British Columbia Utilities Commission
Sixth Floor
900 Howe Street
Vancouver, B.C. V6Z 2N3

Attention: Ms. Erica M. Hamilton, Commission Secretary

Dear Ms. Hamilton:

Re: Terasen Gas Inc.'s ("TGI") Role in Maintaining Olympic Legacy

We are writing to advise the Commission that TGI has entered into an arrangement with the Vancouver Organizing Committee for the 2010 Olympic and Paralympic Winter Games ("VANOC") that will allow the Company to be involved in maintaining the 2010 Olympic and Paralympic Games legacy in Vancouver. The opportunity, the details of which are described below, will ensure that the Olympic and Paralympic Cauldron will remain as after the Games have ended and the Olympic Flame has been extinguished. We consider this investment to be important for the Company and customers.

Background

The permanent Olympic and Paralympic Cauldron is located near the Vancouver Trade and Convention Centre, at the Jack Poole Plaza in downtown Vancouver. As you are no doubt aware from the TV images of Wayne Gretzky lighting the cauldron following the Opening Ceremonies, the cauldron is a significant monument. TGI's investment of $3 million funded the Olympic and Paralympic Cauldron.

The Company's agreement with the owner of Jack Poole Plaza (BC Pavilion Corporation) contemplates, in general terms, TGI retaining ownership of the Olympic and Paralympic Cauldron and having a license to permit the Cauldron to remain in Jack Poole Plaza for 20 years with renewal rights for an additional 40 years. The owner of Jack Poole Plaza will be responsible to maintain the Cauldron and keep it in good condition. Under its agreement with VANOC, the Olympic Flame will be permanently extinguished following the conclusion of the Olympic and Paralympic Games. A plaque commemorating the Games and TGI's participation will be part of the legacy.

As part of its Olympic commitment, Terasen obtained certain rights to purchase tickets for Olympic events. None of the tickets purchased were covered in revenue requirements or paid for by customers. All tickets acquired were purchased and paid for by employees with the exception of a block of tickets for the Opening and Closing Ceremonies which were funded by the shareholder.

Customer Benefit and Impact

Customers will benefit from the Company’s involvement in preserving the Olympic legacy. British Columbians have embraced the Olympics with the torch run attracting large, enthusiastic crowds in Vancouver and many other communities in British Columbia. The permanent cauldron, funded by Terasen Gas, has been a focal point of activity and celebration during the Olympics. TGI does business in the BC communities touched by the "Olympic spirit". We rely on good relationships with these communities to facilitate work on the utility infrastructure. Our investment in maintaining and enhancing these relationships assist us in completing projects on time and on budget, and ultimately in delivering energy service in an efficient and cost-effective manner.

We believe that TGI’s customers are getting good value from this investment in the Olympic legacy. The investment, which is included in 2009 rate base and will be amortized over 20 years, was funded through efficiencies realized in our PBR capital expenditure formula in 2009 and as such did not impact the opening rate base used for setting rates for 2010 and 2011 under the Negotiated Settlement Agreement (NSA) which will be unaffected by this investment. Ongoing operating and maintenance costs will be covered by the owner of Jack Poole Plaza. The rate impact of the investment beyond the NSA period is modest (approximately two-tenths of one cent per GJ in 2012 and declining thereafter).

Conclusion

TGI simply wished to advise the Commission that we had made this high profile investment. We believe that our investment in the Olympic legacy is important and in the interests of the Company and customers.

If you have any questions please feel free to contact me.

Sincerely,

TERASEN GAS INC.

Chart of Accounts

Prepared by: Finance & Regulatory Affairs
Chart of Accounts

Revision Date: **June 2011**

TABLE OF CONTENTS

1. ASSETS

1.1 Current Assets

1.1.1 Cash and Temporary Investments

13100	Main Bank Account Cash held in commercial bank accounts (TD Canada Trust) available for general chequing purposes. The balance in this account will agree to the balance shown in the bank statement. Each day, SAP automatically clears the balances from accounts 13120, 13130, 13160, 13170, 13180, 13181, 13600 into this account.
13110	General Disbursement Clearing – Main Bank Clearing account – captures daily batches of outgoing EDI and cheque payments. Amounts are credited to this account from 13160 EDI Transfers & Wire Payments and 13112 CRS Clearing, and transferred daily to 13600 Inter-bank Transfer Clearing.
13111	Outstanding Cheques – Main Bank Outstanding cheques (issued but not yet cashed) relating to GL 13100. The account is credited as cheques are issued through accounts payable, and debited as cheques are cashed (entries from 13112 CRS Clearing Account). Cheques are held in this account until cashed or staledated (outstanding for 6 months or greater). Once cheques become staledated, a program is run that removes the cheques from the outstanding cheques list, and a journal entry is made to move the amounts into GL 25901 Unclaimed Cheques, for publication on the company's Unclaimed Property database.
13112	C.R.S. Clearing Account Clearing account for the CRS (Cheque Reconciliation Service) – a cashed cheque interface from the bank. Amounts are credited to this account from 13111 and then transferred daily to 13110 General Disbursement Clearing.
13120	Outstanding Deposits – Main Bank This account holds deposits in transit until properly recorded in the bank GL 13100. Deposits consist of daily deposits at the Surrey Ops Centre as well as the automated Energy deposits and daily credit card payments.
13130	Incoming Payments This account shall be debited when payments from customers and/or other sources are received, and credited as those amounts are transferred to the main bank account 13100.
13140	Returned Items Main Bank Captures daily returned and rejected items from the bank through GL 13600. Items are then offset to GL 13141 awaiting Energy processing back to customers' accounts.
13141	Unapplied Returned Items Individual returned items from bank such as NSF, credit card charges, and rejected deposit. Once customer accounts are adjusted in the Energy system, the items are then charged to account 14026 Energy – Returned Items Clearing.
13142	Returned Items – AP and Payroll Returns for accounts payable and payroll cheques.
13143	Credit Card Receipts Bank Account This account is debited when customers make payments with credit card. Currently only two major credit cards are accepted: VISA and MasterCard. Operates like 13140.

13150	CUC/CIS Clearing Account This account is used to capture incoming daily deposits from individual Energy CIS (Customer Information System) customers through the CUCBC (Credit Union Central BC) downloads.
13160	EDI Transfers & Wire Payments – Main Bank The EDI Transfers and wire payments are processed by Accounts Payable or Payroll to outside parties. The daily balance is cleared into the main bank account 13100 once matching entries are processed by Accounts Payable or Payroll.
13170	Preauthorized Payments – Main Bank This account includes payments from customers enrolled in the equal payment plan (EPP).
13180	Other – Main Bank This account includes miscellaneous debit and credit entries that are not matched to any bank account due to inconsistent and/or improper description. It also includes incoming funds from the sale of USD converted into CDN. If there are recurring items in this account, they will be monitored and set up to automatically clear by the system.
13181	Treasury Clearing This is a temporary Treasury account set up for the settlement of Commercial Papers and Short Term Investments. Amounts received or paid are coded to this account pending clearing to 13700 or 25001.
13190	Payroll Manual Cheques Bank Account This is a manual chequing account set up and monitored by the payroll department, to enable the issuance of manual payroll cheques on an as-needed basis.
13191	Outstanding Cheques – Payroll This account includes outstanding cheques relating to GL 13190.
13192	O/S Manual Pay Web Banking This is an open item clearing account for the Manual Payroll bank account (GL 13190) and will be used to manage the clearing of the Payroll Web banking entries. The account will assist in the clearing of the AP funding & the Web payments to ensure all Payroll payments are made.
13200	USD Bank Account Main account at TD Canada Trust to bank balance in US funds. Balance will agree to the bank statement balance in US dollars. Similar to 13100, daily balance equals amounts transferred from accounts 13211, 13220, 13260 and 13280 as these amounts clear the bank.
13211	Outstanding Cheques – USD Outstanding cheques (issued but not yet cashed) relating to GL 13200. The account is credited as cheques are issued through accounts payable, and debited as cheques are cashed (offset to 13200). Cheques are held in this account until cashed or staledated (outstanding for 6 months or greater). Once cheques become staledated, a program is run that removes the cheques from the outstanding cheques list, and a journal entry is made to move the amounts into GL 25904 Unclaimed Cheques, for publication on the company's Unclaimed Property database.
13220	Outstanding Deposits – USD This account holds deposits in transit until properly recorded in the bank GL 13200. The account is debited as cash is received and credited as amounts are deposited to the bank.

13260	EDI Transfer & Wire Payments – USD The US dollar EDI Transfers and wire payments are processed by Accounts Payable to outside parties. The daily balance is cleared once matching entries are processed by the bank (GL 13200).
13280	Other – USD This account includes miscellaneous debit and credit entries that are not matched to the USD bank account due to inconsistent and/or improper description. It also includes the sale of US funds and the conversion to CDN. Amounts are cleared from this account once they have been researched.
13501	Lands Imprest Account This account is currently inactive; balance is being maintained at approximately $25,000. Lands department is responsible for the account and its use.
13600	Inter-Bank Transfer Clearing Account Grand totals from EDI Transfers 13160, Unapplied Returned Items 13141 and Credit Card Receipts 13143 are collected into this account daily. If the systems have been processed correctly, these items will zero balance and will be cleared on the day following the daily system downloads.
13700	Temporary Cash Investments This account shall include the book value of temporary investments. Account is debited as funds are invested and credited as investments mature.
13840	CIBC Bank Account This account contains all manual and automated Banner payments, swaps/hedges/banker acceptances, and compressor lease costs for FEVI and FEW. Throughout the month, Treasury transfers funds out of this account to FEVI's TD CDN funds account G/L 13100 (FEVI's main commercial bank account).
13950	Accounts Payable Holdback Account Amounts withheld from vendors through Accounts Payable (usually 10%), to be release upon completion of work to inspection standards. Funds are held in a separate bank account until released (see also GL 25162).
13951	Holdback – Outstanding Cheques Outstanding cheques relating to 13950.
13952	Holdback – Outstanding Deposits Outstanding deposits relating to 13950.

1.1.2 Accounts Receivable

14001	A/R – Customers Core & Industrial Amounts due and collectible for sales of gas from Core and Industrial customers. Entries are posted by ABSU from the Energy system to record sales, refunds, returned cheques, bad debts, and cash received (see G/L 14012 for cash received process). Balance in the G/L will agree to the Energy system.
14003	A/R – Off System Sales Amounts due and collectible for sales of gas not required to meet current demand. Account is debited through journal entry based on reports generated from the Nucleus system, and cleared on the 25th of the month as wires are received from off system sales customers, posted through journal entry to clear the bank.

14004	A/R – Accrued Gas Revenue Unbilled revenue that has not been recorded by the Energy system for gas sales during any calendar month, due to customers not having their meters read, or not having a bill prepared prior to the end of the month. Customer bills and meter reading is based on a 22 cycle system. Unbilled revenue is accrued each month through journal entry, and reversed in the following month.
14012	Unapplied CIS Cash Receipts This account is a temporary clearing account for incoming cash from Energy residential customers. Normally as we receive payments from customers, A/R 14001 is credited and cash is debited. However, the Energy process has been to place incoming funds into a holding account 14012 and then using Energy reports to apply to A/R accounts in the four divisions (Lower Mainland, Fort Nelson, etc.) When customer payments are collected, the following entries are generated on Work Day 5: DR 131xx Bank CR 14012 Holding account Account Reconciliation can only be done after WD 5 once Energy group applies the cash. When there are rejects, the entries will be: CR 131xx Bank DR 14012 Holding account The process is done through the Automated Payment Exchange System (APES). The residual debit amounts represent the amounts returned and rejected deposits from the APES. Energy will then investigate which customer accounts should be reversed and produce a daily statement to show rejected items. Timing difference is usually caused by the time taken for the investigation. The rejected items are then cleared to G/L 14026 Energy – Returned Items Clearing.
14014	A/R – Other Amounts receivable for miscellaneous services, not billed through the Energy system. Amounts are billed through the SAP AR subsystem; the balance in this account will agree to the details in that subsystem.
14025	Energy – General Journal Clearing This account currently contains miscellaneous journal entries from Energy that need to be investigated and cleared to the correct G/L accounts and/or internal orders. Debits and credits to this account are generated from JV's done by ABSU at month end from the Monthly Gas Tariff Analysis Report or the Monthly Journal Batch Detail Report – General Journals. This account is to be used as a temporary holding account for items that need to be investigated where it is not clear where the amounts are supposed to reside.
14026	Energy – Returned Items Clearing This account includes rejected/returned payments from Energy handled customer accounts. The returned items come through different sources depending on the payment method (e.g. EFT, cheques, automated payments, etc.). They are cleared each month to the appropriate GL after investigation.
14027	Clearing – OF to Energy Billing This account contains billable jobs that have been completed per the Order Fulfilment (OF) subsystem. These jobs have been sent to the Energy system for billings, but have not yet been billed. Account is debited through entries from the OF system, and credited through journal entry posted by ABSU from the Energy system for transfers to Energy.

14028	A/R – ABSUI This account contains amounts receivable from Accenture Business Services for Utilities Inc. (ABSUI) pending invoicing through the A/R subsystem. Account is debited through internal orders for salaries, overhead and bank charges. As the amounts are invoiced into G/L 14014 (A/R-Other), this account is credited.
14029	A/R – Unbilled BC Hydro Transportation This account includes unbilled revenue for BC Hydro transportation on Vancouver Island. Amounts are accrued each month through journal entry and reversed the following month.
14030	A/R – Vancouver Island Joint Venture This account includes unbilled revenue for the 'Vancouver Island Joint Venture' which is comprised of seven mills. Amounts are accrued each month through journal entry and reversed the following month.
14050	Interest Receivable on Loans This account includes the interest receivable on short-term interest bearing investments (received at back end). Upon maturity of such investments, this account shall be cleared when the interest is received. Entries are through interface from the Treasury module of SAP.
14051	Financing Plan Receivable Amounts receivable from customers who are financing their gas payments in FEVI. Entries are from the Banner system.
14052	Customer Refund Clearing This account includes refunds owing to gas customers that are awaiting payment. The account is credited through journal entry from the Energy system, and debited as payments are made to customers through Accounts Payable.
14070	Energy Contra – EPP Smoothing This account represents amounts receivable or payable to Equal Payment Plan (EPP) customers based on the difference between the equal monthly amounts they have been billed through Energy and the actual gas consumed. Entries are from ABSU based on information in the Energy system.
14075	Miscellaneous Deposits Miscellaneous deposits paid by FortisBC and held by external parties. Account is debited as payments are made through Accounts Payable and credits as amounts are refunded to FortisBC. Deposits can be held for various time periods depending on the terms of the contract.
14076	Licence of Occupation Deposit Security deposits paid by FortisBC to Land & Water British Columbia Inc. The security deposits are for the right of way of our lines through creeks and rivers on Crown land. Account is debited as payments are made through Accounts Payable and credited as amounts are refunded to FortisBC.
14089	A/R – Unapplied Miscellaneous This account is a temporary clearing account for cash received in payment of miscellaneous accounts receivable (GL 14014) pending clearing to the correct GL account. Credits are via postings from the AR subsystem; debits are through AP as payments are transferred to the correct payee, or through journal voucher to clear.

14095	FICA Clearing When summary records are transferred from contract accounts receivable and payable to the general ledger, a document split may be required if not all the items in a G/L document could be posted in one document (due to the item limit of 999 in FI Documents). This G/L is used to balance each of the G/L document created. Posting to a transfer account will result in a zero balance once all the transfer documents have been posted.
14102	Employee Salary Advances Amounts advanced to employees through the payroll system. As amounts are advanced, this account is debited. When the employee reimburses the company (timeframe for repayment specific to each agreement), the cheque is credited to this account via journal entry.
14105	Employee Paid Absences Reimbursement Pension Meetings Amounts receivable from the FortisBC Gas Pension Plan for employee time spent attending pension meetings. The account is debited through the payroll system. When payroll submits an invoice requisition to bill the pension plan, an invoice is created in the AR subsystem (account 14014) and this account is credited.
14107	A/R – Gas Supply Hedges Amounts receivable for gas supply hedges from hedging counterparties. Amounts receivable are set up via journal entry based on reports from the Nucleus system. On the 25th of the month, wire transfers are received through the bank or paid through accounts payable to settle the hedge positions. The account can be in either a debit (receivable) or credit (payable) position.
14109	Employee Paid Absences Reimbursed Union Bus IBEW Amounts receivable from the IBEW for employee time spent on IBEW union business. The account is debited through the payroll system. When payroll submits an invoice requisition to bill the IBEW, an invoice is created in the AR subsystem (account 14014) and this account is credited.
14110	Employee Paid Absences Reimbursed Union Bus COPE Amounts receivable from the COPE for employee time spent on COPE union business. The account is debited through the payroll system. When payroll submits an invoice requisition to bill the COPE, an invoice is created in the AR subsystem (account 14014) and this account is credited.
14190-14196	FI/CO Reconciliation Accounts Used for FI/CO Reconciliation postings – restricted use.
14300	HST/GST Input Tax Credits Receivable Amount receivable for Harmonized Sales Tax/Goods and Services Tax Credits from the Federal Government. This account is used to code all HST/GST paid on suppliers' invoices through Accounts Payable or from the bank through wire transfers. At month-end, the balance of both this account and 25118 HST/GST Collected, is transferred to 25628 HST/GST Payable, and the net amount is either paid to or received from the Government.
14310	Residential Energy Credit (REC) Receivable Amount receivable for Residential Energy Credit from the Ministry of Finance. This account records the amount of REC receivable filed with the Ministry of Finance each month and will clear out upon receipt of the monthly credit.

14500	Allowance for Doubtful Accounts This is a contra account for GL 14001 AR Customers Core & Industrial and 14004 AR Accrued Gas Revenue. It contains the estimated allowance for bad debts relating to those two accounts. The allowance is based on an estimated percentage of receivables, based on experience. The balance is reduced as amounts are written off against the account from the Energy system, but adjusted back to the estimated percentage at each month end through journal entry to the bad debt expense accounts.
14800	WIP – Accounts Receivable This account shall contain costs incurred that are expected to be recovered from third parties. The costs are accumulated in this account until the job is completed and they are ready for billing. The process is that a project owner asks for an order to be created that settles to this account, and costs are coded against this order as they are incurred (CR to settlement cost element; DR to 14800). Once the project is ready for billing, the project owner sends a request to the Misc. AR billing group, indicating the order number. Once the invoice is entered into the AR system, the order is credited, and the 14800 account is cleared (CR to 14800; DR to 14014). If amounts that are billed differ from amounts collected, the project owner is contacted and the difference is written off per his/her instructions.
14801	WIP – Intercompany A/R This account is used to keep track of actual costs vs. budgeted costs for continuing service contracts. Credits to this account are generated monthly from JV's to allocate 1/12th of each contract amount. Debits to this account are generated in two ways. The first is actual costs from time sheets that have gone through the various continuing service internal orders that are settled into G/L 14801 on WD3 and WD5. The second is from JV's that are done after settlement to allocate the continuing service overheads. The resulting balance indicates the difference between the actual costs processed to date and the amount budgeted to date. At year-end, the account is cleared to zero, either through adjusting the billings or through clearing to the income statement.

1.1.3 Inventory

15001	Inventory – General Materials Costs of materials purchased primarily for use in the utility business for construction, operation and maintenance purposes. It should include also the book cost of materials recovered in connection with construction, maintenance and the retirement or property, such materials being credited to construction, maintenance or accumulated depreciation provision, respectively. Materials and supplies issued are credited to this account and charged to the appropriate construction, operating expense, or other account on the basis of a unit price determined by the use of cumulative average, first-in first-out, or another method of inventory accounting as conforms with generally accepted accounting principles. Account balance will tie to the SAP Material Management sub ledger balance.
15088	Inventory – SubContractor Clearing Account Clearing account used track material issued to SubContractors. Account is debited through settlement of IO 502988 when materials are issued to SubContractor and SubContractor labour is incurred. Account is credited when goods are received back into inventory at new cost including labour.

15099	Inventory – Gas Regulators Offset to Capital This is a contra to account 15001 Inventory (sub ledger – ties to materials management system). Under a special agreement with the BCUC, the Company is allowed to capitalize gas regulators as soon as they are purchased and start depreciation and AFUDC treatment immediately. Consequently, every month a JV is prepared to debit capital and credit inventory to move the balance of the gas regulator into capital.
15201	Inventory – Gas in Storage Cost of gas purchased, stored and held for use in meeting future gas service requirements of customers. Gas is held at various storage locations operated by third parties. Each month, these parties confirm the gas into storage, the gas taken from storage and the ending balance of gas. Monthly transactions are through journal entries based on these storage statements. For company 2000, amounts debited to this account for gas placed in storage are credited to 62501 GCRA - Gas Moved to Inventory; amounts credited to this account for gas withdrawn from storage are debited to 62502 GCRA – Gas Moved From Inventory. For other companies, amounts are debited to this account as gas is purchased through Accounts Payable; amounts are credited through journal entry based on gas sales volume in the month at the weighted average cost of the gas available for sale. The account is trued up each month-end for any differences between the balance in the account and the calculated inventory balance.
15202	Inventory – Propane Cost of propane purchased, stored and held for use in meeting future propane service requirements of customers. Amounts are debited to this account as propane is purchased through Accounts Payable; amounts are credited through journal entry based on propane sales volume in the month at the weighted average cost of the propane available for sale. The account is trued up each month-end for any differences between the balance in the account and the calculated inventory balance.
15290	Inventory – Odorant Cost of odorant purchased and held for use in the gas distribution system. Amounts purchased settle to this account through internal order 694016. Ending balance is adjusted each month to reports received from gas measurement based on purchases and consumption of odorant inventory for zones 1-3, 4, and 5.
15300	Transmission Line Pack Gas For FEVI, cost of gas owned by the Company and used to maintain such line pressure as is required for the transmission of gas.

1.1.4 Prepaid Expenses and Other Current Assets

16001	Prepaid Insurance This account contains unamortized insurance payments. Account is debited as insurance payments are made in December. Account is credited as the annual payment is expensed on a straight-line basis over the December to November time frame.
16002	Prepaid Training Trust Fund Amounts that have been paid by FortisBC Energy Inc. to the Training Trust Fund but not yet utilized for training expenses. This account was originally set up (debited) as contributions were made to the trust fund in the years 1991, 1992 and 1993, for each of the IBEW, COPE and M&E plans. Each year, the prepaid balance is increased by FortisBC's proportionate share of interest on the contributions, and reduced as FortisBC's proportionate share of funds are spent on training.

16003	Prepaid Other Items This account contains amounts that have been paid out that relate to periods falling within the next twelve months (other than insurance 16001 and interest 16004). These payments are amortized on a straight-line basis over the period they are expected to benefit.
16004	Prepaid Interest This account contains interest on issued commercial paper that has been paid up front. Interest will be calculated and expensed by the Treasury module according to the rates and terms of the specific commercial paper.
16200	Other Current and Accrued Assets This account includes the book value of any other current and accrued assets, not classified elsewhere.

1.2 Investments in and Advances to Subs and Affiliates

1.2.1 Investment in Subsidiaries and Affiliates

12002	Investment in Inland Energy Corporation The carrying value of FortisBC Energy Inc.'s investment in shares of Inland Energy Corporation
12005	Investment in FortisBC Energy Inc. The carrying value of FortisBC HoldingsInc.'s investment in shares of FortisBC Energy Inc.
12006	Investment in FortisBC Huntingdon Inc. The carrying value of FortisBC Holdings Inc.'s investment in shares of FortisBC Huntingdon Inc.
12007	Investment in FortisBC Holdings Inc. The carrying value of FortisBC Energy Inc.'s investment in shares of FortisBC Holdings Inc.
12008	Investment in Inland Pacific Enterprises Ltd. The carrying value of FortisBC Holdings Inc.'s investment in shares of Inland Pacific Enterprises Ltd.
12009	Investment in IPPDA LLC The carrying value of FortisBC Holdings Inc.'s investment in shares of IPPDA LLC
12011	Investment in Inland Pacific Energy Services Ltd. The carrying value of FortisBC Holdings Inc.'s investment in shares of Inland Pacific Energy Services Ltd.
12013	Investment in Inland Pacific Energy Corp. The carrying value of FortisBC Holdings Inc.'s investment in shares of Inland Pacific Energy Corp.
12023	Investment in 0849218 BC ULC The carrying value of FortisBC Energy Inc.'s investment in shares of 31905 Yukon Inc.
12024	Investment in 3857042 Canada Inc. The carrying value of FortisBC Holdings Inc.'s investment in shares of 3857042 Canada Inc.
12025	Investment in 605555 BC Ltd. The carrying value of FortisBC Holdings Inc.'s investment in shares of 605555 BC Ltd.

12027	Investment in 0849217 BC ULC The carrying value of 31905 Yukon Inc.'s investment in shares of 31916 Yukon Inc.
12028	Investment in FortisBC Holdings Inc. The carrying value of FortisBC Holdings Inc.'s investment in shares of Terasen Gas Holdings Inc.
12032	Investment in FortisBC Energy (Vancouver Island) Inc. The carrying value of FortisBC Holdings Inc.'s investment in shares of FortisBC Energy (Vancouver Island) Inc.
12033	Investment in CustomerWorks LP The carrying value of FortisBC Holdings Inc.'s investment in shares of CustomerWorks LP.
12037	Investment in 630319 BC Ltd. The carrying value of FortisBC Holdings Inc.'s investment in shares of 630319 BC Ltd.
12051	Investment in Homeworks Services Inc. The carrying value of FortisBC Holdings Inc.'s 25% investment in preference shares of FortisBC Home works Services Inc.
12064	Investment in FortisBC Energy Services The carrying value of FortisBC HoldingsInc.'s investment in shares of FortisBC Alternative Energy Services
12076	Investment in FortisWest The carrying value of FortisBC Holdings Inc.'s investment in series C preferred shares of FortisWest.
12077	Investment in Dockside Green Energy LLP The carrying value of FortisBC Alternative Energy Services investment in shares of Dockside Green Energy LLP.
12078	Investment in FortisBC Gas (Whistler) The carrying value of FortisBC Holdings Inc.'s investment in shares of FortisBC Energy (Whistler).

1.2.2 Advances to Subsidiaries and Affiliates

14200	Advances – Uncleared Asset Transfer Asset transfers between companies in the FortisBC group that have not yet cleared.
14201	Advances –FortisBC International Inc. This account contains all amounts due from and payable to FortisBC International Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as invoices are generated in GL 14229.
14203	Advances – Inland Energy Corp. This account contains all amounts due from Inland Energy Corp., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.

14205	Advances – FortisBC Huntingdon Inc. This account contains all amounts due from FortisBC Huntingdon Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14207	Advances – FortisBC Holdings Inc. This account contains all amounts due from FortisBC Holdings Inc. to FEI including advances, trade accounts and interest, but excluding management fees. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14208	Advances – Inland Pacific Enterprises Ltd. This account contains all amounts due from Inland Pacific Enterprises Ltd., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as invoices are generated in GL 14229.
14209	Advances – FortisBC Holdings Inc. Other This account contains all amounts due from FortisBC Holdings Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14212	Advances – FortisBC Energy Inc. This account contains all amounts due from FortisBC Energy Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14215	Advances – IPPDA LLC This account contains all amounts due from IPPDA LLC, including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as invoices are generated in GL 14229.
14216	Advances – Inland Pacific Energy Corp. This account contains all amounts due from Inland Pacific Energy Corp., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as invoices are generated in GL 14229.
14229	A/R – Inter Company Customers Amounts receivable from affiliated companies, billed through the SAP AR subsystem; the balance in this account will agree to the details in that subsystem.
14231	Advances – 605555 BC Ltd. This account contains all amounts due from 605555 BC Ltd., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as amounts are invoiced in G/L 14229 – A/R-Inter-company Customers.
14232	Advances – 3857042 Canada Inc. This account contains all amounts due from 3857042 Canada Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as amounts are invoiced in G/L 14229 – A/R-Inter-company Customers.

14233	Advances – FortisBC Holdings Inc. This account contains all amounts due from FortisBC Gas Holdings Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as amounts are invoiced in G/L 14229 – A/R-Inter-company Customers.
14234	Advances – 0849218 BC ULC This account contains all amounts due from 0849218 BC ULC (formerly 31905 Yukon Inc.), including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as amounts are invoiced in G/L 14229 – A/R-Inter-company Customers.
14235	Advances – 0849217 BC ULC This account contains all amounts due from 0849217 BC ULC (formerly 31916 Yukon Inc.), including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as amounts are invoiced in G/L 14229 – A/R-Inter-company Customers.
14237	Advances – CustomerWorks LP This account contains all amounts due from CustomerWorks LP, including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared as amounts are invoiced in G/L 14229 – A/R-Inter-company Customers.
14238	Advances – FortisBC Energy (Vancouver Island) Inc. This account contains all amounts due from FortisBC Energy (Vancouver Island) Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14254	Advances – FortisBC Energy (Whistler) Inc. This account contains all amounts due from FortisBC Energy (Whistler) Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14266	Advances – FortisBC Alternative Energy Services This account contains all amounts due from FortisBC Alternative Energy Services Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14267	Advances - Fortis Inc. Borrowings This account contains all amounts due from Fortis Inc., including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14268	Advances - Fortis Inc. - Other This account contains all amounts due from Fortis Inc., excluding advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.

14269	Advances - Fortis BC This account contains all amounts due from Fortis BC, including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.
14270	Advances – BCGI Trust This account contains all amounts due from BCGI Trust, including advances, trade accounts and interest. Amounts are charged or credited to this account through various sources, such as journal entry, order settlement and accounts payable postings. Balances are cleared through wire transfers.

1.3 Deferred Charges

1.3.1 Deferrals

17001	Unamortized Long Term Debt Issue Costs This account includes the net debit balances arising from the discount or premium, commission and expenses of each issue of Long Term Debt. The account is credited and interest expense is charged to reduce the balance to zero over the term of the individual debt.
17002	Unamortized Debt Discount & Expense – Series 2 & 3 This account includes the net debit balances arising from the discount or premium, commission and expenses of FortisBC Inc's issue of Series 2 and Series 3 medium term notes. The account is credited and interest expense is charged to reduce the balance to zero over the term of the individual debt.
17210	Preliminary Survey and Investigation Costs (WIP) All expenditures for preliminary surveys, plans, investigations, etc., made for the purpose of determining the feasibility of projects for gas services, and with the costs associated with applications for certificates of public convenience and necessity, board hearings, the acquisition of options to purchase land or land rights to provide a future supply of natural gas, easements and similar items for use in contemplated projects, unless these costs are being tracked separately in another deferral account. If, as a result of the surveys, plant for gas services is acquired or constructed this account will be credited and the appropriate gas plant account charged. If the work is abandoned, the charge will be to Account No. 31901 (Other Income Deductions). The records supporting the entries to this account will be so kept that the company can furnish complete information at to the nature and purpose of the survey, plans or investigations, and the nature and respective amounts of the charges. *Note 1: Preliminary engineering projects costing less than $10,000 are expensed to a general operations account.* *Note 2: A preliminary engineering project in excess of $10,000, for which no decision or result is obtained AFTER the allowable 12 months have expired, will revert as an expense to the cost centre which initiated the project. The cost centre must budget for this expense in the next available fiscal period, which is when the write-off will take place.*
17254	FortisBC Energy (Whistler) – Pipeline Study This account includes FEW costs for the pipeline to Whistler study. No additional costs to be incurred from 2001 onwards will be included here. These costs are not being amortized as they will become part of CPCN. Account receives AFUDC and net-of-tax treatment.

17263	FEW Pipeline Development Costs Deferral account set up to capture the pre-approval development costs relating to the FEW propane to natural gas conversion project and the FEVI pipeline project. These costs reflect activities by both FEW and FEVI to develop the project to the approval stage, including those costs related to the regulatory review and approval process of both the FEW and FEVI Applications. The deferral account was approved as part of the Whistler Pipeline CPCN under order C-3-06. This is a non-rate base deferral account attracting AFUDC until the pipeline goes into service in 2009, at which time it becomes a rate base deferral account. It will be amortized at 2.5% starting in 2010.
17510	Unamortized Conversion Expense FEI and Squamish expenses incurred while in the process of the original conversion of customers to a natural gas system. Included herein are all charges for labour and expenses of employees on converting the gas system and customers' appliances and includes all damage claims arising from such conversion.
17520	Accumulated Depreciation – Unamortized Conversion Expense The accumulated amortization of GL 17510. The amortized portion will be debited to Account No. 30402 (Amortization) over 50 years (Squamish) or 100 years (FEI).
17540	Propane to Natural Gas Customer Appliance Retrofit Conversion Costs (07-08) This account will contain the deferral costs for expenditures relating to the Appliance Retrofit Conversion costs plus the AFUDC charges per Commission Order G-53-06 and Decision dated May 18, 2006. The Decision per pages 49 and 50 sets out the basis that restricts the amount of costs that can be charged to this account. This account will be amortized over 20 years starting January 1 the year after the conversion is completed. This amount is net-of-taxed.
17541	Propane to Natural Gas Customer Appliance Retrofit Conversion Costs (2009) This account will contain the deferral costs for expenditures relating to the Appliance Retrofit Conversion costs plus the AFUDC charges per Commission Order G-53-06 and Decision dated May 18, 2006. The Decision per pages 49 and 50 sets out the basis that restricts the amount of costs that can be charged to this account. This account will be amortized over 20 years starting January 1 the year after the conversion is completed. This amount is not net-of-taxed.
17810	Organization Expense All fees paid to governments for the privilege of incorporation, other market development expenditures incident to organizing the corporation and putting it in readiness to do business and the related special counsel fees. *Note 1: All expense incurred in the issue of capital stock will be included in Account No. 177xx (Capital Stock Expense).* *Note 2: All discount and expenses incurred in the issue of long term debt will be* included in Account No.17001 (Unamortized Debt Discount and Expense).
17820	Accumulated Depreciation – Organization Expense This account records the accumulated depreciation relating to account 17810, which is being amortized to income G/L 30301 on a straight-line basis.
17904	Deferred interest on Debt In FEI, this account is used to keep track of the interest expense deferred due to the difference between the actual interest rate and the Company hurdle rate on long term and short term debt. The interest is deferred monthly and recovered over three years as approved by the BCUC order G-7-03. Account is maintained on a net-of-tax basis.

17907	Goodwill – CNG/FNG/SQ This account is used to record the unamortized goodwill resulting from the acquisition of Columbia Natural Gas (CNG) & Fort Nelson Natural Gas (FNG) and the amalgamation of Squamish (TGS). Since goodwill is no longer amortized as per the CICA Handbook, the amortization stopped as of 2004.
17912	SCP Net Mitigation Revenue This account is used to record any differences between actual net FEI revenues from SCP mitigation and what has been approved in the current revenue requirement, on a net-of-tax basis. Amounts are being amortized to income over 5 years under BCUC G-7-03.
17915	Property Tax Variance Deferral This account includes the differences between FEI actual and forecasted property taxes. The differences are recorded on a net-of-tax basis and amortized over a three year period under BCUC G-7-03.
17926	Midstream Costs Reconciliation Account – MCRA In company 2000, this account is a subdivision of the former Gas Cost Reconciliation Account (GCRA) and will reflect the difference between actual and forecast midstream gas costs as recovered in base rates allocable to all sales customers for whom FortisBC Energy acquires gas supply. Per BCUC order G-7-03, the MCRA account forecast is reviewed quarterly by the BCUC; if necessary, an adjustment will be made to the midstream cost recovery on customers' bills. Account is maintained net-of-tax and receives interest treatment.
17927	Revenue Stabilization Adjustment Mechanism – RSAM This deferral account will be used to mitigate the effect on the Company's earnings of unpredictable and uncontrollable factors, namely volume volatility caused primarily by weather and natural gas cost volatility as authorized by the BCUC Order G-07-03 and G-138-10 for FEI and FEW respectively. The RSAM will accumulate the margin impact of variations in the actual versus forecast volume use for residential and commercial customers. The offsetting accounts include: 32901 – RSAM for Fort Nelson Rates 1, 2.1, 2.2, and 25 32911 – RSAM for Lower Mainland, Inland, and Columbia areas as well as FEW Rate 1 32912 – RSAM for Lower Mainland, Inland, and Columbia areas as well as FEW Rate 2 32913 – RSAM for Lower Mainland, Inland, and Columbia areas as well as FEW Rate 3 32914 – RSAM for Lower Mainland, Inland, and Columbia areas Rate 23 Deferred RSAM costs are reviewed annually by the BCUC; and recovered from customers through Rider 5 on customers' bills. Account is maintained net-of-tax with interest deferral treatment to GL 17999.
17946	Pension Costs Variances For company 2000, this account will be used to record differences between actual pension costs (excluding OPEB) and the allowed pension cost based on the PBR filing. The account is maintained on a net-of-tax basis; amounts are amortized to income in the following year.
17947	Insurance Cost Variances For company 2000, this account will be used to record the difference between actual insurance costs vs. allowed insurance costs based from PBR filing. The account is maintained on a net-of-tax basis; amounts are amortized to income in the following year.

17973	Deferred Interest - MCRA This account holds the interest calculated on the difference between the actual and forecast average balance of MCRA times the composite interest rate as approved by the BCUC order # G-19-03. Account is maintained net-of-tax.
17977	Deferred NGV Grants For company 2000, this account includes new NGV Deferred Grants for 1998-2005 on a net-of-tax basis. Program developed as per I/O 500020 and approved by the BCUC orders # G-98-99 and G-07-03. Grants are being amortized over 5 years.
17981	Deferral – Other This account will include: a) the unamortized portion of unusual expenses not provided for elsewhere; b) the amount of debit balances in suspense accounts that cannot be cleared and disposed of until additional information is received; and c) the debit balances in clearing accounts not distributed at the end of the accounting period, deferred debit items not otherwise provided for and similar items the proper disposition of which is uncertain at the balance sheet date.
17982	Earnings Sharing Mechanism/Capital Incentive Mechanism For company 2000, this account includes the balance of the Earnings sharing mechanism which provides that customers will share equally in earnings variances (positive or negative) between allowed & actual earnings. Estimations are made monthly; actual amount is determined in annual report filing and refunded to/recovered from customers through rider 3 as approved by the BCUC order # G-07-03. Account is maintained on a net-of-tax basis. As well, it includes the capital off ramp incentive which is approved in the 2010/2011 NSP filing. This amount will be returned to customers over 2 years through Rider 3.
17991	Taxes on Post Employment Benefits In FEI, this account is used to record the tax on the difference between post employment benefits accrued according to GAAP and actual amounts paid. The deferral is calculated using the current tax rate. The deferral is not being amortized.
17993	OPEB Accounting – Initial Adoption In FEI, this account was used to capture the original expense relating to adopting the new accounting policy on OPEB in 2000 (accrue benefits as earned, rather than as they are paid). BCUC order # G-135-99. The deferral is not being amortized.
17999	Deferred Interest on RSAM This account will include the interest deferral of financing costs variances between forecasted and actual RSAM balances as per BCUC instructions from February 2003 for FEI and November 2010 for FEW. Deferral is on a net-of-tax basis; recovered as Rider 5 is recovered on RSAM account 17927. This FEI account will include the interest deferral of financing costs variances between forecasted and actual RSAM balances as per BCUC instructions from February 2003. Deferral is on a net-of-tax basis; recovered as Rider 5 is recovered on RSAM account 17927.
18003	Rider 2 ROE Revenue Requirement To set up additional revenues for the difference in rates between the approved April 1, 2009 delivery rates and the allowed July 1, 2009 delivery rates (based on the December 2009 ROE decision effective July 1, 2009). The rider will be charged to all customers (except bypass customers) for the 12 month period January to December, 2010 to recover these revenues.

18005	Residential Commodity Unbundling – O&M Costs This GL will be used to capture the ongoing operating and maintenance costs incurred in the running of the residential unbundling program. This account will begin to accumulate costs in 2007, once marketers are allowed to begin to enrol customers. This account will also contain the deferral for capital costs pertaining to the FEI Residential Unbundling -2008 Customer Education Costs per Commission Order C-6-06 from Aug 14, 2006 and accumulated in order 502101. The total amount to be charged to this GL is $3.0 million in 2008. This GL is a deferral account, with amounts recovered from eligible residential customers over a one year period starting in 2008.
18007	Alternative Energy Projects-O&M For Company 2000, this deferral account will recover the revenues & ongoing O&M related costs for investment in alternative energy solutions. The deferral account is a non-rate base account attracting AFUDC. The future treatment of the account will be applied for in the revenue requirement application for that year.
18008	Alternative Energy Projects-Capital For Company 2000, this deferral account will capture the capital-related costs for investment in alternative energy solutions. The deferral account is a non-rate base account attracting AFUDC. The future treatment of the account will be applied for in the revenue requirement application for that year.
18100	Goodwill – Victoria Assets This account includes the Goodwill on acquisition of Victoria assets from BC Hydro in 1989. The balance is not amortized as per CICA HB unless impairment exists (when fair value is less than carrying amount).
18109	PCEC Start-up Costs In company 6000, this account includes the start-up costs incurred prior to October 1, 1991 of $1,754,000 to be amortized at a rate of 2.5% per year. Pacific Coast Energy used to own the transmission portion of the business which was planned to be amortized over a period of 40 years starting in 1996.
18120	FEVI Pension & OPEB Variances This account includes deferred escalating costs on pension/OPEB for FEVI (actual vs. budget); amortized in the same year they are incurred. The balance in this account should be zero at year end (taken from O&M to amortization only).
18122	FEVI Insurance Costs Variances This account includes the deferred escalating costs on insurance for FEVI (actual vs. budget) which are amortized in the same year they are incurred. The balance in this account should be zero at year end (taken from O&M to amortization only).
18124	FEW Deferred Interest This account will be used to record the FEW dollar difference between the actual cost of short term debt and the long term debt rates that have been included in the application. File in revenue requirement to recover it. These costs will be amortized in the following 1-3 years.
18127	FEW Cost of Gas Deferral This account contains the difference between allowed and actual rate cost of gas for company 6100 on a net of tax basis. This account is to be reviewed quarterly. See G/L 18129 for recovery of gas.
18128	FEW Property Tax Variances For company 6100, this account will be used to record any variances between actual property taxes and property taxes in settlement document on a net of tax basis.

18129	FEW Cost of Gas Recovered This account includes the gas recovery of variance deferred in company 6100 G/L 18127. Costs are recovered through riders on customers' bills, posted through an interface from the Banner system. Recoveries are maintained on a net-of-tax basis.
18131	FEW Sales Margin Adjustment For company 6100, this account will include the deferral of the sales margin impact resulting from differences between normalized sales volumes, and those approved in rates, on a net of tax basis. Actual sales volumes are normalized to 'level' the temperature induced swings in energy sales. The offset of this account is G/L 32903 – Whistler Margin Adjustment. The balance is amortized to income in the following year.
18132	Deferral - Gas Cost Variance Account (GCVA) In company 6000, this account will include the deferred expenses resulting from differences between actual and budgeted gas cost on a royalty adjusted basis. The account serves to hold, and recover/refund the differences between the actual, and forecast cost of gas of the core market over a shorter time frame than if the variance flowed directly to the Rate Stabilization Deferral Account (RSDA) G/L 18201. The current year GCVA deficit/surplus is amortized into Cost of Service for the following year in the BCUC Annual Review process. The offset of this account is G/L 62326 – Gas Cost Variance Account (GCVA).
18137	Commodity Cost Reconciliation Account – CCRA This account is a subdivision of the former Gas Cost Reconciliation Account (GCRA) and will reflect the difference between actual and forecast commodity gas costs as recovered in base rates allocable to all residential customers and certain commercial customers for whom FortisBC Gas acquires gas supply. Per BCUC order G-7-03, the CCRA account forecast is reviewed quarterly by the BCUC; if necessary, an adjustment will be made to the commodity cost recovery on customers' bills. Account is maintained net-of-tax and receives interest treatment.
18139	Commercial Commodity Unbundling O&M Costs This account will contain the deferrals for operating and maintenance costs pertaining to the FEI Commercial Commodity Unbundling pursuant to the BCUC order number G-25-04. Costs are accumulated under internal order 501717 and maintained on a net-of-tax basis. Recoveries are through fees charged to the marketers (also coded to order 501717).
18146	Unbundling – Marketer Clearing This is a clearing account for company 2000 commercial unbundling marketer purchases and sales. It is debited each month with the marketer purchases; credited with the marketer sales; and the difference is transferred to the MCRA account as the marketer volume variance. The account should have a zero balance at month-end.
18148	OSC – Compliance Certification Costs This account is used to capture the costs related to OSC certification compliance M152-109 for 2004 & 2005 under BCUC G-112-04. Costs are captured under order 501776 and recorded on a net-of-tax basis. The deferral will be fully amortized by the end of 2005. FortisBC Energy Inc. (company 2000) will allocate 10% of the OSC costs to FEVI (company 6000).
18149	BCUC Assessments Post 2004 In company 2000, this account will include BCUC levies higher than budget to be deferred on a net-of-tax basis and amortized the following year as per Order G-112-04.
18154	Deferred gain/loss on swaps In company 1000, this account will include the deferral of gains or losses on swaps.

18159	Residential Unbundling Implementation (Capital) This account will be used to collect costs associated with the design and validation of the business model rules for the FEI Residential Unbundling Program. BCUC order numbers G-66-05 and G-110-05. The initial amount allowed under G-66-05 was $300,000, with an additional $1,053,800 under G-110-05 (total $1,353,800). Costs will be collected under internal order 501846, and recorded on a net of tax basis. As well, this account will contain costs accumulated under project Q-143 per Commission Order C-6-06 from Aug 14, 2006. The total amount to be charge to this GL is $11.1 million ($4.0 million in 2006 and $7.1 million in 2007). The project starts in September 2006 and ends in December 2007. This GL is a deferral account, with amounts recovered from eligible residential customers over a three year period starting in 2008. RUF Phase # 2 costs and Residual Customer Choice costs are also to be recorded here under order 502122 and 502123.
18160	Revenue Requirement Application The account includes the incremental cost related to creation of the new Revenue Requirement Application for all FortisBC Energy Companies. Amortization period will be determined as part of the Revenue Requirement decision.
18165	Energy Efficiency & Conservation Program In company 2000 & 6000, this rate base deferral account is used to record the EEC costs approved under BCUC Order G-36-09. These costs are recorded net-of-tax and amortized over 10 years.
18173	Deferred Interest - CCRA This account holds the interest calculated on the difference between the actual and forecast average balance of CCRA times the composite interest rate as approved by the BCUC order # G-19-03. Account is maintained net-of-tax.
18174	Biomethane Variance Account (BVA) This account is a rate base deferral account to capture the costs incurred to procure and process consumable Biomethane gas and the revenues collected through the Biomethane energy recovery component of rates. The account is similar to the other gas cost deferral accounts, and will reflect the difference between the actual and forecast biomethane supply and consumption volumes and dollars. Recovery rates will be reviewed quarterly by the BC Utilities Commission and will typically be reset on an annual basis. The account will be also used to record recovery from RS11B contract customers. The account is maintained net-of-tax.
18175	Biomethane Program – O&M Costs This non-rate base account attracts AFUDC and captures the program O&M costs. Beginning in 2012, the costs will be recovered through the delivery rate and amortized over a three year period. The account settles using I/O#503121.
18176	Biomethane Program – Cost of Services (Capital) This non-rate base account captures the capital related cost of services. Beginning in 2012, the costs will be recovered through the delivery rate and amortized over a three year period. The account does not attract AFUDC.
18200	2009 Revenue Surplus During 2009, FEVI's revenues were sufficient to fully recover the accumulated revenue deficiency (RDDA), and also to create a revenue surplus. The 2009 Revenue Surplus Account captures the revenue surplus that was created during 2009 for the difference between revenues collected less the cost of service less the 2008 ending balance of the RDDA. Of the balance in this non-rate base deferral account, $1.481 million will be returned to customers in each of 2010 and 2011. The remaining balance will be transferred to the Rate Stabilization Deferral Account.

18201	Rate Stabilization Deferral The Rate Stabilization Deferral Account is a non-rate base deferral account that captures: (a) differences in 2010 and 2011 between: i. the net revenues received; and ii. the actual cost of service, excluding O&M variances from forecast; and (b) any Accumulated Revenue Deficiency in the RDDA after December 31, 2009. Any balance in the RSDA, including accumulated interest, will be amortized into cost of service after 2011.
18504	SCP PST Reassessment Deferral Regulated deferral account to capture the $10 million payment made to the Provincial Government in relation to the proposed $36 million reassessment of PST on the SCP Project. FortisBC Energy is appealing the reassessment and when the appeal is resolved, FortisBC will seek a Commission order with respect to the disposition of the deferral account.
18507	Customer share of Lochburn land sale This account is used to capture the customer share of the gain on sale from the Lochburn property under BCUC G-116-07. Per the order "A refund of $2.5 million to ratepayers over one year by a rate rider to be filed with the first quarterly gas review following the date of completion of the sale is approved."
18509	IFRS Conversion Costs Rate base deferral account to capture the incremental costs of converting FortisBC from Canadian GAAP to International Financial Reporting Standards – primarily consulting, travel, training, SAP costs. Recovery will be determined at a future date.
18513	Carbon Tax Cost of Service Deferral Rate base deferral account used to capture the deferral of the carbon tax on own use fuel, as well as the resulting reduction in the Corporate Income Tax rate. This deferral will be amortized over three years beginning in 2009.
18514	Regulated Future Income Tax Deferral Non-rate base deferral account used to capture the deferral of the regulated future income tax amounts. The non-regulated amounts will be coded directly to the income statement through account 30602 – Future Income Tax Expense.
18515	Olympic Security Costs Deferral Rate base deferral account used to recover the critical security costs associated with the 2010 Olympic and Paralympic Winter Games, per order G-191-08. This deferral will be amortized over three years beginning in 2011.
18516	ROE Variance (2009) Regarding BCUC Order G-172-06, this account will be used to capture the ROE variance between the 2005 approved rate-setting ROE (9.75%) and the 2009 actual allowed ROE.
18517	Delivery Rate Refund Rider This account is used to capture the over collection of revenues for the period January 1, 2009 through March 31, 2009 associated with the misstatement of the January 1, 2009 Delivery Rate. Per BCUC Order No. G-XXX-09 "the forecast amount over collected from customers for the period January 1, 2009 through March 31, 2009, on account of the revenue deficiency overstatement, is refunded via a nine month Delivery Rate Refund Rider effective April 1,2009.

18518	2009 ROE & Capital Structure Costs This account is used to accumulate costs relating to the 2009 Return on Equity and Capital Structure application and hearing for Company 2000, 6000, and 6100. The account is maintained on a net-of-tax basis with amortization over five years beginning 2010.
18519	Capital Contribution to FEVI Pipe
18520	CCE CPCN Application costs This account is used to accumulate costs relating to the CCE CPCN application for FEI, FEVI and FEW. The account is maintained on a net-of-tax basis with amortization over five years beginning 2010.
18521	Tilbury Property Purchase-Capital This account is used to accumulate costs for the land related to the Tilbury Property Purchase. It is a non-rate base deferral account that accumulates AFUDC until the land is added to rate base and included in the year-to-year revenue requirements of FEI. FEI anticipates that the Tilbury Property Purchase incremental revenue requirement will not flow into rates until 2012, and that the deferred costs would be amortized over three years at that point.
18522	LILO tax reassessment Per the 2010/2011 revenue requirement application, this account is used to accumulate the full tax impact until the CRA ruling is reviewed. Due to the significant uncertainty around any potential tax liability, FortisBC Energy believes it is appropriate that a non-rate base deferral account attracting AFUDC be created, to record any resulting payments and associated legal costs, for disposition pursuant to a future direction from the Commission.
18523	Tilbury Property Purchase-O&M This account is used to accumulate costs for the remaining incremental O&M items related to the Tilbury Property Purchase. It is a non-rate base deferral account that accumulates AFUDC until the land is added to rate base and included in the year-to-year revenue requirements of FEI. FEI anticipates that the Tilbury Property Purchase incremental revenue requirement will not flow into rates until 2012, and that the deferred costs would be amortized over three years at that point.
18525	Income Tax Variances This account is used to accumulate any costs related to income tax variances from what was filed in the 2010/2011 NSP. It is a rate base deferral account and the amortization period will be three years.
18526	Gains and Losses on Asset Disposition IFRS requires that gains and losses on disposal of assets be recognized in the income statement. FortisBC Energy proposed to defer the amount of these gains and losses during the term of this Application for recovery in future years. This will have the same result as current practice, which is to record gains and losses in accumulated depreciation, and recover through future depreciation rates. The Company does not forecast gains or losses on asset disposals, however we requested Commission approval for any gains and losses incurred during 2010 and 2011 to be included in this rate base deferral account. The amortization period for these amounts will be determined in the next RRA.
18527	Deferred Removal Costs For 2010 & 2011, the provision for removal costs will be removed from depreciation estimates and included in the cost of service and recovered from customers. This new deferral account was created to capture any variances between the actual amount of net removal costs realized and the estimated amounts included in cost of service. Please refer to Appendix A, page 12 of the FEI Negotiated Settlement.

18528	IFRS Transitional Deferral A number of assumptions have been made in the preparation of this Application about final IFRS and their impacts on FortisBC Energy. The Company proposes a deferral account to capture: -Retained earnings adjustments required on transition to IFRS. -The 2011 impact of a one-time adjustment to pension expense under IFRS to recognize a market valuation allowance. -The one-time transfer of the existing gain balance from General Plant as part of the conversion in preparation for IFRS. -The impact of any difference between the depreciation rates or methodology recommended in the 2010/2011 NSP Application and the rates eventually required to comply with IFRS. -The impact of any difference between the overhead capitalization rate or methodology recommended in the 2010/2011 NSP Application and the rate or methodology required to comply with IFRS. -The rate impact of any other standard where the result of the particular IFRS is varied from what is assumed in the preparation of the 2010/2011 NSP Application. -This will be a rate base deferral with disposition of the actual balances to be determined at a future date.
18529	FEI 2010 Revenue Surplus Per the 2010/2011 NSP filing, a 2010 revenue surplus was established that must be moved to 2011. The 2010 entry will credit this account and debit account 32920 monthly and will be curved based on budget.
18530	IFRS Revenue Requirement Adjustment This non rate base deferral account is used to transfer the impacts of IFRS on the 2010 Revenue Requirements to 2011. For FEI, the impact of IFRS on the 2010 Revenue Requirements was a debit of $800,000, and this amount will be credited to 2010 income and charged against 2011 income. For FEVI, the impact of IFRS on the 2010 Revenue Requirements was a credit of $1,400,000, and this amount will be charged to 2010 income and credited against 2011 income.
18533	Interest on Gas in Storage This account holds the interest calculated on the difference between the actual and forecast average balance of Gas in Storage times the composite interest rate as approved by the 2010/2011 NSP. Account is maintained net-of-tax.
18534	2012 Revenue Requirement Application The account includes the incremental cost related to creation of the new Revenue Requirement Application for all FortisBC Companies. Amortization period will be determined as part of the Revenue Requirement decision.
18535	Decommissioning of Propane Assets BCUC Commission Order No. G-53-06 & G-35-09. The net book value of the Propane assets, including proceeds and disposal costs (other than Propane Land) is to be transferred to this deferral account. This account will also include the net book value of the IP Liquids line that is being retired along with the retirement costs. The transferred net book value is to be amortized over 20 years beginning in January, 2010. Income tax offset is not applicable to this deferral account as the net book value is not being expensed for income tax, but are already embedded in the respective CCA pool(s).
18536	Capital Gain on Sale of Propane Land BCUC Commission Orders G-53-06 & G-35-09. The after tax capital gain on the sale of the propane land is to be booked to this deferral account. The book of the propane is to be transferred to this deferral account, proceeds on disposal will be credited to this account and disposal costs including land remediation costs will be charged to this deferral account. The effective tax on the capital gain from the sale of the land will be charged to the deferral account; the account is to be amortized over 20 years beginning in 2010.

18537	Garbally Regional Office Replacement Project The project will complete a schematic and design development phase for a building and yard compound to support our Victoria Regional Office. The costs incurred for the this project will be consulting fees for Architectural, Structural, Mechanical, Electrical, Design and Industrial. This design completion will ensure the construction pricing for the application is accurate (90%).
18539	CCE Project O&M Costs This rate base deferral account will be used to capture any incremental costs related to the Customer Care Enhancement Project.
18540	Ft Nelson ROE and Capital Structure Deferral This rate base deferral is the result of the FNG 2010/2011 revenue requirement and is calculated on Attachment 2 of the RRA. It represents the difference in the 2009 approved ROE (8.47%) vs. the revised approved ROE (9.50%) multiplied by the approved equity of 35.01% * actual rate base of $5M. The balance in this account will be amortized in 2012.
18541	Tilbury Land Purchase Relating to account 18521-Tilbury Property Purchase and per BCUC Order G-68-10, this account will contain $3.3 million for the part of the land that FEI will be seeking to subdivide and sell. The account will be non rate base with interest. If FEI does sell the land, the proceeds will be credited against this account with any difference being returned to (or recovered from) customers over a yet to be determined period. If the land is not sold it by January 1, 2014, the balance will enter into rate base as land.
18542	2012 Rate Design Deferral The account will collect costs for extra resources – legal and consulting associated with the research, analysis and drafting of the 2012 Rate Design Application for postage stamp rates. The account includes costs for the regulatory proceeding such as evidence preparation for a possible oral hearing, BCUC billing and intervener billing. The deferral is rate based.
18543	NGV Fuelling Service Application Deferral A non-rate base deferral account attracting AFUDC to capture the NGV Fuelling Services costs incurred in 2010 and 2011 to recover those costs from all non-bypass customers by amortizing them through delivery rates commencing January 1, 2012 over a 3 year period.
18544	Deferred Removal Costs – Net of tax Please see description for a/c#18527 “Deferred Removal Costs”. This account was created to record net-of-tax entries for a/c#18527 as manual entries cannot be recorded in a/c#18527, which is mapped as a sub-ledger account in SAP.
18545	NGV Program Costs Deferral – Capital Cost of Service A non-rate base deferral account to capture the NGV Fuelling Services Program’s capital related Cost of Services. The account does not attract AFUDC and is not net of tax.
18546	Biomethane Application Costs Deferral A non-rate base deferral account attracting AFUDC to capture the Biomethane appcliation costs incurred in 2010 and 2011. The recovery of this account will be determined in the 2012/13 Revenue Requirement application.
18547	NGV Program Costs Deferral – O&M and Revenue A non-rate base deferral account to capture the NGV Fuelling Services Program’s O&M and Revenue. The account attracts AFUDC and is net of tax.
18548	US GAAP Conversion Costs Non-rate base deferral account to capture the incremental costs of converting FortisBC from Canadian GAAP to US GAAP – primarily consulting, travel, training, SAP costs. Recovery will be determined at a future date.

1.4 Other Long-Term Assets

1.4.1 Other Long Term Assets

12101	Long Term Investments – General The carrying value of the investments in securities issued by a non-related company; also investment advances made to such companies.
12300	Miscellaneous Special Funds This account is used to record the income tax timing differences associated with recording deferral accounts on a net-of-tax basis. The amounts in this account are used by the tax department to adjust taxes payable to a cash basis.
12501	Employee Mortgage and Housing Loans Amounts advanced to specific employees for home mortgages. Amounts are repaid (credited) to this account through payroll deduction until the loan has been repaid in full.
12502	Long Term Receivable (Huntingdon) Lease The capital lease receivable from FortisBC Huntingdon Inc. Balance is reduced as payments are received from Huntingdon; book value should agree to the book value of account 24901 in company 4000.
12506	Employee Loans Loans receivable from employees for financing of gas appliances. Amounts are repaid (credited) to this account through payroll deduction until the loan has been repaid in full.
12512	Loans Receivable Loans receivable from third parties. Account is debited as cash is advanced and credited as payments are received from the debtor.
12513	LILO Lease Payment Receivable Capital lease receivable from municipalities or cities that have elected to purchase the gas distribution assets within their franchise area. Lease receivable is created at the inception of the lease and charged each month with interest on the lease. Lease receivable is reduced as semi-annual payments are received from the municipalities or cities.
12515	Employee Share Purchase Loans This account records Fortis employee share purchase loans and the repayment through payroll deduction. The account is an open item managed by employee personnel number.

2. LIABILITIES

2.1 Current Liabilities

2.1.1 Short Term Debt

25001	Commercial Paper and Other Notes Payable This account will include the debt outstanding in the form of commercial paper and notes payable, due on demand or within a time frame not exceeding one year from date of issue. Account is credited as notes are issued and debited as they are repaid through postings from the Treasury module.
25002	Bank Loans This account will include bank loans payable, due on demand or within a time frame not exceeding one year from date of issue. Account is credited as bank loans are issued and debited as they are repaid, through journal entries from the bank statement.

2.1.2 Accounts Payable and Accrued Liabilities

25101	A/P – Trade Amounts payable by the Company to regular vendors for invoices entered into the AP system but not yet paid. The balance in this account will agree to the AP system.
25102	A/P – One Time Vendors Amounts payable by the Company to one-time vendors for invoices entered into the AP system but not yet paid. The balance in this account will agree to the AP system.
25103	A/P – Employee Amounts payable by the Company to employees for expense reimbursements and other miscellaneous amounts, where the expense claim has been entered into the AP system but not yet paid. The balance in this account will agree to the AP system.
25106	Biomethane Purchase Cost Liability For company 2000, actual biomethane purchases are created to this account based on information from the Entegrate deal capture system. Payments are made on the 25th of each month via wire transfer.
25111	Social Service Tax Payable All amounts payable by the Company to the Provincial Government for Social Services Tax (PST) collected from customers' gas and merchandise accounts and for tax self-assessed on purchases, but not yet remitted. Account is credited through ABSU's journal entry based on customer billings in Energy, and also through Accounts Payable postings for self-assessed PST. Account is debited as amounts are remitted to the government through Accounts Payable the following month.

25112	Miscellaneous Accruals This account will be used for standing accruals and as a temporary holding account for items that need to be accrued at month end/year end where payments will not be processed by Accounts Payable before the required deadlines. Debits and credits to this account are generated from JV's or payments processed by Accounts Payable. Guidelines for accruals are any items where the goods have been received or the service has been performed by the month end deadline, but the purchase order has not been processed in the purchasing system (25193 to 25198), and the invoice has not been entered into accounts payable (25101, 25102, 25103).
25114	Motor Fuel Tax Payable Amounts payable by the Company for Motor Fuel Taxes payable to the Provincial Government on natural gas consumed by the Company's compressor stations. The offset of this account is 64104 Facilities – Internal Charges in FEI and 30503 Motor Fuel Tax Expense in FEVI. Account is credited through journal entry based on compressor fuel consumption, and debited as amounts are remitted to the government through Accounts Payable the following month.
25115	Accrued Interest – Short Term Debt Interest accrued and payable on short-term debt (notes payable, commercial paper where interest is paid upon maturity, and bank loans) and on temporary investments where interest is received up front. Account is credited as interest is accrued at month-end and debited as interest is paid out, through postings from the Treasury module.
25117	Non Resident Withholding Tax Payable Tax withheld from service invoices where payment is to a country other than Canada. Postings are through the Accounts Payable system.
25118	HST/GST Collected This account will be credited with all the HST/GST collected from customers' gas accounts, merchandise accounts, and miscellaneous billings (i.e. after hours service calls, etc.). The balance on this account will be netted against account 14300 "HST/GST Input Tax Credits" in order to determinate the exact amount of the remittance (account 25628) or refund.
25119	Corporate Accruals Company-level accruals for items such as restructuring, incentives, LILOs, environmental, regulatory, and other items of a corporate nature. Accruals are through journal entry, payments are through Accounts Payable or Payroll.
25120	BC Hydro & PHH Vehicle Service Accrual This account will be credited when the monthly file is received from either BC Hydro (company 2000) or PH&H (company 6000) for the monthly lease and mileage charges for leased vehicles. The account is cleared as payments are made through Accounts Payable.
25125	Gas Purchase Cost Liability For companies 2000 and 3000, this account will include the estimated liability for the current month's gas purchases, based on information from Nucleus. This entry reverses in the following month. For all companies, actual gas purchases are credited to this account based on information from the Nucleus system. Payments are made on the 25th of each month via wire transfer initiated by the Accounts Payable department.
25126	Cost of Gas Accrual For companies 6000 and 6100, this account will include the estimated liability for the current month's Cost of Gas, System Gas Use, and Storage injection or withdrawal. The Cost of Gas estimate is then reversed in the following month when the actual gas purchase invoices are known (G/L 25125).

