by TGVI in the Application.

---

[2] Decision and Order No. G-36-09 dated April 16, 2009 in the TGI-TGVI Energy Efficiency and Conservation Application.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

(d) All agreed to EEC expenditures will be considered and evaluated within the existing portfolio, and be subject to the same financial treatment, as per the Commission's EEC Decision dated April 16, 2009 (Application, page 438, Item 15). However, Innovative Technology programs will be managed by TGVI as a separate segment of the overall portfolio to have a weighted average TRC of 1.0 or more. TGVI will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee.

(e) TGVI will report to the Commission on innovative technology programs as part of TGVI's annual report on EEC activities required under the EEC Decision.

The Parties offer the following rationale for the agreed upon 2011 EEC funding.

All Parties agree that it is important to maintain EEC funding levels in 2011 to allow customers to have continued access to EEC programs and incentives. The residential and commercial EEC programs relating to the $4.726 million funding in 2011 on a portfolio basis in aggregate have a TRC of one or more. This means that, from a resource perspective and on a portfolio basis, these programs are expected to yield favourable results for customers. The predictability and continuity of these programs on a sustained basis is critical to their overall success.

Issue No. 1 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "EEC Program – TGVI is to provide results of programs approved by the EEC Decision and expectations for new programs before the Commission Panel will approve additional EEC program funding."

There are practical difficulties associated with the approach identified by the Commission Panel. They include the following:

- As per the EEC Decision (Order No. G-36-09), TGVI will be reporting 2009 activities and results by no later than March 31, 2010. This report will also outline the forecasted activities and programs for 2010. Recognizing the timing of the recent EEC Decision and its current implementation in the Fall of 2009, the EEC Report for 2009 results will give the Commission and stakeholders another check point to validate the level of spend for 2011. However, there is expected to be very little additional information on the results of programs available in March 2010 than exists presently and is included in the evidentiary record of this proceeding. TGVI's EEC programs only completed start up phase in the Fall of 2009. It typically takes longer than 6-8 months to achieve momentum with EEC programs. There will be no information available in March 2010 on results for programs relating to innovative technologies initiated in 2010 as a result of this Agreement. The information that the Commission Panel appears to desire will be more likely included in TGVI's 2010 results report to be filed in March 2011.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

- Employees responsible for the programs at TGVI, whose salaries are funded from EEC funding, will face the prospect of losing their jobs in 2011. This could lead to employee retention issues. Employee turnover issues may disrupt the program implementation progress and potentially be more costly if EEC activity is ceased and later resumed.

- Programs will need to begin winding down in advance of 2011 if the 2011 funding is not approved. For example, programs will need to have an end date of December 31, 2010 which may not yield positive results since programs will be winding up in the middle of the heating season.

7.2 The Parties agree that the Commission may sever Section 7.1 (a) and (b) above from this Agreement, with the remainder of this Agreement remaining in force and effect. If the Commission severs Section 7.1 (a) and (b), then the Parties agree that the following provisions take effect:

(a) The Residential and Commercial EEC programs totaling $4.726 million in 2011 will be removed from the EEC expenditure forecast and the revenue requirements for 2011. (If 7.2 takes effect, the financial schedules in Part IV of this Agreement and the cost of service/revenue requirements resulting from this Agreement will be revised to reflect this).

(b) The Parties agree that the first annual report on EEC Activities, which was due to be filed on March 31, 2010 pursuant to Order No. G-36-09, will instead be filed on or before June 30, 2010. Concurrent with that report, TGVI will file an application with the anticipation of a decision within 120 days after filing. The application will include requests for:

i. approval of the above EEC funding for 2011;

ii. approval of the same financial treatment approved in the EEC Decision; and

iii. approval for the continuation of the portfolio approach and assessment methodology as approved in the EEC Decision.

8. Alternative Energy Solutions

Alternative Energy Solutions ("AES") means Geo-exchange, Solar-thermal and District Energy Systems as those terms are described in the Application.

The forecast costs of pursuing AES projects in the TGVI service area were included in the Shared Services cost pool, which is allocated pursuant to the Shared Services Agreement among TGI, TGVI and TGW. The costs related to AES projects that would otherwise have been allocated to TGVI have been allocated to TGI's New Energy Solutions Deferral Account pursuant to the Settlement Agreement for the TGI 2010 and 2011 Revenue Requirements. Accordingly, TGVI withdraws its requests for relief in the Application relating to AES. The Parties acknowledge that TGI will be pursuing AES projects within the TGVI

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

service area and agree that the costs incurred by TGI to provide AES will not be recovered in TGVI's natural gas service rates. Any direct costs, sales and marketing O&M and other development costs incurred by TGVI in assisting TGI in pursuit of AES will be directly charged to the TGI New Energy Solutions Deferral Account of TGI by timesheets or other direct charge.

9. Natural Gas for Vehicles ("NGV")

The Commission Issue No. 2 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "Natural Gas Vehicles ("NGV") – if NGV is to proceed why should the natural gas ratepayer fund this initiative rather than Terasen's non-regulated businesses or the competitive market?"

The Parties agree:

(a) The new NGV Service Rate Schedule (as set out in the Application Appendix J-4) – the NGV Service Rate Schedule should be approved as filed; and

(b) NGV Grants will be accounted for on a net-of-tax basis in a deferral account and amortized over a five year term (the same treatment as under TGI Rate Schedule 6 (as set out in the Application, Part III, Section C, Tab 3, page 224); and

(c) The marketing costs in support of NGV that are included in the Application are appropriately included in the 2010 and 2011 cost of service.

(d) Upon acceptance of this Agreement by the Commission, TGVI withdraws its request in the Application for the following:

i. Compression and Refueling Service Rate Schedule; and

ii. the Compression Service ("CS") Test; and

iii. NGV non-rate base deferral account for Compression Equipment Costs and Expenses.

The Parties acknowledge that these requests are being withdrawn by TGVI to facilitate a settlement on other issues presented in the Application. The Parties agree that TGVI's withdrawal of its requests regarding NGV is without prejudice to TGVI's right to bring forward similar requests in 2010 or 2011 or otherwise in the future. The Parties acknowledge that TGVI intends to develop this area of business and that TGVI anticipates it will bring forward applications on NGV projects to the Commission on a case-by-case basis during the term of this Agreement and in future years. The Parties agree that TGVI is at liberty to do so.

10. Biogas

Issue No. 3 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "Biogas – could be reviewed by a CPCN which demonstrates market uptake of customers that are willing to pay the full cost."

The Parties agree that, upon acceptance of this Agreement by the Commission, TGVI withdraws its requests in this Application related to Biogas. The Parties acknowledge that these requests are being withdrawn to facilitate a settlement on other issues presented in this Application. The Parties agree that TGVI will bring forward an application (the "Biogas Application") during the test period that will:

(a) Address the economic assessment model; and

(b) Provide Biogas rates (including green rate, transportation rate, etc.); and

(c) Provide for recovery of costs associated with providing Biogas service.

TGVI may include in the Biogas Application any Biogas Projects under development at that time. TGVI is, however, not precluded from applying for Commission approval in respect of individual Biogas Projects at any time, either prior to the Biogas Application or afterwards.

11. CPCN Threshold

Issue No. 6 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "CPCN threshold – why should the threshold increase from $5 million."

The Parties accordingly agree that the CPCN threshold will be $5 million for 2010 and 2011. TGVI's Category C Capital Expenditures forecast for the forecast period will be revised to reflect this change (please see item 13 below).

12. Category A Capital

TGVI had utilized an incorrect inflation rate in the Application when calculating the forecast capital expenditures for Distribution Mains (BCUC IR 1.120.5). The Parties agree to use the correct inflation rate, resulting in a decrease to the Category A Capital Expenditures of $188 thousand in 2010 and $154 thousand in 2011, and an associated decrease in the Revenue Requirement in each of those years, from the amounts set out in the Application.

13. Category C Capital

As a consequence of the CPCN threshold being established at $5 million for 2010 and 2011 (see item 11 above), TGVI will file a CPCN application for the Victoria Regional Office project identified in TGVI's Application. The Category C Capital will consequently be reduced by $5.2 million in 2010 and a further $3.3 million (totaling $8.5 million) in 2011. TGVI will seek deferral treatment for 2011 of the capital costs associated with those projects at the time of filing the CPCN Applications.

The Parties agree that Category C Capital will additionally be reduced by a total of $0.5 million in each of 2010 and 2011. The revised Category C Capital Expenditures, reflecting the removal of the Victoria Regional Office capital expenditures and the $0.5 million IT Capital reduction, are now $4.4 million in 2010 and $4.1 million in 2011.

14. Gross O&M (to be recovered from gas customers)

The Parties agree that the proposed gross O&M recoverable from gas customers is reduced by $0.874 million in 2010 and $0.947 million in 2011, resulting in gross O&M in 2010 of $31.231 million and gross O&M of 2011 of $ 32.702 million. The Parties agree to fix the Gross O&M amounts for the purposes of determination of RDDA and/or RSDA balances at the end of each year. The changes as compared to the Application include the following three components:

1. Reduced Shared Services costs from TGI in the amount of $0.339 million in 2010 and $0.491 million in 2011 as discussed in Item 15 below; and

2. Reduced Corporate Services cost from Terasen Inc. in the amount of $0.535 million in 2010 and $0.540 million in 2011, as discussed in Item 15 below.

3. TGVI inadvertently omitted to include the fixed costs associated with electric Demand charges for general operations of the LNG facility including liquefaction, vapourization, and boil-off compression. The Parties agree that these incremental costs, totalling $83 thousand ($37 thousand for additional electricity and $46 thousand for additional fuel), will be included in the 2011 gross O&M amounts (BCUC IR 1.101.9).

15. Shared Services/Corporate Services

The Parties agree that the amount of Shared Services costs allocated to TGVI from TGI should be reduced by $0.339 million in 2010 and $0.491 million in 2011 as a result of the outcome of the concurrent TGI RRA.

The Parties agree that the amount of Corporate Services costs allocated to TGVI from Terasen Inc. should be reduced by $0.535 million in 2010 and $0.540 million in 2011. As a result of these Corporate Services reductions, and as contemplated in the TGI 2010-2011 RRA Settlement Agreement, the amount of Corporate Services allocated to TGI from Terasen Inc. will increase by a corresponding amount in each year to ensure recovery of all of the combined Corporate Services.

The Parties agree that the current Shared Services Agreement between TGVI and TGW will be discontinued, and acknowledge that TGI will be providing shared services to TGW.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

16. Depreciation Study

The Parties agree that the depreciation rates specified in the Gannett Fleming study included the Application under Appendix H-2 for Parts I-III, and in the Supplemental filing dated July 8, 2009 for Parts IV and V, will be implemented effective January 1, 2010, with the exception of:

(a) incorporating the correct updated rates from the depreciation study results in a change in the rate for asset class 475 from 1.62 per cent to 1.94 per cent, and a change in the rate for asset class 477 from 4.92 per cent to 4.60 per cent (BCUC IR 1.146.3); and

(b) the component of those rates that represent recovery of negative salvage (see item 17 below).

Adjusting for the Distribution Asset Classes, negative salvage, and overheads capitalized and capital expenditures changes yields total depreciation expense of $21.8 million in 2010 and $26.0 million in 2011, of which approximately $1.2 million results from the updated Gannett Fleming depreciation study.

The Parties agree that TGVI will undertake an updated depreciation study to be included as part of TGVI's next Revenue Requirements Application. This study will address the methodology and rates for net negative salvage to be included in cost of service for future periods. TGVI will work with Commission staff and a depreciation rate specialist in determining the requirements of the study.

17. Negative Salvage Values

On an annual basis, TGVI includes a provision for estimated net negative salvage value (removal costs less proceeds) in its depreciation rates. This treatment, which was approved as recently as 2004, along with an estimate of the salvage amount to be included in depreciation rates recognizes that net negative salvage value is a cost of providing service using the asset and should be recovered from customers over the useful life of the asset. An alternative treatment is to recover the net negative salvage values at the time they are incurred resulting in future customers paying for the removal costs, which TGVI views as inappropriate. The inclusion of a provision for estimated net negative salvage value in depreciation rates is a practice that has been followed by TGVI historically, and with this RRA TGVI had proposed continuation of this treatment. This treatment is consistent with the BCUC Uniform System of Accounts and is generally followed by other investor-owned utilities in British Columbia and across Canada.

The Parties agree that for the purposes of the two year period covered by this Agreement, the provision for net negative salvage (net removal costs) will be removed from the depreciation estimates. Instead, an estimate of the amount of net removal costs to be incurred in each of the years 2010 and 2011 ($0.343 million and $0.344 million) will be included in the cost of service and recovered from customers in each of those years. Any variances between the actual amount of net removal costs realized and the estimated amounts included in cost of service will be recorded in a new deferral account created for this purpose that will be called the "Removal Cost Deferral Account". The amount

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

accumulated in the Removal Cost Deferral Account over the two year period of this Agreement will be recovered from (or returned to) customers in 2012.

TGVI continues to be of the position that removal costs should be recovered over the service life of the asset and not at the time the removal costs are actually incurred. TGVI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the removal costs and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.

The Parties agree that TGVI will update its financial schedules to increase the opening balance of the Accumulated Amortization of Contributions in Aid of Construction and correspondingly decrease the opening balance of Accumulated Depreciation by $13.275 million (BCUC IR 2.37.1.1) with no effect on rate base or cost of service.

18. Unrecovered Losses

Issue No. 7 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "Unrealized losses in rate base – should some of these losses be to the shareholder? Parties should present a separate settlement package."

Unrealized (unrecovered) losses relate to Unrecovered Depreciation on assets used 100 per cent for the provision of utility service to ratepayers (BCUC IR 1.112.1).

The Parties agree that the treatment for unrecovered losses as proposed in the Application is acceptable for the 2010 and 2011 period covered by this Agreement. TGVI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the unrecovered losses and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.

19. Overheads Capitalized

The Parties agree to a change in the overheads capitalized rate to 14 per cent of Gross O&M for 2010 and 2011.

20. International Financial Reporting Standards ("IFRS") 2010 Impact

Issue No. 4 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "International Financial Reporting Standards ("IFRS") – could have no IFRS impact in 2010."

The Parties agree to defer the 2010 revenue requirement impact of IFRS, resulting from Items 25 (b), (c), (d) and (e) in this Agreement, to be reflected in revenue requirements in 2011 up to a maximum of $2.0 million. Amounts, if any, over $2.0 million would be deferred and reflected in revenue requirements after 2011 based on the amortization approved by the Commission at that time.

21. Allocation of 2009 Revenue Surplus Account ("RSA") Balance (Application page 322 Item (7)(b))

The Commission approved the creation of a 2009 Revenue Surplus Account in Order No. G-84-09. TGVI currently forecasts that the RDDA balance will reach zero in 2009 and that a surplus will be recorded in the 2009 RSA. The actual balance in the 2009 RSA will not be known until the Commission approves the 2009 year end balance in the RDDA, pursuant to section 2.10(f) of the Special Direction.

Issue No. 8 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "Rate Design – should BC Hydro receive any refund for the expected 2009 RDDA surplus?"

The Parties have considered the issue raised by the Commission Panel. The Parties agree, for the purposes of achieving overall Agreement, that the answer to Commission Panel Issue No. 8 is, "Yes", and that the forecast balance in the 2009 RSA of $2.962 million will be amortized equally over the forecast years 2010 and 2011 to all customers, other than the VIGJV and TGI Squamish Service Area (TGI Squamish), as follows:

(a) $2.677 million to Core Market

(b) $0.246 million to BC Hydro

(c) $0.039 million to TGW

Any variance between the forecast and actual 2009 RSA balance will be captured in the RSDA described below.

22. Rate Stabilization Deferral Account ("RSDA") (Application page 323 Item (7)(c))

Variances between forecast cost of service and actual cost of service, other than O&M, are items that will be "trued up to actual" as per the Special Direction. Gross O&M will be as stated in Item 14, and not "trued up to actual" (i.e. variances from forecast O&M specified in Item 14 will be an at-risk item for the shareholder). The allowed rate of return on Equity will be adjusted to that approved by the Commission during the period of the settlement and will not be trued up to actual. For clarity, this means that approved rate of return on equity percentage will apply to the actual rate base consistent with the methodology employed since 2003 for TGVI.

The Parties agree that TGVI will establish a RSDA to capture:

(a) differences in 2010 and 2011 between:

i. the net revenues received; and

ii. the actual, "trued-up", cost of service, excluding O&M variances from forecast stated in Item 14; and

(b) any Accumulated Revenue Deficiency in the RDDA after December 31, 2009.

The Parties agree that any balance in the RSDA will be amortized into the cost of service after 2011. However, the Parties agree that the following issues will be deferred to a future proceeding:

(a) how any balance in the RSDA will be allocated among customer classes; and

(b) the period over which any balance in the RSDA will be amortized into the cost of service.

RATE DESIGN

23. Rate Design

The Vancouver Island Natural Gas Pipeline Agreement contemplates the Provincial Government Royalty Revenues to TGVI ceasing at the end of 2011. The Parties agree that given the pending loss of Royalty Revenues from the Provincial Government and the strategies to deal with the potential rate shock associated with that circumstance, including potential amalgamation, that it would be appropriate to defer a full scale rate design at this time.

The Parties have differing views on the appropriate rate design. The Parties did not agree on an appropriate rate design, and did not agree on:

(a) Various cost allocation principles;

(b) Revenue to cost ratios; and

(c) The treatment of interruptible transportation revenues.

Instead, the Parties agree that this Negotiated Settlement Agreement is without prejudice to any position Parties may take in the future. The Parties agree that no precedent is set by this Agreement.

24. Rate Proposals

The Parties agree that the proposed core market rate freeze for the two year test period is accepted. The Parties agree to the rates for each customer class is set out in Schedule 1 under Part IV of this Agreement.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

Issue No. 5 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "2010 Rate Changes – in the event that a 2010 rate reduction were to occur as a result of negotiations, the current rates should remain unchanged and place the revenue surplus into a deferral account to apply against 2011 and future rate increases with a phase in amortization that strives for rate stability."

The Parties agree that Commission Panel Issue No. 5 is addressed for core market customers.

The Parties agree that the rates for transportation customers, effective January 1, 2010, other than those that have specified rates set out in their contract (VIGJV and TGI Squamish), are as set out below.

(a) BC Hydro

i. Firm Transportation Rate $0.830 per GJ

ii. Summer Interruptible Rate $0.830 per GJ

iii. Winter Interruptible $1.330 per GJ

(b) TG Whistler

i. Firm Transportation Rate $0.930 per GJ

These transport rates are based on TGVI's current allowed return on equity ("ROE") of 9.17 per cent and subject to changes flowing from the Commission's decision in TGVI's concurrent ROE and Capital Structure Application[3], or as adjusted from time to time by the Commission. Nothing in this Agreement precludes TGVI from applying to the Commission in 2010 or 2011 for changes to its allowed ROE and capital structure.

The Parties agree to the following formula to reflect changes in the allowed ROE in the transportation rates, other than those that have specified rates set out in their contract (VIGJV and TGI Squamish). Every 1 basis points difference in the approved ROE as compared to the current ROE of 9.17 per cent will cause the firm and interruptible rates to change in the same direction by 0.034 cents per GJ rounded to the nearest tenth of a cent.

PART III – REQUESTS UNCHANGED FROM THE APPLICATION

The Parties agree to the following items set out in this section, which are consistent with the proposals in TGVI's Application.

---

[3] Filed jointly by the Terasen Utilities [TGI, TGVI. and Terasen Gas (Whistler) Inc.] on May 15, 2009.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

25. Accounting Policy Changes as per Application Part III, Section E - Approvals Sought - to be effective January 1, 2010

The Parties agree to the following accounting policy changes, as set out in TGVI's Application:

(a) Training and Feasibility Study Costs to be treated as O&M expense, rather than capital (Application Page 438 and 439, Item 18).

(b) Capitalization of Major Inspection and Overhaul Costs, including the creation of new Asset Classes (Application Page 438 and 439, Item 18).

(c) Capitalization of the Current Service portion of Pensions and OPEBs expense that is applicable to capital projects (Application Page 438 and 439, Item 18).

(d) Capitalization of Depreciation on Assets used in Construction (Application Page 438 and 439, Item 18).

(e) All capital expenditures, including CPCNs, to be included in plant in service (and rate base) in the month following the available-for-use date, with depreciation starting at that time (Application Page 438 and 439, Item 18).

(f) Adoption of the effective interest method for calculating interest expense on long-term debt (Application Page 438 and 439, Item 18).

26. Various Accounting Related Proposals as per Application Part III, Section E - Approvals Sought effective January 1, 2010

The Parties agree to the following accounting related changes, as set out in TGVI's Application:

(a) Adoption of the Cash Working Capital Lead/Lag Days as set out in the Lead/Lag study (Application page 438, Item 16d).

(b) The treatment of Customer Security Deposits as part of the unfunded debt, instead of as a component of working capital (Application Page 438 and 439 Item 18).

(c) The inclusion of the reserve for bad debts as a component of working capital (Application Page 438 and 439 Item 18).

(d) Consolidated Core Market Administration Expenses (for TGI, TGVI and TGW), including allocation percentages (Application page 438, Item 16e).

27. Tariff Change Proposals as per Application Part III, Section E - Approvals Sought, Item 19

The Parties agree to the following Tariff changes, as set out in TGVI's Application:

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

(a) Revised Fee New Customer Application fee from $85 to $25

(b) Revised dishonoured cheque charge from $10 to $20

(c) Revised Fee Meter Testing fee from $50 to $60

(d) Removed special meter reading charge

(e) Removed move meter from inside to outside premises at consumer's request charge

(f) Removed resetting of meter and regulator charge

(g) Removed where services performed at cost charge

(h) Changes to the Standard Terms and Conditions as set out in Part III, Section C, Tab 12 and Appendix J-2 of the Application.

28. <u>Deferral Account Proposals as per Application Part III, Section E - Approvals Sought, Item 17</u>

The Parties agree to the continuation, modification or adoption of the following deferral accounts as set out in TGVI's Application:

(a) Deferral Accounts - No Change:

i. Gas Cost Variance Account (Application page 316, Item (1)).

ii. Insurance variance (Application page 318, Item (3) (a)).

iii. Pension & OPEB variance (Application page 318, Item (3) (b)).

iv. Olympic Security costs (Application page 318, Item (3) (d)).

v. IFRS conversion costs (Application page 318, Item (3) (e)).

vi. PCEC Start Up Costs (Application page 319 Item (5)(a)).

vii. Accounts Amortized in 2010 (Application page 321, Item (6) (c)).

viii. RDDA (Application Page 322 Item (7)(a)).

(b) Deferral Accounts - New:

i. BCUC Levies variance (Application page 318, Item (3) (c)).

ii. Costs of applications (CCE, ROE, RRA) (Application page 319, Item (4)).

iii. IFRS Transitional Deferral Account (Application page 319, Item (5) (b)).

iv. Pension and OPEB funding differences (Application page 320, Item (5) (c)).

v. Gains and Losses on Asset Disposition (Application page 320, Item (5) (d)).

29. RDDA Balance as at December 31, 2008

The Parties agree pursuant to section 2.10 (f) of the Special Direction that the December 31, 2008 year end balance in the RDDA is $7,149,210, as set out in Part III, Section B, Tab 2 of the Application. (Application page 437, Item 12)

30. Cost of Service

The Parties agree pursuant to section 2.10(a)(i) of the Special Direction that TGVI's forecast Cost of Service for 2010 and 2011 will be as set out in Schedule 14, in Part IV of this Agreement, but subject to (a) the need to recover any Accumulated Revenue Deficiency in the RDDA after December 31, 2009 as explained in Part III, Section B, Tab 2 and (b) changes in TGVI's allowed return on equity. (Application page 436, Item 4).

31. Capital

The Parties agree pursuant to section 2.10(a)(i) of the Special Direction that TGVI's forecast capital expenditures for 2010 and 2011 will be as set out in Schedule 42, in Part IV of this Agreement. (Application page 437, Item 9)

32. Revenue

The Parties agree pursuant to section 2.10(a)(i) of the Special Direction that TGVI's revenues will be as per Schedule 14, in Part IV of this Agreement.

33. Customer Segmentation

The Parties agree to accept the customer segmentation as filed in the Application.

34. Mt. Hayes LNG Storage – Storage and Delivery Agreement

The Parties agree to accept Schedule A of Tariff Supplement No. 4 (Storage and Delivery Agreement between TGI and TGVI), as set out in Part III, Section B, Tab 3 of the Application.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS (VANCOUVER ISLAND) INC.
DATED THURSDAY, NOVEMBER 5

PART IV – REVISED FINANCIAL SCHEDULES

The revised Financial Schedules follow.

~~CONFIDENTIAL AND WITHOUT PREJUDICE - FOR NSP PURPOSES ONLY~~

RDDA CONTINUITY
FOR THE YEARS ENDING DECEMBER 31, 2007 - 2009
In Dollars

Line No.	Particulars	Approved 2007	Actual 2008	Projected 2009	Reference
	(1)	(2)	(3)	(5)	(6)
1	**Opening Balance**	$41,626,420	$ 27,907,609	$ 7,149,120	
2	Deemed Interest on Subordinated Debt	$ 3,207,564	$ 2,481,026	$ 1,269,953	
3	Annual Revenue Surplus Allocated to Sub Debt Interest Payment	(3,207,564)	(2,481,026)	(1,269,953)	
4	Annual Revenue Surplus Allocated to RDDA Amortization	(13,718,811)	(20,758,489)	(7,149,120)	*See Note
5	**Closing Balance**	$ 27,907,609	$ 7,149,120	$ -	

*2009 is projected to be the first year where the Annual Revenue Surplus is greater than the sum of the Opening Balance and the Subt Debt Interest. The remainer of the surplus not shown as allocated to either Sub Debt Interest Payment or RDDA Amortization has been allocated to the 2009 Revenue Surplus Deferral Account.

Terasen Gas (Vancouver Island) Inc. 2010-2011 Revenue Requirements Application
Negotiated Settlement Process
Issues of Particular Concern to the Commission Panel

In accordance with sections 3 and 9 of the Negotiated Settlement Process-Policy, Procedures and Guidelines, the Commission Panel has identified the following issues of particular concern that parties should be aware of during the negotiations:

1. EEC Program-TGVI is to provide results of the programs approved by the EEC Decision and expectations for new programs before the Commission Panel will approve additional EEC program funding.

2. Natural Gas for Vehicles ("NGV")-if NGV is to proceed why should the natural gas ratepayer fund this initiative rather than Terasen's non-regulated businesses or the competitive market?

3. Biogas-could be reviewed by a CPCN which demonstrates market uptake of customers that are willing to pay the full cost.

4. International Financial Reporting Standards ("IFRS")-could have no IFRS impact in 2010.

5. 2010 Rate Changes-in the event that a 2010 rate reduction were to occur as a result of the negotiations, the current rates should remain unchanged and place the revenue surplus into a deferral account to apply against 2011 and future rate increases with a phase in amortization that strives for rate stability.

6. CPCN threshold-why should the threshold increase from $5 million.

7. Unrealized losses in rate base-should some of these losses be to the shareholder? Parties should present a separate settlement package.

8. Rate Design-should BC Hydro receive any refund for the expected 2009 RDDA surplus?

Re: Terasen Gas Vancouver Island Inc. Revenue Requirements 2010-2011 Negotiated Settlement

This is to confirm, that we are satisfied that the draft Settlement Agreement circulated by Mr. Thompson and Mr. Loski on November 5, 2009 accurately captures the consensus reached by the parties to the Negotiated Settlement Process in this proceeding, and that we have been instructed by our clients, BCOAPO et al., to endorse it.

Accordingly, we ask that the Commission incorporate it into a consent Order for the resolution of all issues in the Application.

Our only further comments, made here only "for the record" and in no way detracting from our clients' endorsement of the Settlement, concern the “Alternative Energy Solutions" addressed under heading 8 of the document. While we believe that the ultimately appropriate corporate and regulatory formats for these lines of business are subject-matters which may require eventual determination by the Commission, our clients are content with the treatment of these issues in the Settlement Agreement over its term, in that it provides a “firewall” to ensure that the utility’s natural gas distribution customers do not subsidize or otherwise contribute to these nascent programs through their rates.

Yours truly,

BC PUBLIC INTEREST ADVOCACY CENTRE

Attention: Erica M. Hamilton,
Commission Secretary

Dear Sirs/Mesdames:

Re: Terasen Gas (Vancouver Island) Inc. ("TGVI") 2010 and 2011 Revenue Requirements and Rate Design Application, Project No. 3698563

We are counsel to the Commercial Energy Consumers Association of British Columbia (the "CEC"). We confirm that the CEC accepts the terms of the final version of the Negotiated Settlement Agreement on the above-noted Application circulated by TGVI on November 5, 2009 and have no comments on that draft.

The CEC thanks the Commission staff and facilitator, TGVI and the other customer representatives for their efforts during these negotiations.

If you have any questions regarding the foregoing, please do not hesitate to contact the undersigned.

Yours truly,

Dear Ms. Hamilton:

RE: Project No. 3698563
British Columbia Utilities Commission (BCUC)
British Columbia Hydro and Power Authority (BC Hydro)
Terasen Gas (Vancouver Island) Inc. 2010 and 2011 Revenue Requirements and Rate Design Application - Negotiated Settlement Agreement

BC Hydro acknowledges receipt of the final version of the Negotiated Settlement Agreement from Terasen Gas (Vancouver Island) Inc. (TGVI) and that the company has reviewed the document.

BC Hydro accepts the Negotiated Settlement Agreement and confirms that it has taken no position with respect to matters reflected in the Negotiated Settlement Agreement other than matters related to the Rate Design and those referred to in items 21 and 22 of the Negotiated Settlement Agreement.

Yours sincerely,

Leon Cender

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

An Application by Terasen Gas Inc.
for Approval of 2010 and 2011 Revenue Requirements and Delivery Rates

BEFORE: A.W.K. Anderson, Panel Chair/Commissioner
D.A. Cote, Commissioner
M.R. Harle, Commissioner

November 26, 2009

O R D E R

WHEREAS:

A. On June 15, 2009 Terasen Gas Inc. ("Terasen Gas") filed an application for approval of interim and permanent delivery rates effective January 1, 2010 and January 1, 2011 (the "Application") pursuant to sections 59 to 61 and 89 of the *Utilities Commission Act* (the "Act"), representing an increase of 5.3 percent for 2010 and 4.1 percent for 2011; and

B. Terasen Gas sought other approvals in the Application, including Orders pursuant to sections 59 to 61 of the Act, approving Tariff changes effective January 1, 2010 for Compression and Refueling and Transportation Services for Natural Gas Vehicles and economic models for evaluating biogas projects and alternative energy extensions for geo-exchange, solar thermal and district energy systems to complement its core natural gas business; and

C. The interim and permanent delivery rates sought in the Application are subject to adjustment for any changes in Terasen Gas' allowed return on equity and capital structure; and

D. Terasen Gas proposed a written hearing process to address the Application but was open to a Negotiated Settlement Process ("NSP") addressing all of the issues; and

E. In accordance with Commission Order G-76-09, a Workshop was held July 6, 2009 for a review of the Application and a first Procedural Conference was held on July 15, 2009. Commission Order G-89-09 established the requirement for a second Procedural Conference, held on September 25, 2009 to address the regulatory process and preliminary timetable; and

F. At the second Procedural Conference, the Commission Panel received submissions on the principal issues arising from or related to the Application, process options for the review of the Application, location of the proceedings and other matters that would assist the Commission's efficient review of the Application. The primary issues raised were whether a separate Certificate of Public Convenience and Necessity ("CPCN") review was required for the Alternative Energy Solutions proposed in the Application and whether the regulatory process should be in the form of an oral or written hearing or NSP; and

G. The Intervenors expressed a wish to avoid a separate CPCN process for the Alternative Energy Solutions and all Intervenors supported an NSP for the review of the Application. The Intervenors submitted that, in the event that the NSP is not successful in resolving all issues, an Oral Public Hearing could be ordered by the Commission. Terasen Gas requested that, if an Oral Public Hearing is established, it be limited in scope; and

H. Terasen Gas proposed that its application for interim rate approval be deferred until the end of November 2009; and

I. By Order G-119-09, the Commission Panel established a regulatory timetable for an NSP commencing October 21, 2009. The settlement discussions concluded on November 3, 2009; and

J. On November 13, 2009, the Negotiated Settlement Agreement ("NSA"), together with the Letters of Support received from the participants in the NSP, the Letter of Comment from Commission Staff and Terasen Gas' response to the Letter of Comment ("Settlement Package"), was made public and circulated to the Commission Panel; and

K. The Settlement Package was also distributed to Registered Intervenors who did not participate in the NSP ("Other Intervenors"). The Other Intervenors were requested to provide their comments on the Settlement Package to the Commission by November 20, 2009. The Commission Panel received no comments from Other Intervenors regarding the Settlement Package; and

L. The Commission Panel having reviewed the proposed NSA and the comments related thereto and noting the support of all parties to the proposed Negotiated Settlement Agreement, in which only sections 12(a) and (b) are severable, subject to the implementation of section 12.2, considers that approval is warranted.

NOW THEREFORE pursuant to sections 59 to 61 and 89 of the Act the Commission orders as follows:

1. The Negotiated Settlement Agreement attached as Appendix A to this Order is approved.

2. TGI is to file an amended Summary of Rates and Bill Comparison schedules based on the Negotiated Settlement Agreement.

3. The Commission will accept, subject to timely filing by TGI, amended permanent Gas Tariff Rate Schedules in accordance with the terms of this Order. TGI is to provide notice of the permanent rates to customers via a bill message, to be reviewed in advance by Commission Staff to confirm compliance with this Order.

DATED at the City of Vancouver, In the Province of British Columbia, this 26th day of November 2009.

BY ORDER

(*TGI-2010-11RR-RI*)

Dear Registered Intervenors:

Re: Terasen Gas Inc.
2010-2011 Revenue Requirements Application
Negotiated Settlement

Enclosed with this letter is the proposed settlement package for Terasen Gas Inc.'s 2010-2011 Revenue Requirements Application.

This settlement package is now public and is being submitted to the Commission and all Intervenors. Also enclosed are Letters of Comment received to date from the participants in the negotiated settlement process.

Prior to consideration by the Commission, Intervenors who did not participate in the settlement negotiations are requested to provide to the Commission with their comments on the settlement package by Friday, November 20, 2009. Thereafter, the Commission will consider the settlement package. A public hearing may not be required unless there is significant opposition to the proposed settlement.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

An Application by Terasen Gas Inc.
for Approval of 2010 and 2011 Revenue Requirements and Delivery Rates
Negotiated Settlement Process

WHEREAS:

A. On June 15, 2009, Terasen Gas Inc. ("TGI") filed its 2010 and 2011 Revenue Requirements Application, which was supplemented by a filing on July 9, 2009 and amended by filings on August 14 and September 18, 2009 (the "Application"); and

B. Amongst other things, the Application sought:

1. An order pursuant to sections 59 to 61 of the *Utilities Commission Act* (the "Act"), approving delivery rates for all non-bypass customers effective January 1, 2010 and January 1, 2011, representing an increase of 5.3 percent for 2010 and an additional 4.1 percent for 2011, subject to changes in TGI's allowed return on equity ("ROE") and capital structure; and

2. An order pursuant to section 44.2 of the Act approving an expenditure schedule for the continuation in 2011 of TGI's residential and commercial Energy Efficiency and Conservation ("EEC") funding, as well as new EEC funding for 2010 and 2011 for interruptible industrial programs and innovative technologies; and

3. New tariff offerings and economic tests for Compression and Refuelling and Transportation Services for Natural Gas Vehicles ("NGV"), geo-exchange, solar thermal and district energy systems and a pilot program for Biogas; and

C. A complete listing of the relief sought by TGI in the Application was included in Section D (pages 513-516)[1] of the Application; and

D. In accordance with Commission Order No. G-76-09 issued on June 19, 2009, a Workshop was held on July 6, 2009 for a review of the Application, a procedural conference was held on July 15, 2009, and TGI responded to two rounds of Information Requests; and

E. In accordance with Commission Order No. G-89-09 issued on July 20, 2009, a second procedural conference was held on September 25, 2009; and

---

1 Page 516 of the Application was amended on September 18, 2009.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

F. On October 2, 2009, the Commission issued Order G-119-09 establishing a Negotiated Settlement Process ("NSP") for the Application; and

G. The Parties to the NSP were TGI, British Columbia Old Age Pensioners et al. ("BCOAPO"), Commercial Energy Consumers Association of British Columbia ("CEC"), Teck Coal Ltd. ("Teck"), and the Ministry of Energy, Mines and Petroleum Resources ("MEMPR") (collectively referred to in this Agreement as the "Parties"); and

H. At the outset of the NSP on October 21, 2009, Commission Staff provided the Parties with a document prepared by the Commission Panel titled "Issues of Particular Concern to the Commission Panel", a copy of which is appended as Appendix 1 to this Agreement; and

I. The NSP was held on October 21-23, 30, and November 3 and 4, 2009; and

J. The Parties have negotiated in good faith to achieve a compromise settlement, reflected in this Agreement, of the issues raised by the Application, and the Commission Panel document referenced in recital H above, and further consider the Agreement reached to be fair, just and reasonable; and

K. This Agreement consists of four Parts:

Part I includes general provisions;

Part II includes the items agreed to that differ from what was requested in the Application;

Part III includes the items agreed to that remain as proposed by TGI in the Application; and

Part IV includes revised financial schedules reflecting all items set out in the Agreement.

NOW THEREFORE THE PARTIES AGREE AS FOLLOWS

PART I – GENERAL

1. <u>Agreement a Product of Compromise</u>

The Parties recognize and emphasize that this Agreement is the product of compromise on the part of all Parties, yielding an overall package that the Parties consider to be fair, just and reasonable. The Parties agree that any compromises resulting from this Agreement are without prejudice to the Parties' ability to take different positions after 2011 and without prejudice to the Parties right to intervene in any applications contemplated in or resulting from this Agreement.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

2. Whole Agreement

Unless otherwise stated in this Agreement, portions of this Agreement cannot be removed or changed by the Commission without nullifying the whole Agreement.

3. TGI to Manage Business

The Parties agree that TGI will have the discretion to manage its business and determine how best to allocate the overall O&M and Capital expenditures stipulated in this Agreement.

4. Final IFRS Rate-regulated Activity Standard

The Parties acknowledge that this Agreement is predicated on the Final IFRS Rate-regulated Activity Standard permitting the financial accounting treatment contemplated in this Agreement in the manner outlined in the current Exposure Draft on Rate-regulated Activities. The Parties agree that if, in TGI's opinion, the Final IFRS Rate-regulated Activity Standard differs from the current Exposure Draft on Rate-regulated Activities so as not to permit the financial accounting treatment contemplated in this Negotiated Settlement Agreement, which among other things anticipates the recognition of regulatory assets and liabilities for external reporting purposes, then TGI is at liberty to apply to the Commission during the period of this Agreement for a determination of that issue, and to seek changes in the regulatory treatment contemplated in this Agreement to accord with the Final IFRS Rate-regulated Activity Standard, with the resulting impacts flowed through into rates commencing in 2011.