25127	Imbalance – Gas This account will include the difference between Westcoast Energy Pipeline metered and authorized deliveries and also the difference between transportation customers receipts and deliveries. Entries are through journal entry; the account will be adjusted monthly to reflect the most current balance available. The offset of this account is G/L 62413 – Imbalance Chg WEI & Transportation.
25131	IBEW Prior Year Timebank Liability Liability for time off earned but not yet paid to IBEW employees relating to prior years. The liability is drawn down throughout the year from postings from payroll as timebanks are used, and trued up to the calculated amount owing at the end of each year via journal entry prepared by the payroll department.
25132	Accrued WCB Accruals for Workers Compensation Board (WCB) payments. WCB is accrued as part of each payroll run based on rates configured in SAP payroll system (WCB'able earnings * rate). Each quarter, an assessment payment is made to the WCB – payroll receives remittance form and runs SAP report on WCB assessable earnings, enters this into a spreadsheet to calculate the remittance, and submits a payment requisition to Accounts Payable.
25133	COPE/M&E Prior Year Timebank Liability Liability for time off earned but not yet paid to COPE and M&E employees relating to prior years. The liability is drawn down throughout the year from postings from payroll as timebanks are used, and trued up to the calculated amount owing at the end of each year via journal entry prepared by the payroll department.
25134	COPE Dollar Bank Liability Liability for overtime banked but not yet taken as pay for COPE employees. Entries are through the payroll system.
25135	IBEW Dollar Bank Liability Liability for overtime banked but not yet taken as pay for IBEW employees. Entries are through the payroll system.
25137	ICE Levy Liability All amounts payable by the Company to the BC Government for the Ice Levy collected from customers' gas and for tax self-assessed on purchases, but not yet remitted. The account is credited in two ways: 1) through ABSU's journal entry based on customer billings in Energy, and 2) through Accounts Payable postings for self-assessed PST. Account is debited as amounts are remitted to the government through Accounts Payable the following month.
25138	Payroll Liability – Income Tax This account will include the income tax from employees' source deductions to be remitted by the Company to the CRA. Liability is created through entries from the payroll system; and reduced as amounts are transferred to GL 25166 for posting into Accounts Payable.
25139	Payroll Liability – Employment Insurance (EI) This account will include the Employment Insurance from employees' source deductions and the Company's expense to be remitted by the Company to the CRCA. Liability is created through entries from the payroll system; and reduced as amounts are transferred to GL 25166 for posting into Accounts Payable.
25140	Payroll Liability – Canada Pension Plan (CPP) This account will include the CPP from employees' source deductions and the Company's expense to be remitted by the Company to the CRA. Liability is created through entries from the payroll system; and reduced as amounts are transferred to GL 25166 for posting into Accounts Payable.

25141	Payroll Liability – Medical Service Plan (MSP) Accruals for Medical Service Plan (MSP) payments for COPE, IBEW and pensioners. MSP is accrued as part of each payroll run based on rates configured in SAP payroll system. Each month, payments are made through Accounts Payable based on reports generated from the payroll system. Balance should clear each month.
25142	Payroll liability – Dental Accruals for dental payments for COPE, IBEW and pensioners. Dental is accrued as part of each payroll run based on rates configured in SAP payroll system. In the following month, payments are made through Accounts Payable based on invoices received from Pacific Blue Cross. Differences between accruals and actual payments are expensed throughout the year.
25143	Payroll Liability – EHB Accruals for extended health benefits (EHB) payments for COPE, IBEW and pensioners. EHB is accrued as part of each payroll run based on rates configured in SAP payroll system. In the following month, payments are made through Accounts Payable based on invoices received from Pacific Blue Cross. Differences between accruals and actual payments are expensed throughout the year
25144	Payroll Liability – Disability Insurance Accruals for disability insurance payments for COPE and IBEW employees. Disability insurance is accrued as part of each payroll run based on rates configured in SAP payroll system. Payments to Manulife are made through Accounts Payable in three parts: a monthly deposit for administration of the plan is due in the current month; premiums relating to claims experience is due in the following month; management fee $100,000 for the year. Differences between accruals and actual payments are expensed throughout the year
25145	Payroll Liability – Accident Insurance Accruals for AD&D insurance payments for COPE and IBEW employees, and business travel accident (BTA) insurance for all employees. Insurance is accrued as part of each payroll run based on rates configured in SAP payroll system; payments are through Accounts Payable to W Sutton. Differences between accruals and actual payments are expensed throughout the year.
25146	Payroll Liability – Optional Life Insurance Accruals for optional life insurance payments for COPE and IBEW employees. Optional life insurance is deducted from employees' payroll as part of each payroll run based on rates configured in SAP payroll system. Payments to Manulife are made through Accounts Payable in two parts: a monthly deposit for administration of the plan is due in the current month and premiums relating to claims experience are due in the following month. Differences between accruals and actual payments are expensed throughout the year
25147	Payroll Liability – M&E Flex Benefits Accruals for the M&E Flex Benefits program for MSP, Health Spending Account (H.S.A.), Dental, Extended Health, Long-term disability, Group Life, Optional Life and AD&D). The M&E flex benefits liability is accrued as part of each payroll run based on rates configured in SAP payroll system. Payments are made through Accounts Payable as follows: MSP – payments to MSP are due in the current month H.S.A, Dental and Extended Health – payments to PBC are due in the following month LTD, Group Life, Optional Life – deposit paid in current month, premium paid in following month to Manulife. AD&D – deposit paid in current month, premium paid in following month to W Sutton Differences between accruals and actual payments are expensed throughout the year

25148	Payroll Liability – Group Insurance Accruals for group life insurance payments for COPE and IBEW employees. Insurance is accrued as part of each payroll run based on rates configured in SAP payroll system. Payments to Manulife are made through Accounts Payable in two parts: a monthly deposit for administration of the plan is due in the current month and premiums relating to claims experience are due in the following month. Differences between accruals and actual payments are expensed throughout the year.
25149	Union Defined Benefit Pension Liability Liability for the IBEW and COPE defined benefit pension plan. The estimated liability is calculated each month through the SAP payroll system based on employees' years of credited service and remuneration. The liability is reduced as amounts are transferred to GL 25166 for posting into Accounts Payable and remittance to the pension plan. Each quarter-end, the liability is trued up to actuarial estimates through a journal entry.
25150	Payroll Liability – RRSP This account will include the RRSP deductions from employees' pay to be remitted by the Company to London Life. Liability is created through entries from the payroll system; and reduced as amounts are transferred to GL 25166 for posting into Accounts Payable.
25151	Payroll Liability – Union Dues This account will include the union dues deducted from employees' pay to be remitted by the Company to the IBEW or COPE. Liability is created through entries from the payroll system; and reduced as amounts are transferred to GL 25166 for posting into Accounts Payable
25152	Payroll Liability - M&E Pension Plan Remittances Liability for the M&E pension plan. The estimated liability is calculated each month through the SAP payroll system based on employees' years of credited service and remuneration. The liability is reduced as amounts are transferred to GL 25166 for posting into Accounts Payable and remittance to the pension plan. Account will normally clear to zero each month.
25153	M&E Defined Benefit Pension Liability Liability for the M&E defined benefit basic and supplemental regulated pension plans. The estimated liability is calculated each month through the SAP payroll system based on employees' years of credited service and remuneration. The liability is reduced as amounts are transferred to GL 25166 for posting into Accounts Payable and remittance to the pension plan. Each quarter-end, the liability is trued up to actuarial estimates through a journal entry.
25154	Other Post Employment Benefits Accrual Accruals for Post Employment Benefits other than pensions, such as supplemental health, dental and life insurance coverage, to be paid to already retired employees and active employees upon retirement. The liability is determined based on actuarial estimates, and true up each quarter-end through a journal entry.
25155	Non-Regulated Pension Liability Liability for the M&E defined benefit supplemental non-regulated pension plan. The estimated liability is trued up to actuarial estimates through a journal entry each quarter-end.
25156	Payroll Liability – United Way This account will include employees' donations to the United way deducted at source to be remitted by the Company to the United Way. Liability is created through entries from the payroll system; and reduced as amounts are transferred to GL 25166 for posting into Accounts.

25157	Payroll Liability – Employee Share Purchase Plan (ESPP) This account will pool together the contributions made by employees for the purpose of shares purchases of common stock purchases of Fortis Inc. at a 10% discount to market. The balance of this account will be remitted on a regular basis by the Company to the Plan Administrator (Computershare) according to established procedures.
25158	Payroll Liability – Sundry Liability for payroll-related items, such as garnishees, not accrued under any other payroll liability account. Liability is created based on information from the payroll run, and reduced as payments are made through Accounts Payable.
25162	Construction Holdback Liability The Builder's Lien construction holdback as determined by the construction contract and purchase order terms and conditions. The holdback is 10% of the vendor invoice. Entries are through journal entry to record the holdback liability and the offsetting deposit to the holdback bank account; and to record the subsequent payment of the holdback once all the terms have been met and the offsetting cheque from the holdback bank account.
25164	Net Payroll Liability Liability for payroll due to employees, where the payroll has run but the payment has not yet been sent to the bank through wire transfer.
25165	Payroll Accruals Estimated liability for payroll due to employees, for the period of time between the last payroll run and the end of the month. Entry is calculated automatically from the payroll system, and reversed in the following month.
25166	Third Party Clearing for HRA Accounts Clearing account for payroll-related amounts to be remitted to CRA, pension plans, unions, etc. The system automatically posts the required payment to this account, and it is cleared when the amounts are cleared into accounts payable. Account normally has a zero balance at month-end.
25167	Pay Temp Net – No Bank Account Temporary holding account for pay liabilities, where banking information is missing or incomplete.
25168	IBEW Union & H&W Dues – Contractors Liability for union and health & welfare (H&W) dues payable to the IBEW for dependent contractors. Liability is created as payments to contractors are made through Accounts Payable, and reduced as amounts are remitted to the IBEW.
25171	Employee Savings Plan Liability This account is being used for the new employee savings plan starting in Jan 2007 and will be used in the creation of Payroll processing Journals.
25175	M&E Defined Benefit (2007) Pension Liability

25189	Payroll Liability – IBEW Flex Benefits Accruals for the IBEW Flex Benefits program for MSP, Health Spending Account (H.S.A.), Dental, Extended Health, Long-term disability, Group Life, Optional Life and AD&D). The COPE flex benefits liability is accrued as part of each payroll run based on rates configured in SAP payroll system. Payments are made through Accounts Payable as follows: MSP – payments to MSP are due in the current month H.S.A, Dental and Extended Health – payments to PBC are due in the following month LTD, Group Life, Optional Life – deposit paid in current month, premium paid in following month to Manulife. AD&D – deposit paid in current month, premium paid in following month to W Sutton Differences between accruals and actual payments are expensed throughout the year
25191	Payroll Liability – COPE Flex Benefits Accruals for the COPE Flex Benefits program for MSP, Health Spending Account (H.S.A.), Dental, Extended Health, Long-term disability, Group Life, Optional Life and AD&D). The COPE flex benefits liability is accrued as part of each payroll run based on rates configured in SAP payroll system. Payments are made through Accounts Payable as follows: MSP – payments to MSP are due in the current month H.S.A, Dental and Extended Health – payments to PBC are due in the following month LTD, Group Life, Optional Life – deposit paid in current month, premium paid in following month to Manulife. AD&D – deposit paid in current month, premium paid in following month to W Sutton Differences between accruals and actual payments are expensed throughout the year
25192	Large Customer Visa Clearing Clearing account for company VISA credit card purchases from trade vendors. As payment is made to Scotiabank VISA for the current month's purchases, this account is debited; as coding is received for the expenditure, this account is credited and the appropriate expense account is debited.
25193	GR/IR Meter Inventory Items Liability for meter inventory items where the goods have been received (GR) in the purchasing system, but the invoice has not been entered into Accounts Payable (IR). The account is credited based on entries from the purchasing system, and debited as amounts are transferred to Accounts Payable 25101. It is activated by a 101 movement in SAP. This movement activates the process that allows vendors to be paid for materials received.
25194	Credit Card Clearing Account Clearing account for company VISA credit card purchases by employees. As payment is made to Scotiabank VISA for the current month's purchases, this account is debited; as VISA statements with coding are received from employees, this account is credited and the appropriate expense account is debited.
25195	GR/IR IT Items Liability for IT (information technology) items where the goods have been received (GR) in the purchasing system, but the invoice has not been entered into Accounts Payable (IR). The account is credited based on entries from the purchasing system, and debited as amounts are transferred to Accounts Payable 25101. It is activated by a 101 movement in SAP. This movement activates the process that allows vendors to be paid for materials received.

25196	Vendor Managed Inventory / Consignment Contra Inventory This account will include the reconciliation amounts for vendor managed inventories. When goods are received into the warehouse, G/L 15001 – Inventory Account is debited and this account (25196) is credited (and vice versa). When the summary invoices come in, they are cleared to this account should all the prices stated balance. If they do not balance, then corrections are made on the goods' invoices to correct the pricing (these differences may arise due to unit of measure conversion issues for example).
25197	GR/IR Non Inventory Items Liability for non-inventory items where the goods have been received (GR) in the purchasing system, but the invoice has not been entered into Accounts Payable (IR). The account is credited based on entries from the purchasing system, and debited as amounts are transferred to Accounts Payable 25101. It is activated by a 101 movement in SAP. This movement activates the process that allows vendors to be paid for materials received.
25198	GR/IR Inventory Items Liability for inventory items (other than meters) where the goods have been received (GR) in the purchasing system, but the invoice has not been entered into Accounts Payable (IR). The account is credited based on entries from the purchasing system, and debited as amounts are transferred to Accounts Payable 25101. It is activated by a 101 movement in SAP. This movement activates the process that allows vendors to be paid for materials received.
25203	Payroll Liability – Benefits Deposits This account consists of payroll benefits premium deposits for COPE, M&E and IBEW employees for all companies (Co. 1000, 2000, 6000 and 6100).
25210	Employee Prepaid Benefits The account is used to facilitate reconciliation of prepaid benefit amounts. The process will require an employee going on leave to provide either a cheque or allocate an amount to be paid out from a time bank to be used to prepay all benefit/pension deductions due during the leave up to the last pay period ending date of that year. Since benefit amounts often change at year end, a new cheque will be required for the new year. The prepaid accounts should be reconciled each year end. Any remaining amounts should be refunded to the employee.
25211	Employee Prepaid Pensions The account is used to facilitate reconciliation of prepaid pension amounts. The process will require an employee going on leave to provide either a cheque or allocate an amount to be paid out from a time bank to be used to prepay all benefit/pension deductions due during the leave up to the last pay period ending date of that year. Since benefit amounts often change at year end, a new cheque will be required for the new year. The prepaid accounts should be reconciled each year end. Any remaining amounts should be refunded to the employee.
25301	Dividends Payable – Preferred This account will include the amounts payable as dividends to preferred shareholders as of the date of record.
25302	Dividends Payable – Common This account will include the amounts payable as dividends to common shareholders as of the date of record.
25303	Dividends Payable – 8.0% Capital Securities This account will include the amounts payable as dividends/interest to holders of FortisBC Inc.'s 8.0% Capital Securities as of the date of record. Dividends are accrued monthly through journal entry, and paid out by Accounts Payable,

25401	Customer Security Deposits Customer security deposits are collected from customers who have no history with FortisBC within the last two years, or have a poor credit history. Amounts collected are regulated by the BCUC. Customers earn interest on security deposits; they will be returned once certain conditions are met. Postings to this account through journal entries from ABSU based on information in the Energy system. The account balance will agree to listings of security deposits from the Energy system. The account will be credited when deposits are received and debited when refunds are issued.
25501	CIAC after 1997 Contributions in Aid of Construction (CIAC) received after 1997 are to be collected in this account. If the customer meets the requirements for refund under the MX contribution test, the amounts will be refunded. If the customer does not meet the requirements, after the designated number of years have passed, the contributions are transferred to GL 21101 "CIAC" as a credit to capital. Contributions are received through cash; and refunds are made through the Accounts Payable system.

2.1.3 Income and Other Taxes Payable

25601	Taxes Accrued – Income This account will be credited with the accruals of corporate income taxes which are payable to federal and provincial authorities. Each month, a journal entry is processed to accrue income tax payable based on current month's income or loss, less permanent differences, multiplied by the current income tax rate. Also each month, an instalment payment is made through Accounts Payable and debited to this account. At year-end, adjustments to the accruals may be made based on instructions from the tax department. When final tax calculations are made in June of the following year, adjustments are made to true-up the prior years accruals based on these filings. Any net balance owing or receivable is either paid through Accounts Payable or received via cheque from the CRA.
25610	Carbon Tax on Consumption All amounts payable by the Company to the Government for Carbon Tax collected from customers' gas and merchandise accounts and for tax self-assessed on purchases, but not yet remitted. The account is credited through ABSU's journal entry based on customer billings in Energy, and also through Accounts Payable postings for self-assessed carbon tax. Similarly, the account is debited as amounts are remitted to the government through Accounts Payable the following month.
25625	Taxes Accrued – Property This account will be credited with the accruals of property taxes which are payable to various municipalities, accrued on a straight-line basis as 1/12th of the annual budgeted amount. In June or July of each year, the annual property taxes are paid, and the liability is adjusted to account for any over or under accrual. In company 2000, any variance between actual and budgeted property taxes is deferred to G/L 17915.
25626	Taxes Accrued – Other This account will be credited with the accruals of any taxes not captured in another account (example would be Ontario taxes payable). Amounts are adjusted to actual once the payment is made.
25628	HST/GST Payable This account will be debited with HST/GST Input Tax Credits (ITCs) from account 14300 and credited with the HST/GST collected from customers (account 25118). The net result will determine the liability or the refund of HST/GST. Amounts are paid to (received from) the Receiver General in the following month.

25650	Taxes Accrued – Franchise Franchise fees are collected from customers located within municipal boundaries in the Inland and Columbia service areas. These fees are remitted by FortisBC Energy Inc. to the municipalities in either February or October of the following year. Fees are collected from customers through the Energy billing system on a calendar year basis; a JV is created which credits 25650 at 3.09% of revenues and debits 14001 (Customer AR). In the following year, ABSU prepares a payment requisition for each municipality. These payment requisitions are sent to the customer care manager at FortisBC for approval before being sent to accounts payable for payment. Upon being entered into the Accounts Payable system, 25650 is debited and AP is credited. Once all the payments have been made for the preceding year, variances should be investigated.

2.1.4 Interest Payable and Accrued

25701	Accrued Interest – Long Term Debt This account will include the amount of interest payable or accrued on long term liabilities, and on customer security deposits. Interest on long term debt is calculated each month and charged to Account No. 32000 (Interest on Long Term Debt) on a journal entry. Payments are through Accounts Payable according to scheduled interest payment dates.
25703	Swap Interest Receivable This account will include the amount of interest payable or receivable on interest rate swaps. Entries are through journal voucher each month.

2.1.5 Current Portion – Long Term Debt

25800	Current Portion – Long Term Debt The principal amount of long term debt which is due within the next year. Credits to this account are through journal entry to transfer amounts from long-term to current. As debt is redeemed through the Accounts Payable system (wire transfers), the account is debited.

2.1.6 Other Current and Accrued Liabilities

25900	Audit Fee Accrual This account will include the accrual for auditing fees. One twelfth of the estimated annual amount is accrued each month. Payments are made either quarterly or annually through Accounts Payable. Any differences between accruals and payments are adjusted at the time of payment.
25901	Unclaimed Property < $50 This account contains cheques outstanding issued to one time vendors, customers that closed their respective account(s) with a credit balance, and miscellaneous refunds not cashed. This account will be used where we have credits owed to customers/vendors but are unable to locate the customer to mail a cheque. We must keep the credit until either the customer/vendor requests payment of the amount or the appropriate time period has expired and then it may be reclassified as unclaimed property (as per the Unclaimed Property Act). This account will be debited when a cheque is reissued to an eligible customer/vendor, or when allowed by the UPA, qualified amounts can be transferred to Miscellaneous Income by the Company by way of a journal entry. On the other hand, the account will be credited as issued cheques become stale dated.

25902	Unclaimed Property > $50 & < $1000 This account contains cheques outstanding issued to one time vendors, customers that closed their respective account(s) with a credit balance, and miscellaneous refunds not cashed. This account will be used where we have credits owed to customers/vendors but are unable to locate the customer to mail a cheque. We must keep the credit until either the customer/vendor requests payment of the amount or the appropriate time period has expired and then it may be reclassified as unclaimed property (6 years as per the Unclaimed Property Act in 2010). This account will be debited when a cheque is reissued to an eligible customer/vendor, or when allowed by the UPA, qualified amounts can be transferred to Miscellaneous Income by the Company by way of a journal entry. On the other hand, the account will be credited as issued cheques become stale dated.
25903	Unclaimed Property > $1000 & < $25000 This account contains cheques outstanding issued to one time vendors, customers that closed their respective account(s) with a credit balance, and miscellaneous refunds not cashed. This account will be used where we have credits owed to customers/vendors but are unable to locate the customer to mail a cheque. We must keep the credit until either the customer/vendor requests payment of the amount or the appropriate time period has expired and then it may be reclassified as unclaimed property (10 years as per the Unclaimed Property Act in 2010). This account will be debited when a cheque is reissued to an eligible customer/vendor, or when allowed by the UPA, qualified amounts can be transferred to Miscellaneous Income by the Company by way of a journal entry. On the other hand, the account will be credited as issued cheques become stale dated.
25904	Unclaimed Credits This account currently contains credit balances transferred from Energy accounts and CUCBC Rejects/Suspense Debtor Items - Energy. This account will be used where we have credits owed to customers but are unable to locate the customer to mail them a cheque and must keep the credit until either the customer requests payment of the amount or the appropriate time period has expired and it may be claimed as unclaimed property. This account is debited when a journal entry is created in Energy to transfer credits back to an existing/active Energy account or credited when a journal entry is created in Energy to transfer credit balances to unclaimed credits so that an inactive account can be finalized. This account will also be debited by way of a journal entry when the appropriate time period has expired after the payment was originally received and the funds can be transferred to miscellaneous income per the Unclaimed Property Act.
25908	Unclaimed Property > $25000 This account contains cheques outstanding issued to one time vendors, customers that closed their respective account(s) with a credit balance, and miscellaneous refunds not cashed. This account will be used where we have credits owed to customers/vendors but are unable to locate the customer to mail a cheque. We must keep the credit until either the customer/vendor requests payment of the amount or the appropriate time period has expired and then it may be reclassified as unclaimed property (30 years as per the Unclaimed Property Act in 2010). This account will be debited when a cheque is reissued to an eligible customer/vendor, or when allowed by the UPA, qualified amounts can be transferred to Miscellaneous Income by the Company by way of a journal entry. On the other hand, the account will be credited as issued cheques become stale dated.
25910	Internal Audit Fee Payable This account will include the accrual for auditing fees. One twelfth of the estimated annual amount is accrued each month. Payments are made either quarterly or annually through Accounts Payable. Any differences between accruals and payments are adjusted at the time of payment.

25911	Customer Refunds To record refund liability to customers due to changes in sales rate. The credit balance will be gradually reduced when customers are charged at a lower rate from June 1 to December 31, 2009.

2.2 Long Term Liabilities

2.2.1 Long Term Debt

22000	Long-term Debt Total book value of outstanding debt, issued for a term of greater than one year. The amounts included will be further divided so as to show the amount of each class of long term debt, as follows: a) Mortgage Bonds - Bonds secured by lien on physical property. b) Debentures - Obligations secured under trust deed but not secured by a lien on physical property. c) Convertible Bonds - Bonds which may be converted into capital stock of the Company, according to the agreement under which they are issued. d) Long Term Notes Payable – Other notes payable. Each of the above classes will also be divided into sub-classes according to differences in mortgage or other lien or security thereof, rate of interest, interest dates, or date of maturity. The total of the amounts included in this account which are payable within one year from the date of the balance sheet will be reclassified to 25800 Current Maturities – Long-term Debt.
22002	Subordinated Debt This account will be used to record the principal of FEVI's subordinated debt to FortisBC Inc. as part of the acquisition agreement to convert Westcoast Energy Inc.'s Preferred Shares series A into debt. The interest on this debt was set at conversion and is subjected to reset. As a surplus is available, debt is drawn down based on whichever series is closest to coming due for reset at time of pay down. The offset to this account is G/L 32203 – Interest on Class B Subordinated Debt.
22005	Long Term Debt – Fortis Inc. Debt advanced to FortisBC Holdings Inc. by Fortis Inc. for a term greater than one year.
22006	Term Interco Debt – Fortis Inc. Debt advanced to FortisBC Holdings Inc. By Fortis Inc.
20100	8.0% Capital Securities The book value of FortisBC Holdings Inc.'s $125.0 million balance of 8.0% Capital Securities with a term to maturity of 40 years issued on April 19, 2000. The Company may elect to defer payments on these securities and settle such deferred payments in either cash or common shares, and has the option to settle principal at maturity through the issuance of common shares. Accordingly, the capital securities have been classified as equity. The securities are exchangeable at the option of the holder on or after April 19, 2010 for common shares of the Company at 90% of the market price, subject to the right of the Company to redeem the securities for cash. Distributions on these securities, net of related income taxes, are deducted from net earnings for the purposes of calculating earnings applicable to common shares.

24901	Capital Lease Obligation This account will contain the balances of the long term obligation arising from an arrangement for leasing property/equipment, which is in substance a purchase agreement with the lessee (FortisBC) being responsible for all expenses of ownership and the lessor providing financing for the purchase.

2.2.2 Other Long Term Liabilities

27102	Other Unearned Income This account will include any unearned income, not categorized elsewhere.
27103	Deferred Gains – LILO This account contains the unrecognized portion of the gain on sale and leaseback of pipeline assets to certain municipalities (currently Kelowna, Vernon, Prince George, Nelson and Creston). These gains are being amortized to income over the 17 year terms of the operating leases, commencing at the time of the sale transactions.
27601	Future Income Taxes This account will include the timing differences between income tax expense recorded for accounting purposes and income tax as reported on the tax returns. Currently, the regulated entities in the FortisBC group use the income taxes payable basis, and therefore do not calculate future income tax liabilities.
27902	Propane Cost Variances This account contains the deferred propane costs for the Revelstoke division and FortisBC Energy Services for Oliver's Landing. This is the difference between what Revelstoke/TES pays for propane vs. the reference price of propane. Amounts are recorded net of tax.
27905	ONA Scholarship Trust Fund Liability This account contains an opening balance of $92,100 which will be used to provide 5 scholarships (2 X $1500 + 3 X $500) annually to members of the Okanagan Nation. The balance will be invested into a one year term, annually. Interest entries are through journal voucher each year. For the payment of the scholarships, entries will be through Accounts Payable.
27907	MEMPR funds This account contains the funds remaining for the benefit of the MEMPR project. $5,155,000 was received from the Ministry of Energy, Mines and Petroleum (MEMPR) in support of LiveSmart BC's energy conservation and efficiency goals. In particular, these funds are focused on the Efficiency Incentive Program - Low-income Household Component. Allocation: $1.5 M to be spent in conjunction with BC Housing; $1.5 M with BC Hydro's low income program and the remaining $2.15 M will fund new low income programs. The program end date is March 31, 2012 or earlier if the funds are spent prior to this date.

3. SHAREHOLDER'S EQUITY

20001	Preferred Shares FortisBC Hodlings Inc.
20501	Common Shares – Par Value $.50/share This account will include the par value for all common shares issued and outstanding. The amount of consideration received from the sale of par value stock in excess of the amount credited to this account will be included in account 20502.
20502	Common Shares – Proceeds above $.50/share This account will include proceeds above the par value for all common shares issued and outstanding. The amount of consideration received up to the par value will be included in account 20501.
20504	Contribution from FortisBC Holdings Inc. Capital contributions from FortisBC Holdings Inc.
21001	Contributed Surplus Primarily related to contributed surplus resulting from Tax Loss Utilization Plans (TLUPs).
21002	Gain on Preferred Shares Purchase This account will contain the amount of consideration received from the repurchase of preferred shares in excess of the amount credited in preferred shares.
21103	Stock Compensation Liability This account tracks the stock compensation liability of FortisBC Holdings Inc. Amounts are expensed to G/L 60414.
21201	Retained Earnings General The balance in this account represents the corporation's unrestricted accumulated undistributed net income (or net loss).
21202	Retained Earnings – Prior Year Adj. Adjustments to retained earnings for items other than earnings. Adjustments would usually be for the retroactive restatement of prior year's income as a result of changes to Generally Accepted Accounting Principles, or corrections of prior year's errors.
35701	Dividends on Common Shares The amounts declared payable from retained earnings as dividends on outstanding common share capital issued by the Company.
35900	Adjustments to Retained Earnings This account will include significant non-recurring transactions relating to prior periods such as litigation settlements and related income taxes applicable to retained earnings adjustments. The records supporting the entries to this account will be kept so that the Company can furnish complete information as to the nature and amount of each transaction. All entries to this account must receive prior commission approval.

4. REVENUES AND COST OF GAS (MARGIN)

4.1 Residential Sales

52001	Rate 1 Residential Revenue from the sale of gas to residential customers (Rate 1) for the Lower Mainland, Inland, Columbia, Ft Nelson and Squamish service areas. Includes billed revenues from ABSU Energy system, and unbilled estimates.
52050	Residential Gas Sales (RGS) Revenue from the sale of gas to residential customers (Rate RGS) for the Vancouver Island service areas. Includes billed revenues from Banner billing system, and unbilled estimates.
52060	Residential Gas Sales (RGS) Revenue from the sale of gas to residential customers (Rate RGS) for the Whistler service areas. Includes billed revenues from Banner billing system, and unbilled estimates.
52081	Residential Propane Sales (SGS2) Revenue from the sale of propane to residential customers (Rate SGS2) for the Whistler service area. Includes billed revenues from Banner billing system, and unbilled estimates.
52090	Residential Propane Sales Revenue from the sale of propane to residential customers for the Inland (Revelstoke) and Squamish service areas. Includes billed revenues from ABSU Energy billing system, and unbilled estimates.
52091	Residential Geothermal Revenue from the sale of geothermal energy to residential customers. This account is for FortisBC Alternative Energy Services only.

4.2 Commercial Sales

52102	Rate 2 Small Commercial Revenue from the sale of gas to small commercial customers (Rate 2) for the Lower Mainland, Inland, Columbia, Ft Nelson and Squamish service areas. Includes billed revenues from ABSU Energy billing system, and unbilled estimates.
52103	Rate 3 Large Commercial Revenue from the sale of gas to large commercial customers (Rate 3) for the Lower Mainland, Inland and Columbia service areas. Includes billed revenues from ABSU Energy system, and unbilled estimates.
52104	Rate 4 Seasonal Revenue from the sale of gas to seasonal commercial customers in the Lower Mainland and Inland service areas. Includes billed revenues from ABSU Energy system, and unbilled estimates.
52150	Small Commercial 1 Gas Sales (SCS1) Revenue from the sale of gas to small commercial customers (Rate SCS1) for Vancouver Island service area. Includes billed revenues from Banner billing system, and unbilled estimates
52151	Small Commercial 2 Gas Sales (SCS2) Revenue from the sale of gas to small commercial customers (Rate SCS2) for the Vancouver Island service area. Includes billed revenues from Banner billing system, and unbilled estimates

52152	Small Commercial 1 Gas Sales (SCS1) Revenue from the sale of gas to small commercial customers (Rate SCS1) for Whistler service area. Includes billed revenues from Banner billing system, and unbilled estimates
52160	Large Commercial 1 Gas Sales (LCS1) Revenue from the sale of gas to large commercial customers (Rate LCS1) for the Vancouver Island service area. Includes billed revenues from Banner billing system, and unbilled estimates
52161	Large Commercial 2 Gas Sales (LCS2) Revenue from the sale of gas to large commercial customers (Rate LCS2) for the Vancouver Island service area. Includes billed revenues from Banner billing system, and unbilled estimates
52162	Large Commercial 3 Gas Sales (LCS3) Revenue from the sale of gas to large commercial customers (Rate LCS3) for the Vancouver Island service area. Includes billed revenues from Banner billing system, and unbilled estimates
52163	High Load Factor Sales (HLF) Revenue from the sale of gas to high load factor (HLF) customers for the Vancouver Island service area. Annual energy consumption must equal or exceed 6,000 GJ per year. The consumer is required to sign a contract for service with FEVI under this Tariff for a minimum of one year. The consumer must demonstrate a monthly coincident peak (average January and February) load factor of greater than 85%
52164	Inverse Load Factor Sales Revenue from the sale of gas to inverse load factor (ILF) customers for the Vancouver Island service area. Annual energy consumption must equal or exceed 6,000 GJ per year. The consumer is required to sign a contract for service with FEVI under this Tariff for a minimum of one year. The contract will specify a maximum daily use (Contract Demand) for the months of November, December, January, February and March. Service under this rate schedule requires daily energy use metering. The Consumer is required to pay the additional cost for a meter capable of measuring daily use.
52165	Apartment Rack Sales (S2, L1, L2) Revenue from the sale of gas to apartment rack customers in rate classes S2, L1 and L2 for the Vancouver Island service area. Rates are negotiated by customers. FEVI currently has three customers in this rate class: CFB Comox, Doman Industries and Natural Gas Vehicles.
52166	Apartment Rack Sales (LCS3) Revenue from the sale of gas to apartment rack customers in rate class LCS3 for the Vancouver Island service area. Annual energy consumption must equal or exceed 6,000 GJ per year. Currently FEVI has no customers in this rate class.
52167	Contract Rate Sales (CRXX) Revenue from the sale of gas on contract rates for the Vancouver Island service area. For rate class S2, apartments' annual energy consumption must equal or exceed 200 GJ per year. For rate class L1, apartments' annual energy consumption must equal or exceed 600 GJ per year. For rate class L2, apartments' annual energy consumption must equal for exceed 2,000 GJ per year.
52168	Large Commercial 1 Gas Sales (LCS1) Revenue from the sale of gas to large commercial customers (Rate LCS1) for the Whistler service area. Includes billed revenues from Banner billing system, and unbilled estimates
52169	Large Commercial 2 Gas Sales (LCS2) Revenue from the sale of gas to large commercial customers (Rate LCS2) for the Whistler service area. Includes billed revenues from Banner billing system, and unbilled estimates

52170	Large Commercial 3 Gas Sales (LCS3) Revenue from the sale of gas to large commercial customers (Rate LCS3) for the Whistler service area. Includes billed revenues from Banner billing system, and unbilled estimates
52180	Small Commercial 1 Propane Sales (SGS1) Revenue from the sale of propane to small commercial customers (Rate SGS1) for the Whistler service area. Includes billed revenues from Banner billing system, and unbilled estimates.
52181	Small Commercial 2 Propane Sales (SGS2) Revenue from the sale of propane to small commercial customers (Rate SGS2) for the Whistler service area. Includes billed revenues from Banner billing system, and unbilled estimates.
52191	Rate 2.1 Small Commercial Sales Revenue from the sale of gas to small commercial customers (Rate 2.1) for the Ft Nelson service area. Includes billed revenues from ABSU Energy billing system, and unbilled estimates.
52192	Rate 2 Small Commercial Propane Sales Revenue from the sale of propane to small commercial customers (Rate 2) for the Inland (Revelstoke) and Squamish service areas. Includes billed revenues from ABSU Energy billing system, and unbilled estimates.
52193	Rate 3 Large Commercial Propane Sales Revenue from the sale of propane to large commercial customers (Rate 3) for the Inland (Revelstoke) service area. Includes billed revenues from ABSU Energy billing system, and unbilled estimates.
52199	Revenue from Marketers Revenue from the sale of gas to core market customers who purchase their gas directly from marketers for the Lower Mainland, Inland, Columbia, Ft Nelson and Squamish service areas. Includes billed revenues from ABSU Energy system, and unbilled estimates.

4.3 Industrial & NGV Sales

52205	Rate 5 Industrial Firm Sales Revenue from the sale of gas to industrial general firm service customers (Rate 5) for the Lower Mainland, Inland and Columbia service areas. Includes billed revenues from ABSU Energy billing system, and unbilled estimates.
52207	Rate 7 Industrial Interruptible Sales Revenue from the sale of gas to industrial interruptible service customers (Rate 7) for the Lower Mainland and Inland service areas. Includes billed revenues from ABSU Energy billing system, and unbilled estimates.
52208	Rate 16 Interruptible LNG Revenue from the sale of LNG to interruptible Rate 16 customers. Includes billed revenues and unbilled estimates.
59001	Rate 6 NGV Station Sales Revenue from the sale of a firm supply of vehicle fuel in the Natural Gas for Vehicles Project. Includes revenues from NGV sold through public service stations. Billings are through the Energy billing system.

4.4 Transportation Sales

57001	Rate 22 Industrial Interruptible Transportation Revenue from the transportation of non-owned gas to large volume industrial interruptible customers (Rate 22) for the Lower Mainland and Inland service areas. Revenues are from ABSU Energy billing system.
57002	Rate 22A Industrial Firm Transportation Revenue from the transportation of non-owned gas to large volume industrial customers (Rate 22A) for the Inland service area. This includes basic, admin, firm demand and firm charges. Revenues are from ABSU Energy billing system.
57003	Rate 22B Industrial Firm Transportation Revenue from the transportation of non-owned gas to large volume industrial customers (Rate 22B) for the Columbia service area. This includes basic, admin, firm demand and firm charges. Revenues are from ABSU Energy billing system.
57004	Rate 25 Large Commercial Firm Transportation Revenue from the transportation of non-owned gas to large volume commercial firm customers (Rate 25) for the Lower Mainland, Inland, Columbia and Ft Nelson service areas. Revenues are from ABSU Energy billing system.
57005	Rate 27 Industrial Interruptible Transportation Revenue from the transportation of non-owned gas to large volume industrial interruptible customers (Rate 27) for the Lower Mainland and Inland service areas. Revenues are from ABSU Energy billing system.
57006	Rate 23 Large Commercial Firm Transportation Revenue from the transportation of non-owned gas to large volume commercial firm customers (Rate 23) for the Lower Mainland, Inland and Columbia service areas. Revenues are from ABSU Energy billing system.
57009	Burrard Thermal Transportation Revenue from the transportation of non-owned gas to the Burrard Thermal generation plant. Revenues are from ABSU Energy billing system.
57012	Fording Coal (Byron Creek) Transportation Revenue from the transportation of non-owned gas to Fording Coal (Byron Creek). Revenues are from ABSU Energy billing system.
57014	Rate 22B Elkview Firm Transportation Revenue from the firm transportation of non-owned gas to Elkview. Revenues are from ABSU Energy billing system.
57015	Rate 22 Bypass Transportation Revenue from the bypass transportation of non-owned gas (Rate 22). Revenues are from ABSU Energy billing system.
57016	Rate 22A Bypass Transportation Revenue from the transportation of non-owned gas to Rate 22A Bypass customers in the Inland service area. Revenues are from ABSU Energy billing system.
57017	Rate 25 Bypass Transportation Revenue from the transportation of non-owned gas to Rate 25 Bypass customers in the Inland service area. Revenues are from ABSU Energy billing system.
57018	Rate 27 Adams Lake Transportation Revenue from the transportation of non-owned gas to Adams Lake. Revenues are from ABSU Energy billing system.

57019	Rate 22 Industrial Firm Transportation Revenue from the industrial firm transportation of non-owned gas (Rate 22). Revenues are from ABSU Energy billing system.
57020	Rate 22A Industrial Interruptible Transportation Revenue from the transportation of non-owned gas to large volume industrial customers (Rate 22A) for the Inland service area. This only includes the interruptible charges. Revenues are from ABSU Energy billing system.
57021	Rate 22B Industrial Interruptible Transportation Revenue from the transportation of non-owned gas to large volume industrial customers (Rate 22B) for the Columbia service area. This only includes the interruptible charges. Revenues are from ABSU Energy billing system.
57022	Rate 22B Elkview Interruptible Transportation Revenue from the interruptible transportation of non-owned gas to Elkview. Revenues are from ABSU Energy billing system.
57023	Rate 26 NGV Transportation Transportation revenue (non commodity) version of rate 6 where a customer can choose a marketer for commodity supply.
57024	Rate 13 Large Commercial Transportation Revenue from the transportation gas to large volume commercial customers (Rate 13) for the Vancouver Island service areas.
57025	This account is used in CRB Billing rate variants which are created to collect quantities and statistical information only. **There will be no revenue or dollar posting attached to the account and it is required to support CRB processing of its quantity only.**
57030	Transportation Service – VI Joint Venture This account will include the monthly toll revenue on 'Vancouver Island Joint Venture' deliveries. The joint venture consists of seven mills: Woodfibre, Harmac, Port Mellon, Powell River, Elk Falls, Alberni, and Crofton. The offset of this account is G/L 14030 – A/R – Joint Venture Transportation.
57031	Transportation Service – BC Hydro This account will include the monthly toll revenue on BC Hydro deliveries. The offset of this account is G/L 14029 – A/R – Hydro Transportation.
57032	Transportation Service – Squamish Toll Revenue This account will include the income arising from the agreement between FEVI and the Provincial Government's Ministry of Energy & Mines to recover the monthly toll revenue on Squamish deliveries. The offset of this account is G/L 14031 – Squamish RSF.
57034	Transportation Service – FEW This G/L will be used for 2009 transportation revenue collected in cost centre 6164 from FEW.

4.5 Other Revenues (Income)

55000	Royalty Income This account will contain the income established by the agreement between FEVI and the Provincial Government's Ministry of Energy & Mines to recover the Weighted Average Wellhead Price (WAWP) on a deemed volume of gas each year. The offset of this account is G/L 14060 – Royalty Receivable.

56001	Late Payment Charges Revenue from late payment charges imposed on customers because of the failure of customers to pay their gas bills on or before the due date. Postings are from customer information system (Banner or Energy).
56101	Connection Charges Company 2000 and 3000 revenue from natural gas connection charges billed to customers through the Order Fulfilment system.
56102	NSF Cheque Charges Company 2000 and 3000 - this account will include NSF (not sufficient funds) cheque charges that have been billed back to customers through the Energy billing system for all service areas.
57904	Wheeling Charge Income – FEVI FortisBC Energy Inc. charges a monthly fee to FortisBC Energy (Vancouver Island) Inc. for pipeline capacity.
57905	SST Collection Commission This account will include monthly commission revenue from the Province of BC for collecting Social Services Tax (PST) from customers.
57907	Other Miscellaneous Revenue In company 2000, the income from the transfer of SAP lease costs to company 6000, and marketing revenues (such as Homeswest).
57909	SCP Monthly Demand Revenue This account captures the monthly demand charges related to the Southern Crossing Pipeline (SCP) billed to BC Hydro and North West Natural through the Energy billing system.
57910	SCP Net Mitigation Revenue This account will include Southern Crossing's net mitigation revenues from third parties for the use of transportation capacity from Yahk to Huntingdon (Southern Crossing Pipeline) not being utilized by the firm's transportation agreement customers.
57911	Other Revenue – GSMIP Records monthly estimates and annual true up of the Gas Supply Mitigation Incentive Plan (GSMIP) income, net of the 10% bonus accrual.
57913	NRB Overhead Recoveries This account captures the recovery of 5% overhead on labour to non-regulated businesses (NRBs) per actual timesheets submitted, per agreement with the BCUC.
57914	EMS Revenues This account captures any Energy Management Services (EMS) revenues earned over and above what is allowed to offset core costs (use 69114 for regular recoveries).
57915	Other revenue – Amortization of CIAC This account captures the other side of CIAC additions per IFRS requirements.
57916	Mt. Hayes LNG Mitigation Revenue This account will include fees that FEI pays to FEVI for using the Mt. Hayes LNG facility in accordance with the terms in the storage agreement between FEI and FEVI.
69810	Loss on Asset Sale Losses on sale of non-regulated assets. Postings are from the asset subsystem.

38101	Service Work – Revenue In company 6000, used to capture service work revenue - alterations, line hits, meter moves, customer call outs, etc. Entries are through order settlement. (See account 38201 for costs)
38201	Service Work – Cost In company 6000, used to capture service work costs - alterations, line hits, meter moves, customer call outs, etc. Entries are through order settlement. (See account 38101 for revenues)
31901	Other income – General This account will include all "other income" items not provided for elsewhere. A CO cost object is not required for entries to this account.
31902	Other Revenue – LILO This account includes the amortization of the unrecognized gains on sale and leaseback of pipeline assets to certain municipalities (currently Kelowna, Vernon, Prince George, Nelson and Creston) over the 17 year term of the operating leases.
31904	Pref. Dividend Income – FortisWest This account will include the 6.75% dividends earned on the Investment in FortisWest.
31905	Other Interest Income This account will include all interest income not provided for elsewhere.
31906	Interest Income – banking For all companies, this account will include interest income on bank balances, temporary investments and other related banking income.
31907	Other Revenue – Biomethane gas This account will include capital related costs of service for the biogas project that are attributable to all FEI customers and Biomethane Variance Account (BVA) cost of service associated with and attributable to customers electing the program. The offsetting GL account is 69129 "Biomethane Cost of Service Allocation". The capital cost of services commences amortization through delivery rates effective January 1, 2012 for 3 years. The account is NOT net of tax. The BVA cost of service is currently recovered through a new commodity rate "BERC".
31908	Other Revenue – NGV This account will include capital related costs of service for the NGV project.

4.6 Margin Stabilization Adjustments

32901	RSAM Margin Adjustment – Fort Nelson Revenue Stabilization Adjustment Mechanism (RSAM) is used as authorized by BCUC Order G-07-03 to mitigate the effect on the Company's earnings of unpredictable and uncontrollable factors that impact volumes sold. This RSAM account accumulates the margin impact of variations in the actual versus forecast volume use for customers rate 1, 2.1, 2.2, and 25 in the Fort Nelson area. The offset to this account is G/L 17927 – Revenue Stabilization Adjustment Mechanism – RSAM.

32902	Earnings Sharing Mechanism The Earnings Sharing Mechanism Account (ESM) was established to provide a 50/50 sharing mechanism between FortisBC Energy Inc. and customers. This account captures 50% of the difference between the "achieved" ROE and the "allowed" BCUC ROE, to be returned to customers in the following year through a rate rider (rider 3). The offset to this account is GL 17982.
32904	Revenue Deficiency Deferral Account (RDDA) FEVI maintains a BCUC approved Revenue Deficiency Deferral Account (RDDA) to accumulate unrecovered costs of providing service to customers or to draw down such costs where earnings exceed an allowed return as approved during the Annual Review process by the BCUC. This account is the result of the 'Vancouver Island Natural Gas Pipeline Agreement' (VINGPA), which expires in 2014, and allows FEVI to earn its allowed rate base earnings. Under the agreement, any surplus earnings for the year must be used to payback the subordinated debt. The RDDA is supported by a series of Promissory Notes Payable to FortisBC Inc. in G/L 22002. The offset to this account is GL 18201
32911	RSAM Margin Adjustment Rate 1 Revenue Stabilization Adjustment Mechanism (RSAM) is used as authorized by BCUC Order G-07-03 to mitigate the effect on the Company's earnings of unpredictable and uncontrollable factors that impact volumes sold. This RSAM accumulates the margin impact of variations in the actual versus forecast volume use for customers in rate 1 in the Lower Mainland, Inland, and Columbia areas as well as FEW. The offset to this account is G/L 17927 – Revenue Stabilization Adjustment Mechanism – RSAM.
32912	RSAM Margin Adjustment Rate 2 Revenue Stabilization Adjustment Mechanism (RSAM) is used as authorized by BCUC Order G-07-03 to mitigate the effect on the Company's earnings of unpredictable and uncontrollable factors that impact volumes sold. This RSAM accumulates the margin impact of variations in the actual versus forecast volume use for customers in rate 2 in the Lower Mainland, Inland, and Columbia areas as well as FEW. The offset to this account is G/L 17927 – Revenue Stabilization Adjustment Mechanism – RSAM.
32913	RSAM Margin Adjustment Rate 3 Revenue Stabilization Adjustment Mechanism (RSAM) is used as authorized by BCUC Order G-07-03 to mitigate the effect on the Company's earnings of unpredictable and uncontrollable factors that impact volumes sold. This RSAM accumulates the margin impact of variations in the actual versus forecast volume use for customers in rate 3 in the Lower Mainland, Inland, and Columbia areas as well as FEW. The offset to this account is G/L 17927 – Revenue Stabilization Adjustment Mechanism – RSAM.
32914	RSAM Margin Adjustment Rate 23 Revenue Stabilization Adjustment Mechanism (RSAM) is used as authorized by BCUC Order G-07-03 to mitigate the effect on the Company's earnings of unpredictable and uncontrollable factors that impact volumes sold. This RSAM accumulates the margin impact of variations in the actual versus forecast volume use for customers in rate 23 in the Lower Mainland, Inland, and Columbia areas. The offset to this account is G/L 17927 – Revenue Stabilization Adjustment Mechanism – RSAM.

32920	FEI 2010 Revenue Surplus Per the 2010/2011 NSP filing, a 2010 revenue surplus was established that must be moved to 2011. The 2010 entry will debit this account and credit deferral account 18529 monthly and will be curved based on budget.
32930	FEI Capital Incentive Mechanism Per the 2010/2011 NSP filing, this amount represents a difference in the regulated vs. finance rate base that needs to be recovered from customers over 2010/2011. The entry will debit 17982-ESM/Capital Incentive Mechanism deferral and credit this account.

4.7 Cost of Gas

62301	Cost of Gas – Rate 1 Residential Cost of gas recorded for Rate 1 Residential customers for the Lower Mainland, Inland, Columbia, Ft Nelson and Squamish service areas. Cost of gas is calculated by multiplying the calendar month sales volume by the BCUC approved gas cost recovery rates; the offset accounts are 17926 for the Midstream cost recovery and 18137 for the Commodity cost recovery and 18174 for Biomethane Variance Account.
62302	Cost of Gas – Rate 2 Commercial Cost of gas recorded for Rate 2 Small Commercial customers for the Lower Mainland, Inland, Columbia, Ft Nelson and Squamish service areas. Cost of gas is calculated by multiplying the calendar month sales volume by the BCUC approved gas cost recovery rates; the offset accounts are 17926 for the Midstream cost recovery and 18137 for the Commodity cost recovery.
62303	Cost of Gas – Rate 3 Commercial Cost of gas recorded for Rate 3 Large Commercial customers for the Lower Mainland, Inland and Columbia service areas. Cost of gas is calculated by multiplying the calendar month sales volume by the BCUC approved gas cost recovery rates; the offset accounts are 17926 for the Midstream cost recovery and 18137 for the Commodity cost recovery.
62304	Cost of Gas – Rate 4 Seasonal Cost of gas recorded for Rate 4 Seasonal customers for the Lower Mainland and Inland service areas. Cost of gas is calculated by multiplying the calendar month sales volume by the BCUC approved gas cost recovery rates; the offset accounts are 17926 for the Midstream cost recovery and 18137 for the Commodity cost recovery.
62305	Cost of Gas – Rate 5 Industrial Firm Cost of gas recorded for Rate 5 Industrial Firm Service customers for the Lower Mainland, Inland and Columbia service areas. Cost of gas is calculated by multiplying the calendar month sales volume by the BCUC approved gas cost recovery rates; the offset accounts are 17926 for the Midstream cost recovery and 18137 for the Commodity cost recovery.
62308	Cost of Gas – Rate 6 NGV Stations Cost of gas recorded for Rate 6 vehicle fuel for the Natural Gas for Vehicles Project. Cost of gas is calculated by multiplying the calendar month sales volume by the BCUC approved gas cost recovery rates; the offset accounts are 17926 for the Midstream cost recovery and 18137 for the Commodity cost recovery.
62310	Cost of Gas – Rate 7 Industrial Interruptible Cost of gas recorded for Rate 7 Industrial Interruptible Service customers for the Lower Mainland and Inland service areas. Cost of gas is calculated by multiplying the calendar month sales volume by the BCUC approved gas cost recovery rates; the offset accounts are 17926 for the Midstream cost recovery and 18137 for the Commodity cost recovery.

62314	Cost of Gas – Rate 22 Balancing/Backstopping This account includes the cost of Transportation Rate 22 Balancing and Backstopping gas for the Lower Mainland and Inland service areas. The offset account is 17926 MCRA.
62315	Cost of Gas – Rate 22 UOR/AOR This account includes the cost of Transportation Rate 22 Unauthorized Over Run Gas (UOR) and Authorized Over Run Gas (AOR) for the Lower Mainland and Inland service areas. The offset account is 17926 MCRA.
62316	Cost of Gas – Rate 23 Balancing/Backstopping/UOR/AOR This account includes the cost of Transportation Rate 23 Balancing and Backstopping Gas, Unauthorized Over Run Gas (UOR) and Authorized Over Run Gas (AOR) for the Lower Mainland and Inland service areas. The offset account is 17926 MCRA.
62317	Cost of Gas – Rate 25 Balancing/Backstopping/UOR/AOR This account includes the cost of Transportation Rate 25 Balancing and Backstopping Gas, Unauthorized Over Run Gas (UOR) and Authorized Over Run Gas (AOR) for the Lower Mainland and Inland service areas. The offset account is 17926 MCRA.
62318	Cost of Gas – Rate 27 Balancing/Backstopping/UOR/AOR This account includes the cost of Transportation Rate 27 Balancing and Backstopping Gas, Unauthorized Over Run Gas (UOR) and Authorized Over Run Gas (AOR) for the Lower Mainland and Inland service areas. The offset account is 17926 MCRA.
62319	Cost of Gas – Squamish UAF Unaccounted for gas (UAF) in company 3000 – difference between physical gas inventory and calculated gas inventory. Entries are through journal voucher each month.
62323	Cost of Gas – Transportation Service UAF This cost element will contain the transportation service unaccounted for (UAF) balance based on transportation monthly volumes UAF multiplied by UAF percentages for each area times a forecast unit cost for UAF. Entries are through journal voucher, with the offset to 17926 Midstream Cost Recovery Account.
62324	Cost of Gas – Propane Cost of propane sold to residential and commercial customers in the Inland (Revelstoke) and Squamish service areas. Cost of propane is calculated by multiplying the calendar month sales volume by the allowed unit propane cost. For Revelstoke, the difference between the actual cost of propane and the allowed cost of propane is credited to 27902; in Squamish the difference is credited to 17914.
62325	Cost of Gas Adjustment In companies 6000 and 6100, captures the cost of gas (6000) or propane (6100), calculated by multiplying the calendar month sales volume by the actual average unit gas cost or propane cost. In company 3000, captures the Furry Creek cost of propane sales and the UAF (unaccounted for) propane due to wastage or normal loss.
62326	Gas Cost Variance Account (GCVA) In company 6000, this account will contain the difference between actual and budgeted gas cost on a royalty adjusted basis. The offset of this account is 18132 – Deferral – Gas Cost Variance Account.
62327	GCVA Amortization For company 6000, the amortization of the prior year's Gas Cost Variance Account (GCVA) as allowed by the regulator. Entries are through recurring journal entry.

62328	Company Use Fuel and Gas This account includes charges to company 6000 for gas consumed in the administration and operating areas (compressors, station heaters and company use gas). The offset of this account is G/L 64104 – Facilities - Company Use Gas
62329	Cost of Gas – Rate 23 Balancing/Backstopping/UOR/AOR (Cost of Gas – Rate 23 UOR/AOR) This account includes the cost of Transportation Rate 23 Balancing and Backstopping Gas, Unauthorized Over Run Gas (UOR) and Authorized Over Run Gas (AOR) for the Lower Mainland and Inland service areas. The offset account is 17926 MCRA.
62406	Cost of Service Credits-Supplier Refunds Used to record various credits received from suppliers/producers. This includes the sale of by-products of gas to ConocoPhillips and Duke and a transportation refund from Paramount from March through October. This account settles to 17926 MCRA.
62410	Gas Brokerage & Other Fees Monthly brokerage fees posted through Accounts Payable. Gas Supply uses brokers for the purchase/sale of gas. This account will settle to 17926 MCRA.
62413	Imbalance Chg WEI & Transportation This account will include the difference between Westcoast Energy Pipeline metered and authorized deliveries and also the difference between transportation customers receipts and deliveries. Entries are through journal entry; the account will be adjusted monthly to reflect the most current balance available. The offset of this account is 25127 – Imbalance-Gas and the entries to this account settle to 17926 MCRA.
62414	Company Use Fuel & Gas This account includes credit entries to MCRA to offset the charges to company 2000 for gas consumed in the administration and operating areas (compressors, station heaters and company use gas). The offset of this account is G/L 64104 – Facilities - Company Use Gas and the entries to this account settle to the 17926 MCRA.
62415	Hedging Contracts To record hedging gains and losses of commodity derivative transactions, and also the mark-to-market value of ineffective hedges not designated for hedge accounting (as per AcG-13 Hedge Accounting Guidelines).
62416	Ft Nelson Commodity (was Base Commodity Charges) To record commodity purchases for Fort Nelson. This account will settle to Fort Nelson GCRA (17926 – order 500131).
62417	Marketer Commodity (was Non-Base Commodity) To record commodity purchases from marketers for supply to marketer customers. This account will settle to 18137.
62433	Commodity – Biogas/Biomethane To record biogas / biomethane purchases from various suppliers.

62501	GCRA – Gas Moved to Inventory The cost of gas injected into inventory at any of the underground storage facilities (Mist, LNG, Carbon, Aitken Creek, etc.). Includes the commodity price of gas as well as all tolls and fees associated with injection. This account will settle to 17926 MCRA.
62502	GCRA – Gas Moved from Inventory The cost of gas withdrawn from inventory at any of the underground storage facilities (Mist, LNG, Carbon, Aitken Creek, etc.). The gas is withdrawn from storage at the weighted average cost of the gas currently held in storage. This account will settle to 17926 MCRA.
62601	GCRA Offset – Rate 1 Offset to 62301 – Cost of Gas-Rate 1 Residential used to book Rate 1 cost of gas recovery to 17926 MCRA, 18147 CCRA or 18174 for BVA..
62602	GCRA Offset – Rate 2 Offset to 62302 – Cost of Gas-Rate 2 Commercial used to book Rate 2 cost of gas recovery to 17926 MCRA or 18147 CCRA.
62603	GCRA Offset – Rate 3 Offset to 62303 – Cost of Gas-Rate 3 Commercial used to book Rate 3 cost of gas recovery to 17926 MCRA or 18147 CCRA.
62604	GCRA Offset – Rate 4 Offset to 62304 – Cost of Gas-Rate 4 Seasonal used to book Rate 4 cost of gas recovery to 17926 MCRA or 18147 CCRA.
62605	GCRA Offset – Rate 5 Offset to 62305 – Cost of Gas-Rate 5 Industrial Firm used to book Rate 5 cost of gas recovery to 17926 MCRA or 18147 CCRA.
62608	GCRA Offset – Rate 6 Offset to 62308 – Cost of Gas-Rate 6 NGV Stations used to book Rate 6 cost of gas recovery to 17926 MCRA or 18147 CCRA.
62610	GCRA Offset – Rate 7 Offset to 62110 – Cost of Gas-Rate 7 Industrial Interruptible used to book Rate 7 cost of gas recovery to 17926 MCRA or 18147 CCRA.
62614	GCRA Offset – Rate 22 Balancing & Backstopping Offset to 62314 – Cost of Gas-Rate 22 Balancing/Backstopping used to book Rate 22 balancing and backstopping to 17926 MCRA.
62617	GCRA Offset – Rate 25 UOR/AOR Offset to 62317 – Cost of Gas-Rate 25 UOR/AOR used to book Rate 25 balancing, backstopping, UOR and AOR to 17926 MCRA.
62618	GCRA Offset – Rate 27 UOR/AOR Offset to 62318 – Cost of Gas-Rate 27 UOR/AOR used to book Rate 27 balancing, backstopping, UOR and AOR to 17926 MCRA.
62623	GCRA Offset – Transportation Service UAF Offset to 62323 – Cost of Gas-Transportation Service UAFused to book Transportation UAF to 17926 MCRA.
62626	Marketer Balancing & Backstopping

62627	MCRA/CCRA Gas Lost Billable For all companies, this account records the recoveries related to the gas lost amounts billed to third-parties for damages to the utility's pipelines. Gas lost amounts are calculated and billed for damage incidents where the volumes of gas lost are considered material, and the amounts recovered reduce the costs borne by Core customers.
62628	MCRA Recovery – Rate 23 Bal/Back/UOR/AOR (GCRA Offset – Rate 23 UOR/AOR) Offset to 62329 – Cost of Gas-Rate 23 UOR/AOR used to book Rate 23 balancing, backstopping, unauthorized overruns (UOR) and authorized overruns (AOR) to 17926 MCRA.
62701	Off System Sales Purchases This account includes commodity purchases settled to MCRA account 17926. The offset of this account is G/L 25125 – Gas Purchase Cost Liability.
62702	Off System Sales – Capacity Release This account reflects the cost of gas transported on available pipeline capacity for an incremental fee; and it is included in the Gas Supply Mitigation Incentive Program (GSMIP).
62703	Off System Sales – GSMIP This account includes the cost of gas supply transactions that relate to the Gas Supply Mitigation Incentive Program (GSMIP) including commodity gas sales, storage or transportation demand fees.
62704	Off System Sales – Non GSMIP This account includes the cost of gas supply transactions that do not relate to the Gas Supply Mitigation Incentive Program (GSMIP) including commodity gas sales, storage or transportation demand fees.
62706	GCRA offset – propane Cost of Propane in FortisBC Energy Services recovery to 18137 GCRA (Sun Peaks) or 27902 GCRA (Oliver's Landing).
62750	MCRA Recovery – Balancing Gas The sale of gas to Rate 10 Large Volume Interruptible Service customers for the Lower Mainland, Inland and Columbia service areas, billed through the Energy system and posted by ABSU. This account settles to 17926 MCRA.
62751	MCRA Recovery – Rate 14A The sale of gas to Rate 14A Term and Spot Gas Sales customers for the Lower Mainland, Inland and Columbia service areas, billed through the Energy system and posted by ABSU. This account settles to 17926 MCRA.
62754	BVA Recovery 11B This account is used for Rate 11B contracts, which are customers who purchase biomethane gas from FortisBC at the BERC rate. These customers are not monthly billed but purchase biomethane gas on occasion.
62795	Stable Rate Volume Variance to MCRA This account includes the volume variance of stable rate gas purchases to gas sales for the month transferred to the MCRA account 17926 at the average commodity cost of sale.

62796	Marketer Volume Variance to MCRA This account includes the volume and price variance of marketer gas purchases to gas sales for the month transferred to the MCRA account 17926.
62797	Foreign Exchange Gas Purchases This account includes the foreign exchange gain/loss transferred to the MCRA account 17926 and CCRA account 18137 which occurs as a result of the US dollar sales and purchases and the buying and selling of US dollars, related to the purchase and sale of gas.
62798	CCRA Volume Variance to MCRA This account includes the volume variance balances between CCRA gas purchases to gas sales for the month transferred to the MCRA account 17926 at the average cost of gas.
62801	Rider 6 – Rate 1 Rider 6 charged or recovered for midstream cost reconciliation account (MCRA – 17926). Amounts are calculated as Rate 1's consumption billed in volumes (GJs) multiplied by rider rate. Entry is through journal voucher offset to 17926.
62802	Rider 6 – Rate 2 Rider 6 charged or recovered for midstream cost reconciliation account (MCRA – 17926). Amounts are calculated as Rate 2's consumption billed in volumes (GJs) multiplied by rider rate. Entry is through journal voucher offset to 17926.
62803	Rider 6 – Rate 3 Rider 6 charged or recovered for midstream cost reconciliation account (MCRA – 17926). Amounts are calculated as Rate 3's consumption billed in volumes (GJs) multiplied by rider rate. Entry is through journal voucher offset to 17926.
62804	Rider 6 – Rate 4 Rider 6 charged or recovered for midstream cost reconciliation account (MCRA – 17926). Amounts are calculated as Rate 4's consumption billed in volumes (GJs) multiplied by rider rate. Entry is through journal voucher offset to 17926.
62805	Rider 6 – Rate 5 Rider 6 charged or recovered for midstream cost reconciliation account (MCRA – 17926). Amounts are calculated as Rate 5's consumption billed in volumes (GJs) multiplied by rider rate. Entry is through journal voucher offset to 17926.
62808	Rider 6 – Rate 6 Rider 6 charged or recovered for midstream cost reconciliation account (MCRA – 17926). Amounts are calculated as Rate 6's consumption billed in volumes (GJs) multiplied by rider rate. Entry is through journal voucher offset to 17926.
62811	Rider 6 – Interest Drawdown Rider 6 interest drawdown is a percentage of the rider 6 charged or given back to the customers which draws down the deferral account 17973 – Deferred Interest on MCRA/CCRA. The percentage is determined by Regulatory/Finance each year. 2.5% for 2006.
69912	GCRA Settlement Captures the settlement of orders to the 17926 MCRA and 18137 CCRA accounts. This account will reduce the total of accounts 62501 to 62902 to zero after settlement is run each month end.

5. COST ELEMENTS

5.1 Salaries – Management and Exempt (M&E)

60100	Retiring Allowance – M&E Retiring allowances paid to Management and Exempt employees are posted to this account from the SAP payroll system. Any retiring allowances that have been accrued in previous periods will be removed from this expense account through journal entry and charged to the liability account 25119.
60101	Salaries – M&E Regular salary earnings of Management and Exempt employees including salaries for dependent contractors, posted from the SAP payroll system.
60102	Paid Absences – M&E Includes statutory holidays, sick leave, and other leaves of absence with pay, as well as pay in lieu of statutory holidays for Management and Exempt employees, posted from the SAP payroll system.
60103	Overtime – M&E Paid overtime for Management and Exempt employees for time worked in excess of the normal hours of work, posted from the SAP payroll system.
60104	Salary Premiums – M&E Premiums and allowances paid to Management and Exempt employees, posted from the SAP payroll system. Account includes bonuses, housing allowance, car allowance, first aid allowance, but excludes gainsharing, MIP, EIP and GSMIP payouts, which are all posted to account 25119 to offset amounts accrued in prior periods.
60108	Salaries – Time Off Taken – M&E Time off taken reflects current annual vacation and accumulated days off (ADOs) that have been taken by Management and Exempt employees, posted from the SAP payroll system.
60109	Salary – Time Off Earned – M&E Time off earned reflects current year entitlements for annual vacation and ADOs not used by year end by Management and Exempt employees. This cost element balance represents the annual cost of timebanks charged to the cost centre through journal entry.
60401	Employee Incentive Plans – M&E Employee Incentive Plan accruals for Management & Exempt employees. Accruals are through journal entry based on 1/12th of the estimated annual expense each month. Amounts are trued up at year-end based on the most recent estimates from Human Resources.
60503	Salary Adjustment – M&E Salary adjustments recorded against cost centres or internal orders. Includes salary cost adjustments required at the cost centre level to resources available as well as adjustments between internal orders. Includes recoveries from third parties. Entries are through journal voucher.
69899	Transfer Salaries to Subs Cost element is used to transfer salaries between companies within the FortisBC group through journal entry. The entry is to credit this cost element and charge the intercompany account.

5.2 Salaries – COPE

60110	Retiring Allowances – COPE Retiring allowances paid to COPE employees are posted to this account from the SAP payroll system. Any retiring allowances that have been accrued in previous periods will be removed from this expense account through journal entry and charged to the liability account 25119.
60111	Salaries – COPE Regular salary earnings of regular full-time and part-time COPE employees including salaries for dependent contractors and retroactive salary increases made upon conclusion of negotiations for a new COPE agreement, posted from the SAP payroll system.
60112	Paid Absences – COPE Includes statutory holidays, sick leave, and other leaves of absence with pay, as well as pay in lieu of statutory holidays for COPE employees, posted from the SAP payroll system.
60113	Overtime – COPE Paid or banked overtime at 200% for COPE employees for time worked in excess of the normal hours of work, posted from the SAP payroll system
60114	Salary Premiums – COPE Premiums and allowances paid to COPE employees, posted from the SAP payroll system. Account includes upgroupings, shift premiums, AV differential and first aid allowances, but excludes annual incentive payouts, which are posted to account 25119 to offset amounts accrued in prior periods.
60115	Salaries & Benefits – COPE temporary Regular earnings and benefits of part-time temporary COPE employees, including pay in lieu of benefits, posted from the SAP payroll system.
60118	Salary – Time Off Taken – COPE Time off taken reflects current annual vacation and accumulated days off (ADOs) that have been taken by COPE employees, posted from the SAP payroll system.
60119	Salary – Time Off Earned – COPE Time off earned reflects current year entitlements for annual vacation and ADOs not used by year end by COPE employees. This cost element balance represents the annual cost of timebanks charged to the cost centre through journal entry.
60402	Employee Incentive Plans – COPE Employee Incentive Plan accruals for COPE employees. Accruals are through journal entry based on 1/12th of the estimated annual expense each month. Amounts are trued up at year-end based on the most recent estimates from Human Resources.
60404	Other Premiums – COPE COPE premiums recorded against internal orders, usually through journal entry.
60502	Salary Adjustment - COPE Salary adjustments recorded to cost centres or internal orders. Includes salary adjustments required at the cost centre level to resources available as well as adjustments between internal orders. Includes recoveries from third parties. Entries are through journal voucher.
60504	CS Salary Adjustment - COPE Salary adjustments recorded to cost centres or internal orders. Includes salary adjustments required at the cost centre level to resources available as well as adjustments between internal orders. Includes recoveries from third parties. Entries are through journal voucher.

60507	Salary Adjustment – CS COPE (Salary Adjustment – OPEIU) Salary adjustments recorded to cost centres or internal orders. Includes salary adjustments required at the cost centre level to resources available as well as adjustments between internal orders. Includes recoveries from third parties. Entries are through journal voucher.

5.3 Wages – IBEW

60120	Retiring Allowances – IBEW Retiring allowances paid to IBEW employees are posted to this account from the SAP payroll system. Any retiring allowances that have been accrued in previous periods will be removed from this expense account through journal entry and charged to the liability account 25119
60121	Wages – IBEW Regular wages of all IBEW employees (FTR, PTR, FTT, PTT), top ups of WCB and LTD payments, shorter work year leave (swyl) payments, and retroactive wage increases made upon conclusion of negotiations for a new IBEW agreement, posted from the SAP payroll system.
60122	Paid Absences – IBEW Includes statutory holidays, sick leave, rest time and other leaves of absence with pay for IBEW employees, posted from the SAP payroll system.
60123	Overtime – IBEW Paid or banked overtime at 100% or 200% for IBEW employees for time worked in excess of the normal hours of work, posted from the SAP payroll system
60124	Wage Premiums – IBEW Premiums and allowances paid to IBEW employees, posted from the SAP payroll system. Account includes standby duty on weekends and evenings as defined in the IBEW agreements, first aid allowance paid to employees with a valid industrial first aid certificate, and amounts paid for high time, shift premium, statutory premium, crew premium, helicopter premium.
60128	Wages – Time Off Taken – IBEW Time off taken reflects current annual vacation and shorter work year leave (swyl) that has been taken by IBEW employees, posted from the SAP payroll system.
60129	Wages – Time Off Earned – IBEW Time off earned reflects current year entitlements for annual vacation and shorter work year leave (swyl) not used by year end by IBEW employees. This cost element balance represents the annual cost of timebanks charged to the cost centre through journal entry.
60403	Employee Incentive Plans – IBEW Employee Incentive Plan accruals for IBEW employees. Accruals are through journal entry based on 1/12th of the estimated annual expense each month. Amounts are trued up at year-end based on the most recent estimates from Human Resources.
60405	Other Premiums – IBEW IBEW premiums recorded against internal orders, usually through journal entry.
60501	Wage Adjustment – IBEW Wage adjustments recorded to cost centres and internal orders. Includes wage adjustments at the cost centre level to resources available as well as adjustments between internal orders. Includes recoveries from third parties. Entries are through journal voucher.

60130	Retiring Allowances – CS (Customer Service) COPE Retiring allowances paid to COPE employees are posted to this account from the SAP payroll system. Any retiring allowances that have been accrued in previous periods will be removed from this expense account through journal entry and charged to the liability account 25119.
60131	Salaries – CS COPE Regular salary earnings of regular full-time and part-time COPE employees including salaries for dependent contractors and retroactive salary increases made upon conclusion of negotiations for a new COPE agreement, posted from the SAP payroll system.
60132	Paid Absences – CS COPE Includes statutory holidays, sick leave, and other leaves of absence with pay, as well as pay in lieu of statutory holidays for COPE employees, posted from the SAP payroll system.
60133	Overtime – CS COPE Paid or banked overtime at 200% for COPE employees for time worked in excess of the normal hours of work, posted from the SAP payroll system
60134	Salary Premiums – CS COPE Premiums and allowances paid to COPE employees, posted from the SAP payroll system. Account includes upgroupings, shift premiums, AV differential and first aid allowances, but excludes annual incentive payouts, which are posted to account 25119 to offset amounts accrued in prior periods.
60135	Salaries & Benefits – CS COPE temporary Regular earnings and benefits of part-time temporary COPE employees, including pay in lieu of benefits, posted from the SAP payroll system.
60138	Salary – Time Off Taken – CS COPE Time off taken reflects current annual vacation and accumulated days off (ADOs) that have been taken by COPE employees, posted from the SAP payroll system.
60139	Salary – Time Off Earned – CS COPE Time off earned reflects current year entitlements for annual vacation and ADOs not used by year end by COPE employees. This cost element balance represents the annual cost of timebanks charged to the cost centre through journal entry.

5.4 Benefits – M&E

60200	M&E Pension – Defined Benefit To record the defined benefit pension costs for Management & Exempt employees. Costs are accrued to estimates supplied by the Company's actuaries; for company 2000, any amounts in excess of that allowed by the BCUC are deferred to GL 17946. Expensed amounts are accrued to GL 25152.
60201	M&E Pension – Defined Contribution To record the pension contribution for Management & Exempt employees on the defined contribution pension plan. All M&E contributions are posted from the SAP payroll system; the defined benefit contributions are adjusted out of this account through journal entry. Expensed amounts are accrued to GL 25153.
60202	M&E (Retirees only) Medical Plan To record the cost of providing Medical Services Plan (MSP) coverage for retirees (M&E is included in cost element 60218 Flex Benefits). MSP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25141.

60203	M&E Canada Pension Plan To record the Company's share of Canada Pension Plan (CPP) contributions for M&E employees. CPP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25140.
60204	M&E Employment Insurance To record the Company's share of Employment Insurance (EI) contributions for M&E employees. EI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25139.
60205	M&E (Retirees only) Group Life Insurance To record the cost of providing Group Life Insurance (GLI) coverage for retirees (M&E is included in cost element 60218 Flex Benefits). GLI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25148.
60207	M&E Long Term Disability Top Up Supplemental benefit granted to long term sick leave M&E employees, calculated and expensed each month by the SAP payroll system.
60208	M&E Workers' Compensation To record the cost of Workers' Compensation Board (WCB) contributions for M&E employees. WCB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25132.
60209	M&E (Retirees only) Extended Health To record the cost of providing Extended Health Benefits (EHB) coverage for retirees (M&E is included in cost element 60218 Flex Benefits). EHB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25143.
60210	M&E (Retirees only) Dental To record the cost of providing Dental coverage for retirees (M&E is included in cost element 60218 Flex Benefits). Dental is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25142.
60211	M&E Benefit Program Costs Cost of administration and consultation to support the management and exempt health programs, including the costs of the employee assistance program.
60212	M&E Flex Benefit Expense To record the cost of providing benefits under the M&E flex benefits program, starting in 2005. Benefits covered under this program include medical, dental, extended health, long-term disability, group life, optional life, AD&D, business travel accident insurance, health spending account, additional days off purchased, taxable cash, in various combinations as selected by employees. Accruals are made through the SAP payroll system based on benefit dollars allocated to each employee, with the offsetting liability to GL 25147.
60215	M&E Benefits Adjustments To record miscellaneous benefits adjustments for M&E employees not captured elsewhere.
60219	M&E ESP - Employee Savings Plan To record company costs of the employee savings plan for M&E employees. Postings are from the SAP payroll system.
60222	M&E Empl Share Purchase 10% Top-up This account has been created to record the company cost for the 10% top up on Share purchase and dividend re-investment for Fortis Employee Share Purchase Plan for M&E employees.

60223	CS COPE Pension – Defined Benefit (CS COPE Pension Contributions) To record the pension contribution for CS COPE employees on the defined benefit pension plan. All CS COPE contributions are posted from the SAP payroll system; each quarter the contributions are adjusted to one-quarter of the annual defined benefit expense as calculated by the Company's actuaries. Amounts are accrued to GL 25149.
60224	CS COPE Medical Plan To record the cost of providing Medical Services Plan (MSP) coverage for CS COPE employees. MSP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25141.
60225	M&E OPEB These G/Ls are required to record the cost of Other Post Employment Benefits for current employees (new benefit loading effective 2010).
60226	CS COPE Canada Pension Plan To record the Company's share of Canada Pension Plan (CPP) contributions for CS COPE employees. CPP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25140.
60227	CS COPE Employment Insurance To record the Company's share of Employment Insurance (EI) contributions for CS COPE employees. EI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25139.
60228	CS COPE Group Life Insurance To record the cost of providing Group Life Insurance (GLI) coverage for CS COPE employees. GLI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25148.

5.5 Benefits – COPE

60231	COPE Pension – Defined Benefit To record the pension contribution for COPE employees on the defined benefit pension plan. All COPE contributions are posted from the SAP payroll system; each quarter the contributions are adjusted to one-quarter of the annual defined benefit expense as calculated by the Company's actuaries. Amounts are accrued to GL 25149.
60232	COPE Medical Plan To record the cost of providing Medical Services Plan (MSP) coverage for COPE employees. MSP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25141.
60233	COPE Canada Pension Plan To record the Company's share of Canada Pension Plan (CPP) contributions for COPE employees. CPP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25140.
60234	COPE Employment Insurance To record the Company's share of Employment Insurance (EI) contributions for COPE employees. EI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25139.

60235	COPE Group Life Insurance To record the cost of providing Group Life Insurance (GLI) coverage for COPE employees. GLI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25148.
60236	COPE Long Term Disability To record the cost of providing Long Term Disability (LTD) coverage for COPE employees. LTD is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25144.
60237	COPE Long Term Disability Top Up Supplemental benefit granted to long term sick leave COPE employees, calculated and expensed each month by the SAP payroll system.
60238	COPE Workers' Compensation To record the cost of Workers' Compensation Board (WCB) contributions for COPE employees. WCB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25132.
60239	COPE Extended Health Benefits To record the cost of providing Extended Health Benefits (EHB) coverage for COPE employees. EHB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25143.
60240	COPE Dental To record the cost of providing Dental coverage for COPE employees. Dental is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25142.
60241	COPE Empl Share Purchase 10% Top-up This account has been created to record the company cost for the 10% top up on Share purchase and dividend re-investment for Fortis Employee Share Purchase Plan for COPE employees.
60245	COPE Benefits Adjustments To record miscellaneous benefits adjustments for COPE employees not captured elsewhere.
60246	COPE ESP - Employee Savings Plan To record company costs of the employee savings plan for COPE employees. Postings are from the SAP payroll system.
60247	COPE Flex Benefit To record the cost of providing benefits under the COPE flex benefits program, starting in 2008. Benefits covered under this program include medical, dental, extended health, long-term disability, group life, optional life, AD&D, business travel accident insurance, health spending account, additional days off purchased, taxable cash, in various combinations as selected by employees. Accruals are made through the SAP payroll system based on benefit dollars allocated to each employee, with the offsetting liability to GL 25191.
60248	CS (Customer Service) COPE Long Term Disability To record the cost of providing Long Term Disability (LTD) coverage for CS COPE employees. LTD is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25144.
60251	CS COPE Fringe Benefits

60252	CS COPE Workers' Compensation To record the cost of Workers' Compensation Board (WCB) contributions for CS COPE employees. WCB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25132.
60253	CS COPE Extended Health Benefits To record the cost of providing Extended Health Benefits (EHB) coverage for CS COPE employees. EHB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25143.
60254	CS COPE Dental To record the cost of providing Dental coverage for CS COPE employees. Dental is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25142.
60255	COPE OPEB These G/Ls are required to record the cost of Other Post Employment Benefits for current employees (new benefit loading effective 2010).
60256	CS COPE Empl Share Purchase 10% Top-up This account has been created to record the company cost for the 10% top up on Share purchase and dividend re-investment for Fortis Employee Share Purchase Plan for CS COPE employees.
60257	CS COPE Benefits Adjustments (Benefits Adjustments) To record miscellaneous benefits adjustments for CS COPE employees not captured elsewhere.
60258	CS COPE ESP Employee Savings Plan To record company costs of the employee savings plan for CS COPE employees. Postings are from the SAP payroll system.
60259	CS COPE Flex Benefit To record the cost of providing benefits under the CS COPE flex benefits program, starting in 2008. Benefits covered under this program include medical, dental, extended health, long-term disability, group life, optional life, AD&D, business travel accident insurance, health spending account, additional days off purchased, taxable cash, in various combinations as selected by employees. Accruals are made through the SAP payroll system based on benefit dollars allocated to each employee, with the offsetting liability to GL 25191.

5.6 Benefits – IBEW

60261	IBEW Pension – Defined Benefit To record the pension contribution for IBEW employees on the defined benefit pension plan. All IBEW contributions are posted from the SAP payroll system; each quarter the contributions are adjusted to one-quarter of the annual defined benefit expense as calculated by the Company's actuaries. Amounts expensed are accrued to GL 25149.
60262	IBEW Medical Plan To record the cost of providing Medical Services Plan (MSP) coverage for IBEW employees. MSP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25141.
60263	IBEW Canada Pension Plan To record the Company's share of Canada Pension Plan (CPP) contributions for IBEW employees. CPP is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25140.

60264	IBEW Employment Insurance To record the Company's share of Employment Insurance (EI) contributions for IBEW employees. EI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25139.
60265	IBEW Group Life Insurance To record the cost of providing Group Life Insurance (GLI) coverage for IBEW employees. GLI is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25148.
60266	IBEW Long Term Disability To record the cost of providing Long Term Disability (LTD) coverage for IBEW employees. LTD is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25144.
60267	IBEW Long Term Disability Top Up Supplemental benefit granted to long term sick leave COPE employees, calculated and expensed each month by the SAP payroll system.
60268	IBEW Workers' Compensation To record the cost of Workers' Compensation Board (WCB) contributions for IBEW employees. WCB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25132.
60269	IBEW Extended Health Benefits To record the cost of providing Extended Health Benefits (EHB) coverage for IBEW employees. EHB is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25143.
60270	IBEW Dental Plan To record the cost of providing Dental coverage for IBEW employees. Dental is accrued as part of each payroll run based on rates configured in SAP payroll system to GL 25142.
60271	IBEW Flex Benefit To record the cost of providing benefits under the IBEW flex benefits program, starting in 2007. Benefits covered under this program include medical, dental, extended health, long-term disability, group life, optional life, AD&D, business travel accident insurance, health spending account, additional days off purchased, taxable cash, in various combinations as selected by employees. Accruals are made through the SAP payroll system based on benefit dollars allocated to each employee, with the offsetting liability to GL 25189.
60275	IBEW Benefits Adjustments To record miscellaneous benefits adjustments for IBEW employees not captured elsewhere.
60276	IBEW Empl Share Purchase 10% Top-up This account has been created to record the company cost for the 10% top up on Share purchase and dividend re-investment for Fortis Employee Share Purchase Plan for IBEW employees.
60277	IBEW OPEB These G/Ls are required to record the cost of Other Post Employment Benefits for current employees (new benefit loading effective 2010).
60278	IBEW ESP Employee Savings Plan To record company costs of the employee savings plan for IBEW employees. Postings are from the SAP payroll system.

5.7 Other Benefit Costs

60409	Other Post Employment Benefits To record the other post employment benefit expense for all employees. Costs are accrued to estimates supplied by the Company's actuaries; for company 6000, any amounts in excess of that allowed by the BCUC are expensed to GL 60415.
60410	Employee Incentive Plans – CS (Customer Service) COPE (Gainsharing – CS COPE) Employee incentive Plan accruals for CS COPE employees. Accruals are through journal entry based on 1/12th of the estimated annual expense each month. Amounts are trued up at year-end based on the most recent estimates from Human Resources.
60414	Stock Compensation Expense To record the estimated stock compensation expense for the quarter, calculated and booked by Finance through journal voucher. Liabilities are recorded through intercompany payable to FortisBC Holdings Inc.; in FortisBC Holdings Inc., the offset is G/L 21103 – Stock Compensation Liability.
60298	Benefits Adjustment Year End Miscellaneous year-end corporate benefits adjustment posted by Finance.
60415	FEVI Pension & OPEB Adjustment For Company 6000, this account will be used to book the difference between the Pension and Other Post Employment Benefits (OPEB) expense as calculated by the Company's actuaries, and the allowed OPEB expense as filed with the BCUC.
60506	Pension Adjustments & Letters of Credit Used to adjust pension expenses to orders.
69105	Recoveries – Employee Benefits Recoveries of employee benefits paid by FortisBC; postings are from the payroll system.

5.8 Employee Expenses

60301	Employee - Course Fees Amounts paid to educational institutions, suppliers of equipment, industrial and professional organizations for course registration and tuition.
60302	Employee Travel (Non-Training) Employee expenses related to out-of-town travel and travel to/from meetings, but not travel related to training. Travel expenses include flights and airport improvement fees, hotel rooms, telephone charges, taxis, parking and other incidental travel expenses. Does not include mileage allowances (60308), cost of meals (60303), living out allowances (60306) or entertainment expenses (60303).
60303	Meals & Entertainment (Non-Training) Cost of all meals and entertainment events that are not training-related. (Entertainment events include tickets to sporting or cultural events and related expenses while attending those functions such as room rentals, cost of travel to and from, cost of parking or of private boxes.) Not to include those meals/entertainment expenses specifically provided for under 100% tax deductible; those costs incurred by the employer for the benefit of all employees or related to an event whose primary purpose is to benefit a registered charity (60310). Not to include meals/entertainment expenses related to training (60305).

60304	Employee Travel (Training) Training-related only: employee expenses related to both in town and out-of-town travel to/from courses, such as flights and airport improvement fees, hotel rooms, telephone charges, taxis, parking and other incidental travel expenses. Does not include cost of meals or entertainment expenses (60305) related to these courses. Travel that is not related to training should be coded to 60302.
60305	Meals & Entertainment (Training) Training-related only cost of meals and entertainment events. Meals and entertainment not related to training should be coded to 60303. Not to include those meals/entertainment expenses specifically provided for under 100% tax deductible; those costs incurred by the employer for the benefit of all employees or related to an event whose primary purpose is to benefit a registered charity (60310).
60306	Employee Allowance – LOA & Meal Meal Allowance and Living Out Allowance (LOA) paid to employees that stay out of town overnight outside regular work headquarters. The allowance is effective when employees travel out of town to perform work, provide relief for employees in other locations, help out locations that are shorthanded, and/or travel to larger centres for training. Living Out Allowances are charged against a job number determined such as the last job of the day or the job the employee spent the most time on.
60308	Allowance – Mileage Cost of company use of employee owned vehicles while on company business at designated rates.
60310	Company Functions Included in this account is the cost of meals and entertainment provided by the employer for the general benefit of all employees such as Christmas parties, retirement parties, golf tournaments, etc. All other meals and entertainment expenses should be coded to either 60303 or 60305.
60313	Employee Hiring Cost of hiring employees, including advertising in newspapers and other publications. Entries are through Accounts Payable.
60314	Employee Relocation Cost of employee relocation, excluding cost of meals which should be captured in cost element 60303. This cost is borne by the cost centre. Entries are through journal entry or postings from Accounts Payable.
60315	Employee Expenses – Adjustment Employee expense adjustments recorded to VP cost centres in the Co module. Balances in the account should be zero. Entries are through journal voucher.
69307	Credit Card Purchases (default) – for Accounts Payable Use Only Default account for purchases of materials and services using corporate credit card. This cost element will be used by Accounts Payable to process monthly credit card statements which have not been reconciled.

5.9 Material & Supplies

62101	Personal Supplies Purchase and cleaning of uniforms, smocks, hard hats, safety shoes, gloves, and other personal supplies. Entries are through Accounts Payable.

62102	Office Furniture and Equipment Purchase, renting, leasing, repair & maintenance of office furniture and equipment, including postage meters and photocopying machines, and the cost per copy when contracts are based on copies produced. Amounts under the minimum capitalization level are charged to an O&M order; amounts over the level are charged to the appropriate Capital Internal Order. Entries are through Accounts Payable. *Note: Purchase of telephones and related equipment is not charged here, but to cost element 64101.*
62103	Office Supplies and Stationary Office supplies, newspapers, magazines, printing and books. Includes subscriptions for newspapers and periodicals, photocopying of unbound documents, reproduction of drawings, BC Hydro print shop charges for printing services provided to FortisBC, the cost of printed documentation such as specifications, agreements, tender documents, gifts & greeting cards. Entries are through Accounts Payable.
62201	Tools The initial purchase or replacement of instruments, tools and equipment. Amounts under the minimum capitalization level are charged to an O&M order; amounts over the level are charged to the appropriate Capital Internal Order. Entries are through Accounts Payable for external purchases, or through the Materials Management system when items are removed from inventory.
62202	Miscellaneous Field Materials The purchase of materials to be consumed in the construction of assets, and not covered by another specific cost element, including shoring material, road plates, barricades and other items. Entries are through Accounts Payable for external purchases, or through the Materials Management system when items are removed from inventory.
62203	Shop Materials The purchase of materials to be used in shop activities, including repair parts for tools, conditioner used for preventive maintenance measures, compressed gases, solvents, chemicals, reagents and other materials utilized in gas analysis work and processing operation, and any other miscellaneous shop materials, not specified above. Entries are through Accounts Payable for external purchases, or through the Materials Management system when items are removed from inventory.
62205	Road Surfacing Materials The purchase of blacktop (asphalt) and associated materials used for repairing road surfaces disturbed during work on gas plant facilities. Entries are through Accounts Payable.
62206	Backfill Materials The purchase of gravel, sand and topsoil used to restore excavated surfaces. Entries are through Accounts Payable.
62207	Gas Meters The purchase of meters or devices used in measuring the quantity of gas delivered to users, whether actually in service or held in reserve (storage). Entries are through the Materials Management system when items are removed from inventory.

62208	Gas Meters Parts The purchase of associated meter parts and equipment, such as locks, gauges, meters bars, risers, seals, guards, etc. Entries are through the Materials Management system when items are removed from inventory.
62209	Gas Regulators The purchase of devices used for reducing varying high pressure to a constant lower pressure throughout a range of flows. Entries are through the Materials Management system when items are removed from inventory.
62210	Gas Regulator Parts The purchase of associated parts and equipment for gas regulators. Entries are through Accounts Payable for external purchases, or through the Materials Management system when items are removed from inventory.
62211	Gas Pipe – Steel The purchase of steel gas pipe for the gas supply system, to direct the flow of gas to customers. Entries are through the Materials Management system when items are removed from inventory.
62212	Gas Valves and Fittings – Steel The purchase of any non-pipe items which form part of the pressurized steel gas system. Entries are through the Materials Management system when items are removed from inventory.
62214	Gas Valves and Fittings – Polyethylene The purchase of any non-pipe items which form part of the pressurized polyethylene gas system. Entries are through the Materials Management system when items are removed from inventory.
62215	Gas Pipe – Polyethylene The purchase of polyethylene gas pipe for the gas supply system, to direct the flow of gas to customers. Entries are through the Materials Management system when items are removed from inventory.
62218	Exempt Materials Captures the costs of exempt material issued from stores to bin usage at muster stores and truck stops e.g. small pieces of pipe and fittings, welding rods, paint, etc. Entries are through the Materials Management system when items are removed from inventory.
62219	Valves & Fittings for Transmission & Stations The purchase of valves & fittings for transmissions and stations. Entries are through Accounts Payable for external purchases, or through the Materials Management system when items are removed from inventory.
62220	Fittings & House Lines The purchase of fittings and house lines. Entries are through the Materials Management system when items are removed from inventory.

62221	Radio Equipment Purchase, renting, leasing, repair & maintenance of radio equipment Amounts under the minimum capitalization level are charged to an O&M order; amounts over the level are charged to the appropriate Capital Internal Order. Entries are through Accounts Payable.
69301	Inventory Write Down/ Revaluation Account To record losses (gains) on the disposal of inventory in excess of the provision for loss on disposal of obsolete inventory account. Also used to record the additions to the provision account. This cost element is directly posted to; no automatic account assignments.
69304	Inventory Shrinkage & Adjustments Includes losses (gains) on inventory shrinkage during system inventory counts as well as manual sample counts. Configured system transactions are directed to this cost element. Movement types 701 and 702 default to this cost element from the Materials Management system.
69306	Small Differences – Invoice Verification Collects 3-way matching differences on invoice verification which fall within tolerance limits, posted from the Materials Management system.
69309	Freight Charges Direct freight charges on invoices posted through Accounts Payable.
69310	Inventory – SubContractor Costs Account is used to record labour costs incurred by the SubContractor on inventory issued for work. Amount will settle through account 69943 – Settlement: Inv – SubContractor Costs back to account 15088 Inventory – SubContractor Clearing Account so the net income impact is zero.
60505	Material Adjustments Various adjustments to material costs, made at a high level. Used for all Manufacturing and Muster Stock clearing entries. Includes recoveries from third parties.

5.10 Fees & Admin Costs

63102	Government Fees Fees paid to a government agency for such items as testing of gas revenue meters at regular intervals in accordance with Federal Government re-verification regulations, other gas and electrical safety and inspection fees, overweight and oversize permits, elevator inspection fees, trailer licences, disputed meter tests, D.O.C. radio license fees, etc. Amounts are posted through Accounts Payable.
63103	Membership Dues Membership fees and dues paid by the company, in any association, organization or club; includes both individual and corporate memberships in professional organizations. Excludes dining/golf/recreation dues or fees which are non-deductible for tax purposes (use cost element 63114). Amounts are posted through Accounts Payable.
63104	BCUC Assessments (for Finance Use Only) Monthly accruals and annual adjustment of assessments paid to BCUC quarterly, annually and special assessments. Amounts are posted through recurring journal voucher.

63105	External Auditors Fees (for Finance Use Only) Monthly accruals and annual adjustment of fees paid to external auditing firms for the interim and annual audits, and special projects. Amounts are posted through recurring journal voucher. Work done by external auditors which is of a non-audit nature (consulting, administrative) should not be charged here, but to cost elements 63101 or 65202.
63106	Legal Fees and Retainers Legal fees, retainers and other associated legal expenses. Postings are through Accounts Payable.
63108	Board Meeting Expenses Expenses incurred by company 1000 related to Board of Directors Meetings. Postings are through Accounts Payable.
63109	Continuing / Shared Services Charges to FortisBC Huntingdon Inc. or Inland Energy Corp. for continuing/shared services provided by FortisBC Energy Inc. Entries are through recurring journal voucher.
63110	Directors' Fees and Expenses Expenses incurred by company 1000 related to Directors' fees, the value of DSUs (Deferred Share Units) held by directors, and other miscellaneous expenses. Entries are through payroll, through journal entry for estimated DSU fair value adjustments, and through Accounts Payable for miscellaneous expenses.
63111	Charitable Donations Donations to registered charities, posted through Accounts Payable. Receipts for charitable donations should be forwarded to Financial Accounting for summarization in the corporate tax returns. This cost element can be used only by cost centre 2267 in company 2000 and cost centre 1042 in company 1000.
63112	Corporate Sponsorships Amounts paid for sponsorship of community events, scholarships and awards that fall under the categories of environment, education, or community development. Sponsorships should be coordinated through the Community Investment Committee (contact the Community Investment Manager). Postings are through Accounts Payable.
63113	Shareholder Expenses Amounts paid by company 1000 related to the company's shareholders such as filing fees, stock exchange listing fees, transfer agent fees, costs dividend notices, Annual General Meeting costs, etc.
63114	Golf/Recreation Dues/Fees – Non-Deductible Non-deductible dues and fees relating to dining, recreational or sporting clubs. e.g. golf or dining club dues and memberships and green fees.
63115	Management Services Expense Amounts paid to FortisBC Energy Inc. or FortisBC Holdings Inc. for management services, including gas management fees and gas control management fees. Entries are through recurring journal voucher.
63117	Political Contributions Contributions to political parties, either through direct donation or sponsorship of a political event. Account is only used by company 1000; postings are through Accounts Payable.

63118	Management Services Expense – Other Amounts paid to Fortis BC for management services for the shared executives.
63119	Restricted HST This account will be used to capture HST that is not recoverable as an input tax credit.
63202	Land Acquisition Fees All costs and fees with respect to land and land right acquisitions, including legal fees in connection with search and registration which includes: all search, registration, and registrar of companies' fees, notary fees, property appraisal costs, etc. Postings are through Accounts Payable.
63203	Easement and Rights-of-Way All costs and fees related to acquiring easements and rights-of-way including bridges, railway and foreshore crossings. Postings are through Accounts Payable.
63301	Communications – Investors Costs related to financial reporting to shareholders, primarily the costs of printing and distributing the Quarterly and Annual Reports. Postings are through Accounts Payable.
63303	Communications – Public Relations The cost of informing the public regarding energy use and other issues of public interest. This includes the cost of direct mail-outs, bill stuffers, television advertising, etc. Postings are through Accounts Payable. *Note: Does not include the cost of employee communication publications (included in cost element 63304) or investor communications (included in cost element 63301)*
63304	Communications – Employee The cost of employee communication programs, including printed material and the cost of meetings and other programs - coordinated and administered by Public Affairs. Postings are through Accounts Payable.
63401	Advertising – Media Advertising in newspapers including space and production costs. Advertising in trade and other publications, including space and production costs. Radio advertising including time and production or purchase of commercial material. Television advertising including time and production costs. Postings are through Accounts Payable.
63402	Advertising - Printed Matter Direct mail, pamphlets, brochures and similar materials for sales promotion purposes. Postings are through Accounts Payable.
63403	Miscellaneous Advertising Display materials for dealers, costs of exhibits in exhibitions and fairs, advertising such as transit vehicles, transit shelters, billboards, mail posters, stadium or building advertising, and small branded items used for promotional purposes. Also included are sponsorships of a promotional nature (see also corporate sponsorships 63112) Postings are through Accounts Payable. Does not include charitable donations (63111) or advertising related to hiring employees (60313).

63501	Administration – Postage Cost of bulk mail for customers' bills, metered mail for general office use, postage stamps, registry and postal insurance fees and postage due charges. Postings are through Accounts Payable.
63502	Administration – Couriers and Freight Cost of couriers and miscellaneous freight charges for deliveries Postings are through Accounts Payable.
63503	Administration – Contracts and Outside Services Work performed and services supplied by outside companies, and not covered by a specific cost element. Includes costs associated to store company records offsite, temporary help agencies, health monitoring etc.
63504	Miscellaneous Administration Expenses Miscellaneous administration expenses of a non-recurring or unusual nature which are not covered by a specific cost element. This account should only be used as a last resort where no other account is appropriate. Entries are from Accounts Payable.
63505	ICE Levy Tax This account will include the .4% Social Services Tax paid to the BC government on purchases of electricity, natural gas, fuel oil and propane received after September 1/2007. Refunds will apply once this account has reached a limit of $100,000.
63506	Gas Lost – Billable For all companies, this account records the gas lost amount billed to third-parties for damages to the utility's pipelines. Gas lost amounts are calculated and billed for damage incidents where the volumes of gas lost are considered material.
63601	Radio – Site Rentals Rent related to radio sites (see 63602 for radio licences). Postings are through Accounts Payable.
63602	Radio – Government Licences Radio licence fees. Postings are through Accounts Payable.
63901	Damages to Third-Party Utilities Costs related to repairing damage to third-party utilities, including filing fees and damage settlement payments. Postings are through Accounts Payable.
63902	Insurance (Finance use only) Monthly accruals and annual true ups for insurance costs, including general liability, all risk, directors' liability, umbrella, excess liability, boiler & machinery. Entries are through recurring journal voucher.
63903	Injuries and Damages Costs in connection with accidents including all expenses, except legal expenses incurred in settlement of injuries and damage claims (see 63106). Excludes costs coded to 63901 Damages to Third-Party Utilities.
63904	Bad Debts Expense – Rate 1 (For Finance Use Only) This account contains the provision for estimated unrecoverable accounts receivable for Rate 1 Customers. Each month a provision is estimated based on bad debt experience and the balance in the aged accounts receivable accounts, and booked through journal entry.

63905	Bad Debts Expense – Rate 2 and 3 (For Finance Use Only) This account contains the provision for estimated unrecoverable accounts receivable for Rate 2 and 3 Customers. Each month a provision is estimated based on bad debt experience and the balance in the aged accounts receivable accounts, and booked through journal entry.
63906	Bank Charges Bank charges, including cash management fees, maintenance fees, credit card fees, wire charges, bank confirmation charges, etc. Postings are through the bank interface program and through journal entry.
63907	Collection Costs – General Includes commissions and bonuses paid to collection agencies for the collection of overdue accounts and the costs of obtaining credit reports. Postings are through Accounts Payable.
63908	Bad Debts Expense – Industrial (For Finance Use Only) This account contains the provision for estimated unrecoverable accounts receivable for Rate 14 and other Industrial Customers. Each month a provision is estimated based on bad debt experience and the balance in the aged accounts receivable accounts, and booked through journal entry.
63909	Customer Service Refunds This account is used to charge amounts that are refunded to customers in situations where the Company has not provided an appropriate level of service to the customer. This account is only to be used with the approval of a Manager or more senior level employee. This account should not be used to record write-offs of accounts receivable or other uncollectible amounts. Postings are through journal entry based on information from the Energy system.
63910	Bad Debts Expense – System Alteration To record system alteration receivable accounts either sent to collection agencies or written off.
63911	Bad Debts Expense – System Damage To record system damage receivable accounts either sent to collection agencies or written off.
63913	Customer Rebates This account will include the rebates we pay out to customers for converting vehicles and appliances to natural gas (DSM).

5.11 Facilities

30801	Lease Costs This account will include the expense related to FEVI's two compressors lease agreements. The account is debited as automatic payments are deducted from G/L 13840 – CIBC Bank Account CDN, and remitted to the Canadian Western Bank which holds the debt instruments on these compressors; one for Coquitlam, and one for Port Mellon.
64101	Facilities – Communications Costs of communications such as telephone (local, long distance, mobile), answering services and cost of moving telephones. Includes the cost of purchasing communication equipment, such as telephones and related equipment. Data line charges should be coded to 64122. Entries are through Accounts Payable.

64102	Facilities – Heat & Light (3rd Party) Cost of heat and electricity used in the operation of buildings, paid to parties other than FortisBC. Payments are primarily to BC Hydro, paid through Accounts Payable.
64103	Facilities – Water Annual water fees paid to cities and municipalities for FortisBC facilities (sewer fees are GL 64118). Payments are through Accounts Payable.
64104	Facilities – FortisBC Gas Charges Cost of using gas from own system for use in compressors, line heaters, LNG, offices, and muster stations in the administration and operating areas of the Company. The offset of this account is G/L 62414 – Company Use Fuel & Gas. Postings are through journal entry.
64105	Facilities – Carpet & Upholstery Cost associated with cleaning of carpets and upholstered furniture. Postings are through Accounts Payable.
64106	Facilities – Catch Basin & Sump Cost associated with cleaning of storm drain catch basins in roadways and parking lots as well as sump maintenance. Postings are through Accounts Payable.
64107	Facilities – Electrical Maintenance Cost associated with electrical maintenance and repairs on buildings, as well as all exterior lighting including parking lots and walk ways. Postings are through Accounts Payable.
64108	Facilities – Fence/Door/Gate Repair Costs associated with maintenance and repair of fencing and gates (costs relating to locks are 64113). Postings are through Accounts Payable.
64109	Facilities – Garbage Costs associated with non-recyclable garbage disposal. Postings are through Accounts Payable.
64110	Facilities – HVAC Costs associated with maintenance of the heating, ventilation and air conditioning (HVAC) system including changing of filters, reprogramming of control systems, etc. Postings are through Accounts Payable.
64111	Facilities – Janitorial Costs associated with daily janitorial cleaning of buildings. Postings are through Accounts Payable.
64112	Facilities – Landscaping Costs associated with maintaining trees, shrubs, lawns and sprinkler systems (pest control is 64114). Postings are through Accounts Payable.
64113	Facilities – Locksmith Costs associated with repairing and changing locks as well as key replacement. Postings are through Accounts Payable.
64114	Facilities – Pest Control Costs associated with controlling rodents, bugs etc. both internally and externally. Postings are through Accounts Payable.
64115	Facilities – Plumbing Costs associated with plumbing repairs, leaking facets, leaking or broken water and sewer pipes etc. Postings are through Accounts Payable.

64116	Facilities – Recycling Costs associated with recycling of cardboard and paper products. Postings are through Accounts Payable.
64117	Facilities – Security Costs associated with security guard services and security system maintenance. Postings are through Accounts Payable.
64118	Facilities – Sewer Annual sewer fees paid to cities and municipalities for FortisBC facilities (water fees are GL 64103). Payments are through Accounts Payable.
64119	Facilities – Snow Removal Costs associated with the removal of snow on FortisBC's premises. Payments are through Accounts Payable
64120	Facilities – Window Cleaning Costs associated with window cleaning in FortisBC's buildings. Payments are through Accounts Payable
64121	Facilities – Yard Maintenance Costs associated with yard maintenance. Payments are through Accounts Payable
64122	Facilities – Data Line Charges Data line charges such as internet (ISP) costs, LAN and WAN costs. Charges are coded through Accounts Payable. See also 64101 Facilities – Communications for voice communication charges.
64123	Facilities – Building Maintenance Costs associated with building (structure) maintenance such as roof repairs, tiles, wall inspections, etc. Payments are through Accounts Payable
64124	Southern Crossing Lease Rental and lease costs associated with FortisBC occupied buildings posted through Accounts Payable and the lease costs associated with the Southern Crossing Pipeline posted through journal entry.
64125	Facilities – Fire Safety System Costs associated with building fire alarms, sprinkler system, fire extinguishers, and emergency systems. Postings are through Accounts Payable.
64126	Facilities – Elevator Costs associated with elevator maintenance and permits. Postings are through Accounts Payable.
64127	Facilities – Signage Costs associated with external and internal signs and nameplates. Postings are through Accounts Payable.
64128	Facilities – Moves Costs associated with employee move. Postings are through Accounts Payable.
64129	Facilities – Equipment Maintenance Costs associated with the maintenance of equipment such as air tools, pneumatics, overhead cranes

64130	Facilities – Roofs Costs associated with roof maintenance. Postings are through Accounts Payable.
64131	Construction or renovation on Facilities & property. Postings are through Accounts Payable.
64132	Remediation work on contamination removal for building or yards i.e. asbestos removal. Postings are through Accounts Payable.
64133	Facilities - Communication Adjustment Employee expense adjustments recorded to VP cost centres in the Co module. Balances in the account should be zero. Entries are through journal voucher.
65101	Rentals – Building/General Rental and lease costs associated with FortisBC occupied buildings posted through Accounts Payable.

5.12 Vehicles

60504	Vehicle Cost Adjustment Miscellaneous adjustment to vehicle costs. Includes recoveries from third parties. Entries are through journal voucher.
65102	Rentals – Trucks Rental of trucks from outside rental agencies. Entries are through Accounts Payable.
65103	Rentals – Backhoes Rental of backhoes without operators. (Contract backhoes are charged to cost element 65208). Postings are through Accounts Payable.
65104	Vehicle Purchases Covers the purchase of vehicles. This cost element should only be used in conjunction with a Capital Internal Order. Postings are through Accounts Payable.
65105	Leased Vehicles – Management Cost of leasing and operating leased vehicles for management personnel (includes repairs and maintenance and insurance costs).
66101	Company Vehicles – Cars (Vehicles – Cars) Costs of operating assigned and/or pooled FortisBC cars. Postings are through Accounts Payable.
66102	Company Vehicles – Trucks (Vehicles – Trucks) Costs of operating assigned and/or pooled FortisBC trucks. Postings are through Accounts Payable.
66103	Equipment – Backhoes Costs of operating backhoes. Postings are through Accounts Payable.
66104	Equipment – Other Costs of operating assigned and/or pooled FortisBC vehicles and equipment not covered by cost elements 66101 or 66102. Postings are through Accounts Payable.
66107	Vehicles – Mini-Equipment Charges for the use of leased mini-equipment. Postings are through Accounts Payable.

66108	Vehicles – Licence Fee Charges for vehicle licensing paid to ICBC and/or other applicable insurer/public body.
66109	Vehicles – Fuel Expense Charges for fuel used in Company vehicles.
66110	Vehicles – Repair & Maintenance Charges for repairs and maintenance to Company vehicles.
66111	Vehicle Lease/Rental Charge Monthly lease charges for vehicles being leased from PHH. Postings are via upload to a journal voucher.
66114	Vehicles – Miscellaneous Charges Any miscellaneous charges related to vehicles that do not fit in the following cost elements: 66108 to 66114
66115	Fleet Management Monthly cross charging from fleet cost centres to cost centres that have vehicles. Postings are via journal voucher.
66116	Vehicle Gain/Loss Gain or loss on disposal units.
66117	Restricted HST - Vehicles This account will be used to capture HST that is not recoverable as an input tax credit arising from charges related to vehicles.

5.13 Contractors

63101	Consulting Fees Management consulting fees, including labour dispute mediation fees, engineering and consulting fees, personnel services, financial process development and review services, etc. Includes CustomerWorks customer care services to the end of 2005 only. Excludes computer consulting costs, which are charged to 68101. Entries are through Accounts Payable.
63116	Customer Care Services This account will be used to allocate the fees charges by CustomerWorks for customer care services (customer contact, billing support, meter services and credit & collections) beginning in 2006 (prior to this included in 63101). Entries are through Accounts Payable.
63122	Consulting – Adjustment Consulting adjustments recorded to VP cost centres in the Co module. Balances in the account should be zero. Entries are through journal voucher.
65202	Contractors – Miscellaneous Cost of contractors (labour only), not covered by any other cost element. Entries are through Accounts Payable.
65203	Contractors – Flagging Cost of contractors hired for flagging and traffic control. Entries are through Accounts Payable.

65204	Contractors – Cartage Cost of contractors hired for cartage, particularly of backfill material. Entries are through Accounts Payable.
65206	Contractors - Installation Cost of gas installation contractors hired for construction, removal and maintenance of gas plant facilities, including primary mains service line contractors. Entries are through Accts Payable.
65207	Contractors – Paving Cost of contractors hired for paving, either directly or through cities and municipalities for permanent repairs to paving disturbed during work on gas plant facilities. Entries are through Accounts Payable.
65208	Contractors – Other Cost of independent contractors that provide both labour and equipment, not covered by any other cost element. Entries are through accounts Payable.
65209	Contractors – Survey Cost of contractors performing survey work. Entries are through accounts Payable.
65227	Pipeline Patrol The costs of pipeline patrol in company 6000. Postings are from Accounts Payable.
65232	Removal Costs Removal costs that were previously capitalized are now being expensed under IFRS reporting. Entries are through recurring JE's only as amount is set per regulatory filing.

5.14 Computers & Technology

68101	Computer – Consulting Consulting fees incurred in connection with the development, operation, maintenance and support of various operational systems. Excludes all non-computer related consulting costs which should be charged to 63101. Entries are through Accounts Payable.
68102	Computer – Outsourcing Computer service charges such as: computer terminals, computer printers, computer terminal transactions, TSO (Time Sharing Option) usage costs and Information Centre costs. Exclude consulting (68101). Entries are through Accounts Payable.
68106	Computer – Software Cost of acquisition and installation of software and upgrades. Entries are through Accounts Payable.
68107	Computer – Hardware Cost of acquisition of computer hardware and accessories. Entries are through Accounts Payable.

5.15 Recoveries

69100	AR Deposits Clearing to Capital Account holds deposits received on the accounts receivable system (GL 14014). This account is credited when the deposits are received; when the job is billed through the AR system, the appropriate recovery cost elements are credited and this account is debited, clearing it to zero (but receipt and application of deposit may not offset in same year). The account settles to capital orders each month-end.
69101	Non-Refundable CIAC Received Includes non-refundable contributions in aid of construction (CIAC), and other non-refundable contributions received towards capital projects. Entries are through posting from AR system or journal entry for cash received.
69102	Recoveries on Damage Claim A/R Includes credits for sundry recoverable work done by or on behalf of FortisBC, and the recovery of accounts written off to bad debts. Not to include contributions in aid of construction. Entries are through posting from AR system or journal entry.
69103	Recoveries – Salvaged Materials Amounts received as recoveries from salvaged materials. Entries are through journal entry for cash received.
69104	Recoveries – Damage Claim Overhead Direct cost of billable work is credited to work in process, overhead recovered is credited to this cost element.
69107	Recoveries – Manufactured Materials to Stock Recoveries of manufactured inventory. Postings are from the materials management system.
69108	Recoveries of O&M Costs Miscellaneous recoveries not covered by another cost element which offset O&M expenses incurred, and are not undertaken with an expectation of profit. Examples are lease recoveries, sales of miscellaneous O&M materials at cost, charges to ABSUI for SAP resources, continuing service fee income, employee gym memberships. Entries are through posting from AR system or journal entry for cash received.
69109	NRB Overhead Recovery (For Finance Use Only) This account creates the cost associated with the recovery of 5% overhead on labour to non-regulated businesses (NRBs) per actual timesheets submitted, per agreement with the BCUC. These amounts are posted through journal entry - offset is GL 57913. Overhead on other labour billed to NRBs through the AR subsystem (GL 14014) is also captured in this account.
69110	NRB Labour Recovery (For Finance Use Only) Direct cost of non-regulated business (NRB) continuing service labour. For pooled contracts, amounts are posted through recurring journal entry at 1/12th of the annual budgeted amounts each month. Other labour is billed through the AR subsystem (GL 14014) to NRBs based on actual time incurred.
69111	Recoveries - Costs Recoveries of work done by the Measurement Technology group from 3rd parties. Entries are from the AR subsystem (GL 14014).
69112	Recoveries - Overheads Recoveries of overhead on work done by the Measurement Technology group from 3rd parties. Entries are from the AR subsystem (GL 14014)

69113	Recoveries – Bad Debts Recoveries of bad debts previously written off for gas sales customers (rates 1, 2, 3). Entries are from the Energy system, posted by ABSU.
69114	Recoveries – Revenue Classified as O&M Miscellaneous revenues not covered by another cost element which are classified as O&M expenses, but are undertaken with an expectation of profit. Examples are reactivation charges, fees charges to marketers, external gas management and admin fees. Entries are through posting from AR system or journal entry for cash received.
69115	Recoveries – Miscellaneous A/R Recoveries of miscellaneous accounts receivable (GL 14014), primarily through collection efforts of Wiggins (collection agency), offset by small write-offs to A/R. Includes recoveries of overheads from third parties. Entries are through journal entry for cash received.
69116	Management Services Income Recoveries of management services, including gas management fees, gas control management fees and IT management fee income including rent, facilities, data line, IT and SAP. Entries are through recurring journal voucher
69121	Recoveries – CIAC Excess Footage Recoveries of Contributions in Aid of Construction (CIAC) related to excess footage. Postings are from the Order Fulfilment system. Account settles to capital at month-end.
69122	Recoveries – CIAC Billable Alterations Recoveries of Contributions in Aid of Construction (CIAC) related to alterations. Postings are from the Order Fulfilment system. Account settles to capital at month-end.
69123	Recoveries – CIAC Main Extensions Recoveries of Contributions in Aid of Construction (CIAC) related to main extensions. Postings are from the Order Fulfilment system. Account settles to capital at month-end.
69124	Recoveries – CIAC Service Line Fees Recoveries of Contributions in Aid of Construction (CIAC) related to main extensions. Postings are from the Order Fulfilment system. Account settles to capital at month-end.
69125	Recoveries – CIAC Additional Meters Recoveries of Contributions in Aid of Construction (CIAC) related to additional meters. Postings are from the Order Fulfilment system. Account settles to capital at month-end.
69126	Recoveries – CIAC Other Recoveries of Contributions in Aid of Construction (CIAC) billed through the AR subsystem (GL 14014). Account settles to capital at month-end.
69127	Recoveries – Application Fee Application service fee revenue of $85 per application received from customers, posted from the Order Fulfilment system. Account settles to 56101 Connection Charges at month-end.
69128	AES Overhead Recovery of regulated amount of $500K to be charged to the Alternative Energy Solutions deferral account.

69129	Biomethane Cost of Service Allocation Recovery of capital related Biomethane cost of service (Earned Return, Income Tax & Depreciation Expense) that are attributable to Biomethane Variance Account (BVA) for the upgrader equipment – GL#18174 – and cost of service associated with the capital costs of assets connecting to the distribution grid (immediately downstream of the upgrader) – GL#18176. The offsetting GL account is 31907 “Biomethane – Other Revenue”.
69700	Overheads Capitalized Credits for overheads allocated to construction as a result of the Overhead Capitalization Policy. Entries are system generated with the offsetting debit to capital at month-end.
69898	Intercompany Cost Allocations This is the offset account for the FICO reconciliation account. It is the replacement for the 1419x accounts. If someone does a posting in CO which crosses company codes then this account is used to post the intercompany entry in FI because the secondary cost elements in CO don't exist in FI. This cost element is also used for the HR recovery between FEVI and FEW – credit in company 6000 and debit in company 6100. Postings are through recurring journal voucher.

5.16 Allowance for Funds Used During Construction (AFUDC)

69200	AFUDC (Allowance for Funds Used During Construction) Cost of capital charged to projects greater than three months in duration, costing at least $50,000. AFUDC is automatically calculated by SAP. Do not charge directly to this cost element.

6. CORPORATE INCOME AND EXPENSE DESCRIPTIONS

6.1 Depreciation and Amortization

30301	Depreciation This account will include the amount of depreciation expense for depreciable plant at the depreciation rates maintained in the asset management system. The offset for these charges is GL 10500 Accumulated Depreciation – Gas Plant. This account will also include the amount of amortization for contributions in aid of construction (CIAC) received (GL. 21101). The offset for these charges is GL 21102 Accumulated Amortization – CIAC. Other amounts charged to this account are the amortization of conversion expenses offset to GL 17520 and the amortization of organization costs offset to GL 17820. This account is credited through journal entry to remove the depreciation of the Lease in Lease Out (LIILO) assets for financial reporting purposes (included in asset management system for regulatory accounting purposes).
30303	Vehicle Lease Depreciation This account will include the amount of depreciation expense for leased vehicles. The offset for these charges is GL 10502 Accumulated Depreciation – Capital Lease vehicles.
30401	Amortization This account will include the amount of amortization expense for plant at the amortization rates maintained in the asset management system. The offset for these charges is GL 10500 Accumulated Depreciation – Gas Plant.
30402	Amortization – Non Plant This account will include the amount of amortization for deferred charges and deferred credits. Significant items amortized to this account include deferred interest, property tax, pension and insurance variances, Coastal Facilities deferral, NGV deferrals, rate hearing costs, marketing rebates. Postings are through recurring journal voucher.
30403	Amortization – Government Loans For company 6000, this account will include the charges arising from the monthly amortization expense of repayable Government loan(s). Amounts are posted through journal entry.

6.2 Property and Other Taxes

30501	Property Taxes This account includes property tax expense levied by various municipalities. This account will be debited with recurring journal entries, accrued on a straight-line basis as 1/12th of the annual budgeted amount to G/L 25625. In June or July of each year, the annual property taxes are paid, and the expense is adjusted to account for any over or under accrual. In company 2000, any variance between actual and budgeted property taxes is deferred to G/L 17915.
30502	Other Taxes For company 1000, this account will include accruals for Ontario taxes payable (offset to 25626).

30503	Motor Fuel Tax Expense For company 6000, this account will include the Motor Fuel Tax paid to the Provincial Government on natural gas consumed by FEVI compressor stations. The offset of this account will be G/L 25114 – Motor Fuel Tax Payable.
30504	SST – Meter Station Fuel For company 6000, this account will include the Social Services Tax paid to the Provincial Government on natural gas consumed by FEVI compressor stations. The offset of this account will be G/L 25111 – SST Payable.

6.3 Interest on Long Term Debt

32000	Interest Expense on Long Term Debt This account will include the amount of interest expense on all classes of long-term debt, the principal of which is included in Account No. 22000 (Long-Term Debt).
32001	Interest Expense on 8.0% Capital Securities This account will include the amount of interest expense on the $125 million 8.0% Capital Securities. This account is being used since February 2005 as the expense was previously charged to G/L 35705 – Dividends on 8.0% Capital Securities. The offset to this account is 25303 – Dividends Payable – 8.0% Capital Securities.
32002	Swap Interest Expense This account captures the net interest expense on interest rate swaps outstanding. The offset to this account is 25703 – Swap Interest Receivable.
32003	Interest Income – Interco PMM C D This account will include the amount of interest income on Series C and Series D Debentures with the status of Purchase Money Mortgages (PPM), between FortisBC Energy Inc. and Inland Energy Corporation. The Series C Debenture has a book value of $75,000,000, bears interest at 9.75% and is due September 30, 2037. The Series D Debenture has a book value of $75,000,000, bears interest at 10.52% and is due September 30, 2038. The Debentures are included in Account 22000 (Long-Term Debt).
32004	Interest Expense – Interco PMM C D This account will include the amount of interest expense on Series C and Series D Debentures with the status of Purchase Money Mortgages (PPM), between FortisBC Energy Inc. and Inland Energy Corporation. The Series C Debenture has a book value of $75,000,000, bears interest at 9.75% and is due September 30, 2037. The Series D Debenture has a book value of $75,000,000, bears interest at 10.52% and is due September 30, 2038. The Debentures are included in Account 22000 (Long-Term Debt).
32005	Long Term Interest – Fortis Inc. This account will include interest expense on long-term payable to Fortis Inc.
32101	Amortization Debt Discount, Premium and Expense This account will be charged or credited during each fiscal period with the proportion of the discount, premium, and expense on long-term debt obligations applicable to that period. The amount charged each period will reduce the unamortized balance to zero over the term of the individual debt (see account 18001).

32203	Interest on Class B Subordinated Debt This account will be used to record the interest incurred on FEVI's subordinate debt to FortisBC Holdings Inc. as part of the acquisition agreement to convert Westcoast Energy Inc.'s Preferred Shares series A into debt. The interest on this debt was set at conversion and is subjected to reset. As a surplus is available, debt is drawn down based on whichever series is closest to coming due for reset at time of pay down. The offset of this account is G/L 22002 – FEVI Subordinated Debt.

6.4 Short Term Interest Expense

32301	Short Term Interest on Bank Debt This account will include the amount of interest expense on all bank loans, the principal of which is included in Account No. 25002 (Bank Loans).
32302	Short Term Interest on Commercial Paper This account will include the amount of interest expense on short-term notes and commercial paper issued by the Company maturing in one year or less, the principal of which is included in Account No. 25001 (Commercial Paper and Other Notes Payable). Entries are through the Treasury system.
32303	Other Interest Expense This account will include all short-term interest expense not provided for elsewhere, such as security deposit interest, bank interest and bank service charges, less interest income on LILO lease payments receivable 12513.
32305	Interest on MCRA, CCRA and Gas in Storage This account records the interest income or expense on the excess of the allowable debit or credit balance on the MCRA, CCRA and Gas in Storage (17926, 18137 and 18533) deferral accounts as allowed by the BCUC.
32306	Foreign Exchange Gain/(Loss) This account contains the foreign exchange gain or loss that results from holding US dollar denominated assets and liabilities. The SAP system runs a program each month end that revalues the US denominated amounts into CDN; and posts the difference into this account; the entry is reversed in the following month. In addition, journal entries are posted here to manually convert amounts from US to CDN.
32307	Cash Discount Taken Income from cash discounts taken by paying Accounts Payable invoices per the cash discount terms of the vendor. Postings are from Accounts Payable.
32308	Interest Income – FortisBC Energy (Vancouver Island) Inc. Interest income in company 1000 from FortisBC Energy (Vancouver Island) Inc., on the intercompany debt between the two companies.
32309	Interest on RSAM This account will include interest calculated on the difference between the actual and forecast mid-month average balance of the deferral account RSAM G/L 17927, multiplied by the composite interest rate based on short term debt & investments as authorized by the BCUC Order G-07-03 for FEI and G-138-10 for FEW.
32310	Other Financing Costs This account will include the costs incurred for the ESP transfer agent & registrar fees paid to CIBC Mellon Trust.

32312	Deferred Interest – FortisBC Energy (Whistler) Inc. This account will be used to record the FEW dollar difference between the actual cost of short term debt and the long term debt rates that have been included in the application. Offset is to 18124.
32314	Interest on Goodwill This account will include the calculation of current portion of interest expense applicable to Goodwill on FEVI, a non-rate based item. This is a reclassification only, as the offset is in 32303.
32315	Non Regulatory Interest In FEVI, used to record non-regulatory interest, including stand by fees.
32317	Commissions & Backstopping Fees This account will include the amount of commission expense and backstopping fees on short-term notes and commercial paper issued by the Company maturing in one year or less, the principal of which is included in Account No. 25001 (Commercial Paper and Other Notes Payable). Entries are through the Treasury system.
32318	Vehicle Lease Interest This account will include all short-term interest expense on leased vehicles.
32319	Short Term Interest - Fortis This account will include all short-term interest expense from Fortis loans.

6.5 Interest Capitalized

32400	AFUDC Equity Portion This account is used to capture the Allowance for Funds Used During Construction (AFUDC) that relates to equity. AFUDC is calculated on all Gas Plant Under Construction, where the individual project is greater than $50,000 and longer than 3 months. This account is credited and the project is debited.
32401	Interest Capitalized Equity Portion In FEVI, this account is used to capture the interest capitalized on deferral accounts (equity portion).
32500	AFUDC Debt Portion This account is used to capture the Allowance for Funds Used During Construction (AFUDC) that relates to debt. AFUDC is calculated on all Gas Plant Under Construction, where the individual project is greater than $50,000 and longer than 3 months. This account is credited and the project is debited.
32501	Interest Capitalized Debt Portion In FEVI, this account is used to capture the interest capitalized on deferral accounts (debt portion).

6.6 Income Taxes

30601	Current Income Taxes This account will include provision for federal, provincial or other government current income taxes based on the company's income or loss for the fiscal period. Current income tax expense is accrued each month through journal voucher; the annual provision is reviewed and adjusted as appropriate by the tax department. When income tax returns are finalized in the following year, the provision is adjusted to reflect actual taxes payable or receivable.
30602	Future Income Taxes This account will include the timing differences between income tax expense recorded for accounting purposes and income tax as reported on the tax returns. Currently, the regulated entities in the FortisBC group use the income taxes payable basis, and therefore do not calculate future income tax expense.
30603	Current Income Taxes – NREG This account will include provision for federal, provincial or other government current income taxes based on the company's non-regulated income or loss for the fiscal period. Current non-regulated income tax expense is accrued each month through journal voucher; the annual provision is reviewed and adjusted as appropriate by the tax department. When income tax returns are finalized in the following year, the provision is adjusted to reflect actual taxes payable or receivable.