PART II – AGREED CHANGES FROM THE APPLICATION

5. Delivery Rates

The Delivery rate changes for 2010 and 2011 that would flow from this Agreement would be a decrease of 1.73 per cent in 2010 and an increase of 3.93 per cent in 2011, subject to being updated as contemplated in this Agreement. Issue No. 5 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "2010 Rate Changes – in the event that a 2010 rate reduction were to occur as a result of negotiations, the current rates should remain unchanged and place the revenue surplus into a deferral account to apply against 2011 and future rate increases with a phase in amortization that strives for rate stability."

Therefore, the Parties agree that this Agreement will not result in a decrease in delivery rates for 2010 and that the 2010 forecast revenue surplus will be recorded in a 2010 Revenue Surplus Deferral Account and be applied to offset any forecast increase in delivery rates in 2011. The forecast 2010 revenue surplus of $9.2 million per Schedule 1 included in Part IV of this Agreement, is recorded in the 2010 Revenue Surplus Deferral Account, which will be amortized in 2011 to reduce the 2011 forecast revenue deficit. The 2010 Revenue Surplus Deferral Account will be included in Rate Base.

However, the delivery rates for 2010 and 2011 will be updated to reflect changes in TGI's allowed ROE and capital structure flowing from the Commission's decision in TGI's concurrent ROE and Capital Structure Application[2], or as adjusted from time to time by the Commission. Nothing in this Agreement precludes TGI from applying to the Commission in 2010 or 2011 for changes to its allowed ROE and capital structure.

6. Service Quality Indicators

The Parties agree that TGI will report on the same SQI's as set out in the 2004-2007 PBR Agreement and the 2008-2009 extension thereof through quarterly postings on TGI's website.

7. Customer Additions Forecast

The Parties agree that TGI's net Residential customer additions forecast is revised to be 5,952 in 2010 (increase of 352 from Application[3]) and 6,166 in 2011 (increase of 316 customers from the number specified in the Application), reflecting the updated published CMHC Q3 2009 forecast, and TGI's year end 2009 number of customers has additionally been updated to be 835,862. Customer additions for the other rate classes remain unchanged from what was specified in the Application[4].

8. Use Per Customer Rates

The Parties agree that the Residential annual use per customer is revised upward from 89.7 GJ to 91.7 in 2010 and from 88.3 to 90.3 in 2011. Use per customer rates for the other rate classes remain unchanged from what was included in the Application (other than Industrial as set out in item 9).

9. Industrial Demand Forecast

The Parties agree that the industrial demand forecast is revised upwards from what was requested in the Application based on responses TGI has since received from the 2009 Industrial Survey and actual year-to-date demand. The revised industrial demand forecast includes forecast demand of 46.5 PJ and 46.5 PJ (compared to 43.4 PJ and 43.3 PJ as presented in the Application) for 2010 and 2011 respectively.

---

[2] Filed jointly by the Terasen Utilities [TGI, Terasen Gas (Vancouver Island) Inc. and Terasen Gas (Whistler) Inc.] on May 15, 2009.

[3] See Application, page 276

[4] IBID

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

10. Inclusion of SCP Capacity in MCRA

The Parties agree that TGI will continue for 2010 and 2011 to include in the MCRA the $3.6 million representing the annual cost of Southern Crossing Pipeline (SCP) capacity, because the benefits and use of the SCP capacity are used by Core Market Customers (Rate Schedules 1-7).

11. Energy Efficiency and Conservation ("EEC") Funding for 2010

The Parties agree as follows in respect of the EEC funding sought by TGI for 2010:

(a) TGI will reallocate from residential and commercial EEC programs an additional $1.6 million from the amount approved for 2010 in the EEC Decision[5] to low income and rental housing programs. This brings the total for low income and rental housing programs to $2.4 million for 2010.

(b) EEC funding for industrial interruptible programs for 2010 will be $435,000, which is the amount requested by TGI in the Application.

(c) EEC funding for innovative technologies will be $2.3 million for 2010, which is the amount requested by TGI in the Application.

(d) All agreed to EEC expenditures will be considered and evaluated within the existing portfolio, and be subject to the same financial treatment, as per the Commission's EEC Decision dated April 16, 2009 (Application, page 514, Item 6). However, Innovative Technology programs will be managed by TGI as a separate segment of the overall portfolio to have a weighted average Total Resource Cost ("TRC") of 1.0 or more. TGI will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee.

12. EEC Funding for 2011

12.1 The Parties agree as follows in respect of the EEC funding sought by TGI for 2011:

(a) EEC funding for residential and commercial programs for 2011 will be $23.075 million, which is the amount requested by TGI in the Application.

(b) TGI will reallocate from 2011 residential and commercial EEC funding ($23.075M for 2011) an additional $1.6 million (from the $0.8 million included in the Application) to low income and rental housing programs. This brings the total for low income and rental housing programs to $2.4 million for 2011.

---

[5] Decision and Order No. G-36-09 dated April 16, 2009 in the TGI-TGVI Energy Efficiency and Conservation Application

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

(c) EEC funding for industrial interruptible programs will be $1.875 million for 2011, which is the amount requested by TGI in the Application.

(d) EEC funding for innovative technologies will be $4.669 million for 2011, which is the amount requested by TGI in the Application.

(e) All agreed to EEC expenditures will be considered and evaluated within the existing EEC portfolio, and will be subject to the same financial treatment, as per the Commission's EEC Decision dated April 16, 2009 (Application, page 514, Item 6). However, Innovative Technology programs will be managed by TGI as a separate segment of the overall portfolio to have a weighted average TRC of 1.0 or more. TGI will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee.

(f) TGI will report to the Commission on industrial interruptible and innovative technology programs as part of TGI's annual report on EEC activities required under the EEC Decision.

The Parties offer the following rationale for the agreed upon 2011 EEC funding.

All Parties agree that it is important to maintain EEC funding levels in 2011 to allow customers to have continued access to EEC programs and incentives. The residential and commercial EEC programs relating to the $23.075 million funding in 2011 on a portfolio basis in aggregate have a TRC of one or more. This means that, from a resource perspective and on a portfolio basis, these programs are expected to yield favourable results for customers. The predictability and continuity of these programs on a sustained basis is critical to their overall success.

Issue No. 1 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "EEC Program – TGI is to provide results of programs approved by the EEC Decision and expectations for new programs before the Commission Panel will approve additional EEC program funding."

There are practical difficulties associated with the approach identified by the Commission Panel. They include the following:

- As per the EEC Decision (Order No. G-36-09), TGI will be reporting 2009 activities and results by no later than March 31, 2010. This report will also outline the forecasted activities and programs for 2010. Recognizing the timing of the recent EEC Decision and its current implementation in the Fall of 2009, the EEC Report for 2009 results will give the Commission and stakeholders another check point to validate the level of spend for 2011. However, there is expected to be very little additional information on the results of programs available in March 2010 than exists presently and is included in the evidentiary record of this proceeding. TGI's

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

EEC programs only completed start up phase in the Fall of 2009. It typically takes longer than 6-8 months to achieve momentum with EEC programs. There will be no information available in March 2010 on results for industrial programs or programs relating to innovative technologies initiated in 2010 as a result of this Agreement. The information that the Commission Panel appears to desire will be more likely included in TGI's 2010 results report to be filed in March 2011.

- Employees responsible for the programs at TGI, whose salaries are funded from EEC funding, will face the prospect of losing their jobs in 2011. This could lead to employee retention issues. Employee turnover issues may disrupt the program implementation progress and potentially be more costly if EEC activity is ceased and later resumed.

- Programs will need to begin winding down in advance of 2011 if the 2011 funding is not approved. For example, programs will need to have an end date of December 31, 2010 which may not yield positive results since programs will be winding up in the middle of the heating season.

12.2 The Parties agree that the Commission may sever Section 12.1 (a) and (b) above from this Agreement, with the remainder of this Agreement remaining in force and effect. If the Commission severs Section 12.1 (a) and (b), then the Parties agree that the following provisions take effect:

(a) The Residential and Commercial EEC programs totaling $23.075 million in 2011 will be removed from the EEC expenditure forecast and the revenue requirements for 2011. (If 12.2 takes effect, the financial schedules in Part IV of this Agreement and the revenue requirements resulting from this Agreement will be revised to reflect this).

(b) The Parties agree that the first annual report on EEC Activities, which was due to be filed on March 31, 2010 pursuant to Order No. G-36-09, can be filed on or before June 30, 2010. Concurrent with that report, TGI will file an application with the anticipation of a decision within 120 days after filing. The application will include requests for:

i. approval of the above EEC funding for 2011;

ii. approval of the same financial treatment approved in the EEC Decision; and

iii. approval for the continuation of the portfolio approach and assessment methodology as approved in the EEC Decision.

13. Alternative Energy Solutions

Alternative Energy Solutions ("AES") means Geo-exchange, Solar-thermal and District Energy Systems as those terms are described in the Application.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

Natural Gas service taken in combination with AES will be charged under TGI's natural gas rates.

The Parties agree that the costs incurred by TGI to provide AES should not be recovered as part of natural gas service rates, and visa versa. The Parties agree that TGI's proposed New Energy Solutions Deferral Account, attracting AFUDC, is an appropriate mechanism to address allocation issues as between TGI's gas customers and TGI's AES customers. Therefore, the Parties agree that the new Energy Solutions Deferral Account will remain in effect pending a future rate design application at an unspecified future date after 2011 and will capture and record the following (plus AFUDC) to be recovered from AES customers:

(a) Direct costs associated with AES projects as outlined on pages 267-268 of the Application, including cost of design, equipment, etc. constructing and financing; and

(b) Sales and marketing O&M and other development costs will be directly charged to the deferral account by time sheets or other direct charge (estimated at $1.0 million in 2010 and $1.5 million in 2011, representing a portion of the agreed upon Gross O&M reduction from gas customers of $4.0 million in 2010 and $5.5 million in 2011); and

(c) An appropriate overhead allocation, which the parties have agreed will be $500,000 in each of 2010 and 2011 (representing a portion of the agreed upon Gross O&M reduction from gas customers of $4.0 million in 2010 and $5.5 million in 2011).

Revenues received from customers for all AES projects, which are based on contracts approved by Commission will be recorded in the AES deferral account.

The risk of non-recovery of amounts in the New Energy Solutions Deferral Account will not be borne by natural gas ratepayers. The Parties agree that any debit balance in the New Energy Solutions Deferral Account will not be recovered through natural gas rates and any credit balance will not be applied to reduce natural gas rates.

In evaluating AES projects, TGI will apply the economic test outlined in the Application. The Parties agree that the proposed GT&C (Section 12A – Alternative Energy Extensions) are acceptable. Pursuant to the *Utilities Commission Act,* within the Alternative Energy class of service, project-specific contracts with AES customers will be filed with the Commission for acceptance as a rate, at which time the Commission may review and adjust the economic test and GT&C Section 12A – Alternative Energy Extensions.

The CPCN threshold of $5 million applies to AES projects brought forward in 2010 and 2011.

The Parties agree that it is premature to address issues relating to the gas load and gas consumption profiles of AES projects that incorporate a natural gas component. Such issues are appropriately addressed in a future rate design application, once TGI has sufficient AES customers that take gas so as to provide reliable information on gas load and gas consumption profiles.

TGI will capture costs and revenue on a project specific basis and will report on AES projects as part of the next Revenue Requirements application.

14. Natural Gas for Vehicles ("NGV")

The Commission Issue No. 2 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "Natural Gas Vehicles ("NGV") – if NGV is to proceed why should the natural gas ratepayer fund this initiative rather than Terasen's non-regulated businesses or the competitive market?"

The Parties agree:

(a) NGV Rate Schedule 26 - NGV Transportation Service should be approved as filed.

(b) The marketing costs in support of NGV that are included in the revenue requirements Application are appropriately recoverable in 2010 and 2011 rates.

(c) Upon acceptance of this Agreement by the Commission, TGI withdraws its request in this Application for the following:

  i. Rate Schedule 6C NGV Compression and Refueling Service and 6A NGV Refueling Service; and

  ii. the Compression Service ("CS") Test; and

  iii. NGV non-rate base deferral account.

The Parties acknowledge that these requests are being withdrawn by TGI to facilitate a settlement on other issues presented in this Application. The Parties agree that TGI's withdrawal of its requests regarding NGV is without prejudice to TGI's right to bring forward similar requests in 2010 or 2011 or otherwise in the future. The Parties acknowledge that TGI intends to develop this area of business and that TGI anticipates it will bring forward applications on NGV projects to the Commission on a case-by-case basis during the term of this Agreement and in future years. The Parties agree that TGI is at liberty to do so.

15. Biogas

Issue No. 3 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "Biogas – to be reviewed by a CPCN which demonstrates market uptake of customers that are willing to pay the full cost."

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

The Parties agree that, upon acceptance of this Agreement by the Commission, TGI withdraws its requests in this Application related to Biogas. The Parties acknowledge that these requests are being withdrawn to facilitate a settlement on other issues presented in this Application. The Parties agree that TGI will bring forward an application (the "Biogas Application") during the test period that will:

(a) Address the economic assessment model; and

(b) Provide Biogas rates (including green rate, transportation rate, etc.); and

(c) Provide for recovery of costs associated with providing Biogas service.

TGI may include in the Biogas Application any Biogas Projects under development at that time. TGI is, however, not precluded from applying for Commission approval in respect of individual Biogas Projects at any time, either prior to the Biogas Application or afterwards.

16. CPCN Threshold

Issue No. 6 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "CPCN threshold – stay at $5 million."

The Parties accordingly agree that the CPCN threshold will remain at $5 million for 2010 and 2011. TGI's Category B Capital Expenditures forecast for the forecast period will be revised to reflect this change (please see item 18 below).

17. Category A Capital

The Parties agree that Category A Capital will be $43.3 million for 2010 and $46.0 million for 2011, reflecting the proposed amount updated to reflect the published CMHC Q3 2009 forecast, and TGI's adjusted re-forecasted year end net customer addition numbers (as set out in item 7).

18. Category B and Category C Capital

As a consequence of the CPCN threshold being established at $5 million for 2010 and 2011 (see item 16 above), TGI will file CPCN applications for the Huntingdon and Kootenay Crossing projects identified in TGI's Application. The Category B Capital will consequently be reduced by $2.2 million in 2010 and $16.0 million in 2011. TGI will seek deferral treatment for 2011 of the capital costs associated with those projects at the time of filing the CPCN Applications.

The Parties agree that Category B and C Capital will be reduced by a total of $3 million in each of 2010 and 2011. For the purposes of the determination of revenue requirements

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

with this Application, Category B Capital has been reduced by $1 million and Category C IT Capital has been reduced by $2 million.

The revised Category B Capital Expenditures, reflecting both the CPCN adjustment and the $1 million reduction in spending, are now $17.4 million in 2010 and $14.9 million in 2011.

The revised Category C Capital Expenditures, reflecting the $2 million IT Capital reduction, are now $32.8 million in 2010 and $32.7 million in 2011.

19. Gross O&M (to be recovered from gas customers)

The Parties agree that the proposed gross O&M, before shared service allocations, recoverable from gas customers for 2010 and 2011 is reduced from the amounts included in the original Application by $4.0 million in 2010 and a further $1.5 million (for a total impact of $5.5 million) in 2011. This reduction of Gross O&M will result in a reduction in the pool of costs subject to the Shared Services Agreement with TGVI and with TGW by an estimated $3.3 million in 2010 and $4.8 million in 2011. Therefore, and as discussed in Item 21, the final Gross O&M to be included in TGI's cost of service for 2010 and 2011 will be determined based on the Shared Services and Corporate Services allocations determined in the TGVI RRA.

20. Interest Expense

The Parties agree that TGI will update its assumptions around both the issuance of long-term debt and the associated interest rates. TGI has determined that Long-term Debt Series 25 will not be issued December 1, 2009 as originally forecast and is now anticipated to be issued April 1, 2010. In addition, the interest rate forecast for Long-term Debt Series 26, to be issued July 1, 2011, has been revised downwards from 6.13 per cent to 5.65 per cent.

21. Shared Services/Corporate Services Allocations

The 2010 and 2011 revenue requirements stipulated in this Agreement are based on TGI's proposed Shared Services and Corporate Services allocation for 2010 and 2011. The Parties acknowledge, however, that the final amount allocated to TGI for Shared Service and Corporate Services cannot be confirmed until the Commission determines the TGVI RRA. The Parties agree that if the amounts allocated to TGVI for Shared Services and/or Corporate Services for 2010 or 2011 changes from that agreed to in this Agreement as a result of a settlement or decision in the concurrent TGVI RRA proceeding, then the amount(s) allocated to TGI and its revenue requirements for 2010 and 2011 will be updated by a corresponding amount to ensure recovery of all of the combined Corporate Services and Shared Services costs.

22. Depreciation Study

The Parties agree that the depreciation rates specified in the Gannett Fleming study included the Application under Appendix H-2 for Parts I-III, and in the Supplemental filing dated July 8, 2009 for Parts IV and V, will be implemented effective January 1, 2010, with the exception of:

(a) Masonry Structures, which has been updated to 40 years instead of 22.88 years; and

(b) the component of those rates that represent recovery of negative salvage (see item 23 below).

Adjusting for the Masonry Structures, negative salvage, and the impacts of capitalized overhead and capital additions changes yields total depreciation expense of $98.3 million in 2010 and $100.5 million in 2011, of which approximately $6.3 million results from the updated Gannett Fleming depreciation study.

The Parties agree that TGI will undertake an updated depreciation study to be included as part of TGI's next Revenue Requirements Application. This study will address the methodology and rates for net negative salvage to be included in cost of service for future periods. TGI will work with Commission staff and a depreciation rate specialist in determining the requirements of the study.

23. Negative Salvage Values

On an annual basis, TGI includes a provision for estimated net negative salvage value (removal costs less proceeds) in its depreciation rates. This treatment recognizes that net negative salvage value is a cost of providing service using the asset and should be recovered from customers over the useful life of the asset. An alternative treatment is to recover the net negative salvage values at the time they are incurred resulting in future customers paying for the removal costs, which TGI views as inappropriate. The inclusion of a provision for estimated net negative salvage value in depreciation rates is a practice that has been followed by TGI historically, and with this RRA TGI had proposed continuation of this treatment. This treatment is consistent with the BCUC Uniform System of Accounts and is generally followed by other investor-owned utilities in British Columbia and across Canada.

The Parties agree that for the purposes of the two year period covered by this Agreement, the provision for net negative salvage (net removal costs) will be removed from the depreciation estimates. Instead, an estimate of the amount of net removal costs to be incurred in each of the years 2010 and 2011 ($8.038 million and $11.29 million) will be included in the cost of service and recovered from customers in each of those years. Any variances between the actual amount of net removal costs realized and the estimated amounts included in cost of service will be recorded in a new deferral account created for this purpose that will be called the "Removal Cost Deferral Account". The amount accumulated in the Removal Cost Deferral Account over the two year period of this Agreement will be recovered from (or returned to) customers in 2012.

TGI continues to be of the position that removal costs should be recovered over the service life of the asset and not at the time the removal costs are actually incurred. TGI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the removal costs and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.

24. Unrecovered Losses

Issue No. 7 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "Unrealized losses in rate base – should some of these losses be to the shareholder? Parties should present a separate settlement package."

Unrealized (unrecovered) losses relate to Unrecovered Depreciation on assets used 100 per cent for the provision of utility service to ratepayers (as discussed in the response to BCUC IR 2.131.1.4).

The Parties agree that the treatment for unrecovered losses as proposed in the Application is acceptable for the 2010 and 2011 period covered by this agreement. TGI will work with Commission staff and a depreciation rate specialist in determining both the methodology and estimates for the unrecovered losses and include the documentation to support the rates in its next depreciation study filed as part of its next Revenue Requirement Application.

25. Changes to CCA Rates

TGI amended its 2007 and 2008 tax returns to reflect changes to CCA rates announced in 2007 but not enacted until 2009. TGI proposed this benefit be shared in accordance with the terms of the PBR settlement. Some Parties have expressed the view, however, that all of the benefit should have been flowed through to customers via the Tax Deferral Account. The Parties, acting in good faith, have concluded that they have a fundamental and legitimate disagreement regarding the terms of the 2004-2009 PBR Settlement Agreement as it relates to the items to be included in the Tax Deferral Account. TGI has nevertheless agreed, as a compromise in furtherance of reaching an overall Agreement among the Parties, to include the full value of the incremental tax benefit associated with the difference in the CCA rates for 2007 and 2008 totalling $921,000 and remove the proposed 50% sharing benefit from the Earnings Sharing Mechanism.

26. Taxes – Tax Benefits Relating to Prior Periods – SCP Landscaping Costs

TGI had proposed to accelerate the deduction of the remaining Regulatory Tax balance of SCP Landscaping costs (amounting to approximately $8.2 million) in 2009. That proposal would have resulted in the related tax benefit of approximately $2.4 million being flowed through the Earnings Sharing Mechanism pursuant to the PBR Settlement Agreement, resulting in a net benefit to customers of approximately $1.2 million.

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

The Parties agree that, instead, TGI will continue to amortize the balance of SCP Landscaping costs for 2009 as contemplated in the approved rates for 2009 and consistent with prior years, resulting in a deduction of approximately $0.3 million for Regulatory Tax purpose in 2009 and a related tax benefit. TGI will then deduct the remaining balance (approximately $7.9 million) in 2010 with the full value of the remaining benefit (approximately $2.3 million) going to customers reflected as a reduction in revenue requirements in 2010.

The Parties agree that the acceleration of this benefit to customers was the result of tax planning actions taken by TGI and acknowledge that the agreed upon treatment set out above reflects customers receiving 100% of the value of the deductions of the SCP Landscaping costs. The intervenor Parties to this Agreement will not seek any additional recovery in respect of SCP Landscaping costs.

27. Overheads Capitalized

The Parties agree to a change in the overheads capitalized rate to 14 per cent of Gross O&M for 2010 and 2011 which reflects the approximate actual Overheads Capitalized rate for 2009.

28. International Financial Reporting Standards ("IFRS") 2010 Impact

Issue No. 4 in the Commission Panel's "Issues of Particular Concern to the Commission Panel" stated:

> "International Financial Reporting Standards ("IFRS") – no IFRS impact in 2010."

The Parties agree to defer the 2010 revenue requirement impact of IFRS to be recovered in rates in 2011 (relating specifically to capitalization of the current service portion of pension and OPEB related costs; capitalization of inspection costs; and timing of depreciation expense) up to a maximum of $1.0 million. Amounts, if any, over $1.0 million would be deferred and recovered in rates after 2011 based on the amortization approved by the Commission at that time.

PART III – REQUESTS UNCHANGED FROM THE APPLICATION

The Parties agree to the following items set out in this section, which are consistent with the proposals in TGI's Application.

29. Rate Proposals as per Application Part III, Section D .1 - Approvals Sought

The Parties agree to the following rate proposals, as set out in TGI's Application:

(a) Allocation of delivery margin rate changes - Annual margin increase allocated to variable (volumetric & demand) based delivery charges, with no change to fixed (basic and admin fee) charges in each year (Application Page 513, Item 1).

(b) Earnings Sharing Mechanism (ESM) rider (incl. end of term capital) - Change the ESM rate rider to be ($0.040)/GJ effective January 1st, 2010, and change the estimated ESM rate rider to be ($0.046)/GJ effective January 1st. 2011. ESM amount to include End of Term Capital phase out and to be amortized over two years. The final 2011 rider amount will be adjusted based on 2009 actual earnings. TGI will submit an application to change the 2011 ESM rate rider at the same time it submits its Q4 quarterly gas cost report in early December 2010 (Application Page 513, Item 3).

(c) Rate Stabilization Adjustment Mechanism (RSAM) rider - Change the RSAM rate rider to be ($0.053)/GJ effective January 1st, 2010 and change the estimated RSAM rate rider to be ($0.052)/GJ effective January 1st, 2011. The 2011 rider amount will be adjusted based on 2009 actual results and 2010 year to date actual results. TGI will submit an application to change the 2011 RSAM rate rider at the same time it submits its Q4 quarterly gas cost report in early December 2010 (Application - Page 514 Item 4).

30. <u>Accounting Policy Changes as per Application Part III, Section D.1 - Approvals Sought - to be effective January 1, 2010</u>

The Parties agree to the following accounting policy changes, as set out in TGI's Application:

(a) Training and Feasibility Study Costs to be treated as O&M expense, rather than capital (Application Page 515 and 516, Item 11).

(b) Capitalization of Major Inspection Costs, including the creation of a new Asset Class (Application Page 515 and 516, Item 11).

(c) Capitalization of the Current Service portion of Pensions and OPEBs expense that is applicable to capital projects (Application Page 515 and 516, Item 11).

(d) Capitalization of Deprecation on Assets used in Construction (Application Page 515 and 516, Item 11).

(e) All capital expenditures, including CPCNs, to be included in plant in service (and rate base) in the month following the available-for-use date, with depreciation starting at that time (Application Page 515 and 516, Item 11).

(f) Treatment of Vehicle Lease as a capital lease and inclusion of the NBV of vehicles in rate base (Application Page 515 and 516, Item 11).

(g) Discontinuation the Software Tax Credit as part of the CIAC additions (Application Page 515 and 516, Item 11).

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

31. Various Accounting Related Proposals as per Application Part III, Section D .1 - Approvals Sought effective January 1, 2010

The Parties agree to the following accounting related changes, as set out in TGI's Application:

(a) Adoption of the Cash Working Capital Lead/Lag Days as set out in the Lead/Lag study (Application page 515, Item 8c).

(b) Consolidated Core Market Administration Expenses (for TGI, TGVI and TGW), including allocation percentages to TGVI and TGW (Application page 515, Item 8d).

(c) Modify the Pricing Methodology for Company Use Gas to be based on market-based Sumas pricing, rather than pricing for expired "netback" contracts (Application page 514, Item 7a).

(d) The MCRA will absorb any volumes not used or excess volumes required for company use gas, as opposed to the O&M costs being adjusted for the differences (Application page 514, Item 7b).

32. Tariff Change Proposals as per Application Part III, Section D .1 - Approvals Sought, Item 12 & 13

The Parties agree to the following Tariff changes, as set out in TGI's Application:

(a) New NGV Transportation Service (RS 26)

(b) Revised Fee New Customer Application fee from $85 to $25

(c) Revised Fee Meter Testing fee from $30 to $60

33. Deferral Account Proposals as per Application Part III, Section D .1 - Approvals Sought, Item 10

The Parties agree to the continuation, modification or adoption of the following deferral accounts as set out in TGI's Application:

(a) Deferral Accounts - No Change:

i. CCRA, MCRA, RSAM, and associated Interest and Revelstoke Propane (Application pages 429 and 430, Items (1) (a), (1) (b), (1) (c), (1) (d), (1) (e)).

ii. NGV Conversion Grants (Application page 432, Item (2) (b)).

iii. Property Tax variance (Application page 433, Item (3) (a)).

iv. Insurance variance (Application page 433, Item (3) (b)).

~~CONFIDENTIAL~~
NEGOTIATED SETTLEMENT AGREEMENT
TERASEN GAS INC.
DATED THURSDAY, NOVEMBER 5

v. BCUC Levies variance (Application page 433, Item (3) (d)).

vi. Interest variance (Application page 434, Item (3) (e)).

vii. Olympic Security costs (Application page 434, Item (3) (g)).

viii. IFRS conversion costs (Application page 435, Item (3) (h)).

ix. Accounts Amortized in 2010 (Application page 438, Item (6) (a)).

x. SCP PST Reassessment (Application page 439, Item (6) (b)).

xi. Deferred Service Line Installation Fee (Application page 439, Item (6) (d)).

xii. ESM (Application page 440, Item (6) (e)).

(b) Deferral Accounts - Modified:

i. SCP Mitigation Revenues Variance Account - combine the two currently approved accounts into one account (Application page 431, Item (1) (f)).

ii. Pension & OPEB variance - modify to add OPEB (Application page 433, Item (3) (c)).

iii. Tax variance - broader (changes in tax laws, practices, reassessments) (Application page 434, Item (3) (f)).

iv. Pension and OPEB funding Differences - expand to include pension funding differences and include addition in rate base not net of tax (Application page 437, Item (5) (c)).

(c) Deferral Accounts - New:

i. Interest variance calculation on gas in storage inventory (Application page 434, Item (3) (e)).

ii. Costs of applications (CCE, ROE, RRA) (Application page 435, Item (4)).

iii. IFRS Transitional Deferral Account (Application page 435, Item (5) (a)).

iv. Gains and Losses on Asset Disposition (Application page 436, Item (5) (b)).

v. CCE CPCN Costs (incremental non-capital costs plus timing impacts) (Application page 437, Item (5) (d)).

vi. LILO Reassessment (Application page 439, Item (6) (c)).

34. Transfer Pricing Policy (TPP) and Code of Conduct (COC)

The Parties agree that the existing COC and TPP Policies will be maintained.

PART IV – REVISED FINANCIAL SCHEDULES

The revised Financial Schedules follow.

19
20 Note 1:
21 Terasen Gas is projecting a 2009 return on equity of 11.41%, which is 2.94% higher than
22 the allowed ROE of 8.47%. Under the earnings sharing mechanism, Terasen Gas is to share
23 equally with its customers, earnings variances between the authorized level of earnings as
24 determined annually under the settlement and the actual earnings of the utility. Accordingly,
25 customer's portion of the 2009 earnings surplus is $18.038 million. The detailed calculations
26 for 2009 are as follows:
27
28 After Tax surplus available for sharing = $858.965 million x (11.41% - 8.47%) = $25,254 million
29 Customers' 50% share (Net-of-Tax) = $12.627 million
30 Customers' 50% share (Pre-Tax) = $18.038 million

CALCULATION OF AMORTIZATION OF RSAM (RIDER 5)
FOR THE YEAR ENDING DECEMBER 31, 2010
($000s)

Particulars	2010 Volumes (TJ)	2011 Volumes (TJ)	2010 Amortization ($000s)	2011 Amortization ($000s)	2010 Amortization of RSAM Unit Rider ($/GJ)	2011 Amortization of RSAM Unit Rider ($/GJ)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
RSAM (Rider 5) Calculation						
Rate 1 - Residential	67,829.2	67,190.5			($0.053)	($0.052)
Rate 2 - Small Commercial	24,374.3	24,603.1			($0.053)	($0.052)
Rate 3 - Large Commercial	16,818.6	17,168.5			($0.053)	($0.052)
Rate 23 - Large Commercial Transportation	6,134.0	6,177.2			($0.053)	($0.052)
	115,156.1	115,139.3	($6,156)	($5,990) (1)		

(X-Ref - Tab C-13, Schedule 54; - Tab C-13, Schedule 55,sum of lines 6 & 7 and columns 8 & 9)

Note 1: RSAM Rider Change

Terasen Gas forecasts that there will be approximately -$5.6 million (net-of-tax) of RSAM additions by the end of 2009. After offsetting the 2009 RSAM Rider recovery, the RSAM account including interest is now projected to be a credit balance of $13,204,000 on a net-of-tax basis by the end of 2009. In accordance with the 2004-2009 Extended PBR Settlement, the RSAM balance is to be amortized over three years. Accordingly, the net-of-tax RSAM balance to be amortized in 2010 is a credit of $4,402,000. On a pre-tax basis, this amounts to $6,156,000 or a refund to the customer of $0.053/GJ, which is a $.054 reduction from the existing charge of $0.001/GJ. The corresponding 2011 refund to the customer is $0.052/GJ.

2010 Net-Of-Tax Amortization = 1/3 of Projected December 31, 2009 RSAM Balance
= 1/3 * ($-13,166 RSAM + $-38 RSAM Interest)
= 1/3 * $-13,204
= $-4,402 Net-of-tax amortization

2010 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
= $-4,402 / (1 - 28.5%)
= $-6,156

2011 Net-of-Tax Amortization = 1/2 of Projected December 31, 2010 RSAM Balance
= 1/2 * ($-8,777 RSAM + $-29 RSAM Interest)
= 1/2 * $-8,806
= $-4,402 Net-of-tax amortization

2011 Pre-Tax Amortization = Net-of-tax amortization / (1 - tax rate) + Amortization on Prior years' balances
= $-4,402 / (1 - 26.5%)
= $-5,990

Terasen Gas Inc. 2010-2011 Revenue Requirements Application
Negotiated Settlement Process
Issues of Particular Concern to the Commission Panel

In accordance with sections 3 and 9 of the Negotiated Settlement Process-Policy, Procedures and Guidelines, the Commission Panel has identified the following issues of particular concern that parties should be aware of during the negotiations:

1. EEC Program-TGI is to provide results of the programs approved by the EEC Decision and expectations for new programs before the Commission Panel will approve additional EEC program funding.

2. Natural Gas for Vehicles ("NGV")-if NGV is to proceed why should the natural gas ratepayer fund this initiative rather than Terasen's non-regulated businesses or the competitive market?

3. Biogas-to be reviewed by a CPCN which demonstrates market uptake of customers that are willing to pay the full cost.

4. International Financial Reporting Standards ("IFRS")-no IFRS impact in 2010.

5. 2010 Rate Changes-in the event that a 2010 rate reduction were to occur as a result of the negotiations, the current rates should remain unchanged and place the revenue surplus into a deferral account to apply against 2011 and future rate increases with a phase in amortization that strives for rate stability.

6. CPCN threshold-stay at $5million.

7. Unrealized losses in rate base-should some of these losses be to the shareholder? Parties should present a separate settlement package.

Re: Terasen Gas Inc. Revenue Requirements 2010-2011
Negotiated Settlement

This is to confirm that we are satisfied that the draft Settlement Agreement circulated by Mr. Thompson and Mr. Loski on November 5, 2009 accurately captures the consensus reached by the parties to the Negotiated Settlement Process in this proceeding, and that we have been instructed by our clients, BCOAPO et al., to endorse it.

Accordingly, we ask that the Commission incorporate it into a consent Order for the resolution of all issues in the Application.

Our only further comments, made here only "for the record" and in no way detracting from our clients' endorsement of the Settlement, concern the “Alternative Energy Solutions" addressed under heading 13 of the document. While we believe that the ultimately appropriate corporate and regulatory formats for these lines of business are subject-matters which may require eventual determination by the Commission, our clients are content with the treatment of these issues in the Settlement Agreement over its term, in that it provides a “firewall” to ensure that the utility’s natural gas distribution customers do not subsidize or otherwise contribute to these nascent programs through their rates.

Yours truly,

BC PUBLIC INTEREST ADVOCACY CENTRE

Attention: Erica M. Hamilton,
Commission Secretary

Dear Sirs/Mesdames:

Re: Terasen Gas Inc. ("Terasen") 2010 and 2011 Revenue Requirements and Delivery Rates Application, Project No. 3698562

We are counsel to the Commercial Energy Consumers Association of British Columbia (the "CEC"). We confirm that the CEC accepts the terms of the final version of the Negotiated Settlement Agreement on the above-noted Application circulated by Terasen on November 5, 2009 and have no comments on that draft.

The CEC thanks the Commission staff and facilitator, Terasen and the other customer representatives for their efforts during these negotiations.

If you have any questions regarding the foregoing, please do not hesitate to contact the undersigned.

Yours truly,

OWEN BIRD LAW CORPORATION

Mr. Philip Nakoneshny
Director of Rates and Finance
British Columbia Utilities Commission

RE: Negotiated Settlement Terasen Gas Inc. (TGI) Revenue Requirements Settlement 2010/2011

Dear Mr. Nakoneshny:

On November 5, 2009, TGI forwarded a Draft Agreement and requested that edits and comments be forwarded to TGI. Ministry of Energy, Mines and Petroleum Resources staff have reviewed the Draft Agreement and from a policy perspective, have an interest in 5 items:

11. Energy Efficiency and Conservation ("EEC") Funding for 2010
12. EEC Funding for 2011
13. Alternative Energy Solutions
14. Natural Gas for Vehicles
15. Biogas

Other components of the negotiated settlement such as capital cost structure, interest rates, depreciation rates, salvage values, etc., are outside the purview of the Ministry's interests in this agreement. However, we note that, in the future, Use per Customer Rates (8) and Industrial Demand Forecast (9) may be lower depending on the implementation of TGI's EEC programs.

The 2007 Energy Plan and Climate Action Plan, 2008 amendments to the *Utilities Commission Act,* Ministerial Order B.C. Reg. 326/2008, and the Ministry's involvement in the 2008/09 TGI/TGVI Energy Efficiency and Conservation Application indicate the Province's intent to require electric and natural gas utilities to pursue energy efficiency.

The Ministry is particularly pleased with the reallocation of funds for low income and rental housing programs to $2.4 million for 2010 and 2011. The Ministry also appreciates the increase in industrial energy efficiency program funding in 2011.

.../2

We believe there is great potential for a significant amount of this industrial funding to be applied collaboratively with existing demand side management programs at electric utilities, especially at BC Hydro, in order to minimize duplication of structural costs and to maximize energy savings benefits at industrial facilities.

Appropriate oversight of EEC funding is maintained through the TRC requirements and annual reporting to the Commission. As a result, the Ministry supports Option 12.1 (a) and (b) to maintain program continuity and effectiveness.

Alternative Energy Solutions is a new type of service that TGI proposes to offer to existing and new customers. Geo-exchange, solar-thermal and district energy systems offer the potential to reduce greenhouse gas emissions, and as such, the Ministry is encouraged that TGI is proposing to offer this new type of service.

The Ministry supports the expanded use of natural gas for vehicles (NGV) and biogass, and is encouraged that TGI intends to apply to the Commission for appropriate rates.

Sincerely,

Paul Wieringa

Philip Nakoneshny
Director of Rates and Finance
British Columbia Utilities Commission

Dear Philip

Terasen Gas Revenue Requirements Application-2010/2011
Negotiated Settlement

I write on behalf of Teck Coal.

Teck Coal participated in the Negotiated Settlement Process ("NSP"),facilitated by the Staff of the British Columbia Utilities Commission, and held in the offices of the Commission ,which commenced on October 21,2009.

Teck Coal in the negotiations took into consideration the 7 "Issues of Particular Concern to the Commission Panel ",as provided by the Commission Panel at the commencement of the negotiation.

Issue Number 5 stated " 2010 Rate Changes- in the event that a 2010 rate reduction were to occur as a result of the negotiations ,the current rates should remain unchanged and place the revenue surplus into a deferred account to apply against 2011 and future rate increases with a phase in amortization that strives for rate stability"

Teck Coal supports the Negotiated Settlement Agreement Package ("TGI NSP Agreement Package ") dated and circulated by Terasen Gas Inc incorporating a decrease of (1.73%) in the Fiscal Year commencing January 1,2010,previously an increase of 5.3%.and an increase of 3.93% in the Fiscal Year Commencing January 1,2011,previously an increase of 4.1% .