6.7 Income from Affiliates

31501	Dividend Income – Inland Energy Corp. This account will include dividend income recorded at the date dividends are declared by Inland Energy Corp. (company 5000).
31502	Dividend Income – FortisBC Holdings Inc. This account will include dividend income recorded at the date dividends are declared by FortisBC Holdings Inc. (company 1000).
31504	Dividend Income – FortisBC Energy Inc. This account will include dividend income recorded at the date dividends are declared by FortisBC Energy Inc. (company 2000).
31505	Dividend Income – IPPDA LLC This account will include dividend income recorded at the date dividends are declared by IPPDA LLC.
31506	Dividend Income – Other This account will include dividend income recorded at the date dividends are declared by any company for which there is not a specific dividend income account.
31507	Dividend Income – FortisBC Gas Holdings Inc. This account will include dividend income recorded at the date dividends are declared by FortisBC Holdings Inc. (company 1021).
31508	Dividend Income – 0849218 BC ULC This account will include dividend income recorded at the date dividends are declared by 0849218 BC ULC. (company 2010).
31509	Preferred Dividend Income – FortisBC Energy (Vancouver Island) Inc. This account will include dividend income recorded at the date dividends are declared by FortisBC Energy (Vancouver Island) Inc. (company 6000).

31510	Interest Income (FEVI Subordinated Debentures) This account includes the interest income in company 1000 on the subordinated debentures it holds in company 6000. The interest income and expense (account 32203) are recorded each month through journal voucher.
31513	Interest Income - TES This account consists of interest income earned by company 1000 on advances to company 7000.
31602	Interest Income – FortisBC Huntingdon Inc. This account will include intercompany interest income on advances and loans to FortisBC Huntingdon Inc. (company 4000).
31604	Interest Income – Intercompany This account will include intercompany interest income on advances and loans to companies within the FortisBC group, where those amounts are not tracked in a separate G/L.
31606	Equity Pickup – CustomerWorks LP This account will include the company's share of income or loss from CustomerWorks LP, recorded on an equity accounting basis.
31705	Intercompany Lease Income This account includes the lease income from leases with other companies within the FortisBC Group. Example would be the SCP lease income.
31706	Partnership Income This account will include the company's share of partnership income.

Regarding the OGAA Implementation: All necessary regulations, documents and background information on OGAA can be found at www.ogc.gov.bc.ca/OGAA/
For any questions pertaining to the status of this document, please contact the Commission at (250) 261-5700.

August 25, 2006 **INFORMATION LETTER #OGC 06-12**

SUBJECT: **Adoption of CAN/CSA Z662-03 Oil and Gas Pipeline System Annex N Guideline for Integrity Management Programs.**

TO: All Stakeholders

In June 2005, the Canadian Standards Association (CSA) published *Supplement No. 1* to *CSA Standard Z662-03: Oil and Gas Pipeline Systems.* The supplement contained the new *Annex M: Sour Service Pipelines* and *Annex N: Guidelines for Pipeline Integrity Management Programs (ANNEX N)*. Annex N provides an approach for ensuring that pipelines are capable of transporting product safely, without short-term or long-term negative effects on public safety or the environment.

The Oil and Gas Commission (OGC) proposed to make Annex N mandatory and requested stakeholder comment by means of Information Letter #OGC 06-08*: Canadian Standards association Can/CSA Z662-03 "Oil and Gas Pipeline Systems, Annex M and N Supplement No. 1*, which was posted in April 2006 on the OGC Web site for stakeholder comment. The OGC considered all comments received.

Information Letter # OGC 06-08 noted that CSA Z662-03, Annex M, is mandatory for sour service pipelines. Pipeline integrity management programs are included within Annex M, and therefore licensees are required to develop and implement an integrity management program for sour service pipelines regardless of the overall adoption of Annex N for other types of pipeline.

Requirement

In accordance with Section 10 of the Pipeline Regulation the OGC has adopted Annex N as a revision to CAN/CSA Z662-03. Owners or operators of pipelines must develop and implement an integrity management program in accordance with CSA Z662-03, Annex N.
As oil and gas companies may require time to meet this requirement, licensees must

• by **March 1, 2007**, develop an integrity management program (Clauses N.1 to N.9), and

• by **September 1, 2007**, develop hazard identification and controls, risk assessments, and program planning (Clauses N.10 to N.17).

INTRODUCTION

1.1 Contents of the Manual

Chapter 1: Introduction

Overview of contents, purpose and audience

Chapter 2: Capitalization Policy

Outlines the minimum capitalization level and policy issues by category

Chapter 3: Capital Expenditures Control

Describes the Approval Levels and the policies related to controlling capital expenditures

Chapter 4: Plant In Service and Retirements

Outlines the policies related to custody, care, transfers and retirements of capital assets

Chapter 5: Depreciation

Describes the depreciation process for various types of assets

1.2 Purpose of the Manual

This manual has been prepared to provide guidelines for accounting and field personnel, and to document accounting standards at Terasen Gas. Use this manual to:

- determine which expenditures can be capitalized and which should be expensed
- learn about capitalization policies related to plant additions, transfers and retirements; including the application of overhead, allowance for funds used during construction and depreciation
- ensure that capitalized expenditures are appropriately authorized, recorded and controlled
- describe the administration in caring for and maintaining custody and control over the Company's capital assets
- identify the accounting classification of gas plant in service, work in progress and other gas plant
- follow prescribed procedures to help you with the process of capital expenditure control and to maintain adherence to capitalization policies

1.3 Audience for the Manual

This manual should be read and complied with by all Company personnel who are involved in the construction, acquisition, maintenance, removal and disposal of capital assets.

CAPITALIZATION POLICY

2.1 Introduction

This chapter covers the capitalization policies related to the capital additions acquired or constructed, defining capital versus maintenance expenditures, the basis of capital costs, and the classification for certain types of capital expenditures.

Matching Costs

Terasen Gas policy is to distribute expenditures as equitably as possible among present and future customers by matching capitalized costs to the accounting period in which associated benefits accrue. This is accomplished in accordance with the Company's depreciation/amortization practices, which are subject to BCUC regulations.

Capitalization

All costs associated with the acquisition and construction of capital assets are capitalized.

Capital Asset

Expenditures are classified as a capital asset following these criteria:

- the expenditure must provide, or contribute, benefits to Terasen Gas for a service life greater than one year
- the expenditure must result in, or contribute toward, acquisition of an economic resource or asset over which Terasen Gas has a legally enforceable claim to a service potential, right or specific benefit. Terasen Gas must also control the asset
- the expenditure must be expected to result in, or contribute toward, a benefit which leads with a reasonable degree of certainty to recover through potential sales of service or products, or which is required to meet safety or governmental regulations
- the expenditure must meet the minimum capitalization level requirements

2.2 Minimum Capitalization Level

Minimum Level

For direct costs incurred in acquiring or constructing the addition or replacement of a PRU which falls into one of the categories, is capitalized if the cost of the PRU exceed the specified limits:

	Minimum $
Tools and equipment	1,000
Furniture and equipment	1,000

Purchased computer software/hardware	1,000
Other general plant equipment	1,000
In-house developed computer software and/or based on assessment of individual projects	10,000

Concept of PRUs

The concept of Property Retirement Units (PRUs) is defined in the Company's PRU Catalogue. The PRU Catalogue is an integral part of the Capitalization Policy.

2.3 Capital Versus Maintenance

PRU Additions

The PRU outlines/describes the lowest level of expenditure for capitalization purposes for a unit of property in the asset subledger.

Maintenance

Items smaller than a component outlined/described in the PRU or an item whose acquisition cost is lower than the minimum capitalization level is charged to maintenance.

Expenditure on Existing PRUs

Expenditure on existing PRUs in service are capitalized if the expense results in:

- a replacement of the entire PRU or
- a substantial improvement or betterment of the PRU

Classification of Expenses

Expenditures during ownership of capital assets are classified as:

- maintenance and repairs
- improvements and additions
- rehabilitation/major renewals
- replacements and retirements

these expenditures are defined in further detail below to set them apart and to distinguish the cost as capital or a maintenance charge.

2.3.1 Maintenance and Repairs

Concept

Maintenance costs are expenditures made to keep the asset in good condition (preventive); while repair costs are made to put the asset back into good working condition (curative).

Does not Affect

Maintenance and repair costs are not expected to prolong the normal life of an asset (PRU), or materially add to its service value. As no additional benefits are anticipated, the costs of maintenance and repairs are charged to maintenance in the current accounting period.

2.3.2 Improvements and Additions

Substantial Betterments

Improvements or substantial betterments refer to capital expenditures on existing PRUs which:

- materially add to the service value of the PRU(s); or
- materially extend the normal service life of the PRU(s)

Increase in Service Value

The service value of a PRU may be increased through expansion and extension where there is an increase in the physical size of an asset. For example, a new wing is added to a building or more equipment is added to an existing capital asset.

Increase in Service Life

The normal service life of a PRU is increased through substitution where there is an increase in the quality of an asset. For example, paving a gravel parking lot increases the quality of an existing asset.

Consult Asset Accounting

When in doubt about each case in Section 2.3, consult Asset Accounting to assist you in deciding the appropriate accounting treatment.

Significant cost and long life do not by themselves decide that a replacement cost can be capitalized; e.g. the cost to replace a roof with the same kind of materials is accounted for a maintenance expense.

2.3.3 Rehabilitation/Major Renewals

To Restore

Expenditures to restore or improve buildings or equipment purchased in a rundown condition (e.g. second-hand plant), with the intention of rebuilding, can be charged to capital assets as part of the cost of acquisition, provided that;

- the costs of renewals, which means the costs of material (other than excluding second-hand parts remaining in the rebuilt PRU), plus the cost of labour used in the rebuilding process, exceeds fifty percent (50%) of the replacement cost of a new plant unit of the same kind and class
- the costs of dismantling and/or repairing old parts reused, are excluded and charged to expense

- the rebuilt plant unit (PRU) is accounted for as a capital addition, and the old plant unit PRU is accounted for as retired from service

2.3.4 Replacements and Retirements

Complete PRU

Replacement of a complete PRU:

- the original cost of the old asset (PRU) is retired and the cost of the new item is capitalized

Part of PRU is Maintenance

Replacements of parts and (less than a PRU):

- the costs of replacing parts and components of a PRU is accounted for as maintenance expense. Replacements of parts and components here means to restore the PRU to its original condition, and keep it in efficient operating condition

Extensive Replacement

Extensive replacements of part (less than a PRU) could be considered as capital improvement/substantial betterment.

The cost incurred to replace components or part of a PRU, which according to government or agency regulation creates a health or safety hazard, does not automatically qualify for capitalization. Such projects must meet the 'substantial betterment' criteria on an individual PRU, project/location basis.

In each case, please consult Asset Accounting.

2.4 Basis of Cost

At Cost

Expenditure for capital assets are recorded at the historic cost to Terasen Gas. Cost includes direct expenditures related to the acquisition/construction as well as a proportionate allocation of overhead and, where applicable, allowance for funds used during construction charges.

Construction by Terasen Gas

- If the capital asset is constructed for or by Terasen Gas, the construction costs including labour, material and supplies, contract work, special machine and heavy work equipment service, insurance, normal levels of damages, privileges, a proportionate allocation for overhead, and where applicable, allowance for funds used during construction.
- When a project necessitates the purchase of PRU equipment items such as office equipment, heavy work equipment, transportation equipment to be used exclusively for the project, the cost of such equipment is, for the

duration of the project, charged to construction, subject to approval by Asset Accounting.

Surplus-to-Project Material

- When a project is completed, surplus inventory items, considered re-usable, are returned to stores by crediting the project at the prevailing inventory unit cost.
- Non-inventory items that can be identified:
  - for future project use, scheduled to begin with two years are taken into Central Stores by crediting the project at fair market value; or
  - as office, heavy work or transportation equipment which were initially purchased exclusively for project use and now considered re-usable as general plant equipment, are transferred from WIP account to plant-in-service at fair market value, provided it meets the minimum capitalization level. If it is not considered re-usable as general plant equipment, it must be disposed of through re-sale and the proceeds credited to the project.

2.5 Capitalized Overhead

Cost Classification

Costs which cannot be directly identified with individual construction projects are collected by a cost centre and classified as operating /maintenance expense or capitalized overhead.

Allocation Predetermined

Overhead will be capitalized on the basis of predetermined rates established by Finance and reviewed annually, to ensure that the apportionment of Operating and Maintenance expense to capitalized overhead is reasonable and consistent.

Capitalization rates will be calculated annually by Finance, based initially on budgeted costs with revision at year end, to actual costs where the change is considered to be material.

Certain administrative/common costs are capitalized at fixed maximum rates, which do not vary with construction levels and will not be recalculated annually.

Distributed to Plant

The resultant overheads capitalized are charged monthly to GL account 10098 (Overhead Charged to Construction).

Plant Not Applicable

Overhead is NOT applied to:

- removal/dismantling costs
- general plant capital additions
- 47810 Meters
- CPCN projects

2.6 Allowance for Funds Used During Construction (AFUDC)

Policy

AFUDC is capitalized on projects under construction whose costs are greater than $50,000 each and which are expected to take three (3) or more months to construct. AFUDC is the cost of capital that is the cost of borrowed funds and a reasonable rate on other funds such as equity, used for the purpose of construction.

Rate Determined

The AFUDC rate is the return on rate base for Terasen Gas as approved by the BCUC.

AFUDC Applied

AFUDC is applied to both specific and certain recurring plant expenditures based on previous month-to-date total direct and overhead costs, less contributions in aid of construction received, if any.

AFUDC Begins

AFUDC will commence on the date the project work commences and ends when the project is placed into service For further information, refer to AFUDC documentation.

Preliminary Charges

Refer to section 2.8.2 below.

Adjustment

AFUDC applied to specific projects, may be subject to recalculation or reversal, if the AFUDC criteria is not met or the AFUDC rate is adjusted.

AFUDC Not Applied

AFUDC is not applied on expenditures in the following capital asset classifications:

- capital assets in service
- capital assets held for future use
- capital assets held for resale
- research, development and preliminary engineering
- projects with budgeted costs less than $50,000

- projects which are expected to be completed in less than three (3) months

2.7 Contribution In Aid of Construction

Source of

Consists of contributions or grants in cash, service or property from governments or government agencies, corporations, individuals and others for contributions in aid of construction and other purposes.

Refundable Contribution

Customers' Advance for Construction, G/L Account 25501 is reviewed at least annually by Finance, and any balance remaining by customer according to agreement or rule, shall be reclassified to contribution in aid of construction

Accounted for

The gross costs of the capital asset constructed is charged to the appropriate Gas Plant in Service account with a contra 21101 account to offset, the contribution in aid of construction.

From Billable Work

Recoverable costs, from billable work capitalized as capital additions, are accounted for as a contribution in aid of construction.

2.8 Classification of Capital Expenditures

Reason for

Certain types of expenditures warrants explanations in respect of capitalization policy, because of their function purpose and unique characteristics they are:

- computer software
- land
- leased property
- leasehold improvements
- pipeline – relocations and replacements
- major inspections and overhauls
- spare parts
- gas plant held for future use
- gas plant not in rate base
- deferred projects
- abandoned projects
- property taxes

Each of these are described below.

2.8.1 Computer Software

Purchased

Purchased computer software is capitalized according to the minimum capitalization level; See Capitalization Policy, Minimum Capitalization Level, Section 2.2.

In-House

The cost of in-house developed software will be considered for capitalization in accordance with the Capitalization Policy, Minimum Capitalization Level, Section 2.2.

- or based on an assessment of the individual project, it will include the cost of designing programs and implementing the system

2.8.1.1 Costs excluded from capitalization

Costs that are no longer capitalized and should be expensed include:

- development of training materials
- data conversion
- user training costs and
- feasibility costs

Enhancements

Subsequent enhancements are capitalized if:

- it meets the Improvement and Additions Criteria referred to under Section 2.3.2, and
- it meets the same minimum capitalization level set for in-house developed software

2.8.2 Land

Temporary Accounts

The cost of land is capitalized to plant and classified in one of the following accounts until it is placed in service:

- gas plant held for future use – when purchased with no immediate use
- work-in-progress – when purchased directly for, or transferred in from gas plant held

Cost Excluded

The costs of clearing, grading, leveling and surveying both before and after the construction are to be included in the cost of constructing the plant facilities and, therefore, are not to be included in the cost of the land.

Not-In-Service, Resale

Land that is not-in-service or removed from in-service for resale, is classified as Gas Plant Not In Rate Base; until sold

2.8.3 Leased Property

Capitalization Criteria

Leases are capitalized if the terms of the lease transfer substantially all of the benefits and risks of ownership related to the property from the lessor to Terasen Gas (lessee). There are no restrictions on the term of capitalized leases.

Transfer of Ownership

Ownership passes to Terasen Gas at the inception of the lease provided one or more of the following conditions are present:

Time of Transfer

- the terms of the lease provide that ownership of the leased property passes to Terasen Gas by the end of the lease term, or the lease provides for a bargain purchase option minimum $500 per PRU

Receive Economic Benefits

- the lease term is of such a duration that Terasen Gas will receive substantially all the economic benefits expected to be derived from the use of the leased property over its useful life (when lease term exceeds 75% of useful life)

Returns Assured

- the lessor would be assured of recovering the investment in the leased property and of earning a return on the investment as a result of the lease agreement

Leases Less Than $10,000

- for leases with payments over the term totaling less than $10,000 and where the asset is acquired at the end of the agreement or on buyout, the asset is recorded at the time of transfer of title to Terasen Gas

2.8.4 Leasehold Improvements

Criteria

A leasehold improvement exists when Terasen Gas leases property and incurs costs to make the property suitable for its use; e.g. offices, warehouses.

Capitalized When

Leasehold improvements are capitalized to the extent that:

- they exceed the owner's allowance by $500; and
- they provide benefits to Terasen Gas; and
- the term of the lease is in excess of 12 months

Types of Expenditures

Leasehold improvements

- office renovations to walls, floors and ceilings
- items permanently affixed to the structure
- non-salvageable, e.g. communication cables

Amortized

Leasehold improvements are amortized over the life of the lease and retired from plant in service when the facility is vacated.

2.8.5 Pipeline Relocations and Replacements

Pipe Relocations

Where a transmission or distribution pipeline of 20 or more continuous meters (65 feet) in length is relocated, that section changed is considered capital. The new line is a capital addition and charged to the appropriate capital asset. Where such a relocation results from action by a governmental authority, it will be accounted for in a similar manner.

Pipe Replacements

Where a transmission or distribution pipeline of 20 or more continuous meters (65 feet) in length is replaced for any reason, the original cost of the section removed is treated as a retirement and the total cost of opening and back filling the trench, as well as the installed cost of the new pipe is capitalized

Pipe Removed

A retirement entry is to be made for pipeline removed and/or abandoned due to a relocation or replacement. The costs of removing the retired pipe from the trench are accounted for as removal/dismantling costs.

Service Line Pipe

The costs of extending or shortening an existing service line is defined as an alteration and therefore capitalized. No retirement entry is made until the entire service line is removed or abandoned. Note however, that changes in as-built length must be updated accordingly.

Reconditioning

The costs of reconditioning pipeline not removed are charged to maintenance.

2.8.6 Spare Parts

Charged to Maintenance

Terasen Gas maintains an inventory of spare parts for its gas utility system. Spare parts generally are items comprised of less than a PRU and are, therefore, charged to inventory when purchased and expensed to maintenance when issued.

Types of Parts

Some spare parts, however constitute Retirement PRUs such as:

- spare modules for gas meters
- spare telemetry circuit boards

and are capitalized upon purchase and depreciated over the same estimated service life as the PRU to which they are related.

.

2.8.7 Major Inspections and Major Overhauls

Major Inspections: are those considered to be undertaken to assess transmission or distribution infrastructure or other major asset infrastructure or equipment, for possible required capital improvements (including, but not limited to, all ILI) and thus should be capitalized and depreciated separately over the appropriate useful life to the next inspection rather than being expensed. The specific circumstances and facts pertaining to each type of inspection need to be considered. Some possible indicators that can assist in identifying additional major inspections could include consideration of the following (this is not an exhaustive list):

- Cost greater than $250,000, or
- Frequency greater than 1 year (eg. occurs once every 5 years), or
- Required by law or regulations as part of the safe operation of the related asset

The following types of inspections are considered to be "major inspections" as of the date of this memo and should be capitalized as a separate asset:

- In-Line Inspections (includes marine ILI)
- Marine Crossing Inspections (external)

Major overhauls may be required at regular intervals over the useful life of an item of property, plant and equipment, such as the compressor station equipment, to allow the continued use of the asset. The overhaul costs should be capitalized and depreciated separately over the appropriate useful life to the next overhaul rather than being expensed. The specific circumstances and facts pertaining to each type of overhaul need to be considered. Some possible indicators that can assist in identifying additional major overhauls could include consideration of the following (this is not an exhaustive list):

- Cost greater than $250,000
- Frequency greater than 1 year (eg. occurs once every 5 years)
- Required by law or regulations as part of the safe operation of the related asset

The following types of overhauls are considered to be "major overhauls" as of the date of this policy and should be capitalized as a separate asset:

- Gas Turbine Overhauls
- Gas Compressor Overhauls

Intangible Assets

Non-Physical

Expenditure which results in the acquisition of intangible (non-physical) assets, are capitalized provided that:

Provision

- the privileges obtained runs in perpetuity or for a specified term of more than one year; or
- the expenditure is necessary or valuable in the operation of the company and
- the expenditure are in excess of $10,000

Type of Expenditures

Types of tangible asset expenditures are:

- franchises and consents paid to governmental authorities
- patents, licenses, rights and privileges

2.9 Gas Plant Held for Future Use

How to Maintain

The costs of acquiring or constructing plant items for future use are capitalized and classified as Gas Plant Held for Future Use. This account should be maintained in such detail as though the plant were in service.

Qualification Criteria

In order to qualify as Gas Plant Held for Future Use, the plant item must be:

- a physical asset, at a minimum of $500 each
- not in-service or part of unfinished construction
- intended for a specific potential use within 20 years

Held for Resale

If the project is terminated and no other future use is planned, the physical plant items are held for resale at the lower of cost or market value and the gain or loss included in the other income accounts.

2.10 Gas Plant Not in Rate Base

Established By Regulation

Terasen Gas may acquire or construct plant items which are useful and beneficial to the company, but, according to BCUC regulations, are not to be included in the rate base. Such costs are capitalized but classified as Gas Plan NOT in Rate Base.

Detailed Records

Terasen Gas will maintain subsidiary records in which Gas Plant Not in Rate Base is subdivided according to the plant facility to which it applied and to each group of plant accounts.

Type of Expenditures

Gas Plant Not in Rate Base may include the following Capital expenditures:

- BCUC disallowances on cost capitalized in prior years
- corporate art
- premium costs paid on acquisition of other gas utilities, whose plant costs are to be involved in rate base

Disposition

The disposition of Gas Plant Not in Rate Base is reflected on the Income Statement as other income or other income deductions. Refer to Chapter 4, Gas Plant In Service, Section 4.4.3, for policy on premium cost retirements.

Deferred Projects

Criteria

A project is deferred if the scheduled in-service or turn-on date has been delayed by management decisions and the work is halted for more than one year.

Write-Offs

Appropriate write-offs may be made at the time of the deferral and in subsequent reviews where:

- specific obsolescence of some costs is identified; or
- changes in technology or environmental considerations may progressively diminish the usefulness and degree of certainty of recovery

Treatment of Assets Retained

Assets retained at the site may have to be mothballed. Costs of mothballing and maintenance costs during the deferral period as well as demothballing costs are all charged against operations when incurred, since no betterment of the asset has occurred.

2.11 Abandoned Projects

Written-Off

A capital project is considered abandoned when it is decided never to reactivate it again. The costs incurred to date, exclusive of AFUDC and physical assets remaining, are written-off as charges to operations, or if significant, to other income deductions.

Accounting For Physical Assets

Physical assets relating to abandoned projects are either:

- disposed of by resale
- returned to inventory
- transferred to other projects at market value, except where no market value exists in which case original costs will be used; or
- written-off if they have no alternative use or market value

2.12 Property Taxes

Paid on Assets

Terasen Gas pays property taxes, grants or percentage amount in lieu of general taxes on its assessable capital assets while they are in-service or held for future use.

Capitalized When

Taxes on capital assets under construction or on capital assets that are not yet ready for service are capitalized and charged to the appropriate work order or capital account.

Reporting Quantity Data

Operations managers will be responsible to report as required the quantitative data by capital district for Recurring Plant to Lands Department. This data is used to compute the assessable capital assets for property tax purposes.

Reporting Capital Data

Asset Accounting is responsible to accumulate and report capital additions and retirements of assessable capital assets to the Taxation department.

CAPITAL EXPENDITURE CONTROL

3.1 Introduction

This chapter covers the policies related to controlling capital expenditures during the capital acquisition or construction stage.

3.2 Authorization Of Capital Expenditures

Specific Approval Levels

Terasen Gas has established specific authority levels for approving Capital and Operating Expenditures as defined in the Company's Expenditure Authority Policy.

Budgeted vs. Non-Budgeted Items

These levels cover both budgeted and non-budgeted items. Approval authority for budgeted items may be delegated to immediate subordinates. Delegation is not allowed for non-budgeted items.

Types of Cost Monitoring Objects

The following types of objects are used to ensure that Capital expenditures are controlled:

- Internal Orders (I/O)
- Projects and Work Breakdown Structures (WBS)

Recurring and Specific Plant

The use of these objects warrants explanation with respect to the Capitalization Policy, because the capitalization of costs are classified between Recurring and Specific Plant; and variation in level of control is recognized.

Field Operations Responsibility

Recurring Plant expenditures are budgeted for and monitored by Operations.

3.3 Internal Orders (I/O)

Definition

Internal Orders are temporary cost objects used to track one-time events or recurring programs.

Types of Capital Internal Orders

- The types of Capital Orders are listed in the Budget Guidelines Manual, Section 7.1 Capital Expenditures. General Plant direct purchases
-

Internal Order Creation

It is the responsibility of each operating department to create internal orders to capture and monitor costs. Costs can be planned in the internal order for comparison between actual and plan. It is important that all mandatory fields are completed accurately and detailed descriptions are maintained so proper settlement rules can be completed.

Settlement Rule

Asset Accounting will enter settlement rules in the orders based on the information entered in the master data of the internal order record. The settlement rule specifies which asset will receive the costs collected in the internal order. Once the asset receives the costs, the asset goes in service.

Internal Order Status

There are four different statuses for an internal order, each allows for different processes to occur. In the created status planning and settlement rule maintenance is allowed. In the released status additional planning, settlement rule maintenance, actual cost posting and settlement to AUC is allowed. When the status is changed to technically complete (TECO) settlement rule maintenance, actual cost posting and final settlement is allowed. The order status is moved to close when all costs are processed and costs are moved to the final asset.

Additional Information

For additional information regarding the use of internal orders, please refer to the Budget Guidelines.

3.4 Projects and Work Breakdown Structures (WBS)

Definition

Projects and WBS Elements are temporary cost objects used to track one-time events or specific programs.

Project and WBS Creation

It is the responsibility of each project manager and or OFA/OFC with the assistance of Asset Accounting to create project definitions and WBS elements to capture and monitor costs. Costs can be planned in the WBS element for comparison between actual and plan. It is important that all mandatory fields are completed accurately and detailed descriptions are maintained so proper settlement rules can be completed.

Settlement Rule

The settlement rule specifies which asset will receive the costs collected in the WBS element. Once the asset receives the costs when the asset is in service. Asset Accounting will enter settlement rules in the project based on the information entered in the master data of the project record.

Project and WBS Status

There are four different statuses for a project or WBS element, each allows for different processes to occur. In the created status planning and settlement rule maintenance is allowed. In the released status additional planning, settlement rule maintenance, actual cost posting and settlement to AUC is allowed. When the status is changed to technically complete (TECO) settlement rule maintenance, actual cost posting and final settlement is allowed. The WBS status is moved to close when all costs are processed and costs are moved to the final asset.

Additional Information

For additional information regarding the use of Project and WBS elements, please refer to the Budget Guidelines.

PLANT IN SERVICE & RETIREMENT

4.1 Introduction

This chapter covers the policies related to custody, care, transfers, removal and or abandoning, and final disposal of capital assets within/from gas plant in service.

4.2 Capital Assets: Care, Custody and Control

Project/Asset Manager Responsible For

As part of their responsibility for the utilization, care and safekeeping of Terasen Gas capital assets under their control, managers shall ensure that:

- all transfers, removals from service are fully reported to them
- adequate internal controls are maintained
- all status change documents are forwarded to Asset Accounting

Asset Accounting Responsibility

Asset Accounting shall ensure that the accounting records correctly report additions, transfers, retirement, and changes of status, based on the information provided by the responsible managers.

General Ledger Capital Accounts

Accounts are setup on the Budget Guidelines Manual, Section 7, “Capital Budgets”. Manuals to capture the current year’s capital additions, retirements, related removal costs and salvage proceeds.

Subsidiary Plant Records

These accounts are called asset classes and are designed to classify the gas plant in service assets acquired or constructed and physically placed into service. These sub-accounts are primarily maintained by Asset Accounting and serve as subsidiary records to the GL100 and GL105 accounts. These asset classes can be found in the Budget Guidelines Manual, Section 7.3.3 Asset Class List.

PRU Catalogue

Asset Accounting maintains an inventory record of capital assets by Property Retirement Units (PRUs), as defined in the Property Retirement Unit Catalogue. The PRU Catalogue is an integral part of the Capitalization Policy. A PRU defines the lowest level of expenditure for capitalization and control.

Primary Sources

The primary sources of data for an accurate record of capital assets are, Fixed Asset Transfer (FAT) and Plant Retirement Requests (PRRs) documents. Each of these are discussed below.

4.3 Fixed Asset Transfers (FAT)

Change in Custody Only

Transfer of capital assets is confined to movements and changes in custody of one or more PRUs, which will continue to be used for the original or equivalent purpose.

Applies to

- General Plant or "portable type" PRUs when such units are physically transferred to another plant facility location in a different Capital District or Region
- Plant under construction (WIP), where existing PRUs are removed from one plant facility location and immediately re-installed, subject to cleaning or refurbishing, at a new project site under construction

Original Cost and Depreciation

The original cost, estimated if not known, of the PRU and, where applicable, the accumulated depreciation value is transferred. The accumulated depreciation applies where the transfer affects divisional boundaries.

Asset Transfer Document

The Asset Transfer form is prepared by the sending Cost Centre at the time the PRU is transferred, and must show the complete PRU description, make/type, serial number, year of acquisition, present and new locations, appropriate approvals and acknowledgement by the receiving cost centre.

4.4 Retirements

Service Value

The original cost or, where applicable, a reasonable estimate, is credited to the appropriate capital account with the offset entry to the accumulated depreciation account, for the PRU retired.

Items Less Than a PRU

- When plant, comprising less than a PRU, is removed and not replaced or improved upon in accordance with Section 2.3.2 "Improvements and Additions", no retirement entry will be made to the capital accounts at that time. Its value will be retired upon the retirement of the PRU with which it is associated.

- A retirement will be made where the PRU is rebuilt in excess of 50% of the replacement cost of a new plant unit of the same kind and class, see Section 2.3.3 "Rehabilitation/Major Renewals"

4.4.1 Specific Plant Retirement

Specific plant retirement occurs when:

Occurrences

- a complete PRU is physically removed or abandoned from plant in service
- an existing PRU is replaced
- improvements, substantial betterments, rehabilitations or major renewals are made to an existing PRUs concurrently with partial removal or abandonments to these PRUs. See Chapter 2, Sections 2.3.2 and 2.3.3

Documentation

- To maintain efficiency in processing documents on asset retirements/disposals, a separate form is used appropriate to the type of asset retirement. Refer to the Procedure Section of this manual.
- In the absence of specific retirement/disposal procedures, a Plant Retirement Request (PRR) is to be used.

4.4.2 Recurring Plant Retirement

Recurring plant retirement occurs when:

Occurrences

Mains (47500)	a main is removed or abandoned;
Services (47300)	a service line is deactivated to a stub service or, a complete service line is removed or abandoned;
Meter (47810)	a residential or commercial meter is removed from service

Quantity Reporting

No Plant Retirement (PRR) is required to retire Recurring Plant. In its place, annual plant unit reports for mains and services retired are generated by by running a Business Warehouse report in SAPFor meters retired monthly information is provided by the Measurement Group to Asset Accounting.

4.4.3 Retirement Accounting

By Asset Accounting

Asset Accounting Department makes all retirement accounting entries.

Unit Cost Tables

Retirement Unit Cost tables are computed annually for Recurring Plant, and used to establish retirement values based on quantity supplied by operations.

Original costs, estimate if not known, are used to retire Specific Plant PRUs.

.

4.5 Removal Dismantling Costs

Associated With Retirements

Removal or dismantling costs are associated with asset retirements. It includes labour, material, contract services and other direct expenditures related to demolishing, dismantling, tearing down or otherwise removing PRUs from plant in service.

Refurbishing Costs

Costs incurred to refurbish “used” inventory or non-inventory materials recovered from gas plant in service is chargeable to the removal/dismantling project to which it relates; unless the refurbishment results in a rebuilt plant unit refer to Section 2.3.3 of this Manual.

Overhead

Overhead is NOT applied to removal/dismantling costs. Such costs are not considered significantly large in contrast to capital additions.

Negative Salvage Values

The provision for net negative salvage or removal costs are no longer included in deprecation but instead actual costs are estimated and included in cost of service and recovered from customers in each respective year. Any variances between the actual amount of net removal costs realized and the estimated amounts included in cost of service are recorded in a deferral account ‘Removal Cost Deferral Account’ by Asset Accounting.

4.6 Salvage/Proceeds Values

Credited to Work Order

Salvage or proceeds is the value of material recovered from capital retired and is credited to work orders.

Types of Salvage

Salvage value can be realized through:

- disposal by sale – salvage value is equal to the selling price
- recovery of large items to stock – reusable materials consisting of large individual items, usually a PRU, are salvaged at its original costs, estimated if not known
- recovery of small items to stock – reusable material consisting of relative small items, usually pipe fittings, is salvaged to stock at the prevailing inventory unit cost

Repair To Salvage Items

The cost incurred for repairing or refurbishing salvage items to its reusable condition, is part of the removal and dismantling process of asset retirement. When such repairs are done concurrent with the dismantling process, it can be charged to the appropriate dismantling/removal work order; otherwise, a new work order must be raised.

Insurance Claims

The value of insurance claim settlements received should be accounted for as follows:

- Property Retirement Unit (PRU) – as a salvage credit to the retirement of the PRU
- Non-Capital – the insurance proceeds will be credited to the account(s) chargeable with the expenditure necessary to restore the damaged plant

4.7 Gains and Losses on Disposal

Depreciable Assets

Gains or losses on asset disposal are transferred to a deferral account by asset accounting. Salvage proceeds realized whether through resale or recovery to inventory is credited to the accumulated depreciation reserve.

4.8 Inactive Plant

Classification

Assets retained but not longer considered actively engaged in gas utility operations are classified as Inactive Plant, and should either be:

- reclassified to gas plant held for future use
- disposed through resale
- removed/dismantled and scrapped

4.9 Fixed Assets Held For Resale

Initial Recording

Such assets are normally maintained in the capital account to which asset was initially recorded.

Intent To Dispose

If however, the intent to dispose of the asset by re-sale has been determined with no established date, and the asset is considered "inactive", then Asset Accounting may reclassify the asset to a separate capital sub-account, "Fixed Assets Held For Re-sale".

DEPRECIATION

5.1 Introduction

This Chapter covers the accounting policies concerning the computation of depreciation and the accounting treatment for special depreciable items of capital.

Matching Cost Concept

Capital expenditures are distributed as equitably as possible between present and future customers by matching these costs to the accounting period in which the associated benefits accrue. This is accomplished by the depreciation/amortization practices used by the Company.

5.2 Depreciation Versus Amortization

Allocation to Operating Expense

Both terms relate to allocating the cost of depreciable capital to operating expense except that:

- depreciation extends over the actual service life of the asset, where as
- amortization is limited to the contractual term of the asset

5.3 General Requirements

Basis of Depreciation

The basis is to allocate the cost of the depreciable asset, the salvage proceeds, over the estimated service life of an asset in a systematic and rational manner.

Commencement

Depreciation begins the month following when the asset is considered in-service.

Timing

Depreciation is provided on a straight-line basis, and computed in conformity with the "group system", i.e. a group of individual assets (PRUs) classified under the same capital account.

Method

Depreciation under the straight-line service-life method is computed by applying the annual percentage to the cost of depreciable capital as recorded in the capital account, divided by twelve for the monthly recording.

Rate

A separate rate for each asset class is used in computing depreciation.

Approval

The various rates are approved by regulatory authorities, e.g. BCUC.

The Service Life

The service life is the period of time between the installation or acquisition of the asset and its retirement for accounting purposes.

Depreciation Under Group System

The "group system" contemplates that some part of the investment in a group of assets will probably be recovered through salvage realizations, and that probably there will be variations in the service lives of assets constituting the group, even among assets of the same class. The depreciation provision determined for the group is a weighted average of the various individual provisions reflecting the individual expectancies of life and salvage for each PRU in the group.

Maintain Depreciation Records

It is not the intention of this group classification to require the Company to keep records of the accumulated depreciation of each PRU.

For the purposes of analysis, however, the Company shall maintain subsidiary records in which accumulated depreciation is sub-divided according to each group of Gas Plant Accounts.

5.4 Accounting For Special Depreciable Items

in rate base.

5.4.1 Contribution in Aid of Construction

Contribution credits in the G/L 21101 account are amortized over the average service lives of the capital assets to which they relate.

5.4.2 Leasehold Improvements

Leasehold improvements are amortized over the life of the lease (must be greater than 12 months), and retired from plant in service when occupancy is vacated.

5.4.3 Obsolete and Surplus Stock (Used)

The value of obsolete and/or surplus stock removed from inventory which can be identified as used items, shall be charged to accumulated depreciation as an adjustment to previous salvaged-credits realized.

5.5 Non-Depreciable Capital

Depreciation/amortization is not charged on:

- land and land rights
- work in progress
- inactive plant, unless by regulated agreement
- plant held for future use
- plant not in service

5.6 Disposal

When non-depreciable capital is disposed of through resale, the original cost of the asset is credited to the applicable capital account, and any substantial gain or loss is recorded as an extra ordinary item in the income statement. If this amount is not significant, it is reported as income or income deductions.

When depreciable capital is disposed of through resale the original cost of the asset is credited to the applicable capital account and charged to its corresponding accumulated depreciation account. The net salvage proceeds, if any is credited to the related accumulated depreciation account.

Attachment 99.2

Main Extensions

Replaces: CUS 07-08 dated 30 March 2006.

Overview

This specification outlines Terasen Gas requirements for initiating, processing, and obtaining approval for the construction of main extensions to the Terasen Gas Lower Mainland and Interior distribution systems in accordance with the Terasen Gas Inc., Terasen Gas (Vancouver Island) Inc., and Terasen Gas (Whistler) Inc. tariffs.

Audience

This document is intended for employees working in the Customer Contact Centre, Planning and Design, Marketing and administrators involved in the main extension process.

References

- ADM 04-01 *Authorization Levels*
- CUS 07-05 *Charges for Service Line Work*
- DES 04-02-01 *New Loads and Changes in Existing Loads*
- Form 1754 *Distribution System Capital Expenditure Approval/Summary*
- Economic Test Training Materials
- Terasen Gas Inc. Tariff
- Terasen Gas (Vancouver Island) Inc. Tariff
- Terasen Gas (Whistler) Inc. Tariff

Policy

Terasen Gas will make extensions to its gas distribution system according to development requirements, in a manner that is consistent with this standard and the Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc., and Terasen Gas (Whistler) Inc. tariffs. All main extensions will be the property of Terasen Gas.

Caution: Printed documents may not be current. Verify online.

Definitions

Annual Consumption GJ/Unit

Annual consumption is the number of gigajoules consumed per premises, based on the building type, end use application, insulation, and normal degree-day conditions.

CAFE

Customer Attraction Front End (CAFE) is a custom software tool developed for Terasen Gas that provides a "front end" customer application tool to SAP. It is primarily used to process data resulting from customer related work such as gas service applications, main extensions, abandonments and alterations. CAFE is also configured to perform the economic test.

Contributing Customer

A contributing customer is a customer connecting to a main who must pay a contribution toward the cost of the main extension.

Direct Cost

The direct cost is the cost of an installation including labour (with concessions and benefits), vehicles, equipment, material, and contractors, excluding overhead and GST.

Discounted Cash Flow (DCF)

The DCF is a stream of costs or revenues over time, discounted to give the present value.

Double Main

A double main is an installation with mains on each side of a street. This eliminates road crossings for services or stubs installed with the main to the property line.

Economic Test

The Economic Test or formerly known as the Main Extension Test (MX Test) is a discounted cash flow analysis of the projected revenue and costs associated with the main extension and has been approved by the BCUC. The total revenues and costs for the main extension project are calculated over a 20-year period, based on the number of customers projected to connect to the main extension within five years of construction, along with their forecast annual consumption. The economic test determines whether or not a contribution is required from those customers connecting to the main extension within the first five years of construction.

GST

GST is the Goods and Services Tax.

Main Extension

A main extension is an extension of one of Terasen Gas' mains with distribution, intermediate or transmission pressures, and includes tapping of transmission pipelines, the installation of any required pressure regulating facilities and upgrading of existing Mains, or pressure regulating facilities on private property.

Main Extension Contribution

Also known as a contribution in aid of construction (CIAC), this represents the portion of the capital cost a customer must pay to offset the revenue deficiency of the main extension, as determined by the economic test.

Net Present Value (NPV)

The net present value (NPV) is determined through the economic test, and represents the present value of the expected cash flows over 20 years (both costs and revenues) of a proposed main extension. The net present value of a main extension is determined on a discounted cash flow basis.

A positive NPV indicates that the present value of the projected revenues exceeds the present value of the costs. A negative NPV indicates a revenue deficiency or shortfall.

Profitability Index (PI)

The profitability index (PI) is the revenue to cost ratio, which compares the present value of revenues expected from a main extension project to the present value of costs expected over a set period of time.

Caution: Printed documents may not be current. Verify online.

Revenue Deficiency

A revenue deficiency or shortfall is the amount of additional revenue needed to achieve a zero NPV in the DCF analysis used in the economic test.

Service Line

The service line is the portion of Terasen Gas' gas distribution system extending from a main or a service header to the inlet of the meter set. In case of a vertical subdivision, or multi-family housing complex, the service line may include the piping from the outlet of the meter set to the customer's individual premises, but not within the customer's individual premises.

Service Header

A service header is a gas distribution pipeline located on private property connecting three or more service lines or meter sets to a main.

SAP

SAP is a business application software tool supports order fulfillment which includes customer related work such as gas service applications, main extensions, planning and work management tools. It also supports the financial, budgeting, controlling, materials management, inventory management, purchasing, measurement technologies, plant management, operate & maintain, and human resource functions.

Single Main

A single main is a main that runs on one side of a street, with services to customers on both sides of the street.

System Improvements (SIs)

System Improvements (SIs) are system reinforcements made to ensure that adequate system capacity is available to meet customer energy requirements at the minimum system pressure approved by System Planning. The treatment of SIs in the economic test evaluations is discussed in more detail below.

Vertical Subdivisions (VSD)

Vertical subdivisions (VSD) are a multi-storey building that has individually metered units and a common service header connecting banks of meters typically located on each floor.

Caution: Printed documents may not be current. Verify online.

Terasen Gas

Initiating a Main Extension

When Terasen Gas determines that a main extension is needed to meet system development requirements, the planner will initiate a main extension scenario in CAFE to capture design details, pricing and options associated with the project.

Planning and Design

The Distribution Planning & Design Group is responsible for:

- Initiating jobs (or scenarios) in the appropriate systems.
- Ensuring that system job numbers are used on all correspondence and files.
- Determining the annual number of customers projected to connect to a main extension within five years of construction.
- Determining the annual consumption for each customer (see **Annual Consumption**) that is projected to connect to the main extension within five years of construction.
- Designing the pipe layout, size, length, and other facility requirements.
- Estimating direct costs for the main and associated facilities.
- Running the economic test and recording the results on **Form 1754** *Distribution System Capital Expenditure Approval/Summary* (see **Main Extension Test**).
- Communicating with the Commercial Sales and Marketing Manager, or the Commercial Account Representative regarding any main extension applications for main extensions for customers who exceed an estimated load of over 5,000 GJ per year. In these cases CAFÉ generates an automated alert to inform the above mentioned manager/representative, and they will arrange for any required contracts and also work with the Marketing Process Support Analyst to run the economic test.
- Informing Engineering and Transmission Operations about any applications requiring extensions to IP and TP pipelines.
- Providing a plan of all existing facilities connecting to IP or TP mains and facilities.
- Ensuring that enough gas service applications and contributions have been secured before advancing a project to the construction stage.

Caution: Printed documents may not be current. Verify online.

- Providing a Load Information Memo (LIM) to System Planning for analysis of the main extension.
  - See **DES 04-02-01** *New Loads and Changes in Existing Loads*

- Communicating with the Right of Way group regarding the requirement of a right of way, or if there are infringements on Terasen Gas pipeline right of ways, and also ensuring that the required documentation is in place prior to construction.
- Ensuring that any required internal and external approvals are obtained prior to construction.
- Issuing the required documentation and construction drawings to the field.
- Ordering construction materials.
- Liaising with IRM Dispatch and Installation/Distribution Managers regarding resource ability, scheduling, and reviewing estimates.

Costs

Direct cost estimates for main extensions will be determined for the economic test based on the following guidelines:

- The direct cost estimate will include the size of the main and/or service header, and associated facilities required to serve the customers projected to connect to the distribution system within five years of construction.
  - The System Planning Manager may elect to install a larger main to allow for future growth. The customer will not be responsible for any additional costs associated with installing the larger main.

- A double main will be installed if it is the least cost alternative, or if it is required by local governments.
  - The least cost alternative will be determined by comparing the cost estimate of double mains plus the service lines, to the cost estimate of a single main plus service lines.
  - The cost of the double main will be included in the direct cost estimate.

Caution: Printed documents may not be current. Verify online.

- Costs such as river crossings, bridges, surveying, land transaction costs, bedrock blasting, right of way clearing, and environmental impact investigations will be included in the direct cost estimate.
- Archaeological costs are the responsibility of the customer and will only be factored into the economic test if Terasen considers the costs a necessity to secure future growth.
- The planner will provide project specific service line direct cost estimates for all customers in the economic test.
- The planner will provide specific meter set direct cost estimates for large commercial and/or industrial customers in the economic test .
  - Typically, meter set costs for residential and small commercial customers are automatically selected by CAFÉ, but for larger load customers they are manually obtained and entered into CAFÉ to be used as an input for the economic test.

- SI costs are to be included as an input into the evaluation of a main extension for all customers.
- Incremental operating, maintenance, and overhead costs, and other appropriate fees are automatically calculated in the economic test based on each customer's rate class and annual projected load, and the direct cost estimate of the main, service lines, meter sets and other main extension components described above.

Annual Consumption

Residential and Small Commercial Customers

The Planner will forecast the annual consumption (GJ/customer) for residential and small commercial customers based on the type of premise(s) being connected, the building characteristics, and appliances expected to be connected.

Customers other than Residential and Small Commercial

The Planner will forecast the annual consumption (GJ/unit) for customers other than residential and small commercial on an individual basis, using similar criteria as for residential and small commercial customers, including building characteristics, expected appliances to be connected, equipment ratings, and also consumption data for comparable existing customers.

Caution: Printed documents may not be current. Verify online.

Economic Test

As discussed above in the definitions, the economic test is a discounted cash flow analysis of the projected revenues and costs associated with a main extension.

The economic test will be applied to new applications for services requiring new gas mains, as well as for service header and vertical subdivision applications. In vertical subdivision applications, the direct cost estimate of the underground pipe, plus the building piping and associated equipment, will be used as the direct cost estimate of the main. Similarly, in service header applications, the direct cost estimate of the service header will be used as the direct cost estimate of the main.

- See **CUS 07-05** *Charges for Service Line Work*

The following data is required to run the economic test:

- System job number
- Direct cost of the main
- Direct cost of the service header
- Direct cost of each service line
- Direct cost of each meter
- Direct cost of each regulator
- Direct cost of common pressure regulating assemblies for vertical subdivisions
- Number of customers projected to be added annually within five years of construction
- Each customer's rate schedule
- Each customer's projected annual consumption (GJ/yr.).

If the economic test indicates a revenue deficiency, the customers will need to pay a contribution equal to the revenue deficiency in order for the project to proceed.

- See the Contributions section of this document.

The Sales and Marketing Manager will arrange for the economic test to be run for exceptionally large commercial and industrial customers.

Approvals

The Planning & Design Work Leader has the authority to give final approval to main extension applications if:

- The Planner has reviewed the application and signed the main extension authorization form.
- The total mains and facilities installation direct costs do not exceed \$50,000.

The Planning & Design Manager, has the authority to give final approval to main extension applications if:

- The Planner and Planning & Design Work Leader has reviewed the application and signed the main extension authorization form.
- The total mains and facilities installation direct costs do not exceed \$100,000
- The appropriate approvals from other departments are received.

The Director, Operations Centre has the authority to give final approval to main extension applications if:

- The Planning & Design Manager has reviewed the application.
- The total mains and facilities installation direct costs do not exceed \$250,000.
- The appropriate approvals from the Customer Management & Sales Department are received to confirm the forecast number of attachments and projected annual consumption.
- The appropriate approvals from other departments are received.

The VP, Distribution has the authority to give final approval to main extension applications if:

- The Manager, Operations Centre has reviewed the application.

Caution: Printed documents may not be current. Verify online.

- The total mains and facilities installation direct costs do not exceed $500,000, in accordance with the capital approval levels identified in **ADM 04-01***Authorization Levels.*
- The appropriate approvals from the VP, Marketing & Business Development is received to confirm the forecast customer attachments and projected annual consumption.
- The appropriate approvals from other departments are received

Main extension applications not eligible for approval by the VP, Distribution will require the approval of the President, Gas Segment, up to $2,000,000 in accordance with the capital approval levels identified in **ADM 04-01** *Authorization Levels.*

Main extensions requiring connection to the Terasen Gas transmission system (excluding service lines from IP pipelines) require the approval of the Manager, Transmission Operations.

Main extensions that may infringe on an existing Terasen Gas transmission pipeline right of way require the approval of the Manager, Property Services.

Main extensions that require system improvements or oversizing to accommodate future load growth, or involving pipe sizes of 114 mm or larger, require the approval of the System Capacity Planning Manager and the Distribution Assets and Improvements Manager.

Main extensions that require alteration to, or the construction of, a new pressure reducing facility, require the approval of the Distribution Assets and Improvements Manager.

Those providing approvals of main extensions must sign **Form 1754***Distribution System Capital Expenditure Summary/Approval.*

Variances

Installation/Distribution Managers are responsible for ensuring that the main extension is installed as designed and approved. If any changes are necessary, the Installation/Distribution Manager, in conjunction with the Planner, must alter the design and obtain the necessary approval before construction.

Caution: Printed documents may not be current. Verify online.

Any completed main extensions with significant variances will be identified and reviewed by the Planning & Design Manager. The Planner and Installation/Distribution Manager will work together to explain the variance and any explanations will be kept in the project work order file.

Contributions

When the results of the economic test indicate a profitability index of less than 0.8 for TGI & TGVI or less than 1.0 for TGW, Terasen Gas will collect a contribution from the customers initially connecting to the main extension.

Contributions will not be adjusted based on updated or actual revenues and/or costs unless approved by the appropriate Marketing manager (Manager, Residential & Commercial Energy Solutions or Manager, Commercial and Industrial).

Quotations to customers for main extensions must be given in writing. These quotations are normally valid for 90 days. The Planning & Design Manager must approve any extensions to the 90 day period.

Construction may only begin after:

- The required contributions are collected from customers initially connecting to the main.
  or
- Agreement is obtained to have the contribution funded through regional taxation.
  and
- All required permits and approvals are obtained.

The Planning & Design Manager may waive contributions of less than $100 per customer connecting to the main extension.

Contribution

The total required contribution will be paid by the Customers connecting at the time the main extension is built. Terasen Gas will collect contributions from all customers connecting during the first five years after the main extension is built. As additional contributions are

Caution: Printed documents may not be current. Verify online.

received from customers connecting to the main extension, partial refunds will be made to those customers who had previously made contributions. At the end of the fifth year, all customers will have paid an equal contribution, after reconciliation and refunds.

For larger main extension projects, Terasen Gas may use a main extension contribution agreement for initial contributions. Customers will be billed the contribution based on the terms of the agreement.

Situations that cannot be resolved using the above guidelines will be referred to the Customer and Energy Forecasting Manager.

Refunds

A review will be performed annually, or more frequently at the Company's discretion, to determine if a refund is payable to all customers who have contributed to the extension.

If the review of contributions indicates that refunds are due:

- Individual refunds greater than $100 will be paid at the time of the review.
- Individual refunds less than $100 will be held until a subsequent review increases the refund payable to more than $100, or until the end of the five-year contributory period.
- No interest will be paid on contributions that are subsequently refunded.
- The total amount of refunds issued will not be greater than the original amount of the contribution.
- If, after making all reasonable efforts, Terasen Gas is unable to locate a customer who is eligible for a refund, the customer will be deemed to have forfeited the contribution refund and the refund will be credited to the other customers who contributed towards the main extension.

Contributory main extensions and service headers will be identified in the GIS system and also on the plate maps. The GIS system and plate map will have all main extensions labeled with a unique number, and contributory main extensions will have a suffix of "$YR" ("YR" is the year the main was installed).

Terasen Gas

Main Extension Refund Database

The contribution amount for each contributory main extension will be tracked in the Main Extension Refund Database. The Marketing Process Support Analyst (administrator) will administer the database. The Planners will have read-only access to the database reports, through a folder on the Terasen Gas "S drive". The Planner will complete the mains contribution database input form, and forward it to the administrator for each customer addition to an existing or new contributory main extension.

The administrator is to coordinate the issuing of refunds and also maintain the refund database.

Extensions to Contributory Extensions

When a main extension is being attached to an existing contributory main extension that was constructed less than five years ago, those customers connecting to the new extension may be required to pay a contribution towards the older contributory main extension as well as towards the new main extension. The new main extension will be evaluated using the economic test to determine whether a contribution is required for that extension, and then a prorated portion of the total contribution required for the existing contributory main will also be assigned to those customers connecting to the new main extension.

If an application for an extension to a contributory main extension is received, the Planner will notify the Marketing Process Support Analyst who will then determine the amount of the contribution for the extension of the contributory extension.

GST

The GST must be added to any contributions collected from the customer. It must be noted separately in any correspondence (including receipts), making reference to the Terasen Gas GST registration number for the appropriate company.

Records

Form 1754 *Distribution System Capital Expenditure Approval/Summary* must be completed and signed as indicated in **Planning and Design** and **Approvals**. The completed forms are to be forwarded to and retained in the Planning and Design Department

Caution: Printed documents may not be current. Verify online.

Main Extensions

Terasen Gas

Replaces: DES 04-03-08 [OI PLN 100-3] dated 14 September 1998.

Overview

This specification outlines Terasen Gas requirements for initiating, processing, and obtaining approval for the construction of main extensions to the Terasen Gas lower mainland and interior distribution systems in accordance with the **Terasen Gas Tariff** *General Terms and Conditions*, Section 12.

Audience

Install Coordination Centre staff, marketing staff, and administrators involved in the main extension process.

References

- ADM 04-01 *Authorization Levels*
- CUS 07-05 *Charges for Service Line Work*
- DES 04-02-01 *New Loads and Changes in Existing Loads*
- DES 04-02-10 *Charges for Service Line Work*
- GEN 01-03 *Technical Definitions (Terminology)*
- Form 1754 *Main Extension Approval Summary*
- MX Training Materials
- **Terasen Gas Tariff** *General Terms and Conditions*

Policy

Terasen Gas will make extensions to its gas distribution system according to development requirements, in a manner that is consistent with this standard and the **Terasen Gas Tariff**. All main extensions will be the property of Terasen Gas.

Definitions

Annual Consumption GJ/Unit

Annual consumption is the number of gigajoules consumed per premises, based on the building type, end use application, insulation, and normal degree-day conditions.

Terasen Gas

Contributing Customer

A contributing customer is a customer connecting to a main who must pay a contribution toward the cost of the main extension.

Contribution

A contribution is the portion of the capital cost a customer must pay to offset the revenue deficiency of the main extension.

Direct Cost

The direct cost is the cost of an installation including labour (with concessions and benefits), vehicles, equipment, material, and contractors, excluding overhead and GST.

Discounted Cash Flow (DCF)

The DCF is a stream of costs or revenues over time, discounted to give the present value.

Double Main

A double main is an installation with mains on each side of a street. This eliminates road crossings for services.

Extension

An extension is an extension of a Terasen Gas distribution or transmission main, including additional pressure regulating facilities and headers.

GST

GST is the Goods and Services Tax.

Header

A header is common gas distribution piping on private property serving three or more customers.

Main Extension (MX) Test

The MX Test is used to determine the forecast Net Present Value of a main extension. It is explained in detail in this standard.

Caution: Printed documents may not be current. Verify online.

MX Test Program

The MX Test program is a computer program used to calculate the MX Test results.

Net Present Value (NPV)

The NPV is the result of the MX Test comparing projected revenues and costs of a proposed main extension on a discounted cash flow basis.

A positive NPV indicates that the present value of the projected revenues exceeds the present value of the costs. A negative NPV indicates a revenue deficiency or shortfall.

Revenue Deficiency

A revenue deficiency or shortfall is the amount of additional revenue needed to achieve a zero NPV in the DCF analysis used in the MX Test.

Service Line

A service line is the portion of the gas distribution system extending from the main to the meter set inlet.

SAP

Terasen Gas business application software that includes main extension planning and work management tools.

Single Main

A single main is a main that runs on one side of a street, with services to customers on both sides of the street.

System Improvements (SIs)

SIs are system reinforcements made to ensure that adequate system capacity is available to meet customer requirements at a minimum system pressure approved by System Planning. The treatment of SIs in MX evaluations is discussed in more detail below.

Vertical Subdivisions

A vertical subdivision is a multi-storey building that has individually metered units and a common service line connecting banks of meters typically located on each floor.

Terasen Gas

Initiating a Main Extension

When Terasen Gas determines that a main extension is needed to meet system development requirements, the Install Coordinator will initiate the main extension by completing the appropriate screens on SAP.

Planning and Design

The Install Coordination Centre is responsible for:

- Initiating jobs on SAP.
- Ensuring that a SAP job number is used on all correspondence and files.
- Determining the annual number of customers projected to connect to a main extension within five years of construction.
- Determining the annual consumption for each customer (see **Annual Consumption**).
- Designing the pipe layout, size, length, and other facility requirements.
- Estimating direct costs for the main and associated facilities.
- Running the MX Test and recording the results on **Form 1754** *Main Extension Approval Summary* (see **Main Extension Test**).
- Informing the Commercial Sales and Marketing Manager or the Commercial Account Representative about any main extension applications to other than Rate 1, 2, or 3 customers (estimated load over 5000 GJ/yr). The Commercial Sales and Marketing Manager or Commercial Account Representative will arrange for any required contracts and for the Sales and Administration Business Analyst to run the MX Test program.
- Informing Engineering and Transmission Operations about any applications requiring extensions to IP and TP pipelines.
- Providing a plan of all existing facilities connecting to IP or TP mains and facilities.
- Ensuring that enough gas service applications and contributions have been secured before advancing a project to the construction stage.
- Providing a Load Information Memo (LIM) to System Planning for analysis of the main extension.
    - See **DES 04-02-01** *New Loads and Changes in Existing Loads*

Caution: Printed documents may not be current. Verify online.

- Informing the Right of Way group about any infringements on Terasen Gas pipeline rights of way, and ensuring that the required documentation is in place prior to construction.
- Informing the Lands group if a right of way is required.
- Issuing the required documentation and construction drawings to the field.
- Ensuring that any required internal and external approvals are obtained.
- Ordering construction materials.

Costs

Direct cost estimates for main extensions will be determined for the MX Test based on the following guidelines.

- The direct cost estimate will include the size of the main and/or service header, and associated facilities required to serve the customers projected to connect to the distribution system within five years of construction.
  - The System Planning Manager may elect to install a larger main to allow for future growth. The customer will not be responsible for any additional costs associated with installing the larger main.
- A double main will be installed if it is the least cost alternative, or if it is required by local governments.
  - The least cost alternative will be determined by comparing the cost estimate of double mains plus the service lines, to the cost estimate of a single main plus service lines.
  - The cost of the double main will be included in the SAP direct cost estimate.
- Costs such as river crossings, bridges, surveying, land transaction costs, bedrock blasting, right of way clearing, and environmental impact investigations will be included in the direct cost estimate.
- The install coordinator will provide project specific service line direct cost estimates for all customers in the MX Test program.
- The install coordinator will provide specific meter set direct cost estimates for Rate 3 customers in the MX Test program.

- Meter set costs for Rate 1 and 2 customers will be automatically selected by the MX Test program, based on the annual projected load.

- SI costs will be included in the evaluation of an main extension based on the following.
  - Average SI costs are automatically calculated based on each customer's annual projected load in the MX Test program for Rate 1, 2, 3, and 23 customers.
  - Average SI costs, adjusted to the customer's projected load factor, will be included in the MX Test program for firm customers (Rate 5, 25, and 22 customers).
  - Project specific SI costs will be included in the direct cost estimate for interruptible and seasonal customers (customers in Rates 4, 7, 27, and 22).
- Incremental operating, maintenance, and overhead costs are automatically calculated in the MX Test program based on each customer's rate class and annual projected load, and the direct cost estimate of the main, service lines, meter sets and other MX components described above.

Annual Consumption

Rates 1 and 2

The install coordinator will forecast the annual consumption (GJ/unit) for Rate 1 and 2 customers by running the MX Test program. The consumption section of the MX Test program estimates a customer's annual gas consumption based on:

- Type of premise
- Building characteristics
- Normalized area weather conditions
- Appliances connected (e.g., domestic water heater, furnace, dryer, range)

Rates Other Than 1 and 2

The Install Coordinator will forecast the annual consumption (GJ/unit) for customers other than Rate 1 and 2 on an individual basis, using criteria such as heat loss calculations, equipment ratings, and consumption data for comparable existing customers.

Main Extension Test (MX Test)

The MX Test is a discounted cash flow analysis of the projected revenue and costs associated with the main extension. The total revenues and costs for the main extension project are calculated over a 20-year period, based on the number of customers projected to connect to the main extension within five years of construction, and their forecast annual consumption. The main extension will be deemed to be economic, and may be constructed without contributions, if the results of the MX Test indicate a zero or greater net present value, provided the required approvals are obtained.

The MX Test will be applied to new applications for service requiring new gas mains, as well as for service header and vertical subdivision applications. In vertical subdivision applications, the SAP direct cost estimate of the underground pipe, plus the building piping and associated equipment, will be used as the SAP direct cost estimate of the main. Similarly, in service header applications, the SAP direct cost estimate of the service header will be used as the SAP direct costs estimate of the main.

- See **DES 04-02-10** *Charges for Service Line Work*

The following data is required to run the MX Test for Rate 1, 2, 3, or 23 customers:

- SAP job number
- Direct cost of the main
- Direct cost of the service header
- Direct cost of the service lines
- Direct cost of the meter manifolds with three or more meters for Rate 1 customers
- Direct cost of meter manifolds with two or more meters for other than Rate 1 customers
- Direct cost of common pressure regulating assemblies for vertical subdivisions
- Whether the meter manifolds have common regulators or individual regulators

Caution: Printed documents may not be current. Verify online.

- Number of customers projected to be added annually within five years of construction
- Each customer's rate schedule
- Each customer's projected annual consumption (GJ/yr.)
- Meter set direct costs for Rate 3 or 23 customers.

If the MX Test indicates a revenue deficiency, the customers will need to pay a contribution equal to the revenue deficiency in order for the project to proceed.

- See the Contributions section of this document.

The Sales and Marketing Manager will arrange for the MX Test to be run for customers on rates other than Rate 1, 2, 3, or 23.

Approvals

The Install Centre Manager has the authority to give final approval to main extension applications if:

- The install coordinator (IC1) has reviewed the application and signed the main extension authorization form.
- The total mains and facilities installation direct costs do not exceed $100,000.
- The appropriate approvals from other departments are received.
- Jobs with total mains and facilities installation direct costs exceeding $50,000 require sign off by the Install Centre Manager.
- Jobs with total mains and facilities installation direct costs less than $50,000 will be reviewed using exception reporting, and individual main extension authorization forms do not require sign off by the Install Centre Manager

The Manager, Operations Centre has the authority to give final approval to main extension applications if:

- The Install Centre Manager has reviewed the application.
- The total mains and facilities installation direct costs do not exceed $250,000

Caution: Printed documents may not be current. Verify online.

- The appropriate approvals from other departments are received.

The VP, Distribution has the authority to give final approval to main extension applications if:

- The Manager, Operations Centre has reviewed the application.
- The total mains and facilities installation direct costs do not exceed $500,000, in accordance with the capital approval levels identified in **ADM 04-01** *Authorization Levels.*
- The appropriate approvals from other departments are received.

Main extension applications not eligible for approval by the VP, Distribution will require the approval of the President, Gas Segment, up to $2,000,000 in accordance with the capital approval levels identified in **ADM 04-01** *Authorization Levels.*

Main extensions requiring connection to the Terasen Gas transmission system (excluding service lines from IP pipelines) require the approval of the Manager, Transmission Operations.

Main extensions that may infringe on an existing Terasen Gas transmission pipeline right of way require the approval of the Manager, Property Services.

Main extensions that require system improvements or oversizing to accommodate future load growth, or involving pipe sizes of 88 mm or larger, require the approval of the System Capacity Planning Manager and the Distribution Assets and Improvements Manager.

Main extensions that require alteration to, or the construction of, a new pressure reducing facility, require the approval of the Distribution Assets and Improvements Manager.

Those providing approvals of main extensions must sign **Form 1754** *Main Extension Approval Summary.*

Variances

Asset Managers are responsible for ensuring that the main extension is installed as designed and approved. If any changes are necessary, the

Asset Manager, in conjunction with the Install Coordinator, must alter the design and obtain the necessary approval before construction.

Upon completing the main extension, a job detail summary report will be produced to identify the actual and estimated costs. Any significant variances will be explained by the Asset Manager. The report and any explanations will be kept in the project work order file.

Contributions

When the results of the MX Test indicate an NPV less than zero, Terasen Gas will collect a contribution in the amount required to eliminate the negative NPV from the customers initially connecting to the main extension.

Contributions will not be adjusted based on updated or actual revenues and/or costs unless approved by the appropriate Marketing manager (Manager, New Construction and Residential Growth or Manager, Commercial and Industrial).

Quotations to customers for main extensions must be given in writing. These quotations are normally valid for 60 days. The Install Centre Manager must approve any extensions to the 60 day period.

Construction may only begin after:

- The required contributions are collected from customers initially connecting to the main.
  or
- Agreement is obtained to have the contribution funded through regional taxation.
  or
- A sufficient number of customers agree to pay the contribution by signing the Terasen Gas Main Extension Contribution Agreement (to be implemented).
  and
- All required permits and approvals are obtained.

The Install Centre Manager may waive contributions of less than $100 per customer connecting to the main extension.

Contribution Amounts

The amount that each contributing customer will pay will be determined in a fair and reasonable manner. If all contributing customers are on Rates 1 and 2, then each customer will pay an equal contribution amount. If one or more customers are other than Rate 1 or 2, then the following guidelines will be used to determine the amount of the contribution for each customer:

1. The MX Test will be run in three ways:
   - With Rate 1 and 2 customers only (Result A)
   - With customers other than Rate 1 and 2 customers (Result B)
   - With all customers (Result C)
2. If either Result A or Result B is non-contributory, then that group will not pay a contribution.
3. No group will pay a contribution larger than its stand-alone contribution (i.e. Result A or Result B).
4. If Result C is less than Result A + Result B, then the total contribution (Result C) will be apportioned to the other two groups in the same proportion as Results A and B, unless guideline 2 or 3 is in effect.
5. Within the Rate 1 and 2 groups, all customers pay the same contribution.
   - If there is more than one customer in the non-Rate 1 or 2 groups, the contribution will be apportioned within that group using techniques similar to those described above.

Situations that cannot be resolved using the above guidelines will be referred to the Marketing Planning Manager.

- See **Terasen Gas Tariff** *General Terms and Conditions* Section 12.6 "Contributions in Aid of Construction"

Refunds

All Rate 1 and 2 customers connecting to a contributory main extension during its first five years of existence will pay the same net contribution at the end of the five year period. This equity will be achieved through a series of contributions and refunds.

The initial customer's contributions and refunds will be calculated as described in the contributions section of this document. Subsequent or infill customers will be identified as having applied to connect to a contributory main extension.

Contributory main extensions and service headers will be marked on plate maps. The plate map will have all main extensions labelled with a unique number, and contributory main extensions will have a suffix of "$YR" ("YR" is the year of the MX Test used).

- See **Terasen Gas Tariff** *General Terms and Conditions* Section 12.8 "Refund of Contributions"

MX Refund Database

The contribution amount for each contributory main extension will be tracked in the MX Refund Database. The Marketing Pricing Analyst (administrator) will administer the database. The install coordinators will have read-only access to the database, through the public folders on the Terasen Gas electronic mail system. The install coordinator will complete the MX contribution database input form, and forward it to the administrator for each customer addition to an existing or new contributory main extension.

The administrator will notify the Financial Accounting Clerk to issue refunds and will update the database.

Refund Process Example

The refund process is illustrated by the following example:

Caution: Printed documents may not be current. Verify online.

Table 1: Refund Process

Total contribution required 12 initial customers each pay	$12,000 $1,000	(12,000 / 12 customers)
Four additional first year customers pay First year reconciliation: each of the 12 initial customers refunded	750 250	($12,000/ 16 customers) [(4 X $750)/ 12 customers]
Four second year customers each pay Second year reconciliation: each of the 16 customers refunded	600 150	($12,000/ 20 customers) [(4 X $600)/ 16 customers]
Four third year customers each pay Third year reconciliation: each of the 20 customers refunded	500 100	($12,000/ 24 customers) [(4 X $500)/ 20 customers]

The process continues for five years. Final refunds are issued at the end of five years.

For main extensions with other than Rate 1 or 2 customers, refunds will be prorated amongst the rate classes, on the basis of their original contributions.

Refund Guidelines

The following guidelines will be used when refunds are due:

- Individual refunds greater than $100 will be paid at the time of the review.
- Individual refunds less than $100 will be held until a subsequent review, when they become greater than $100, or until the end of the five-year contributory period.
- No interest will be paid on contributions that are subsequently refunded.
- If, after reasonable efforts, and five years have passed since the main was constructed, Terasen Gas cannot locate a customer eligible for a refund, the customer will be deemed to have forfeited the refund, and it will be credited to the other customers who contributed toward the main extension.

See **Terasen Gas Tariff** *General Terms and Conditions* Section 12.7 "Contributions Paid by Connecting Customers", and Section 12.8 "Refunds of Contributions"

Extensions to Contributory Extensions

When a new main extension is connected to an existing contributory extension, during the first five years of its existence, the customers on the new main may pay a contribution toward the existing extension. The amount of the contribution will typically be a portion of the total contribution for the existing main extension, assigned to the new main extension based on expected use, point of connection and other factors. In addition, customers on the new extension will pay any contribution required for the new extension.

The install coordinator will notify the Customer Care Manager of any applications for extensions to contributory extensions. The Customer Care Manager will determine amount of the contribution for applications for extensions to contributory extensions.

GST

The GST must be added to any contributions collected from the customer. It must be noted separately in any correspondence (including receipts), making reference to the Terasen Gas GST Registration Number (R100431592). When charged or collected, the GST should be coded to Account 251-018.

Records

Form 1754 *Main Extension Approval Summary* must be completed and signed as indicated in **Planning and Design** and **Approvals**. The completed forms are to be forwarded to and retained in the Install Centre.

June 1, 2011

British Columbia Utilities Commission
6th Floor, 900 Howe Street
Vancouver, BC
V6Z 2N3

Attention: Ms. Alanna Gillis, Acting Commission Secretary

Dear Ms. Gillis:

Re: FortisBC Energy Inc. ("FEI") and FortisBC Energy (Vancouver Island) Inc.[1] ("FEVI") 2010 Year End Reports for:

- **FEI-FEVI Main Extension ("MX") Report – British Columbia Utilities Commission (the "Commission") Order No. G-152-07 Compliance Filing; and**
- **FEI Vertical Subdivision Report – Commission Order No. G-6-08 Compliance Filing**

On December 6, 2007, the Commission issued Order No. G-152-07 and Reasons for Decision approving changes to the FEI-FEVI System Extension and Customer Connection Policies. Subsequently, FEI was directed to make revisions to the MX test methodology and to provide information relating to Vertical Subdivisions under Commission Order No. G-6-08 issued on January 10, 2008.

The Companies applied the MX Test (also referred to as the "economic test") as approved by the Commission to 2007, 2008 and 2009 main extensions, and filed the respective Main Extension reports in compliance with the requirements of orders G-152-07 and G-6-08 on April 7, 2008, April 3, 2009 and April 10, 2010 respectively.

The Companies and Commission Staff have engaged in dialogue with respect to the 2010 MX Report via written correspondence, phone calls and a meeting on February 15, 2011 to review the compliance reporting requirements. In addition, the Companies provided a draft report on March 31, 2011 to Commission Staff for discussion and met with Commission Staff on April 12, 2011 to present the findings contained within the draft report. Commission Staff provided comments on the draft report on April 20, 2011.

As an outcome of the ongoing dialogue and pursuant to Commission Order Nos. G-152-07 and G-6-08, the Companies respectfully submit the attached 2010 FEI and FEVI Year End Main Extension and FEI Vertical Subdivision reports.

---

[1] Formerly Terasen Gas Inc. ("TGI") and Terasen Gas (Vancouver Island) Inc. ("TGVI"), respectively.

We trust that the Commission will find the reports in order. If there are any questions, please contact Paul Craig at 604-592-7459.

Yours very truly,

FORTISBC ENERGY INC.
FORTISBC ENERGY (VANCOUVER ISLAND) INC.

for 2010 Year End

Compliance filing in Accordance with

Commission Orders No. G-152-07 and G-6-08

June 1, 2011

Table of Contents

Index of Tables and Figures

1 EXECUTIVE SUMMARY

The Main Extension ("MX") Report from FortisBC Energy Inc. ("FEI") and FortisBC Energy (Vancouver Island) Inc. ("FEVI") (collectively the "Companies") and the FEI Vertical Subdivision ("VSD") Report for 2010 Year End (collectively referred to as the "Report") are respectfully filed in accordance with Commission Orders G-152-07 and G-6-08.

The four key findings for consideration from the Report are summarized below.

1. The Companies are in compliance with the relevant Commission reporting directives.

Each of the compliance requirements under Commission Orders G-152-07 and G-6-08 have been addressed within the Report. The Introduction section provides the specific page reference where each compliance requirement has been addressed.

Further, the Companies have made improvements to the Report that the Companies believe will provide the Commission with greater insight into the results over the five year period of main extension projects.

2. The variance in forecast versus actual 2010 main extension costs is reasonable and the cost estimating processes followed by the Companies continue to be appropriate.

The actual main extension costs compared to forecast main extension costs were $0.1 million and $0.2 million lower for FEI and FEVI respectively. In comparison, the total, actual capital costs were $2.9 million and $0.9 million for FEI and FEVI, representing only 0.1% and 0.2% of their respective approved 2010 rate base. Based on the 2010 results, geo code pricing continues to be an appropriate method of forecasting main extension costs for the majority of the population. As discussed in last year's report, the Companies have identified that for a small number of main extensions, the geo code pricing methodology is not the most appropriate estimating method, and thus have made improvements by implementing a manual cost estimating process in order to ensure that the forecast costs for these main extensions are as accurate as possible. FEVI introduced the manual cost estimating process on a pilot project basis in early 2010, and this was subsequently introduced to FEI later in 2010.

3. A rebound in the 2010 BC housing market is reflected in positive consumption results for 2008-2010 main extension projects.

The BC housing market and the Companies' consumption results are closely related. The Report shows that both the BC housing market and the Companies' customer attachments have been highly cyclical in the recent past. Results for main extensions from 2008 to 2010 indicate that with the economy returning to growth following a bearish period, BC building developments have picked up and, in turn, the Companies' consumption and attachment results have improved. Housing starts are forecast to grow slightly in 2011 and the Companies' customer attachments are expected to follow this trend as well.

However, several factors could adversely affect growth prospects, including higher home prices from the HST, higher interest rates and new mortgage rules. Inevitably there will always be uncertainty and variability inherent in forecasting housing attachments, despite the Companies' best efforts to apply their industry knowledge, experience and conservative approach to forecasting.

4. In 2010, the number of main extensions, the forecast attachments and system throughput has dropped significantly compared to previous years.

Although 2010 represents a return to modest growth in the BC housing market and the forecast versus actual attachments have improved relative to 2009, the number of main extensions and forecast attachments in 2010 are approximately 50% lower than 2008 levels. This significant decline can be partially attributable to the wide capital cost differential between natural gas and electricity in heating and hot water heating applications, the cornerstones of our gas business. The drop in the number of main extensions and forecast attachments is happening concurrently with a 4.27%[1] drop in overall normalized system throughput between 2008 and 2010. The Companies will continue to monitor and report to the Commission on these concerning trends in subsequent MX reports.

In summary, on a portfolio basis for both FEI and FEVI, the main extensions installed are economical and do not harm existing customers, as demonstrated by the fact that the forecast profitability index ("PI") values are 1.8 and 2.5 respectively. In fact, the addition of economical main extensions benefits existing customers, especially in an environment where the Companies are experiencing a decline in the number of main extensions, attachments and system throughput. As such, the PI thresholds as determined in Order G-152-07 do not need to be adjusted on a going-forward basis as results demonstrate that existing customers are not adversely affected by the addition of a new customer or customers.

[1] System throughput includes FEI and FEVI residential, commercial, industrial and transportation customers.

2 INTRODUCTION

The following section provides the regulatory history of the MX Test, a summary outlining that the Companies are in compliance with the relevant Commission reporting requirements, and an overview of the Report.

The Companies have provided all relevant information in the Report in accordance with Commission Order Nos. G-152-07 and G-6-08, and the Executive Summary section above summarized the most salient issues from the Report. The Companies believe that the format of the Report and information provided in this Report allow the Commission to conduct an efficient regulatory review of the Companies' main extension activities and results over the five-year time frame.

2.1 MX Test Regulatory History

On July 31, 2007, the Companies applied to the Commission for changes to the System Extension and Customer Connection Policies ("TGI-TGVI System Extension and Customer Connection Policies Review")[2]. In December, 2007, the Commission issued Order No. G-152-07 and Reasons for Decision approving changes to the TGI-TGVI System Extension and Customer Connection Policies Review. The 2007 order (G-152-07) established the parameters for the Main Extension ("MX") test and the Companies were directed to file with the Commission a MX report (page 37 of G-152-07 and Reasons for Decision):

> *"within 90 days of calendar year end, a Main Extension Report including the following:*
>
> - *a review of a random sampling of MX test results representing a confidence interval of +/- 12 percent at a 95 percent confidence level and the five highest cost main extensions to determine if the aggregate PI thresholds need to be adjusted on a go forward basis in order to achieve the aggregate PI of 1.1. The review is to include a comparison of forecast and actual costs; consumption; and PI for the first five years of main extensions in the sample;*
> - *a concise explanation of the random sampling methodology used; and*
> - *a comparison of the forecast and actual cost for all service line and main extension installations."*

Subsequently, FEI was directed to make revisions to the MX test methodology and were further directed to provide information relating to Vertical Subdivisions under Commission order G-6-08[3] issued on January 10, 2008:

[2] Terasen Gas Inc. (TGI) and Terasen Gas (Vancouver Island) Inc. (TGVI) are the former names for FortisBC Energy Inc. (FEI) and FortisBC Energy (Vancouver Island) Inc. (FEVI) respectively.

[3] Order Number G-6-08 was issued in response to an application by TGI to amend the general terms and conditions of its Tariff to allow an alternative method of providing gas service to Vertical Subdivision developments.

> *"Terasen is directed include, in the Main Extension Report that Terasen was directed to file in the Commission's Main Extension Decision, the results of TGI's main extension tests to Vertical Subdivisions."*

The Companies applied the MX Test (also referred to as the "economic test") as approved by the Commission to 2007, 2008 and 2009 main extensions, and filed the respective Main Extension reports in compliance with the requirements of orders G-152-07 and G-6-08 on April 7, 2008, April 3, 2009 and April 10, 2010 respectively.

As a result of discussions with Commission Staff subsequent to the filing of the 2009 Report and a meeting with Commission Staff held on July 13, 2010, the Companies submitted a revised 2009 Report on August 18, 2010 with further information. FEVI also submitted a detailed report for the Shawnigan Lake Main Extension, providing additional information and explanations for the performance of the Shawnigan Lake Main Extension based on available information.

The Companies and Commission Staff have continued their dialogue with respect to the MX Report via written correspondence, phone calls and a meeting on February 15, 2011 to review the compliance reporting requirements. The Companies filed a draft report on March 31, 2011 prior to filing this final report. The Companies also met with Commission Staff on April 12, 2011 and presented the findings contained within the draft report. Commission Staff provided comments on the draft report on April 20, 2011.

The table below provides a summary of the various Commission directives and the specific page reference in the Report where each directive is addressed.

Table 1: Reporting Requirements Met by the Companies

Order Number	Compliance Reporting Requirement	Report Page Reference #
G-152-07	Provide schedules comparing the existing and updated geo-codes and MX Test input parameters.	p.8-15
G-152-07	Update FEVI MX Test to refelect FEVI use per appliance	p.9
G-152-07	Reflect in the Companies' MX tests their experience of consumption ramp-up in the early months of service	p.12
G-152-07	Comparison of forecast and actual costs, consumption and PI for the first five years of main extensions in the sample	p.21-28
G-152-07	A concise explanation of the random sampling used	p.15-16
G-6-08	Confirm that it reflects, in the MX test inputs, the fact that larger developments may require several years before all units are occupied and normal consumption patterns are established.	p.12
G-6-08	The results of FEI's main extension tests to Vertical Subdivisions	p.24

The Companies believe that they are in full compliance with the directives set forth in Order Nos. G-152-07 and G-6-08.

As cited above, in Order No. G-152-07, the Commission specifically directed three categories of information to be included in the Companies' annual compliance report:

1. a review of a random sampling of MX test results representing a confidence interval of +/-12 percent at a 95 percent confidence level and the five highest cost main extensions to determine if the aggregate PI thresholds need to be adjusted on a go forward basis in order to achieve the aggregate PI of 1.1. The review is to include a comparison of forecast and actual costs; consumption; and PI for the first five years of main extensions in the sample;
2. a concise explanation of the random sampling methodology used; and
3. a comparison of the forecast and actual cost for all service line and main extension installations.

From the Companies' communication with Commission Staff and from Commission Staff's Comments letter dated April 20, 2011, the Companies understand that in terms of compliance with the above cited Directives, the Commission Staff do not take issue with items 2 and 3. The Commission Staff's issue, as the Companies understand it, is whether the Companies are in compliance with the Commission Directives by providing a yearly PI result that will be using the forecasted consumption data originally provided in year 1 of the five-year period, without incorporating year-to-date actual consumption data and without the re-forecasted consumption data for the remainder of the five-year time frame.

The Companies first want to emphasize that they take the Commission's directives very seriously and do their best to comply fully with them. Furthermore, the Companies are endeavouring to make improvements to both the format and substance of the compliance reports wherever appropriate and without violating Commission orders.

The Companies believe that they are in compliance with the Commission Directives by generating and reporting a yearly PI result using actual main extension cost data with originally forecasted consumption data for the following reasons.

First, there is no specification in the Commission Directives or the Commission's Decision that under the MX Test, "actual" consumption data must be used when determining PI. The MX Test is used to determine a PI that represents a ratio of the PV of expected revenues to the PV of expected costs. Consumption data is an input parameter for determining revenue. Additionally, the MX test examines customer attachments for a five-year period. On page 11 of the Commission's Decision dated November 6, 2007, the Commission cited the MX Test parameters provided by the Companies. Specifically with respect to the "consumption estimate" and "revenue" input parameters, the Companies provided the following:

Consumption Estimate	From Residential End Users Study
Revenue (based upon Consumption)	Specific to each utility and Rate Class. Revenues are for distribution margin only and do not include the cost of commodity.

No specific reference to or requirement of actual or forecast consumption or segmented consumption data (e.g., by rate class) is made in terms of calculation of revenue. In the Decision, the Commission clarified (1) that consumption estimates in the FEVI area should reflect use per appliance, and (2) that consumption estimates should account for consumption "ramp-up." The Commission Order did not specifically require that the yearly PI result be generated with a set of actual consumption data, nor did it specifically require the Companies to provide re-forecasted consumption data and re-run the MX Test.

Second, although in last year's report the Companies presented PI results with actual consumption data,[4] departure from a past practice does not necessarily mean that the Companies are non-compliant with a Commission order or need a variance from the Commission Directives. The Companies have not changed the PI formula or the input parameters of the MX Test as they have been approved by the Commission. Nor have the Companies failed to provide information as directed by the Commission Directives. As explained in section 3.2.2 of this Report, not only will the Companies continue to provide updated actualized consumption data for information purposes, but they will also furnish improved consumption and cost data as detailed in section 3.2.2. Additionally, the Companies will continue to present PI results in their annual report.

Third, the Companies believe that there is limited value in reporting on a re-forecasted PI value based on re-forecasting consumption for every main extension annually and then re-running the MX Tests. The accuracy of any potentially revised attachment and consumption forecasts will not necessarily be any more precise as they would be subject to the cyclical BC housing market conditions that are out of the Companies' control and difficult to predict into the future.

Lastly, the PI results using forecast consumption continue to enable the Commission to monitor the progress of the Companies' system extensions, without adding substantially to the administrative burden of administrating the MX Test. As explained in section 3.2.3 of this Report, presenting yearly PI results using re-forecasted consumption data and re-running MX Tests annually creates an undue administrative burden. Given that there are potentially 2,000 extensions on a rolling-basis, this can make the re-forecasting and re-running of the MX Tests very labour-intensive and time consuming. This argument also applies even if the Companies were to report on a random sample of the entire main extension population.

---

4 The Companies note that the PI results presented in the last year's report did not incorporate re-forecast consumption data for the remainder of the five year period. The Companies' consumption data presented was based on year to date actual data plus the <u>original</u> forecast for the year to date to the year 5 time frame. Please refer to pages 17 and 18 for further explanation of this approach.

The appropriate time frame to provide the actual main extension's PI is at the end of the five year period (i.e. for 2010 main extensions this would occur in October 31, 2015; similarly, for 2008 and 2009 main extensions, actual PI will be provided following October 31, 2013 and October 31, 2014 respectively)

In sum, the Companies believe that they have complied with the Commission's Directives that request a comparison of forecast and actual costs; consumption, and PI results for the five-year horizon in the annual report. The Companies believe that the Report provides information that demonstrates the fair and equitable treatment of customers and that existing customers are not adversely affected by the addition of a new customer or customers.

2.2 2010 MX Report Overview

The Report is organized in the following manner:

a) Executive Summary:

As described earlier, this section summarizes the four key findings from the Report.

b) Introduction

This section provides the relevant regulatory history of the MX Test including a summary of how the Companies are complying with the Commission reporting requirements. This section also provides an overview of the Report.

c) Methodology

This section provides an overview of the MX Test formula and the inputs into the formula including appliance data, economic parameters and geo code pricing parameters. As well, this section will discuss the criteria used to determine manual versus geo code pricing for main extensions. Finally, this section describes the methodology used to report on main extension results.

d) BC Housing Market

This section summarizes the cyclical nature of the BC housing market and the modest return to growth of housing starts in 2010.

e) 2010 MX Test Results & 2010 VSD Results

This section provides data for the 2010 mains in aggregate and top 5 mains for both FEI and FEVI. This section reviews forecast versus actual cost, attachments, consumption and forecast PI and the decline in the number of main extensions and forecast attachments in 2010 compared to previous years. This section also provides a discussion of the 2010 VSDs.

f) 2009 MX Test Results

This section provides an update on the 2009 mains including forecast versus actual consumption.

g) <u>2008 MX Test Results</u>

This section provides an update on the 2008 mains including forecast versus actual consumption.

<u>Glossary of Terms</u>

This section provides definitions relevant to the Report.

3 METHODOLOGY

The following section provides a discussion of the methodology used to establish inputs into the 2010 MX Test as well as the methodology used to present the results of the Report. It begins with an overview of the MX Test formula and the relevant inputs followed by a description of the data used to report on main extension results.

3.1 MX Test Formula

All applications to extend the gas distribution system to one or more new customers are subject to an MX Test approved by the Commission. The primary purpose of extension and connection policies is to promote fair and equitable treatment of customers and, more specifically, to ensure that customers in existence at the beginning of the year are not adversely affected by the addition of a full year's cohort of customers. The MX Test develops a PI which is the ratio of the discounted present value of all forecast net cash inflows over twenty years divided by the discounted present value of the capital costs of attaching customers in the first five years of the main extension.

Under Order G-152-07, the Commission has approved for both FEI and FEVI that if an individual PI is 0.8 or greater, the system extension can proceed without the need for a customer contribution. If the PI is less than 0.8, a customer contribution would be required to make up the shortfall to bring the PI up to the 0.8 threshold, before the system extension can be built. In the same Order, the Commission also approved an aggregate PI of 1.1 as a threshold for the portfolio of main extensions completed on an annual basis.

Both FEI and FEVI currently use the same discounted cash flow test to evaluate main extensions; however, the inputs for the tests vary between each utility (please refer to Section 3.1.1 for a discussion on the inputs and the differences between each utility). While there are many components factored into the calculation of this ratio, the following formula provides a summary of the major components:

PI = Net Present Value of Net Cash Inflows (Delivery Margin + Connection Fees – O&M - System Improvement Charge – Property Tax – Income Tax)/Net Present Value of Capital Costs (Mains, Services, Meter Costs)

A discussion of the net cash inflow, capital cost and discount rate inputs into the MX Test formula follows. Throughout the Report, the Companies provide the requisite level of discussion of the variance from previous year's data.

3.1.1 NET CASH INFLOWS

Net cash inflows are composed of the delivery margin plus connection fees, less O&M, a system improvement charge, property tax, and income tax. Each of these components is discussed below.

The projected delivery margin used in the economic test is determined by

(a) estimating the number of customers to be served by the main extension;

(b) establishing consumption estimates for each customer;

(c) projecting when the customer will be connected to the main extension; and

(d) applying the appropriate delivery margin for each customer's consumption.

The delivery margin projection takes into consideration the estimated number and type of gas appliances used. Customers who intend to install both high efficiency gas fired space (namely an Energy Star rated furnace or boiler) and water heating appliances (tankless water heaters, or water heaters with an efficiency rating of 78 percent or greater) receive a credit of 10 percent of the volume otherwise used for both appliances. Customers who intend to install both high efficiency gas fired space and water heating appliances and attain a minimum of LEED™ (Leadership in Energy and Environmental Design) General Certification receive a credit of 15 percent of the volume otherwise used for both. In addition, the projected revenue from application fees is included in net cash inflows. Only those customers expected to connect to the main extension within 5 Years of its completion are considered.

In order to determine consumption estimates for each customer, the Companies use annual usage estimates by appliance type. The usage per appliance data used in the MX Test to determine projected delivery margin is presented in the following table:

Table 2: Appliance Use Inputs for MX Test

	2009 & 2010 (GJ/yr)	2011 (GJ/yr)		
Appliance	All Regions	Lower Mainland	Interior	Vancouver Island
Barbeque	3.1	3.1	3.1	3.1
Boiler	60.0	62.0	51.6	43.0
Clothes Dryer	4.0	4.2	3.6	3.4
Fireplace - Décor	16.8	21.4	19.8	19.7
Fireplace - Heating	15.8	18.3	15.9	16.1
Furnace (primary)	60.0	62.0	51.6	43.0
Furance (secondary)	60.0	18.1	39.3	19.9
Hot Tub	17.9	19.5	19.5	19.5
Hot Water Tank	20.8	20.4	18.8	18.8
Pool	53.5	38.5	38.5	38.5
Range/Cooktop	8.5	5.6	5.1	4.7
Wall Heater	18.1	7.1	7.1	7.1

The Companies use data from internal residential end use studies and operational experience as the basis for updating appliance usage. As seen in the table above, in 2011 the Companies introduced changes whereby usage is segmented by region and updated as per the 2008 Residential End Use Study ("REUS"). These changes were made to improve the accuracy of forecasting appliance usage and subsequently improve consumption forecasting.

The basic and delivery charges, the in lieu rate and new service fee data are as follows:

Table 3: Basic & Delivery Charges, In Lieu Rate & New Service Fee

	2009				2010			
Rate Class	Basic Charge ($/yr)	Delivery Charge ($/GJ)	In Lieu Rate (%)	New Service Fee ($)	Basic Charge ($/yr)	Delivery Charge ($/GJ)	In Lieu Rate (%)	New Service Fee ($)
FEI								
Rate 1	$143.88	$3.00	2.97%	$85.00	$142.08	$3.18	2.55%	$25.00
Rate 2	$301.80	$2.51	3.70%	$85.00	$298.08	$2.64	3.11%	$25.00
Rate 3/23	$1,610.40	$2.16	3.36%	$85.00	$1,590.24	$2.26	2.87%	$25.00
FEVI								
RGS	$126.00	$4.49	2.08%	$85.00	$126.00	$7.69	2.84%	$25.00
SCS-1	$113.40	$7.10	1.87%	$85.00	$113.40	$10.30	2.40%	$25.00
SCS-2	$402.36	$6.62	1.93%	$85.00	$402.36	$9.82	2.55%	$25.00
LCS-1	$732.00	$3.51	2.54%	$85.00	$732.00	$6.71	4.15%	$25.00
LCS-2	$1,173.84	$2.47	3.02%	$85.00	$1,173.84	$5.67	6.22%	$25.00
LCS-3	$2,418.12	$2.18	3.39%	$85.00	$2,418.12	$5.38	8.47%	$25.00
AGS	$480.00	$2.53	3.06%	$85.00	$480.00	$5.73	6.23%	$25.00

The basic charge revenue used in the main extension test is the annual sum of the basic monthly charge. The delivery charges used in the main extension test are applied to the forecasted consumption for all respective rate classes. In the case of FEVI, an effective delivery margin is calculated by subtracting the unit cost of gas from the sales rate. The FEVI sales rate remained at the same level for 2009 and 2010. The change in the derived delivery rate results from a change in the unit cost of gas.[5] The basic charge and delivery charge updates for 2010 are based on the approved tariff on January 1, 2010 per respective rate classes for FEI[6] and

[5] In 2010, the unit cost of gas includes royalty credits. Including the royalty credits in the cost of gas results in a derived delivery rate that more closely resembles the gross margin of FEVI

[6] FEI Basic and Delivery Charges – "Terasen Gas Inc. General Terms and Conditions, Rate Schedule 1, twelfth revision of page R.1.1; Rate Schedule 2, Rate Schedule 1 (pg. R-1.1); Rate Schedule 2, twelfth revision of page R-2.1; Rate Schedule 3, twelfth revision of page R-3.1.)"

FEVI[7]. The Companies are required to collect 1% of revenues and remit it to local governments. Since the MX Test model uses only the delivery-related portion of the rates, the in lieu rates scale up for the total rate relative to the delivery portion of the rate only.

The new service fee for main extensions reflects the value found in each Company's respective tariff.[8]

The net cash inflows portion of the MX Test formula includes economic parameter inputs used for all rate classes. The relevant parameters are summarized below:

Table 4: Net Cash Inflows Economic Parameters[9]

	FEI			FEVI		
Economic Parameter	**2009**	**2010**	**2011**	**2009**	**2010**	**2011**
O&M per Customer						
Residential	$75.00	$75.00	$86.00	$62.48	$62.48	$70.00
Commercial	$98.00	$98.00	$89.00	$86.48	$86.48	$85.00
System Improvement (SI)	$0.16	$0.16	$0.16	$0.15	$0.15	$0.15
Property Tax Rate	1.85%	1.96%	1.95%	1.71%	1.81%	1.86%
Income Tax Rate	30.00%	28.50%	26.50%	30.00%	28.50%	26.50%

As seen above, in 2011[10] the Companies updated the O&M per customer figures to reflect data available from the 2010-2011 Revenue Requirement Applications ("RRAs").[11] The O&M updates have been developed following a similar methodology as in the past, where applicable costs related to servicing a new gas customer (i.e. Distribution Operations Support, Customer Management and Support) are allocated to the respective customer classes using two primary cost drivers: the number of customers in each rate class and peak day factors representative of Distribution system capacity related costs. The resulting proposed rates are generally higher than in the past driven by the higher level of O&M funding approved with the RRAs.[12] The next window for updating the assumptions again would be on approval of the next RRA.

---

7 FEVI Basic and Delivery Charges – "Terasen Gas (Vancouver Island) Inc., Standard Terms and Conditions and Rates for Gas Service, seventh revision of page C-2 to C-7 and page C-11".

8 FEI New Service Fees – "Terasen Gas Inc. General Terms and Conditions, Third revision of page S-1) as per Commission order no: G-141-09." FEVI New Service Fees – "Gas (Vancouver Island) Inc., Standard Terms and Conditions and Rates for Gas Service", third revision of page C-1 as per Commission order G-140-09.

9 For this table, FEI Commercial is defined as Rate Schedule 2 and FEVI Commercial applies to all sales customers excluding Residential (RGS)

10 2011 data has been provided for informational purposes only, the data does not apply to the 2010 Main Extensions, the parameters will be used in the 2011 Main Extension Portfolio

11 *Terasen Gas Inc 2010 and 2011 Revenue Requirements and Delivery Rates Application (Commissions approval order G-141-9) and Terasen Gas (Vancouver Island) Inc. 2010 and 2011 Revenue Requirements, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account Balance Application (Commission approval order G-140-09)*

12 IBID

Also shown in Table 4, system improvement[13] remains unchanged (while property tax rates are based on actual property tax payments. The changes in income tax rates reflect those included in the RRAs.[14]

3.1.1.1 Consumption Ramp Up

As per Commission Order Nos. G-152-07 and G-6-08, the Companies confirm that they do reflect the fact that larger developments may require several years before all units are occupied and normal consumption patterns are established in the MX Test inputs.

Various considerations go into the forecast consumption of the MX Test to reflect "ramp up" such as economic conditions, project forecasts from builder/developers and the Companies' expertise and experience in these areas.

3.1.2 CAPITAL COSTS

The total cost to be used in the economic test includes, without limitation:

(a) The full labour, material, and other costs necessary to serve the new customers including mains, service lines, meter sets and any related facilities such as pressure reducing stations and pipelines;

(b) The appropriate allocation of the Companies' overheads associated with the construction of the main extension;

(c) The incremental operating and maintenance expenses necessary to serve the customers; and

(d) An allocation of system improvement costs.

Points (a) and (b) are discussed in the following section while points (c) and (d) were addressed in the Net Cash Inflows section.

Geo code and manual estimate pricing are the two methods used to determine main extension costs. Geo code pricing refers to a unit cost methodology which is based upon the geographical region, typical ground conditions and length of service to be installed. The purpose of using geo code estimates is to provide an efficient and unbiased approach that produces reasonable variance results for the Companies to estimate the costs of hundreds of main extensions

---

[13] The purpose of the System Improvement charge is to allocate the cost of system improvements on the distribution system that result from increases to system capacity. The System Improvement charge uses a five year forecast of system improvement costs and the growth in peak day over that period. The Companies believe that a five year time frame is appropriate for determining a System Improvement charge over the time period. The current System Improvement charge was calculated in 2007, and therefore, no changes have been made as the time period is within the five year period. The next System Improvement assessment will take place in 2012.

[14] Terasen Gas Inc 2010 and 2011 Revenue Requirements and Delivery Rates Application (Commissions approval order G-141-9) and Terasen Gas (Vancouver Island) Inc. 2010 and 2011 Revenue Requirements, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account Balance Application (Commission approval order G-140-09)

annually. Geo code values are derived using linear regression performed on historical main extension cost data.

For a small percentage of main extensions (approximately 10%), the geo code pricing methodology is not the most appropriate estimating method due to unique site specific requirements. In these circumstances, manual estimates are used. The following table illustrates the criteria used by the Companies to determine the requirement to use geo code versus manual estimates.

Table 5: Geo Code & Manual Estimates Criteria

Pipeline Criteria	Geo Code	Manual Estimate
Pressure	Distribution pressure (DP)	Intermediate pressure (IP)
Material	Ployetheleyne (PE)	Steel (ST)
Diameter	Up to 60 mm (2")	88mm (3.5") and larger for PE and ST
Length	Maximum 1000m	Greater than 1000m
Cost	Maximum $100,000	Greater than $100,000
Crossing Type	Road or pipeline only	Directional drills, highway, bridge, water or railway crossing
Environmental impacts	All envirnonmental impacts except fish bearing streams	Environmental impact of fish bearing streams
Other		Vertical Sub Divisions
		Conversion Mains
		Mains in transmission right of ways

For those main extensions where manual estimating is determined to be appropriate, the person responsible for developing the cost estimate of the project (the "Planner") uses information contained in the construction services contract with the Companies' service provider. In other words, the Planner uses the same criteria for cost projections as those actually performing the construction of these projects. In addition to the development of the criteria above, the Companies have also introduced more site visits to confirm site requirements, additional controls and management oversight of cost estimates. All Planners responsible for providing cost inputs receive the requisite training that includes an estimating manual complete with sample cases.

Recent geo codes measured in $ per metre ($/M) and manual estimate inputs used in the MX Test are as follows:

Table 6: Geo code & manual estimate parameters

Geo code & manual pricing ($/Metre)							
		PE Pipe ($/m)			Steel Pipe ($/m)		
Year	Zone	Up to 60 mm	88 - 114 mm	168 mm	Up to 60 mm	88 - 114 mm	168 mm
2010							
	Vancouver & Richmond	$83	$141	$227	$208	$353	$566
	North Shore & Squamish	$55	$94	$150	$138	$234	$375
	North of Fraser River	$56	$95	$153	$140	$238	$382
	South of Fraser River	$47	$80	$128	$118	$200	$321
	Interior North	$35	$60	$96	$88	$149	$239
	Interior South	$26	$44	$71	$65	$111	$177
	Vancouver Island	Manual	Manual	Manual	Manual	Manual	Manual
2009							
	Vancouver & Richmond	$59	$84	$162	$148	$211	$405
	North Shore & Squamish	$54	$77	$148	$136	$192	$370
	North of Fraser River	$62	$88	$169	$154	$219	$422
	South of Fraser River	$40	$56	$108	$99	$140	$270
	Interior North	$27	$39	$74	$68	$96	$185
	Interior South	$28	$40	$77	$71	$101	$193
	Vancouver Island	$61	$87	$167	$153	$218	$419

In the table above, “manual” refers to how the Companies introduced manual pricing for that particular type of main extension in 2010. The practice of using manual pricing for main extension cost estimating was introduced to FEVI on a pilot basis in 2010. The process was introduced to FEI in the latter part of 2010.

The variance in values seen in the table above relates to the use of linear regression on historical main extension cost data as the basis for geo code estimates. In Vancouver and Richmond for example, the actual main extension costs in that area have risen since 2009 due to the higher costs of installing mains in a developed, urban environment; consequently, the geo code input rose as well.

The capital cost portion of the MX Test formula includes economic parameter inputs used for all rate classes. The relevant parameters are summarized below:

Table 7: Capital Cost Economic Parameters

	FEI			FEVI		
Economic Parameter	2009	2010	2011	2009	2010	2011
Overhead Rate	32.00%	32.00%	30.00%	32.00%	32.00%	30.00%
CCA Class 1	6.00%	6.00%	6.00%	6.00%	6.00%	6.00%
Working Capital Rate	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%

As seen above, in 2011[15] the Companies updated the applicable overhead figures to reflect data available from the RRAs.[16] This overhead rate represents applicable costs required in support of new mains activities and is reflective of the Companies current cost structure and overhead capitalization

3.1.3 DISCOUNT RATE

The discount rates used for 2009 and 2010 are 4.2% and 5.1% for FEI and 4.3% and 4.7% for FEVI respectively. The discount rates reflect the capital structure of each company and the relative borrowing costs and allowed ROE (Commission Order No. G-158-09) as per the Companies' respective RRAs. For each year, the discount rates were adjusted to real dollars using an inflation factor of 2%.

3.2 Reporting of 2010 Main Extension Data

As will be seen in the following section, the methodology followed by the Companies in reporting annual MX Test results is consistent with the principle of having economic new main extensions that ensure that existing customers are not adversely affected by the addition of a new customer or customers.

3.2.1 MAIN EXTENSIONS INCLUDED IN DATA SET

The aggregate data set for the 2010 main extensions was determined based on the following criteria.

1. All main segments within the MX test that were installed after November 1, 2009.
2. All completed main segments that were technically complete prior to October 31, 2010.

In the Report, the Companies are reporting on the entire 2010 main extension population as the basis of the random sample. By reporting on the results of all the annual main extensions, the Companies are ensuring the information presented to the Commission is as comprehensive and accurate as possible. The Companies also present a data set comprised of the top five main extensions for each utility based on actual costs.

In the Report, the Companies are diverging from the sampling methodology followed in 2008 and 2009 whereby main extension data was presented specific to the year in question. In 2010, the Companies will also report separately on results from 2008 and 2009 main extensions. The reporting for 2008 and 2009 main extensions will also be based on the entire main extension

[15] 2011 data has been provided for informational purposes only, the data does not apply to the 2010 Main Extensions, the parameters will be used in the 2011 Main Extension Portfolio

[16] Terasen Gas Inc 2010 and 2011 Revenue Requirements and Delivery Rates Application (Commissions approval order G-141-9) and Terasen Gas (Vancouver Island) Inc. 2010 and 2011 Revenue Requirements, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account Balance Application (Commission approval order G-140-09)

population. Going forward, historical main extensions will be reported on until the end of the five year period, for example, through to October 31, 2013 for 2008 projects. This improvement in reporting by tracking historical mains over five years exceeds the requirements set forth in Commission Orders G-152-07 and G-6-08 and is expected to provide additional insight into the results of historical main extensions.

3.2.2 COST AND CONSUMPTION

In this section, the Companies discuss the forecast versus actual costs, consumption, the PI for the first five years of main extensions in each Companies' portfolio, and the five highest cost main extensions. The Companies have made a number of improvements to the Report that are outlined below and are expected to provide greater insight to the Commission over the five year period of main extension projects.

The Companies have made cost reporting improvements in 2010 by reporting on the main extension, service line and meter costs over the five year period and over the time frame in question. For example, for 2009 main extensions, the Companies will report on forecast versus actual costs incurred over the two years since the 2009 main extensions were complete as well as the forecast costs over the five year period. Actual costs for the five year period will be provided at the end of the five year period. Cost reporting will be provided for 2010, 2009 and 2008 main extensions. Previously, the Companies reported on main extension costs for the year in question only.

The Companies have made consumption reporting improvements in 2010 by segmenting consumption in terms of attachments, consumption in gigajoules ("GJ") and GJ per attachment. Consumption is further segmented by the forecast total over years 1- 5, the forecast up to the current year and the actual year to date results. Detailed notes accompany each table describing the data presented is also provided.

Actual 2010 year to date consumption data will be provided for information purposes only and is not necessarily indicative of consumption patterns, due to a lag time effect. For example, a main extension technically complete on October 31, 2010 would have a year 1 forecast attachment date of October 31, 2011, one year from the technically complete date. In comparison, the cut off for the actual year to date attachments is March 1, 2011 when the Companies pulled the data for reporting purposes to the Commission. In this hypothetical example, there is an eight month lag time effect between the year 1 forecast and the year to date actual results. The appropriate time frame to evaluate 2010 consumption results will be in 2011 and subsequent years when the effect of the lag time will have diminished. The 2008 and 2009 MX Test Results sections present results that are more indicative of consumption patterns as the lag time effect is not as significant as in the current year.

The Companies factor in rate class considerations when making consumption forecasts as a part of the MX Test. However, the Companies are not able to report on consumption data segmented by rate class given the current resources available as it would create an undue administrative burden, and this level of detail exceeds the Commission compliance requirements noted in Table 1.

3.2.3 PROFITABILITY INDEX

The Companies have also made PI reporting improvements in 2010. The Companies are reporting a forecast PI for the first five years of main extensions in the sample as well as providing a forecast PI over the same time frame using actual main extension costs and forecast consumption, service line and meter costs. The appropriate time frame to provide the actual 2010 main extensions PI will be at the end of the five year period (i.e. October 31, 2015). Similarly, for 2008 and 2009 main extensions, actual PI will be provided following October 31, 2013 and October 31, 2014 respectively. The actual PI at the end of the respective five year periods will reflect all relevant consumption and main extension, service line and meter cost data.

As will be described in the BC Housing Market section, the BC housing market has been highly cyclical in the recent past as seen by the bullish conditions from 2006-2007 contrasted with the bearish conditions from 2008-2009. For this reason, it is appropriate to look at aggregate main extension PIs over a five year time horizon, not using one year of results in isolation. By taking this longer term view, the actual PI results will factor in the realities of the ups and downs of the BC housing market as opposed to assessing short term results in a myopic and potentially reactionary manner.

Providing a forecast PI using actual costs and the forecast consumption that was used in the MX Test is a departure from the reporting methodology followed in 2008 and 2009. In those years, the Companies presented forecast PI values based on actual costs and consumption based on year to date actual data plus the original forecast for the year to date to the year 5 timeframe.

For example, in the hypothetical main extension project below, the consumption forecast was 10 attachments per year over five years, and, the year to date actual attachments for year 1 was zero. The 2008-2009 PI method would have used 40 attachments in the re- forecasted PI.

	Forecast Attachments	YTD Actual Attachments
Year 1	10	0
Year 2	10	10
Year 3	10	10
Year 4	10	10
Year 5	10	10
Total	50	40

The methodology used in 2008 and 2009 presented an unrealistically negative picture of MX Test results because it did not account for the possibility that consumption that did not materialize as forecast in year 1 might show up at some later point in the five year timeframe (i.e. 10 attachments in the hypothetical example). Delayed attachments are a particularly salient issue during a bearish period such as 2009 because the delayed attachments tend to rebound along with the BC housing market. For example, as will be seen in the 2008 and 2009 results, the delayed attachments from 2009 have generally materialized in 2010.

The Companies are proposing to provide a forecast PI based on actual main extension costs and the original forecast consumption, service line and meter costs. And, actual main extension PI values will be provided at the end of the five year period using actual consumption data. The Companies will not, in the interim, be annually re-forecasting consumption for individual main extension projects and then subsequently re-running individual MX Tests to develop re-forecasted PI values. The Companies believe that there is limited value in reporting on a re-forecasted PI value based on re-forecasting consumption for every main extension annually and then re-running the MX Tests. There are two main reasons for this:

- First, re-forecasting attachment and consumption data for hundreds of main extensions each year would be impractical and create an undue administrative burden. If the Companies were to adopt this practice, the Companies could be in the position of re-running thousands of main extension tests at the end of a five year period resulting in the need to hire at least one additional full time employee.
- Second, the accuracy of any potential, revised attachment and consumption forecasts would still be variable as they would be subject to the cyclical BC housing market conditions which are out of the Companies' control and difficult to predict into the future, as described in Section 4.

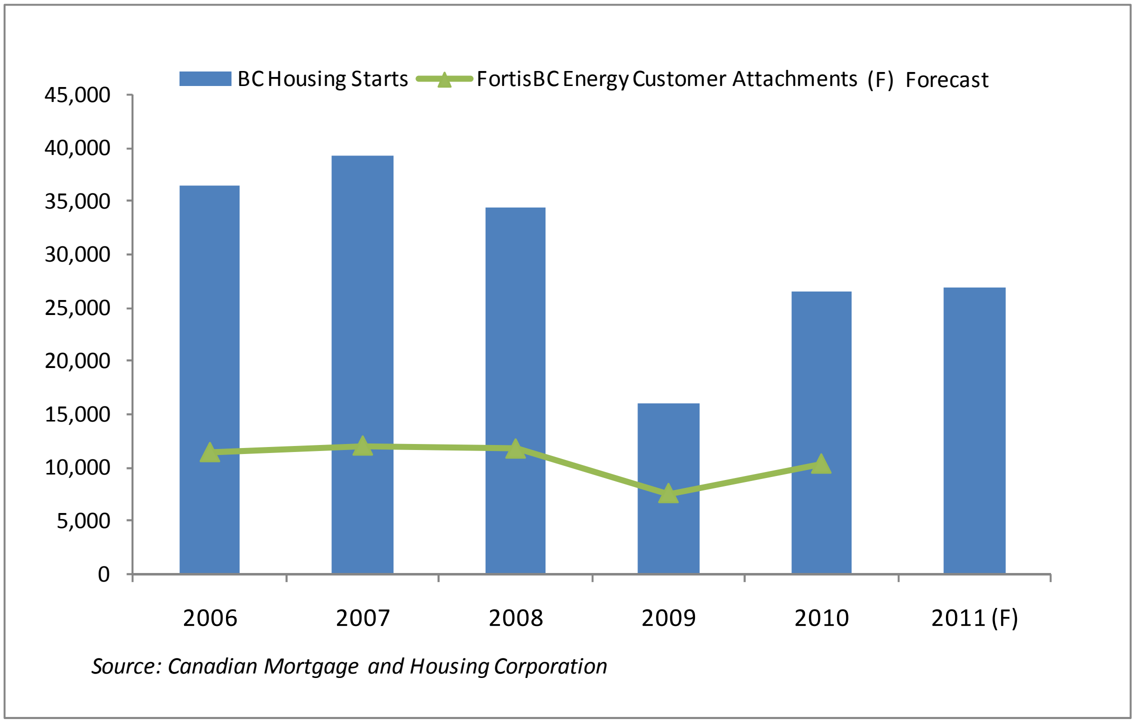
Consequently, re-forecasting load annually and re-running MX Tests would provide limited added value to the Commission's MX Test review while adding substantively to the Companies' administrative workload, resulting in additional costs for customers. The appropriate time to provide actual main extension PI values with actual consumption data is at the end of five-year period.

In sum, the Companies have demonstrated compliance with respect to reporting on MX Test parameters. And, the Companies have improved reporting in 2010 by providing 2008-2009 main extension project updates, enhanced cost reporting, greater segmentation of consumption data and a PI forecast that is as accurate as possible without adding substantially to the Companies' administrative workload. These improvements are expected to provide greater insight for the Commission over the five year review period of main extension projects.

4 BC HOUSING MARKET

The BC housing market and the Companies' consumption results are closely related. Both the BC housing market and the Companies' customer attachments have been highly cyclical in the recent past, as seen in the figure below. The return to growth in 2010 from the bearish years starting in 2008 will be discussed in the following section and used as an example to support the Companies' position that it is prudent to take a longer term view when evaluating PI results rather than taking a limited, one year horizon.

Figure 1: BC Housing Starts & the Companies' Customer Attachments



2008 marked BC's first decline in GDP since 1982 and it was also the first time since 2001 that the BC economy grew more slowly than the Canadian average.[17] GDP fell even further in the first half of 2009. Job losses during this period translated to reduced domestic demand for goods and services, and reduced consumer spending. BC's resource-based exports were also significantly lower with the forestry sector being the hardest hit due to the housing slowdown of its largest customer, the US. The fall of the US dollar against the Canadian dollar posed an added challenge to BC forestry and other commodity companies as well. Developers reacted to these market indicators, as housing starts fell somewhat in 2008 and more dramatically in 2009. The less than optimal MX Test results reported in 2009[18] were attributable to the economic

---

17 BC Ministry of Labour and Citizen Services, BC Stats Business Indicators, April 2009

18 TGI and TGVI Main Extension Report and TGI Revised Vertical Subdivision Report for Year End, submitted August 18, 2010

downturn that resulted in multifamily projects and developments being put on hold and fewer customers attaching to main extensions than forecast.

Results in the Report will show that the 2009 MX Test report[19] appropriately indicated that with the economy returning to growth, building developments would restart and in turn attachment and consumption results would improve in future years.

By 2010, low mortgage rates, improved financial markets and consumer spending helped provide renewed confidence to investors and consumers and an impetus for buyers to return to the housing market. The impending arrival of the HST on July 1st 2010 together with tax relief rebates also encouraged home sales, as buyers sought to avoid the increase in the purchase price of a new home, renovation of an existing home and closing costs (commission, legal fees, inspections, etc.) associated with the HST. Developers responded to this demand with increased housing starts in the first half of 2010 before tapering off for the rest of the year. This decline is partly attributed to the HST, given the experience of other regions like the Maritimes that already have HST and experienced a 2,000 unit decrease in housing starts following harmonization[20].

Economic growth is expected to grow at a similar pace as 2010 with BC's GDP at 3.1% for 2011. Housing starts are forecast to grow slightly with a forecast of 26,900 starts in 2011[21] and the Companies' customer attachments are expected to follow this trend as well. However, several factors could adversely affect the number of housing starts, including higher home prices from the HST, higher interest rates and new mortgage rules.

Inevitably there will be uncertainty and variability inherent in forecasting housing attachments, despite the Companies' best efforts to apply their industry knowledge, experience and conservative approach to forecasting. Given the highly cyclical nature of the BC housing market such as the period recently observed, and the uncertainty in forecasting housing attachments, it is appropriate to review MX Test results over a longer period such as the five year period as approved by the Commission.

5 2010 MAIN EXTENSIONS & VERTICAL SUBDIVISIONS

The following section summarizes the results for 2010 main extensions. As discussed in the Methodology section, the results from both the aggregate and top 5 main extensions will be reviewed. For 2010, there were no vertical subdivisions.

5.1 2010 Main Extensions

In 2010, the Companies re-aligned sales efforts and designated a specific territory for each sales person to improve the actual attachments and consumption data at the end of any given five year period. This allowed for greater focus and a closer working relationship with Planners, municipal governments and developers as projects evolve. In 2010, every main extension had a Planner and sales manager assigned to the project to evaluate, implement and monitor over the five year horizon. Furthermore, for historical main extensions such as the 2008 and 2009 installations, sales managers are responsible for monitoring the consumption and following up with builder/developers as required.

The table below summarizes the aggregate 2010 main extension results along with notes explaining the data provided. The results below refer to the entire main extension population of 205 and 106 installations for FEI and FEVI respectively.

Table 8: 2010 Aggregate Main Extensions

Utility	Cost ($)			Attachments			Consumption (GJ)			Consumption (GJ/Attachment)			PI	
	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-5 Forecast, Actual Main Cost
FEI	$6,212,805	$4,673,000	$ 4,461,177	3,156	1,649	1,151	547,661	335,945	72,874	174	204	63	1.6	1.8
FEVI	$2,060,741	$1,820,857	$ 1,352,772	1,070	758	321	78,238	60,910	18,928	73	80	59	2.1	2.5

Notes:

Cost ($)	
Years 1-5 forecast	Estimated main extension, service line and meter costs at the end of year 5.
Year 1 forecast	Estimated main extension, service line & meter costs at the end of year 1.
YTD Actual	Actual main extension, service line & meter costs for the period November 1, 2009-March 1, 2011
Attachments	
Year 1-5 forecast	Forecast main extension attachments at the end of year 5.
Year 1 forecast	Forecast main extension attachments at the end of year 1
YTD Actual	Actual attachments for the period November 1, 2009-March 1, 2011.
Consumption (GJ)	
Year 1-5 forecast	Forecast main extension conumption at the end of year 5.
Year 1 forecast	Forecast main extension consumption at the end of year 1.
YTD Actual	Actual consumption for the period November 1, 2009-March 1, 2011.
Consumption (GJ/Attachments)	
Year 1-5 forecast	Forecast main extension conumption at the end of year 5.
Year 1 forecast	Forecast main extension consumption at the end of year 1.
YTD Actual	Actual consumption for the period November 1, 2009-March 1, 2011.
PI	
Year 1-5 forecast	Forecast main extension PI.
forecast, Actual Cost	Forecast main extension PI using actual main extension costs, forecast service line and meter costs and forecast consumption.

For clarification purposes, the Year 1-5 forecast refers to the cumulative total at the end of the five year period. Similarly, Year 1 refers to the cumulative total at the end of year one of the five year period. For example, the 2010 Years 1-5 forecast attachments are 3,156 representing the attachments at the end of year 5. The Year 1 forecast attachments are 1,649 meaning that during Years 2-5, 1,507 (3,156-1,649) incremental attachments are forecast to be added.

The YTD actual refers to the period from November 1, 2009 to March 1, 2011 when the data for the Report was obtained. It is not possible for the Companies to match the time period for Year 1 and YTD given the current resources available.

The Consumption in GJ/attachment is derived by dividing consumption in GJ by attachments.

The actual main extension costs compared to forecast costs are $0.1 million and $0.2 million lower for FEI and FEVI respectively. In comparison, the actual main extension costs are $2.8 million and $0.9 million for FEI and FEVI. The actual main extension costs represent only 0.1% and 0.2% of FEI and FEVI's approved rate base.[22] These variances are reasonable in that they are as accurate as possible without adding substantively to the administrative workload associated with estimating main extension costs. The Companies have the internal processes and controls in place, along with the use of geo code and manual estimating, to ensure forecast costs from Planners are as accurate as possible.

Year to date attachment and consumption data for the aggregate and the top 5 main extensions is provided for information purposes only due to the lag time effect discussed in the Methodology section. Because of the lag time effect, it is not concerning that the 2010 year to date actual attachments are less than the year 1 forecast for both utilities.

The forecast PIs for both utilities is above the aggregate 1.1 threshold approved by the Commission. The forecast PI for FEI of 1.6 is comparable to the 1.7 value in 2009. The forecast PI for FEVI is higher at 2.1 in 2010 compared to 1.3 in 2009 due to a variety of factors including higher delivery margins and a rebound in the economic outlook.

All individual main extension's PIs are forecast to be equal to or greater than the 0.8 threshold approved by the Commission. 22 FEI customers and 21 FEVI customers made a contribution in aid of construction in order to reach the individual main extension PI threshold of 0.8. In aggregate, these results demonstrate that the principles of the MX Test are being upheld, whereby customers in existence at the beginning of the year are not adversely affected by the addition of a full year's cohort of customers. In fact, the addition of economical main extensions benefit existing customers, especially in an environment where the Companies are experiencing a decline in the number of main extensions, attachments and system throughput as will be discussed in the following section.

The top 5 main extensions with the highest cost for each of the utilities are summarized below. The notes from the table above apply to this table as well.

---

[22] 2010 approved rate base $2.5 billion and $0.6 billion for FEI and FEVI as per Terasen Gas Inc 2010 and 2011 Revenue Requirements and Delivery Rates Application (Commissions approval order G-141-9) and Terasen Gas (Vancouver Island) Inc. 2010 and 2011 Revenue Requirements, Rates, Cost of Service, Rate Design and Revenue Deficiency Deferral Account Balance Application (Commission approval order G-140-09)

Table 9: 2010 Top 5 Cost Main Extensions

Utility	Cost ($)			Attachments			Consumption (GJ)			Consumption (GJ/Attachment)			PI
	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast	Year 1 Forecast	YTD Actual	Years 1-5 Forecast
FEI													
Gislason Ave.	$250,216	$165,736	$222,244	100	20	70	10,815	2,163	4,182	108	108	60	1.0
Whiskey Jack Dr.	$194,214	$149,099	$145,183	65	30	26	6,548	3,022	560	101	101	22	0.8
Progress Way	$169,868	$125,155	$82,930	24	3	1	11,543	1,912	59	481	637	59	1.1
Pinot Noir Dr.	$164,138	$84,220	$85,803	62	0	8	6,244	0	611	101	0	76	0.8
Highway 95A	$110,795	$78,965	$141,760	45	15	51	4,532	1,511	2,825	101	101	55	0.9
FEVI													
Norton Rd.	$82,041	$58,911	$93,303	45	15	22	3,150	1,050	383	70	70	17	1.4
Fifth St.	$39,093	$39,093	$80,350	18	18	20	9,914	9,914	8,443	551	551	422	18.4
Rosstown Rd.	$27,664	$22,539	$38,968	8	3	1	628	221	7	79	74	7	0.8
Chilco Rd.	$144,013	$102,045	$31,502	65	22	0	2,878	1,060	0	44	48	0	1.2
Riverstone Dr.	$104,099	$104,254	$49,544	45	45	15	3,150	3,150	71	70	70	5	1.2

In the top 5 cost main extensions the difference between forecast and actual main extension costs is either minimal, below or above forecast. In aggregate, the main extension costs variances for FEI and FEVI are approximately $64,000 and $34,000 below forecast respectively. Note that the Chilco Road and Riverstone Road projects have additional phases still to be completed so the YTD actual costs will come closer to forecast. All FEI and FEVI projects were done with geo code estimates, excluding Rosstown Road. The cost estimating techniques continue to provide an efficient, unbiased and reasonable means to estimate costs. The results also reflect the challenges Planners face in providing cost estimates that are as accurate as possible when environmental circumstances can be highly variable and unpredictable. An example of this is the Rosstown Road project that faced poor weather conditions and unexpected site issues.

As in the 2010 aggregate main extension data set, year to date attachment and consumption data for the top 5 main extensions is provided for information purposes only. The lag time effect has not impacted FEI's year to date attachments whereas FEVI's year to date attachments are roughly one half of forecast, similar to the aggregate data set. The Chilco Road main extension for example, was completed October 27, 2010 so attachments will lag behind the year 1 forecast. The lag time effect has affected the actual year to date consumption for both utilities.

5.1.1 DECLINE IN MAIN EXTENSIONS, ATTACHMENTS & THROUGHPUT

A concerning trend emerged in 2010 whereby the number of main extensions, the forecast attachments and the system throughput have dropped significantly. As seen in the table below, between 2008 and 2010, the following trends have been observed for the Companies:

- The number of main extensions have reduced from 492 in 2008 to 311 in 2010
- Forecast attachments decreased 47%
- Normalized system throughput dropped 4.27%[23]

[23] System throughput includes FEI and FEVI residential, commercial, industrial and transportation customers

Table 10: Declining Main Extension & Attachments in 2010

	Actual Main Extensions	Actual Cost ($ 000)		Forecast Attachments	Normalized Volumes (TJ)
	Aggregate	Aggregate	Top 5	Year 1-5	System Wide
2008	492	$ 8,434	$ 1,921	7,433	210,091
2009	376	$ 8,598	$ 3,314	6,517	200,821
2010	311	$ 3,731	$ 588	4,226	201,110

So, while 2010 represents a return to modest growth in the BC housing market and the forecast versus actual attachments presented in the Report have improved relative to 2009, the number of main extensions and attachments in the Companies' main extensions are significantly lower than 2008 levels.

The decline in the number of main extensions and attachments is partly attributable to the housing inventory left over from the recession that developers sold off first, before building new inventory. The decline is also partly attributable to the significant capital cost differential between natural gas and electricity in the heating and hot water heating applications. Feedback from our customers to sales managers indicates that builders and developers are likely to select electricity over natural gas due to the incremental capital cost of installing natural gas equipment in building a typical home if they don't believe they can recover these cost differences in the selling price of the home.