The Negotiated Settlement Agreement Package, incorporates ,amongst others,Issues of Particular Concern to the Commission Panel No. 5

Teck Coal recognizes and emphasizes that this Agreement is the product of compromise on the part of all Parties, yielding an overall package that the Parties consider to be fair, just and reasonable. The Parties agreed that any compromises resulting from this Agreement are without prejudice to the Parties¹ ability to take different positions after 2011 and without prejudice to the Parties right to intervene in any applications contemplated in or resulting from this Agreement.

Yours Truly

J.David Newlands

Negotiated Settlement Agreement
Letter of Comment

Commission staff participated in the settlement discussions that led to a Negotiated Settlement Agreement ("Settlement Agreement") being reached between Terasen Gas Inc. ("Terasen Gas") and the registered Intervenors (collectively, the "Parties") in accordance with the *Negotiated Settlement Process-Policy, Procedures and Guidelines, January 2001* ("NSP Guidelines"). Commission staff has informed the Parties that the agreements reached on certain issues were not supported by Commission staff and that Commission staff intended to submit a Letter of Comment in respect of those issues. The Parties agreed to Commission staff adopting that course.

There are three items in the Settlement Agreement that Commission staff do not support:

1. **Item 10-Inclusion of SCP Capacity in MCRA**

   Commission Order G-98-05 states that:
   "The Commission approves the debiting of the annual charge of $3.6 million (based on the monthly instalments) against the Midstream Cost Reconciliation Account, with an equal and offsetting amount to be credited to the delivery margin the revenue account for a limited period as a unique and unusual transaction in the circumstances of the SCP and the termination of the BC Hydro TSA. The debiting and the crediting will commence on either November 1, 2005 or January 1, 2006, as consistent with the amount of the BC Hydro/Terasen Inc. TSA revenue that Terasen Gas forecast in its Annual Review submission for 2005 and will end on the earlier of the November 1, 2010 or such other date as the Commission may determine."

   The Settlement Agreement continues to include the annual charge of $3.6 million against the MCRA with an offsetting credit to the delivery margin. In Commission staff's view, extending this treatment beyond November 1, 2010 as contemplated by Order G-98-05 requires a determination by the Commission Panel.

Commission staff accepts that such determination will occur if the Commission Panel approves the Settlement Agreement.

2. Item 13-Alternative Energy Solutions

Terasen Gas added 9 enhanced sales and business development staff in 2009 estimated to cost $1.35 million and proposes increases of $3.0 million in 2010 for an additional 10 enhanced sales and business development staff including $1.1 million for consultants and studies and a further $0.6 million in 2011 for 4 enhanced sales and business development staff (BCUC IR 1.72.2 and IR 2.96.2 to 2.96.4; IR 1.114.7). The number of customers are expected to increase between 1.0 to 1.1 percent from 2009 to 2011, but the level of spending in Customer Solutions and Services increases by 17 percent, 27 percent and 8 percent respectively from 2009 to 2011 (BCUC IR 1.96.3).

The New Energy Solutions Deferral Account is to capture direct costs, sales and marketing O&M and other development costs by timesheets or other direct charge and an overhead allocation. In Commission staff's view, due to the modest growth in customer additions from 2009 to 2011, the additional enhanced sales and business development staff were primarily hired in 2009 to 2011 to develop and market Alternative Energy Solutions. The use of timesheets, direct charges and overhead allocations may result in a proper reallocation of costs from the gas utility to the New Energy Solutions Deferral Account.

The down time or idle time that will likely be experienced while the Alternative Energy is being marketed may not be captured by the timesheet allocation and could remain as a cost to the gas utility. In Commission staff's view, it would be preferable to directly charge the fully loaded cost of the additional enhanced sales and business development staff and the costs of consultants and studies to the New Energy Solutions Deferral Account to avoid any of these costs being borne by natural gas customers.

If Terasen Gas is able to demonstrate that the use of timesheets, direct charges and overhead allocations would result in none of the costs that are incurred for Alternative Energy Solutions including down time and the costs of consultants and studies to be borne by gas customers, then Commission staff's concern is addressed.

3. Item 14-Natural Gas for Vehicles ("NGV")

Terasen Gas proposes to treat as general O&M, rather than track separately, NGV marketing and project development costs incurred prior to signing a contract with a customer for compression and refuelling service (BCUC IR 1.21.1).

Commission staff attempted to obtain information on the NGV marketing costs that are currently incurred through information requests, but were unsuccessful. In Commission staff's view, information on the incremental marketing costs being incurred will be required if Terasen Gas, during 2010 and 2011, applies

…/3

for approval of Rate Schedule 6 C NGV Compression and Refuelling Service and 6A NGV Refuelling Service , including recovery of the incremental marketing costs, and the Commission is to review the applications on a case-by-case basis as contemplated in the Settlement Agreement.

Yours truly,

Attention: Mr. Philip Nakoneshny, Director, Rates and Finance

Dear Mr. Nakoneshny:

Re: Terasen Gas Inc. ("Terasen Gas")
2010 and 2011 Revenue Requirements Application
Negotiated Settlement Agreement

On June 15, 2009, Terasen Gas filed its 2010 and 2011 Revenue Requirements Application, which was supplemented by a filing on July 9, 2009 and amended by filings on August 14 and September 18, 2009 (the "Application").

In accordance with Commission Order No. G-76-09 issued on June 19, 2009, a Workshop was held on July 6, 2009 for a review of the Application, a Procedural Conference was held on July 15, 2009, and Terasen Gas responded to two rounds of Information Requests. In accordance with Commission Order No. G-89-09 issued on July 20, 2009, a second Procedural Conference was held on September 25, 2009 and on October 2, 2009, the Commission issued Order G-119-09 establishing a Negotiated Settlement Process ("NSP") for the Application. In accordance with Order No. G-120-09, the NSP commenced on Wednesday, October 21, 2009 and concluded on Wednesday, November 4, 2009.

Terasen Gas has reviewed the attached settlement documents, including the Negotiated Settlement Agreement and associated financial schedules (collectively the "Negotiated Settlement") arising from the NSP. Terasen Gas recognizes the Negotiated Settlement as being the product of good faith compromises among parties with diverse interests in the issues raised by the Application. The Parties have expressly considered the Commission Panel's Issues. In fulfilling their role pursuant to the Commission's Negotiated Settlement Process Policy, Procedures and Guidelines (the "Guidelines"), Commission Staff made additional information available to the parties which they believed was in the public interest. The parties considered all such information in reaching the compromise Settlement Agreement and Terasen Gas considers the resulting Negotiated Settlement to be fair, just and reasonable. As the Negotiated Settlement represents compromises among the parties and an overall balance of interests, Terasen Gas stresses that the Negotiated Settlement should be considered as a package, with no part being severed unless otherwise stated in the Agreement. On that basis, Terasen Gas accepts the Negotiated Settlement.

Commission Staff have provided written comment on the NSP, and TGI responds to those comments below.

Terasen Gas

Inclusion of Southern Crossing Pipeline ("SCP") Capacity in the Midstream Cost Reconciliation Account ("MCRA"): TGI notes for reference that the evidence on the inclusion of the SCP costs in the MCRA is found in the Application on pages 314 to 315 and its response to BCUC IRs 1.68.1 and 2.92.1-7. The result of taking the approach in the Agreement is a lower delivery rate, all else equal, with an offsetting charge to the MCRA.

Alternative Energy Solutions (Geothermal/District Energy Systems and Solar Thermal): Staff's position on this issue turns on its view that, *"due to the modest growth in customer additions from 2009 to 2011, the additional enhanced sales and business development staff were primarily hired in 2009 to 2011 to develop and market Alternative Energy Solutions."* While that may be Staff's position, it is at odds with TGI's evidence. Staff's conclusion appears to rest on the notion that TGI could not truly require additional staff for marketing if there is only modest growth in customer additions, i.e. that there is a linear correlation between marketing effort and customer additions. TGI's evidence was that the competitive factors facing the gas business mean that it is necessary to invest more to maintain and grow the business, including the gas business.

Staff also identifies an issue relating to overhead allocation to the alternative energy class of service, so as to ensure gas customers are not bearing costs attributable to the pursuit of geothermal, solar thermal and district energy systems. The cost allocation methodology outlined in the Agreement is structured to avoid cross subsidization by gas customers. The Agreement contemplates a $500,000 annual overhead allocation to alternative energy solutions, and a corresponding reduction in overhead allocated to gas customers. This is a direct benefit to gas customers. As a point of comparison, the allocation of overhead to alternative energy solutions is approximately two times the allocation to Terasen Gas (Whistler) Inc., suggesting that the issue of overhead allocation is addressed adequately. The risk of non-recovery lies with TGI's shareholder, not gas customers. Notably, the gas customers themselves have endorsed the Agreement.

NGV Marketing Costs: TGI notes that it has an existing NGV tariff and the amount of NGV marketing costs in the revenue requirements for 2010 and 2011 is very modest (see TGI's responses to BCUC IR 1.21.2 (last paragraph) and BCUC IR 2.96.2). Issues relating to NGV have been deferred by the terms of the Settlement Agreement. TGI respectfully submits that there is no need for the Panel to address Staff's issue at this time.

TGI wishes to make one final comment relating to our procedural concerns regarding the publication of Staff's comments. Commission Staff unquestionably plays an important role during the confidential settlement discussions in providing information and assisting the parties, and providing a perspective regarding their view on the public interest. That role is one sanctioned by, and described in, the Commission's Guidelines. However, under the Guidelines (at page 8) Commission Staff is precluded from, "endorsing a particular position". TGI therefore questions whether the letter provided by Commission Staff is consistent with the Guidelines.

Terasen Gas

TGI respectfully submits that the requirement for the Commission Staff not to take positions on issues makes good sense. Commission Staff is not a party to the resulting Agreement; rather, the Negotiated Settlement Agreement is simply an agreement among intervenors and the applicant that a certain outcome is acceptable to them and should be jointly submitted for consideration by the Panel. In this case, the Agreement is clear that the Parties, having fully considered the information provided by Staff during the course of the NSP, have reached a compromise agreement that they consider to be in all respects fair, just and reasonable. As is inherent in every compromise, there will be outcomes about which a particular party was only supportive in exchange for other concessions. By commenting on the Agreement reached, Commission Staff places the parties in the position of having to justify individual items without being able to detail the steps that led to the outcome (which would not be appropriate in any event). It similarly places focus on isolated issues in the absence of the whole context of the negotiation that occurred in confidence. As a means of highlighting the difficulty this type of commentary creates, it is not possible for TGI to address in this letter Staff's statements about the information on NGV provided by TGI with reference to any additional information provided in the course of the confidential discussions.

To the extent that Staff has decided to make its views known on the present Agreement, TGI appreciates Staff having done so in a transparent manner; the alternative of having these views being conveyed in a non-transparent manner without any ability to respond would have been unpalatable. TGI nevertheless respectfully submits that the overall Settlement Agreement package should be assessed without isolating for consideration three issues where Staff might potentially have preferred a different outcome.

With that comment, Terasen Gas would like to express sincere thanks to Commission Staff and Intervenor representatives for their active participation in achieving this Negotiated Settlement Agreement on the Application. Terasen Gas also wishes to thank the NSP facilitator, Mr. Paul Cassidy, for his leadership, guidance and assistance to all parties throughout the NSP process.

If there are any questions regarding the attached, please contact the undersigned.

Yours very truly,

TERASEN GAS INC.

Tom A. Loski

cc (e-mail only): Parties to the NSP

Appendix D

BC ENERGY EFFICIENCY ACT STANDARDS

B.C. ENERGY EFFICIENCY ACT STANDARDS:

Gas Furnaces

MEMPR ENFORCEMENT BULLETIN 09-03

What products are you regulating? The British Columbia *Energy Efficiency Act (EEA)* Automatic operating gas-fired central forced-air furnaces that use propane or natural gas and have an input rate not exceeding 66 kW (225 000 Btu/h). The regulation applies to residential and commercial furnaces.

Are you forcing me to replace my furnace? No. The regulation only applies to purchases of new or replacement furnaces. Individuals can keep their existing furnaces for as long as they wish.

What is the regulated energy efficiency standard for those products? Such products must achieve an Annual Fuel Utilization Efficiency (AFUE) equal to or greater than 90%, as tested under the standard CSA P.2-07: *Testing Method for Measuring the Annual Fuel Utilization Efficiency of Residential Gas-fired Furnaces and Boilers*. These products are commonly known as "condensing furnaces."

When will the regulations take effect in British Columbia?
For furnaces for new residential construction and all commercial buildings: January 1, 2008.
Replacement furnaces in existing dwellings: December 31, 2009.

Can I sell my inventory of non-compliant products after the effective date? For furnaces for new residential construction, any products manufactured after January 1, 2008 must comply with the regulation.

For replacement furnaces, any products manufactured after December 31, 2009 must comply with the regulation. If you have unsold inventory of products manufactured before the effective date, they can still be sold legally in British Columbia after the effective date.

Are there any exemptions to these regulations? Furnaces for recreational vehicles are exempted from the regulation. The Ministry is also providing an extended timeline for "through the wall' furnaces. A through-the-wall gas furnace is a gas-fired furnace that is designed and marketed to be installed in an opening in an exterior wall that is fitted with a weatherized sleeve. For through-the-wall gas-fired furnaces only, the 90% AFUE standard will come into effect on December 31, 2012.

B.C. ENERGY EFFICIENCY ACT STANDARDS:

Gas Furnaces

BRITISH COLUMBIA
The Best Place on Earth

MEMPR ENFORCEMENT BULLETIN 09-03

How can I tell if a product is compliant with the energy efficiency regulations? Suppliers can demonstrate compliance with the standard by ensuring that the product is listed in the Natural Resources Canada furnace database, and that the database indicates an AFUE equal to, or greater than 90%: www.oee.nrcan.gc.ca/residential/business/manu¬facturers/search/gas-furnace-search.cfm?attr=4

Who enforces this regulation? The Ministry of Energy, Mines and Petroleum Resources is responsible for enforcing all regulated standards under the *EEA*.

What are the penalties for non-compliance? Under the *EEA*, the Ministry can conduct inspections to verify compliance with the *Act* and regulations. *EEA* enforcement begins with education and voluntary compliance measures. Ministry staff follow up on all complaints and other information respecting non-compliance, and communicate directly with industry participants to develop a compliance plan.

The Ministry can also seek to have those who have contravened the legislation charged under the *Offence Act*. An offence can result in fines up to $2,000.

What do I do if I see a non-compliant product for sale or distribution? Please circulate this enforcement bulletin to the retailer or distributor. You can also report infractions to Erik Kaye, Ministry of Energy, Mines and Petroleum Resources at 250-356-1507 or Erik.Kaye@gov.bc.ca

For more information on B.C.'s *Energy Efficiency Act*:
www.empr.gov.bc.ca/EAED/EnergyEfficiency/Pages/EEAct.aspx

B.C. ENERGY EFFICIENCY ACT STANDARDS:

Gas and Propane-Fired Water Heaters

MEMPR INFORMATION BULLETIN 09-05

What products are you regulating? Storage-type water heaters with a rated storage capacity of 76 to 380 litres and an input of 75 000 Btu/h or less, for use with natural gas or propane.

Are you forcing me to replace my water heater? No. The regulation applies to voluntary purchases of new or replacement water heaters. Individuals can keep their existing water heaters for as long as they wish.

What is the regulated energy efficiency standard for those products? The Energy Factor (EF) must be greater or equal to[1] :
0.70 – (0.0005×V)

Here are the new minimum EF levels for several common sizes:

Rated Storage Capacity in litres (US gallons)	Minimum Energy Factor
114 L (30 US gal)	0.64
151 L (40 US gal)	0.62
181 L (48 US gal)	0.61
189 L (50 US gal)	0.61
246 L (65 US gal)	0.58
283 L (75 US gal)	0.56

For a lookup table with all sizes, go to:
www.empr.gov.bc.ca/EAED/EnergyEfficiency/Pages/EEAct.aspx

When will the regulation take effect? September 1, 2010

Can I sell my inventory of non-compliant products after the effective date? Any water heaters manufactured after September 1, 2010 must comply with the regulation. If you have unsold inventory of products manufactured before the effective date, they can still be sold legally in British Columbia after the effective date.

How can I tell if a product is compliant with efficiency regulations? Suppliers can ensure compliance with the standard by stocking only products that meet the minimum EF level outlined above. If the manufacturer's product literature is not clear on this point, Natural Resources Canada has a gas water heater database which lists EF by model number, which can be found at www.oee.nrcan.gc.ca/residential/business/manufacturers/search/gas-water-heaters-search.cfm?attr=4

[1] In this equation, V is the water heater's rated storage capacity in litres, as tested under the standard *CAN/CSA-P.3-04: Testing Method for Measuring Energy Consumption and Determining Efficiencies of Gas-Fired Storage Water Heaters.*

Gas and Propane-Fired Water Heaters

MEMPR INFORMATION BULLETIN 09-05

Do ENERGY STAR water heaters meet the new standard?
As of September 1, 2010, all new ENERGY STAR water heaters will be compliant with the B.C. regulation. ENERGY STAR water heaters manufactured before September 1, 2010 may not meet the standard in all cases, please check the database referenced in the previous question to confirm. Note: the ENERGY STAR standard is the same for all water heater sizes, whereas the new B.C. requirements vary with the tank size.

Who enforces this regulation? The Ministry of Energy, Mines and Petroleum Resources is responsible for enforcing all regulated standards under the *EEA*.

What are the penalties for non-compliance? Under the *EEA,* the Ministry can conduct inspections to verify compliance with the *Act* and regulations. *EEA* enforcement begins with education and voluntary compliance measures. Ministry staff follow up on all complaints and other information respecting non-compliance, and communicate directly with industry participants to develop a compliance plan.

The Ministry can also seek to have those who have contravened the legislation charged under the *Offence Act.* An offence can result in fines up to $2,000.

What do I do if I see a non-compliant product for sale or distribution?
Please circulate this information bulletin to the retailer or distributor. You can also report infractions to Erik Kaye, Ministry of Energy, Mines and Petroleum Resources at 250-356-1507 or Erik.Kaye@gov.bc.ca.

For more information on B.C.'s *Energy Efficiency Act*:

Appendix F

LETTERS OF SUPPORT

March 22, 2011

Mr. Mark Grist,
FortisBC Energy Inc.
Manager Business Development
16705 Fraser Highway
Surrey B.C. V4N 0E8

Dear Mr. Grist,

The Commercial Energy Consumers ("CEC") Association of BC is writing to you at this point in time to communicate its views with respect to the provision of FortisBC Energy Inc. ("FEI") Energy Efficiency and Conservation ("EEC") funds to support the transition of diesel oil fuelled transportation markets to natural gas fuelled transportation, particularly for the trucking component of the transportation market.

The CEC has supported the provision of FEI's EEC funds to transforming the transportation market and continues to support FEI in allocating EEC funds to this purpose for one very simple reason; it is in the interest of FEI's customers, the ratepayers. The CEC believes all ratepayers and specifically the commercial ratepayers will benefit significantly from investing in the transformation of this market. The CEC has been supportive of FEI in moving to capture this opportunity for its customers and critical whenever the movement to capture this opportunity is moving too slowly or not being planned aggressively enough.

The CEC is putting forward this position to FEI because at the stakeholder workshop, held to discuss EEC programs, we were informed of issues arising from the recent interim decision of the BC Utilities Commission ("BCUC") with respect to the Waste Management contracts and initiative being undertaken by FEI. We understand from FEI that it is interested in stakeholder's views with respect to these initiatives and that FEI might like to include these views in its submissions to the Commission relative to its planned filing with the BCUC of FEI's 2010 Report on its EEC Programs.

We understand that the Commission's recent decision may have created some uncertainty with respect to FEI providing funds to support the Waste Management initiatives and potentially with respect to advancing the transformation of the trucking transportation markets in general. The CEC would like to see this uncertainty resolved as soon as possible. The CEC would therefore support a reconsideration of the decision leading to the uncertainty or any plan to have clarification and certainty returned to the FEI transportation market transformation initiatives. We understand that FEI believes that the best opportunity to seek the required certainty would be found in BCUC regulatory process considering the issues in conjunction with the FEI 2010 EEC Report. The CEC would therefore support any initiative by FEI or the BCUC to consider the funding issues as part of the FEI 2010 EEC Report filing.

The CEC has been an active participant in the original FEI EEC application made in 2008, has been an active participant in the 2010-2011 FEI Revenue Requirements Application (“RRA”) regulatory process, including being a signatory to the Negotiated Settlement Agreement (“NSA”) arising from that process, is involved in the current BCUC regulatory process considering the approval criteria for Natural Gas for Vehicles (“NGV”) initiatives and the CEC has attended all of the EEC stakeholder workshops held since FEI instituted these consultation processes in 2009. As a consequence the CEC believes that it is reasonably informed with respect to the issues involved.

Over the course of these various regulatory proceedings the CEC has come to understand the attractiveness of the FEI NGV Programs for all customers and specifically for the CEC commercial sector. The CEC would characterize the FEI approach with respect to its NGV initiatives as having been and continuing to be nothing but open and transparent. The CEC believes that FEI has worked diligently to build understanding and support for its NGV initiatives. The CEC has directly been involved in the regulatory processes, in which the CEC believed that FEI was being provided the CEC support and consent to both pursue these NGV initiatives and to fund these initiatives from EEC funds. The CEC is precluded (as a consequence of confidentiality provisions) from discussing the specific content of discussion in a Negotiated Settlement Process (“NSP”) but may disclose its own positions at any time. The CEC believes that its sign off with respect to the RRA NSA carried the weight of its support for FEI providing funding for its NGV initiatives. Specifically the CEC believes that item 14 of the NSA supports the fuelling and transportation services to be provided and that item 11 of the NSA supports the funding envelope for the Innovative technologies for 2010-2011. The CEC in stakeholder consultation both in group processes and in numerous other consultations FEI has provided the CEC the opportunity for input, has consistently voiced the view that the NGV opportunity needs to be pursued vigorously. The CEC notes that FEI has also been cautious to ensure that it is trying to pursue these opportunities prudently and has taken the time to do so in a number of ways. The CEC believes that the current uncertainty may arise as from a perspective on a technicality with regard to FEI’s ability to provide funding for the NGV programs. The CEC believes that substance should trump technicality, although the CEC with respect supports FEI’s efforts to review the issues.

In substance, the CEC believes that the FEI NGV initiatives have a positive Total Resource Cost (“TRC”) both independently and as part of the FEI EEC programs. The CEC believes that funding from the Innovative Technologies Program (“ITP”) exceeds a TRC of 1 when including the NGV funding. The CEC understands that the NGV initiatives result in environmental reduction of greenhouse gases emissions from transportation use of fuel. Where this can be done with a positive TRC the CEC is particularly supportive and has expressed strong support for this strategic direction of FEI.

The CEC understand that whether it is dealing with BC Hydro (“BCH”) Electricity Conservation and Efficiency (“ECE”) programs or the FEI EEC programs that the fundamental principle has not been to micro-manage every program and every component of the program for basic regulatory efficiency reasons. The CEC believes that FEI has the ability to make changes, refinements or even switches of specific funding activity from the submissions it makes with respect to EEC programs at any given point in time. The CEC believes that FEI can be held accountable for the prudence of its management in after the fact review processes enabled by the BCUC regulatory processes. The CEC believes that the TRC test accountability as well as the specific program reporting accountability and the frequent stakeholder consultation opportunities the CEC is engaged in provide an ample framework for ensuring that FEI is at risk and accountable for its decisions with respect to the prudent management of the EEC funds.

The CEC believes that it has sufficient access to regulatory processes to ensure that customer perspectives are incorporated into the BCUC's final decisions with respect to the public interest. In this case the CEC believes that the FEI NGV activities are substantially in the public interest and that prolonged uncertainty with respect to funding would be counterproductive to the best interest of the ratepayers.

The CEC supports the use of EEC funds for FEI's NGV programs specifically understanding that these funds are recovered through the delivery margin from ratepayers and not directly from specific rates charged to NGV users. The CEC supports this because tf the contribution it believes this program may provide to all customers as a strategic direction for FEI and its customers.

The CEC will support whatever process FEI or the BCUC take in regard to obtaining an early resolution of the uncertainties arising from the Waste Management interim decision and specifically the FEI initiative to have these issues considered as part of its 2010 EEC Report filing. The CEC will support and participate fully in any expedited process to achieve an early resolution to the uncertainty, because the CEC believes that commercialization initiatives need the nurturing of appropriate degrees of certainty to ensure that the benefits can be developed and captured for the FEI customers and specifically those the CEC represents.

Yours truly,

David Craig
Executive Director
Commercial Energy Consumers

21 March 2011

To:
Shawn Hill,
FortisBC
Vancouver, BC
By email: shawn.hill@fortisbc.com

Dear Shawn,

Re: FortisBC's Energy Efficiency and Conservation Plan Annual Report

This is to confirm that, as an active participant in the 2009 Energy Efficiency and Conservation Application of Terasen Gas, and a current member of FortisBC's EEC Stakeholder Group, the BC Sustainable Energy Association supports the use of FortisBC's EEC program to incent the purchase of heavy duty NGVs in place of diesel-powered vehicles where cost effective, primarily because of the greenhouse gas emissions reductions benefits. (BCSEA does not support incentives for fuel switching toward natural gas in the *passenger* vehicle sector, where hybrid and plug-in electric vehicles are on the cusp of achieving substantial market penetration.) BCSEA believes that using EEC monies in this instance is consistent with the objectives of the *Clean Energy Act* and other government policies on energy efficiency and greenhouse gas reductions.

Regards,

Thomas Hackney,
Vice-President for Policy

RE: EEC Funding of NGVs

Dear Mr. Bennett:

This letter is to confirm that The City of Vancouver has been a participant in stakeholder review sessions held by FortisBC regarding Energy Efficiency and Conservation (EEC) programs. We confirm that two stakeholder review sessions were held in 2010 (March and November) and that NGV programs were presented and discussed at these sessions. The City of Vancouver supports the continuation of the program to provide NGV incentives for heavy duty vehicle applications as adoption of NGVs in these markets provides GHG reductions and fuel cost savings to operators of NGVs.

Sincerely yours,

Sean Pander

Re: Letter of Support - Stakeholder Review of FortisBC EEC Programs

Dear Mr. Grist:

Further to our discussions at the EEC Stakeholder meeting held on March 15, 2010, the BC Apartment Owners & Managers Association (BCAOMA) would like to express its support for the use of Energy Efficiency & Conservation program incentives to encourage the use of Natural Gas Vehicles within BC's heavy duty transportation markets. The BCAOMA participated in stakeholder review sessions organized by FortisBC and had the opportunity to review and comment on the planned use of incentives to encourage the adoption of NGVs. During the November 24, 2010 session FortisBC provided a detailed presentation on the NGV program for BC, including the proposed use of EEC funding under the Innovative Technologies program. This presentation was favourably received by the stakeholder group. The BCAOMA believes that this consultation process meets the "Accountability Measures" defined in the Commission EEC Approval Decision G-36-09 and supports FortisBC's view that it has the necessary approvals to proceed with the NGV incentive program. The BCAOMA support this program as it has significant potential to reduce GHG emissions in the transportation sector while providing delivery rate revenues that will benefit all users of the FortisBC system.

Sincerely yours,

Marg Gordon

Fraser Basin Council

March 23, 2011

Mark Grist
Manager, Business Development
Fortis BC
16705 Fraser Highway
Surrey, B.C. V4N 0E8

Dear Mark,

I am writing in followup to the meeting of Fortis BC Energy Efficiency and Conservation Stakeholder Meeting on March 15, 2011.

The Fraser Basin Council is a non-profit organization with a mandate of advancing sustainability in British Columbia, with a focus on the Fraser River watershed. We participate in the Fortis BC EEC Stakeholder sessions, as one of our strategic priorities in action on climate change and air quality.

Over the past six years, one component of FBC's climate change work has been to engage public and private sector vehicle fleets on emissions reduction activities, as a key leadership area in the transportation sector. This includes the delivery of a national green rating system – E3 Fleet – that provides third-party green certification of vehicle fleets. We have over 100 members in the program across Canada. We are technology and fuel neutral, and work with leading fleets to implement a variety of practices that reduce emissions and fuel costs.

Through our involvement in the EEC Stakeholder group over the past two years, we have been informed of Fortis BC's ongoing plans to provide incentives for natural gas vehicles (NGVs) and interest in providing natural gas compression and refueling service. We are supportive of this effort by Fortis BC to provide incentives for NGV purchase, and are also supportive of Fortis BC providing natural gas compression and refueling service. We have noticed, based on recent unsolicited calls from fleets, that there is growing interest amongst the fleets that we work with in exploring the use of natural gas as one means for reducing emissions. We also know that incentives are required to assist in overcoming the barrier of increased capital cost for NGVs. In addition, our experience in working with fleets is that in many cases there is a need for third-parties such as Fortis BC who can provide refueling services.

If you have any questions, please do not hesitate to contact me at 604-488-5359 or via email at jvanderwal@fraserbasin.bc.ca.

Sincerely ,

Jim Vanderwal

Appendix G

CONTRACTOR STUDY QUALITATIVE REPORT

Terasen Contractor Telephone Interviews

Summary Of Findings

February 2011

Table Of Contents

Background And Objectives

BACKGROUND

A number of Energy Efficiency (EE) programs have been developed to encourage residential and commercial users to reduce their energy consumption. One such program is LiveSmart BC, a joint retrofit incentive initiative between FortisBC, Terasen Gas (Terasen), BC Hydro and the Ministry of Energy.

The success of these programs depends on both contractor and homeowner participation. New programs are being developed to educate and provide information to contractors and building trades. Stakeholders such as Terasen and LiveSmart BC partners are interested in understanding how to:

- Disseminate program information to those in the building industry;
- Assist or train contractors and trades to promote energy efficiency programs to homeowners; and,
- Use views and feedback from industry professionals for program development.

Methodology

METHODOLOGY

Study partners had a large number of information needs, so a qualitative phase was added to supplement the planned quantitative survey. This report summarizes findings from the qualitative in-depth interviews.

- 15 telephone interviews were conducted in December 2010 and January 2011 with contractors involved in the home building or renovation field. Contractors represented the following industries: insulation, glass, plumbing, and heating (both natural gas and electric).
- Interviewees were scheduled by a professionally trained recruiter using a screening questionnaire. Interviewees were paid a cash incentive for their involvement in this study.
- Interviews were between 30 minutes and 75 minutes in duration.
- All interviews were conducted by Anne Jacox of Cue Research.

Summary Of Findings (1)

The following observations surfaced from the qualitative phase. While they are not meant to serve as conclusive findings about all contractors, they provide a number of insights that can inform the future quantitative study.

Contractors' Involvement in Energy Efficiency (EE) Inventive Programs

- As they stand, current EE Incentive programs are not compelling enough for contractors to become fully engaged. Participants suggest that programs need to offer a greater value proposition for contractors to get involved.
- A key barrier to contractors' participation in EE Incentive programs appears to be their feeling that the rewards do not compensate sufficiently for the time and energy invested – both the added un-billable time with the customer, and extra time completing paperwork. Strategies that reduce the time required will be very important to gain contractors' full involvement. This could amount to simplified paperwork, or simplified programs that are easier for contractors to learn about and communicate to consumers
- A second key barrier to contractors' full involvement is their reluctance to promote programs that are constantly changing or may end abruptly. Several mentioned the unexpected withdrawal of federal government rebate programs that gave customers a large discount on a new furnace. Other programs offer much lower incentives and contractors fear the parameters might change without their knowledge. Because of this, contractors tend to avoid giving their input altogether, often advising customers to learn more from the program website directly. Given the importance of contractors' influence in consumers' decision making, creating more stable, enduring programs, and developing more effective methods for contractors to communicate these program offerings to consumers is recommended.

Summary Of Findings (2)

Customers' Involvement In EE Incentive Programs

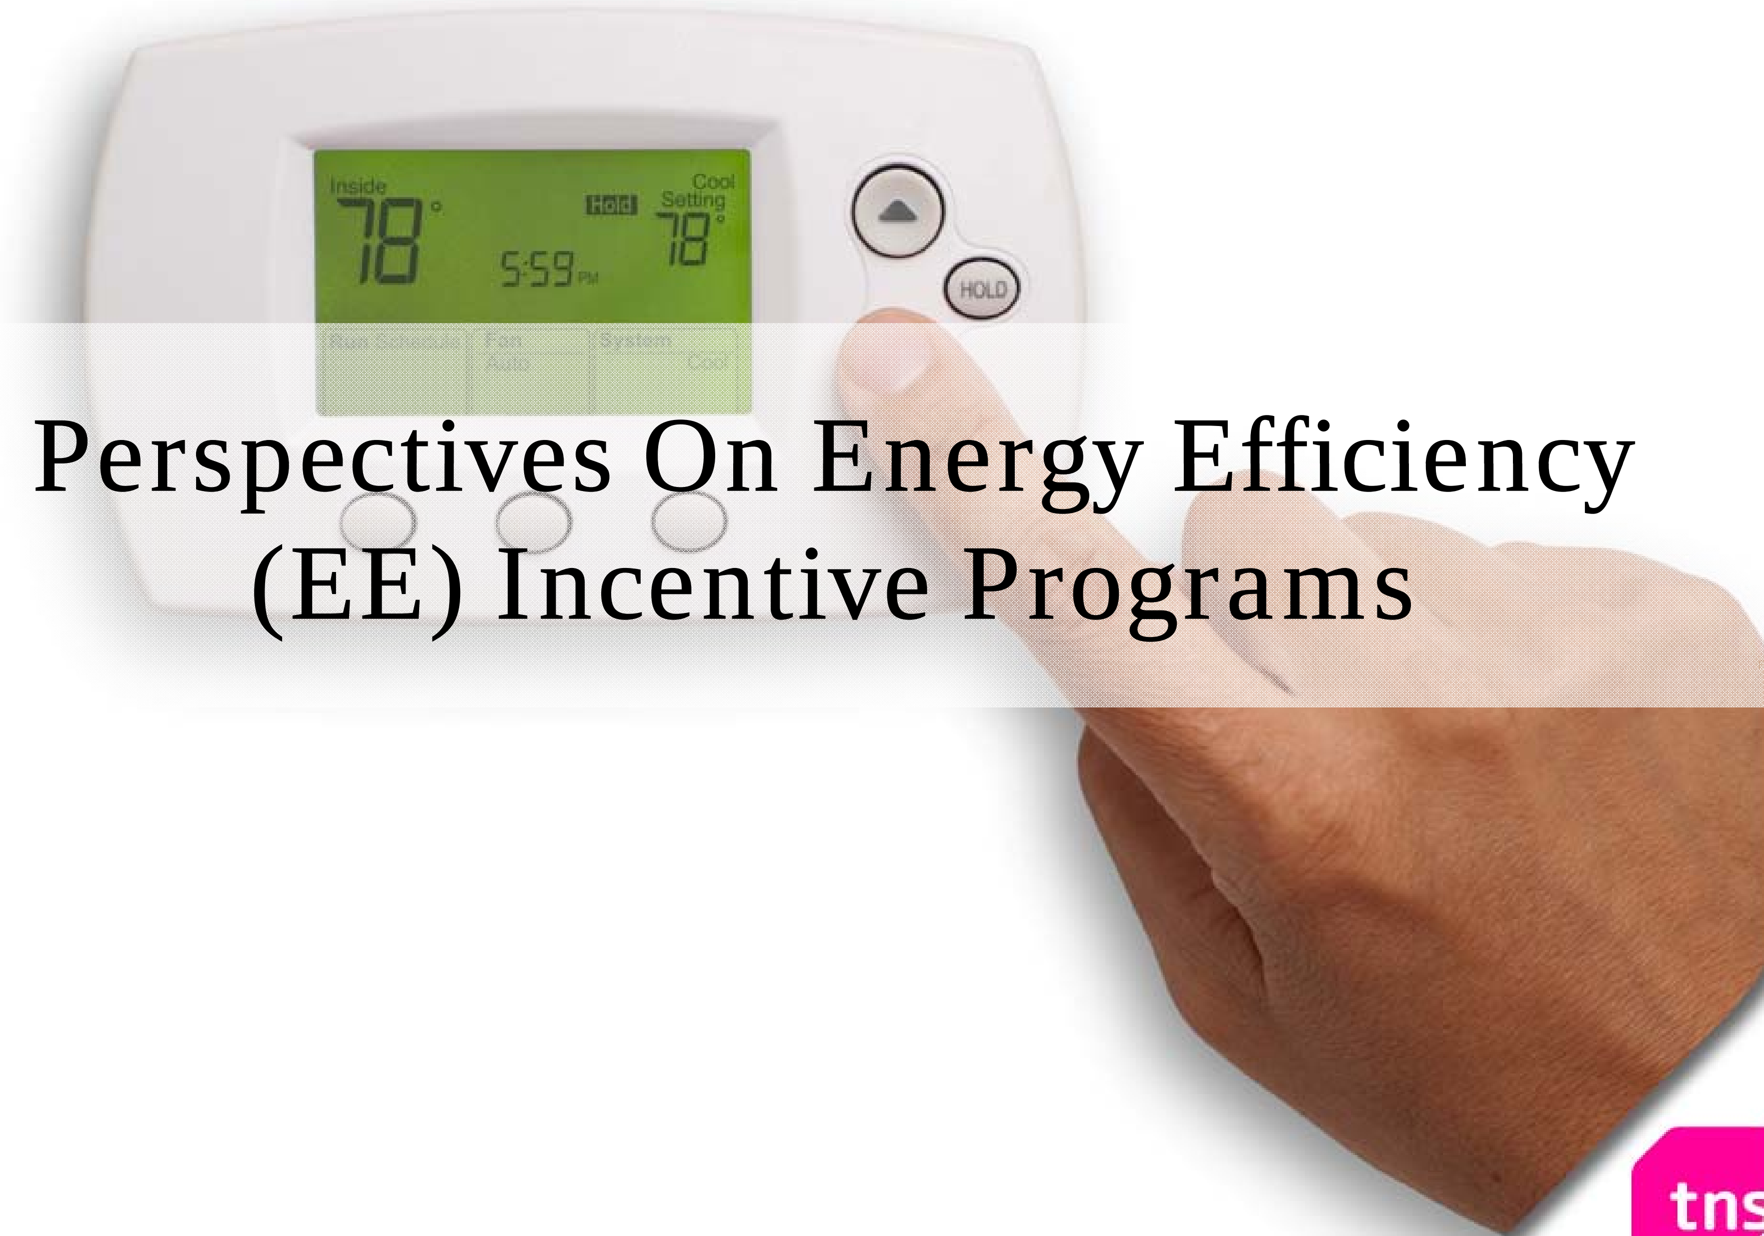
- Some contractors feel that current programs do not offer enough value to customers due to the cost of home inspection, time required for pre- and post-inspections, and paperwork required.
- They feel that EE Incentive programs *can* be of significant value to the customer, if the programs offer enough of a financial incentive.
- Contractors suggest that good EE Incentive programs should specify a deadline that motivates action. Some suggest that significant rebates toward new appliances would be the most sought-after reward for an EE Incentive program.