The Companies' recent submission of the Review of Price Risk Management Objectives and Hedging Strategy[24] described that the upfront cost to install a high efficiency gas furnace (90% efficiency) and associated duct work in a home is estimated to be approximately $7,000 whereas the upfront estimated cost of installing baseboard electric heating is approximately $2,500. The upfront cost to install a gas hot water heater in a home is estimated to be approximately $1,409 (including venting) whereas the upfront estimated cost of installing an electric hot water heater is approximately $973. These wide capital cost differentials coupled with the views of our customers and the decline of the number and attachments in 2010 main extensions suggest that the Companies are facing a significant challenge in generating new customer growth in terms of the heating and hot water heating segments, the cornerstones of our business.[25] The Companies will continue to monitor and report to the Commission on this trend in subsequent MX Test reports.

---

[24] TGI and TGVI Review of Price Risk Management Objectives and Hedging Strategy submitted confidentially to the Commission January 27, 2011.
[25] IBID. pp. 48-49

5.2 2010 Vertical Subdivision

There are no vertical subdivision projects to report in 2010. If there were projects to report, the Companies would have reflected in the MX the fact that VSDs require several years before all units are occupied and normal consumption is established, as per the Commission "ramp up" reporting requirements.

In summary, in 2010 the MX Test promoted fair and equitable treatment of customers and avoided undue discrimination. The full year's cohort of 2010 customers did not adversely affect the customers in existence at the beginning of the year.

6 2009 MAIN EXTENSIONS

The following section summarizes the attachment and consumption results for 2009 main extensions. As discussed in the Methodology section, the results from both the aggregate and top 5 main extensions will be reviewed.

The table below summarizes the aggregate 2009 main extension results along with notes explaining the data provided. The results below refer to the entire main extension population of 265 and 111 installations for FEI and FEVI respectively.

Table 11: 2009 Aggregate Main Extensions

Name	Cost ($ 000)			Attachments			Consumption (GJ)			Consumption (GJ/Attachment)			PI	
	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-5 Forecast, Actual Cost
FEI	$9,142,651	$7,168,915	$9,005,810	4,850	2,554	2,769	750,253	475,055	495,178	155	186	179	1.7	1.6
FEVI	$4,072,525	$3,586,043	$5,795,961	1,667	1,102	993	112,527	77,596	89,435	68	70	90	1.3	0.7
FEVI Excluding Shawnigan Lake	$3,136,306	$2,708,925	$3,757,568	1,474	937	905	98,967	69,321	85,498	67	74	94	1.4	1.0

Notes:	
Cost ($)	
Years 1-5 forecast	Estimated main extension, service line and meter costs at the end of year 5.
Years 1-2 forecast	Estimated main extension, service line & meter costs at the end of year 2.
YTD Actual	Actual main extension, service line & meter costs for the period November 1, 2008-March 1, 2011
Attachments	
Year 1-5 forecast	Forecast main extension attachments at the end of year 5.
Years 1-2 forecast	Forecast main extension attachments at the end of year 2.
YTD Actual	Actual attachments for the period November 1, 2008-March 1, 2011.
Consumption (GJ)	
Year 1-5 forecast	Forecast main extension conumption at the end of year 5.
Years 1-2 forecast	Forecast main extension consumption at the end of year 2.
YTD Actual	Actual consumption for the period November 1, 2008-March 1, 2011.
Consumption (GJ/Attachments)	
Year 1-5 forecast	Forecast main extension conumption at the end of year 5.
Years 1-2 forecast	Forecast main extension consumption at the end of year 2.
YTD Actual	Actual consumption for the period November 1, 2008-March 1, 2011.
PI	
Year 1-5 forecast	Forecast main extension PI.
Year 1-5 forecast, Actual Cost	Forecast main extension PI using actual main extension costs, forecast service line and meter costs and forecast consumption.

The main extension cost variance has been reviewed in a previous report filed to the Commission[26]. The variance between Years 1-2 forecast and YTD actual costs is attributable to a combination of variance in costs and attachments.

Actual year to date attachment and consumption data relative to forecast is reasonable for 2009 main extensions. For example, FEI's year to date attachments exceed the years 1-2 forecast. These results reflect a combination of the Companies' on-going efforts to secure economic customer attachments, the improved BC housing market conditions in 2010 and the diminishment of the lag time effect discussed in the 2010 Main Extension section. The positive

[26] TGI & TGVI Main Extension Report and TGI and Revised Vertical Subdivision Report for 2009 Year End, submitted to the Commission August 18, 2010.

results for 2009 main extensions support the position that a longer term view must be taken with respect to establishing actual PI values as opposed to an isolated, one year horizon.

The forecast PI of 1.6 for FEI is above the aggregate 1.1 threshold approved by the Commission. The forecast PI for FEVI is 0.7, and 1.0 if Shawnigan Lake is removed. FEVI believes that the cost estimating issues regarding Shawnigan Lake have been addressed and are unlikely to occur in the future. Thus, the forecast 1.0 PI is more indicative of 2009 FEVI results. 26 FEI customers and 17 FEVI customers made a contribution in aid of construction in order to reach the individual main extension PI threshold of 0.8.

The top 5 cost main extensions for both utilities are summarized below. The notes from the table above apply to this table as well.

Table 12: 2009 Top 5 Cost Main Extensions

Utility	Cost ($ 000)			Attachments			Consumption (GJ)			Consumption (GJ/Attachment)			PI
	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-2 Forecast	YTD Actual	Years 1-5 Forecast
FEI													
Tronson Road	$500,549	$412,524	$263,350	205	100	6	24,100	0	63	118	0	10	0.9
2nd Avenue	$548,442	$333,756	$300,291	306	114	82	29,733	4,685	1,768	97	41	22	1.3
Upper Hyde Creek	$186,765	$184,580	$228,944	115	115	86	13,161	13,161	7,275	114	114	85	1.5
108 Avenue	$168,699	$119,457	$155,710	78	30	40	8,699	1,638	2,629	112	55	66	1.0
S of University Way	$211,465	$184,732	$99,027	78	1	1	10,489	0	995	134	0	995	0.8
FEVI													
Shawnigan Lake	$936,219	$823,750	$2,052,520	193	193	88	9,914	7,044	3,135	51	36	36	0.9
West Coast Road	$410,472	$460,287	$401,092	201	201	0	14,070	14,070	0	70	70	0	1.6
Wild Ridge Way	$91,923	$90,707	$174,513	64	64	40	4,480	4,480	1,576	70	70	39	1.9
Hammond Bay Road	$164,340	$114,580	$99,572	80	40	13	4,262	1,400	305	53	35	23	1.2
Kettle Creek Station	$114,424	$76,918	$93,406	58	20	15	5,067	1,747	322	87	87	21	1.7

Although the 2009 attachment and consumption results have improved relative to the results presented to the Commission in 2009, the Companies will continue to work with developers on specific projects to explore ways to improve attachment and consumption results where warranted.

As a result of discussions with Commission Staff, on November 2, 2010, FEVI filed the TGVI Shawnigan Lake Main Extension Report with the Commission which included comprehensive data, analysis and discussion regarding this project. Since a limited time period has passed since filing this report, FEVI intends to provide an update on the Shawnigan Lake main extension project in the 2011 MX Test year end report.

In summary, for 2009 main extensions the MX Test promoted the fair and equitable treatment of customers and avoided undue discrimination. The full year's cohort of 2009 customers did not adversely affect the customers in existence at the beginning of the year.

7 2008 MAIN EXTENSIONS

The following section summarizes the attachment and consumption results for 2008 main extensions. As discussed in the Methodology section, the results from both the aggregate and top 5 main extensions will be reviewed.

The table below summarizes the aggregate 2008 main extension results along with notes explaining the various sections. The results below refer to the entire main extension population of 305 and 107 installations for FEI and FEVI respectively.

Table 13: 2008 Aggregate Main Extensions

Utility	Cost ($ 000)			Attachments			Consumption (GJ)			Consumption (GJ/Attachment)			PI	
	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-5 Forecast, Actual Cost
FEI	$ 15,198,096	$13,417,466	$ 11,133,650	5,436	4,498	4,274	680,095	583,389	551,681	125	130	129	1.3	1.2
FEVI	$ 7,848,502	$ 7,515,441	$ 5,595,532	1,997	1,865	1,859	159,679	148,818	148,193	80	80	80	1.6	1.4

Notes:	
Cost ($)	
Years 1-5 forecast	Estimated main extension, service line and meter costs at the end of year 5.
Years 1-3 forecast	Estimated main extension, service line & meter costs at the end of year 3.
YTD Actual	Actual main extension, service line & meter costs for the period November 1, 2007-March 1, 2011
Attachments	
Year 1-5 forecast	Forecast main extension attachments at the end of year 5.
Years 1-3 forecast	Forecast main extension attachments at the end of year 3.
YTD Actual	Actual attachments for the period November 1, 2007-March 1, 2011.
Consumption (GJ)	
Year 1-5 forecast	Forecast main extension conumption at the end of year 5.
Years 1-3 forecast	Forecast main extension consumption at the end of year 3.
YTD Actual	Actual consumption for the period November 1, 2007-March 1, 2011.
Consumption (GJ/Attachments)	
Year 1-5 forecast	Forecast main extension conumption at the end of year 5.
Years 1-3 forecast	Forecast main extension consumption at the end of year 3.
YTD Actual	Actual consumption for the period November 1, 2007-March 1, 2011.
PI	
Year 1-5 forecast	Forecast main extension PI.
Year 1-5 forecast, Actual Cost	Forecast main extension PI using actual main extension costs, forecast service line and meter costs and forecast consumption.

The cost variance has been reviewed in a previous report filed to the Commission[27] and the historical results are presented above.

Actual year to date attachment and consumption data compared to forecast is reasonable for 2008 main extensions. Both FEI and FEVI's year to date attachments are comparable to the years 1-3 forecast. Similar to the 2009 MX Test results, the 2008 results reflect a combination of the Companies' on-going efforts to secure economic customer attachments, the improved BC housing market conditions in 2010 and the diminishment of the lag time effect discussed in the 2010 Main Extension section. The positive results for 2008 main extensions support the position that a longer term view must be taken with respect to establishing actual PI values as opposed to an isolated, one year horizon.

[27] TGI & TGVI Main Extension Report and TGI and Revised Vertical Subdivision Report for 2008 Year End, submitted to the Commission April 3, 2009.

The forecast PIs of 1.2 and 1.4 for both utilities are above the aggregate 1.1 threshold approved by the Commission. 23 FEI customers and 24 FEVI customers made a contribution in aid of construction in order to reach the individual main extension PI threshold of 0.8.

The top 5 cost main extensions for both utilities are summarized below. The notes from the table above apply to this table as well.

Table 14: 2008 Top 5 Cost Main Extensions

Utility	Cost ($ 000)			Attachments			Consumption (GJ)			Consumption (GJ/Attachment)			PI
	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast	Years 1-3 Forecast	YTD Actual	Years 1-5 Forecast
FEI													
Trans-Canada Highway	$1,321,079	$1,224,075	$841,250	511	280	6	79,801	41,906	407	156	150	68	0.9
Juniper Road	$63,521	$51,297	$119,211	44	20	0	5,500	2,500	0	125	125	0	1.7
Crystal Creek Drive	$64,646	$66,648	$126,848	22	22	9	3,070	3,070	1,026	140	140	114	1.0
163 & 61A Avenue	$242,492	$242,560	$277,473	171	110	128	16,507	10,619	12,555	97	97	98	1.4
Rio Drive	$187,818	$188,654	$133,128	92	85	16	3,649	3,371	147	40	40	9	0.8
FEVI													
Players Drive	$265,791	$264,624	$284,519	74	74	49	13,307	13,307	1,856	180	180	38	1.5
French Road	$107,795	$106,793	$204,775	50	50	34	3,500	3,500	1,086	70	70	32	1.2
Hutchinson Road	$136,457	$135,032	$155,400	75	75	52	4,125	4,125	991	55	55	19	1.4
Sewell Road	$60,723	$60,587	$120,754	25	25	28	2,750	2,750	1,237	110	110	44	1.0
Phillips Road	$287,608	$332,976	$77,894	87	87	1	4,670	4,670	21	54	54	21	0.9

As discussed in the 2009 Main Extension Results section, although the 2008 attachment and consumption results have improved relative to the results presented to the Commission in 2009, the Companies will be following up with developers on specific projects to explore ways to improve attachment and consumption results where warranted.

On November 26, 2008, FEVI filed the Sooke Main Extension 2008 Annual Report. In the cover letter, FEVI indicated that it was filing the fifth and final annual report. Consequently, the Companies will not be reporting on the Sooke main extension in this Report.

In summary, for 2008 main extensions the MX Test promoted the fair and equitable treatment of customers and avoided undue discrimination. The full year's cohort of 2008 customers did not adversely affect the customers in existence at the beginning of the year.

GLOSSARY OF TERMS

The following definitions taken from the FEI General Terms & Conditions are relevant to the MX Test:

Contributions in Aid of Construction

If the economic test results indicate a Profitability Index of less than 0.8, the Main Extension may proceed provided that the shortfall in revenue is eliminated by contributions in aid of construction by the Customers to be served by the Main Extension, their agents or other parties, or if there are non-financial factors offsetting the revenue shortfall that are deemed to be acceptable by the British Columbia Utilities Commission.

FEI may finance the contributions in aid of construction for Customers. Contributions of less than $100 per Customer may be waived by FEI.

Contributions Paid by Connecting Customers

The total required contribution will be paid by the Customers connecting at the time the Main Extension is built. FEI will collect contributions from all Customers connecting during the first five Years after the Main Extension is built. As additional contributions are received from Customers connecting to the main extension, partial refunds will be made to those Customers who had previously made contributions. At the end of the fifth Year, all Customers will have paid an equal contribution, after reconciliation and refunds.

For larger Main Extension projects, FEI may use the Main Extension Contribution Agreement for initial contributions. Customers will be billed the contribution amount after the Main Extension is built.

Costs

The total costs to be used in the economic test include, without limitation

(a) the full labour, material, and other costs necessary to serve the new Customers including Mains, Service Lines, Meter Sets and any related facilities such as pressure reducing stations and pipelines;

(b) the appropriate allocation of FEI's overheads associated with the construction of the Main Extension;

(c) the incremental operating and maintenance expenses necessary to serve the Customers; and

(d) an allocation of system improvement costs.

In addition to the costs identified, the economic test will include applicable taxes and the appropriate return on investment as approved by the British Columbia Utilities Commission.

In cases where a larger Gas distribution Main is installed to satisfy future requirements, the difference in cost between the larger Main and the smaller Main necessary to serve the Customers supporting the application may be eliminated from the economic test.

Customer

A Person who is being provided Service or who has filed an application for Service with FEI that has been approved by FEI.

Economic Test

All applications to extend the Gas distribution system to one or more new Customers will be subject to an economic test approved by the British Columbia Utilities Commission. The economic test will be a discounted cash flow analysis of the projected revenue and costs associated with the Main Extension. The Main Extension will be deemed to be economic and will be constructed if the results of the economic test indicate a Profitability Index of 0.8 or greater for an individual main extension.

Gas

Means natural gas (including odorant added by FEI) and propane.

General Terms & Conditions of FortisBC Energy Inc

The general terms and conditions of FEI from time to time approved by the British Columbia Utilities Commission.

Geo Code Pricing

A unit cost methodology which is based upon the geographical region, typical ground conditions and length of service to be installed.

Gigajoule

A measure of energy equal to one billion joules used for billing purposes.

Main

Pipes used to carry Gas for general or collective use for the purposes of distribution.

Main Extension

An extension of one of FEI's mains with low, distribution, intermediate or transmission pressures, and includes tapping of transmission pipelines, the installation of any required pressure regulating facilities and upgrading of existing Mains, or

pressure regulating facilities on private property.

Meter Set

An assembly of FortisBC Energy owned metering and ancillary equipment and piping.

Person

Means a natural person, partnership, corporation, society, unincorporated entity or body public.

Premises

A building, a separate unit of a building, or machinery together with the surrounding land.

Profitability Index

The revenue to cost ratio comparing the revenues expected from a Main Extension project to the expected costs over a set period of time.

Revenue

The projected revenue to be used in the economic test will be determined by FortisBC Energy by

(a) estimating the number of Customers to be served by the Main Extension;

(b) establishing consumption estimates for each Customer;

(c) projecting when the Customer will be connected to the Main Extension; and

(d) applying the appropriate revenue margins for each Customer's consumption.

The revenue projection will take into consideration the estimated number and type of Gas appliances used and the effect variations in weather conditions throughout the applicable Service Area have on consumption. Customers who intend to install both high efficiency gas fired space (namely an Energy Star rated furnace or boiler) and water heating appliances (tankless water heaters, or water heaters with efficiency rating of 78 percent or greater), will receive a credit of 10 percent of the volume otherwise used for both appliances. Customers who intend to install both high efficiency gas fired space and water heating appliances and attain a minimum of LEEDTM (Leadership in Energy and Environmental Design) General Certification will receive a credit of 15 percent of the volume otherwise used for both. In addition, the projected revenue from Application Fees will be included. Only those Customers expected to connect to the Main Extension within 5 Years of its completion will be considered.

Service

The provision of Gas Service or other service by FEI.

Service Line

Means that portion of the gas distribution system extending from a Main or a Service Header to the Meter Set. In case of a Vertical Subdivision, or multi-family housing complex, the Service

Line may include the piping from the outlet of the Meter Set to the Customer's individual Premises.

Vertical Subdivision

A multi-storey building that has individually metered units and a common Service Header connecting banks of meters, typically located on each floor.

Year

A period of 12 consecutive months.

DRAFT ORDER

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

Application by the FortisBC Energy Utilities
(comprising FortisBC Energy Inc., FortisBC Energy Inc. Fort Nelson Service Area,
FortisBC Energy (Whistler) Inc., and FortisBC Energy (Vancouver Island) Inc.)
for Approval of 2012 and 2013 Natural Gas Rates

BEFORE: D.A. Cote, Panel Chair/Commissioner
A.A. Rhodes, Commissioner
N.E. MacMurchy, Commissioner

O R D E R

WHEREAS:

A. On May 4, 2011, the FortisBC Energy Utilities (FEU or the Companies) filed an Application for their combined Revenue Requirements for FortisBC Energy Inc. (FEI), the Fort Nelson Service Area of FEI (Fort Nelson), FortisBC Energy (Whistler) Inc. (FEW), and FortisBC Energy (Vancouver Island) Inc. (FEVI), and for approval of interim and permanent natural gas delivery rates effective January 1, 2012 and permanent rates effective January 1, 2013, pursuant to sections 59 to 61 and 89 of the *Utilities Commission Act* (the Act), with any variance between 2012 interim rates and permanent rates to be refunded to or collected from customers by way of a rate rider following the approval of 2012 permanent rates;

B. FEI seeks, among other things, approval, pursuant to sections 59 to 61 of the Act, of a permanent natural gas delivery rate increase of **X.X** percent effective January 1, 2012 and a further X.X percent permanent increase effective January 1, 2013 representing an annual average lower mainland residential customer total bill increase of X.X percent in 2012 and a further X.X percent increase in 2013;

C. FEI further seeks approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for applicable rate classes and approval of the cost allocation to Thermal Energy Services (previously referred to as Alternative Energy Services) as set out in the Application;

D. Fort Nelson region seeks, among other things, approval pursuant to sections 59 to 61 of the Act, of a permanent natural gas delivery rate increase of X.X percent effective January 1, 2012 and a further X.X percent permanent increase effective January 1, 2013, representing an annual average Fort Nelson residential customer total bill increase of X.X percent in 2012 and a further X.X percent increase in 2013. Fort Nelson also seeks approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for applicable rate classes as set out in the Application;

E. FEW seeks, among other things, approval, pursuant to sections 59 to 61 of the Act, of a permanent natural gas delivery rate increase of X.X percent effective January 1, 2012 and a further X.X percent permanent increase effective January 1, 2013, representing an annual average residential customer total bill increase of X.X percent in 2012 and a further X.X percent increase in 2013, and approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for applicable rate classes as set out in the Application;

F. FEVI seeks, among other things, approval, pursuant to sections 59 to 61 of the Act and section 2.1 of the Special Direction, to maintain current natural gas rates for all customers other than those with specified rates in their transportation service agreements, for a two-year period commencing January 1, 2012. FEVI proposes to utilize the surplus that will exist in the Rate Stabilization Deferral Account (RSDA) to allow for rates to remain unchanged for 2013;

G. FEVI further seeks approval of its schedule of demand and commodity charges, forecast gross O&M expenditures and, pursuant to section 2.10 of the Special Direction, for its forecast cost of service, forecast capital expenditures, and forecast revenue as set out in the Application;

H. The FEU seek, among other things, approvals including: allocation of costs for shared services between the Companies; discontinuation, continuation, and creation of deferral accounts and the amortization and disposition of balances in deferral accounts; changes to depreciation rates; and pursuant to section 44.2 of the Act, for Energy Efficiency and Conservation (EEC) expenditures;

I. In addition to the specific requests included in the Application for each of the Companies, the FEU are collectively applying for a Commission determination of the combined utility cost of service for 2013, subject to the Companies obtaining, at a later date, the necessary approvals to amalgamate. In the event that amalgamation proceeds, the combined cost of service will provide the basis for a harmonized rate structure for an amalgamated entity;

J. On May 6, 2011, the Commission issued Order G-81-11 establishing Regulatory Timetable for the review of the Application as well as setting dates for a Workshop and a Procedural Conference. Further, Orders L-42-11 and L-45-11 Amended the Regulatory Timetable.

K. A Workshop took place on May 18, 2011 and a Procedural Conference took place on June 15, 2011.

L. The Commission has reviewed and considered the Application, the evidence and the submissions and has determined that the Application should be approved.

NOW THEREFORE the Commission orders as follows:

1. Pursuant to sections 59 to 61 of the *Utilities Commission Act* (the Act), the following approvals are granted for FEI:
   a. Approval of a permanent delivery rate increase to recover the revenue requirements as described in Section 3.3.1 of the Application, resulting in an increase of X.X percent, compared to 2011 delivery rates, for all non-bypass customers, effective January 1, 2012. The increase is to be applied to the delivery charge and the basic charge will remain at 2011 levels.
   b. Approval of the Rate Stabilization Adjustment Mechanism (RSAM) rider for customers served under FEI Rate Schedules 1, 1B, 1S, 1X, 2, 2U, 2X, 3, 3U, 3X and 23 effective January 1, 2012 of ($0.032)/GJ as set out in Section 3.4.3 of the Application (the 2013 RSAM rider will be adjusted with the FEI Fourth Quarter 2011 Gas Cost filing).
   c. Approval of the 2012 cost allocation to Thermal Energy Services (formerly Alternative Energy Services) as set out in Section 5.3.18 and Appendix G of the Application.
   d. Approval of the continuation of the debiting of the MCRA and crediting of the delivery margin revenue in the amount of $3.6 million per year for the 2012 forecast period as set out in Section 5.5 of the Application.
   e. Approval of the change in the allocation between the delivery margin and midstream of the SCP costs and revenues, and of the Spectra Energy Kingsvale South charges related to the NWN capacity as set out in Section 5.5 of the Application.
2. The following approvals are granted for FEVI:
   a. Pursuant to sections 59 to 61 of the Act and section 2.1 of the Vancouver Island Natural Gas Pipeline Agreement Special Direction (the "Special Direction"), approval of permanent rates for FEVI effective January 1, 2012 for Core Market sales and transportation customers, other than customers who have specified rates in their transportation service agreements, at the same level as 2011 rates.
   b. Pursuant to section 2.10(a)(i) of the Special Direction, approval of FEVI's forecast Cost of Service for 2012 as set out in Section 3.3.2 of the Application.
   c. Pursuant to section 2.10(a)(i) of the Special Direction, approval of FEVI's forecast capital expenditures for 2012, as set out in Section 6.2 of the Application.
   d. Pursuant to section 2.10(a)(ii) of the Special Direction, approval of FEVI's forecast revenue for 2012, based on its proposed rates, as set out in Section 4.5.6 of the Application.
   e. Pursuant to sections 59 to 61 of the Act, approval of the forecast gross O&M expenditures for 2012 of $35.236 million.
   f. Pursuant to sections 59 to 61 of the Act, approval of the 2012 cost of gas and discontinuation of the quarterly reporting of gas costs for FEVI as set out in Sections 5.2 and 6.3 of the Application.

g. Pursuant to sections 59 to 61 of the Act, approval of the difference between the net revenues received and the actual cost of service, excluding O&M variances from forecast, to be allocated to the RSDA, as set out in Section 3.4.2 of the Application.

3. Pursuant to sections 59 to 61 of the Act, the following approvals are granted for FEW:

   a. Approval of permanent delivery rates for FEW for all customers effective January 1, 2012, to recover the requested revenue requirements as described in section 3.3.3 of the Application, resulting in an increase of X.X per cent compared to 2011 delivery rates, with the increase to be applied to the delivery charge, holding the basic charge at 2011 levels.

   b. Approval of the RSAM rider for customers served under FEW Rate Schedules SGS 1/2, LGS 1, LGS 2 and LGS 3 effective January 1, 2012 of $0.524/GJ as set out in Section 3.4.3 of the Application. (2013 RSAM rider will be adjusted with the FEW Fourth Quarter 2011 Gas Cost filing.)

4. Pursuant to sections 59 to 61 of the Act, the following approvals are granted for Fort Nelson:

   a. Approval of permanent delivery rates for Fort Nelson customers effective January 1, 2012, to recover the requested revenue requirements as described in section 3.3.4 of the Application, resulting in an increase of X.X per cent compared to 2011 delivery rates, with the increase to be applied to the delivery charge and the minimum monthly service charge.

   b. Approval of the RSAM rider for customers served under Fort Nelson Rate Schedules 1, 2.1, 2.2 and 25 effective January 1, 2012 of ($0.011)/GJ as set out in Section 3.4.3 of the Application. (2013 RSAM rider will be adjusted with the Fort Nelson Fourth Quarter 2011 Gas Cost filing.)

5. Subject to the approval of the amalgamation of the FEU and harmonized rates for 2013, the Commission approves the following 2013 rates for the individual utilities:

   a. Pursuant to sections 59-61 of the Act, the following approvals are granted for FEI:

      i. Approval of permanent delivery rates for FEI for all non-bypass customers effective January 1, 2013, to recover the requested revenue requirements as described in section 3.3.1 of the Application, resulting in an increase of X.X per cent compared to 2012 delivery rates, with the increase to be applied to the delivery charge, holding the basic charge at 2011 levels.

      ii. Approval of the 2013 cost allocation to the Thermal Energy Services (previously referred to as Alternative Energy Services) customer class as set out in section 5.3.18 and Appendix G of the Application.

      iii. Approval to continue debiting of the MCRA and crediting of the delivery margin revenue in the amount of $3.6 million per year for the 2013 forecast period as set out in section 5.5 of the Application.

   b. The following approvals are granted for FEVI:

      i. Pursuant to sections 59-61 of the Act and section 2.1 of the Special Direction, approval of permanent rates for FEVI effective January 1, 2013 for Core Market sales and transportation customers, other than customers who have specified rates in their transportation service agreements, at the same level as 2011 rates.

ii. Approval pursuant to section 2.10(a)(i) of the Special Direction of FEVI's forecast Cost of Service for 2013 as set out in section 3.3.2 of the Application.

iii. Approval pursuant to section 2.10(a)(i) of the Special Direction of FEVI's forecast capital expenditures for 2013, as set out in section 6.2 of the Application.

iv. Approval pursuant to section 2.10(a)(ii) of the Special Direction of FEVI's forecast revenue for 2013, based on its proposed rates, as set out in section 4.5.6 of the Application.

v. Approval of the forecast gross O&M expenditures for 2013 of $35.482 million.

vi. Approval of the 2013 cost of gas as set out in section 5.2 of the Application.

vii. Approval for the difference between the net revenues received and the actual cost of service, excluding O&M variances from forecast, to be allocated to the RSDA, as set out in section 3.4.2 of the Application.

c. Pursuant to sections 59-61 of the Act, approval of permanent delivery rates for FEW for all customers effective January 1, 2013, to recover the requested revenue requirements as described in Section 3.3.3 of the Application, resulting in an increase of X.X per cent compared to 2012 delivery rates, with the increase to be applied to the delivery charge, holding the basic charge at 2011 levels.

d. Pursuant to sections 59 to 61 of the Act, approval of permanent delivery rates for Fort Nelson customers effective January 1, 2013, to recover the requested revenue requirements as described in Section 3.3.4 of the Application, resulting in an increase of X.X per cent compared to 2012 delivery rates, with the increase to be applied to the delivery charge and the minimum monthly service charge.

6. Pursuant to sections 59-61 of the Act, the following approvals are granted for FEI, FEVI, FEW and Fort Nelson to be used in the determination of rates for FEI, FEVI, FEW and Fort Nelson effective January 1, 2012:

a. Approval of the allocation of costs for corporate services between FortisBC Holdings Inc. and each of FEI, FEVI and FEW, as reflected in the Corporate Services Agreements between FortisBC Energy Holdings Inc. and FEI, FEVI and FEW as described in section 5.3.18 of the Application.

b. Approval of the allocation of costs for shared services between FEI and FEVI, as described in section 5.3.18 of the Application.

c. Approval of the allocation of costs for shared services between FEI and FEW, as described in section 5.3.18 of the Application.

d. Approval to allow for charges between regulated entities to be based on a fully loaded benefits and concessions charge and to not include overheads, including a facilities fee as described in section 5.3.18 of the Application.

e. Approval of the consolidated Core Market Administration Expense (for FEI, FEVI and FEW), and allocation percentages, as set out in section 5.2 of the Application.

f. Approval of the discontinuance, modification, and creation of deferral accounts, and the amortization and disposition of balances of deferral accounts, for FEI, FEVI, FEW and Fort Nelson all as set out in section 6.2 and Appendix G of the Application and summarized in the following table.

Type of Change	Account	Company	Reference
New Account	Compliance with Emissions Regulations	FEU	Section 6.3.2.3; Additions and Amortization period TBD
	Customer Service Variance Account	FEU	Section 6.3.3.10; Additions and Amortization period TBD
	2012-2013 Revenue Requirement Application Costs	FEU	Section 6.3.4.1; amortization period of 2 years commencing January 1, 2012, allocated to FEU based on average customers
	Long Term Resource Plan Application Costs	FEU	Section 6.3.4.1; amortization period of 2 years commencing January 1, 2013, allocated to FEU based on average customers
	Gas Assets Records Project	FEU	Section 6.3.5.11; amortization period of 5 years commencing January 1, 2012, allocated to FEU based on average customers
	BCOneCall Project	FEU	Section 6.3.5.12; amortization period of 5 years commencing January 1, 2012, allocated to FEU based on average customers
	Residual Delivery Rate Riders	FEI	Section 6.3.6.3; amortization period of 1 year commencing January 1, 2012
Amortization Period Change- New or Modified	Revenue Stabilization Account Mechanism	FEW	Section 6.3.1.3; recovery through Rate Rider 5, 3 year recovery period consistent with FEI and FN, commencing January 1, 2012
	Gas in Storage Interest	FEI	Section 6.3.1.4; 3 year amortization period, commencing January 1, 2012
	Property Tax Variance Account	FEW, FN	Section 6.3.3.1; change from 1 year to 3 year amortization period, commencing January 1, 2012
	Interest Variance Account	FEW, FN	Section 6.3.3.5; change from 1 year to 3 year amortization period, commencing January 1, 2012
	Tax Variance Account	FEW	Section 6.3.3.6; 1 year amortization period, commencing January 1, 2012
	Vancouver Island HST Implementation	FEVI	Section 6.3.3.7; 1 year amortization period, commencing January 1, 2012
	Victoria Regional Centre CPCN	FEVI	Section 6.3.4.3; 1 year amortization period, commencing January 1, 2012
	Pipeline Contributions Variance Account	FEW	Section 6.3.5.3; 1 year amortization period, commencing January 1, 2012

Type of Change	Account	Company	Reference
	Deferred Removal Costs	FEU	Section 6.3.5.5; 2 year amortization period, commencing January 1, 2012
	IFRS Transitional Account	FEI, FEVI	Section 6.3.5.7; amortization by plan over EARSL
	2010-2011 Customer Service O&M and Cost of Service	FEU	Section 6.3.5.9; 8 year amortization period, commencing January 1, 2012
Other	Energy Efficiency and Conservation	FEU	Section 6.3.2.1; 1. Combined EEC rate base deferral account additions of $20.0 million in 2012 and $20.0 million in 2013, included on a net-of-tax basis and amortized in rates over a ten year period; 2. The allocation of the 2012 and 2013 EEC rate base deferral account additions amongst Mainland, Vancouver Island and FEW on an average customer basis; 3. The creation of the EEC rate base deferral account for FEW, with additions included on a net-of-tax basis and amortized in rates over a ten year period; 4. The creation of the EEC Incentive non-rate base deferral account for FEI attracting AFUDC, to capture the remaining portion of the EEC costs as incurred and allocated by FEI to each utility based on the actual spend in the service area of each utility in 2012 and 2013, and to recover the balance over a ten year period beginning in 2014.
	CNG and LNG Service Costs and Recoveries	FEI	Section 6.3.2.6; inclusion of variations from the revenue forecast pertaining to Rate Schedule 16
	Property Tax Variance Account	FEW	Section 6.3.3.1; include the forecast balance of the existing Propane Plant Property Tax Deferral account in the Property Tax Variance account
	Tax Variance Account	FEI	Section 6.3.3.6; inclusion of LILO reassessment costs
	Gains and Losses on Asset Disposition	FEU	Section 6.3.5.6; transfer the general plant gains and losses as at January 1, 2010 from the IFRS Transitional account into the Gains and Losses on Asset Disposition account; 20 year amortization period, commencing January 1, 2012
Discontinuance	Residential Commodity Unbundling Account	FEI	Appendix G, 2.2; discontinuation of this account effective January 1, 2012

Type of Change	Account	Company	Reference
	Commercial Commodity Unbundling Account	FEI	Appendix G, 2.2; discontinuation of this account effective January 1, 2012

g. Approval of changes to the following accounting policies to be used in the determination of rates for FEI, FEVI, FEW and Fort Nelson effective January 1, 2012:

   i. The depreciation and amortization rates and the creation of a separate sub account (474.02) to record future additions to Distribution Systems Meters/Regulator Installations with depreciation expense for this sub account calculated using a whole life rate, set out in Sections 5.4.2 and 5.4.5 of the Application.

   ii. The negative salvage rates and the treatment of negative salvage as set out in Section 5.4.3 of the Application.

   iii. Modification to the approved Lead Lag days with the removal of the GST and PST lead days and the insertion of the proposed HST and REC lead days as set out in Section 6.1 of the Application.

7. With respect to Energy Efficiency and Conservation ("EEC") expenditures, the Commission orders as follows:

   a. Pursuant to section 44.2(a) of the Act, the Commission accepts the following EEC expenditure schedules for the FEU to be spent on the EEC program areas described in Appendix K-1 of the Application, including the expansion of the interruptible industrial Program Area eligibility to customers of FEVI and all EEC program eligibility to customers of FEW and Fort Nelson:

      i. $17.8 million for FEI for each of 2012 and 2013;

      ii. $2.0 million for FEVI for each of 2012 and 2013;

      iii. $0.2 million for FEW for each of 2012 and 2013;

      iv. An additional $54.5 million for FEI for each of 2012 and 2013 to be spent in the service areas of FEI, FEVI, FEW and Fort Nelson.

   b. Pursuant to sections 59 to 61 of the Act, the Commission approves the treatment of EEC costs in accordance with the EEC deferral accounts as described in the table of deferral accounts above in section 6.

   c. With respect to assessing EEC expenditures, the Commission directs FEU pursuant to section 43 of the Act as follows:

      i. To continue to file an EEC Annual Report in which it will:

         1. Continue to evaluate EEC expenditures as an overall portfolio, and with Innovative Technologies having an additional criterion that as an individual program area it must have a benefit-cost ratio of 1.0 or greater, as previously approved in the 2010-2011 RRA;

2. To continue to report on funding transfers between approved program areas.
3. Continue to evaluate EEC expenditures on the basis previously approved by the Commission, except with respect to the following changes.
    a. The overall portfolio including all EEC-funded activity, and the Innovative Technology program area individually, should have a benefit-cost result of 1.0 or greater, using a Societal Cost Test consisting of the following three modifications to the current benefit-cost analysis:
        i. Use of a social discount rate of 3 percent, rather than the Companies' weighted average cost of capital;
        ii. Use of the ceiling price for biomethane, which is based on an efficiency-adjusted cost of electricity, as the avoided cost of gas, for all EEC programs except for the NGV incentive program which will continue to use the forward projection of market costs for conventional fossil fuel-based natural gas;
        iii. Use of a "deemed adder" of 30 percent for non-energy benefits of EEC activity.
    b. The inclusion of spillover in the calculation of the Net-to-Gross Ratio when estimating program effects.

8. In anticipation of an Amalgamation and Rate Design Phase 'A' Application to be filed in Fall 2011 for 2013 harmonized rates, the following approvals are granted as an initial stage in the ratemaking process for an amalgamated utility including FEI, FEVI, FEW and Fort Nelson. For clarity, these approvals do not pre-determine the merits of any future application by the FEU to address amalgamation and harmonized rates, or the allocation of costs among rate classes or as between delivery rates and the midstream. The approvals are as follows:
    a. Pursuant to sections 59-61 of the Act, approval of an amalgamated cost of service for 2013 for FEI, FEVI, FEW and Fort Nelson combined as set out in section 3.3.5 of the Application.
    b. Pursuant to sections 59-61 of the Act, approval of a deferral account to capture the costs and savings related to the amalgamation that vary from the forecast of zero for 2013.
    c. Pursuant to section 99 of the Act, approval to defer the filing of evidence with respect to FEVI and FEW's equity component required by Directive No. 7 of Commission Order G-158-09, to the Amalgamation and Rate Design Phase 'A' Application in Fall 2011 as described in section 5.7 of the Application.

DATED at the City of Vancouver, In the Province of British Columbia, this day of <MONTH>, 20XX.

LARRY E. KENNEDY

TECHNICAL SPECIALTIES

Public Utility Plant Depreciation
Public Utility Plant Accounting

PERSONAL INFORMATION

Diploma, Applied Arts - Business Administration, Northern Alberta Institute of Technology, 1978
Member, Society of Depreciation Professionals
Certified Depreciation Professional

EXPERIENCE

Mr. Kennedy joined Gannett Fleming, Inc. in January 1999 and is the Director of Canadian Services for the Valuation and Rate Division. His responsibilities include the assembly of data, the preparation and review of depreciation studies, advice to clients regarding asset retirement obligation accounting, plant accounting issues, and provision of general regulatory litigation support.

Representative assignments include:

- International Financial Reporting Standards (IFRS). Mr. Kennedy has been retained by numerous clients encompassing most Canadian Provinces and Territories. The assignments included the review of company's assets and depreciation practices to provide opinion on the compliance to the IFRS. The assignments have also included the issuance of opinion to the External Auditors of Utilities to comment on the manner in which the Utilities can minimize differences in the regulatory ledgers and the accounting records used for financial disclosure purposes. Mr. Kennedy has also presented to the Canadian Electric Association, the Society of Depreciation Professionals and to the British Columbia Utilities Commission on this topic.

- Fortis Inc. Studies have included the development of annual and accrued depreciation rates for the electric distribution assets in Alberta and for the generation, transmission, and distribution assets in British Columbia. The FortisBC study was completed and filed with the BCUC in 2005. FortisAlberta studies were completed in 2004 (updated in 2005) and in 2009. Elements of the studies included the development of average service lives using the retirement rate method of analysis, development of net salvage estimates, and the determination of appropriate annual accrual and accrued depreciation rates.

- BC Hydro. This assignment included the development of an average service life study for all of the BC Hydro's electric generation, transmission, distribution and general plant assets. The study, which was prepared for submission to the British Columbia Utilities Commission ("BCUC), included development of depreciation policy for the company, development of procedures to extract data from the company databases, tours of the company facilities, interviews with operational and management representatives, and the compilation of a detailed report. The assignment has included the support of the study through the regulatory process.

- AltaLink LP. A study was developed for submission to the Alberta Energy and Utilities Board in 2002. The study included the estimation of service life characteristics, and the estimation of net salvage requirements for all electric transmission assets. A net salvage study and technical update was also filed with the Board in 2004, and a second average service life study was filed in 2005.

LARRY E. KENNEDY

- Newfoundland and Labrador Hydro. Mr. Kennedy developed a comprehensive depreciation study that included the development of depreciation policy and rates for Newfoundland and Labrador Hydro. The study provided a significant review of the previous depreciation policy, which included use of a sinking fund depreciation method and provided justification for the conversation to the straight-line depreciation method. The study, which was prepared for submission to the Newfoundland and Labrador Utilities Commission, included a significant amount of discussion regarding the development of depreciation policy for the company. The study also included development of procedures to extract data from the company databases, tours of the company facilities, interviews with operational and management representatives, development of appropriate net salvage rates, development of average service life estimates, and the compilation of the report for submission in a General Tariff Application.

- ATCO Electric. Studies have included the development of annual and accrued depreciation rates for the electric transmission and distribution systems for the Alberta Assets of ATCO Electric, in addition to the generation, transmission, and distribution assets of Northland Utilities (NWT) Inc. and the distribution assets of Northland Utilities (Yellowknife) Inc. The ATCO Electric study was submitted to the Alberta Energy and Utilities Board for review, while the Northland Utilities Inc. studies were submitted to the Northwest Territories Utilities Board. Elements of the studies included the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook, and the estimation of net salvage requirements.

- Yukon Energy Corporation. The study included the development of annual accrual and accrued depreciation rates for all electric generation, distribution and transmission assets. The study was completed in 2004 and submitted to the Yukon Energy and Utilities Board in 2005. The study included the development of appropriate depreciation policies, site tours of company facilities, and operational and management interviews. Development of average service lives; net salvage estimates and depreciation rates were based on statistical analysis of company data, operational and management meetings, and site tours.

- ENMAX Power Corporation. Studies have included the development of annual and accrued depreciation rates for all depreciable electric transmission assets. Elements of the studies included the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook, and the estimation of net salvage requirements. Studies were prepared for submission to the Alberta Department of Energy and more recently for submission to the Alberta Energy and Utilities Board. Similar studies have also been completed for submission for the ENMAX Electric Distribution assets for submission to the Alberta Energy and Utilities Board. The ENMAX distribution asset assignments also included an extensive asset verification project where the plant accounting and operational asset records were verified to the field assets actually in service.

- Manitoba Hydro. A study was developed to determine the appropriate depreciation parameters for all electric generation, transmission and distribution assets. The study was submitted to the Manitoba Public Utilities Board. Elements of the study included a field review of electric generation and transmission plant, the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook, and the estimation of net salvage requirements. A similar study was also completed in 2006.

LARRY E. KENNEDY

- Centra Gas Manitoba, Inc. The study included development of annual and accrued depreciation rates for all gas plant in service. Elements of the study included a field inspection of metering and compression facilities, service buildings and other gas plant; service life analysis for all accounts using the retirement rate analysis on a combined database developed from actuarial data and data developed through the computed method; discussions with management regarding outlook; and the estimation of net salvage requirements. A similar study was completed in 2006.

- TransCanada PipeLines Limited – Alberta Facilities. The assignment included working with the company to develop the appropriate depreciation policy to align with the organization's overall goals and objectives. The resulting depreciation study, which was submitted to the Alberta Energy and Utilities Board, incorporated the concepts of time-based depreciation for gas transmission accounts and unit based depreciation for gathering facilities. The data was assembled from two different accounting systems and statistical analysis of service life and net salvage were preformed. For gathering accounts, the assignment included the oversight of the development of appropriate gas production and ultimate gas potential studies for specific areas of gas supply. Field inspections of gas compression, metering and regulating, and service operations were conducted. Studies were completed in 2002 and 2004, 2007 and 2009.

- TransCanada PipeLines Limited – Mainline Facilities. The study prepared for submission to the National Energy Board of Canada included the development of annual and accrued depreciation rates for gas transmission plant east of the Alberta – Saskatchewan border. Elements of the study included a field inspection of compression and metering facilities, service life and net salvage analysis for all accounts. The study was completed in 2002, and was supported through an appearance before the NEB. Study updates have been completed in 2005, 2007 and 2009.

- AltaGas Utilities Inc. A number of depreciation studies have been completed, which included the assembly of basic data from the Company's accounting systems, statistical analysis of retirements for service life and net salvage indications, discussions with management regarding the outlook for property, and the calculations of annual and accrued depreciation. The studies were prepared for submission to the Alberta Energy and Utilities Board.

- Mackenzie Valley Pipeline Project. This assignment included the review of the proposed depreciation schedule for the proposed Mackenzie Valley Pipeline. The review included a discussion of the policies used by the company and the depreciation concepts to be included in a depreciation schedule for a Greenfield pipeline. The review was supported through appearance at the oral public hearings before the National Energy Board of Canada.

- Alberta Municipal Affairs. The first assignment was conducted in two phases. The first phase involved significant consultation with the Alberta Department of Municipal Affairs and various stakeholder groups to develop a report outlining the method of depreciation that would most appropriately result in a fair market value assignment for the Province's oil and gas pipelines, and for all segments of the electric industry (generation, transmission and distribution). The second phase of the project was to develop specific depreciation schedules to implement the recommendations that were accepted by Alberta Municipal Affairs for the oil and gas pipelines, as well as for all three aspects of the Province's electric industry. A second assignment related to developing models for the determination of the fair assessment value for the Province's Telecommunication and Railway Systems was completed in 2004, and was updated in 2005 and 2006.

LARRY E. KENNEDY

- Property Tax Appeals. Mr. Kennedy has provided expert evidence regarding the fair market valuation for a number of clients before the Alberta Municipal government Board.

- The City of Calgary. These assignments consisted of providing advice and testimony for the City of Calgary on depreciation issues in various general rate applications. Elements of these assignments include the review of applicant evidence and policies, development of information requests, submission of evidence, response to information requests, and providing expert testimony.

Mr. Kennedy has successfully completed the series of week-long programs offered by Depreciation Programs, Inc. and is a past president of the Society of Depreciation Professionals.

Mr. Kennedy has appeared as an expert witness before various regulatory boards as summarized in the attached “Summary of Appearances”.

JOHN J. SPANOS

TECHNICAL SPECIALTIES

- Public Utility Plant Depreciation
- Public Utility Plant Original Cost

PERSONAL INFORMATION

M.B.A., York College of Pennsylvania, 1997
B.S., Industrial Management and Mathematics, Carnegie-Mellon University, 1986
Member, Society of Depreciation Professionals
Member, American Gas Association Industry Accounting Committee
Certified Depreciation Professional

EXPERIENCE

Mr. Spanos joined the firm in 1986 and is a Vice President of the Valuation and Rate Division. He assembles and oversees the basic data required for depreciation studies, conducts statistical analyses of accounting data, estimates service life and net salvage, and calculates annual and accrued depreciation. He performs field inspections for purposes of estimating service lives and verifying property records for original cost, bond indenture and depreciation studies. He also has supervised the updating of continuing property records.

Several assignments include:

- The Cincinnati Gas & Electric Company and Subsidiaries - Depreciation Studies for Gas and Electric. The studies included development of annual depreciation rates for all gas and electric plant in service for The Cincinnati Gas & Electric Company; Union Light, Heat and Power Company; and The Lawrenceburg Gas Company. Field inspections of electric and gas facilities were performed. Statistical analyses of service life and salvage data were conducted. Annual and accrued depreciation were calculated using several alternative bases and procedures.

- Chugach Electric Association - Depreciation Study. The elements of the study included a field inspection of power plants and major substations, data assembly and life analysis for generation and transmission accounts, discussions with management regarding outlook, the estimation of service life and net salvage and the calculation by plant account of annual depreciation rates.

- Northwest Territories Power Corporation. The depreciation study included assembly of basic data from the Corporation's property record listing, statistical analyses of retirements for indications of service life, an extensive field review of facilities, discussions with management regarding the outlook for the property, calculations of annual and accrued depreciation using several accepted procedures and bases and a report setting forth the study results.

- Omaha Public Power District. The study involved supervision of OPPD personnel assembling the basic plant accounting data required for analysis of historical indications of service life and net salvage. The data were analyzed using both the retirement rate method and the simulated plant record method. The net salvage estimates for the power plants were based on a regression analysis of industry cost of retiring data that correlated the cost per kilowatt with each unit's kilowatt capacity. A field review and discussions with management provided an outlook for future service lives compared to historical indications. The calculations of annual and accrued depreciation using several combinations of procedures and bases were performed and presented to management.

JOHN J. SPANOS

- Penn Fuel Gas, Inc. This assignment involved 26 service districts which were organized into seven operating groups for this gas distribution company. Our responsibilities included establishing continuing property records for each district. Some districts had previous work performed and others needed a complete review of accounting records, field inspections and digitization of distribution maps. The original costs and property identification were entered into an in-house created computer data base to facilitate the preparation of a service life study and the establishment of a mechanized property record system.

- Pennsylvania-American Water Company. Several studies have been performed for the Company and include the estimation of service lives, unitization of acquired treatment plant facilities and the determination of original costs for acquired water systems. The service life study included data assembly of two predecessor water systems, statistical analyses of service life and calculation of annual depreciation accrual rates for a rate filing with the state commission. The unitization of treatment plant facilities included a field inspection of each acquired plant and identification of property on a retirement unit basis for establishing property records. The determination of the original cost of assets to be acquired from small water systems within Pennsylvania included field reviews of the water systems, verification of plant accounting records, Handy-Whitman indexing of property costs and establishment of original cost less depreciation.

- Duquesne Light Company. The assignment involved performing an independent engineer's certificate report of actual property in service. A random sample of all types of property was selected and verified through a physical inventory. The thorough physical inventory included production, transmission, distribution and general plant. The final results were documented and filed with the Company's mortgage bond trustee.

- United Telephone of New Jersey, Inc. This assignment included an extensive physical inventory of telephone plant for the five predecessor companies. A random sample of each type of property for each predecessor company was inventoried by serial number. The final results were documented and filed with the Company's mortgage bond trustee.

- Nova Gas Transmission Ltd. The study incorporated the use of time-based depreciation for transmission and general accounts and unit of production depreciation method for gathering accounts. The data were assembled by account and statistical analyses of service life and salvage were performed. For the gathering accounts, the property was identified by specific production areas for calculation of depreciation on a unit basis. Field inspections of gas transmission facilities were conducted. Discussions with key personnel regarding management policy compared to several depreciation alternatives were presented for determination of final depreciation rates.

Mr. Spanos' technical education has included formal instructional programs offered by Depreciation Programs, Inc. Courses successfully completed include "Techniques of Life Analysis", "Techniques of Salvage and Depreciation Analysis", "Forecasting Life and Salvage", "Modeling and Life Analysis Using Simulation", and "Managing a Depreciation Study". Mr. Spanos also completed the week long course "Introduction to Public Utility Accounting" conducted by the American Gas Association.

Attachment 153.2

Charges for Service Line Work

Replaces: CUS 07-05 dated 16 July 2009

Overview

This standard specifies the charges for the installation, alteration, or abandonment of service lines to customers in accordance with the FortisBC (Natural Gas), the FortisBC (Vancouver Island) Inc., and FortisBC (Whistler) Inc. (collectively referred to as FBC (Gas)) tariffs.

Audience

This document is intended for employees working in the Customer Contact Centre, Planning & Design, and Marketing departments who are involved in installation, alteration, repair, or abandonment of service lines to customers.

Definitions

BCUC

British Columbia Utilities Commission.

Caution: Printed documents may not be current. Verify online.

Conversion Service

A new gas service installed at a pre-existing building.

CAFE

Customer Attraction Front End (CAFE) is a custom software tool developed for FBC (Gas) that provides a "front end" interface to SAP. It is primarily used to process data resulting from customer related work such as gas service applications, main extensions, abandonments and alterations. CAFE is also configured to perform the economic test.

General or Standard Terms and Conditions

The General or Standard Terms and Conditions are part of the FBC (Gas) Tariff and are approved by the BCUC.

Economic Test (MX Test)

The economic test is a discounted cash flow analysis of the projected revenues and costs associated with a main extension and has been approved by the BCUC. The total revenues and costs for the main extension project are analyzed over a 20-year period, based on the number of customers projected to connect to the main extension within five years of construction, along with their forecast annual consumption. The economic test determines whether or not a contribution is required from those customers connecting to the main extension within the first five years of construction.

- See **CUS 07-08** *Main Extensions.*

Economic Pricing

When a customer requests a service attachment to a new main (less than or equal to five years of age) **and** the estimated costs for that service line were included in the economic test for the main it is being attached to, the customer would only be required to pay the Application Fee and any additional charges such as meter protection, extra length past standard meter location, or winter charges. Economic Pricing is the term used to describe the method of estimating costs for these cases.

Geo Pricing

Geo pricing is the standard methodology for estimating the cost of installing a service line. It is a unit cost methodology which is based upon both the geographical region, typical ground conditions, and length of service to be installed.

FBC (Gas) service territories have been reviewed and assigned a "geo code", which essentially groups different areas together under the assumption that they exhibit common characteristics with regards to the general conditions under which service line installations take place.

On an annual basis, all service installations within each geo code are analyzed in order to estimate the unit cost (per metre) associated with service line installations in that area. The results of this analysis provide the basis for pricing new services for the following year (until the next analysis is completed), and are uploaded into CAFÉ when the analysis is completed.

Manual Pricing

Manual pricing, also known as free form or detailed estimating, is the process of estimating the installation costs for service line where atypical conditions exist. Atypical conditions would include (but are not limited to) the need for blasting or directional drilling, or in cases where larger pipe sizes are required, where environmental concerns exist, or in cases where either the length of service or expected cost of the installation is significantly greater than normal. Conditions under which manual pricing should be used are listed in the document called "Business Rules for Manual Estimating" found in the FBC (Gas) Knowledge Base.

SAP

SAP is a business application software tool that supports order fulfillment, and includes customer-related work such as gas service applications, main extensions, planning and work management tools. It also supports the financial, budgeting, controlling, materials management, inventory management, purchasing, measurement technologies, plant management, operate & maintain, and human resource functions.

Service Header

A service header is a gas distribution pipeline located on private property that is connecting three or more service lines or meter sets to a main.

Service Lateral

Also known as a branch service and is a service line connected to a prime service or a service header.

Caution: Printed documents may not be current. Verify online.

Service Line

The service line is the portion of FBC (Gas) gas distribution system extending from a main or a service header to the inlet of the meter set or inlet of multi meter manifold. In case of a vertical subdivision, or multi-family housing complex, the service line may include the piping from the outlet of the meter set to the customer's individual premises, but not within the customer's individual premises.

Service Line Cost Allowance

Service Line Cost Allowance (SLCA) represents the maximum allowable expenditure that FBC (Gas) will invest to install a service line to connect a new customer to the gas distribution system.

Service Line Connection Fee

The service line connection fee is the estimated cost of installing the service which exceeds the SLCA that will be charged to the customer.

Standard Fees and Charges

Table 1: Standard Fees and Charges

Application Fee	
Account transfer fee	$25
New Installation	$25
New Installation - Manifold Meters	$25 per meter
New Installation - Vertical Subdivision	$25 per meter
Service Line Cost Allowance	
Duplex	$3070
Other than a duplex	$1535

Application for New Service

Connection Fee

The connection fee includes the Application Fee and the service line connection fee and other charges if applicable. In addition, FBC (Gas) may charge the customer for all additional costs, incurred as a result of installing a service line by way of a customer request rather than FBC (Gas) preferred installation, (see **Customer Requested Routing**).

For large commercial and industrial customers who have a forecast annual consumption of 2000 GJ/yr or greater, FortisBC will perform an economic test to determine the amount of the service line connection fee. See **CUS 07-08** Main Extensions.

The connection fee may be billed on the customer's first invoice unless:

- It is a mass market customer and the contribution exceeds $1,500.
- FBC (Gas) is not comfortable with the builder developer's is known to have a questionable credit rating and the contribution exceeds $1,500.

Application Fee

The Application Fee for a new service is$25 per gas meter.

Service Line Connection Fee

The service line connection fee is a contribution in aid of construction. For residential and small commercial customers the service line connection fee is subject to the type of pricing the customer is eligible for. These pricing types are standard, manual, full cost, or economic.

Customers may be charged if:

- Standard or manual pricing is required and the estimated installation costs exceed the SLCA (the connection fee in these cases will equal the difference between the estimated installation costs and the SLCA).
- Full cost is required and the customer is not eligible for the SLCA, (see Additional Gas Services)

Customers may not be charged if:

- Standard or manual pricing is required and the estimated installation costs are less than the SLCA.
- Economic pricing applies.

In cases where the economic test is applied to a new service attachment it will determine the service line cost.

- See **CUS 07-08** Main Extensions

Caution: Printed documents may not be current. Verify online.

Service Line Cost Allowance (SLCA)

As discussed above in the definitions, the SLCA represents the maximum amount FBC (Gas) will invest to install a new residential or small commercial customer to the gas distribution system. The principal objective of the SLCA is to limit the costs the utility would otherwise incur for new customers with extraordinary connection costs.

The SLCA is currently $3070 for duplexes or $1535 for all other service attachments. If the estimated cost for a service line exceeds the SLCA, the customer will pay the excess amount.

When a new main extension is required, all the capital costs required to provide service to the customer (main extension, service line and meter) will be input into the economic test and a distinction between service line and main will not be made, therefore eliminating the requirement for the SLCA.

Winter Installation of Services

If FBC (Gas) approves construction in winter frost conditions, all costs associated with the construction will be included in determining the contribution in aid of construction.

The customer will be responsible for spring clean-up on the property. FBC (Gas) personnel will inform the customer about this responsibility at the time of application.

FBC (Gas) may perform repairs of a minor nature due to the inability to perform trench compaction because of frozen soil conditions.

Standard Installation

Service Line Route

FBC (Gas) will designate the entry point to the property and the route the service line will follow to ensure the following:

- Installations meet long-term operating efficiency needs
- Personnel safety
- Customer safety

FBC (Gas) will plan, design, and install all services according to the requirements of the following:

- **FBC (Gas) Tariff** including its General or Standard Terms and Conditions
- **FBC (Vancouver Island) Inc. Tariff**
- **FBC (Whistler) Inc. Tariff**
- **CSA B149.1** *Natural Gas and Propane Installation Code*
- **CSA B149.2** *Propane Storage and Handling Code*
- **CSA Z662** *Oil and Gas Pipeline Systems*
- Policies, specifications, guidelines, procedures, standard drawings, and other approved FBC (Gas) documentation

Whenever possible, the service connection point should be at a right angle to the main or header, and continue in a straight line to the meter location. An offset from the straight running line should not normally exceed 1.5 m.

Additional costs (if any) as a result of a deviation from the standard running line will be at the customer's expense.

- See **Standard Drawings for New and Conversion Services**

Preferred Meter Location

Meters should be located in a visible, accessible location in order to:

- Help emergency response personnel and the public locate meters and service lines.
- Facilitate meter changing, maintenance, and reading.
- Ensure reliability in the system survey.

The meter location must meet all FBC (Gas)and industry standards and codes.

The customer is responsible for ensuring that a meter location meeting FBC (Gas) and industry standards and codes is available.

Additional costs as a result of a deviation from the preferred meter location will be at the customer's expense.

- See **DES 07-17** *Locating Meter Sets*

Caution: Printed documents may not be current. Verify online.

Single Unit Buildings with One Meter

The preferred meter location for a service will be on the outside wall of the building that faces the gas main or header (front wall), or on a connecting sidewall at the location nearest to the main that meets industry code requirements. A customer will not be billed for additional length exceeding 1.5 metres past the front wall to the first safe meter location. Additional charges will apply if the customer requests a meter location beyond the first safe preferred meter location.

The glass dial of the meter must not exceed one metre above the final grade level. A fully enclosed garage attached or located within a building is considered to be part of the building being served. An open post and beam carport is not considered part of the building being served.

- See **Standard Drawings for New and Conversion Services** Figures 1 to 4.

Multi-Unit Buildings with More Than One Meter

The preferred meter manifold location is on the building's outside wall that faces the gas main or header (front wall), or up to 1.5 metres past the front wall on a connecting sidewall. The glass dial of the lowest meter on the manifold must not exceed one metre above the final grade level. Where there is a common wall connecting two premises, it is acceptable to have a meter manifold located on the common wall. It is strongly encouraged to position the meters on a single meter manifold. Individual service laterals from the service header will be treated as service lines.

- See **Standard Drawings for New and Conversion Services** Figures 5 to 13.

If a new service is required to connect three or more customers to a meter manifold, and the estimated service cost exceeds the SLCA, a cost/benefit analysis based on the economic test will be performed. If the analysis indicates a deficiency, the customers will be required to pay a contribution in aid of construction, in addition to the application fee.

The economic test will be applied to multi-unit buildings requiring a service header. If one or two residential customers apply for service to a conversion townhouse, the planner will apply the economic test for the initial and projected future customers identified in the survey. This will ensure fair treatment of all customers connecting within the complex.

Caution: Printed documents may not be current. Verify online.

- See **CUS 07-08** *Main Extensions.*

Preferred Meter Location Larger Customers

The preferred meter location for large commercial and/or industrial customers is the first available and acceptable outside location inside the customer's property line, closest to the main. The customer is responsible for supplying the meter pad and protection. The meter pad and protection must meet FBC (Gas)standards.

Existing Service Stubs

If there is an existing service stub, and using it will produce the most efficient service installation, FBC (Gas) will notify the customer of its intention to reuse this stub and the intended meter location.

If the customer requests a route or meter location that prevents the use of the service stub, FBC (Gas) will charge the customer the cost estimate for the service stub abandonment and the new service to the customer's preferred meter location will be the costs estimate minus the SLCA.

- See Standard Drawings for Services Figure 4.

Estimates

The majority of service installations are estimated in CAFE which uses the geo pricing approach. However, when detailed, site-specific cost estimates are required, FBC (Gas) will estimate the direct costs associated with the installation which may include:

- SAP allocated travel, set-up, and site preparation time
- Traffic control
- All surface breaking or cutting and restoration
- Construction materials including pipe, manifolds, meters, regulators, and associated equipment
- Excavation, boring, and restoration materials and services
- Pipe preparation and installation
- Special installation procedures and materials due to anticipated weather and ground conditions (see **Application for New Service** *SLCA* "Winter Installation of Services") or route selection
- Fees and permits

Caution: Printed documents may not be current. Verify online.

The rates and applicable overheads will be reviewed periodically to determine whether or not an update is necessary. When an update is deemed necessary, the administrator will update these parameters in the appropriate systems.

Customer Requested Routing

Customer Requested Service Line Routes

If a customer requests a service line route that is different from the FBC (Gas) preferred route, the customer will pay any additional costs between the direct cost estimate for the FBC (Gas) preferred and the customer requested routes, as well as any other costs greater than the SLCA.

Customer Requested Meter Locations

If the customer cannot meet the FBC (Gas) preferred meter location requirements, the meter may be located at the customer requested meter location if it:

- Meets the FBC (Gas) requirements
- Meets industry standards and code requirements
- Is approved by the Installation/Distribution Manager

The customer will pay any additional costs to locate the meter from the FBC (Gas) preferred meter location and the customer requested meter location.

Additional Gas Services

If a customer applies for gas service to an additional premise on the same property, and the additional premise has the same civic address, FBC (Gas) will determine whether another service line to the property or a lateral from the existing service line will be installed. The FBC (Gas) preferred route will be the most economic combination of initial construction costs and long term operating costs that will provide FBC (Gas) with a safe, reliable, and practical system.

If the additional gas service installation is for the same customer (or the spouse, contractor, employee, agent, or partner of the same customer), on the same property, and at the same rate, FBC (Gas) will charge the customer the estimated cost plus the Application Fee of $25 (the SLCA is not applicable).

If the additional gas service installation is for the same customer, on the same property, but at a different rate schedule, FBC (Gas) will treat the additional gas service as a new installation.