Communications

- To learn about EE Incentive programs, contractors recommend either emails that are specific to these programs or a forum where they could meet face-to-face and ask questions (e.g., BC Safety Authority meetings).
- The easier these programs are to communicate, the more likely they are to gain contractors' involvement in promoting them. Time (in educating customers) is money to contractors. Materials that expedite the communications process are desirable, such as brochures. Websites seem to be an expectation, and serve as an important tool for addressing consumers questions.
- Most contractors do have an advertising budget, although word of mouth is very strong in their industries.

Training And Upgrading

- While some would like opportunities to upgrade their skills, they seem opposed to training sessions that focus on marketing and sales of products or programs. Training programs that offer genuine and relevant skills would be of interest to some of the contractors.



Perspectives On Energy Efficiency (EE) Incentive Programs

Awareness Of EE Incentive Programs

Contractors

- Contractors become aware of EE incentive programs through a variety of sources:
  - Manufacturers
  - Suppliers
  - Customers
  - Other contractors
  - Brochures, newsletters
  - Their marketing consultant
- Many of the contractors involved in this study were vague about specific EE incentive programs that are available. Although they stated they are aware of EE programs, many feel they are not up to date on the availability of current offerings.

Customers

- Contractors are sometimes the source of information for the customer in creating awareness of EE incentive programs.
- Contractors sometimes offer the customer a brochure (if they have it available), but are more likely to direct the customer to the appropriate website in order to learn about the incentive program requirements themselves.

Value Of EE Incentive Programs

- While many of the interview participants feel that EE incentive programs are no longer of value, discussions indicate they can be of value if they meet one or more of the following criteria:
  - They provide enough of an incentive to motivate the customer to action, i.e., purchase a new product rather than repair an existing product.
  - The program has a specific time frame (i.e., closing date) as this further motivates the consumer to make a decision, and, they know the program will not be unexpectedly halted.
  - The incentive is of enough value (i.e., creates good business for the contractor and saves the customer money).

Barriers To Contractor Participation

- **Number of incentive programs / changes to incentive programs** – some contractors indicated that EE incentive programs are rapidly changing, hence, it is difficult to keep abreast of what is currently being offered. Many also feel that the low savings or rebate results in them being less interested in keeping current with these programs.
- **Lack of value to contractor** – many of the smaller incentive programs are not worth the contractors' efforts in filling out the required paperwork. This takes time away from the work they are getting paid for, hence, it is often not worthwhile for them.
- **Lack of value to customer** – some customers feel the incentives are too low, or are simply not interested in finding out all of the details due to the perceived low value.
- **Administrative requirements** – current incentive programs are more complicated and require more paperwork than the original ones that had larger incentives.
- **Time commitment** – due to the amount of paperwork and the need to go through the paperwork with the clients, contractors find incentive programs add time to each call, and this is time that they are not making any money on.
- **Awareness of current programs being offered** – because there are more and more incentive programs, and they keep changing, contractors are often not comfortable in being the source of information for the customer. They do not want the responsibility of ensuring the information they are providing to the customer is up-to-date, hence, they will direct the customer to a website rather than becoming involved.
- **Not relevant to their business** – many contractors feel that these programs are not relevant to their business, for example, insulation contractors generally feel that once the customer is ready for their service, they have already assessed available programs and included them in the work they request.

Perceived Barriers To Customer Participation

- **Lack of interest/value** – some incentive programs are of low value to the customer, hence, consumers are unwilling to find out all of the program information.
- **Higher cost of equipment** – programs that require new appliances, such as a high efficiency furnace, are often not desirable due to the high cost of this product, the high cost of gas, and the feeling that the furnace will cost more in repairs once the warranty expires.
- **HST** – a number of contractors indicated that sales in general have fallen as customers are reluctant to purchase a high cost appliance (e.g., high efficiency furnace) when there is question as to whether there will be a referendum on HST.
- **Additional costs** – other incentive programs have a cost associated with them to the customer, e.g., having an inspection of the home requires additional funds.
- **Confusion** – most customers are confused about the incentive program requirements and need assistance from the contractor in order to fulfill program requirements.
- **Amount of work required** – some feel there is just too much work required in order to find out about the program and gather and submit the necessary paperwork.
- **Skepticism** – some are skeptical of these programs feeling that utility costs are high and these programs are not going to reduce the high cost of their daily living. One contractor stated that consumers are increasingly complaining about the high cost of their utility bills and wondering why these companies cannot reflect incentives in the monthly cost of their bills, rather than requiring them to do additional work to get rebates.

Communications Of Energy Efficiency Programs

Preferred Means Of Communications

- Most of the contractors who participated in this study suggested that brochures that come in the mail are the preferred means of getting information to them. However, their awareness in regard to specific programs, or details of the programs, suggests that they might not read this information closely.

- Some indicate that the best means of communicating with them is in a forum where they could meet face to face, have the information explained, and have the opportunity to ask questions. One respondent stated that a representative of a utility company attending one of their industry safety meetings might be an appropriate venue. He also suggested that most contractors would show up if a free lunch was included.

- Some feel that email is the best means of communicating program information; particularly if the email is specific to incentive programs and brief enough to highlight the key information. The email might also include attachments that could be printed for distribution to customers.

- Any information that is viewed as an asset to their business (e.g., something that will aid in generating new business or making a profit) will be welcomed by contractors. Manufacturers are felt to be a valued source of information as they provide sessions to familiarize contractors with their products, provide trouble-shooting support, and offer promotions (e.g., cash back) that the contractor can use to give the customer a discount, give the customer a free product such as a thermostat, or simply use the cash to enhance their profit on the job.

Desirable Support Materials

- The following were suggested by some contractors as desirable support materials (materials they could have available for their customers) :
  - Website address; and,
  - Brochures – with pictures and bullet form information (concise, limited).
- One contractor suggested that a website to direct customers to is best, as the frequency of changes to programs is too rapid for him to become aware of, and he does not want to be responsible for providing inaccurate information to the customer.
- Some contractors indicated they would provide brochures to customers if they had them available.
- It should be noted that contractors really want the customer to assume responsibility for these incentive programs, as they do not want to add un-billable time to each project in order to educate the customers. However, they strive for customer satisfaction, hence, would like to be able to quickly give the customer information that might enhance their image as a service provider.

Contractors' Advertising

- Most have an advertising budget and the size of that budget varies considerably.
- Many use the Yellow Pages and a website to promote their business. Some will also take advantage of opportunities they are presented with, such as a deal on flyer distribution to neighbourhoods.
- Most are not really sure what the impact of their advertising is having, so will try different methodologies (that are low cost), or stick to what they have been doing.
- Word-of-mouth tends to be strong in this industry.

Co-op Advertising:

- Most contractors would be interested in any type of co-op advertising they felt would enhance their business. Brochures that are linked to utility companies (by having the utility company and contractor logo on them) are felt to be appealing as the utility endorsement would lend credibility to the contractor and provide an information piece that could be left with the customer.

Perspectives On Training And Upgrading

Training And Upgrading

- Attitudes toward training and upgrading vary substantially. Some are very interested in any training that will benefit their skills, aid in making recommendations to their customers, and keep them abreast of new technologies or techniques relevant to their field. Hands-on training is of particular value to these individuals. In other words, if the training will add value to the product they offer, and in turn, increase sales, they are interested.
- There are concerns that training offered through utility companies might be related to marketing and sales of products or programs. There is no interest in this type of training.
- Some recognize the need for on-going training and upgrading, stating that the technology is continually changing. As one interviewee stated, *"plumbers used to be able to handle any heating problems, but heating is increasingly becoming an area of specialization."* However, their time is limited as training means time in which they are not making money. Manufacturer training sessions are valued as it is specific to the products they are dealing with.
- Most indicate that they do not want these sessions to be longer than half a day (they are really looking for information sessions, rather than training sessions).
- Interest in training and upgrading varies according to:
  - The age of the contractor (e.g., how close to retirement he is, whether he is looking for new business).
  - The number of employees in the business.
  - How specialized the business is (e.g., some feel that they have such an exclusive product that new training would not benefit them).
  - The type of customer they have (e.g., if the customer has no concerns regarding the cost of a project, or if the customer has a lot of concerns about minimizing the cost of a project).

Certification

- Very few indicated they would be interested in additional certification, as this would not benefit their business or their customers.
- One interviewee indicated he would be interested in additional certification as any added credentials increase the credibility of the company to his customers, hence, an asset to business sales.

Information Needs

- Most contractors are more than satisfied with the amount of information they receive from industry association newsletters and magazines that are specifically tailored to the needs of their profession. In fact, many have difficulty keeping up with the printed materials they currently receive.
- Contractors are more likely to gain new technology information and other insights from the following sources:
  - Manufacturers;
  - Trade publications;
  - People they work with; and,
  - Other trades workers.

the sixth sense of business™

Appendix H

EEC STAKEHOLDER GROUP

EEC Stakeholder Group

The Companies recognized the need for accountability in the EEC Application and proposed to form and engage an EEC Stakeholder Group. The objectives of the EEC Stakeholder Group are to guide and provide input on EEC activity. The corresponding agenda, priorities, presentations, and minutes from the March 11, 2010 and November 24, 2010 meetings are included in the Appendix.

List of EEC Stakeholder Members (as of March 15, 2011)

Member	Organization	Title
Marg Gordon	B.C. Apartment Owners and Managers Association	Chief Executive Officer
Steve Hobson	BC Hydro	Director Power Smart
Rob Noel	BC Mechanical Contractors Assoc	Commercial contractors
Mary McWilliam	BC Non Profit Housing Association	Director of Strategic Energy Management
Jim Quail	BC Public Interest Advocacy Centre	Executive Director
Erik Skehor	BC Safety Authority	Operations Manager
Tom Hackney	BC Sustainable Energy Association	Vice-President of Policy
Alison Richter	BC Utilities Commission	Regulatory Analyst - First Nations and Sustainability
MJ Whitemarsh	Canadian Home Builders' Association of BC	President
Craig Williams	Canadian Manufacturers and Exporters	Vice President
Mike Todd	Canfor Pulp	Energy Manager
Stuart Gairns	Canfor Pulp	PGI Energy Leader
Mark Hartman	City of Vancouver	Buildings Energy Programs Manager
Tony Gioventu	Condominium Home Owners' Association	Executive Director
David Craig	Consolidated Management Consultants	President
Joan Huzar	Consumers Council of Canada	
Dan Pasacreta	Crosby Property Managements, Ltd	Licensed Strata Agent
Keith Veerman	FortisBC Inc.	Manager-Energy Efficiency
Bob Purdy	Fraser Basin Council	Director, External Relations & Corporate Development
Amy Spencer-Chubey	Greater Vancouver Home Builders' Association	Director of Government Relations
Gord Monro	Heating, Refrigeration and Air Conditioning Institute of Canada	Contractor Division BC Regional
Richard Siegenthaler	Hemmera	Renewable Energy Specialist
Bruce Macgowan	IBC Technologies Inc.	President
Andrew Pape-Salmon	Ministry of Energy and Mines	Director Energy Efficiency Branch
Nir Kushnir	National Energy Equipment	General Manager, Trane
Elizabeth	Natural Resources Canada	Senior Officer, Stakeholder

Westbrook		Relations
Nina Winham	New Climate Strategies	Consultant and Rate 1 customer
Al Kemp	Rental Owners and Managers Society of BC	CEO
Cindy Stern	Tseshaht First Nation	Chief Operating Officer
Jeff Fischer	Urban Development Institute	Deputy Executive Director

EEC Stakeholder Meeting Agenda
March 11, 2010
Hyatt Hotel
655 Burrard St, Vancouver – Stanley Room

9:30 - 9:45	Registration (coffee served)
9:45 - 10:00	Welcome and Agenda
10:00 - 10:15	Roundtable Introduction
10:15 -11:15	Stakeholder Workshop: Sharing goals and priorities
11:15 – 11.30	TG topic: Alternative Energies Solutions
11:30 – 12:00	TG topic: Innovative Technologies
12.00 – 12.45	Lunch
12.45 – 14:00	2009 Annual report review and 2010 Update
14:00 -14:15	Break
14:15-15:00	Stakeholder Dialogue: Setting Action
15:00-15:15	Closing

Terasen Gas Energy Efficiency & Conservation Stakeholder Meeting
March 11, 2010

Attendees

Al Kemp, Rental Owners and Managers Society of BC
Alison Richter, British Columbia Utilities Commission, Regulatory Analyst – First Nations and Sustainability
Amy Spencer-Chubey – Greater Vancouver Home Builders' Association, Director of Government Relations
Bob Purdy, Fraser Basin Council
Bruce Macgowan - IBC Technologies
Cindy Stern – Tseshaht First Nation, CEO
Dan Pasacreta – Crosby Property Management, Licensed Strata Agent
David Craig- Consolidated Management Consultants, President
Elizabeth Westbrook-Trenholm, Natural Resources Canada, Office of Energy Efficiency, Stakeholder Relations
Erik Kaye – Ministry of Energy, Mines, and Petroleum Resources, Acting Manager, Energy Efficiency Policy
Jeff Fischer, Urban Development Institute, Deputy Executive Director
Jen Richards – City of Vancouver, Sustainability, Program Assistant
Joan Huzar, Consumers Council of Canada
Marg Gordon, BC Apartment Owners and Managers' Association
Mark Warren – FortisBC
Nina Winham, New Climate Strategies; Terasen Gas rate 1 customers
Nir Kushnir – National Energy Equipment, General Manager (Trane)
Steve Hobson – BC Hydro, Director Power Smart
Wayne Lock, BC Safety Authority, Gas Operations Manager

Regrets
Eugene Kung, BC Public Interest Advocacy Centre, Barrister & Solicitor
Mark Hartman, City of Vancouver Sustainability, Building Energy Programs Manager
Marni Vistisen, City of Prince George, Energy Manager
Rob Noel – BC Mechanical Contractors Association, Commercial Contractors
Vanessa Joehl – CHBA-BC, Built Green BC Program Administrator

Terasen Gas Staff

Beth Ringdahl	Ned Georgy
Jenny Chia	Ramsay Cook
Ken Ross	Sarah Smith
Gary Lengle	John Turner
Michelle Petrusevich	Doug Tufts
Arvind Ramakrishhnan	Mark Grist
Shawn Hill	

John Turner
Alternative Energy Solutions

(no questions)

Doug Tufts
Arvind Ramakrishhnan
Innovative Technologies

Q: Do programs have to be for upgrading?
: Solar can be for new or retrofit; hydronic, new; NGVs can be converted

Q: Why is there less money for TGVI?
a. Dollars is proportionally based on the # of customers we have on TGVI

Q: Referring to the City of Vancouver example, if I understand correctly, if solar is required in regulation, then Terasen is not going to fund it, is that the position?
a. The new buildings just have to be solar ready (ie. Piping), but don' t have to have the solar system installed
b. Utilities cannot provide incentive if it is regulated

Discussion on free riders
Q: What about municipal regulations?

a. Utilities still might advance adoption of regulation but if customer had to put one in, it would be hard to argue that utility incentive had any help with that.
b. Provincially, government is also trying to raise the bar to meet municipal regulations and not have widely diverse buildings. It's a whole market transformation and not just in isolation.
c. Terasen can comment on municipal policies and how affect programs

---

Michelle Petrusevich
Structure and Overview of EEC report

(no questions)

Beth Ringdahl
Residential Programs

Scrap It Furnace – need to get stakeholder feedback on program and need to see what market is like for mid-efficient furnaces

Switch 'n' Shrink – under Fuel Switching in the report. 70% of the participants are from TGVI

Whole Home program – under joint initiatives in the report.

Hot water tank program – hard to get industry information, such as lit of eligible models from manufacturers. Terasen would like to put on directory on the website of eligible models.

Ministry policy on storage tanks have to be 80%; currently condensing storage tanks do no exist in the market today.

Q: in regulation, is BC unique?

a. First in North America; NRCan will be joining in later on. We have ambitious targets. How do we move manufacturers move this along, so need to work with utilities. We don't have the option of waiting.
b. There is a 6-12 month delay product delay from US to Canada.
c. There is a caution in mixing storage and non storage tank issues (are apples vs. oranges)

Q: What is the definition of residential customer?

a. SFDs, mobile homes, and townhomes; multi-family is considered commercial customer
b. There is multi-family homes on oil in Vancouver Island – can apply for Switch 'n' Shrink?
c. Maybe those home can apply for Efficient Boiler Program

Ramsay Cook
Commercial Programs

Q: Are there any absolute caps on funding on custom design program? How are savings measured?

a. About $3/GJ, but will not pay 100%
b. Each project will have to pass a TRC test
c. Will benchmark against energy study, then look at meter and energy consumption

Q: Will the study capture waste heat?

a. Terasen is open to study, we are just trying to get GJ savings

Q: have you looked at purchasing managers as a key audience, they are very risk adverse people and only look at costs involved?

a. Terasen can do education with purchasing managers.

Ned Georgy
Conservation for Affordable Housing

Q: In regards to ReNEW, is there continued training past 2010?

a. Looking to work with some groups on Vancouver Island.

Q: How do you choose participants for the program?

a. Partners choose because they know their audience.

Q: Who is doing the SEMP study? BC Non Profit or City Green?

a. BC Non Profit Housing Association; City Green is involved in all 3 studies. Studies have partners in sharing the cost.

Gary Lengle
Efficiency Partners Program

(no questions)

Jenny Chia
Conservation Education & Outreach

Q: Co-op on tradeshows?

a. Possibly, Terasen has to look it over.

Q: Is there a possibility of using the Pembina tool to train sales associates (ie. At big box stores)?

a. Yes

Stakeholder Action List (roundtable around the room)

Jeff at UDI – look at educating members on incentives and regulation

Al at ROMS BC – look at manufacturer home parks – they are out of the loops. Possibly have a joint Terasen and BC Hydro info session for ROMS for their board/industry

Marg at BCAMOA – provide info in newsletters to members, and include info at board meeting on Wed Mar 17.

Bob at Fraser Basin Council – get in touch with Terasen manager on NGVs

Joan at Consumers Council of Canada – likes the home (energy) labeling idea because it's a good way of letting consumers know

Amy at GVHBA – get together with Beth, Ned, and Jenny and discuss GVHBA opportunities. GVHBA also has a monthly newsletter where info can be placed.

Cindy at Tseshaht First Nation – go back to the community, communicate about Terasen programs for people that are not in social housing; will be speaking about Terasen at national Aboriginal Housing Forum in Calgary

Wayne at BC Safety Authority – is concerned about contractors not having the skill set to install the new technology/equipment; have to look at training and if need to upgrade training, perhaps suppliers should provide training for installers

Burn blue. Save green.

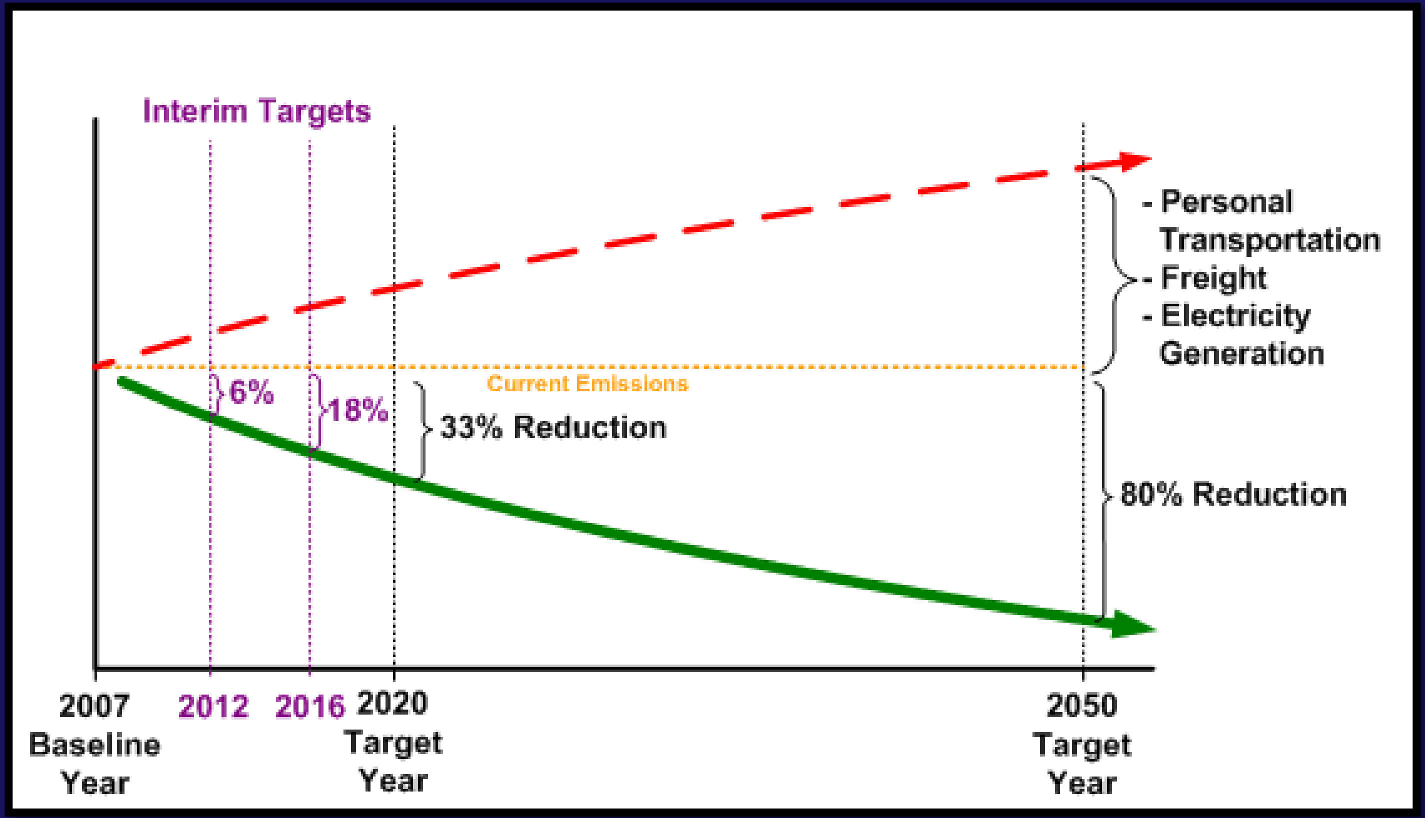
Terasen Gas

Alternative Energy Solutions

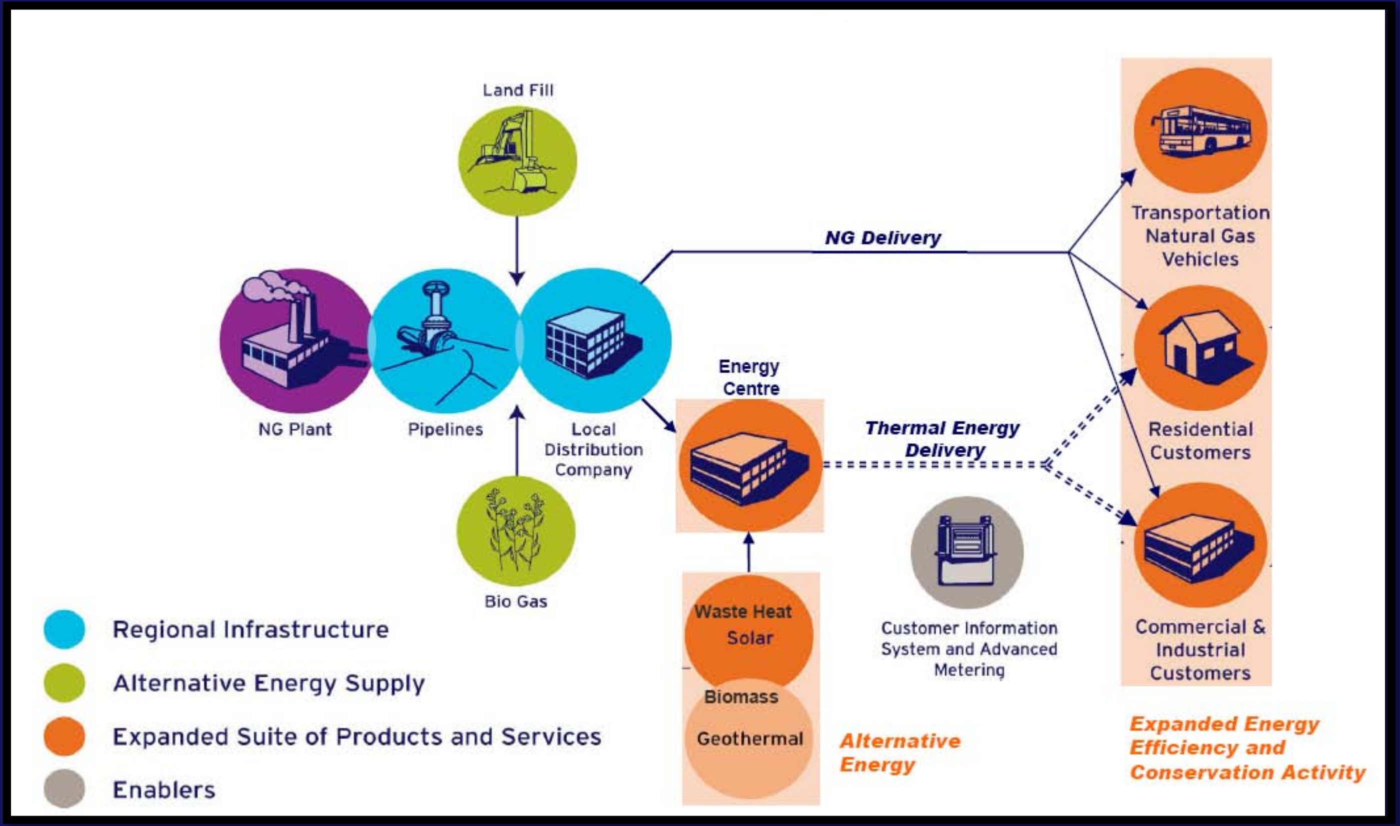
John Turner, Director, Energy Solutions

British Columbia Legislated Targets

- **Reducing BC's GHG emissions by at least 33% below 2007 levels by 2020 and at least 80% below by 2050**



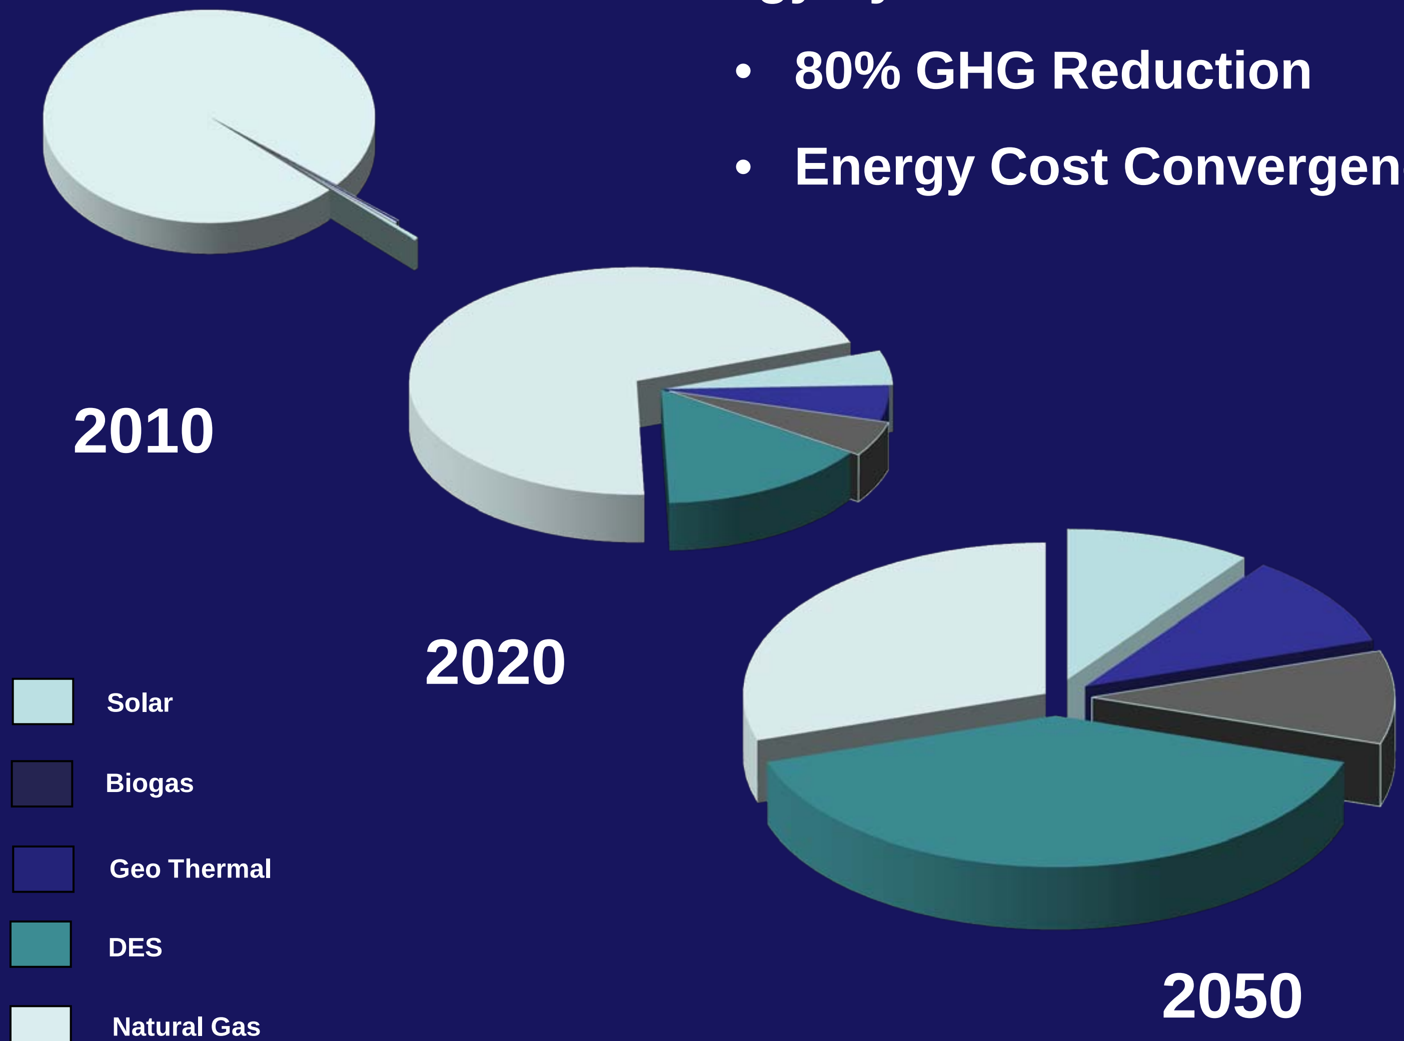
Terasen Approach



A Carbon Lean and Energy Diverse Future

Energy System Evolution

- **80% GHG Reduction**
- **Energy Cost Convergence**



Terasen Large Scale Alternative Energy System Examples

District Energy for Brownfield Re-development

- **Location:** Coquitlam, BC
- **Type of Development:**
    - 89 acre brownfield re-development
        - **3,700** residential units,
        - 275,000 sq. ft of commercial/retail
        - 600,000 sq. ft. of business park/ light industrial
        - 16 acres of open space, parks and trails.
- **Energy System:**
    - District Energy System to incorporate alternative energy sources integrated with natural gas:
        - Local waste heat (industrial recycling plant)
        - Geothermal from groundwater or earth
        - Possibilities for biomass

Fraser Mills Site Plan

- **Environmental Benefits**
    - *Possibilities for biomass*
    - *Reduced demand on BC's electricity grid*
    - *Savings of >8,200 tonnes of GHGs per year (equivalent to removing >2,500 cars from the road)*

Terasen Large Scale Alternative Energy System Examples

Individual Geothermal Systems for Residential Development

Aquattro Site

- **Location:** Colwood, BC
- **Type of Development:**
  - 563 unit residential development
  - 24 buildings

Geothermal drilling

- **Energy System:**
  - *Individual geothermal systems*
    - Ground heat extraction integrated with natural gas
    - Progressive installation as community develops
- **Environmental Benefits**
  - *Reduced demand on BC's electricity grid*
  - *Savings of 2 tonnes of GHGs a year for each 2,000 square foot residential unit*

Terasen Large Scale Alternative Energy System Examples

Expandable Energy System for Urban Infill

- **Location:** Victoria, BC
- **Type of Development:**
  - New & existing buildings
    - 631 new residential units,
    - 175,000 sq. ft of new commercial/retail
    - Multiple existing buildings adjacent to new development.
- **Energy System:**
  - Geothermal system for first two new buildings integrated with natural gas
  - Capability to expand to complete District Energy System incorporating waste heat from ice rink for both new & existing buildings.

Hudson Building

- **Environmental Benefits**
  - *Reduced demand on BC's electricity grid*
  - *Energy Usage in new buildings is reduced by up to 59% & GHGs by up to 73%*

The Intersect between EEC & AES

- Programs will be designed to reduce amount capitalized and charged back to customer
- Programs will be agnostic as to source for energy savings, but cannot be electric baseboard
- Programs will be agnostic as to AES proponents – don't have to work with Terasen to obtain EEC funds for AES projects

Burn blue. Save green.

Terasen Gas

Energy Efficiency and Conservation Innovative Technologies

Doug Tufts
Arvind Ramakrishhan

Innovative Technologies

Background

- TGI and TGVI Energy Efficiency and Conservation Application
  - requested $3 million for Innovative Technology Programs
  - filed on May 28, 2008
- TGI 2010 and 2011 Revenue Requirement Application
  - requested $7.003 million
  - filed on June 15, 2009
- TGVI 2010 and 2011 Revenue Requirement Application
  - requested $1.434 million
  - filed June 29, 2009
- TGI and TGVI Received a Negotiated Settlement on November 13, 2009
  - funding for Innovative Technologies approved

Innovative Technologies

Approved Funding
for Innovative Technologies ($000)

	2010	2011	Total
TGI	2,334	4,669	**7,003**
TGVI	0,478	0,956	**1,434**
Total	**2,812**	**5,625**	**8,437**

Innovative Technologies

Terms of the Negotiated Settlement TGI & TGVI

- That Innovative Technologies be managed as a separate portfolio from our other EEC Programs
- That Innovative Technologies portfolio have a Total Resource Cost (TRC) weighted average of 1.0 or greater
- That Terasen will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee

Innovative Technologies

Proposed Program Costs, TGI

TGI	2010	2011	Total
Solar Thermal	288,000	576,000	**$864,000**
Commercial NGV	808,000	1,616,000	**$2,424,000**
Hydronic Heating Systems	120,000	280,000	**$400,000**
Residential GSHP Systems	107,000	213,000	**$320,000**
Alternative Energy Systems	605,500	1,210,500	**$1,816,000**
Total	**$1,928,500**	**$3,895,500**	**$5,824,000**

Innovative Technologies

Proposed Program Costs, TGVI

TGVI	2010	2011	Total
Solar Thermal	60,000	120,000	**$180,000**
Commercial NGV	160,000	340,000	**$500,000**
Hydronic Heating Systems	25,000	50,000	**$75,000**
Residential GSHP Systems	22,500	44,500	**$67,000**
Alternative Energy Systems	126,000	254,000	**$380,000**
Total	**$393,500**	**$808,500**	**$1,202,000**

Innovative Technologies

Natural gas reductions for TGI and TGVI for the measured life of the programs.

- **A reduction of 577,000Gj**
- **A reduction of 505,000 tonnes of C02**

	Gigajoules	**Alternative energy savings (Diesel liters)**	**Tonnes of C02**
Hydronic heating Systems	24,000		1,325
Alternative energy systems	369,000		20,295
Commercial NGV	-896,000	22,689,000	473,361 (net C02)
GSHP systems	47,514		2,613
Solar thermal hot water	137,154		7,543

California Standard Protocol Tests

Cost Test	Key Question Answered	Approach
TRC	Is the overall economy better off with DSM?	All costs & benefits regardless of who accrues them
SCT	Is the society, Nation better off as a whole?	Includes non energy benefits
PCT	Will the participant benefit over the measure life?	costs & benefits to the program participant
UCT	Will Utility bills rise over time?	costs & benefits that accrue to the Utility system
RIM	Will Utility rates increase over time?	Takes lost revenue as cost & attempts to measure rate impact to all customers.

Proposal for Innovative Technologies

- Conventional EEC Programs
- Innovative Technologies Portfolio
  - Partner Contributions netted out of incremental cost

Example with Solar Thermal – City of Vancouver

Total incremental cost-$5,700(Solar ready bylaw)

- Partner Incentive-$3,375
- Utility Incentive proposed-$1000
- Participant cost-$1,325

System cost into the model = $2,325

Proposed Innovative Technologies

TGI

Programs	TRC Ratios		Program costs		
	2010	2011	2010	2011	Total
Solar Thermal	0.8	0.8	288,000	576,000	$864,000
Commercial NGV	1.5	1.5	808,000	1,616,000	$2,424,000
Hydronic Heating Systems	0.4	0.4	120,000	280,000	$400,000
Residential GSHP Systems	0.2	0.2	107,000	213,000	$320,000
Alternative Energy Systems	1.0	1.1	605,500	1,210,500	$1,816,000
Portfolio level-TGI	1.2	1.2	$1,928,500	$3,895,500	$5,824,000

Proposed Innovative Technologies

TGVI

Programs	TRC Ratios		Program costs		
	2010	2011	2010	2011	Total
Solar Thermal	0.8	0.8	60,000	120,000	$180,000
Commercial NGV	1.4	1.4	160,000	340,000	$500,000
Hydronic Heating Systems	0.4	0.3	25,000	50,000	$75,000
Residential GSHP Systems	0.2	0.2	22,500	44,500	$67,000
Alternative Energy Systems	1.1	1.1	126,000	254,000	$380,000
Portfolio level-TGVI	1.2	1.2	$393,500	$808,500	$1,202,000

Proposed Innovative Technologies

Portfolio Level summary (TGI , TGVI)

company	Portfolio level TRC	Program Costs($)		
		2010	2011	Total
TGI	1.2	1,928,500	3,895,500	5,824,000
TGVI	1.2	393,500	808,500	1,202,000
Total		2,322,000	4,704,000	7,026,000

Innovative Technologies - Summary

Application of the Weighted Average TRC

- Program portfolio of activities

- Remove the partner incentive costs from the total incremental cost

Burn blue. Save green.

Structure & Overview of EEC Report

Presented by **Michelle Petrusevich**, MA
DSM Program Development Lead

EEC Report – Why?