Customer Supplied Work

If a customer is responsible for additional costs over and above the connection fee, the customer may reduce these costs by performing some of the work required for the installation. Work will be limited to excavation, backfill, duct installation, or provision of meter protection. Under no circumstances will the customer be permitted to install, join or pressure test gas carrier piping. All work done by the customer must meet FBC (Gas) specifications and a FBC (Gas) inspector may check the site to ensure compliance. There may be charges for this inspection. Once FBC (Gas) and the customer have agreed upon the extent of the work to be done by the customer, the installation will be estimated again with allowances for the customer's work. The new estimated cost, including the charges for the inspection, will be used to determine the required contribution.

Additional Charges

Meter Protection

If FBC (Gas) determines that meter protection is required, the customer will be charged the estimated direct cost for providing meter protection, or the customer may provide meter protection as long as it meets FBC (Gas) standards.

Redesign

If FBC (Gas) completes a standard design for a service line installation, FBC (Gas) may charge the customer for all customer or agent caused incremental costs arising from the redesign.

Aborted Visit

If FBC (Gas) schedules construction work with the customer, FBC (Gas) may bill the customer for each site visit where no work can be done due to obstructions or unsatisfactory site preparation caused by the customer or agent.

Alterations

If a customer requests an alteration to any part of the service or metering apparatus or has affected the operation or safety of any part of the service or meter installation, then an alteration fee may be charged.

Caution: Printed documents may not be current. Verify online.

The customer will be charged the estimated cost for any alteration and reconnection of the service line or meter set.

The customer must be advised of the charges and the scope of the work before work commences. In situations where FBC (Gas) deems that corrective action is required immediately to maintain the integrity of the system and/or for the customer's safety, then the customer will be advised after the work is complete.

Charges - Miscellaneous

The billing of miscellaneous charges is subject to the Installation/Distribution Manager's approval.

Upgrades Resulting from Increased Load

Service Line

If the capacity of an existing service line is insufficient for the added load, FBC (Gas) will upgrade or install a new service line with sufficient capacity. This upgrade will be done at no cost for residential and small commercial customers. The economic test will be applied to large commercial and industrial customers consuming 2000 GJ/yr or greater. The cost of the service line upgrade and the projected incremental annual load will be inputs in the economic test. If the economic test indicates a revenue shortfall, the customer will be required to pay the calculated contribution.

Meter Set

If the capacity of an existing meter is insufficient for the added load, FBC (Gas) will upgrade or install a new meter with sufficient capacity. This upgrade will be done at no cost for all customers.

Request for Increase in Service Pressure

If a customer requests an increase in service pressure to accommodate an additional appliance, or to supply an appliance with an elevated delivery pressure, FortisBC will evaluate the request for feasibility. The existing service line size serving the existing meter shall be considered, along with the regulator vent clearances specified in the B 149 Provincial Gas Code and any other existing gas facilities in the vicinity. Approval from the System Planning Manager is required for requests for delivery pressure greater than 35kPa.

The Customer will be responsible for the cost associated with providing any modification to their building to accommodate the new meter, and

Caution: Printed documents may not be current. Verify online.

will also be required to provide any required meter protection that FBC (Gas) deems necessary before the new meter and pressure regulator is supplied. In all circumstances the Customer will be responsible for making the connection between the new meter and pressure regulator back to the piping downstream.

Customer requests for increased delivery pressure deemed practical by FBC (Gas) shall be provided to the customer without cost. If an alteration of a minor nature is required to facilitate the new meter and regulator this too will be provided without cost. .

- See **Upgrades Resulting from Increase Load***Meter Set*
- See **DES 04-01-13** *Distribution Set and Delivery Pressure*.

Abandonment/Supply Cut-Off

FBC (Gas) will abandon service lines when they have no planned usage, or when they are unfit due to age, damage, corrosion, or mechanical failure.

If the customer (or the spouse, contractor, employee, or partner of the customer) requests that a service line to a premises be cut off, and subsequently applies for a new service to new premises on the same property with the same legal description, the new service will be handled as a new service application. The customer may be responsible for additional charges if the initial terms of service have not been met.

If the customer (or the spouse, contractor, employee, or partner of the customer) requests that a service line to a premise be cut off and subsequently applies for a new service to the same premise within one year, the customer will be charged the greater of the costs incurred to terminate or reactivate the customer, or the sum of the minimum monthly charges applicable from the time of termination to reactivation.

- See the FBC (Gas) Inc. and FBC (Gas) (Vancouver Island) Inc. tariffs.

FBC (Gas) will not charge for abandoning a service line unless the work is deemed to be an alteration, or in a special circumstance, such as delayed consumption or meter consolidations.

- See **Additional Charges** *Alterations, Delayed Consumption* and **Meter Consolidations**.

Caution: Printed documents may not be current. Verify online.

Meter Consolidations

If a customer requests individual accounts on a single property, or on contiguous properties to be consolidated into a single account, FBC (Gas) will provide this service if the customer agrees to pay the due charges and sign the required release waiving the FBC (Gas) liability for any damages should the customer decide to re-use the abandoned plant downstream of the new meter set. By recovering the out-of-pocket costs, as well as the value of the abandoned pipe, FBC (Gas) can then treat the consolidated accounts as one new customer.

The charges due include:

- Depreciated replacement cost of the plant being abandoned, except the meter
- Estimated cost to the customer for abandoning the pipe and removing the meter sets that will no longer be used.
- Overheads on the above two items
- $25 Application Fee
- Service line costs in excess of the SLCA for residential and small commercial customers.
- Service line costs for large commercial and industrial customers, based on the economic test.

The depreciated replacement cost for abandoned plant will be calculated by estimating the cost to the customer for replacing the abandoned pipe to determine the initial cost (to apply depreciation). The site conditions at the time of construction (ex: whether the pipe was installed before paving and landscaping) must be taken into account when determining the replacement cost. This estimate will be depreciated at a rate of two percent per year for the age of the existing pipe. For example, if the cost to customer estimate is $2000 for replacing pipe installed in 1985, and the replacement occurs in 2005, the depreciated cost is calculated as follows.

2005 – 1985 = 20 years

2% X 20 = 40%

Depreciation = 40% X $2000 = $800

Depreciated replacement value = $2000 – $800 = $1200

Caution: Printed documents may not be current. Verify online.

The customer will be responsible for reconnecting house piping, reactivating equipment, and providing meter set pads and protection meeting FBC (Gas)standards.

The planner will work with the commercial sales representative to ensure the customer is put on the appropriate rate schedule and has reviewed the costs and benefits of the meter consolidation.

If pipe is abandoned that may be used by the customer as house piping, the commercial sales representative is responsible for arranging for the customer to sign the release.

The commercial sales representative will ensure that the customer understands that FBC (Gas) will no longer be responsible for the abandoned pipe or any metering or pressure regulators purchased by the customer from FBC (Gas) or another supplier. Furthermore, it is the customer's responsibility to arrange for maintenance items such as leak survey, cathodic protection, meters, and regulators.

The planner will notify the drafting and records groups to update any drawings and service records. The service record will indicate that a portion of the gas service has been converted to a customer-owned house line and may be live.

If any of the meter sets (located downstream of the consolidated meter) are sold to the customer as informational meters, the planner will:

- Ensure that all FBC (Gas) badges are removed from the meter sets and are forwarded to the measurement technologist in Measurement Technologies.
- Forward to the measurement technologist in Measurement Technologies the customer's name and address, name of commercial sales representative, and name of planner, to be recorded in the meter record system.

Temporary Services

FBC (Gas) considers any service required for less than 12 months as temporary and fully chargeable, unless otherwise stated in the service agreement. A customer requesting a temporary service will pay the cost to customer for the installation and removal of the service line.

Caution: Printed documents may not be current. Verify online.

Delayed Consumption

If a new customer does not consume gas within one year after the service line installation, FBC (Gas) may charge the actual installation cost to the customer of the service line and meter set, less the total of the following:

- The total of the minimum monthly charges billed to the customer to that date **and**
- Any additional costs the customer paid previously

If the actual costs to the customer for the service line installation are not available, a new cost to customer estimate for the installation will be used.

Inactive Services

An inactive service is one with a history of consumption, but no recent consumption, and no expectation of future consumption.

- If FBC (Gas) anticipates no future gas use, the service will be abandoned at the main or header, or at the property line if FBC (Gas) determines that a cut-off at the main is not practical due to pavement, concrete, or other obstacles.
- FBC (Gas) may opt to leave the service gasified and to lock, plug, and tag the above-grade meter cock. FBC (Gas) will apply its leak survey and maintenance policies to gasified but inactive services. FBC (Gas) will confirm the status of each inactive service at least annually.

Transmission Pressure Services (>2070 kPa)

Charges for service lines connected to transmission pressure pipelines are determined by the sum of:

- the costs associated with the tapping of the transmission pressure pipeline and the transmission piping including the pressure reducing facility
- the direct cost estimate of the service line downstream of the pressure reducing facility.

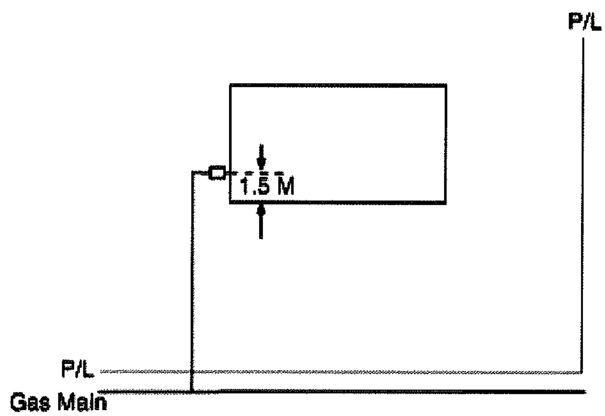
The economic test will be applied to the sum of the above costs and the projected incremental annual load. If the economic test indicates a revenue shortfall, the customer will be required to pay a contribution in aid of construction to eliminate the revenue shortfall.

HST

HST is applicable to all charges.

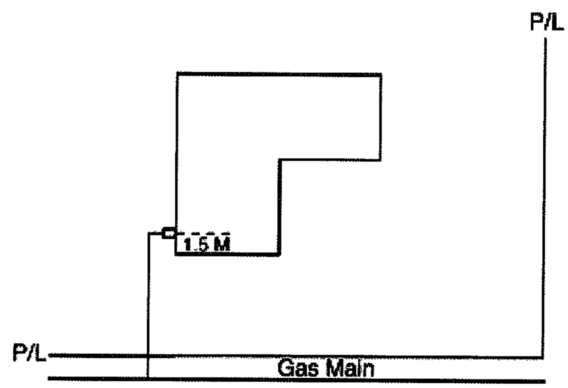
Standard Drawings for Services

Figure 1: Standard Drawing For the FBC (Gas) Preferred Route Residential and Small Commercial to a Single Customer



Design and Construction Reference Items and Charges	
Standard Connection Fee	$25
SLCA	$1535
Non-Standard Connection Fee	$25 + (direct cost estimate - $1535) + HST

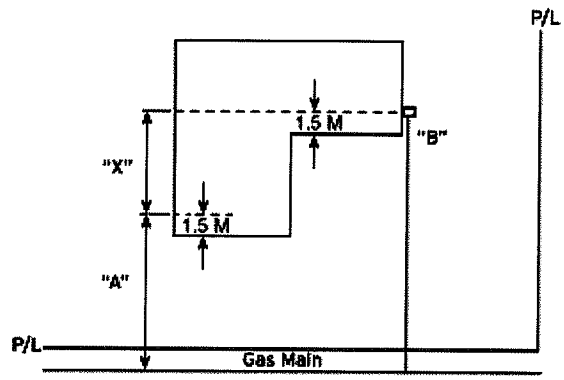
Figure 2: Standard Drawing For the FBC (Gas) Preferred Route for Residential and Small Commercial Services



Design and Construction Reference Items and Charges	
Application Fee	$25
SLCA	$1535
Connection Fee	$25 + (direct cost estimate - $1535) + HST

Caution: Printed documents may not be current. Verify online.

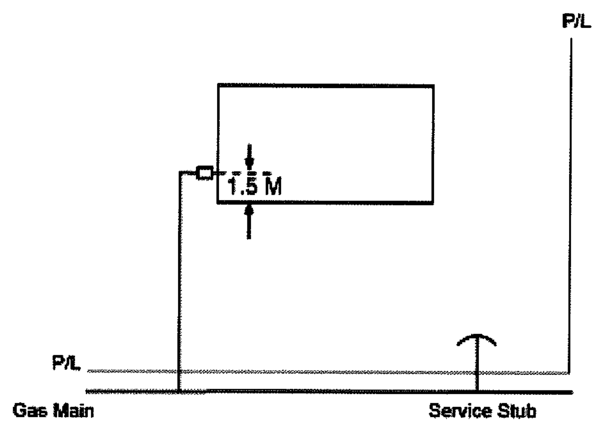
Figure 3: Standard Drawing For the FBC (Gas) Preferred Route for Residential and Small Commercial Services requiring additional footage "B"



Design and Construction Reference Items and Charges	
Application Fee	$25
SLCA	$1535
Connection Fee	$25 + (direct cost estimate - $1535) + additional footage + HST

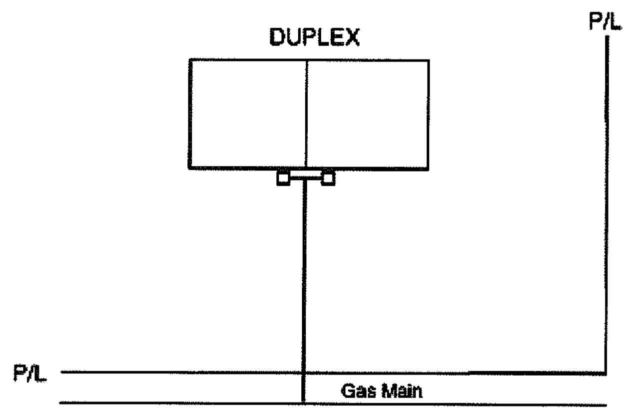
NOTE: "X" represents additional footage

Figure 4: Standard Drawing for FBC (Gas) Preferred Route for Residential and Small Commercial services where the customer requests a route or meter location that prevents the use of the stub service.



Design and Construction Reference Items and Charges	
Standard Connection Fee	$25
SLCA	$1535
Non-Standard Connection Fee	$25 + (direct cost estimate - $1535) + HST
Service Stub Abandonment	$650

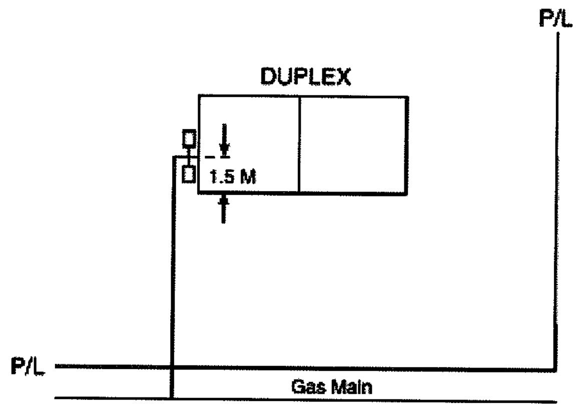
Figure 5: Standard Drawing For FBC (Gas) Preferred Route for Residential and Small Commercial Services For Duplexes with Strata Designation



Design and Construction Reference Items and Charges	
Application Fee	2 x $25
SLCA	$3070
Connection Fee	(2 x $25) + (direct cost estimate - $3070) + HST

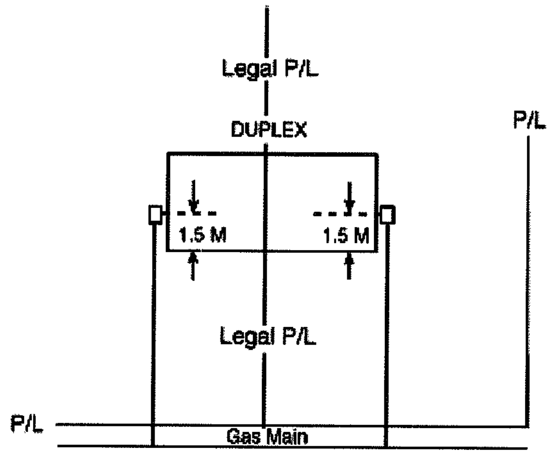
Caution: Printed documents may not be current. Verify online.

Figure 6: Standard Drawing For FBC (Gas) Permissible Route For Resdential and Small Commercial Services, For Duplexes With Strata Designation



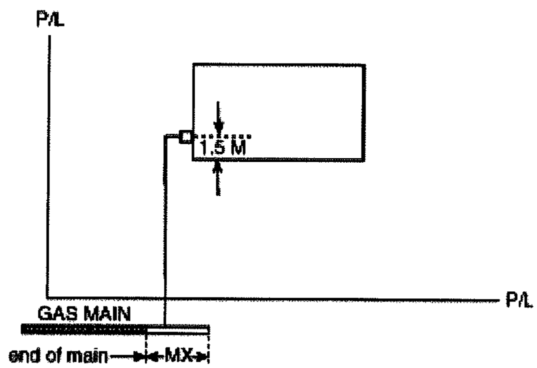
Design and Construction Reference Items and Charges	
Application Fee	2 x $25
SLCA	$3070
Connection Fee	(2 x $25) + (direct cost estimate - $3070) + HST

Figure 7: Standard Drawing For FBC (Gas) Preferred Route for Residential and Small Commercial Services, For Duplexes with a Non-Strata Designation



Design and Construction Reference Items and Charges	
Application Fee	$25 each
SLCA	$1535 each
Connection Fee *each service is treated like an individual service line	$25 + (direct cost estimate - $1535) + HST

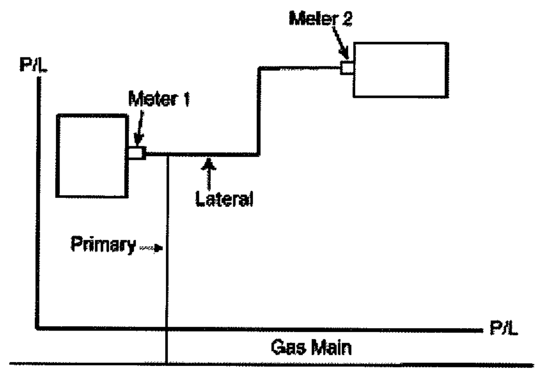
Figure 8: Standard Drawing For the FBC (Gas) Preferred Route for Residential and Small Commercial Services, For a Single Customer with a Main Extension



Design and Construction Reference Items and Charges	
Application Fee	$25
SLCA	N/A
Connection Fee	$25 + ET Contribution + HST

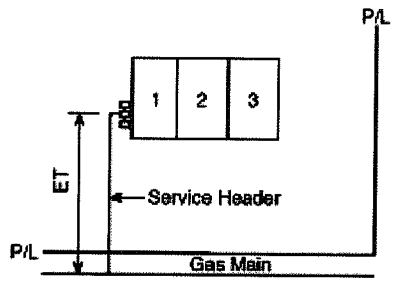
Economic Test is required. All estimated direct costs to provide service to the customer (main extension, service line and meter) will be input into the Economic Test and a distinction between the service line and main will not be made, therefore eliminating the requirement for the SLCA.

Figure 9: Standard Drawing For the FBC (Gas) Preferred Route for Residential and Small Commercial Services, For a Service Extension to Two Risers, Same Customer on the Same Rate Schedule and Property



Design and Construction Reference Items and Charges	
Application Fee	2 x $25
SLCA	$1535
Connection Fee	(2 x $25) + full cost of lateral service + (direct cost estimate for primary service - $1535) + HST

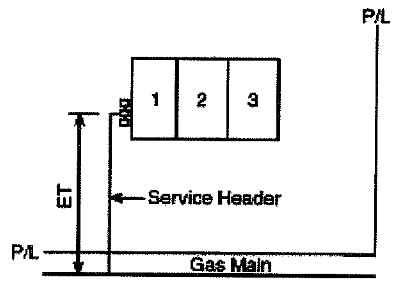
Figure 10: Standard Drawing For FBC (Gas) Preferred Route for Residential and Small Commercial Services, Multi-Unit Building



Design and Construction Reference Items and Charges	
Application Fee	3 x $25
SLCA	$3070
Connection Fee	(3 x $25) + (direct cost estimate - $3070) + HST or (3 x $25) + ET Contribution + HST

If the estimated cost of the service exceeds the SLCA, a cost benefit analysis based on the Economic Test will be performed.

Figure 11: Standard Drawing For FBC (Gas) Preferred Route for Large Commercial and Industrial Services, Multi-Unit Building



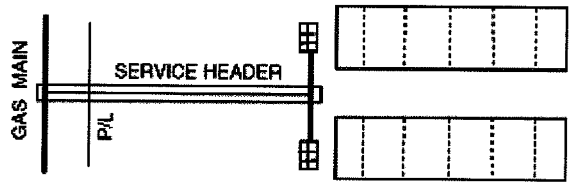
Design and Construction Reference Items and Charges	
Application Fee	3 x $25
SLCA	Not Applicable
Connection Fee	(3 x $25) + ET Contribution + HST

Economic Test is required. All estimated direct costs to provide service to the customer (main extension, service line and meter) will be input into the Economic Test and a distinction between the service line and main will not be made, therefore eliminating the requirement for the SLCA.

Standard Drawing for FBC (Gas) Preferred Route for Residential and Small Commercial Services, Multi-Unit Building with Three or More Gas Meters at Two or More Locations

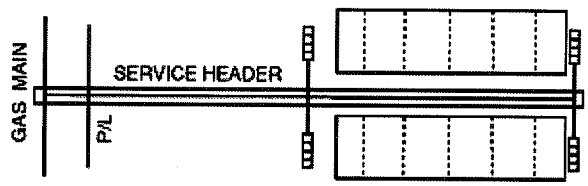
The preferred method and acceptable alternative for serving multi-unit building customers are shown in descending order of preference, in all configurations below. The Economic Test is required in all configurations.

Figure 12: Meters Banked at One End of the Building



Application Fee	$25.00 x 12 gas meters
Connection Fee	(12 x $25) + ET Contribution + HST

Figure 13 Meters Banked at Both Ends of the Building



Application Fee	$25.00 x 12 gas meters
Connection Fee	(12 x $25) + ET Contribution + HST

Renewable natural gas

When bacteria break down organic waste and manure, they create biogas. We're capturing and purifying it to provide you with renewable natural gas, a locally produced, carbon-neutral energy source.

FortisBC residential customers are among the first in North America who can choose renewable natural gas, supplied by their utility, for their home.

Sign up for renewable natural gas <link to sign up page>, and for an extra $0.53 per gigajoule—about $4 per month for an average home—10 per cent of the natural gas you use will be designated renewable natural gas. We'll then inject the equivalent amount of renewable natural gas into our system.

Sign up & enter to win
Sign up before July 15, and you could win a Whistler eco-tour prize pack.

- **Sign up now!**

Renewable natural gas sources in BC
We're working with local businesses and municipalities.

>Learn more

Certified carbon neutral by Offsetters
A carbon-neutral source of energy, renewable natural gas has many environmental benefits <link to environmental benefits page>. Using renewable natural gas displaces conventional natural gas and is a renewable fuel source.

And because it is carbon neutral, subscribers get a 10 per cent credit on the BC carbon tax!

Signing up is simple

If you are a residential FortisBC customer in the Lower Mainland, Fraser Valley, Inland (Interior and North) or Columbia (Kootenays) service areas and not enrolled with a gas marketer, you can sign up for renewable natural gas.

Call 1-888-224-2710 or sign up through your Account Online. Visit the Sign up <link to sign up page> page for details.

Questions?

Read the FAQs <link to FAQ>, email **renewablenaturalgas@fortisbc.com** or call **1-888-224-2710**.

Sign up for renewable natural gas

By signing up for renewable natural gas from FortisBC, you're supporting sustainable energy for BC. Here's how to join:

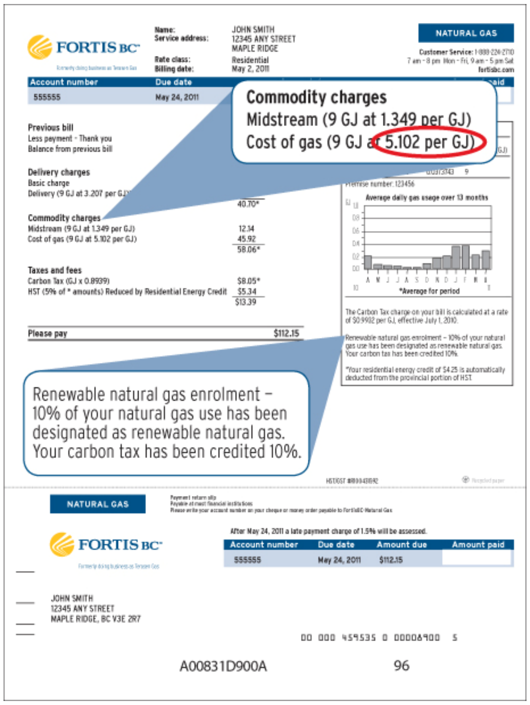
Questions?

- Read the FAQs
- Call 1-888-224-2710

1. Check your eligibility <link to details and eligibility>: you must be a residential customer in the Lower Mainland Valley, Inland (Interior and North) or Columbia (Kootenays) service areas, and not currently enrolled with a gas marketer.
2. Log in to Account Online to apply. Have your FortisBC natural gas account number ready.
3. Once logged in, a link on the left-hand side of your screen will guide you through the sign-up process. You may also enroll by calling **1-888-224-2710**.
4. Get confirmation of enrolment. If subscriptions for renewable natural gas exceed supply, interested customers can be waitlisted to be notified of available spots.

Sign up before July 15, 2011 for a chance to win a Whistler eco-tour prize pack! Read the contest rules & details <link to contest page> before entering.

Renewable natural gas will show up as a line item on your bill, like this:



Environmental benefits of renewable natural gas

Made from an abundant renewable resource—organic waste—renewable natural gas can help reduce your carbon footprint:

- displaces the use of conventional natural gas with a renewable source of energy
- considered carbon-neutral because it is produced from organic waste and captures methane that would otherwise escape into atmosphere, reducing equivalent carbon dioxide emissions by up to 21 times[1]
- reduces the greenhouse gas emissions of a typical British Columbia home by about half a tonne per year[2], the equivalent of diverting 158 kg of waste from our landfills through recycling[3]
- contributes to developing renewable and sustainable energy in BC
- helps BC meet its greenhouse gas emission targets

Sign up & enter to win

➢ **Sign up now!**

Join us. Sign up today for a more sustainable energy future for BC.

Offsetters, Canada's leading carbon management solutions provider, independently reviewed FortisBC's renewable natural gas offering. Offsetters assessed the expected lifecycle emissions savings of renewable natural gas and confirmed that renewable natural gas meets the requirements to be granted Offsetters' Carbon Neutral Product status in BC. For more information, read Offsetters' certification assessment of renewable natural gas. <link to PDF>

[1] Intergovernmental Panel on Climate Change's (IPCC) *Fourth Assessment Report* (2007), Table 2.14, available at http://www.ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-10-2.html#table-2-14.

[2] Renewable natural gas displaces fossil fuel natural gas that has a carbon intensity of 50 kg/ CO_2e (equivalent carbon dioxide). Based on an average residential natural gas consumption of 95 GJ/year, 10 per cent renewable natural gas = 9.5 GJ. 9.5 GJ x 0.05 = 0.475 tonne CO_2 reduction.

[3] Calculated using the Greenhouse Gas Equivalencies Calculator at http://www.epa.gov/cleanenergy/energy-resources/calculator.html

Renewable natural gas sources in BC
We're working with local businesses and municipalities.

>Learn more

What is renewable natural gas?

Renewable natural gas is derived from biogas, which is produced from decomposing organic waste from landfills or agricultural waste (such as cow or chicken manure). When captured and cleaned, renewable natural gas (also called biomethane) can be injected into the existing natural gas pipeline system. It is a carbon-neutral substitute to conventional natural gas and can be used in all natural gas appliances.

How does it work?

Once upgraded, biomethane is interchangeable with natural gas. No changes are required to customer appliances, and biomethane can be delivered using our existing pipeline infrastructure.

How do I sign up for renewable natural gas?

You can sign up <link to sign up page> for renewable natural gas by logging in to your Account Online, and clicking on the renewable natural gas enrolment link.

Alternatively, you can call us at **1-888-224-2710** to sign up. If your residence is eligible, your enrolment will be complete and effective on the 1st of the following month. Note that if you apply within one week of the start of the next month, your successful enrolment will commence the following month.

How will I receive renewable natural gas?

Because renewable natural gas is interchangeable with conventional natural gas, it can be injected into FortisBC's natural gas distribution system, displacing conventional natural gas. Customers who sign up for renewable natural gas continue to draw conventional natural gas from the pipeline, but will have a portion of their consumption designated as renewable natural gas. We'll then inject the equivalent amount of renewable natural gas into our system.

If I sign up for renewable natural gas and my neighbour doesn't, will we both receive a mixture of natural gas and biomethane to our homes?

The location of production facilities will determine where renewable natural gas will physically be introduced to the FortisBC system. Customers signing up for the renewable natural gas rate may not receive actual renewable natural gas at their home, but instead are contributing to the cost of injecting the same amount of renewable natural gas into FortisBC's system. Thereby, you are displacing conventional natural gas and reducing your personal carbon footprint.

Is it safe?

Yes. Renewable natural gas is composed primarily of methane – the same primary component of natural gas.

Will my appliances be affected?

No. FortisBC will ensure that renewable natural gas meets the same quality standards as conventional natural gas. There will be no noticeable difference.

Do I need any special equipment?

No. FortisBC will ensure that renewable natural gas meets the same quality standards as conventional natural gas. There will be no noticeable difference.

Will my Equal Payment Plan (EPP) amount change if I sign up for renewable natural gas?

There will be no immediate change to your Equal Payment Plan installment amount. However, the plan will still be reviewed quarterly against current usage and rates, and may be adjusted at those times.

Will I still have to pay the carbon tax if I sign up for the renewable natural gas rate?

Since renewable natural gas is considered carbon neutral, the BC carbon tax amount will be credited by 10 per cent. The revised amount will appear on your FortisBC natural gas bill each month.

Is FortisBC the first to offer such a program?

In 2010, FortisBC became the first utility in Canada to receive approval from its regulator, the BC Utilities Commission, to invest in biogas upgrading and interconnection infrastructure in order to inject renewable natural gas produced through decomposition of organic materials into the natural gas distribution system.

FortisBC is the first utility in North America to introduce a renewable natural gas offering to residential customers.

What are the greenhouse gas (GHG) benefits?

Renewable natural gas is considered carbon neutral. It will help reduce GHG emissions in BC by displacing conventional natural gas, which has a carbon intensity of 50 kg of carbon dioxide per gigajoule. Additionally, by capturing methane that would otherwise be released to atmosphere, equivalent carbon dioxide emissions may be reduced by up to 21 times.[4]

When will the program be expanded to other regions and rate classes?

FortisBC will phase in renewable natural gas as supplies become available and customer interest grows. Renewable natural gas is currently available to residential Rate 1 customers in the Lower Mainland, Inland (Interior and North) and Columbia (Kootenays) regions.

---

[4] Intergovernmental Panel on Climate Change's (IPCC) *Fourth Assessment Report* (2007), Table 2.14, available at http://www.ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-10-2.html#table-2-14.

Future phases are planned to expand the offering to commercial customers and to other service areas in British Columbia.

What happens if I move?

You may elect to remain on the Renewable Natural Gas rate if your new residence is eligible.

Don't see an answer to your question? Call us: 604-592-7844.

Details & eligibility

You must be a residential customer (single family or separately metered multi-family) located in the Lower Mainland or Fraser Valley, Inland (Interior and North), or Columbia (Kootenays).

This offer is not available on Vancouver Island, the Sunshine Coast, in Whistler, Revelstoke or Fort Nelson.

Customers must not currently be enrolled with a gas marketer.

Sign up & enter to win
Sign up before July 15, and you could win a Whistler eco-tour prize pack.

- **Sign up now!**

Questions?
Where does RNG come from? What does 10% look like?

- Read the FAQ

Summary of rate calculation

Only your cost of gas will change on your bill. Customers who sign up for renewable natural gas will be moved from the residential rate <link to rate schedule 1> to the renewable natural gas rate <link to rate schedule 1B>. The rate will now be 10 per cent renewable natural gas cost and 90 per cent standard cost of gas. Since renewable natural gas is considered carbon neutral, the BC carbon tax amount on your bill will be credited by 10 per cent.

Example below:

Cost of gas as of Apr 1, 2011 (adjusted quarterly)*		$4.568 GJ x 90%
Renewable natural gas cost as of Jan 1, 2011 (adjusted annually)*		$9.904 GJ x 10%
Renewable natural gas rate	subtotal:	$5.102 GJ

At today's prices, this works out to $0.53 more per gigajoule or about $4 more per month based on the average use of 95 GJ per year.

**Renewable natural gas costs will be set on annually with a January 1 effective date. The standard cost of gas will remain subject to quarterly rate adjustments, therefore, the resulting renewable natural gas rate that you will see on your bills could change up to four times a year as the standard cost of gas changes.*

Start & end dates
Enrolment will be effective the first of the month. Please note that if the application is made within one week of the start of the month, it will be completed for the following month.

Customers can choose to return to the residential rate at any time and requests will be processed within one week.

There are no fees associated with moving from one rate to the other.

Win a Whistler eco-tour prize pack

Sign up for renewable natural gas before July 15, 2011, and you'll be entered to win a Whistler eco-tour prize pack valued at $955, including:

- Two passes for a Ziptrek Eagle Tour in Whistler
- One $200 gift card for Araxi restaurant
- A one-night stay for two at the Four Seasons Whistler (parking included)

The prize will be drawn July 22, 2011 in Surrey, BC, and the winner will be contacted by phone. Please read the contest rules below.

Bacteria make yuck useful

Sign up today!

Renewable natural gas stops waste from going to waste.

Dear Vancouver resident:

One day, Vancouver hopes to be the greenest city in the world. By 2020, we want to reduce community-based greenhouse gas emissions by 33 per cent from 2007 levels, and we need your help to get there.

Last summer we asked you for ideas on how we can reach our goals. One Vancouverite responded:

> *Separate organic matter out of the waste stream and convert it to biogas: When food scraps and organic matter decompose in landfills, methane, a powerful greenhouse gas, is created. If captured properly, methane can be used as a fuel source (known as biogas)....*

FortisBC is now making yuck useful by capturing biogas and upgrading it to renewable natural gas. Sign up now at fortisbc.com/makeyuckuseful to reduce your carbon footprint and support local, carbon-neutral renewable natural gas.

Together we can make Vancouver the greenest city in the world by 2020!

Sincerely,

City of Vancouver & FortisBC

CITY OF VANCOUVER | VANCOUVER GREEN CAPITAL

Welcome to renewable natural gas

11-041.11

Welcome Letter

Welcome to renewable natural gas

You're now part of a clean energy revolution: **making yuck useful**, supporting sustainable energy for British Columbia and reducing your carbon footprint.

Consider yourself an energy pioneer—you're among the first customers of a regulated utility in North America to choose renewable natural gas, which is made from biogas captured when bacteria break down organic waste. Just by signing up, you're helping make this energy option possible.

Your participation not only displaces conventional natural gas with renewable natural gas but also prevents methane emissions from entering our atmosphere, where they can be 21 times more harmful than carbon dioxide.[1] We estimate that in the first year alone, subscribers to renewable natural gas will collectively save about **5,000 tonnes of greenhouse gases**[2]—the equivalent of diverting 1,742 tonnes of waste from our landfills through recycling.[3]

The best part is, you don't need to do anything differently. FortisBC designates 10 per cent of your home's natural gas usage as renewable, and injects an equivalent amount into our system from local renewable natural gas projects.

Choosing renewable natural gas sends a positive message to your community. You care about energy, the environment and the future. So don't be shy: spread the word to family, friends, colleagues and neighbours. Talk, email or tweet about **fortisbc.com/makeyuckuseful**. The more people who know about renewable natural gas, the bigger the difference we can make.

Thank you for signing up and supporting a more sustainable energy future for B.C.

FortisBC

Win a Whistler eco-tour

fortisbc.com/makeyuckuseful [URL]

Renewable natural gas from FortisBC is here. Sign up by July 15, 2011 to enter to win a Whistler eco-tour for two. Learn more today.

Early Subscriber E-mail (Sent to interested customers)

Subject line: **Sign up for renewable natural gas**

Thank you for signing up to receive news about renewable natural gas from FortisBC. Through your interest in renewable natural gas made from organic waste, you've shown your support for making a difference in the environment and future of energy in BC.

Today, we're excited to share the news that enrolment for renewable natural gas is open. To show our appreciation for your support, we're giving you an early opportunity to sign up for renewable natural gas, before we make our formal announcement to the general public on June 15, 2011.

It's easy to sign up: visit **fortisbc.com** and log in to Account Online, or call **1-888-224-2710**.

And if you sign up before July 15, 2011, you'll also get a chance to win a fabulous Whistler eco-tour prize pack* that includes *one night's accommodation at the Four Seasons Whistler, dinner at Araxi, and Ziptrek passes for two!*

For full contest details and rules, visit our renewable natural gas section at **fortisbc.com/makeyuckuseful**.

Sincerely,

Your renewable natural gas team

**Existing FortisBC natural gas customers who sign up for renewable natural gas between Monday, June 13, 2011 and Friday, July 15, 2011, will be automatically entered into contest. Prize pack consists of one night's accommodation for two at the Four Seasons Whistler, one gift card to Araxi restaurant and two passes to Ziptrek Eagle Tours. Approximate retail value of entire prize pack is $955. Prizes are non-transferable and not redeemable for cash. One winner will be chosen from a random draw on July 22, 2011. Winner will be contacted directly and must answer a skill-testing question. Winner must also sign a release in favour of FortisBC Energy Inc. and its affiliates and each of their respective agents and employees from any and all claims and liability arising out of injury, death, accident, loss, damage, or expense suffered or incurred by the winner directly or indirectly relating to the conduct of the contest or the award or use of the prize pack. Odds of winning depend on number of entries received. Employees or agents of FortisBC Energy Inc., FortisBC Inc. and their immediate families are not eligible to win.*

Renewable natural gas

FortisBC is making yuck useful. When bacteria break down organic waste, they produce biogas that can be captured and upgraded to pipeline-quality renewable natural gas. FortisBC residential customers can now sign up for renewable natural gas. It’s a simple way to reduce your carbon footprint even more.

City of Vancouver E-Newsletter (June 15) Content

Reduce your carbon footprint even more

This month FortisBC launches renewable natural gas. It's made when bacteria break down organic waste, producing biogas that can be captured and upgraded to pipeline-quality renewable natural gas. Renewable natural gas not only makes yuck useful but also helps reduce methane emissions in the atmosphere. For about $4 per month for an average Vancouver household, FortisBC will designate 10% of the natural gas you use as renewable and inject an equal amount of renewable natural gas into its pipelines. Since it's carbon neutral, subscribers get a 10% credit on the carbon tax, too. Learn how you can sign up today.

Bill Message (June 15-30)

Renewable natural gas is now here! Be among the first to subscribe to carbon-neutral, locally made renewable natural gas from FortisBC. Sign up at fortisbc.com/renewablenaturalgas or call 1-888-224-2710.

FORTIS BC™

Spring 2011

Renewable natural gas: a first in B.C.

In the evolving world of energy, biomethane—otherwise known as renewable natural gas—is a sustainable, clean energy source that's abundantly available. Providing this renewable energy along with traditional natural gas is one way FortisBC is helping sustainable energy become a reality.

Be among the first!

Soon, FortisBC will introduce a renewable natural gas product*—we're the first utility in North America to do so.

You'll have the option of designating 10 per cent of the natural gas your household uses as renewable natural gas. We'll then inject the equivalent amount of renewable gas into our system. Sign up now to be notified when renewable natural gas is available. Just send an email to **biogasprogram@fortisbc.com** with "renewable natural gas" in the subject line. We'll then email you when the product is available.**

Truly renewable

When organic waste decomposes it produces an energy rich gas called biogas. Biogas can be captured from waste at farms, landfills and wastewater treatment plants. When cleaned and upgraded to biomethane, we inject it into our natural gas system to be used for home heating, electricity or as a transportation fuel. Today, we get biomethane from an Abbotsford agricultural waste facility and, soon, a Salmon Arm landfill.

In the first year, it's estimated that greenhouse gas savings from the program will be equivalent to removing 2,000 vehicles from our roads. Learn more at **fortisbc.com/biogas**.

A common name. A shared vision.

In July 2010, Terasen Gas and FortisBC began sharing one vision and one leadership. In March 2011, Terasen Gas and FortisBC began operating under one name, FortisBC. Combined, we deliver energy to more than 1.1 million customers in 135 communities where we live and work. Visit **fortisbc.com** to learn our story.

In this issue:

** This offering will not be available on Vancouver Island, the Sunshine Coast, in Whistler, Revelstoke or Fort Nelson.*
*** Currently, we have two sources of biomethane and are developing others. This means supplies are limited. Once we reach the limit, interested customers will be added to a wait list to be notified of the next available supply.*

Our new Renewable Natural Gas product launches June 15. We'll be sharing information about it in advance using the hash tag #MakeYuckUseful

What's renewable natural gas? Here's a great overview of how its created by cows in #Abbotsford http://ow.ly/4EK5j via @theprovince #MakeYuckUseful

Renewable Natural Gas captures & uses greenhouse gases that would otherwise be lost directly into the atmosphere. #MakeYuckUseful

Want to be one of the first to know about our #biogas offerings? Email us at biogasprogram@fortisbc.com to sign up for updates. #MakeYuckUseful

Biomethane - noun: renewable natural gas made from organic sources. Learn more at http://ow.ly/5cpDE #MakeYuckUseful

Renewable Natural Gas customers have the option of designating a portion of their #natgas as renewable #MakeYuckUseful

Sources of renewable natural gas include landfills & farms (cow & chicken manure). There's no lack of supply; it replenishes all of the time! #MakeYuckUseful

To sign up for our new Renewable Natural Gas product, visit FortisBC.com/MakeYuckUseful

By capturing methane that otherwise escapes into atmosphere, equivalent CO2 emissions are reduced by as much as 20 times. #MakeYuckUseful

Renewable #natgas customers reduce CO2 emissions by displacing conventional natural gas with a carbon neutral product. #MakeYuckUseful

News Release (June 23, 2011)

FortisBC launches renewable natural gas program for residential customers

June 23, 2011

Renewable natural gas will help British Columbia fight climate change

SURREY, BC – FortisBC announced today it has launched its renewable natural gas product offering for residential customers in the Lower Mainland, Fraser Valley, Interior and the Kootenays. Eligible customers now have the option of designating 10 per cent of their household's natural gas usage as renewable natural gas. FortisBC will then inject an equivalent amount of renewable natural gas into its distribution system from local renewable natural gas projects. Customers will be subscribed on a first-come, first-served basis, for about an additional $4 per month, based on an average annual consumption of 95 gigajoules (GJs).

"I want to encourage our customers to sign up for renewable natural gas. By signing up, customers are helping create a more sustainable future for our province, reducing their carbon footprint and supporting a carbon-neutral B.C.-made product," said Doug Stout, vice president, energy solutions and external relations, FortisBC.

The only portion of the bill that would change for customers who subscribe to renewable natural gas is the cost of gas. Their cost of gas will now be made up of 10 per cent of the renewable natural gas cost and 90 per cent of the standard cost of gas. Subscribers will not be locked into a contract and can opt-out at any time at no cost.

"FortisBC is making it easy for families to choose a greener, more sustainable way to heat and power their homes and take action on climate change," said Rich Coleman, minister of energy and mines. "This renewable fuel of the future will also help the Province to reduce harmful greenhouse gas emissions."

As renewable natural gas is also considered carbon neutral in B.C., subscribers' carbon tax will be credited by 10 per cent. FortisBC's renewable natural gas offering was recently granted Carbon Neutral Product status by Offsetters in B.C., Canada's leading carbon management solutions provider, after assessing the expected lifecycle emissions savings of the program.

"I commend FortisBC for being the first utility in North America to offer renewable natural gas to residential customers," said James Tansey, CEO of Offsetters. "It's an innovative approach that allows their customers to take action on climate change in a simple and cost-effective way."

Renewable natural gas is created by capturing biogas from sources such as landfills and agricultural waste, and then upgrading it to pipeline-quality gas, before being added to FortisBC's distribution system. Renewable natural gas is also interchangeable with conventional natural gas, so FortisBC can use its existing pipelines and changes are not required to customers' appliances. FortisBC estimates that the total greenhouse gas savings in the program's first year will be about 5,000 tonnes, equal to removing almost 1,000 cars off the road each year or keeping 3.8 million pounds of waste out of landfills, based on delivering 100,000 GJ of renewable natural gas to the FortisBC distribution system.

As additional supply becomes available later this year, FortisBC expects to be able to expand the offering to more residential customers. The company also hopes to be in a position to make the product offering available to commercial customers in 2012 throughout the Lower Mainland, Fraser Valley, Interior and the Kootenays. As a demonstration of potential commercial use of renewable natural gas, Central Heat Distribution Limited (CHDL) recently began purchasing the first 1,000 GJs of their commitment to designate 10,000 GJs of the natural gas in their operations as renewable natural gas from FortisBC. CHDL's district energy system serves downtown Vancouver businesses and residents, relying on natural gas to generate thermal energy through its natural gas boilers.

For more information about FortisBC's renewable natural gas offering, visit fortisbc.com/renewablenaturalgas.

Northeast Energy Efficiency Partnerships

REGIONAL EM&V METHODS AND SAVINGS ASSUMPTIONS GUIDELINES

A Product of the Regional Evaluation, Measurement & Verification Forum

May 2010

Facilitated and Managed by Northeast Energy Efficiency Partnerships

Table of Contents

PREFACE

Regional EM&V Methods & Assumptions Guidelines

Background and Purpose: These Regional Evaluation, Measurement and Verification (EM&V) Methods & Assumptions Guidelines ('the Guidelines') were prepared for the Regional EM&V Forum ('the Forum'). The Forum, established in 2008, is a regional project facilitated and managed by Northeast Energy Efficiency Partnerships (NEEP) representing states in New England[1], New York, New Jersey, Maryland, Delaware, and the District of Columbia.

The intent of these guidelines is to provide clarity, transparency, and a common understanding of methods to consider in determining gross energy and demand savings, and savings assumptions for a priority set of energy efficiency program/project types or measures. The Forum initiated this project because it is believed that some form of EM&V guidance, if implemented and used, can provide the following benefits to the Region:

- Improve the credibility and comparability of energy efficiency resources to support state and regional energy, climate change and other environmental policy goals;
- Remove barriers to the participation of energy efficiency resources in regional markets by making EM&V practices and savings assumptions more transparent, understandable and accessible;
- Reduce the cost of EM&V activities by leveraging resources across the region for studies of common interest (where a need for new data has been identified); and
- Inform the potential development of national EM&V protocols.

Basis for Guidelines: The Guidelines are based on research that captures existing EM&V methods used in the industry today[2]. They are presented in the format of cross-cutting recommendations that are applicable to fourteen measures/programs (covering topics such as rigor, site inspections and measure life determination), and in the form of measure specific recommendations. The Guidelines recommend basic EM&V methods, and alternative or additional approaches for conducting EM&V which Forum participants can use independently for any one program/measure type, and/or in combination, depending on the specific energy efficiency project, program or portfolio objectives.

The Guidelines are also based on a review and comparison of savings input assumptions and algorithms for the set of measures/programs. The Guidelines recommend and provide commentary on: where greater consistency on certain savings assumptions makes sense; where consistency is neither appropriate nor warranted; and where better documentation (or

[1] Connecticut, Massachusetts, Maine, New Hampshire, Rhode Island, and Vermont.
[2] The Guidelines are based on the EM&V Forum project *Develop Common EM&V Methods and Savings Assumptions* conducted by KEMA Consulting, April 2010. To view full report, see http://neep.org/emv-forum/forum-products-and-guidelines.

new research) is needed to support savings assumptions, in particular those that are deemed or stipulated.

Use of Guidelines: The Guidelines are not intended to be mandatory, as it is recognized that identical EM&V requirements and practices may be difficult to implement for the entire Forum Region given states or jurisdictions can have different program and EM&V objectives, budgets, and uses for their EM&V analyses. As such, these guidelines attempt to capture an appropriate balance of being flexible and not overly prescriptive, while providing sufficient detail so as to be meaningful and useful so that the Region can move towards greater consistency in how energy efficiency savings are determined.

The Guidelines are intended only to guide the design of comprehensive studies that estimate multiple impact parameters for one of the fourteen measures addressed in this report – *once a determination has been made to conduct such a comprehensive study*. The Guidelines should not be interpreted as suggesting that such comprehensive studies are always desirable, should be conducted with any particular frequency or should be routinely integrated into annual savings verification procedures. Decisions on when such comprehensive studies should be conducted will necessarily be based on local factors, including local trade-offs between the benefits of additional accuracy of savings estimates and the cost of such studies.

The Guidelines are also not necessarily applicable to studies intended to focus only on individual parameters or subsets of parameters. Further, the Guidelines do not make recommendations regarding transferability of evaluated results from one service territory to another within a state or region. While use of secondary data is generally accepted within the Forum region as a means to reduce evaluation costs (including for certain Forum projects e.g., commercial lighting loadshape study), validity implications of data transferability have yet to be explicitly and consistently addressed. It is recommended that the Forum develop guidelines on the transferability of evaluation results and review evaluation cycles to help ensure that the results are valid, appropriate, and reasonable.

Evaluators, program administrators, policymakers and others are encouraged to refer and use these recommended Guidelines, along with other Forum products on common EM&V terminology and common reporting formats, and to make suggestions for improvements and/or changes going forward. These Guidelines, as such, are viewed as a living document, and may lead to future projects that expand the measures/programs covered beyond those included herein. Additional efforts may also include exploring how the Forum's efforts, with respect to consistency, can support or perhaps even lead to similar efforts in other regions and nationally as efficiency becomes an increasingly greater strategy in energy and climate change mitigation efforts.

A special thanks is noted to this project's subcommittee members for their input and guidance in the development of these Forum guidelines: Gail Azulay, Mary Cahill, Alexey Cherniack, Gian DeLuca, Niko Dietsch, Helen Eisenfeld, Victoria Engel-Fowles, Kristy

Fleischmann, Gene Fry, Dimple Gandhi, Ruth Gay, Don Gilligan, Paul Horowitz, David Jacobson, Jeff King, Taresa Lawrence, Cathy Lezon, Huilan Li, Teri Lutz, Laura Magee, Erin Malone, Ed Miller, Josu Omaechevarria, Kim Oswald, David Pirtle, Ralph Prahl, Frederick Sackett, Jeff Schlegel, Mary Straub, Sheldon Switzer, Earle Taylor, Dave Weber, Lynn Westerlind, and John Zabliski.

The Project was managed by Julie Michals (NEEP), with Steve Schiller (Schiller Consulting) serving as project advisor.

Regional EM&V Methods and Savings Assumptions Guidelines

These Guidelines identify and define common and consistent methods for preliminary (ex-ante) savings, gross and net evaluated (ex-post) savings, measure baseline, life, and persistence, and strategies for dealing with uncertainty/rigor. The Guidelines cover the following program and technology types (fourteen in total)

Program Types/Measures	
Residential	
Central A/C Comprehensive Multi-Measure (R)	Gas Boilers/Furnaces Lighting (Res)
Commercial/Industrial	
Comprehensive Multi-Measure (NC) Custom Measures (R/NC) Gas Boilers/Furnaces HVAC (NC/TR) Lighting (NC)	Lighting (R) Motors (NC/TR) Prescriptive Chillers (NC/TR) Unitary/Split HVAC (NC/TR) VSDs (R/NC)

The Guidelines address each of the following EM&V elements:

- Estimating initial/preliminary gross energy and demand savings;
- Calculating gross evaluated energy and demand savings;
- Determining baseline conditions; and
- Determining measure life and persistence.

The first two elements are discrete for each of the fourteen electric and gas efficiency measures herein. For the latter two areas, Cross-Cutting Guidelines are provided.

1.1 Cross-Cutting Guidelines

This section presents guidelines for specific aspects of evaluation, measurement and verification practice that apply across the measures and are equally appropriate for all current and future measures that may be added to these guidelines.

1.1.1 Installation Verification

Verification refers to a program implementation process by which in-house staff or contracted inspectors verify the installation of all or a sample of installed measures. For most measures, this "quality control" procedure is performed prior to issuance of an incentive payment. This sort of verification is impractical for some small prescriptive and self-install measures, e.g. residential retail CFLs. In the context of evaluation, verification is a method of assessing impacts without direct measurement, e.g. phone surveys, on-site inspections, etc. Only when paired with measurement does verification become "M&V."

Verification of a sample of installations is highly recommended for all programs and measure categories. Verification incurs a cost, but as system reliability becomes more closely linked to energy efficiency resource performance, this cost provides increasing benefits. Assuming that payment of an incentive or proof of purchase equates to energy savings becomes riskier as the margins for error decrease.

Verification is often limited to projects/measures with the greatest cost and savings. When much is at stake in large projects, it is easier to verify to also justify the cost. However, some measures, such as compact fluorescent lamps, in aggregate can have an equivalent impact if not installed.

Installations should be verified by either a third party or by program administration staff. We emphasize that sampling approaches and regularly scheduled verification studies may be appropriate for some measures/programs instead of continuous verification for the full population. Procedures should be implemented to ensure that differences noted in inspection get reflected in program tracking. A higher verification fraction is recommended in program infancy, very large installations, or following substantive program revisions.

1.1.2 Determining Baseline Conditions

Within each of the measure-specific guidelines below there is a definition for the measure's baseline efficiency, a critical input into the savings calculation. In its simplest formulation, the savings forecast is the difference between what is (the baseline) and what will be (the intended condition). From there it gets more complicated. The baseline for a specific measure is not a single number.

For most measures there will be at least two baselines, one for market-driven choices (often called "lost opportunity" and either replacing equipment that has failed or new installations) and one for discretionary installations (often called retrofit or early retirement). In the first case, the baseline may be a jurisdictional code, a national standard, or the prevailing level of efficiency in the marketplace. For retrofit installations, the efficiency of the existing equipment may be the baseline, but at some point the savings calculation must incorporate changes to the baseline for new installations, e.g. code or market changes. Even at this level of differentiation, the baseline may not be correct.

A prime example of this phenomenon occurs when code is used as a baseline. The assumption that a legal requirement translates into action is foresworn by the full gamut of human behavior, even when there is enforcement to encourage compliance, as with speed limits. In the realm of efficiency, where compliance mechanisms often lag regulation and the "behavior" is much more private, it is even riskier to assume that the law is being followed.

It is recommended that a regular review of baselines in use be undertaken to determine and prioritize baseline research on a three to five year cycle. This process is critical to achieving, and maintaining, alignment between the conditions as they are and the conditions as they are used in savings calculations.

1.1.3 Determining Measure Life and Persistence

The measure-specific guidelines can be used to determine the savings for a discrete period of time. The capacity savings (kW) are instantaneous and calculated with reference to the maximum load. The energy savings (kWh) are typically presented for the first year. However, most measures last for more than one year.

Comprehensive guidelines should define a process for determining measure life for each measure, and then memorializing both the process and the outcome in comprehensive resources. While any of the methods currently used, e.g. vendor estimates & stipulated value, may be accurate, without structured review and analysis they may misrepresent actual performance. As for baseline conditions above, there should be a regular review cycle to assure that each measure lifetime assumption is not so old as to be out of date. A full measure life study is not needed for each measure every three or five years. Rather, an intentional process to determine if a study is appropriate is recommended.

Temporal factors “persistence” and “in-service rate” are not uniformly used. Some use these factors, some report them as incorporated in the measure life, and in some cases it is not clear if they are addressed. Measure life should be defined to include these factors if they are deemed necessary by the Forum or by external stakeholders, and should be considered in the design of measure life research.

1.1.4 Statistical Precision

The matter of quantifying the statistical precision of a composite domain such as an energy-efficiency portfolio is a complex one, and analytical consultants can assist with this process. One of the practical implications is that the statistical precision for dominant measures/sectors can ‘carry’ one’s portfolio, i.e. ensure the portfolio achieves precision targets regardless of the precision in other program areas. In a strictly statistical sense, the level of precision for dominant program areas such as Large C&I Retrofit or Residential Lighting tends to be far more important than the precision of lesser areas such as HVAC tune-ups or ENERGY STAR Appliances. In fact, the statistical precision of ‘minor’ portfolio components can remain immaterial even with assumed ±100% precision.

Program administrators must also consider that statistical precision in impact evaluation is not solely a matter of regulatory and capacity market rules compliance. Statistical precision is an important means of expressing the validity of estimated tracking and evaluation impacts. Further, one must remember that statistical precision often positively correlates with evaluation cost. This is true because sample size increases with statistical precision, and for each sample point that improves statistical precision there is an added burden of evaluation cost (i.e. added travel costs, monitoring equipment, interviews etc.). Despite increased rigor from capacity market rules, sample designs must remain efficient and optimized to achieve appropriate precision at a reasonable cost.

Recommendations: In order to establish and achieve statistical precision objectives in all required/sought dimensions, the following process should be considered:

1. Identify statistical confidence/precision requirements. These should include key requirements (e.g. capacity market specifications) and legacy objectives (e.g. 90/10 for annual energy savings). Also, establish the domain for each requirement, be it the portfolio, program, state, load-zone, etc.
2. Establish your unique precision targets and dimensions. Regulatory and market requirements may offer program administrators either a threshold or a range of confidence intervals and precision. In either case, program administrators may make an independent assessment of the precision targets that are necessary for their particular needs relative to the domain of the evaluation (i.e. sector, program, end use), their intended use and audience for the evaluation results, and considerations of expected variability and the financial or system impact of varying degrees of uncertainty.
3. Pursue the most challenging target. In most cases, statistical objectives will be multi-pronged, e.g. 80/10 for summer kW, 80/10 for winter kW, and 90/10 for energy kWh. Designing a single sample to meet all objectives can be difficult and is dependent upon the unique population characteristics and expected variability for each parameter. In practice, one often can achieve all objectives by pursuing the element with the greatest variability; for New England large C&I programs, this tends to be the winter coincident demand impact. For example, a recent KEMA large C&I impact evaluation achieved ±10.6% precision for winter kW and ±8.2% precision for summer kW (both at 80% confidence as per ISO New England requirements) and ±4.7% precision at the 90% confidence level.

It is important to note that these confidence/precision requirements are for statistical sampling alone and do not reflect other sources of uncertainty such as measurement error, equipment accuracy, and parameter bias. Most M&V manuals (ISO New England, PJM Interconnection, Federal Energy Management Program (FEMP), American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE)) include guidelines for controlling these other sources of error.

1.1.5 Other Sources of Uncertainty and Threats to Validity

Statistical precision gets a lot of attention in efficiency program evaluation. Most evaluators are familiar with error bounds, confidence intervals, and relative precision, the most commonly used techniques for reporting statistical precision. However, many do not realize that statistical precision can be misleading if there is bias or non-statistical error in the underlying data. Bias can be hard to identify and extremely difficult to quantify, but it ought not be ignored or dismissed. One must remain vigilant for sources of error such as response bias, hand-picked (or excluded) sample projects, and measurement error. The California Evaluation Framework offers some good advice on mitigating bias and strengthening validity:

"In a high quality evaluation, those implementing the study would strive to mitigate the risk of bias and to honestly report any circumstances about the study that might increase the likelihood of bias. Unfortunately, it usually takes extra time and money to reduce the risk of bias, and the usual measures of the statistical precision of the results may not be improved at all. For example, in order to reduce the risk of non-response bias in a telephone survey, a substantial investment may be needed in more extensive training for the surveyors, more call backs, and perhaps to offer a financial incentive to each respondent. It may be tempting to accept a higher non-response rate and divert these resources to a larger sample size since this strategy will almost certainly give a narrower confidence interval. This strategy can seriously compromise the integrity of a study. To make appropriate judgments in planning and executing sound evaluation studies and in interpreting their results, evaluators, reviewers, and those using evaluation results need to understand what bias is, how it can arise, and how it can undermine an evaluation study."[3]

In sections on Statistical Significance, both the ISO New England and PJM Interconnection M&V manuals require Project Sponsors to describe methods for mitigating and controlling bias in demand estimates. These manuals list many sources of potential bias beyond statistical precision. According to these manuals, relevant types of potential bias for estimates based upon engineering and direct measurement include but are not limited to:

- accuracy and calibration of the measurement tools;
- measurement error;
- engineering model bias;
- modeler bias;
- deemed parameter bias;
- meter bias;
- sensor placement bias; and
- sample selection bias or non-random selection of equipment and/or circuits to monitor.

For estimates based upon regression or statistical analysis, relevant types of potential bias include but are not limited to:

- model misspecification;
- statistical validity;
- error in measuring variables;
- autocorrelation;
- heteroscedasticity;

[3] *The California Evaluation Framework*, Chapter 12: Uncertainty, January 2006, p. 290.

- collinearity;
- outlier data points; and
- missing data.

For estimates based upon survey or interview data, relevant types of potential bias include but are not limited to:

- construct validity;
- sampling frame versus population;
- selection bias (for a sample and for a census attempt where not all sites within the census received usable data);
- non-response bias;
- error in measuring variables;
- sample homogeneity relative to project (external validity);
- outlier data points; and
- missing data.

Beyond a few vocal experts and advocates, the evaluation community is only beginning to grasp the importance and implications of these sources of uncertainty. The Forum is calling for a more balanced treatment of the true sources of uncertainty bearing on evaluation results, and this brief overview draws attention to the vast number of threats to validity beyond statistical precision.

1.2 Measure-Specific Guidelines

This section presents guidelines for fourteen measures or program types. The measure specific recommendations use a concise, two-section format to present guidelines on the following issues:

- Estimation methods and savings assumptions for initial/preliminary gross energy and demand; and
- Recommended M&V methods for pursuing gross evaluated energy and demand.

The first piece of each guideline presents the prevailing savings algorithm with a listing of inputs and savings assumptions. The second piece of each guideline is a brief outline of recommendations pertaining to program tracking and recommended/alternative M&V methods. Tracking recommendations relate to the data management processes and systems employed to document and database the savings associated with energy efficiency program measure installations. These recommendations emphasize completeness of pre-evaluation "initial gross" and "net" estimates of energy and demand impacts. *The recommended and alternative M&V methods correspond to the "Options" defined in either the ISO New England or PJM Interconnection M&V manuals.* These regional capacity market M&V

requirements are the prevailing compliance concern in the Forum region, and are largely based on the International Performance Measurement and Verification Protocol (IPMVP).

Finally, while the following guidelines focus upon primary M&V research, the readers should be aware of a recent EM&V Forum effort[4] that investigated the usability and transferability of load shape data from other sources, i.e. secondary data. Many jurisdictions have expressed support for the use of secondary data for measures such as residential lighting. This is an emerging issue, and guidelines for applicability of evaluation results and/or demand savings have yet to be fully explored in the Northeast.

[4] End-Use Load Data Update Project Final Report, Phase1: Cataloguing Available End-Use and Efficiency Measure Load Data, September 2009. Available at http://neep.org/emv-forum/forum-products-and-guidelines.

1.2.1 Residential Central Air Conditioning

RESIDENTIAL CENTRAL AIR CONDITIONING

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh Saved = (Size in Btu/hr) x (1/$SEER_{baseline}$ - 1/$SEER_{installed}$) / 1000 x (Full Load Cooling Hours)
kW Saved = (Size in Btu/hr) x (1/$EER_{baseline}$ - 1/$EER_{installed}$) / 1000 x (Coincidence Factor)

Notes on Algorithm:

1. Some entities express unit size or cooling capacity in terms of "tons" of cooling, a unit of power equivalent to 12,000 Btu/hr but lacking accuracy due to nominal tonnage nomenclature.
2. Other algorithms use discrete estimates of load factor, diversity factor, and coincidence factor in place of a combined "coincidence" factor to account for all these effects. The product of the three discrete factors is equivalent to the single combined loading/diversity/coincidence factor.
3. Most Technical Reference Manuals (TRMs) cite "full load hours" or "equivalent full load hours" in their algorithm, but one TRM uses "cooling load hours" which separates the influence of electrical efficiency from the time term in the equation.