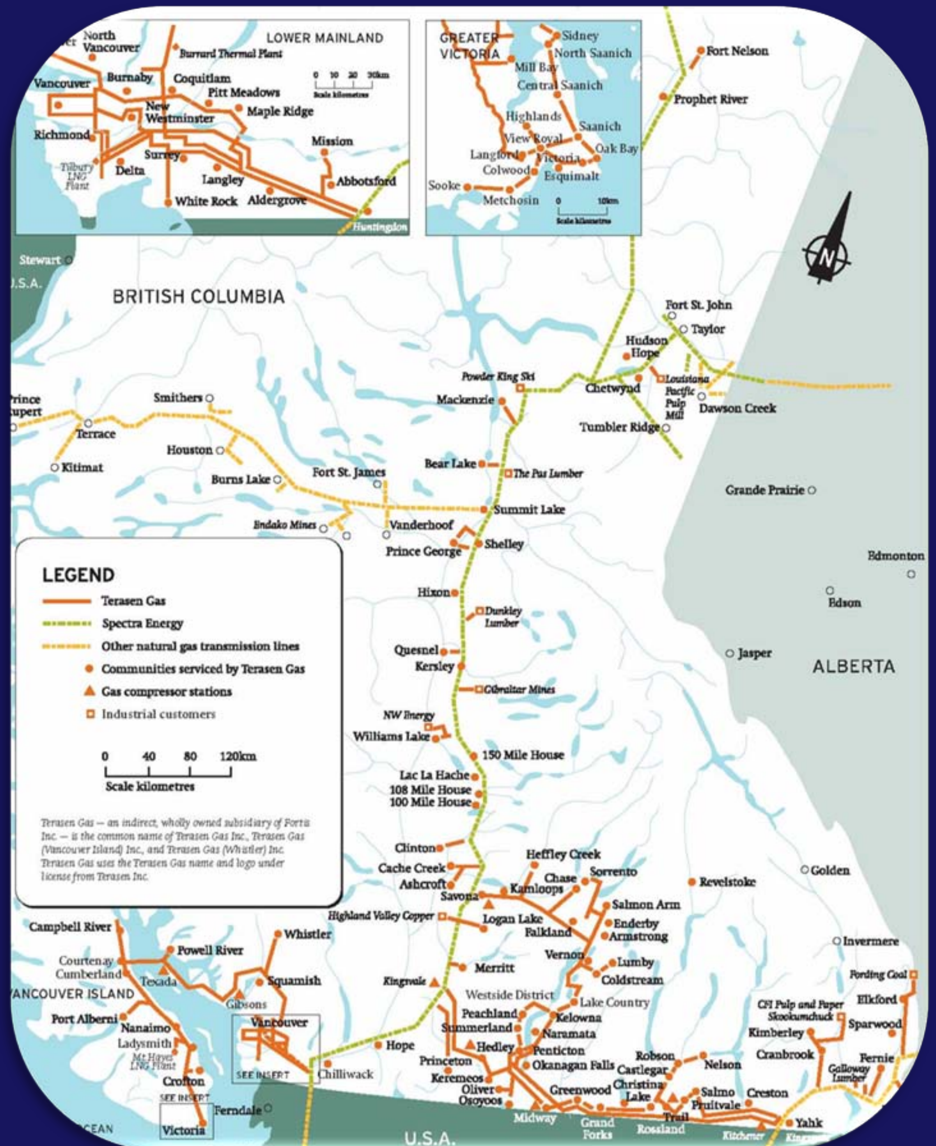
- May 2008 - EEC Application submitted
- April 2009 - BCUC approved the EEC Application

"A requirement that Terasen submit annually to the Commission, by the end of the first quarter following year-end, for each year of the funding period, a report on all EEC initiatives and activities, expenditures and results for TGI and TGVI."

2009 EEC Report Structure

- Introduction & Background
- 2009 Program Results (by program area)
- 2010 Programs
- Data Gathering, Reporting & Internal Audit
- Attribution Section
- Conclusion
- Appendices

Background: DSM Programs on TGI & TGVI



2009 Program Results* - Highlights

Please refer to the Annual Report – to be filed with the BC Utilities Commission by March 31, 2010

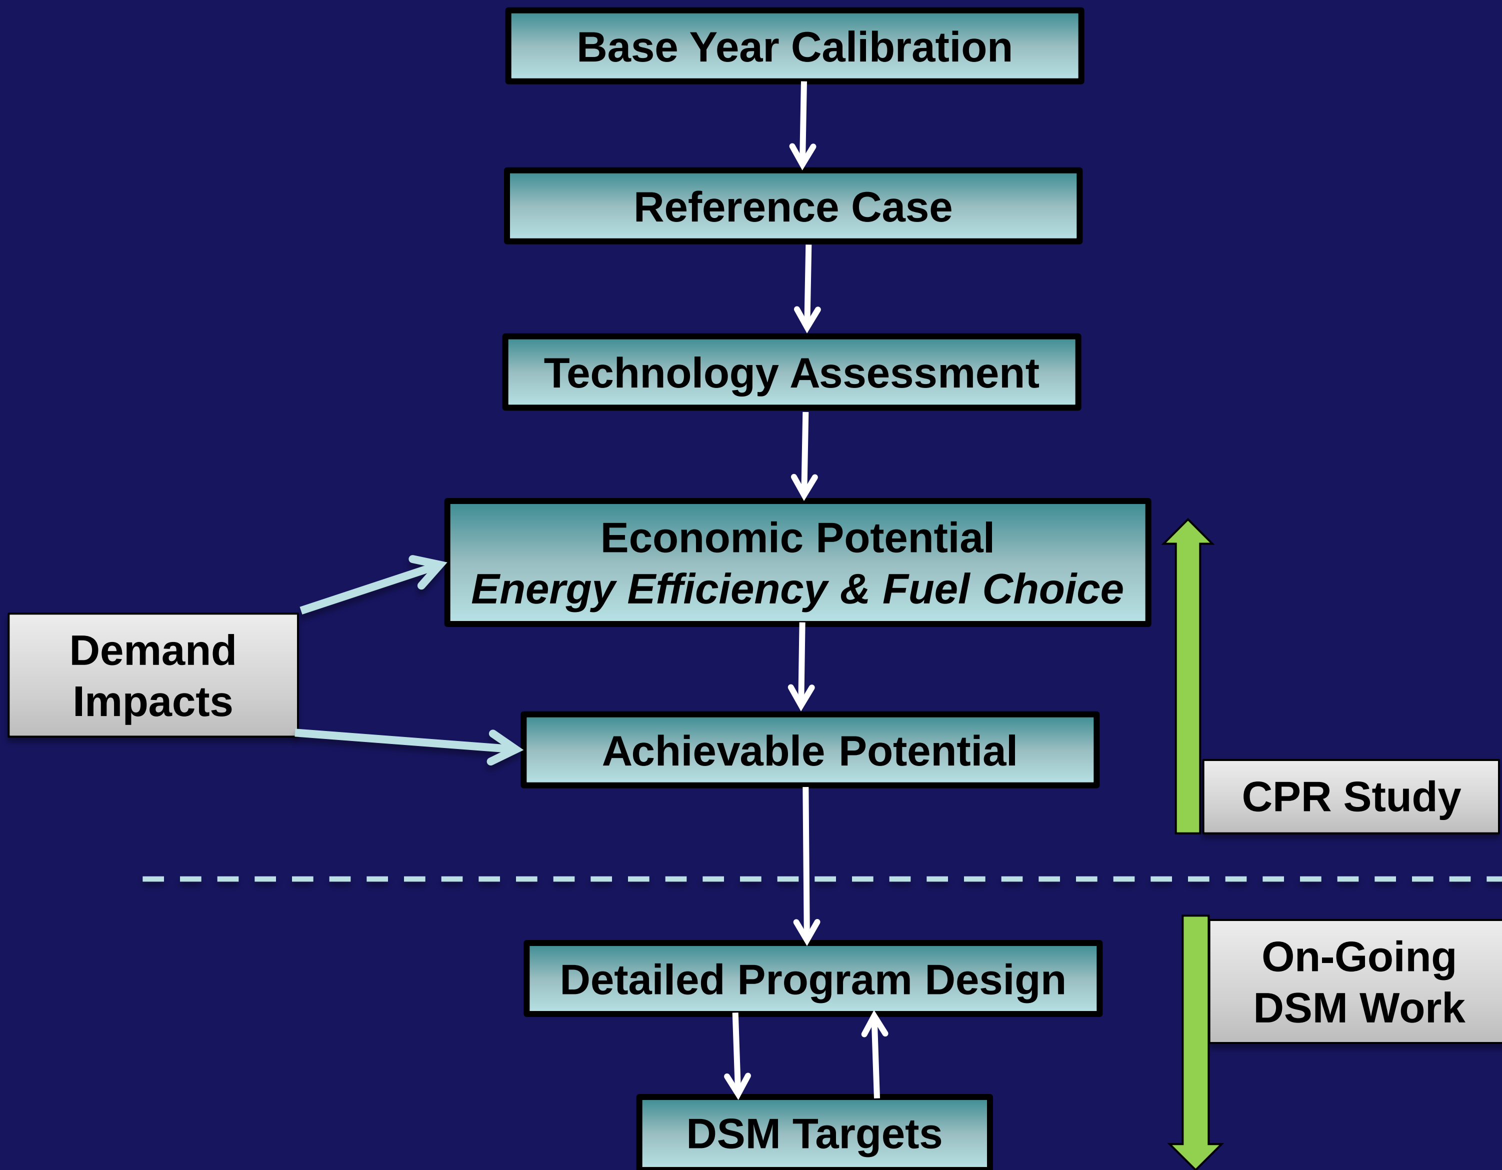
2010 Planned Program Results - Highlights

Please refer to the Annual Report – to be filed with the BC Utilities Commission by March 31, 2010

Research & Evaluation Activities

- 2009 Research & Evaluation Activities
  - REUS Study
  - Sustainability and Social Responsibility Attitudes Study Report
  - Residential Retrofit Market Evaluation for Terasen Gas
  - Energy Star Heating System Upgrade Evaluation (Phase 2 – Billing Analysis)
- 2010 Research & Evaluation Activities
  - Efficient Boiler Program Evaluation
  - Okanagan Spray Saver Pilot Program
  - Commercial Energy Assessment
  - Tankless Water Heater Pilot
  - Home Labelling Pilot in Prince George

Conservation Potential Review (CPR)



Processes and Controls Overview

- Description of current control mechanisms for data gathering, reporting and internal control processes
- DSM Tracking (TrakSmart) System

2010 Residential Programs

Beth Ringdahl,

Residential Program Manager

Presentation Agenda

- Achievements since last meeting
  - NRCan MOU
  - Streamlining Internal Processes
  - Outsourced administration
- 2009 Program Results
- 2010 Program Plan

2009 Residential Program Results

Program Name	Total Incentive & Non Incentive Expenditures ($ 000's)	Participants #' s	TRC
Energy Star Heating System Upgrade (Terasen + LiveSmartBC)	2,104	7930	1.3
EnerChoice Fireplace	84	794	2.5
EcoEnergy Home Energy Assessments – LiveSmart BC	408	5445	"0"

Residential TRC:	**1.3**

*Note: the numbers are preliminary and could be modified for the final report

2010 Residential Programs

- Switch 'N' Shrink
  - Oil and Propane Conversions
- Space Heating
  - EnerChoice Fireplace
  - Furnace Scrap it - TBD
- Domestic Hot Water
  - ENERGYSTAR Tanks
  - Tier 3 Pilots
  - Appliances
- Whole home
  - Utility Partnership + LiveSmartBC
    - Building Envelope Incentives
    - EnerGuide 80

Switch 'N' Shrink

Conversion from High to Low Carbon Fuels

$1000 Rebate

- Launched Jan 1
- Saving $ and environment
- Partnering with associations
- $50 rebate for Variable Speed Motor (BC Hydro, FortisBC)
- Goal: 750 participants

Oil and Propane savings

Domestic Hot Water

ENERGYSTAR ® Tanks

$100 Rebate -
$50 consumer +
$50 contractor

2 GJ per year + early retirement

- Launching May
- Supports Sept 1 regulations
- 90% emergency replacement
- Goal: 3000 retrofit participants
- New construction - TBD

ENERGY STAR

Domestic Hot Water

New Technologies and Conservation

- Tier 3 Technologies – 80% +
  - Condensing Water Tank pilot
  - Tankless H20 Heater pilot
- Appliances - Front load washers
- Hot Water Conservation Campaign

Save
hot water =
save GJs

Whole Home Partnerships

- Utility Partnership
- One stop rebate shop
- Efficiencies through shared marketing, administration and DSM expertise
- Marketing Launch: Fall weatherization campaign
- Leverage any other funds available

Background

- TGI and TGVI Energy Efficiency and Conservation Application
  - requested $3 million for Innovative Technology Programs
  - filed on May 28, 2008
- TGI 2010 and 2011 Revenue Requirement Application
  - requested $7.003 million
  - filed on June 15, 2009
- TGVI 2010 and 2011 Revenue Requirement Application
  - requested $1.434 million
  - filed June 29, 2009
- TGI and TGVI Received a Negotiated Settlement on November 13, 2009
  - funding for Innovative Technologies approved

Innovative Technologies

Approved Funding
for Innovative Technologies ($000)

	2010	2011	Total
TGI	2,334	4,669	**7,003**
TGVI	0,478	0,956	**1,434**
Total	**2,812**	**5,625**	**8,437**

Innovative Technologies

Terms of the Negotiated Settlement TGI & TGVI

- That Innovative Technologies be managed as a separate portfolio from our other EEC Programs
- That Innovative Technologies portfolio have a Total Resource Cost (TRC) weighted average of 1.0 or greater
- That Terasen will consult with stakeholders on the practical application of the weighted average TRC through the EEC Advisory Committee

Innovative Technologies

Proposed Program Costs, TGI

TGI	2010	2011	Total
Solar Thermal	288,000	576,000	**$864,000**
Commercial NGV	808,000	1,616,000	**$2,424,000**
Hydronic Heating Systems	120,000	280,000	**$400,000**
Residential GSHP Systems	107,000	213,000	**$320,000**
Alternative Energy Systems	605,500	1,210,500	**$1,816,000**
Total	**$1,928,500**	**$3,895,500**	**$5,824,000**

Proposed Program Costs, TGVI

TGVI	2010	2011	Total
Solar Thermal	60,000	120,000	**$180,000**
Commercial NGV	160,000	340,000	**$500,000**
Hydronic Heating Systems	25,000	50,000	**$75,000**
Residential GSHP Systems	22,500	44,500	**$67,000**
Alternative Energy Systems	126,000	254,000	**$380,000**
Total	**$393,500**	**$808,500**	**$1,202,000**

Innovative Technologies

Terasen Gas

Natural gas reductions for TGI and TGVI for the measured life of the programs.

	Gigajoules	Alternative energy savings (Diesel liters)	Tonnes of C02
Hydronic heating Systems	24,000		1,325
Alternative energy systems	369,000		20,295
Commercial NGV	-896,000	22,689,000	473,361 (net C02)
GSHP systems	47,514		2,613
Solar thermal hot water	137,154		7,543

- **A reduction of 577,000Gj**
- **A reduction of 505,000 tonnes of C02**

California Standard Protocol Tests

Cost Test	Key Question Answered	Approach
TRC	Is the overall economy better off with DSM?	All costs & benefits regardless of who accrues them
SCT	Is the society, Nation better off as a whole?	Includes non energy benefits
PCT	Will the participant benefit over the measure life?	costs & benefits to the program participant
UCT	Will Utility bills rise over time?	costs & benefits that accrue to the Utility system
RIM	Will Utility rates increase over time?	Takes lost revenue as cost & attempts to measure rate impact to all customers.

Proposal for Innovative Technologies

- Conventional EEC Programs

- Innovative Technologies Portfolio
  - Partner Contributions netted out of incremental cost

Example with Solar Thermal-City of Vancouver

Total incremental cost-$5,700(Solar ready by law)

- Partner Incentive-$3,375
- Utility Incentive proposed-$1000
- Participant cost-$1,325

System cost into the model=$2,325

Proposed Innovative Technologies

TGI

Programs	TRC Ratios		Program costs		
	2010	2011	2010	2011	Total
Solar Thermal	0.8	0.8	288,000	576,000	$864,000
Commercial NGV	1.5	1.5	808,000	1,616,000	$2,424,000
Hydronic Heating Systems	0.4	0.4	120,000	280,000	$400,000
Residential GSHP Systems	0.2	0.2	107,000	213,000	$320,000
Alternative Energy Systems	1.0	1.1	605,500	1,210,500	$1,816,000
Portfolio level-TGI	1.2	1.2	$1,928,500	$3,895,500	$5,824,000

Proposed Innovative Technologies

TGVI

Programs	TRC Ratios		Program costs		
	2010	2011	2010	2011	Total
Solar Thermal	0.8	0.8	60,000	120,000	$180,000
Commercial NGV	1.4	1.4	160,000	340,000	$500,000
Hydronic Heating Systems	0.4	0.3	25,000	50,000	$75,000
Residential GSHP Systems	0.2	0.2	22,500	44,500	$67,000
Alternative Energy Systems	1.1	1.1	126,000	254,000	$380,000
Portfolio level-TGVI	1.2	1.2	$393,500	$808,500	$1,202,000

Proposed Innovative Technologies

Portfolio Level summary(TGI , TGVI)

company	Portfolio level TRC	Program Costs($)		
		2010	2011	Total
TGI	1.2	1,928,500	3,895,500	5,824,000
TGVI	1.2	393,500	808,500	1,202,000
Total		2,322,000	4,704,000	7,026,000

Innovative Technologies -Summary

Application of the Weighted Average TRC

- Program portfolio of activities

- Remove the partner incentive costs from the total incremental cost d5

Terasen Gas EEC Stakeholder Meeting – Stakeholder 2010 Priorities
March 11, 2010

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Greater Vancouver Home Builders' Association	-protecting interests of new home buyers -housing affordability and choice -education -marketing and networking	700+ members Builders Developers Trades Suppliers Architects & designers →Voice of residential construction industry	-reduce/prevent downloading of chares to the price of new homes -promote voluntary market driven green building -underground economy that do not get a permit for renovations	-programs for new home buyers, specifically first –timers -invest in innovative/alternative energy solutions	-continue green incentive programs -educating trades -reno program -consumer behaviour cultural shift -investment for alternative energy solutions
BC Apartment Owners and Managers' Association	-sector sustainability through offering lobbying, education, partnerships with affiliates and associates (price points) -member strength through retention and grown	3000 members Apartment owners & managers (landlords) + associates (suppliers) + affiliates -sustainability	-member education -member retention -member growth -partnership programs to assist members -energy savings; renovations and greener technology -find landlords and hot to reach them	-partnership in education, affiliation, sponsorship -news posts on web, magazine & newsletter -info on present & future opportunities -incentives/split	-workshops and tailor to high rise members, medium buildings, and low rise members -news blasts -intro of new programs -change behavior → how do we make the new "bling" energy efficiency?

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
National Energy Equipment (distributor of Trane)	-increase market creation of home comfort systems for retrofit market -incorporate “clean air” offering into heating and cooling products	-(52) HVAC dealers -homeowners that purchase Trane equipment	-improve quality of installation of Energy Star products -clarify the energy saving message with homeowners	-Terasen dealer (contractor) program -promotions planned outside of the “high season” (Sept –Nov) because impacts quality of installation	-consider “Terasen partners” program on the distribution level (eg. advertising) -work with the NRCan -align upcoming programs with homeowners’ needs and understand consumer mindset
BC Utilities Commission	-increase stakeholder engagement -increase knowledge and capacity in new areas of responsibility, not just an economic regulator		-build capacity/knowledge in commissioners and staff on DSM/energy efficiency best practices from other jurisdictions	-EEC meetings continue -provide updates, feedback and engage with Commission -keep doing what you’re doing	
Consumers Council of Canada	-consumers more aware of energy efficiency options -consumers knowledgeable about the costs/payback/justification of energy efficient purchases -ensure the consumer voice is at the policy table	-residential consumers of energy	-energy efficiency adopted as an objective in building codes -understand consumer attitude to energy efficiency -consumer protection available + accessible to consumers (remedies)	-perhaps a partnership to enable us to get consumers’ opinion/feedback on energy issues + housing issues -access to info on the residential consumer + their preferences & actions (take up of incentives?) -get info to customers	-meet with appropriate Terasen reps to talk about possible options

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Urban Development Institute	-to connect our industry with governments and the public -improve our industry through professional development and education -having a reasonable cost of & regulatory environment for our members	Developers & professionals that support them. -500 corporate members (architects, engineers, banks)	- housing affordability -reducing cost (fees, charges imposed by government -greenbuilding sustainability	-research/education on cost effective green build, energy efficiency, sustainable tools, technologies (how much customers value/do not value on e.e. to potentially support a salesperson education initiative -need consistent approach; various Lower Mainland municipalities are too diverse in policies on sustainable buildings -incentives for our members (green technologies have high upfront costs)	-information -education
Crosby Property Management	-energy savings -green technology	25,000 residential strata owners	-hold costs or do better -looking for incentives -HRTC did a lot in 2009	-information to customers	-timers for fireplaces for strata owners (program)
IBC Technologies	-expand condensing boiler product offering into commercial sizes/markets -more residential market choices with different price points/affordability	-IBC -Canadian Hydronics Council (BC rep) -CSA TC on energy efficiency	-see goals -evolve commercial boiler efficiency measurement standards	-provide clarity on DSM programs and changes thereto -host local roundtable meeting of stakeholders to commercial boiler efficiency issues to take to the national meeting	

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Natural Resources Canada	-improve Canadians' energy consumption practices in commercial and institutional buildings to the end of reduced GHGs (17% by 2020)	Government of Canada	-encourage energy efficiency retrofits and new building design -commissioning and re-commissioning -update energy code -develop bench marketing-data for buildings (offices and schools) -position for transition to post 2011 (funding ending) -build capacity among energy professionals -update the Model National Energy Code for Buildings for release 2012	-information sharing -partnerships/cooperation on optimizing resources in program design/delivery -liaise with regional stakeholders (oversee all of Western Canada)	-develop working groups?
Consolidated Management Consultants	-fair and cost effective supply	-represent commercial energy consumers	-continue to consult with BC Hydro and Terasen Gas -challenge anything that is less than cost effective -success in meeting government's goals-see utilities in succeeding	-consultation on EEC -interested in alternative energy -long term plan for reducing GHGs (by 2050) -interested in cost effective management in utility -continued engagement	
Rate 1 customer/landlord/ New Climate Strategies consultant	-improve energy efficiency infrastructure in my home	-rate 1 customers across BC	-learn about insulation options (for old home) -improve hot water systems - too much waste	-help me assess opportunities in a comprehensive way (not one-off technologies) -expertise for hire, who can assess my options?	-work with BC Hydro to give me coordinated picture of my energy and GHG issues

Organization	**Goals**	**Members represented**	**Priorities for 2010**	**How Terasen can help organization (2-3 ways)**	**Action Item**
Rental Owners and Managers Society of BC	-continue growth to 2400 members -achieve changes to residential tenancy act -increase recognition of rental industry as provider of homes to 1/3 of British Columbian	-2200 residential owners and managers -50,000 rental homes	-increase awareness of ROMS BC among BC's landlords	-recognize distinctiveness & size of residential rental industry +/- 600,000 rental homes -apartment buildings are different from condos or SFDs	-tenants consume, landlords pay??
City of Vancouver	-reduce GHGs -meet community based action goals	-municipality and Vancouver residents	-MURBs and small – businesses -retrofit program (under consideration, require at least 10% of the cost of any permitted renovation to be allocated to e.e. upgrades using prescriptive measures)	-for SFDs – prescribed measures, or Energuide rating -COV support by having green renovation guides online	-example of laneway house with computer interface that indicated energy usage
Ministry of Energy, Mines and Petroleum Resources	-energy efficiency -reducing GHG emissions -develop a culture of conservation		-Energy Plan -Climate action -Clean energy economy	-support for codes and standards -integration with LivesmartBC -innovation with gas (NG vehicles) -communicate with Energuide 80 -go beyond code, maybe home labeling	

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
Tseshaht First Nation	-expand economic development and diversification -expand member employment opportunities -improve quality of life-industry housing -building relationships with Alberni Valley Community	1000 members 750 on reserve	-building 14 new houses (need for 80 families housing—multigenerational, increased growth in community with declining growth in neighbouring community) -7 new RAPS (renovations) -develop partnerships for tourism projects -encourage entrepreneurship -support building of new athletic hall in Port Alberni -new ventures + construction eg. greenhouse	-partnerships for training and mentoring -grants for new athletic hall (gas powered new construction) -seeking appliance bundles for energy efficiency in new houses -cost efficiency and energy efficiency	-do not understand using natural gas on reserve, mainly BC Hydro
Fraser Basin Council	Vision: strong communities, healthy ecosystems and vibrant economies in the Basin and beyond Goals: climate change mitigation/adaptation (reducing GHGs/energy efficiency) -smart planning for communities -regional and sub-regional (local) issue resolution -aboriginal engagement	-all form orders of Canadian government including First Nations + private sector + community/civil society interests	-continue to build on successes: -green fleets BC initiative, transportation -energy solutions for remote communities -supporting community energy planning though BC –demand side management -supply chain Buymost program	-harness power of strategic relationships; facilitate and bring together unlikely parties -multi-interest board	-continuing to build bridges between people, organizations, regions – and action items together

Organization	Goals	Members represented	Priorities for 2010	How Terasen can help organization (2-3 ways)	Action Item
City of Prince George	-climate change goals & objectives that relate to participation in the Partners for Climate Protection Program (PCP). -the goal is a 10% reduction in greenhouse gas emissions from 2012, from a benchmark year of 2002. actively involved in meeting a target of carbon neutral operations by 2012 under the Province's Community Action Charter -20% reduction in overall energy intensity (electricity & natural gas) by 2015 (5 years) -5% reduction in overall energy intensity (electricity & natural gas) for each facility in 2010	-citizens of Prince George	-5% reduction in energy intensity for 2010 -carbon neutral by 2012 -10% Reduction in GHG emissions by 2012	-GHG emissions and energy consumption: easily accessible programs to help decrease GHG emissions, and funding that is available to retrofit old equipment, or implement a project that will decrease natural gas consumption would be appreciated.	

Note: priorities missing from BC Hydro, FortisBC, BC Public Interest Advocacy Centre, Canadian Home Builders’ Association of BC, BC Mechanical Contractors Association, and BC Safety Authority.

Terasen Gas

Terasen Gas EEC Stakeholder Meeting Agenda

Wednesday November 24, 2010
Hyatt Hotel: 655 Burrard St, Vancouver – Grouse Room, 34th Floor

8:50 – 9:00	Registration (coffee served)
9:00 - 9:15	Welcome and Agenda
9:15 – 9:35	TG topic: FortisBC Integration
9:35 – 10:00	TG topic: Natural Gas Vehicle Application
10:00 – 10:10	Break
10:10 – 10:30	EEC 2012 Application
10:35 – 11:45	2010 Programs Review
11:50 – 12:35	Lunch
12:40 – 13:30	Stakeholder Workshop #1, 2011 programs
13:30– 13:45	Break
13:45 – 14:25	Stakeholder Workshop #2, 2011 programs
14:25-14:50	Summary of Workshop Discussions
14:50 – 15:00	Wrap Up and Next Steps

Terasen Gas

Terasen Gas EEC Stakeholder Meeting Minutes
Wednesday November 24, 2010

Attendees
Alison Richter – British Columbia Utilities Commission
Amy Spencer-Chubey – Greater Vancouver Home Builders' Association
Bob Purdy – Fraser Basin Council
Bruce Macgowan – IBC Technologies
Dan Pasacreta – Crosby Property Management
David Craig – Consolidated Management Consultants
Elizabeth Westbrook-Trenholm – Natural Resources Canada
Andrew Pape-Salmon – Ministry of Energy
Jeff Fischer – Urban Development Institute
Jen Richards – City of Vancouver
Mark Hartman – City of Vancouver
Joan Huzar – Consumers Council of Canada
Marg Gordon – BC Apartment Owners and Managers' Association
Keith Veerman – FortisBC
Steve Hobson – BC Hydro, Director Power Smart
Rob Noel – BC Mechanical Contractors Association
MJ Whitemarsh – Canadian Home Builders' Association BC

Regrets
Jim Quail – BC Public Interest Advocacy Centre
Marni Vistisen – City of Prince George, Energy Manager
Al Kemp – Rental Owners and Managers Society of BC
Cindy Stern – Tseshaht First Nation, CEO
Nina Winham – New Climate Strategies; Terasen Gas rate 1 customer
Nir Kushnir – National Energy Equipment, General Manager (Trane)
Wayne Lock – BC Safety Authority, Gas Operations Manager
Brian Jones – Seabird Island

Terasen Gas Staff
Beth Ringdahl
Jenny Chia
Colin Norman
Jim Kobialko
Hakan Kok
Gina Lego
Ned Georgy
Ramsay Cook
Sarah Smith
Mark Grist
Doug Stout

Doug Stout, Corporate Overview (FortisBC Integration)

Question: What is the FortisBC debt/equity ratio?
TG response: 60/40

Mark Grist, Natural Gas Vehicle Program for BC

Question: What is the efficiency of the motors?
TG response: Depends on the engine technology and not the fuel (e.g. heavy duty trucks vs. garbage and transit trucks); for heavy duty trucks, the efficiency can match the efficiency of diesel engines.

Q: Is the carbon tax included in the NGV TRC calculation?
TG: Yes
TG: Terasen is planning to do a workshop in early 2011, to add and monetize additional benefits in the TRC test.

Q: Is there a road tax?
TG: No, not yet. And likely none for the foreseeable future.

Q: What are the different emissions between diesel vs. NGV? For example, particulates, NOx traps. . .?
TG: To meet 2010 emission regulations on diesel engines, manufacturers must install emission controls such as diesel particulate filters and NOx traps. These new additions reduce emissions to levels comparable to NGVs but add cost and reduce the efficiency of diesel engines.

Q: This is the economic thing to do, and the Province is wanting to reduce GHGs – what do you need for a faster transformation adoption?
TG: We are working with the Provincial government to introduce incentive programs to reduce the capital cost barrier. If they contribute funds, this will make the Terasen incentives go further. The Federal government is also looking at tax credits.

Q: What would be helpful from the customers to help this NGV strategy/application?
TG: We do not have approval to provide fueling stations to our customers. Terasen is sending in an application to the BCUC in one to two weeks and additional support, such as letters from the stakeholders, would be appreciated.

Q: Are there safety issues in neighbourhoods?
TG: All fuels have certain risks and appropriate safeguards specific to the specific fuel need to be taken. The risks associated with NG are quite comparable to conventional fuels.

Q: Will a leasing program address the capital cost issue?
TG: Most trucking fleets are leased; hence, we are working on establishing an incentive program specifically designed for leasing situations.
The incentives will also be reduced over time, declining from the existing level of 100% of the incremental cost. We just need to get past the tipping point of adoption (refer to slide 17)

Sarah Smith, EEC Looking Ahead

Question: Is the plan for the application to build from the bottom up again?
TG response: The plan going forward is to ask for funding approval for different areas, but be able to transfer the funds between the different areas within the portfolio if necessary.

TG: Would like input from the group on accountability to ratepayers and stakeholders, for instance we currently have two meetings a year and produce an annual report – is this sufficient? We file our annual report at the end of March (2011) and will ask that any regulatory process relating to the report be deferred to when we file our ask for EEC funding, so that we do not go through two rounds of regulatory process.

Q: What is holding up the mid-efficient furnace change out?
TG: The challenge is that many furnaces are beyond their life cycle. We are looking to do early retirement for furnaces and working with the Ministry of Energy on this issue.

Q: How many programs are explicitly for market transformation? Does Terasen have market transformation plans for their programs?
TG: Not explicitly, however market transformation is one of the Company's EEC Program Principles and most programs are aimed at market transformation. Market transformation should be adopted as a theme for the application for funding approval for 2012, and beyond. One example of a technology where we've launched a program to support market transformation would be the water heater program just launched, and the TLC furnace service program is a market transformation program for behaviour change.

David Craig expressed interest in working with Terasen Gas and BC Hydro for a longer term ask, that is outside of the Revenue Requirement timeframe.

Q: Why is only $10 million of the $30 million budget (for 2010) spent?
TG: We are under spent this year. We underestimated the number of (people) resources required to develop programs and push them out to market. We also have rigorous internal procedures, like developing solid business cases requiring 3 signatures before a program is launched. The rebate funds, however, are not in a holding pattern because we have not been efficient with our application processing. We are looking into simplifying the application process, like putting it on the web for example. If the EEC funds are not used, they are not recovered from ratepayers.

Q: What about using external resources like service organizations and consultants?
TG: We do so when appropriate; we have hired consultants to develop our new construction program, and with our Affordable Conservation program we have several partnerships in place.
BC Hydro: The informed consultant community is also small (limited). We have to compete with other utilities and jurisdictions.
TG: We need to look into building energy efficiency capacity by creating external training opportunities.

Q: In your last application, some of the funds Terasen asked for were reduced, will this happen again?
TG: There were some reductions in our original application, like in the Conservation Education Outreach, but we did get most of what we had asked for. For Innovative Technologies, we re-requested funding approval in our Revenue Requirement application later in 2009.

<u>2011 Programs Workshop – Brainstorming and Discussion</u>

Residential and Conservation for Affordable Housing

<u>Comments on launch of New Construction Program</u>

- Integrate offers with other utility partners or municipalities
- A New Construction Stakeholders Meeting would be beneficial. We need stakeholders' and builders' feedback
- BC Building Code EGH80 introduction is scheduled for November 2011. There are concerns that although builders may be following the prescriptive path through current BC Building Code standards they are not reaching EGH 77 but rather EGH 72-74 is most common. Agreement that Terasen can use EGH 73 for a base line for energy savings calculations since it is a true representation of current industry buildings.
- The EGH80 Nov 2011 new regulations are proposed to focus on improved building envelope standards
- Look at energy specialists into CHBA - 10 Associations already support energy efficiency. How to formalize going forward?
- Cost estimates for EE upgrades are difficult
- Note the regional differences in home performance, costs, upgrades
- Incentivize smaller homes – interesting to look at consumer influences inventory – sell the benefits – is there a potential for small (SPIFFs?) to consumers?
- Municipalities – permit office could distribute program packages (e.g. Saanich, PG, COV)
- Energy Star for Homes is making a comeback (Note CityGreen is administering)
- Nov 2011 new regulation – bundle improved building envelope standards

<u>Tankless Water Heater Program discussion generated a lot of interest</u>

- May be able to add the value of saved floor space into the calculation to help with TRC ; long life span attribution
- Tankless (25-40% savings need to be confirmed)
- North America are laggards in this technology, but need to further understand the 25-40% savings claims in this market
- Survey results are of interest to the group
- 0.80 EF water heater pilot of interest to the group (Jim Kobialko)

<u>Water heaters (storage tanks)</u>

- Increased education for a planned replacement strategy
- TG to look at rentals and financing options
- Clarify efficiency levels with new technology coming to market

<u>Issues in approving programs based on TRC calculations – some ideas</u>

- Look at excluding non-energy related costs from TRC calculations (FortisBC includes this rule in the tariffs)
- Ventilation and carbon monoxide detectors should be considered Enabling Activities that are excluded from TRC calculations.
- Review DSM policy on attribution of savings for all programs and the role of compliance engagement strategies on savings

Affordable Housing Discussion points

- Look at mass purchases for low income: water tanks, furnaces and boilers

Fireplaces

- A lot of discussion regarding need for fireplace programs for MURBs and issues with strata meters and strata policies; Joint program with commercial program manager is under discussion
- Need more customer education on energy use by fireplaces, zone heating/primary/right-sizing, pilot lights and whole home heating

Furnace programs

- Positive feedback for scrap-it program
- TLC Furnace service program success was discussed. Idea for a sticker on furnace for timing of next service

Outreach to TG residential customers & other discussion points

- Explore ways to get unbiased, fuel-neutral, manufacturer-neutral advice to customers
- Need to move beyond energy advisor to advice that is more of a whole-home heating "solution"
- Look at a listserv idea for consumers and the trades to maintain a knowledge base of information and concerns
- How to get the information out to mainstream home/family-based magazines
- Watch for the Canadian Hydronics Council (CHC) upcoming industry advertising campaign "beautiful heat"
  - -essentially gas
  - -alternate energy
  - - focus on health benefits
- Marketing communications could provide more education about why Terasen is involved in conservation:
  - -what's in it for Terasen
  - -what's in it for shareholders
  - -what's in it for customers
- Engage Certified Energy Advisors in promoting programs
- Financing and equipment rentals were discussed briefly. Look to the City of Vancouver program for home retrofits that involves on- tax financing and retrofitting policy
- Consider financing to assist with the deployment of individual metering in Multi-Unit Residential to help promote conservation in suites. Occupants are not readily aware that their gas bills are rolled into strata fees so it is for the common good to reduce their consumption
- Collaborate with key stakeholders on building codes and retrofitting policies. Example, City of Vancouver, Minister Yamamoto, etc.

Commercial

- MURBs – multi-urban residential buildings
- in suite efficiency package, new construction (ie. Terasen option for developers)
- individual metering for stratas
- co funding ad campaigns

Conservation Education

- small business – roundtable (Min. of E. Joy Beauchamp) – Livesmart
- refer to Junior Achievement program
- behaviour change – gov't → Power of 10 gov't buildings
  -bring Terasen in
  -how much control on the gas side?
- behaviour change: continuous optimization program for commercial (on controls)
- 5-10% behaviour energy savings – in commercial
- look at high leverage behaviours (drivers and barriers)
- "social cost of doing nothing"

- new home owner guide/first time home buyer (ie. Terasen hot tips)
- multi-family
- commercial testimonials
- trades students – education, build into training
- school kits as part of curriculum, and take home kits
- industry training – TECA, eg. duct installation problem
- use stakeholder newsletters and channels to promote programs

Portfolio Projects

- energy specialist → program targets (eg. EBP applications)
    - -BC Hydro describes as Sector Enabling
    - -CHBA BA request
    - -CHOA?
- community energy manager → promote programs on a whole
- engage politicians and municipalities – different interests: green, affordability, security, etc.

- CRP findings summary - stakeholder meeting in Jan. 2011
- present to developers (UDI luncheons and important for building codes)
- what technologies pass cost/benefit tests?

- efficiency of model →distributed vs. central model to disseminate information
- compare in-house resources (energy specialists) vs. Terasen EEC solutions managers; in-house seem to get more executive buy-in
- look at supply chain also → procurement, bidding process, etc.

Innovative Technologies and Industrial

- integrated “wireless control system” (eg. dorms, hotels) b/c difference in occupancy levels (Schneider electric)
- heat recover add-ons to rooftop units (Lennox)
- insulation tilt-up concrete buildings , BC (schools)
- solar stack, “glass” space conditions (Manitoba Hydro)
- building architecture
- biomass with Innovative Technologies
- education of technology operations for stakeholders
- Canmet, collaboration studies
- CGA technology

Next Steps

- meeting in March 2011
- getting an industrial and innovative committee member for next EEC meeting

Terasen Gas EEC Stakeholder Meeting

November 24, 2010

FORTISBC | Terasen Gas

Corporate Overview

EEC Stakeholder Meeting

Doug Stout
VP Energy Solutions & External Relations

2.1 million gas and electricity customers

$12 billion assets

FORTIS INC.

- Regulated Utilities
  - FortisBC
  - FortisAlberta
  - Newfoundland Power
  - Maritime Electric
  - FortisOntario
  - Terasen Gas
  - Belize Electricity
  - Caribbean Utilities
  - Turks and Caicos
- Non-Regulated Businesses
  - Fortis Generation
  - Fortis Properties

Fortis in BC: Terasen Gas and FortisBC

- Over one million gas and electric customers
- 135 communities across the province
- Combined assets of $6.4 billion
- Over 1,800 employees
- Have invested $1.03 billion since 2007
- $2.5 billion planned capital investment over next five years

Combined Service Territories

FortisBC

Terasen Gas

Natural Gas Vehicle Program for BC

Mark Grist
Manager, Business Development

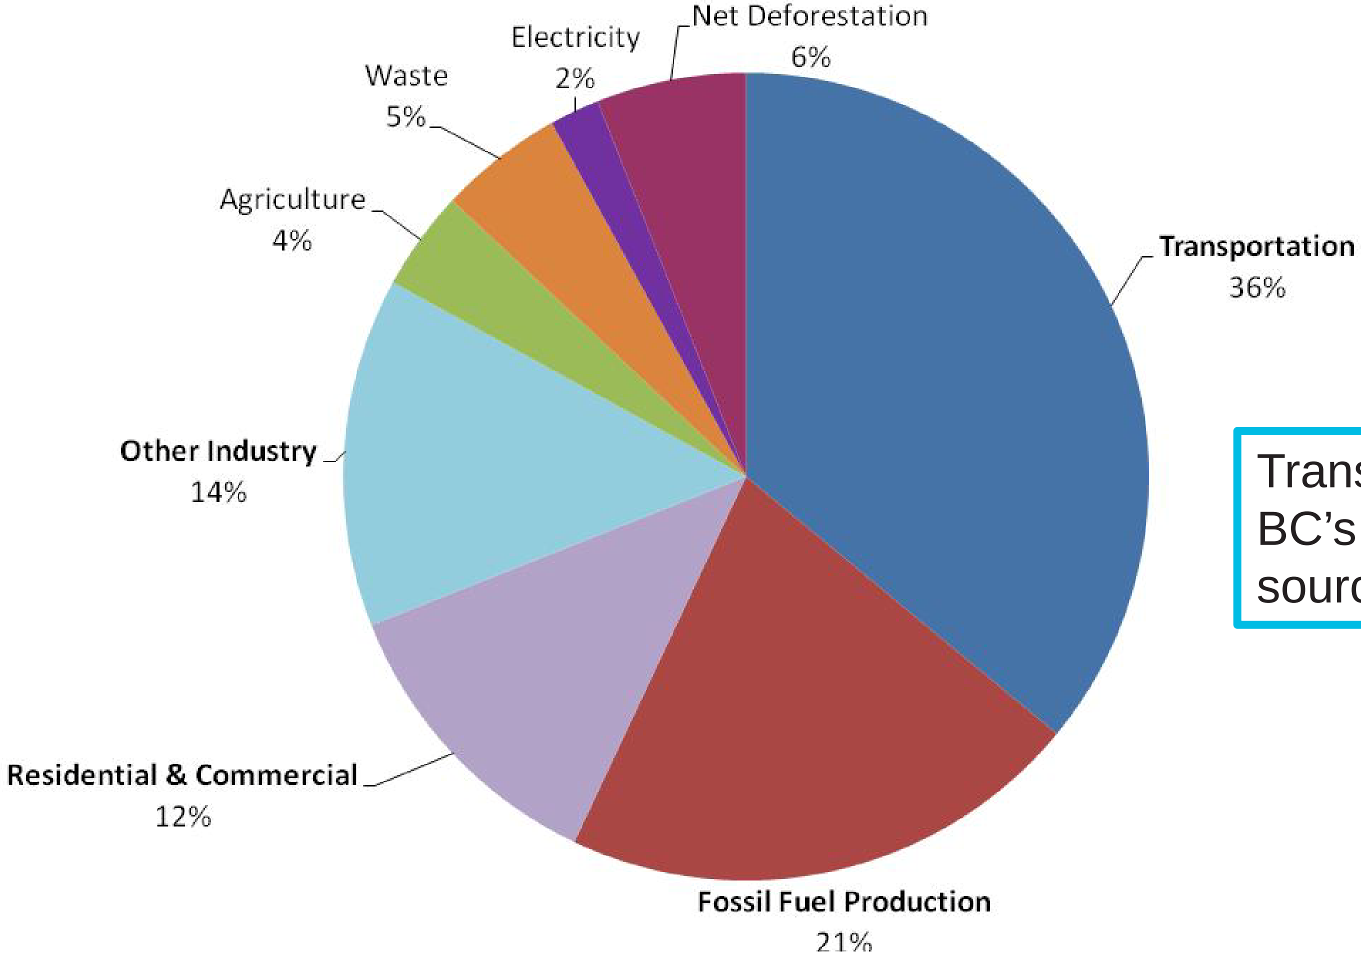
Forward-Looking Statement

By their very nature, forward-looking statements are based on underlying assumptions and are subject to inherent risks and uncertainties surrounding future expectations generally. Such events include, but are not limited to, general economic, market and business conditions, regulatory developments, weather and competition. Terasen and Fortis cautions readers that should certain events or uncertainties materialize, or should underlying assumptions prove incorrect, actual results may vary significantly from those expected. For additional information with respect to certain of these risks or factors, reference should be made to the Corporation's continuous disclosure materials filed from time to time with Canadian securities regulatory authorities. The Corporation disclaims any intention or obligation to update or revise any forward-looking statements, whether as a result of new information, future events or otherwise.

Overview

- Market Context
- NGV Objectives, Strategy & Penetration Estimates
- EEC NGV Incentive Program
- Example Projects & TRC Results
- Non-TRC Benefits
- Energy Security
- Royalty Revenue
- GHG Reductions

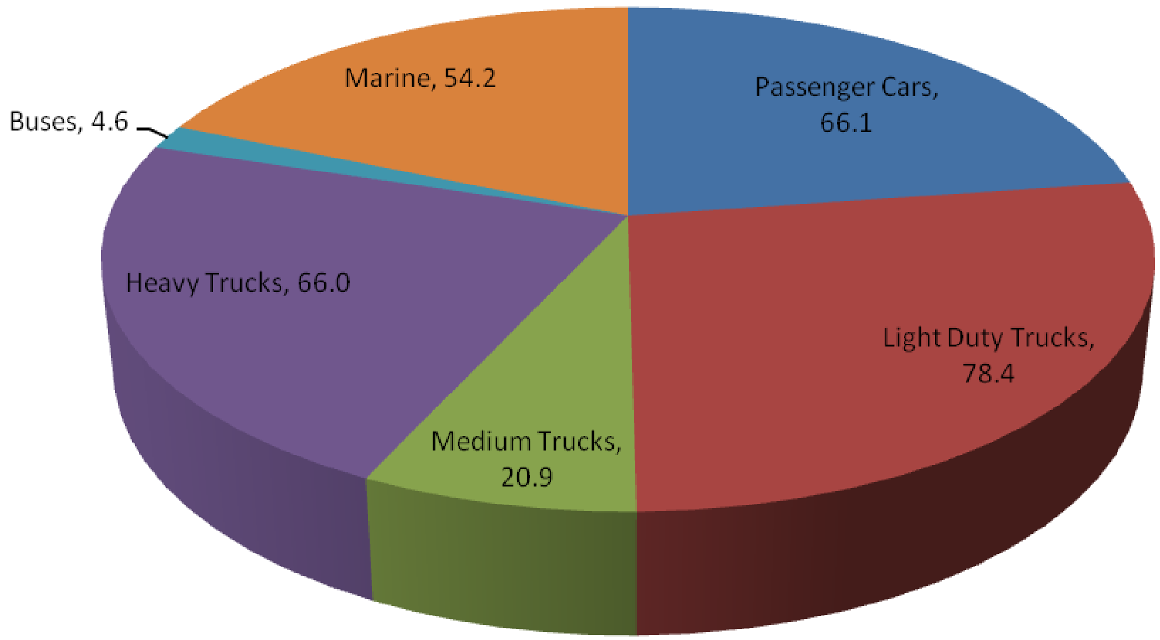
BC’s GHG Emissions by Sector



Transportation sector is BC’s largest GHG source

Source: LiveSmart BC website (2006)

BC's Motor Fuels Market



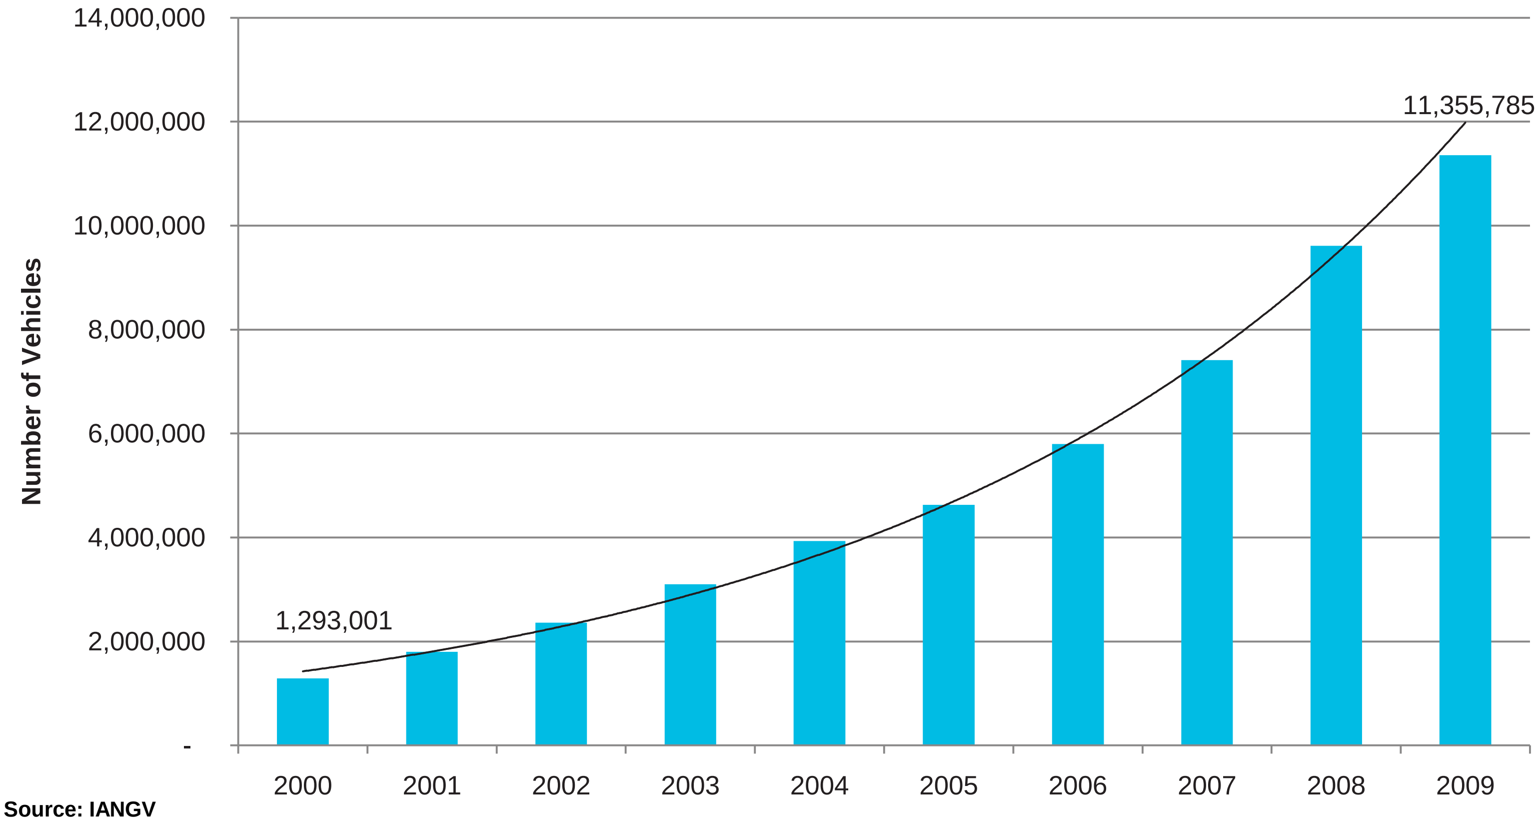
Total : 290.2 PJ
Source: NRCan 2007

Motor fuels market is larger than electricity or natural gas markets in BC

Trucking sector is 57% of total – good target for GHG reductions

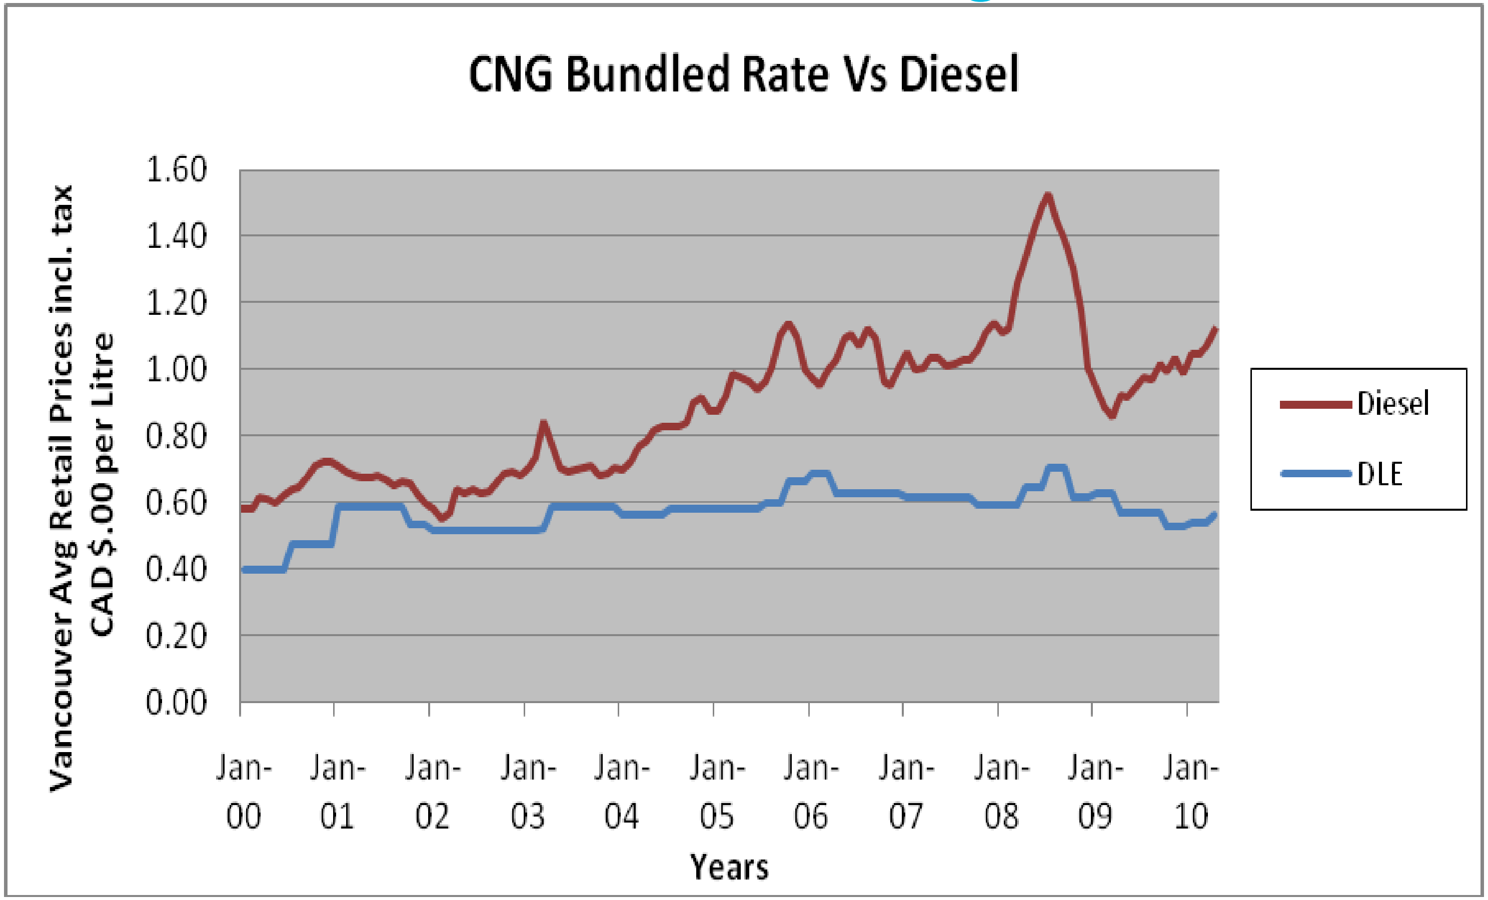
NGVs: A Proven Technology Worldwide

Leading players based in BC



Source: IANGV

Historical Diesel Pricing vs. NG (DLE)



At current pricing NG is 40 to 50% less than diesel

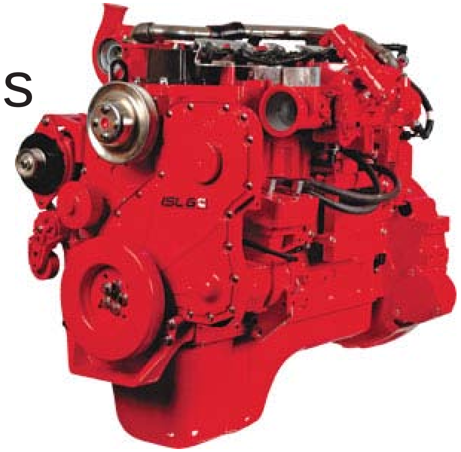
FORTISBC | Terasen Gas

NGV Business Plan Highlights

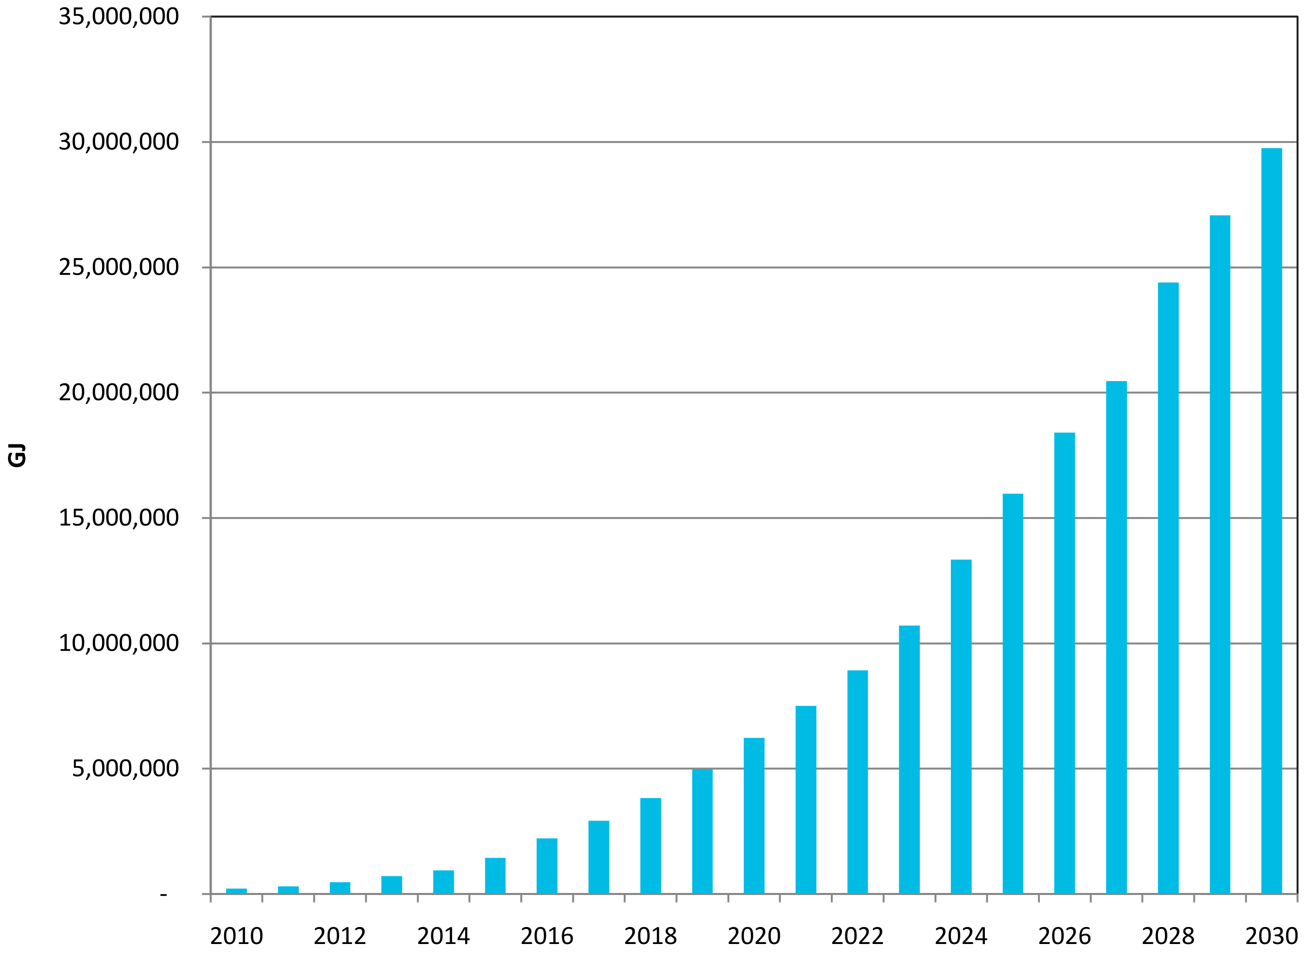
- Achieve 30PJ market penetration by 2030
  - Equivalent to 10% of today's market
  - Roughly equivalent to 15% of Terasen's present system load
- Focus on Heavy Duty Applications
  - Return to base fleets
  - Corridors
- Develop Reference Customers Who Can Ignite Market
  - Leaders in their market segments
- Eliminate Barriers to Adoption
  - Capital cost
  - Fueling infrastructure
  - Vehicle availability

NGV Strategy

- Focus on Heavy Duty Trucks and Transit Buses
- Use Existing NG Engines
- Partner with OEM equipment suppliers
- Support vehicle purchases with incentives



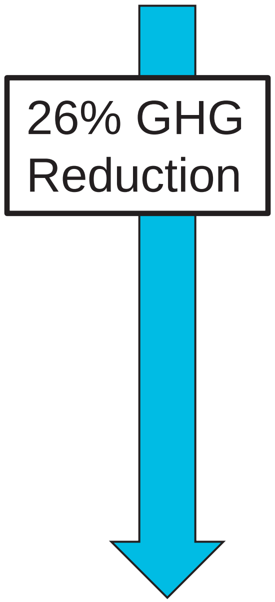
Market Penetration Forecast



Total Target Market Size of 458 PJ by 2030

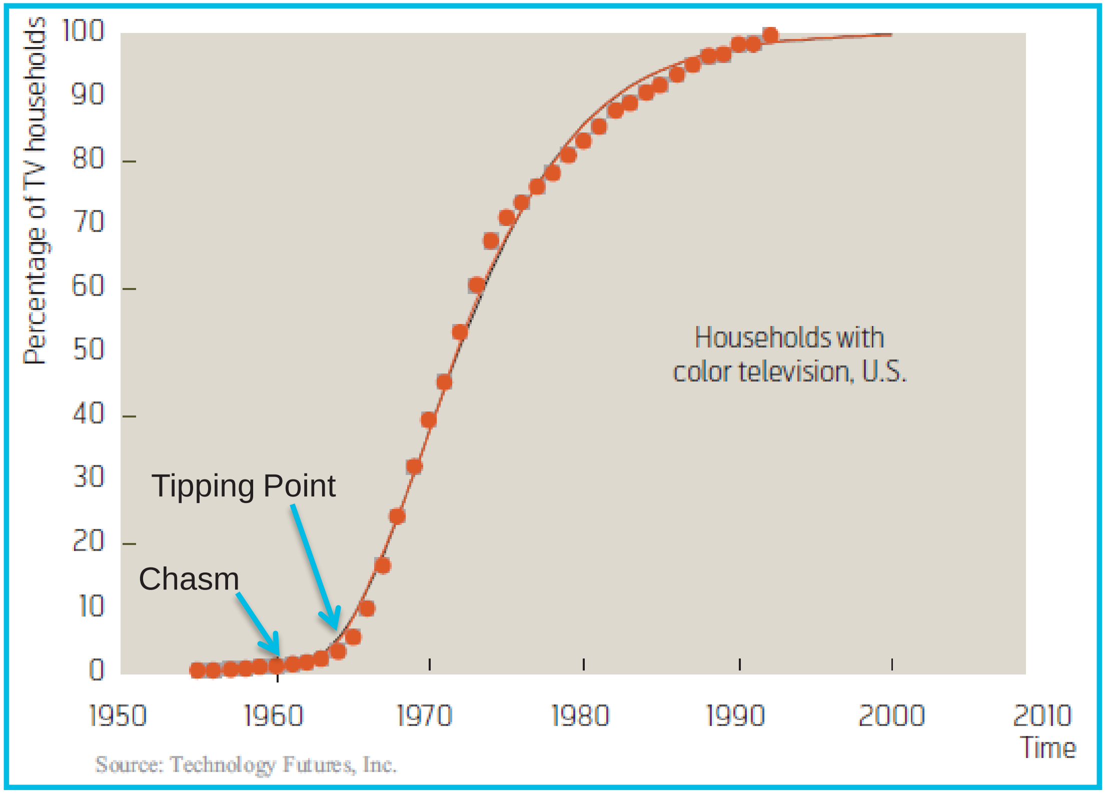
GHG Implications

- 17% of diesel demand can be replaced by natural gas under this scenario by 2030
- GHG savings of 865,000 tonnes CO_2e by 2030
  - Equivalent to displacing 368 million litres of diesel
  - Equivalent to taking 165,000 passenger cars off the road



Market Adoption Curves…

Higher Market Penetration Rates are Probable



New markets follow typical S shaped adoption curve.

Key is getting past "chasm" to "tipping point"

EEC Incentive is Key tool to get past this hurdle

Incentives can decline as market transformation is achieved – final penetration difficult to predict

Everett Rogers – Diffusion of Innovations, 1983

NGVs Delivering Solutions Today

Light Duty Trucks

Port Yard Trucks

Waste Haulers

Transit & School Buses

Urban Work Trucks

Heavy Duty Trucks

Ferries

Lower GHG Emissions with Natural Gas – A Made in BC Fuel

FORTISBC | terasen Gas

NGV Incentive Program

- Covers up to 100% of the incremental cost of the vehicles
- Targeted towards large fleets that run lots of miles
- Generally supports purchases >10 trucks (350,000 litres of diesel)
- Rationale – need scale to pay for fueling infrastructure
- Fueling infrastructure supply not linked to incentive support
- TRC test
- Total cost of incentives and NG fuel vs. cost of diesel
- Does not include GHG or load building benefits
- Commitments to keep vehicles in BC

Terasen Gas Key Projects

Application	Fuel Type	Number of Vehicles	TRC	Displaced Diesel Volume (L/yr)	Annual GHG Savings (tCO2e per fleet)
Garbage truck	CNG	20	1.1	468,000	214
Class 8 tractor	LNG	9	1.0	355,000	213
Class 8 tractor	LNG	25	1.8	5,000,000	3,161
Class 8 tractor	LNG	50	1.2	3,582,850	3,754

Unlike most GHG reduction projects these GHG reductions are achieved at negative cost per tonne of CO2e

The TRC assessments are >1 without factoring in GHG reductions

FORTISBC | Terasen Gas

Additional Upsides

- Load building benefits for all Terasen customers
- Addition of 30 PJ equivalent to 15% increase in load
- Customer benefit estimated at ~ $93 million/year

- GHG Credits
- 865,000 te reduction by 2030
- $21.6 million (@$25/te)

- BC Economy
- Locally produced fuel rather than imports
- Generates production royalties for provincial treasury ($30 million/yr)

Questions?

EEC – Looking Ahead

Sarah Smith
Manager, Energy Efficiency and Conservation

FORTISBC | Terasen Gas

2010 YTD Results

- Portfolio TRC currently 1.1 end Q3
- Projecting $10 million expenditures FY2010
- Cautious pace in growth
- Challenges to rapid expansion of EEC activity
  - Economy
  - Customer Engagement
  - Internal and external resources

2010 EEC Report

- Due March 31 2011
- Any additional content required?
- Regulatory process consolidated with next funding ask

Funding approval request – 2012 and beyond

- How do we ensure EEC resources are focused on efficiency and conservation?
  - Moving beyond the TRC
  - Ability to move funds around
  - Bound by Program Principles
  - Longer term funding approval
  - Funding ceiling
  - Accountability structures

Stakeholder Suggestions: How Terasen can help (March 2010 meeting)	Terasen Action(s)	Program Area(s)	Contact (s)
(relating to new construction) Programs for new home buyers, specifically first –timers Seeking appliance bundles for energy efficiency in new houses For SFDs – prescribed measures, or Energuide rating Support for codes and standards, and go beyond code (eg. home labeling	Quadra Homes pilot Education sessions with GVHBA, CHBAs and other associations Other programs in development	Residential	Beth
Invest in innovative/alternative energy solution	Solar thermal hot water incentives Eg. City of Vancouver	Innovative Technologies	Jim
Partnership in education, affiliation, and sponsorship Partnerships for training and mentoring	In talks with CHBA BC on Built Green Renovator and BC Builder courses ReNEW training program Energy Specialists	Residential Affordable Conservation Portfolio Projects	Beth Ned Colin
News posts on web, magazine & newsletter Info on present & future opportunities	Advertising and outreach through various channels: trade and consumer publications, Terasen bill inserts/newsletters, and call centres	Education – residential and commercial	Jenny
Promotions planned outside of the “high season” (Sept –Nov) because impacts quality of installation	TLC furnace servicing and EnerChoice fireplace programs	Residential	Beth
Perhaps a partnership to enable us to get consumers’ opinion/feedback on energy issues + housing issues	CHBA BC Housing Affordability Symposium	Affordable Conservation	Ned
Incentives for our members (green technologies have high upfront costs)	Solar hot water program	Innovative Technologies	Jim
Host local roundtable meeting of stakeholders to commercial boiler efficiency issues to take to the national meeting	Commercial boiler stakeholder meeting – June 23, 2010	Commercial	Ramsay

Terasen dealer (contractor) program Help me assess opportunities in a comprehensive way (not one-off technologies); expertise for hire, who can assess my options	Existing gas contractor program on Vancouver Island Expansion of gas contractor program on Mainland BC in development Gas contractor newsletters	Efficiency Partners	Gina
Access to info on the residential consumer + their preferences & actions (take up of incentives) Research/education on cost effective green build, energy efficiency, sustainable tools, technologies	Terasen studies: Residential End Use Study Conservation Potential Review Builder/Developer Customer Satisfaction	Residential Research	Beth Colin
Partnerships/cooperation on optimizing resources in program design/delivery Integration with LivesmartBC Harness power of strategic relationships; facilitate and bring together unlikely parties	Currently working on various projects with multiple partnerships and Public Sector Energy Conservation Agreement	Residential Commercial Affordable Conservation	Beth Ramsay Ned
GHG emissions and easily accessible programs to help decrease emissions; funding that is available to retrofit old equipment, or implement a project that will decrease natural gas consumption would be appreciated.	Energy Specialists, funded positions by Terasen Gas for municipalities, hospitals, and school districts Various EEC programs	Portfolio Projects	Colin
Liaise with regional stakeholders (oversee all of Western Canada) Interested in cost effective management in utility	Regional DSM representation Eg. Canadian Gas Association, Northwest Gas Association EEC portfolio	Portfolio	Sarah
Recognize distinctiveness & size of residential apartments and rental industry (+/- 600,000 rental homes)	Fireplace timer pilot program Energy Conservation Assistance Program Energy Saving Kits	Commercial, mult-family Affordable Conservation	Ramsay Ned

FortisBC EEC Stakeholder Meeting Agenda

March 15, 2011
Coast Coal Harbour Hotel, 1180 West Hastings St, Vancouver, BC – Coal Harbour B

8:45 – 9:00	Registration (coffee and pastries served)
9:00 – 9:30	Welcome
9:30 - 10:30	Presentation: 2010 Annual Report: Highlights and Program Budgets
10:30 – 10:40	Break
10:40– 11:05	Presentation: Conservation Potential Review Study Highlights
11:05– 11:50	Presentation: Total Resource Cost Alternatives and Discussion on Non Energy Benefits
11:50 – 12:45	Lunch
12:15 – 12:45	Presentation: 2012 EEC Funding Application Details
12:45 – 12:50	Wrap Up and Next Steps

FortisBC EEC Stakeholder Meeting Minutes
Tuesday March 15, 2011

Attendees
Marg Gordon – BC Apartment Owners and Managers' Association
Steve Hobson – BC Hydro
Mary McWilliam – BC Non Profit Housing Association
Alison Richter – British Columbia Utilities Commission
Tom Hackney – BC Sustainable Energy Association
MJ Whitemarsh – Canadian Home Builders' Association BC
Craig Williams – Canadian Manufacturers and Exporters
Mike Todd – Canfor Pulp
Stuart Gairns – Canfor Pulp
Mark Hartman – City of Vancouver
David Craig – Consolidated Management Consultants
Joan Huzar – Consumers Council of Canada
Dan Pasacreta – Crosby Property Management
Keith Veerman – FortisBC Inc.
Jim Vanderwal – Fraser Basin Council
Amy Spencer-Chubey – Greater Vancouver Home Builders' Association
Richard Siegenthaler - Hemmera
Bridget Macgowan – IBC Technologies
Chris Frye – Ministry of Energy and Mines
Nir Kushnir – National Energy Equipment
Nina Winham – New Climate Strategies; FortisBC rate 1 customer
Jeff Fischer – Urban Development Institute

Regrets
Leigha Worth – BC Public Interest Advocacy Centre
Erik Skehor – BC Safety Authority
Rob Noel – BC Mechanical Contractors Association
Tony Gioventu – Condominium Home Owners' Association
Gord Monro – Heating, Refrigeration and Air Conditioning Institute of Canada
Al Kemp – Rental Owners and Managers Society of BC
Cindy Stern – Tseshaht First Nation

Gina Lego	Shawn Hill

EEC Program Managers, 2010 Annual Report: Highlights and Program Investment Budgets

Question: Didn't we already provide our support of the Natural Gas Vehicle program from the November 24, 2010 presentation?
FortisBC: We require stakeholder support in writing so that we can show the BC Utilities Commission that we have followed the right process in consulting with stakeholders.

Q: What are the savings from the Energy Specialist program?
FortisBC: Enabling Activities do not have any direct energy savings associated with them; however, we will be doing an evaluation of the pilot program later this year.

Jack Habart, Conservation Potential Review Study Highlights 2010
***Note: presentation has not been distributed along with these meeting minutes. The Conservation Potential Review will be filed with the EEC funding application submission in the Spring of 2011.**

Question: Where are the furnaces on the list of residential appliances?
FortisBC: Furnaces do not show up as economically viable with the DSM guidelines set out today, but we know there are thousands of mid to low efficient furnaces still in the marketplace, and we plan to work with government to go after that market potential to change the DSM guidelines, and also discuss a product stewardship strategy.

Question: Why do the furnaces not show up on the graph?
FortisBC: Going from 90-95% efficient furnace is not cost efficient. And right now, we only include economic assumptions, and not behavioural assumptions, such as, people do not always replace their furnace after 18 years (ie. end of useful life).

Question: Do we adjust for this in the base case?
FortisBC: Furnaces do not show up in economic potential, but do show up in achievable potential.

Sarah Smith, 2012 EEC Funding Application Details

Comment: On Joint Initiatives, FortisBC may want to consider keeping a Joint Initiatives category for work with municipalities.

Next Steps

- Annual Report submission to BCUC, March 31, 2011
- EEC funding application, 2012-2013, Spring 2011
- next EEC Stakeholder meeting November 2011

EEC Stakeholder Meeting

March 15, 2011

FORTIS BC™

Agenda

- Welcome and group introductions
- 2010 Annual Report: Highlights and Program Investments
- Conservation Potential Review Study Highlights
- Total Resource Cost Alternatives and Discussion on Non Energy Benefits
- 2012-2013 EEC Funding Application Details

2010/11 Innovative Technologies - Commercial NGV Demonstration Program

- Objective: encourage heavy duty fleet operators to switch from high-carbon diesel to low-carbon NG
- Benefits: displace diesel fuel, reduce upfront capital cost, environmental benefits and load building benefits
- 2010: $5.6 million for 82 vehicles – 50 LNG and 32 CNG
- 2011: $3.8 million for 54 vehicles – 34 LNG and 20 CNG

Utility (Year)	Participants	Incentive Expenditures ($000s)	Non-Incentive Expenditures ($000s)	Annual Energy Displaced (GJ/yr)	NPV Energy Displaced (GJ)	Free Rider Rate	TRC
FEI 2010 Actual	82	$5,587	$2	(164,665)	(784,502)	0%	1.4

FORTIS BC™

Program Area Funding Transfer

- In 2010, $3.487 million transferred from Conventional EEC Program Area into Innovative Technologies Program Area (FEI only)

- Transfer is consistent with Commission Order G-36-09, which allows:

  "…any inter and intra Program Area Initiative funding transfers, with supporting rationale, and the impact of such transfers on the transferor and transferee Program areas, initiatives and measures as the case may be."

FORTIS BC™

A Speed Bump re the NGV Program…

- Opinion in Interim Ruling on Waste Management
  - *"The Commission Panel is not presently persuaded that Terasen has Commission approval for the incentive grant to Waste Management that is described under Vehicle Reimbursement in the WM Agreement."*
  - *"the Commission Panel believes that Terasen is at risk of not being able to recover Incentive payments to Waste Management in its rates."*

- FortisBC believes that we have express approvals to use EEC funds for NGV initiatives, and have followed the principles and processes defined for the EEC program.

- Clarification of this issue being sought through EEC annual report process

FORTIS BC™

Sequence of Events
Ongoing Stakeholder Engagement

2008 EEC Application & Decision (G-36-09)
- The Commission denies Innovative Technology and NGV incentives
- Defines program accountability rules

2010- 2011 Revenue Requirement Application
- Approval of EEC funding for Innovative Technologies
- Withdrawal of request for approval of Compression and Fueling Service

2009 EEC Annual Report
- Expansion of Innovative Technologies Portfolio, to include NGV for commercial vehicles for 2010
- Presentation to EEC stakeholders laying out full NGV plan

2010 Resource Plan
- Includes use of EEC funds to promote NGV

Application for CNG and LNG Service
- Interim Decision granting approval of take or pay rate
- Comments made re use of EEC funds

FORTIS BC™

EEC Accountability Mechanism (G-36-09)

- Proposed Accountability measures:
  - TRC test, Annual Report, Funds not spent not charged etc
  - “Fourth, ….hold annual EEC workshops with stakeholders, at which the companies would present updates on program progress and obtain stakeholder input on new programs and refinements to existing programs.”
- Commission Acceptance
  - “The Commission Panel accepts Terasen’s accountability undertakings…..”

Confusion Re 2010/2011 RRA Decisions

- Two separate and distinct elements
  - EEC Incentive Programs
  - Provision of Compression and Refueling Service
- As part of Negotiated Settlement FortisBC withdrew application for approval of Natural Gas Compression and Refueling Service (postage stamp rate design)
- RRA Negotiated Settlement
  - EEC program, including Innovative Technologies was contained within Negotiated Settlement

FORTIS BC™

EEC Stakeholder Sessions (2010)

- March 11
  - Presentation of proposed Innovative Tech budget
  - Included budget projections for NGVs
- November 24th
  - Detailed 17 page presentation of NGV program for BC
  - 40% Fuel Savings, 20-30% GHG reductions, Provincial Royalties, $93 million per year in benefits to non-NGV customers (by 2030)
- Stakeholder Feedback
  - No opposition to NGV program
- Conclusion
  - Approach Used is Consistent With Accountability Mechanisms approved for EEC programs

FORTIS BC™

2010 Application for CNG and LNG Service

- Application relates to providing fueling service, not to providing vehicle incentives
  - Two distinct and separate issues
- Vehicle Incentives are not contingent on purchase of fueling service
  - Customers can pursue other alternatives where available
  - E.g. City of Surrey

FORTIS BC™

EEC Incentives for NGV: Summary

1
- Meets the cost effectiveness threshold as identified in the original EEC decision and RRA for 2010-2011

2
- Transparency and Stakeholder Engagement (EEC Annual Report, Resource Plan)

3
- Promotes fuel switching from high carbon to lower carbon

4
- Customer uptake and benefits all rate payers (lower delivery rates all else being equal)

5
- Supports the Clean Energy Act and is an example that meets government's GHG emissions reduction objectives (support from Ministry of Energy in FEI RRA for 2010-2011)

FortisBC has express approval to use EEC funds from Innovative Technologies bucket to help fund NGV purchases.

FORTIS BC™

Business Impacts and Call to Action

- Uncertainty impairs our ability to move forward with business initiatives for CNG & LNG vehicles
- Delays in achieving NGV goals and benefits
  - Climate change – reduction of GHG emissions
  - Load building benefits for all FortisBC natural gas customers
  - Cost reductions for NGV customers
- Market transformation momentum that has taken 2 years to develop is at risk
- Seeking Stakeholder support in getting issue clarified
  - Specifically confirmation that approved process was followed

FORTIS BC™

2010 and 2011 Industrial Programs

Objective: Create energy efficient plants.

- Energy Audit Funding Program – incentives up to $20,000
- Pulp and Paper Industry Heat Exchanger Pilot Program (Estimated energy savings 70,000 GJ/yr)
- Certified Pilot Plant Project – ISO 50001 "Energy Management Standard". Available in Q3 2011.
- Automated Burner Management System (Mk6 BMS) (Estimated savings 2000 GJ/yr)

FORTIS BC™

2010 and 2011 Enabling Activities

Energy Specialist Pilot Program

- Currently 14 Energy Specialists in the market
  - 4 more about to be hired
- Evaluation in early Q3 2011
- Progress to date shows successful integration with Energy Manager and large quantity of gas related projects
- Total pilot program investment = $1.2 million

TrakSmart – program tracking

- Initial programs to be launched in TrakSmart in Q2 2011
- Total project investment = $1.4 million

FORTIS BC™

Enabling Activity: Efficiency Partners Program

2010 Milestones

Research, Communication and Outreach Activity

- Contractor Study undertaken to inform EEC Contractor Program and the LiveSmart BC Program
- Consultation workshops held on Vancouver Island, LM
- Focus group sessions held in the LM
- Established quarterly newsletter
- Outreach to trade associations and organizations

FORTIS BC™

2011 Efficiency Partners Program Timeline

Planned Activities	Q 1	Q 2	Q 3	Q 4
Contractor Program Launch				
Website development/launch				
Develop/deliver training				
Co-op advertising				

FORTIS BC™

2010 Conservation Education and Outreach Investments

Program Area (Audience)	Total (Non Incentive) Expenditures ($ 000's)
Residential and General Public Education	$1,118
Commercial Customers Education	$313
Conservation for Affordable Housing Education	$10
Schools	$143
Total	$1,616

Addressing the TRC-Carbon Gap

Alternatives to Conventional California B/C Tests for DSM Programs

Prepared for FortisBC

March 15, 2011
Habart & Associates Consulting, inc
CADMUS GROUP, INC

Marbek

www.marbek.ca

Background & Objectives

- FortisBC rapidly expanding initiatives
- Provincial / Federal GHG targets
  - Require aggressive DSM

- Current program screening approaches do not allow adequate investment in EEC programs
  - Project to develop alternate approaches to screening

- Issue occurring in other jurisdictions

Marbek

Approach

- Literature review / networking
- Identify Range of Options

- 3 Streams of Discussion:
  1. Change TRC input assumptions
  2. Change screening test
  3. Change approach to B/C testing to better reflect GHG objective

Marbek

GHG Targets
(Residential)

- GHG Reduction Targets
  - BC – 33% below 2007 by 2020
  - Federal – 17% below 2005 by 2020
- BC
  - 1,439 kt CO_2e
  - 28,383 TJ
- Federal
  - 735 kt CO_2e
  - 14,502 TJ
- Residential Economic Potential (2020)
  - 8,260 TJ

Marbek

Current Practice

- California Standard Practices Tests (CST)
  - Total Resource Cost Test (TRC)
    - Balance investment between usage & supply
    - Economic efficiency of energy system
  - Societal Cost Test (SCT)
    - Expands TRC to societal perspective
  - Utility Cost Test (UTC)
    - Perspective of utility
    - Cost of program vs cost of add’t supply
- CST not intended for GHG screening

Marbek

Current Practice

- Total Resource Cost Test
  - Conceptually simple, but
    - Assumes consumers are economically rational
    - Assumes non-energy benefits can be quantified / monetized by DSM planners
  - Counter intuitive outcomes
    - Provide incentives for marginally more efficient DWH but no incentive for much more efficient tankless DWH
    - Measure may reduce cost for homeowner, but not pass utility screening if mortgage % < screening %

Marbek

Option #1: Change B/C Inputs

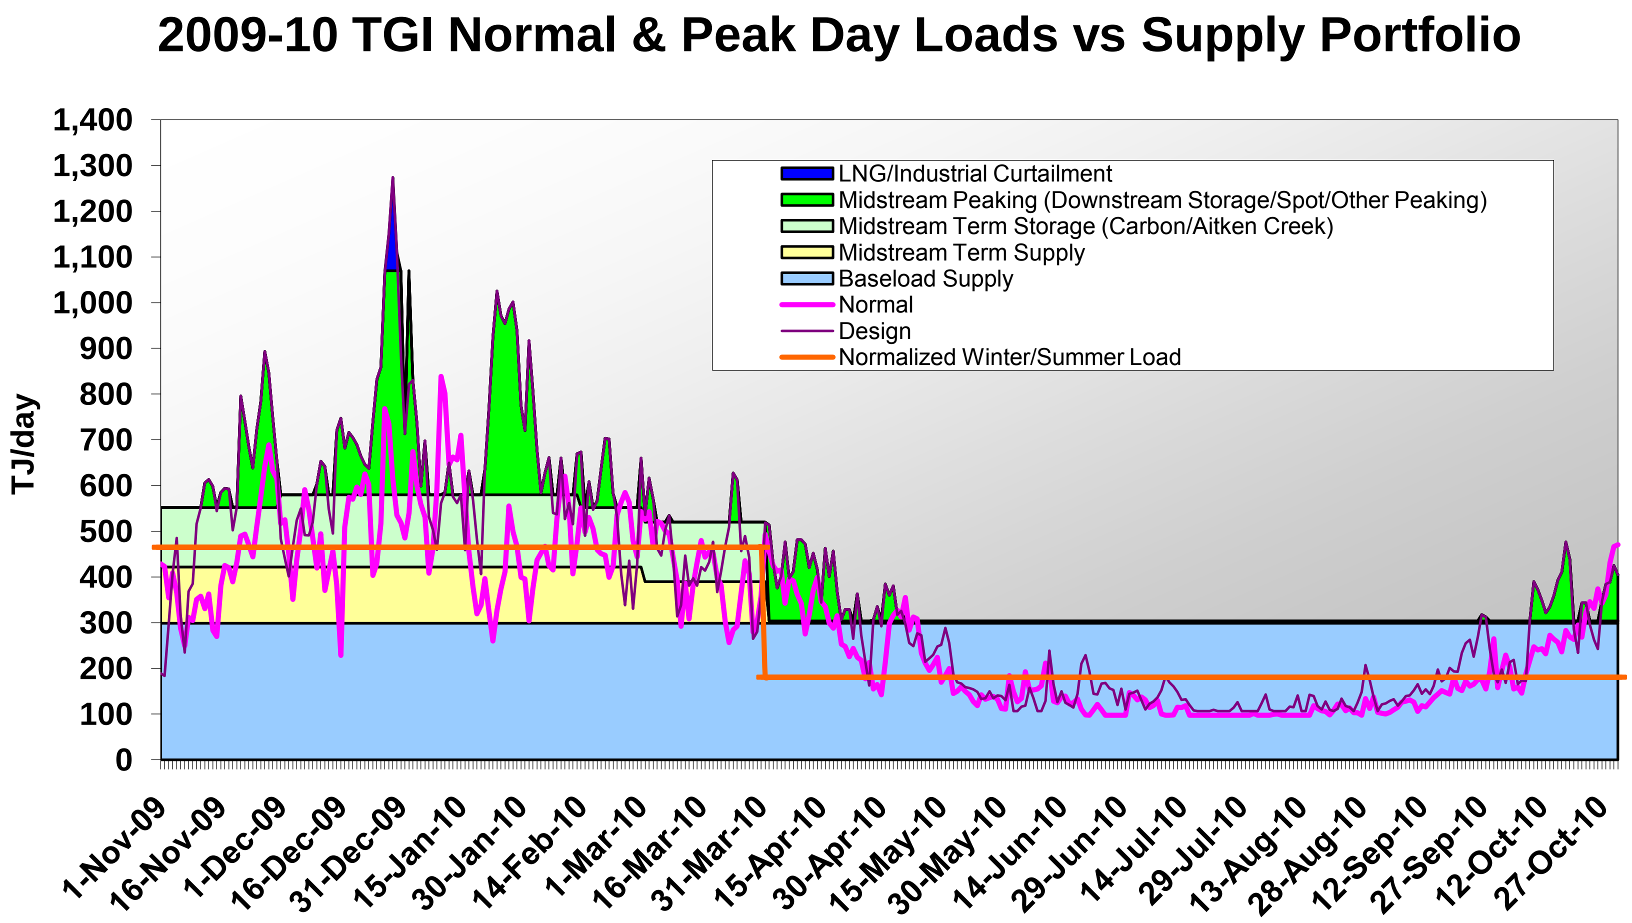
- Critical Inputs
  - Avoided / marginal costs
  - Discount rate
  - Free rider / Spillover treatment
  - Treatment of non-energy benefits
  - Program & measure life

#1 - Avoided / Marginal Costs

- The Issue
  - Marginal cost intended to reflect the avoided cost of supply for that measure
- Options & Challenges
  - Utilities often use “average” marginal costs
    - Seasonal marginal costs
      - Summer / flat loads have a different cost than winter
  - Is MC of fossil fuel the “right” screen?
    - Some jurisdictions have higher feed-in rates for green energy
    - CST allows use of higher MC from other utilities
    - FortisBC – MC gas $7.03 vs $9.90 - $15.28 for biogas (2011)

Marbek

Supply Load Shape



#1 - Avoided / Marginal Costs

- Impact(s)
  - Seasonal marginal costs
    - Not quantified.
  - Marginal cost of biogas (SOC)
    - Possible 40% increase in MC
    - Tankless water heater
      - Base B/C 0.37
      - MC + 40% 0.53

Marbek

#1 - Discount Rate

- The Issue
  - High discount rate reduces future benefits
  - TRC specifies weighted cost of capital
    - FortisBC ~ 7.85%
- Options
  - SCT allows the use of a social discount rate
    - Intergenerational equity (ie: building shell > 50 years)
    - Discussion of 2.5 – 3.5% as appropriate in Canada
- Precedents
  - Some US states use Treasury Bill rates (2.5 – 3.5%)
  - US Center of Disease Control uses 3%
  - UK uses 3.5%

Marbek

#1 - Discount Rate Impacts

		Discount Rate					
	Measure Life	9.0%	7.0%	5.0%	3.0%	1.0%	0.0%
NPV Measure Benefits @$100 annual benefit stream	5	$389	$410	$433	$458	$485	$500
	10	$642	$702	$772	$853	$947	$1,000
	15	$806	$911	$1,038	$1,194	$1,387	$1,500
	20	$913	$1,059	$1,246	$1,488	$1,805	$2,000
	50	$1,096	$1,380	$1,826	$2,573	$3,920	$5,000
Percentage NPV redution relative to zero discount rate	5	78%	82%	87%	92%	97%	
	10	64%	70%	77%	85%	95%	
	15	54%	61%	69%	80%	92%	
	20	46%	53%	62%	74%	90%	
	50	22%	28%	37%	51%	78%	

Marbek

#1 - Discount Rate Impacts

- Impact
  - Tankless water heater
    - Base B/C 0.37
    - 3.5% Disc 0.57

Marbek

#1 - Discount Rate Impacts

- Impact
  - Tankless water heater
    - Base B/C 0.37
    - 3.5% Disc 0.57
    - (both) 0.81

Marbek

#1 - Free Riders / Spillover

- The Issues
  - Attribute motivations for decisions
    - Free Riders – Would they have done it without the program.
    - Spillover – Installed that / other measures, but no rebate
  - No consensus on “correct” methodologies
    - All methods have biases / provide different results
  - Can add significantly to evaluation time / cost
  - Evaluations tend to focus on FRR, not spillover

Marbek

#1 – Free Riders / Spillover

- Options & Challenges
  - Full estimation of both FRR and Spillover
    - Accuracy still uncertain
    - Expensive
  - Assume FRR and Spillover equal out
    - Current practice in some jurisdictions
      - Minnesota, Wisconsin, Oregon, Iowa etc.

Marbek

#1 - Free Riders / Spillover (cont'd)

- Impacts
  - Remove significant distraction
  - Reduce cost of evaluations
  - Does require control to avoid "easy, but they would do it anyway" programs
  - For given program if FRR / Spillover understated
    - For society, same energy at same cost
    - More financial burden on non-participants

Marbek

#1 - Treatment of Non-energy Benefits

- The Issue
  - Many EEC products not “identical”
  - TRC screening requires EEC planners to determine / monetize non-energy benefits
    - Expensive / arguable
- Options & Challenges
  - Include quantifiable benefits
    - I.e.: labour savings for CFL’s
  - Estimate incremental cost of efficient component(s)
  - Adders for low income programs
  - “Deemed” non-energy benefits?

Marbek

#1 - Treatment of Non-energy Benefits

- Impact(s)
  - Likely significant, especially for building shell measures

Marbek

#1 - Measure Life

- The Issue
  - Some jurisdictions artificially cap measure life
  - Discount rates negate longer term benefits
- Options & Challenges
  - Use the “best estimate” of measure life
  - Use sensitivity analysis to determine the shortest measure life that provides a positive B/C
  - Focus on discount rates.

Marbek

#1 – Measure Life Disc. Impacts

		Discount Rate					
	Measure Life	9.0%	7.0%	5.0%	3.0%	1.0%	0.0%
NPV Measure Benefits @$100 annual benefit stream	5	$389	$410	$433	$458	$485	$500
	10	$642	$702	$772	$853	$947	$1,000
	15	$806	$911	$1,038	$1,194	$1,387	$1,500
	20	$913	$1,059	$1,246	$1,488	$1,805	$2,000
	50	$1,096	$1,380	$1,826	$2,573	$3,920	$5,000
Percentage NPV redution relative to zero discount rate	5	78%	82%	87%	92%	97%	
	10	64%	70%	77%	85%	95%	
	15	54%	61%	69%	80%	92%	
	20	46%	53%	62%	74%	90%	
	50	22%	28%	37%	51%	78%	

Marbek

#1 - Program and Measure Life

- Impact(s)
  - Significant with long life / low discount rates

Summary – TRC Changes

- Summary
  - Avoided Cost
    - Biogas ~ +40%
  - Discount Rate
    - Societal discount rate ~ 3.5%
  - Free rider / spillover
    - Not include?
  - Full measure life
    - Significant for building shell etc.

Marbek

Option #2: Change B/C Test

- Options - Use
  - Societal Cost Test
  - Utility Cost Test

Marbek

Summary of Tests

Elements		TRC	UCT	SCT
Benefits	Avoided Supply Costs	√	√	√
	Avoided T&D Costs	√	√	√
	Bill Reductions (Primary Fuel)			
	Conservation "Adder" or Externalities (Environmental)			√
	Indirect Fuel Benefits	√		√
	Bill Reductions (Indirect Fuel)			
	Other Indirect Benefits			√
Costs	Direct Utility Costs	√	√	√
	Direct Customer Costs	√		√
	Utility Program Administration	√	√	√
	Lost Revenues			
Discount Rate		WACC	WACC	SDR

#2 – Use Societal Cost Test

- Pros
  - Allows use of a societal discount rate
  - Allows the use of higher marginal costs
    - Possible to use MC of biogas?
  - Allows expanded treatment of environmental impacts

#2 – Use Societal Cost Test

- Cons
  - Still screens against the MC of new supply
  - Still requires quantification / monetization of non-energy benefits
  - Does not change issues such as RIM, Free riders/spillover
  - Still requires monetization of environmental impacts
    - May use adders from other jurisdictions

Marbek

#2 – Use Societal Cost Test

- Impact on EEC
  - Likely significant for EEC programs
  - Less for GHG

Marbek

Summary of Tests

	Elements	TRC	UCT	SCT
Benefits	Avoided Supply Costs	√	√	√
	Avoided T&D Costs	√	√	√
	Bill Reductions (Primary Fuel)			
	Conservation "Adder" or Externalities (Environmental)			√
	Indirect Fuel Benefits	√		√
	Bill Reductions (Indirect Fuel)			
	Other Indirect Benefits			√
Costs	Direct Utility Costs	√	√	√
	Direct Customer Costs	√		√
	Utility Program Administration	√	√	√
	Lost Revenues			
Discount Rate		WACC	WACC	SDR

Marbek

#2: Use Utility Cost Test

- Pros
  - More like new supply analysis
  - Avoids non-energy benefits
    - Respects consumers to make choices that provide them value for money.
- Cons
  - Weakens linkage with cost of energy to society
    - Can promote non-cost effective technologies
  - Does not change issues such as RIM, free riders etc
  - Still linked to the MC of new supply
- Used by Michigan / Connecticut

#2: Use Utility Cost Test

- Impact on EEC
  - Can’t model, as only impacts program cost / incentive
  - May not provide sufficient incentive for technologies such as tankless water heaters
    - Incremental cost – $2,400
    - Incremental savings – 6 GJ/yr
    - Value of savings - $1,000

Marbek

Summary – Screening Tests

- Summary
  - TRC
    - Screens against cost of new supply
    - Practical limits to DSM investment
  - SOC
    - Greater potential for DSM investment
    - Still screens again cost of new supply
  - UCT
    - Avoids “non-energy benefits”
    - No cost effectiveness boundary

Marbek

#3: GHG Based Approach

- The Issue
  - Provincial target is
    - -33% by 2020
    - -80% by 2050
  - Screening against MC of gas likely doesn’t provide sufficient reduction.
    - Use of SCT will improve this.

Marbek

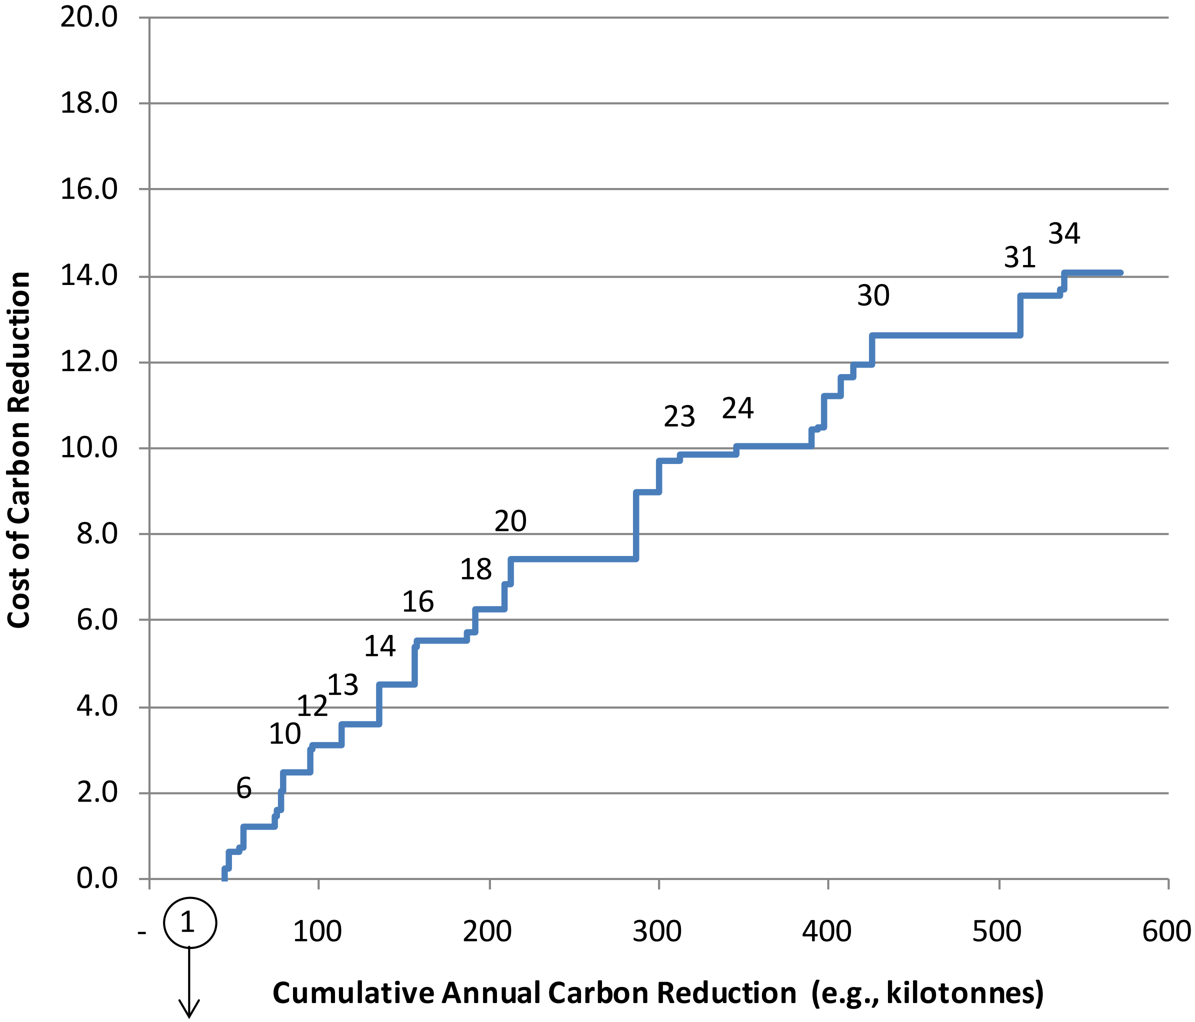
#3: GHG Based Approach

- Options & Challenges
  - Screen against value of GHG
    - No agreed value for GHG damage or mitigation
    - May be like valuing environmental benefits
- Alternative
    - Use CPR data to provide a carbon supply curve
    - Determine desired level of carbon reduction & associated costs
    - Negotiate with Government / BCUC for necessary
      - Funding & Approval process

Marbek

Carbon Reduction Supply Curve

(Concept only)



Carbon Reduction Supply Curve
(Concept only)

- Supply Curve Development Requires
  - CPR Technical Potential
  - Add't Measures that were not screened

- Note:measures lower on the chart are "free"
  - Ie: paid for by DSM savings.

#3: GHG Based Approach

- Pro
  - Provides data to make an informed choice
    - GHG reduction vs. cost / types of initiatives
  - Breaks the link with marginal cost of fossil fuel
  - Directly addresses the GHG policy objective
  - Avoids forecasting MC of gas
- Con
  - Breaks new ground – no precedents
  - Who needs to approve?
  - Who needs to set values / funding?

Thank you

Marbek

2012 - 2013 EEC Funding Application

Sarah Smith

March 15, 2011

FORTIS BC™

Strategy

- 2012 – 2013 Revenue Requirements Application submission May 2 2011
  - 2 year period
- Long Term Resource Plan submission Summer 2012
  - 20 year planning horizon
  - 5 year EEC funding ask

FORTIS BC™

Funding approval request – 2012 and 2013

Program Area	2012 ask ($000's) **Total**	2013 ask ($000's) **Total**
Residential	**9,500**	**9,500**
Joint Initiatives	**n/a**	**n/a**
High Carbon Fuel Switching	**1,500**	**1,500**
Low Income	**5,000**	**5,000**
Commercial	**16,000**	**20,000**
Innovative Technology	**12,050**	**17,690**
Conservation Education and Outreach	**5,000**	**5,000**
Industrial	**3,000**	**3,000**
Portfolio Level	**5,000**	**5,000**
Furnace Scrap-It program	**10,000**	**10,000**
Totals	**67,050**	**76,690**

*Note: the numbers are preliminary and could be modified for the Revenue Requirement Application

FORTIS BC™

Additional Items

- Split 75% FEI, 24% FEVI, less than 1% FEW
- Change in timing of expenditure recovery in rates
- Societal test as primary test
  - Social discount rate
  - Biogas as avoided cost of gas
  - Deemed adder for non-energy benefits
  - Free riders and spillover cancel each other out
  - Exclusion of CEO and Enabling costs from portfolio-level calcs
- Joint Initiatives consolidated with Residential
- EE Financing not included in ask
- S18 programs, with exception of NGV, not included in ask

FORTIS BC™

FortisBC EEC Stakeholder Meeting – Stakeholder 2011 Priorities
March 15, 2011

Organization	**Goals of Organization**	**Members represented**	**Priorities for 2011**	**How FortisBC can help organization (2-3 ways)**	**Action Item for FortisBC in 2011**
Greater Vancouver Home Builders' Association	Protecting interests of new home buyers Housing affordability and choice Education Marketing and networking	700+ members Builders Developers Trades Suppliers Architects & designers →Voice of residential construction industry	Combating the downloading of taxes, fees and levies of homebuyers	Keep us informed about new programs and implementation dates	Let us know what we can do to support funding application
Organization	**Goals of Organization**	**Members represented**	**Priorities for 2011**	**How FortisBC can help organization (2-3 ways)**	**Action Item for FortisBC in 2011**
BC Apartment Owners and Managers' Association	Sector sustainability through offering lobbying, education, partnerships with affiliates and associates (price points) Member strength through retention and grown	3000 members Apartment owners & managers (landlords) + associates (suppliers) + affiliates -sustainability	Successful energy specialist program Green renovations Dealing with controlled revenue and uncontrollable costs Member relations and growth Education Deal with split incentives Zero rating of HST	Assist energy specialist to promote programs and to have member participation Expand programs to involve BC Hydro programs with our energy specialist. Examine ways to shorten pay-back times Facilitate workshops for our members Cross promotion in each other's communication vehicles	Create a workshop for us on operations and maintenance Assist with tenancy engagement Advertise in BCAOMA communication vehicles and participate in events Assist us with a gas pooling program.

Organization	Goals of Organization	Members represented	Priorities for 2011	How FortisBC can help organization (2-3 ways)	Action Item for FortisBC in 2011
National Energy Equipment (distributor of Trane)	Increase market creation of home comfort systems for retrofit market Incorporate "clean air" offering into heating and cooling products	(52) HVAC dealers -homeowners that purchase Trane equipment	Promote consumer education and leverage available programs of energy conservation for new homes and retrofits	Promote homeowners education Provide 2-3 year master plan for stakeholders Explain where and why Fortis is promoting EEC	Establish homeowners online portal Create stakeholder partner program
Organization	**Goals of Organization**	**Members represented**	**Priorities for 2011**	**How FortisBC can help organization (2-3 ways)**	**Action Item for FortisBC in 2011**
Consumers Council of Canada	Consumers more aware of energy efficiency options Consumers knowledgeable about the costs/payback/justification of energy efficient purchases Ensure the consumer voice is at the policy table	Residential consumers of energy	Consume access to energy efficiency information, both in general and specific to their needs	Support consumers councils proposal to develop the councils energy web pages to make them useful and relevant to consumers	Meet the needs of residential consumers who want to implement energy efficiency measures in their homes Increased support of contractors.

Organization	Goals of Organization	Members represented	Priorities for 2011	How FortisBC can help organization (2-3 ways)	Action Item for FortisBC in 2011
Urban Development Institute	To connect our industry with governments and the public Improve our industry through professional development and education Having a reasonable cost of & regulatory environment for our members	Developers & professionals that support them. 500 corporate members (architects, engineers, banks)	Embarking on an Environmental Leadership Initiative (ELI) Affordable housing Communication	Partner with Fortis on ELI Members need more information on district energy, renewable energy, solar, and construction	Would like to do a seminar on District and Renewable Energy. A presentation on Fortis Programs for developers
Organization	**Goals of Organization**	**Members represented**	**Priorities for 2011**	**How FortisBC can help organization (2-3 ways)**	**Action Item for FortisBC in 2011**
Crosby Property Management	Energy savings Green technology	25,000 residential strata owners	Continued implementation of boiler efficiency program	Good representation in place with Ramsay Cook	

Organization	Goals of Organization	Members represented	Priorities for 2011	How FortisBC can help organization (2-3 ways)	Action Item for FortisBC in 2011
Rate 1 customer/landlord/ New Climate Strategies consultant	Improve energy efficiency infrastructure in my home	Rate 1 customers across BC	Weather proofing Assess insulation cost/benefit in older homes Replace aging water heaters	Continue to push "weatherization' as a contractor specialty – consider incentives to increase accessibility/visibility	Help us understand cost/benefit of weatherization and insulation Educate about tankless HW options
Organization	**Goals of Organization**	**Members represented**	**Priorities for 2011**	**How FortisBC can help organization (2-3 ways)**	**Action Item for FortisBC in 2011**
Fraser Basin Council	Vision: strong communities, healthy ecosystems and vibrant economies in the Basin and beyond Goals: climate change mitigation/adaptation (reducing GHGs/energy efficiency) -smart planning for communities -regional and sub-regional (local) issue resolution -aboriginal engagement	All form orders of Canadian government including First Nations + private sector + community/civil society interests	Action on climate change and air quality Clean water and watersheds Sustainable communities	Partner on outreach to fleets Find ways to link local governments climate plans with Fortis EEC programs	Adjust TRC analysis

Organization	Goals of Organization	Members represented	Priorities for 2011	How FortisBC can help organization (2-3 ways)	Action Item for FortisBC in 2011
Canadian Manufacturers and Exporters	Help Canadian Manufacturers and Exporters success in domestic and international markets with a focus on: - Productivity - Energy / Environment - Workplace skills - Business development	Largest economic footprint in BC	Energy Efficiency Programs for Medium Sized Manufacturers	Fund an EE study / implementation program for medium sized manufactures.	
Organization	**Goals of Organization**	**Members represented**	**Priorities for 2011**	**How FortisBC can help organization (2-3 ways)**	**Action Item for FortisBC in 2011**
BC Non Profit Housing Association	Build sustainable future for non-profit housing in BC.	650 non-profit societies with 1500 buildings	10-20% reduction in natural gas over the next two years Customized incentive programs with Fortis for NP Housing retrofits	Creative incentive programs that fit with unique need of non-profit housing societies Funded energy specialist position as soon as possible Operator training and tools for energy management	Streamlines and bundled incentive programs Increased collaboration with BC Hydro Pilot studies and project M&V – share these as case studies with public or stakeholders

Organization	Goals of Organization	Members represented	Priorities for 2011	How FortisBC can help organization (2-3 ways)	Action Item for FortisBC in 2011
Hemmera	Private sector servicing public sector	>3000 client base 144 employees	Expand renewable energy and environmental services to public sector	Provide incentives for feasibility studies and construction at renewable energy projects	Implement societal cost as discount rate base

Organization	Goals of Organization	Members represented	Priorities for 2011	How FortisBC can help organization (2-3 ways)	Action Item for FortisBC in 2011
Canfor Pulp	See website	Mike Todd Stuart Gairns	Implementing ECM's already identified	Energy specialist program Incentives based on GJ Savings End use assessments/studies	Roll out energy specialist program

Organization	Goals of Organization	Members represented	Priorities for 2011	How FortisBC can help organization (2-3 ways)	Action Item for FortisBC in 2011
BC Hydro	Pursue cost effective DSM	PowerSmart	Integrated resource plans 2011 DSM targets	Improve consultation on key DSM industry issues before making allegations and proposals to broad audiences that could harm other interests.	
Organization	**Goals of Organization**	**Members represented**	**Priorities for 2011**	**How FortisBC can help organization (2-3 ways)**	**Action Item for FortisBC in 2011**
BC Sustainable Energy Association	Shift BC to 100% sustainable energy use: educate British Columbians on sustainable energy	BC citizens interested in sustainable energy	Green Landlords project Green Condos Retrofit Project	Partner on projects	More energy efficiency

Missing: BC Utilities Commission, IBC Technologies, Consolidated Management Consultants, City of Vancouver, Ministry of Energy and Mines, and Canadian Home Builders' Association of BC

Appendix I

EFFICIENT BOILER PROGRAM TERMS AND CONDITIONS

Efficient Boiler Program

Terms and conditions

Saving you money. We've got our best people on it.

FORTIS BC™

Table of contents

The incentives

Efficient boiler incentives are made up of two parts: a purchase incentive which is based on the type of boiler purchased, plus either a new construction incentive or a retrofit incentive.

Purchase incentive

For all participants, the incentive applies to the incremental purchase price of a natural gas near-condensing or condensing boiler over the purchase price of a standard-efficiency boiler. The purchase price incentive is based on space-heating and ventilating load. They will be calculated as follows:

- near-condensing boilers: $4,000 per boiler plus $3 per MBH plant input
- condensing boilers: $6,000 per boiler plus $9 per MBH plant input

The purchase price of a standard-efficiency boiler will be estimated using $7 per MBH of the input required to meet the space-heating load.

In addition to the purchase price incentives above, FortisBC will also contribute additional incentives to your upgrade project as outlined below.

New construction

FortisBC will contribute 50 per cent of engineering fees to a maximum of $1,500 toward the cost of estimating the annual gas usage for space-heating using a standard-efficiency boiler system versus a higher efficiency boiler system. Purchase price incentive payments are limited to a maximum of 75 per cent of the purchase price premium over a standard boiler.

Retrofit of existing buildings

The program will pay your contractor up to a maximum of $400 for performing an estimate of the peak space-heating load. It will also pay 50 per cent of the cost of necessary venting modifications up to a maximum of $2,000. During the first year of operation you are also entitled to a monitoring incentive of $1,500 plus $1 per gigajoule of total natural gas saved. Purchase price incentive payments are limited to a maximum of 50 per cent of the purchase price premium over a standard-efficiency boiler.

The benefits

Greater savings

- operating savings from lower energy expenditures
- up to 40 per cent lower fuel costs over a standard-efficiency boiler

Higher performance

- improved operating efficiency through correct boiler sizing

Energy efficiency assistance

- assistance in determining your facility's potential for energy improvements
- help in finding ways to save money and improve your facility's operation

Space efficiency and comfort

- requirement for less space in mechanical rooms
- excellent opportunity to increase occupant comfort and reduce building maintenance

Increased marketability

- improved efficiency appealing to customers who recognize the value it adds to their investment

Environmental benefits

- lower gas usage resulting in fewer CO, CO_2 and NOx emissions
- responsible use of one of the cleanest burning fossil fuels

Program terms and conditions

Note: Subject to change without notice.

1.0 Overview

1.1 The Efficient Boiler Program (the program) from FortisBC Energy Inc. and FortisBC Energy (Vancouver Island) Inc., collectively "FortisBC", is designed to stimulate investment in appropriately sized energy-efficient space-heating boilers that will reduce natural gas usage and associated operating costs. The program is targeted to both new construction and replacement markets.

1.2 The program offers all market participants an incentive payment to partially offset the higher purchase price of higher efficiency boilers, a contribution to the cost of accurately estimating the building's space-heating load.

1.3 In new construction, the program contributes to the engineering fees for estimating the building's annual natural gas usage for space-heating with a standard efficiency boiler and comparing it to that with a higher efficiency boiler. It also partially offsets the higher boiler purchase price incurred by a developer, builder or owner. FortisBC will also recognize the developer's, builder's or owner's commitment to energy efficiency on behalf of tenants, end users and subsequent owners.

1.4 In the replacement market, the program compensates a mechanical contractor to accurately estimate the peak space-heating load. It also reduces the building owner's higher purchase price for an energy-efficient boiler, including an allowance for required venting upgrade modifications. It also promotes proper ongoing operation and maintenance of the heating plant to reduce annual space-heating costs, maintain efficiency and lower life cycle costs by paying building owners a monitoring incentive and a natural gas-saving bonus.

1.5 By taking part in this offer, your boiler may use less natural gas and produce fewer emissions. You agree FortisBC may record any resulting emission reductions you have along with those of other participating customers and credit them to our Greenhouse Gas Management Program.

2.0 Participant eligibility criteria

2.1 The applicant must be a building developer, builder, building owner or owner's designated representative.

2.2 The facility where the boiler is installed must be in the FortisBC service territory in the Lower Mainland, Vancouver Island, Sunshine Coast, or the Interior of B.C. (not available in Whistler).

2.3 The facility where the boiler is installed must use natural gas purchased according to one of the following FortisBC Rate Schedules: 2, 2U, 3, 3U, 23, 5, 25, AGS, SCS-1, SCS-2, LCS-1, LCS-2 or LCS-3.

2.4 Only eligible boilers under the program qualify for the incentive (see Section 4.0 for the boiler eligibility criteria).

2.5 The incentive will only be paid for space-heating boilers. When the boiler is used for space-heating as well as other applications such as domestic hot water and pool heating, the domestic hot water load and the pool heating load will be subtracted from the boiler input to determine the space-heating load for incentive calculations.

2.6 Standby or backup space-heating boiler plants will not normally qualify under this program. Standby or backup boilers are defined as boilers that normally only operate during peak heating load. However, a boiler plant that is not the primary source (i.e., does not provide over 50 per cent) of space-heating for the facility, can qualify if the facility uses natural gas for domestic hot water and make-up air units.

3.0 Program process

All market participants

3.1 Applicant's contractor or qualified professional determines the capacity of the space-heating plant, type of boiler (i.e., condensing or near-condensing), capacity and number of boilers required to meet the space-heating requirements of the building.

3.2 Applicant completes Efficient Boiler Program Application Form and submits it along with required documentation (See Section 7.0) to FortisBC.

3.3 FortisBC reviews application for completeness.

(i) If application is complete, FortisBC estimates the incentive that is payable to the applicant.

(ii) If application is incomplete, FortisBC will ask applicant for additional information.

(iii) If required documents are not completed and submitted within one month of the application date the application may be cancelled.

3.4 Applicant receives a letter from FortisBC stating whether the application was approved or rejected. If approved, an estimate of the incentive(s) payable to the applicant will be attached to the letter.

3.5 Applicant purchases and installs the boiler within 12 months from the date of approval (provided in Section 3.4) by FortisBC.

3.6 Applicant submits required documentation to FortisBC within one month of boiler installation. (See Section 7.0 for documentation.)

3.7 FortisBC reviews documents for completeness.

(i) If all documents are in order and the applicant has met all the requirements of the program and the boiler capacity has not changed from original application, FortisBC issues a boiler incentive cheque to the applicant.

(ii) If all documents are in order and the applicant has met all the requirements of the program, but the installed boiler capacity and/or purchase price has changed since the application was first submitted, FortisBC recalculates the incentive and issues a cheque for the revised boiler incentive.

New construction market participants

3.8 The contribution of FortisBC to the engineering fees required to estimate annual gas usage will be included in the boiler incentive cheque issued to the applicant.

Replacement market participants

3.9. The contributions of FortisBC to the contractor's cost to estimate the peak space-heating load, and to the cost of the required venting upgrades, will be included in the boiler incentive cheque issued to the applicant.

3.10 FortisBC will send the reporting requirements for the monitoring incentive and gas-saving bonus to the applicant with the incentive cheque.

3.11 Applicant prepares the reports that are required for the monitoring incentive and gas-saving bonus.

3.12 Applicant submits the reports to FortisBC. One report is submitted six months after boiler installation; the second report is submitted 12 months after boiler installation.

3.13 FortisBC reviews the reports for completeness.

(i) If applicant meets the reporting requirements, FortisBC calculates the monitoring incentive and gas-saving bonus and issues a cheque. Cheque is issued after FortisBC receives the two complete sequential six-month reports.

(ii) If applicant has not met the reporting requirements, FortisBC advises applicant that reporting requirements have not been met and applicant does not qualify for monitoring incentive and gas-saving bonus.

4.0 Eligible boilers

All boilers

4.1 Must be a natural gas space-heating boiler system (propane boilers in Revelstoke can also qualify). Multiple boiler modules housed in a single jacket constitute one boiler.

4.2 The minimum boiler input rating is 300,000 Btu/hr.

4.3 The maximum boiler input rating is 5,000,000 Btu/hr.

4.4 The minimum space-heating plant input rating is 300,000 Btu/hr.

4.5 The maximum space-heating plant input rating is 10,000,000 Btu/hr.

4.6 The incentive will only be paid for space-heating boilers. (See Section 2.5 for details.)

4.7 Boiler efficiency ratings must be independently tested in accordance with BTS-2000 Testing Standard for Efficiency of Commercial Space-heating Boilers from the Hydronics Institute Division of AHRI (www.ahrinet.org) or CSA 4.9 Gas-Fired Low Pressure Steam and Hot Water Boilers.

4.8 Third-party documentation of boiler combustion efficiencies must be provided for boiler eligibility. Acceptable documentation includes either

- (i) combustion efficiency test reports from testing laboratories accredited by the Canadian Standards Association (CSA International) or the American National Standards Institute or from the Hydronics Institute Division of AHRI;
- (ii) a combustion efficiency certification letter from CSA International; or
- (iii) inclusion in the I=B=R Ratings for Boilers, Baseboard Radiation and Finned Tube (Commercial) Radiation Directory, January 2008 Edition, with the steady state combustion efficiency rating published in the directory (www.ahrinet.org).

4.9 Boiler must be installed in accordance with the manufacturer's specification and must comply with applicable laws, codes, standards and ordinances.

4.10 The boiler must be new. Used or rebuilt boilers do not qualify for the incentive.

4.11 Boilers must be covered by a standard or optional minimum two-year parts and labour warranty.

Near-condensing boilers

4.12 Definition of near-condensing boiler:

- (i) has a minimum steady state combustion efficiency of 85 per cent as tested throughout the turn down range in accordance with BTS-2000[i] or CSA 4.9[ii]
- (ii) has a factory installed intermittent ignition
- (iii) has a forced draft or induced draft burner that properly controls excess air
- (iv) conforming boilers will have continuous capacity modulation (not staged burner output control) to enable AHRI at reduced output down to 50 per cent or less of maximum continuous output. This turndown will be achieved by continuously varying fuel and air input quantities

Condensing boilers

4.13 Definition of condensing boiler:

- (i) has a minimum steady state combustion efficiency of 88 per cent throughout the turn down range as tested in accordance with BTS-2000[i] or CSA 4.9[ii]
- (ii) a Category IV boiler that vents through a Class II Type BH stack or a stack that complies with the manufacturer's recommendations
- (iii) conforming boilers will have continuous capacity modulation (not staged burner output control) to enable operation at reduced output down to 50 per cent or less of maximum continuous output. This turndown will be achieved by continuously varying fuel and air input quantities
- (iv) the boiler can continuously withstand heating system return water temperatures that do not exceed 49°C

List of eligible boilers

4.14 A list of eligible boilers is available on our website at fortisbc.com. This list may be updated during the course of the program.

i - BTS 2000 Testing Standard for Efficiency of Commercial Space-heating Boilers, Hydronics Institute Division of AHRI - 2000

ii - Gas-Fired Low Pressure Steam and Hot Water Boilers, Canadian Standards Association

5.0 Incentives

All market participants

5.1 Boiler purchase price incentives will be calculated as follows:

(i) near-condensing boilers: $4,000 per boiler plus $3.00 per MBH plant input for space-heating load

(ii) condensing boilers: $6,000 per boiler plus $9.00 per MBH plant input for space-heating load

5.2 The purchase price of a standard efficiency boiler will be estimated using $7.00 per MBH of input for space-heating load.

5.3 The boiler purchase price is the applicant's purchase price of the boiler net of any vendor rebates excluding installation labour, venting and accessories.

5.4 FortisBC reserves the right to limit the number of incentive payments it provides for the program.

New construction market participants

5.5 In new construction, FortisBC will pay 50 per cent of a qualified professional's fees to compare the estimated annual natural gas usage for space-heating using a standard efficiency boiler to that with a higher efficiency boiler to a maximum of $1,500. This will be payable to the applicant at the time the boiler purchase price rebate is paid to the applicant and will not be paid unless an eligible boiler is actually installed. Proof of payment must be submitted with the application. The energy modelling must be completed by a qualified professional using DOE, EE4, TRACE, HAP or equivalent program and must compare the space-heating energy use of the building using a standard efficiency boiler and a higher efficiency boiler.

5.6 In new construction, boiler purchase price incentive payments are limited to a maximum of 75 per cent of the premium over a standard efficiency boiler.

Replacement market participants

5.7 In replacement applications, FortisBC will pay a maximum $400 of the cost incurred to estimate the peak space-heating load. This will be payable to the applicant at the time the purchase price incentive is paid and will not be paid unless an eligible boiler is actually installed. Proof of payment must be submitted with the application.

5.8 In replacement applications, boiler purchase price incentive payments are limited to a maximum of 50 per cent of the premium over a standard efficiency boiler.

5.9 In replacement applications, the total amount of the boiler purchase price incentive and the venting replacement incentive is subject to a maximum limit equal to the price of the installed boiler.

5.10 In replacement applications, FortisBC will pay a monitoring incentive of $1,500 plus $1.00/GJ of gas-saving bonus for each GJ of annual weather-normalized reduction in total natural gas consumption. The weather-normalized gas consumption in the 12-month period following the boiler installation will be compared to the weather-normalized gas consumption during the 12-month period prior to the boiler installation. The applicant must report the data from the following inspections:

(i) perform combustion analysis and record combustion efficiency, %CO_2, %O_2, ppm NO_X and flue gas temperature every six months

(ii) perform a diagnostic check of the controls weekly

(iii) perform visual check of system components weekly

(iv) record boiler water outlet temperature weekly

(v) record boiler water inlet temperature weekly

(vi) record boiler room temperature weekly

5.11 Applicant must submit reports that include the data listed above to FortisBC six months and 12 months after the boiler installation to qualify for the monitoring incentive and gas-saving bonus.

TGI + FT NELSON Entries		US GAAP differences
1	Reclass allowance for doubtful account classified as liability for reg purposes and asset for financial purposes	Classification difference - will continue
2	Reclass accumulated depreciation classified as liability for reg purposes and asset for financial purposes	Classification difference - will continue
3	To recognize Gas Plant under Construction is non-rate base	Classification difference - will continue
4	To recognize Lower Mainland Acquisition Premium is non-regulated	Will continue under US GAAP
5	To recognize BCUC Disallowances are non-regulated	Will continue under US GAAP
6	To recognize SCP CIAC is non-regulated	Wound up in early 201 but would not expect a change under US GAAP
7	To recognize LILO assets are non-regulated	Under US GAAP, the financial reporting treatment is expected to change so this different will likely also change
8	To recognize Vehicle leases are capital leases for accounting purposes and operating leases for reg purposes	This became a capital for regulatory starting in 2010 so the difference is eliminated already
9	To separate out Deferred Charges and Future Income Tax embedded in other assets in financial statements	Classification difference - will continue
10	To recognize Future Income Tax on CIAC is non-regulated	Will continue under US GAAP
11	To reclass long-term receivable account to bring net of tax balances to a gross basis	Classification difference - will continue
12	To recognize Goodwill is non-regulated	Will continue under US GAAP
13	Reclass unamortized long-term debt issue costs classified as assets for reg purposes and liabilities for financial purposes	Classification difference - will continue
14	To separate out Regulated CIAC embedded in Property, Plant & Equipment	Classification difference - will continue
15	Opening balance adjustment for BC Gas WIP in financial statements not recognized for reg purposes	Will continue under US GAAP
16	Opening balance adjustment for BC Gas assets in financial statements not recognized for reg purposes	Will continue under US GAAP
17	To separate out LILO Deferred gains and Construction Advances embedded in other long-term liabilities in financial statements	Under US GAAP, the financial reporting treatment is expected to change so this different will likely also change
18	To separate out embedded LILO benefits for regulatory purposes	Under US GAAP, the financial reporting treatment is expected to change so this different will likely also change
19	To recognize regulated portion of FIT	Will continue under US GAAP
20	To reclassify non-rate base deferred charges	Classification difference - will continue
21	To reclassify non-rate base deferred credits	Classification difference - will continue
22	To recognize timing variances in regulated deferrals per Page 61.8 of annual report	Will continue under US GAAP
23	To separate out other operating revenues per annual report	Classification difference - will continue
24	Management fees reclass done for financial purposes only	Classification difference - will continue
25	To recognize Stock options are non-regulated	Will continue under US GAAP
26	To recognize provision for BioGas costs is non-regulated	Will continue under US GAAP
27	To recognize SCP Financing Lease costs are non-regulated	See above re: scp assets
28	To recognize LILO rent is non-regulated	Under US GAAP, the financial reporting treatment is expected to change so this different will likely also change
29	To recognize Vehicle leases are treated as operating leases for regulatory purposes	See above re treatment of capital asset portion of capital lease
30	To recognize depreciation on Lower Mainland Acquisition Premium is non-regulated	See above re lower mainland acquisition premium
31	To recognize depreciation on SCP CIAC is non-regulated	See above re scp assets
32	To recognize depreciation on LILO assets are non-regulated	Under US GAAP, the financial reporting treatment is expected to change so this different will likely also change
33	Rent recoveries reclass done for financial purposes only	Classification difference
34	To remove Earnings Sharing from utility earnings	Will continue under US GAAP
35	To remove equity AFUDC from utility earnings	Will continue under US GAAP
36	To remove LILO gain from utility earnings	Under US GAAP, the financial reporting treatment is expected to change so this different will likely also change
37	To remove GSMIP from utility earnings	Will continue under US GAAP
38	To remove non-regulated gains from utility earnings	Will continue under US GAAP

Appendix L-2

CORPORATE SERVICES AMENDING AGREEMENTS
EFFECTIVE JANUARY 1, 2012

THIS AMENDING AGREEMENT is made effective January 1, 2012 (the "Effective Date").

BETWEEN:

FORTISBC ENERGY INC.
(formerly Terasen Gas Inc.)
16705 Fraser Highway
Surrey, British Columbia, V4N 0E8

(hereinafter referred to as "FEI")

OF THE FIRST PART

AND:

FORTISBC HOLDINGS INC.
(formerly Terasen Inc.)
10th Floor, 1111 West Georgia Street
Vancouver, British Columbia, V6E 4M4

(hereinafter referred to as "FHI")

OF THE SECOND PART

WHEREAS:

A. FEI and FHI entered into an agreement dated as of January 1, 2010 (the "Agreement"); and

B. The parties are now desirous of amending the Agreement on the following terms and conditions.

NOW THEREFORE, in consideration of the mutual promises herein and other good and valuable consideration (the receipt and sufficiency of which is hereby acknowledged), the parties hereby covenant and agree as follows:

1. In this Amending Agreement, capitalized words and expressions used shall have the same meanings as are respectively assigned to them in the Agreement.

2. All references to "Terasen Gas Inc." and "TGI" shall be deleted and replaced with "FortisBC Energy Inc." and "FEI" respectively.

3. All references to "Terasen Inc." and "Terasen" shall be deleted and replaced with "FortisBC Holdings Inc." and "FHI" respectively.

4. Clause 3.1 shall be deleted and replaced with the following:

"3.1 Compensation for Services and Shared Costs

FEI agrees to pay to FHI for the Services to be provided and for a proportionate share of the common expenses incurred by FHI such as shareholder expenses and director compensation the amount of $10,719,700 per annum for the period of January 1, 2012 to December 31, 2012 on a take-or-pay basis and the amount of $11,030,900 per annum for the period of January 1, 2013 to December 31, 2013 on a take-or-pay basis."

5. This Amending Agreement shall be read together with the Agreement as modified.

6. This Amending Agreement shall be governed by and construed in accordance with the laws of the Province of British Columbia and the parties agree to attorn to the jurisdiction of the courts of British Columbia.

7. Words importing the singular include the plural and vice versa; words importing the masculine gender include the feminine and neuter genders; and words importing persons include individuals, sole proprietors, corporations, partnerships and unincorporated associations.

8. This Amending Agreement may be executed in counterparts with the same effect as if all parties had signed the same document. All counterparts will be construed together and will constitute one agreement.

9. All unamended terms and conditions shall remain in full force and effect.

IN WITNESS WHEREOF, the parties hereto have executed this Amending Agreement effective the Effective Date.

B. FEI and FBC each require certain services on an as required basis.

C. FEI and FBC are each willing to provide the Services to the other on the terms and conditions contained in this Agreement.

WITNESSETH THAT, in consideration of the covenants and agreements herein contained, the parties covenant and agree as follows:

PART 1

INTERPRETATION

1.1 Definitions

In and for the purpose of this Agreement

(a) "**Applicable Laws**" means any and all Laws in force and effect from time to time and applicable to the performance of the Services hereunder;

(b) "**Governmental Authority**" means any domestic or foreign, national, federal, provincial, state, municipal or other local government or body and any division, agent, commission, board, or authority of any quasigovernmental or private body exercising any statutory, regulatory, expropriation or taxing authority under the authority of any of the foregoing, and any domestic, foreign, international, judicial, quasi-judicial, arbitration or administrative court, tribunal, commission, board or panel acting under the authority of any of the foregoing;

(c) "**Laws**" means all constitutions, treaties, laws, statutes, codes, ordinances, orders, decrees, rules, regulations and municipal by-laws, whether domestic, foreign or international, any judgements, orders, writs, injunctions, decision, rulings, decrees, and awards of any Governmental Authority, and any published policies or guidelines of any Governmental Authority and including, without limitation, any principles of common law and equity,

(d) "**Person**" includes any individual, corporation, body corporate, partnership, joint venture, association, trust, estate, incorporated or unincorporated association, any government or governmental authority however designated or constituted or any other entity of whatever nature,

(e) "**Services**" means the professional and management services to be provided by FEI or by FBC respectively, as required by the each of the parties from time to time.

1.2 Interpretation

In and for the purpose of this Agreement

1) this "Agreement" means this agreement as the same may from time to time be modified, supplemented or amended in effect,
2) any reference in this Agreement to a designated "Article", "section" or other subdivision is to the designated Article, section or other subdivision of this Agreement,
3) the words "herein", "hereof" and "hereunder" and other words of similar import refer to this Agreement as a whole and not to any particular Article, section or other subdivision,
4) the headings are for convenience only and do not form a part of this Agreement and are not intended to interpret, define or limit the scope, extent or intent of this Agreement,
5) the singular of any term includes the plural, and vice versa, the use of any term is generally applicable to any gender and, where applicable, a corporation, the word "or" is not exclusive and the word "including" is not limiting (whether or not non-limiting language (such as "without limitation" or "but not limited to" or words of similar import) is used with reference thereto), and

6) each word and phrase used herein and not otherwise defined herein, but which has an accepted meaning in the custom and usage of the Canadian utility industry, shall have such accepted meaning.

1.3 Governing Law

Subject to Section 7.1, this Agreement will be interpreted and the rights and remedies of the parties hereto will be determined in accordance with the laws of the Province of British Columbia.

PART 2

SERVICES

2.1 Services

Each party hereby agrees to provide to the other the Services on an as required basis and to the extent the party providing the Services has the capacity, as determined by it in its sole discretion, to provide such Services.

2.2 No Obligation to Provide Additional Services

Neither party shall perform, and shall have no obligation to perform, any services to the other except as set out in this Agreement or any similar agreement.

2.3 Independent Contractor

Nothing in this Agreement shall be construed to create or constitute a partnership or relationship of joint venture between FEI and FBC. In performing the Services, each party shall be an independent contractor. FEI employees and FBC employees shall not be considered employees of the other party for any purpose.

2.4 Compliance

In performing the Services, each party will comply with all Applicable Laws and its own applicable standards and policies.

2.5 Confidentiality

The party providing the Services will comply with confidentiality or non-disclosure agreements between the party receiving the Services and any other Person with respect to information required for the Services. Each party waives any right of confidentiality as between the two parties with respect to any information provided by such party to the other party's employees in the course of providing Services.

2.6 Protection of Personal Information

The party providing the Services will comply with any protection of personal information policy of the party receiving the Services.

PART 3

COMPENSATION

3.1 Compensation for Services and Shared Costs

The party receiving Services agrees to reimburse the party providing Services for all reasonable expenses it has incurred in providing such Services, including, without limitation, such portion of the annual salary and benefits of relevant employees as is determined by the party providing Services to be allocable to the party receiving Services based on the nature and extent of Services actually provided during the applicable period.

3.2 Invoicing

The party providing Services will invoice the other in respect of the Services no later than the 25th day following the end of the month in which such Services are provided or in such other manner as the parties may agree.

3.3 Payment

(a) Except with respect to those portions of an invoice which are the subject of a bona fide dispute between the parties, the party receiving Services shall within thirty (30) days after receipt of an invoice from the party providing Services, pay the amount specified in such invoice.

(b) Any amount to be remitted by the party receiving Services and not remitted on or before the date on which it is due shall thereafter bear interest at rate of 1.5% per month (18% per annum).

3.4 Taxes

Notwithstanding any other provision of this Agreement, the amounts paid or payable by one party to the other in accordance with this Agreement are exclusive of any value added taxes or sales taxes, which are now, or may become during the term of this Agreement, applicable to the provision of the Services. Each party shall pay to the other party any value added taxes or sales tax which one party is obligated to collect from the other at the time such taxes are due and payable.

PART 4

INDEMNIFICATION AND LIMITATION OF LIABILITY

4.1 Indemnity by FBC

Subject to Section 4.4 , FBC will indemnify, defend and hold harmless FEI and its directors, officers, employees, agents and contractors, from and against any claim, demand, loss, liability, action, lawsuit or other proceeding, judgement or award, and cost or expense (including reasonable legal fees and disbursements) which they may suffer or incur arising directly or indirectly, in whole or in part, in connection with this Agreement or with FEI's provision of the Services, except and to the extent, if any, that the same results from or arises out of the wilful misconduct or gross negligence of FEI.

4.2 Indemnity by FEI

Subject to Section 4.4, FEI will indemnify, defend and hold harmless FBC and its directors, officers, employees, agents and contractors, from and against any claim, demand, loss, liability, action, lawsuit or other proceeding, judgement or award, and cost or expense (including reasonable legal fees and disbursements) which they may suffer or incur arising directly or indirectly, in whole or in part, in connection with this Agreement or with FBC's provision of the Services, except and to the extent, if any, that the same results from or arises out of the wilful misconduct or gross negligence of FBC.

4.3 Limitation of Liability of party providing Services

Neither the party providing Services nor any of its directors, officers, employees, agents or contractors will be liable to the other for any claim, demand, loss, liability, action, lawsuit or other proceeding, judgement or award, or cost or expense (including reasonable legal fees and disbursements) which the party receiving Services may suffer or incur arising directly or indirectly, in whole or in part, in connection with this Agreement or with the provision of the Services, except and to the extent, if any, that the same results from or arises out of the wilful misconduct or gross negligence of the party providing Services.

4.4 Consequential Losses

Each party acknowledges and agrees that notwithstanding anything else in this Agreement, in no event shall a party or any of their officers, directors, employees, shareholders, agents, or representatives be liable to the other party, any of its affiliates, or any other party for any special, indirect, incidental, exemplary, or consequential damages or loss of goodwill whether such liability is based on contract, tort, negligence, strict liability, or otherwise, in any way arising from or relating to this Agreement or the performance or non-performance of the Services, even if the party has been notified of the possibility or likelihood of such damages occurring.

PART 5

REPRESENTATIONS AND WARRANTIES

5.1 Representations and Warranties of FEI

FEI hereby represents and warrants to FBC as representations and warranties which are true as at the date hereof and which will be true during the term of FEI's appointment hereunder:

(a) FEI is a corporation duly organized, validly existing and in good standing under the laws of its jurisdiction of incorporation, and FEI has full power and authority to perform its obligations hereunder; and

(b) this Agreement constitutes a valid and binding obligation of FEI enforceable in accordance with its terms, except that (i) such enforcement may be subject to bankruptcy, insolvency, reorganization, moratorium or other similar laws now or hereafter in effect relating to creditors' rights, and (ii) the remedy of specific performance and injunctive or other forms of equitable relief may be subject to equitable defences and to the discretion of the court before which any proceeding therefore may be brought.

5.2 Representations and Warranties of FBC

FBC hereby represents and warrants to FEI as representations and warranties which are true as at the date hereof and which will be true during the term of FEI's appointment hereunder:

(a) FBC is a corporation duly organized, validly existing and in good standing under the laws of its jurisdiction of incorporation, and FBC has full power and authority to perform its obligations hereunder; and

(b) this Agreement constitutes a valid and binding obligation of FBC enforceable in accordance with its terms, except that (i) such enforcement may be subject to bankruptcy, insolvency, reorganization, moratorium or other similar laws now or hereafter in effect relating to creditors' rights, and (ii) the remedy of specific performance and injunctive or other forms of equitable relief may be subject to equitable defences and to the discretion of the court before which any proceeding therefore may be brought.

PART 6

DURATION, TERMINATION AND DEFAULT

6.1 Effective Date and Term

This Agreement will be effective from July 1, 2010 and will end on December 31, 2011, unless earlier terminated pursuant to the provisions hereof. Thereafter this Agreement will automatically be renewed for further one (1) year terms from January 1 to December 31, subject to Section 6.2 below.

6.2 Termination

This Agreement may be terminated by either FEI or FBC in their sole and absolute discretion at any time by giving fourteen (14) days notice after receipt by either FEI or FBC of written notice thereof from the other party. Such termination shall not affect any rights of the parties which have accrued prior to the date of termination and shall not relieve any party from its obligations which have arisen during the term of this Agreement.

6.3 Duties Upon Termination

Upon expiry or termination of this Agreement for any reason, each party will have no further obligations under Part 2 and will promptly deliver to the other any material documents in the possession of each pertaining to the business of the other.

6.4 Compensation of party providing Services on Expiry or Termination

Within one (1) month after the expiry or termination of this Agreement, each party will pay to the other all amounts owing hereunder (including any amount owing on account of the fees provided for in Part 3 calculated up to the date of expiry or termination); provided that for the purposes of this section, the fees provided for in Part 3 which are payable to the party providing Services on a monthly, annual or other periodic basis will be deemed to accrue due and be payable on a daily basis.

PART 7

ARBITRATION

7.1 Arbitration

Any dispute between FEI and FBC regarding any allegation that FEI or FBC is in breach of this Agreement, may be submitted to and settled by arbitration in accordance with the provisions of this Section 7.1. Arbitration proceedings may be commenced by the party desiring arbitration giving notice to the other party specifying the matter to be arbitrated and requesting arbitration thereof. Such arbitration will be carried out by a single arbitrator and in accordance with the rules of National Arbitration Rules of the ADR Institute of Canada Inc. from time to time in force and effect. If the parties are unable to agree upon an arbitrator within ten (10) days after delivery of such notice, either of them may make application to court for appointment of an arbitrator. In the event of the failure, refusal or inability of an arbitrator to act, or continue to act, a new arbitrator will be appointed, which appointment will be made in the same manner as provided above. The decision of an arbitrator appointed as under this Section 7.1 will be final and binding upon the parties and not subject to appeal. The arbitrator will have the authority to assess the costs of the arbitration against either or both of the parties, provided that each party will bear its own witness and counsel fees. The parties will fully co-operate with the arbitrator and provide all information reasonably requested by the arbitrator. Judgement on the award of the arbitrator may be entered in any court having jurisdiction over the party against which enforcement of the award is being sought. Each party hereby irrevocably submits and consents to the jurisdiction of any such court for the purpose of rendering a judgement of any such award.

PART 8

MISCELLANEOUS

8.1 Notice

Any notice, direction or other communication required or permitted to be given hereunder must be in writing and will be sufficiently given if delivered or sent by facsimile to the party from whom it is intended at the address of such party shown on the first page of this Agreement. Any notice, direction or other communication so given will be deemed to have been given and to have been received on the day of delivery, if delivered, or on the day of sending if sent by facsimile (provided such day of delivery or sending is a Business Day and, if not, then on the first Business Day thereafter). Each party hereto may change its address for notice by notice given in the manner aforesaid.

8.2 Assignment

Neither party hereto may assign this Agreement or any of its rights hereunder without the prior written consent of the other party, such consent not to be unreasonably withheld.

8.3 Amendments

Any amendment or modification of this Agreement must be in writing and signed by the party against which such amendment or modification is sought to be enforced.

8.4 Severability

If any term or condition of this Agreement or the application hereof is determined judicially or otherwise to be invalid or unenforceable, the remainder of this Agreement and the application thereof shall not be affected and shall remain in full force and effect.

8.5 Entire Agreement

This Agreement constitutes the entire agreement between the parties pertaining to the subject matter hereof. There are no representations, warranties, covenants or agreements between the parties in connection with such subject matter except as specifically set forth or referred to in this Agreement.

[Intentionally Blank. Signature Page Follows.

8.6 Counterparts, Facsimile

This Agreement may be executed by the execution of one or more counterparts of the execution page, which will be taken together and constitute the execution page, and one or more of such counterparts may be delivered by facsimile transmission.

IN WITNESS WHEREOF, the parties hereto have executed this Agreement effective as of the day and year before written.

DRAFT PROCEDURAL ORDER

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

Application by the FortisBC Energy Utilities
(comprised of FortisBC Energy Inc., FortisBC Energy Inc. Fort Nelson Service Area, FortisBC Energy (Whistler) Inc., and FortisBC Energy (Vancouver Island) Inc.)
for Approval of 2012 and 2013 Natural Gas Rates

BEFORE:

(Date)

WHEREAS:

A. On May 4, 2011, the FortisBC Energy Utilities (FEU or the Companies) filed an Application for their combined Revenue Requirements for FortisBC Energy Inc. (FEI), the Fort Nelson Service Area of FEI (Fort Nelson), FortisBC Energy (Whistler) Inc. (FEW), and FortisBC Energy (Vancouver Island) Inc. (FEVI), and for approval of interim and permanent natural gas delivery rates effective January 1, 2012 and permanent rates effective January 1, 2013, pursuant to sections 59 to 61 and 89 of the *Utilities Commission Act* (the Act), with any variance between 2012 interim rates and permanent rates to be refunded to or collected from customers by way of a rate rider following the approval of 2012 permanent rates;

B. FEI seeks, among other things, approval, pursuant to sections 59 to 61 of the Act, of a permanent natural gas delivery rate increase of 5.0 percent effective January 1, 2012 and a further 6.4 percent permanent increase effective January 1, 2013 representing an annual average lower mainland residential customer total bill increase of 2.4 percent in 2012 and a further 3.0 percent increase in 2013;

C. FEI further seeks approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for applicable rate classes and approval of the cost allocation to Thermal Energy Services (previously referred to as Alternative Energy Services) as set out in the Application;

D. Fort Nelson region, seeks, among other things, approval pursuant to sections 59 to 61 of the Act, of a permanent natural gas delivery rate increase of 6.5 percent effective January 1, 2012 and a further 1.6 percent permanent increase effective January 1, 2013, representing an annual average Fort Nelson residential customer total bill increase of 2.3 percent in 2012 and a further 0.6 percent increase in 2013.

Fort Nelson also seeks approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for applicable rate classes as set out in the Application;

E. FEW seeks, among other things, approval, pursuant to sections 59 to 61 of the Act, of a permanent natural gas delivery rate increase of 2.2 percent effective January 1, 2012 and a further 11.9 percent permanent increase effective January 1, 2013, representing an annual average residential customer total bill increase of 1.5 percent in 2012 and a further 7.1 percent increase in 2013, and approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for applicable rate classes as set out in the Application;

F. FEVI seeks, among other things, approval, pursuant to sections 59 to 61 of the Act and section 2.1 of the Special Direction, to maintain current natural gas rates for all customers other than those with specified rates in their transportation service agreements, for a two-year period commencing January 1, 2012. FEVI proposes to utilize the surplus that will exist in the Rate Stabilization Deferral Account (RSDA) to allow for rates to remain unchanged for 2013;

G. FEVI further seeks approval of its schedule of demand and commodity charges, forecast gross O&M expenditures and, pursuant to section 2.10 of the Special Direction, for its forecast cost of service, forecast capital expenditures, and forecast revenue as set out in the Application;

H. The FEU seek, among other things, approvals including allocation of costs for shared services between the Companies; discontinuation, continuation, and creation of deferral accounts and the amortization and disposition of balances in deferral accounts; changes to depreciation rates; and pursuant to section 44.2 of the Act, for Energy Efficiency and Conservation (EEC) expenditures;

I. In addition to the specific requests included in the Application for each of the Companies, the FEU are collectively applying for a Commission determination of the combined utility cost of service for 2013, subject to the Companies obtaining, at a later date, the necessary approvals to amalgamate. In the event that amalgamation proceeds, the combined cost of service will provide the basis for a harmonized rate structure for an amalgamated entity;

J. The FEU propose a Workshop to review the Application be held on Wednesday, May 18, 2011, commencing at 1:00 pm, at the Commission Hearing Room on the 12th Floor, 1125 Howe Street, Vancouver, BC;

K. The Companies propose that a Procedural Conference be held on Tuesday, May 24, 2011 at the Commission Hearing Room on the 12th Floor, 1125 Howe Street, Vancouver, BC, commencing at 9:00 am;

L. The FEU believe the Application can be addressed efficiently and effectively through a negotiated settlement process, or in the alternative, by a written hearing process, and propose a draft Regulatory Timetable attached as Appendix A for discussion at the Procedural Conference; and;

M. The Commission considers that establishing a Workshop to review the Application and a Procedural Conference to determine the appropriate regulatory process for the review of the Application is warranted.

NOW THEREFORE the Commission orders as follows:

1. The FEU's request pursuant to section 89 of the Act for interim rates as proposed in the Application for 2012 will be addressed in a subsequent order to be issued following the Procedural Conference. The Commission will receive submissions on the proposed interim rates at the Procedural Conference.

2. A Workshop to review the Application will be held on Wednesday, May 18, 2011, commencing at 1:00 pm in the Commission Hearing Room on the 12th Floor, 1125 Howe Street, Vancouver, BC.

3. A Procedural Conference regarding the regulatory process for the review of the Application will be held on Tuesday, May 24, 2011, commencing at 9:00 am in the Commission Hearing Room on the 12th Floor, 1125 Howe Street, Vancouver, BC.

4. The Procedural Conference will address matters such as:

   a. identification of principle issues arising from or related to the Application;
   b. process options for review of the Application, including;
      - negotiated settlement process
      - written hearing
      - oral public hearing
      - or, as appropriate, some combination of the above
   c. timetable (information requests, responses, intervener evidence, etc.);
   d. interim rates;
   e. location(s) of the proceedings;
   f. other matters that will assist the Commission to efficiently review all aspects of the Application.

   After the Procedural Conference, the Commission will issue a further procedural order and regulatory agenda for the review of the Application.

5. The FEU will publish, as soon as possible, in display-ad format, the Notice attached as Appendix B to this Order, in the Vancouver Sun, the Province, and such other appropriate local news publications as may properly provide adequate notice to customers served in the affected service areas.

6. The Application, together with any supporting materials, will be made available for inspection at the FortisBC Energy Utilities, 16705 Fraser Highway, Surrey, BC, V4N 0E8, and at the British Columbia Utilities Commission, Sixth Floor, 900 Howe Street, Vancouver, B.C., V6Z 2N3 and will also be available on the FortisBC Energy Utilities website at www.fortisbc.com and on the BCUC website at www.bcuc.com.

7. Interveners or Interested Parties should register with the Commission, in writing or electronic submission, by Tuesday, May 17, 2011. Interveners should specifically state the nature of their interest in the Application and identify generally the nature of the issues that they may intend to pursue during the proceeding and the nature and extent of their anticipated involvement in the review process.

DATED at the City of Vancouver, in the Province of British Columbia, this day of <month> 2011.

Time:	9:00 am
Location:	Commission Hearing Room Twelfth Floor, 1125 Howe Street Vancouver, BC

THE APPLICATION

On May 4, 2011, the FortisBC Energy Utilities (FEU or the Companies) filed an Application, pursuant to sections 59 to 61 of the *Utilities Commission Act* (the Act), for their combined Revenue Requirements for FortisBC Energy Inc. (FEI), the Fort Nelson Service Area of FEI (Fort Nelson), FortisBC Energy (Whistler) Inc. (FEW), and FortisBC Energy (Vancouver Island) Inc. (FEVI), and for approval of interim and permanent natural gas rates effective January 1, 2012 and permanent rates effective January 1, 2013. In addition to the specific requests included in the Application for each of the Companies, the FEU are collectively applying for a Commission determination of the combined utility cost of service for 2013, subject to the Companies seeking and obtaining, at a later date in a future application, the necessary approvals to amalgamate. The combined cost of service will provide the basis for a harmonized rate structure for an amalgamated entity.

Among other things, the FortisBC Energy Utilities seek approval of the following for each of the Companies:

- FEI seeks approval of a natural gas delivery rate increase of 5.0 percent effective January 1, 2012 and a further 6.4 percent permanent increase effective January 1, 2013, representing an annual average lower mainland residential customer total bill increase of 2.4 percent in 2012 and a further 3.0 percent increase in 2013, and approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for applicable rate classes and approval of the cost allocation to Thermal Energy Services (previously referred to as Alternative Energy Services) as set out in the Application.
- FEI Fort Nelson seeks approval of a natural gas delivery rate increase of 6.5 percent effective January 1, 2012 and a further 1.6 percent permanent increase effective January 1, 2013, representing an annual

average Fort Nelson residential customer total bill increase of 2.3 percent in 2012 and a further 0.6 percent increase in 2013, and approval of the RSAM rider for applicable rate classes as set out in the Application.

- FEW seeks approval of a natural gas delivery rate increase of 2.2 percent effective January 1, 2012 and a further 11.9 percent permanent increase effective January 1, 2013, representing an annual average residential customer total bill increase of 1.5 percent in 2012 and a further 7.1 percent increase in 2013, and approval of the RSAM rider for applicable rate classes as set out in the Application.
- FEVI seeks approval to maintain current natural gas rates for all customers except those with specified rates in their transportation service agreements, for a two-year period commencing January 1, 2012;
- The FEU seek other approvals including allocation of costs for shared services between the Companies; discontinuation, continuation, and creation of deferral accounts and the amortization and disposition of balances in deferral accounts; changes to depreciation rate; and pursuant to section 44.2 of the Act, for Energy Efficiency and Conservation (EEC) expenditures.

THE REGULATORY PROCESS

British Columbia Utilities Commission (Commission) Order G-xx-11 has established a Workshop, a Procedural Conference and a Preliminary Regulatory Timetable for the regulatory review of the Application.

The detailed Regulatory Timetable can be reviewed on the Commission's website at www.bcuc.com>Current Applications>

FEU will hold a Workshop on Wednesday, May 18, 2011 commencing at 1:00 pm in the Commission Hearing Room on the 12th Floor, 1125 Howe Street, Vancouver, B.C.

The Commission will hold a Procedural Conference regarding the further regulatory process for the review of the Application on Tuesday, May 24, 2011 commencing at 9:00 am in the Commission Hearing Room on the 12th Floor, 1125 Howe Street, Vancouver, B.C.

REGISTERING TO PARTICIPATE

Persons who wish to actively participate in this proceeding should register as Interveners with the Commission in writing by Tuesday, May 17, 2011, and should identify the issues that they intend to pursue as well as the nature and extent of their anticipated involvement in the review process indicating whether they plan to attend either or both the Workshop and/or the Procedural Conference. Interveners will receive email notice of all correspondence and filed documents. An e-mail address should be provided if available.

Persons not expecting to actively participate, but who have an interest in the proceeding, should register as Interested Parties with the Commission in writing, by Tuesday, May 17, 2011 identifying their interest in the Application. Interested Parties will receive an Executive Summary of the Application and a copy of the Commission's Decision when issued.

PUBLIC INSPECTION OF DOCUMENTS

The Application and supporting material will be made available for inspection at the following locations:

FortisBC Energy Utilities	**British Columbia Utilities Commission**
16705 Fraser Highway	Sixth Floor, 900 Howe Street
Surrey, BC V4N 0E8	Vancouver, BC V6Z 2N3

The Application and supporting material are also available for viewing on the following web sites:

http:// www.fortisbc.com   http:// www.bcuc.com

All submissions and/or correspondence received from active participants or the general public relating to the Application will be placed on the public record and posted to the Commission's website.