Description of Inputs:

Baseline Efficiency: Rated Seasonal Energy Efficiency Ratio (SEER) and Energy Efficiency Ratio (EER) of baseline equipment as per established standard or baseline study. Approximately 13 SEER and 11 EER. "Early retirement" tracks either prorate the existing and new construction baselines over the measure life or assume 9 or 10 SEER for baseline.

Installed Efficiency: Rated SEER and EER of installed equipment as per Air-Conditioning, Heating, and Refrigeration Institute database. Approximately 14 SEER and 12 EER or refer to "Energy Star or higher".

Units of Cooling Capacity: Engineering units for cooling capacity in Btu/hr for accuracy and to ensure efficiency compliance.

Full Load Cooling Hours: The ratio of annual cooling unit energy to nameplate peak demand. Cooling hours should reflect localized climate conditions and be based upon technical research studies. With few exceptions, most states in the Forum region have distinct climate zones which warrant distinct estimates of cooling hours.

Demand Factors: Adjustments to rated demand for use in deriving coincident impacts; recommendation is to consolidate these discrete adjustments into one coincidence factor for each season, i.e. Summer and Winter. As with full load cooling hours, seasonal coincidence should reflect localized climate conditions and should be based upon technical research studies.

- **Loading**: The ratio of peak observed to rated maximum load for a piece of equipment. A discrete factor to express equipment over sizing effects at the typical unit level.
- **Diversity**: The ratio of the maximum combined demand to the sum of non-coincident demands across a group. A discrete factor which expresses the extent to which a group contributes to a combined maximum.
- **Summer Coincidence**: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. Summer coincidence factors range from 70% to 100% across the regional TRMs.
- **Winter Coincidence**: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. The winter coincidence factor should be 0% for residential central air conditioning.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. Standardize on Btu/hr as the unit of cooling capacity in the interest of accuracy and compliance.
2. Include both SEER and EER in algorithms for the best expression of both seasonal and peak performance.
3. Consolidate load, diversity, and coincidence factors into single factor combining all peak coincidence drivers.
4. Document credible sources for all savings assumptions. Currently, not all savings assumptions are clearly documented, and TRMs ought to cite credible sources for all savings assumptions to improve methodological transparency.
5. Develop (or continue to use) localized assumptions for cooling hours and peak coincidence. Consistent assumptions used for cooling hours across some states may not be warranted due to climate zones.
6. Consider differentiating by home vintage and location in program estimates of full load cooling hours.

RESIDENTIAL CENTRAL AIR CONDITIONING
Summary of Recommended EM&V Methods

This category is limited to central air conditioning (CAC) installed as a stand-alone measure and excludes CAC installed through comprehensive new construction programs. This category does not include ENERGY STAR room air conditioners or "space cooling" measures.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, unit capacity, baseline and installed efficiency, and full load cooling hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Site visits with short-term metering can offer the most defensible approach to residential CAC programs.	Metering methods often include time-of-use loggers and spot power measurements.
Alternative M&V Methods	An enhanced alternative to the above would be on-site inspections with metering that fully isolates the entire CAC system (Option B).	Metering would be interval kW measurements on both the outdoor compressor and indoor fan units.
	Billing analysis (Option C) can be a reasonable energy evaluation method for residential CAC at lower cost. Central AC tends to be rather evident in whole-premise metering, although other substantial electric loads can be an obstacle.	Billing analysis alone cannot quantify demand impacts.
	Calibrated simulation modeling (Option D) is a high rigor alternative which is especially effective at capturing measure interaction. While perhaps excessive for stand-alone CAC, simulation modeling is particularly appropriate for evaluating comprehensive cooling measures.	Metering would mirror Option B probably with whole premise interval kW and some temperature measurements.

1.2.2 Residential Comprehensive Multi-Measure Retrofit

RESIDENTIAL COMPREHENSIVE MULTI-MEASURE RETROFIT
Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:
No prevailing algorithm. These comprehensive retrofits are comprised of a wide variety of measures and technologies. Savings methods for the component measures are not well documented in TRMs.

Notes on Algorithm:
1. The various energy-efficiency vendors that deliver residential comprehensive multi-measure retrofit measures tend to employ in-house software for developing/reporting savings. While the vendors and software methods are approved by the program, the savings methods are not necessarily unified or consistent.
2. A detailed review of the algorithms and savings assumptions for the remaining component measures such as appliances, insulation, weatherization, and water heating necessitates an examination of each vendor's methods. Research is warranted in this area to promote methodological consistency.
3. Technical reference manuals tend not to document residential comprehensive multi-measure retrofits as an umbrella offering and do not provide sufficient data to facilitate a comparison of savings assumptions.

Description of Inputs:
Not available.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:
1. Some of the simpler, component measures within residential comprehensive retrofit programs – such as domestic hot water - lend themselves well to a stipulated savings approach.
2. For lighting measures, a calculated approach using stipulated parameters, e.g. wattage reduction and hours-of-use, offers consistency for connected demand impact and localized tuning for energy and coincident peak demand savings.
3. Administrators should require transparency and consistent savings methodologies across all vendors delivering residential comprehensive retrofits in a given program or state.
4. Given the differences in climate and demographics across the Forum region, it is appropriate for program administrators to continue to develop certain localized assumptions that reflect local characteristics such as lighting hours-of-use, coincidence factors, and market standard insulation levels.

RESIDENTIAL COMPREHENSIVE MULTI-MEASURE RETROFIT

Summary of Recommended EM&V Methods

This category encompasses comprehensive multi-measure retrofit installations in residential homes. Sometimes called "deep retrofits" or "home energy services", these measures are characterized by a whole-home approach which typically involves an audit followed by efficiency recommendations for multiple end uses and technologies. The comprehensive residential approach tends to be electric-centric but also may span fuel measures such as water heating, boilers, or furnaces.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: detail on individual measures, such as: air conditioner, heat pump, boiler/furnace, water heater quantities and sizes; baseline and installed equipment efficiencies; home square footage; insulation and weatherization actions.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Site visits with visual inspections, quality of installation assessments, interviews, and short-term metering for select measures. Simple engineering models of savings impacts.	Metering limited to time-of-use loggers on lighting and HVAC equipment supported by spot power measurements.
Alternative M&V Methods	A dual-fuel option is to pair the Option A approach with a billing analysis (Option C) of gas impacts. Diagnostic testing of HVAC equipment, blower door, and duct blaster tests can add rigor and certainty to savings for envelope measures.	Billing analysis alone cannot quantify demand impacts.
	Calibrated simulation modeling (Option D) is a high rigor alternative which is especially effective at capturing measure interaction. Particularly appropriate for comprehensive multi-measures.	Metering would pursue HVAC system and whole premise interval kW and possibly some temperature measurements.

1.2.3 Residential Natural Gas Boilers and Furnaces

RESIDENTIAL NATURAL GAS BOILERS AND FURNACES

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

Therms saved = (Size in Btu/hr INPUT) x (1/$AFUE_{baseline}$ - 1/$AFUE_{installed}$) x (Full Load Heating Hours) / 100,000

Alternative Algorithm:

Therms savings = (Size in Btu/hr INPUT) x EFLHeff x (AFUEeff/AFUEbase - 1)/100,000
Where the size of the unit and EFLHeff is for the installed high efficiency unit

Notes on Algorithm:

1. Most Technical Reference Manuals (TRMs) cite "full load hours" or "equivalent full load hours" (EFLH) in their algorithm, but one TRM uses "heating load hours" which separates the influence of thermal efficiency from the time term in the equation.
2. One TRM adds a heating load factor to explicitly adjust for over-sizing of the heating unit.
3. One state's algorithm accounts for the size of the installed and baseline units separately, using a fixed baseline capacity of 91,000 Btu/hr to represent the "typical heating unit" based on a baseline study.

Description of Inputs:

Baseline Efficiency: Rated Annual Fuel Utilization Efficiency (AFUE) of baseline equipment as per established standard or baseline study. Efficiency depends upon program type (early replacement, time of replacement, or new construction) as well as equipment type. Prevailing AFUE baselines are 75% for steam boilers, 78%-80% for furnaces, and 80-83% for hot water boilers.

Installed Efficiency: Rated AFUE of installed equipment as per Air-Conditioning, Heating and Refrigeration Institute (AHRI) database. Approximately 82% for steam boilers, 85% for non-condensing hot water boilers, 90% for condensing hot water boilers, and 92% for furnaces or refer to "Energy Star or higher".

Operating Hours: The ratio of annual heating unit energy to nameplate peak demand. Heating hours should reflect localized climate conditions and be based upon technical research studies. With few exceptions, most states in the Forum region have distinct climate zones which warrant distinct estimates of heating hours.

Summer Coincidence Factor: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. The summer coincidence factor should be 0% for residential heating equipment.

Winter Coincidence Factor: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. Currently, most regional TRMs do not specify coincidence factors for natural gas measures. Coincidence should reflect localized climate conditions and should be based upon technical research studies.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. Programs should take credit for electric impacts associated with efficient furnace fans within the natural gas furnace measure.
2. States currently using a custom approach for "point of sale" residential gas furnace and boiler measures should consider a prescriptive approach using the prevailing savings algorithm described above.
3. Develop (or continue to use) localized assumptions for heating hours and peak coincidence. Consistent assumptions used for heating hours across some states may not be warranted due to climate zones.
4. Consider differentiating by home vintage and location in program estimates of heating hours.

RESIDENTIAL NATURAL GAS BOILERS AND FURNACES

Summary of Recommended EM&V Methods

This category is limited to residential natural gas boilers and furnaces and excludes: space heating equipment such as portable or room space heaters; electric or oil space heating equipment; and associated controls such as boiler reset controls. This category addresses stand-alone heating equipment and excludes natural gas boilers/furnaces installed through comprehensive new construction programs.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, unit capacity, baseline and installed efficiency, and full load heating hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	Billing analysis (Option C) supported by telephone surveys or on-site inspections. Telephone surveys can be used to confirm installation and gather data on household demographics and other operational characteristics to support the billing analysis.	Billing analysis is only valid when the pre-existing (electric bills from the pre-retrofit period) is the appropriate baseline to be used in the impact analysis.
Alternative M&V Methods	Adding on-site inspections to the basic method above improves confidence in household characteristics and supports collection of equipment nameplate data. Basic short-term measurements (Option A) can be added on electrical support equipment such as furnace fans and boiler pumps to refine savings estimates.	Metering methods would include time-of-use CT loggers and spot power measurements.
	Calibrated simulation modeling (Option D) is a high rigor alternative which is probably excessive for stand-alone gas heating but would be appropriate for evaluating measures in a comprehensive package.	Natural gas sub-meters can be installed to isolate the heating equipment from other end uses.

1.2.4 Residential Lighting

RESIDENTIAL LIGHTING

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh Saved = $(\text{Quantity}_{\text{baseline}} \times \text{Watts}_{\text{baseline}}) - (\text{Quantity}_{\text{installed}} \times \text{Watts}_{\text{installed}})$ / 1000 × (Annual Hours)

kW Saved = $(\text{Quantity}_{\text{baseline}} \times \text{Watts}_{\text{baseline}}) - (\text{Quantity}_{\text{installed}} \times \text{Watts}_{\text{installed}})$ / 1000 x (Coincidence Factor)

Notes on Algorithm:

1. Some Technical Reference Manuals (TRMs) stipulate the wattage reduction, utilizing a common Quantity term and substituting a ▫Watts or kW/unit term for $(\text{Watts}_{\text{baseline}} - \text{Watts}_{\text{installed}})$ in the equation above.
2. For retail programs, an in-service rate (ISR) often is added to the gross savings algorithm to represent the percentage of rebated units that actually get used. Some entities presume 100% installation rate or account for ISR in a net savings adjustment.

Description of Inputs:

Baseline Fixture Quantity: The number of fixtures in the corresponding baseline. The same as **Installed Fixture Quantity** for one-to-one replacements.

Baseline Fixture Wattage: For CFLs, baseline is typically 3.4 times **Installed Fixture Wattage**. For other fixture/lamp types, baseline wattage obtained from lookup tables developed and refined by technical and baseline studies.

Installed Fixture Quantity: The number of installed fixtures.

Installed Fixture Wattage: The rated wattage of the installed fixture, inclusive of both lamp and ballast. Obtained from nameplate data.

Annual Hours: The number of operating hours for the fixture in a typical year. Depending upon the program delivery vehicle, this can be derived from site-specific information, research-based estimates of lighting hours by room type, or – for retail programs – assigned a typical whole-home estimate which reflects the uncertainty of the lamp location. Residential lighting lends itself well to shared hours-of-use studies.

Coincidence Factors: Adjustments to rated demand for use in deriving coincident impacts; recommendation is to consolidate the Diversity into the Summer and Winter coincidence factors.

Diversity: The ratio of the maximum combined demand to the sum of non-coincident demands across a group. A discrete factor which expresses the extent to which a group contributes to a combined maximum.

Summer Coincidence: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. Summer coincidence factors range from 9% to 35% across the regional TRMs.

Winter Coincidence: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. Winter coincidence factors range from 5% to 100% across the regional TRMs.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. A calculated savings methodology would facilitate regional consistency better than stipulated savings. Demand reductions by lighting technology are logical stipulations as inputs, and a consistent algorithm would allow for localized tuning of hours and coincidence for savings impacts.
2. Direct install residential lighting programs in the region assign lighting hours by both room type and fixture type. Improved consistency would come from agreeing on one hours-of-use dimension – either room type or fixture type.
3. The majority of residential lighting programs factor the ISR into gross savings, while a few reflect this adjustment in net savings. Achieving regional consistency suggests inclusion of ISR as a gross effect.
4. Combine coincidence factor with diversity. This should help to address significant differences observed in winter coincidence factors.
5. Given demographic, geographic, program maturity, and behavioral differences in lighting usage across region, specific states/utilities should consider localized assumptions for lighting hours, peak coincidence, and HVAC interactive factors.

RESIDENTIAL LIGHTING
Summary of Recommended EM&V Methods

This category is limited to single-family residential lighting exclusive of specialty low-income and multi-family programs. These measures span new construction, retrofit, direct install, and retail lighting programs.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: baseline quantity and wattage, installed quantity and wattage, location (as available), hours of use, in-service rate, HVAC interaction.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Complete “socket counts” by room and fixture type provide key data for impact evaluations, baseline studies, and hours-of-use studies. Questions on purchasing habits and “shelf” stock inform in-service rate research. Site visits with time-of-use lighting loggers are the most defensible approach to residential lighting programs.	Time-of-use lighting loggers on a sample of lamps and fixtures, typically by room type.
Alternative M&V Methods	An alternative method is to rely upon telephone surveys to obtain information such as socket counts, hours of use, and purchasing habits. Research has shows that verbal hours tend to be overstated, but this type of Verification (not true M&V) is considered reasonable rigor for certain applications.	Not literally M&V without measurement, but this may comply with ISO-NE/PJM “Option A” with well-documented stipulations.

1.2.5 C&I Comprehensive Multi-Measure New Construction

C&I COMPREHENSIVE MULTI-MEASURE NEW CONSTRUCTION
Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

Technical reference manuals (TRMs) do not provide calculations or algorithms for commercial and industrial comprehensive multi-measures; each project is unique. Comprehensive projects are often directed towards large facilities and cover wide ranges of equipment, schedules, approaches, and measure interactions.

Notes on Algorithm:

1. Comprehensive multi-measures are akin to multiple, interactive custom measures, and custom measures do not have prevailing algorithms. Nonetheless, the fundamental approach is to characterize the full dynamics of energy usage for the baseline and installed conditions across all hours of the year.
2. Hourly building simulations are a popular method, however advanced 8,760 spreadsheets can model energy usage in a more transparent manner.
3. With regard to measure interaction, the sequence in which the multiple measures are assessed affects the total savings for the combined measures.

Description of Inputs:

Not applicable.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. It is not possible to anticipate all possible factors and assumptions that comprise comprehensive multiple measures. However, criteria when comprehensive measures are required should be established and stated clearly in technical program documentation.
2. Calculations using site-specific baselines, installed equipment, and savings assumptions provide the most appropriate and rigorous path to savings impacts. Establishing interactive requirements for custom multiple measures is essential in obtaining true energy and demand savings.
3. Comprehensive projects can be comprised of both custom and prescriptive measures, and interaction should be handled in such a way to avoid double counting. Interactive hierarchies should be developed to provide a uniform track to calculate and report savings.
4. Comprehensive measures are inherently unique and project-specific. Even if methodological consistency is pursued (e.g. using eQUEST models), each project should employ local weather and operational characteristics.

C&I COMPREHENSIVE MULTI-MEASURE NEW CONSTRUCTION
Summary of Recommended EM&V Methods

This category is limited to the installation of commercial and industrial comprehensive multi-measure new construction projects. The comprehensive and multi-measure category is not clearly defined or specifically mentioned in many of the TRMs. References to multiple measures are included in custom measure discussions.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: savings by measure component; description of individual measures with, as applicable, unit quantities, sizes/capacities, baseline and installed efficiencies, and operating hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	Calibrated simulation modeling (Option D) which is especially effective at capturing measure interaction. On-site data collection would gather parameters, specifications, and operational characteristics to inform the model.	Metering would include whole premise interval kW and some end use metering.
Alternative M&V Methods	A viable alternative would be on-site inspections with metering that encompasses the entire set of measures (Option B). A complex engineering spreadsheet model would capture the dynamics and interactions on an hourly basis. Less rigorous metering (Option A) could be performed if accuracy and validity is not a significant concern.	Metering would be interval kW measurements on all or select end use equipment.

1.2.6 C&I Custom Measures

C&I CUSTOM MEASURES

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

Technical reference manuals (TRMs) do not provide calculations or algorithms for custom calculations since the category covers a wide range of equipment, approaches, and measures. Where custom measures are discussed, the TRMs require site specific equipment, operating schedules, baseline and installed efficiencies, and calculation methodologies in the development of energy and demand savings.

Notes on Algorithm:

1. Custom measures are non-standard which do not 'fit' prescriptive savings methods and assumptions.
2. While custom measures do not have prevailing algorithms, the fundamental approach is to characterize the full dynamics of energy usage across all hours and temperature conditions of a typical year.
3. Sometimes building simulations or vendor software are used to assess savings for custom measures. Advanced 8,760 spreadsheets can model energy usage in a more transparent manner than software.

Description of Inputs:

Not applicable.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. The custom approach is indispensable for delivering energy efficiency to customers, markets, or building/process systems that are not conducive to a standardized, prescriptive approach. However, custom measures are more costly and require technical in-house resources to examine and qualify non-prescriptive applications. Where program funding and technical resources permit, include a custom measure offering to capture more complex efficiency opportunities.
2. It is not possible to anticipate all possible factors and assumptions that comprise custom measures, so the scope of custom TRM entries should be limited. Custom calculations using site-specific baselines, installed equipment, and savings assumptions provide the most appropriate and rigorous path to savings impacts. Accordingly, there are no specific recommendations for the standardization of custom measure algorithms or approach.
3. Custom measures are inherently project-specific. Even if methodological consistency is pursued (e.g. standardized calculation models), the savings assumptions should employ localized weather and operational characteristics.

C&I CUSTOM MEASURES
Summary of Recommended EM&V Methods

This category is limited to the installation of commercial and industrial custom measures in both retrofit and new construction situations. The custom category includes measures that either do not comply with or benefit from examination beyond a prescriptive calculation approach. In general, these are more complex measures that necessitate site-specific information and detailed calculations to estimate energy and demand savings. In this context, custom measures may entail any end use or technology.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: measure description with, as applicable, unit quantities, sizes/capacities, baseline and installed efficiencies, and operating hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	On-site inspections with partial (Option A) or complete (Option B) measurements on a sample of program participants. Site visits with short-term metering represent the most defensible approach to C&I Custom measures. A complex engineering spreadsheet model would capture the dynamics and interactions on an hourly basis.	Metering methods often include time-of-use loggers, interval kW recorders, and spot power measurements.
Alternative M&V Method	If the Custom measure involves significant HVAC equipment and/or controls, calibrated simulation modeling (Option D) offers a high rigor alternative which is especially effective at capturing measure dynamics and interaction.	Metering would include whole premise interval kW and some end use metering.

1.2.7 C&I Natural Gas Boilers and Furnaces

C&I NATURAL GAS BOILERS AND FURNACES

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

Furnaces < 225 MBH and boilers < 300 MBH

Therms saved = (Size in Btu/hr INPUT) x (1/$AFUE_{baseline}$ – 1/$AFUE_{installed}$) x (Full Load Heating Hours) / 100,000

Furnaces ≥ 225 MBH and boilers ≥ 300 MBH

Therms saved = (Size in Btu/hr INPUT) x (1/$Efficiency_{baseline}$ – 1/$Efficiency_{installed}$) x (Full Load Heating Hours)/100,000

Alternative Algorithm

Therms savings = (Size in Btu/hr INPUT) x EFLHeff x (AFUEeff/AFUEbase - 1)/100,000

Where the size of the unit and EFLHeff is for the installed high efficiency unit

Notes on Algorithm:

1. The prevailing algorithm only employs Annual Fuel Utilization Efficiency (AFUE), however the Air-Conditioning, Heating and Refrigeration Institute (AHRI) limits the use of AFUE to furnaces under 225 MBH and boilers less than 300 MBH. Units above this size have efficiency ratings in thermal efficiency and combustion efficiency. Accordingly, the recommended algorithm above includes a distinct expression for units above this size threshold.
2. Most Technical Reference Manuals (TRMs) cite “full load hours” or “equivalent full load hours” (EFLH) in their algorithm, but one TRM uses “heating load hours” which separates the influence of thermal efficiency from the time term in the equation.

Description of Inputs:

Baseline Efficiency: Rated AFUE or thermal efficiency of baseline equipment as per established standard or baseline study. Prevailing AFUE baselines are 75% for steam boilers, 78% for furnaces, and 80 for hot water boilers.

Installed Efficiency: Rated AFUE of installed equipment as per AHRI database. Approximately 82% for steam boilers, 85% for non-condensing hot water boilers, 90% for condensing hot water boilers, and 92% for furnaces.

Operating Hours: The ratio of annual heating unit energy to nameplate peak demand. Heating hours should reflect localized climate conditions and be based upon technical research studies. With few exceptions, most states in the Forum region have distinct climate zones which warrant distinct estimates of heating hours.

Summer Coincidence Factor: The ratio of peak demand at the same time as a “summer” period to the peak demand across all periods. Most programs do not estimate peak coincidence for gas measures; however one TRM specifies a 12% summer coincidence factor for commercial gas heating equipment.

Winter Coincidence Factor: The ratio of peak demand at the same time as a “winter” period to the peak demand across all periods. Most programs do not estimate peak coincidence for gas measures; however one TRM specifies an 88% winter coincidence factor for commercial gas heating equipment. Coincidence should reflect localized climate conditions and should be based upon technical research studies.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. While there is reasonable consensus on savings calculation methodologies and assumptions for small commercial natural gas heating equipment, it may be appropriate to treat large commercial boilers as custom measures. States currently using or considering a custom approach for small commercial gas heating equipment might consider a prescriptive approach under a given size threshold.
2. Differing limits placed on eligible capacities throughout the region may pose a barrier to greater consistency for commercial natural gas boiler and furnace measures. In two states, boiler capacity is used to determine whether a measure is treated as a custom measure, so capacity limits also impact how savings are calculated.
3. Given the differences in climate across the Forum region, it is appropriate for specific states or utilities to continue to develop localized assumptions for heating hours due to local characteristics of climate, demographics, and behavior.
4. Different types of commercial buildings may also have different operating patterns, and thus different heating hours. When shown to be relevant, savings parameters by location, vintage, or other dimensions should be employed.

C&I NATURAL GAS BOILERS AND FURNACES
Summary of Recommended EM&V Methods

This category is limited to commercial natural gas boilers and furnaces. Accordingly, the research did not include other types of space heating equipment, such as individual or room space heaters, electric or oil space heating equipment, or associated controls such as boiler reset controls.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, unit capacity, baseline and installed efficiency, and full load heating hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	Billing analysis (Option C) supported by telephone surveys and/or on-site inspections. Telephone surveys can be used to confirm installation and gather data on facility size and operating hours to support the billing analysis.	Billing analysis is only valid when the pre-existing (electric bills from the pre-retrofit period) is the appropriate baseline to be used in impact analysis.
Alternative M&V Methods	Adding on-site inspections to the basic method above improves confidence in building characteristics and supports collection of equipment nameplate data. Basic short-term measurements (Option A) can be added on electrical support equipment such as furnace fans and boiler pumps to refine savings estimates.	Metering methods would include time-of-use CT loggers and spot power measurements.
	Calibrated simulation modeling (Option D) is a high rigor alternative which is probably excessive for stand-alone gas heating equipment but would be appropriate for evaluating significant measures or those in a comprehensive package.	Natural gas sub-meters can be installed to isolate the heating equipment from other end uses.

1.2.8 C&I HVAC: Prescriptive Chillers

C&I HVAC: PRESCRIPTIVE CHILLERS

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh savings = Tons x Δefficiency x Annual operating hours
kW savings = Tons x Δefficiency x Demand factors

Notes on Algorithm:

1. "Δefficiency" (kW/ton) refers to the difference in efficiency between the baseline and installed equipment, i.e. ($Efficiency_{baseline}$ – $Efficiency_{installed}$).
2. "Annual operating hours" are either equivalent full load hours (EFLH) or cooling load hours (CLH).
3. The demand savings algorithm excludes operating hours and incorporates demand factors. These multipliers are called coincidence factors or load factors that modify the chillers peak kW consumption.
4. Prescriptive chiller savings algorithms neglect the impacts of support systems such as pumps, controls, and tower fans.

Description of Inputs:

Baseline Efficiency: Rated efficiency of baseline equipment as per energy code, established standards, or baseline study. Often in units of Energy Efficiency Ratio (EER) for air cooled chillers, kW/ton for water cooled chillers, or the dimensionless coefficient of performance (COP). Depending upon the application, an integrated part load value (IPLV) may be a more appropriate efficiency, particularly for annual energy savings. Baseline efficiencies vary greatly by type (air-cooled/water-cooled, reciprocating/screw/centrifugal) and size and should be supported by technical baseline studies.

Installed Efficiency: Rated efficiency of installed equipment as per manufacturer's performance data.

Full Load Cooling Hours: The ratio of annual cooling unit energy to nameplate peak demand, as informed by technical metering studies designed to update hours-of-use assumptions. Regional Technical Reference Manuals (TRMs) employ estimates ranging from 497 to 3653 full load hours, depending upon region and building type.

Demand Factors: Adjustments to rated demand for use in deriving coincident impacts; recommendation is to consolidate these discrete adjustments into combined Summer and Winter coincidence factors.

Loading: The ratio of peak observed to rated maximum load for a piece of equipment. A discrete factor to express equipment over sizing effects at the typical unit level.

Diversity: The ratio of the maximum combined demand to the sum of non-coincident demands across a group. A discrete factor which expresses the extent to which a group contributes to a combined maximum.

Summer Coincidence: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. Summer coincidence factors range from 67% to 100% across the regional TRMs. Coincidence must reflect localized climate conditions and should be based upon technical research studies.

Winter Coincidence: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. Winter coincidence factors range from 0% to 67% across the regional TRMs.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. Load factors are included in some calculations to account for average seasonal loading and/or oversized systems. By standardizing on Equivalent Full Load Hours, a load factor term is no longer needed.
2. Consolidate load, diversity, and coincidence factors into single factor combining all peak coincidence drivers.
3. Standardize Efficiency. kW/ton is most commonly used to estimate savings, but Integrated Part Load Value (IPLV) can be a better representation of seasonal performance under varying loads.
4. Facility type is unspecified across most TRMs but default operating hours rely on average operation of multiple facility types across regions. Identifying annual operating hours by selected facility types will provide more accurate estimation of prescriptive savings by capturing the unique operating profiles for each facility.

C&I HVAC: PRESCRIPTIVE CHILLERS

Summary of Recommended EM&V Methods

This category is limited to air-cooled and water-cooled chiller installations in commercial and industrial facilities as a prescriptive measure. Custom chiller installations are covered under C&I Custom Measures.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, chiller capacity, baseline and installed efficiency, and full load cooling hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Site visits with short-term metering can offer the most cost-effective approach to prescriptive chiller projects.	Metering methods include interval amp/kW recording or time-of-use loggers coupled with spot power measurements.
Alternative M&V Methods	An enhanced alternative to the above would be on-site inspections with metering that fully captures the entire chiller water system including supporting pumps and tower fans (Option B). Engineers can analyze hourly energy consumption for baseline and installation conditions in a dynamic spreadsheet model using Typical Meteorological Year (TMY) data.	Additional parameters of value include supply and return water temperature and water flow in gallons/minute.
	Calibrated simulation modeling (Option D) is a high rigor alternative which is especially effective at capturing measure interaction. Simulation modeling is particularly good at temperature dependent equipment, but requires a wealth of building and operational characteristics for an accurate model.	Metering would mirror Option B probably with whole premise interval kW and some space temperatures.

1.2.9 C&I HVAC: Unitary/Split

C&I HVAC: UNITARY/SPLIT

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

Cooling Calculations:

kWh Saved = (Size in kBtu/hr) x (1/Efficiency$_{baseline}$ – 1/Efficiency$_{installed}$) x (Full Load Cooling Hours) / 1,000

Heating Calculations:

kWh Saved = (Size in kBtu/hr) x (1/Efficiency$_{baseline}$ – 1/Efficiency$_{installed}$) x (Full Load Heating Hours) / 1,000

Demand Calculations:

kW Saved = (Size in kBtu/hr) x (1/Efficiency$_{baseline}$ – 1/Efficiency$_{installed}$) x (Coincidence Factor) / 1,000

Notes on Algorithm:

1. Seasonal Energy Efficiency Ratio (SEER) is used to calculate cooling energy savings for air source heat pumps and AC units that are < 65,000 Btu/hr in size.
2. Energy Efficiency Ratio (EER) is used to calculate cooling energy savings for all water source heat pumps and for air source heat pumps and AC units that are < 65,000 Btu/hr in size. EER is also used for cooling demand savings.
3. Heating Seasonal Performance Factor (HSPF) is used to calculate heating savings for air source heat pumps < 65,000 Btu/hr.
4. COP (Coefficient of Performance) is used to calculate heating savings for units that are < 65,000 Btu/hr in size. COP is also used for heating demand savings.
5. Equivalent Full Load Hours (EFLH) is used to annualize savings. Separate operating hours are required for heating and cooling modes.

Description of Inputs:

Baseline Efficiency: Rated efficiency of baseline equipment as per energy code, established standards, or baseline study. Units vary as outlined above. Baseline efficiencies vary greatly by type (air conditioner/heat pump, air-source/water-source) and unit capacity and should be supported by technical baseline studies.

Installed Efficiency: Rated efficiency of installed equipment as per the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) database or manufacturer data.

Full Load Cooling/Heating Hours: The ratio of annual cooling/heating unit energy to nameplate peak demand, as informed by technical metering studies designed to update hours-of-use assumptions. Regional Technical Reference Manuals (TRMs) employ widely varying estimates depending upon cooling/heating mode, region, and building type.

Demand Factors: Adjustments to rated demand for use in deriving coincident impacts; recommendation is to consolidate these discrete adjustments into combined Summer and Winter coincidence factors.

- **Loading**: The ratio of peak observed to rated maximum load for a piece of equipment. A discrete factor to express equipment over sizing effects at the typical unit level.
- **Diversity**: The ratio of the maximum combined demand to the sum of non-coincident demands across a group. A discrete factor which expresses the extent to which a group contributes to a combined maximum.
- **Summer Coincidence**: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. Summer coincidence factors range from 44% to 100% across the regional TRMs. Coincidence must reflect localized climate conditions and should be based upon technical research studies.
- **Winter Coincidence**: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. Regional estimates tend to assume 100% for heating mode, but this warrants improvement via further research.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. Operating hours is the most dynamic savings input variable, and a consistent method should embrace inputs that reflect operational diversity by location, building type, or vintage. A consistent regional approach can still reflect regional and operational differences: New York should continue using Equivalent

C&I HVAC: UNITARY/SPLIT
Savings Assumptions for Initial Gross Energy and Demand

Full Load Hours lookup tables by city, but Rhode Island need not.

2. Electric resistance operation is not included in savings estimates, but these savings should be included when water source heat pumps replace air-to-air systems.
3. Standardize Cooling Capacity Units on Btu/hr. Using capacity estimates in kBtu/hr instead of tons prevents rounding errors by excluding nominal designations (10 tons) that may cover several different units.
4. Eliminate Loading/Sizing Factor. Load factors are included in some calculations to account for over sizing systems in the field, but this can be addressed in the Equivalent Full Load Hours parameter.
5. Given the differences in climate across the Forum region, it is appropriate for specific states or utilities to continue to develop localized assumptions for cooling and heating hours due to local characteristics of climate, demographics, and behavior.

C&I HVAC: UNITARY/SPLIT
Summary of Recommended EM&V Methods

This category is limited to unitary HVAC installations in commercial and industrial facilities as a prescriptive measure. Unitary equipment covers split system AC, packaged systems, air-source heat pumps, and water source heat pumps. Custom unitary air conditioning applications are covered under C&I Custom Measures.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, HVAC unit capacity, baseline and installed efficiency, and full load cooling *and heating* hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Site visits with short-term metering can offer the most cost-effective approach to prescriptive chiller projects.	Metering methods include interval amp/kW recording or time-of-use loggers coupled with spot power measurements.
Alternative M&V Methods	An enhanced alternative to the above would be on-site inspections with metering that fully surrounds the measurement boundary (Option B). Engineers can analyze hourly energy consumption for baseline and installation conditions in a dynamic spreadsheet model using Typical Meteorological Year (TMY) data.	Interval kW metering on whole package units or both indoor/outdoor components of a split system.
	Calibrated simulation modeling (Option D) is a high rigor alternative which is especially effective at capturing measure interaction. Simulation modeling is particularly good at temperature dependent equipment, but requires a wealth of building and operational characteristics for an accurate model. May be a viable option for buildings with many HVAC units, zones, or solar coupling effects.	Metering would mirror Option B probably with whole premise interval kW and some space temperatures.

1.2.10 C&I HVAC: Other Measures

C&I HVAC: OTHER MEASURES

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh savings = (Size in Tons) x (Energy Savings Factor)

kW savings = (Size in Tons) x (Demand Savings Factor)

Notes on Algorithm:

1. The prevailing savings approach for all three measures - economizers, dual enthalpy controls, and programmable thermostats - is to employ "savings factors" which scale by HVAC unit size.

Description of Inputs:

Unit Size: HVAC unit capacity in tons of cooling. Nominal value from equipment nameplate.

Energy Savings Factor: Derived from an impact study. Estimates in Forum region Technical Reference Manuals (TRMs) vary greatly from 25 to 289 kWh/ton for dual enthalpy controls.

Demand Savings Factor: Most TRMs do not take credit for kW impacts. One TRM uses 0.289 kW/ton for dual enthalpy controls.

Summer Coincidence: Most TRMs do not take credit for kW impacts. One TRM uses 40% for summer coincidence. Recommend technical research to support savings factors and improve coincidence estimates.

Winter Coincidence: Most TRMs do not take credit for kW impacts. One TRM uses 0% for winter coincidence. Recommend technical research to support savings factors and improve coincidence estimates.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. The lack of reliable source documentation makes it difficult to compare savings assumptions and state what variables are the most accurate and reliable. Given the lack of uniformity between the models, assumptions, and savings factors, more measurement-based research (and perhaps simulation modeling) is warranted to improve consensus and confidence of HVAC economizer and control savings across the Forum region.

C&I HVAC: OTHER MEASURES
Summary of Recommended EM&V Methods

The Forum subcommittee for this project elected to limit this Other HVAC category to HVAC control measures such as thermostats, economizers, and dual-enthalpy controls. This category is limited to prescriptive installations in commercial and industrial facilities. Custom HVAC applications are covered under C&I Custom Measures.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, unit capacity and efficiency, full load cooling hours, free cooling/setback hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling.
Recommended M&V Method	On-site inspections with limited measurements on a sample of program participants (Option A). Site visits for HVAC control measures often focus upon accurately inspecting and verifying operation of the controls.	Metering methods may include strategically placed time-of-use loggers to verify controls.
Alternative M&V Methods	An enhanced alternative to the above would be on-site inspections with metering that fully captures the impacts of the control (Option B). An hourly impact analysis would isolate the control impacts from the monitored data stream and assess across a Typical Meteorological Year (TMY) dataset.	Metering would be interval kW measurements on the affected HVAC units. Advanced metering can include enthalpy readings and damper position.
	Calibrated simulation modeling (Option D) is a high rigor alternative which is especially effective at measure interaction but also control schema. Simulation modeling requires a wealth of building and operational characteristics for an accurate model. May be a viable option for buildings with many HVAC units and complex controls.	Metering would mirror Option B probably with whole premise interval kW and some space temperatures.

1.2.11 C&I Lighting (New Construction)

C&I LIGHTING (NEW CONSTRUCTION)

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh Saved = $(Quantity_{baseline} \times Watts_{baseline}) - (Quantity_{installed} \times Watts_{installed})$ / 1000 × (Annual Hours)

kW Saved = $(Quantity_{baseline} \times Watts_{baseline}) - (Quantity_{installed} \times Watts_{installed})$ / 1000 x (Coincidence Factor)

Notes on Algorithm:

1. Some Technical Reference Manuals (TRMs) stipulate the wattage reduction, utilizing a common Quantity term and substituting a ΔWatts or kW/unit term for $(Watts_{baseline} - Watts_{installed})$ in the equation above.
2. While some algorithms employ an in-service rate (ISR), it is less prevalent in the C&I sector than for residential; many C&I programs either exclude ISR or assume it to be 100%.

Description of Inputs:

Baseline Fixture Quantity: The number of fixtures in the corresponding baseline. The same as **Installed Fixture Quantity** for one-to-one replacements.

Baseline Fixture Wattage: Connected wattage of the baseline fixture. For C&I new construction, usually obtained from lookup tables or derived from lighting power density tables in American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) 90.1.

Installed Fixture Quantity: The number of installed fixtures.

Installed Fixture Wattage: The rated wattage of the installed fixture, inclusive of both lamp and ballast. Obtained from nameplate data.

Annual Hours: The number of operating hours for the fixture in a typical year. For C&I lighting, either site-specific or assigned by building type. Lighting hours-of-use studies by building type inform program estimates when site-specific hours are not available.

Summer Coincidence: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. Summer coincidence factors range from 35% to 100% across the regional TRMs.

Winter Coincidence: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. Winter coincidence factors range from 36% to 100% across the regional TRMs.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. A calculated savings methodology would facilitate regional consistency better than stipulated savings. Demand reductions by lighting technology are logical stipulations as inputs, and a consistent algorithm would allow for localized tuning of hours and coincidence for savings impacts.
2. Two distinct approaches are used in the region: lookups by building type and site-specific hours. A blended approach appears to be a logical and reasonable compromise between these two extremes. Site-specific lighting hours could be employed when available, but prescriptive lighting hours would default to lookup tables by building type or other relevant dimension.
3. In-Service Rate is a valid effect; the only question remains whether to account for it in preliminary or evaluated savings. Recommend dropping the ISR from the C&I lighting algorithm and capturing its effect in the gross evaluated realization rate.
4. There is an opportunity for the region to standardize on an interactive effects approach for C&I lighting. This can be an engineering-based interactive methodology or simply agreeing to include localized HVAC interaction factors in the standard C&I lighting algorithm.
5. Given demographic, geographic, program maturity, and behavioral differences in lighting usage across the Forum region, localized assumptions are prudent for lighting hours, peak coincidence, and HVAC interaction.

C&I LIGHTING (NEW CONSTRUCTION)
Summary of Recommended EM&V Methods

This category encompasses commercial and industrial lighting in new construction programs.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: installed quantity and wattage, corresponding baseline, fixture location, annual operating hours, in-service rate, HVAC interaction factor.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling. Fixture location is critical for evaluation.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Complete inspection and count of all installed lighting with spot verification of lamp/ballast type. Characterize cooling/heating zones and equipment for assessment of HVAC interactive effects. Analysis with simple engineering models.	Time-of-use lighting loggers on a broad sample of fixtures, typically stratified by savings, room type, and or operating schedule.
Alternative M&V Methods	Some C&I lighting installations warrant very high, in-building sample rates or advanced interval metering (Option B). Examples include private office spaces with high uncertainty/diversity, hotel rooms/dormitories, and lighting systems with extensive controls. Interval kW meters have proven useful for recording load on lighting circuits with many, individual occupancy sensors or dimming controls. Analysis with simple engineering models or 8,760 spreadsheets for rigorous assessment of coincident impacts.	More liberal use of lighting loggers. Or: many commercial buildings isolate lighting systems in 277V power panels which can offer a prime opportunity for interval metering on large amounts of lighting.

1.2.12 C&I Lighting (Retrofit)

C&I LIGHTING (RETROFIT)

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh Saved = ($Quantity_{baseline}$ x $Watts_{baseline}$) – ($Quantity_{installed}$ x $Watts_{installed}$) / 1000 × (Annual Hours)

kW Saved = ($Quantity_{baseline}$ x $Watts_{baseline}$) – ($Quantity_{installed}$ x $Watts_{installed}$) / 1000 x (Coincidence Factor)

Notes on Algorithm:

1. Some Technical Reference Manuals (TRMs) stipulate the wattage reduction, utilizing a common Quantity term and substituting a ▫Watts or kW/unit term for ($Watts_{baseline}$ – $Watts_{installed}$) in the equation above.
2. While some algorithms employ an in-service rate (ISR), it is less prevalent in the C&I sector than for residential; most programs either exclude ISR or assume it to be 100%.

Description of Inputs:

Baseline Fixture Quantity: The number of pre-existing fixtures.

Baseline Fixture Wattage: Connected wattage of the pre-existing fixture for C&I retrofit.

Installed Fixture Quantity: The number of installed fixtures.

Installed Fixture Wattage: The rated wattage of the installed fixture, inclusive of both lamp and ballast. Obtained from nameplate data. Rarely measured independently.

Annual Hours: The number of operating hours for the fixture in a typical year. For C&I lighting, either site-specific or assigned by building type. Lighting hours-of-use studies by building type inform program estimates when site-specific hours are not available.

Summer Coincidence: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. Summer coincidence factors range from 17% to 100% across the regional TRMs.

Winter Coincidence: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. Winter coincidence factors range from 36% to 100% across the regional TRMs.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. A calculated savings methodology would facilitate regional consistency better than stipulated savings. Demand reductions by lighting technology are logical stipulations as inputs, and a consistent algorithm would allow for localized tuning of hours and coincidence for savings impacts.
2. Two distinct approaches are used in the region: lookups by building type and site-specific hours. A blended approach appears to be a logical and reasonable compromise between these two extremes. Site-specific lighting hours could be employed when available, but prescriptive lighting hours would default to lookup tables by building type or other relevant dimension.
3. In-Service Rate is a valid effect; the only question remains whether to account for it in preliminary or evaluated savings. Recommend dropping the ISR from the C&I lighting algorithm and capturing its effect in the gross evaluated realization rate.
4. There is an opportunity for the region to standardize on an interactive effects approach for C&I lighting. This can be an engineering-based interactive methodology or simply agreeing to include localized HVAC interaction factors in the standard C&I lighting algorithm.
5. Given demographic, geographic, program maturity, and behavioral differences in lighting usage across the Forum region, localized assumptions are prudent for lighting hours, peak coincidence, and HVAC interaction.

C&I LIGHTING (RETROFIT)
Summary of Recommended EM&V Methods

This category encompasses commercial and industrial lighting in retrofit programs.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: installed quantity and wattage, corresponding baseline, fixture location, annual operating hours, in-service rate, HVAC interaction factor.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling. Fixture location is critical for evaluation.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Complete inspection and count of all installed lighting with spot verification of lamp/ballast type. Characterize cooling/heating zones and equipment for assessment of HVAC interactive effects. Analysis with simple engineering models.	Time-of-use lighting loggers on a broad sample of fixtures, typically stratified by savings, room type, and or operating schedule.
Alternative M&V Methods	Some C&I lighting installations warrant very high, in-building sample rates or advanced interval metering (Option B). Examples include private office spaces with high uncertainty/diversity, hotel rooms/dormitories, and lighting systems with extensive controls. Interval kW meters have proven useful for recording load on lighting circuits with many, individual occupancy sensors or dimming controls. Analysis with simple engineering models or 8,760 spreadsheets for rigorous assessment of coincident impacts.	More liberal use of lighting loggers. Or: many commercial buildings isolate lighting systems in 277V power panels which can offer a prime opportunity for interval metering on large amounts of lighting.

1.2.13 C&I Motors

C&I MOTORS

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh savings = HP x 0.746 x (1/$Efficiency_{baseline}$ – 1/$Efficiency_{installed}$) x (loading) x (annual hours) / 1,000

kW savings = HP x 0.746 x (1/$Efficiency_{baseline}$ – 1/$Efficiency_{installed}$) x (loading) x (demand factors) / 1,000

Notes on Algorithm:

1. Standard motor algorithm; highly consistent in Forum region.

Description of Inputs:

Baseline Efficiency: Rated efficiency of baseline motor as per EPACT 1992. Lookup tables by motor horsepower (HP), type (open drip proof, totally enclosed fan cooled), and speed (rpm).

Installed Efficiency: National Electrical Manufacturers Association (NEMA) efficiency of installed motor as per nameplate data.

Loading: The average percent motor loading. While often ball-parked at 70-80%, best informed by spot power measurement of motor under typical loading conditions.

Annual Hours: The number of hours per year that the motor operates. While some prescriptive motor programs provide for site-specific estimates of operating hours, most Technical Reference Manuals (TRMs) provide default lookup hours by 12-60 facility types and 3-4 end uses.

Summer Coincidence: The ratio of peak demand at the same time as a “summer” period to the peak demand across all periods. Summer coincidence factors vary widely for prescriptive motors across the Forum region.

Winter Coincidence: The ratio of peak demand at the same time as a “winter” period to the peak demand across all periods. Winter coincidence factors vary widely for prescriptive motors across the Forum region.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. Stay on Track. The efficient motor measure is already close to a regional standard. The availability and uniformity of base and installed motor data has been widely adopted making only minor adjustments necessary to create a regional measure.
2. Some TRMs prescribe motor operating hours for an extensive list of facility types and applications, while others are more limited. Shared research and operating hour assumptions may help expand efficiency offerings for programs that do not offer non-HVAC prescriptive motors.
3. Do not neglect loading factor; use site-specific when available. The loading factor accounts for motor over sizing and prevents the assumption that all motors operate continuously at full load.

C&I MOTORS
Summary of Recommended EM&V Methods

This category is limited to the installation of premium efficient motors in commercial and industrial facilities as a prescriptive measure. Motors installed in conjunction with other measures such as with variable speed drives are not included in this document.

Aspect	Detailed Approach	Comments
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, motor horsepower, end use and application (e.g. HVAC supply fan), location, baseline and installed efficiency, loading factor, and annual operating hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling. Motor location is critical for evaluation.
Recommended M&V Method	On-site inspections with partial measurements on a sample of program participants (Option A). Basic site visits with time-of-use metering offers the most defensible and cost-effective approach to constant-speed, prescriptive motors.	Metering methods include time-of-use CT or "magnetic field" loggers and spot power measurements.
Alternative M&V Methods	An enhanced alternative to the above would be on-site inspections with interval kW metering that tracks the electrical performance of the motor throughout its load range (Option B). This added rigor captures part-load efficiency effects that tend to be neglected in a time of use (TOU) metered approach with simple engineering models.	Metering would be interval kW measurements for a reasonable duration to span a variety of motor loading situations.

1.2.14 C&I Variable Speed Drives

C&I VARIABLE SPEED DRIVES

Savings Assumptions for Initial Gross Energy and Demand

Prevailing Algorithm for Energy and Demand:

kWh Saved = Motor horsepower (HP) x energy savings factor (ESF) x annual operating hours
kW Saved = Motor horsepower x demand savings factor (DSF)

Notes on Algorithm:

1. All variable speed drive algorithms in the Forum region boil down to a "savings factor" method, however most programs differentiate factors by building type, equipment type, and/or fan/pump type.
2. The most complex prescriptive variable speed drive (VSD) method utilizes an eleven-bin analysis based on percentage of flow. This adds greater resolution to the calculations, but the underlying algorithm remains consistent.

Description of Inputs:

Motor Horsepower: Motor size in nominal horsepower. From nameplate.
Energy Savings Factor: Estimated from impact studies or theoretical engineering models. Estimates range from 745-1,746 kWh/hp.
Demand Savings Factor: Estimated from impact studies or theoretical engineering models. Estimates range from 0.098-0.744 kW/hp.
Annual Hours: Estimated from impact studies or theoretical engineering models. Estimates range from 1,119-8,670 hours/year.
Summer Coincidence: The ratio of peak demand at the same time as a "summer" period to the peak demand across all periods. Summer coincidence factors vary from 0-100% for prescriptive VSDs depending upon the building type and drive application.
Winter Coincidence: The ratio of peak demand at the same time as a "winter" period to the peak demand across all periods. Winter coincidence factors vary from 0-100% for prescriptive VSDs depending upon the building type and drive application.

Opportunities for Improved Consistency or Areas Where Differences are Warranted:

1. If methodological consistency is a regional objective, a line may need to be drawn between prescriptive and custom VSDs, likely with a simpler line-item calculations and savings factors for prescriptive approach.
2. To improve portability of the VSD method, develop standardized kW/hp factor(s) and localized assumptions for operating hours and peak coincidence. Some algorithms provide a range of default operating hours while others embed annual operation in the "ESF" savings factor.
3. The region would benefit from some standardization, for Technical Reference Manuals (TRMs) vary widely in the range of equipment and size (motor horsepower) covered by the prescriptive variable speed drive application. Eleven types of equipment are covered in one TRM while another list only two applicable types. Installations outside the "standard" offerings simply would become a Custom measure.
4. Similarly, a common set of facility types would facilitate regional methodological consistency. The number of discrete facility types ranges from two to sixty amongst TRMs reviewed.
5. Any compliance or exclusion criteria should be clearly documented. The TRMs clearly identify motor size and application but do not always document exclusion criteria.

C&I VARIABLE SPEED DRIVES Summary of Recommended EM&V Methods		
This category is limited to variable speed drives (VSD) installations in commercial and industrial facilities as a prescriptive measure. Custom VSD applications are covered under C&I Custom Measures.		
Aspect	**Detailed Approach**	**Comments**
Program Tracking	At a minimum: initial gross energy and demand savings, as well as initial net impacts as applicable. Additional: number of installed units, motor horsepower, end use and application (e.g. HVAC supply fan), location, savings factors, and annual operating hours.	Additional parameters useful for quality control and also for evaluation design, e.g. sampling. VSD location is critical for evaluation.
Recommended M&V Method	On-site inspections with interval kW metering that tracks the electrical performance of the motor/VSD combination throughout its load range (Option B). Lesser rigor would not capture the variability intrinsic to a VSD application.	Metering would be interval kW measurements for a reasonable duration to span a variety of loading situations.
Alternative M&V Methods	Calibrated simulation modeling (Option D) is a high rigor alternative which is especially effective at measure interaction but also control schema. Simulation modeling requires a wealth of building and operational characteristics for an accurate model. May be a viable option for facilities with many VSDs on HVAC systems units.	Metering would mirror Option B perhaps with whole premise interval kW and some space temperatures.

Attachment 193.3

43.2.4 On page 35 Table 3.5 Summary Information Other Utilities DSM Activity of the Application it shows the DSM Funding Treatment: O&M, rate base, and public purpose fund.

43.2.4.1 For these utilities that include the costs into rate base/capital what are the amortization periods.

Response:

Please refer to the response to BCUC IR 1.43.2.4.2

43.2.4.2 For these utilities that rate base its DSM expenditures please provide information on the amounts that are capitalized annually and the amounts expensed, if any.

Response:

The table below provides the details on amortization periods for utilities that include the costs into rate base/capital

Utility Name	Amortization Period	Capitalized vs. expensed
BC Hydro	10 yrs	Capitalized but DSM expenditures associated with cancelled programs are written off in the year in which the program is cancelled
FortisBC	10 yrs	Capitalized
Manitoba Hydro	15 yrs	Expensed but spread over a 15 year amortization period
Union Gas/Enbridge Gas Distribution	n/a	Included in rate base; earn based on an incentive mechanism

Further details for each utility are provided below.

BC Hydro

"Costs are capitalized and amortized to appropriately match the costs with energy savings benefits over future years, not to exceed ten years.

Costs incurred in the concept development phase are not capitalized as there is no assurance that any program will be accepted for development and implementation.

Program-specific and non-specific portfolio development and implementation costs are capitalized and amortized over a period not to exceed ten years. Amortization commences in the year following the year in which the expenditure is incurred. DSM expenditures associated with cancelled programs are written off in the year the program is cancelled. Costs that are not capitalized are expensed as OMG&A in the period incurred.”

Source: http://www.bchydro.com/rx_files/info/info45426.pdf, Section 8, p71

DSM expenditure in 2007 was $4.942 million in operating costs and $47.313 in deferred capital.

Source: BC Hydro PowerSmart, “Report on Demand-Side Activities for the Twelve Months ending March 31, 2007”

FortisBC

All DSM expenditures are capitalized, including incentives, labour, expenses including advertising, but none are O&M. About ~10% of the Technical Advisors time is designated as Key Account management and thus O&M. However KAM is for non-DSM matters, so the O&M expense will go to Customer Services.

Also it is the *net* DSM expenditure, after income tax effect (~31%), that is capitalized in rate-base. So a $2.4m nominal spend translates into $1.6m rate base addition.

Source: Email Correspondence, Keith Veerman, FortisBC PowerSense Department.

Manitoba Hydro

The Terasen Utilities had asked Manitoba Hydro to clarify this, below is their response:

None of Centra's[12] DSM costs are capitalized. All of Centra's DSM costs are expensed, but they are spread out over the 15 year amortization period. Manitoba Hydro (the electrical operation) does not earn a return on DSM expenditures because as a crown corporation it is regulated under a cost of service methodology (not rate base/rate of return). Manitoba Hydro's return is based on long term forecasts and rates designed to leave an adequate operating reserve and debt/equity ratio. Return on rate base or like assets is not considered when determining rates. It should be noted that Centra also now regulated under a cost of service methodology but this is very recent and the Manitoba PUB still looks at rate base in Centra's filings and rate base is used as an allocater in its cost of service study.

Source: Email Correspondence, Brad De Ryck, Gas Rates & Regulatory Department Manitoba Hydro.

[12] Centra is the natural gas subsidiary of Manitoba Hydro.

Union Gas and Enbridge Gas Distribution

Both include costs in their rate base, but do not capitalize the expenditure. Uses a Variance Account to reconcile expenditure and revenue at the end of each financial year; neither company earns on the DSM revenue but rather through the SSM mechanism.

http://www.oeb.gov.on.ca/documents/cases/EB-2005-0437/decision-231205.pdf (Section 4 refers to the SSM and Section 6 to the DSMVA).

43.2.4.3 Are the Terasen Utilities aware of any utility that amortizes DSM costs over a 20 year or greater period? If so, please provide the name of the utility and the details of the DSM program.

Response:

Further research failed to uncover any examples where utilities are using or proposing amortization periods as long as 20 years. Note, however, that the 20 year period selected by the Companies is based on estimates of "the life of the assets". There are other instances where utilities have adopted the "life of the asset" approach, but arrived at a different conclusion as to the life of the assets (i.e. a shorter amortization period) in those particular circumstances. The approach is consistent with the Commission's DSM Accounting Policy and the Commission has approved this approach for FortisBC and BC Hydro.

Please also refer to the responses to BCUC IRs No. 1, Questions 10.2, 42.1 and 43.2.4.2. Similarly, the Nevada Administrative Code, NAC 704.9523[13], charges the Public Utility Commission with determining an amortization period that is "consistent with the life of the investment."

43.2.4.4 What is a "public purpose fund" and how is it generally funded? Would a public purpose fund be suitable for the Terasen Utilities?

[13] http://www.leg.state.nv.us/NAC/NAC-704.html#NAC704Sec9523conci

Response:

In general, a "Public Purpose Fund" (PPF) is a mechanism to raise revenues from utility customers for a specific purpose such as DSM, low-income support or the funding of renewable energy resources. The PPF charge typically appears as a separate line-item on the customer bill rather than being rolled into the rates, so it shows up as a rate rider in the utility's tariff. There are different variations on PPFs; in some cases, PPFs fund DSM activity by a central agency. In others, PPFs fund utility DSM activity. More information on this can be found in Appendix 4.

In the case of Oregon, the Public Purpose Fund was established by legislation – by Senate Bill 1149, which was approved in 1999 and which came into effect March 1, 2002. No such statutory basis exists for the Terasen Utilities to fund DSM activity through a PPF – this is one reason that a PPF would not be an appropriate funding vehicle for the Terasen Utilities EEC activity.

In British Columbia, each utility has applied for and managed its own DSM funding according to its particular circumstances and Commission approvals received. British Columbia utilities have also rolled their DSM funding into revenue requirements and rates in keeping with Commission orders. It would not be appropriate for some utilities in the province to be required to fund their DSM programs in the manner of a PPF while others rolled those expenditures into rates. The normal utility regulatory proceedings dealing with revenue requirements, rate design, resource acquisition and compliance reporting provide suitable opportunities to ensure that DSM funding is reviewed, approved and fairly charged in rates. The Energy Plan does not make mention of PPFs, but rather in Policy Action # 3 states that the Ministry will ensure that appropriate incentives are in place to encourage investor-owned utilities to pursue cost-effective DSM programs. The Companies believe that the financial treatment proposed in the Application provides for that financial incentive.

43.2.4.5 Please discuss the pros and cons of the various DSM funding treatments: O&M, rate base, and public purpose fund.

Response:

The pros and cons of the DSM funding treatments in general are discussed below, however in every jurisdiction, nuances in ratemaking exist that impact how the pros and cons laid out below would be experienced or not by each individual utility.

O&M:

Pros: The DSM expenditures are recovered in rates in the same fiscal period in which they are incurred so there is no residual to recover in future fiscal periods.

Cons: Expensing the DSM expenditures in O&M does not allow matching of the EEC costs with the DSM benefits produced which will persist over a number of years. Current customers pay for benefits that will be received by future customers.

To the extent there is year to year variability in the level of DSM spending, expensing the DSM expenditures in O&M will introduce rate volatility.

In order to encourage a utility to make DSM expenditures, an accompanying incentive mechanism is needed, which can be more difficult to administer than including expenditures in rate base and amortizing.

Rate Base:

Pros: The DSM costs are amortized in rates over a similar period for which the benefits of the DSM programs are expected to persist.

Rate volatility from varying levels of DSM spending is avoided. Please refer to the response to BCUC IR 1.10.2. The rate impact of the rate base approach is lower initially and is smoothed relative to the expensing approach. In addition, the present value of the revenue requirements from the rate base approach is lower for customers assuming customers have a time value of money preference based on a higher discount rate than the utility's after-tax cost of capital.

Cons: Effect of DSM spending on rates persists into the future with no related tangible assets on the Companies' books

Public Purpose Fund:

Pros: A public purpose fund provides a relatively straightforward and transparent means of raising funds for programs and activities considered worthy of such support.

Cons: A public purpose fund requires the establishment of a separate organization to administer the collection of funds and the carrying out of programs. This has the potential to become bureaucratic and will likely alter the utility-customer relationship in terms of the provision of DSM services. Please refer to the response to BCUC IR 1.43.2.4.4

Please note that, unlike in Oregon, there is no legislative basis for a Public Purpose Fund in British Columbia making this approach impractical. Please refer to the response to BCUC IR 43.2.4.4.

43.2.4.6 Please describe the currently approved DSM incentive mechanism used by Union Gas and Enbridge Gas Distribution in Ontario.

Response:

The OEB has mandated an incentive mechanism, the Shared Savings Mechanism ("SSM"). This incentive mechanism rewards the utility for success in DSM. The utility receives a portion of all societal benefits resulting from the DSM programs. The monies are collected from the customer and are later distributed to the shareholder.

The formula for determining the SSM payout is laid out in the OEB's decision EB 2006-0021. The table below illustrates the shape of the curve that determines the incentive amount paid out to each utility. As the utilities increase their Total Resource Costs ("TRC"[14]) benefits, they have achieved, the payout increases up to a maximum of $8.5 million. This amount will increase annually by the Ontario Consumer Price Index ("CPI") as determined in October of the preceding year (i.e., the 2008 cap will increase based on CPI at October 2007[15]). The indexing target used in the SSM calculation for 2007 for EGD is $150

[14] TRC test is a benefit-cost test which measures the net costs of a demand-side program as a resource option based on the total costs of the program. It is satisfied when the cost of energy saved through DSM is less than the cost of providing the same energy from new supply.

[15] http://www.oeb.gov.on.ca/documents/cases/EB-2006-0021/dec_dsm_250806.pdf

million, and for Union Gas, $188 million. Targets for subsequent years are set according to a formula.

% of Annual Target achieved	**Payout**
Up to 25%	$225,000
Up to 50%	$675,000
Up to 75%	$2,250,000
Up to 100%	$4,750,000
Up to 125%	$7,250,000
Above 125%	$8,500,000 [1]

[1] Savings above 125% are capped at $8.5 million

Current regulatory settlements for both utilities span three years (2007 to 2009).

Please see the Companies response to BCUC IR 1.10.2.

65.0 Reference: Exhibit B-1, Appendix 1, CPR, DSM Incentive, p. E-xii

65.1 Please confirm that no DSM incentive will be applicable to the programs which may result from this application.

Response:

The EEC Application does not request a DSM incentive for the proposed Energy Efficiency and Conservation program areas outlined in the Application. Rather, the Companies are requesting Commission approval to treat all incremental EEC expenditures as equivalent to capital as outlined in Sections 1.4.2 and 6.12 of the Application. Please also see BCUC IR 1.10.2 for further discussion of capitalization.

29.0 Reference: Exhibit B-2, BCUC IR#1 43.2.4.6; and Exhibit B-1, Appendix 4, p. 29

The response to BCUC IR#1 43.2.4.6 states: "The OEB has mandated an incentive mechanism, the Shared Savings Mechanism ("SSM"). This incentive mechanism rewards the utility for success in DSM." The incentive is based on a sliding scale where higher performance is rewarded with a higher payout.

29.1 Do the Terasen Utilities consider the SSM as an acceptable incentive to align both shareholder and ratepayer interests in achieving the maximum TRC result for the DSM spend?

Response:

The Terasen Utilities believe that the appropriate treatment for the EEC expenditures is to capitalize the expenditures as described in section 6.12, p.80 of the Application (Exhibit B-1) and reiterated in BCUC IR#1 10.2. Further, as stated on p.81 of the Application, the Companies feel that setting a target on which an incentive would be paid out could prove to be challenging and contentious given the Companies have not previously established a target for energy savings from EEC expenditures.

Capitalization of EEC expenditures is also consistent with the Energy Conservation and Efficiency Policies outlined in the "The BC Energy Plan: A Vision for Clean Energy Leadership". Policy item #2 (Ensure a coordinated approach to conservation and efficiency is actively pursued in British Columbia). The Terasen Utilities believe that the capitalization of the Companies' EEC expenditures would be consistent with the treatment approved for the two major electric utilities, BC Hydro and Fortis BC and would help the utilities develop a coordinated approach to energy conservation. Additionally, the accounting treatment proposed by the Companies will allow the Terasen Utilities to earn a return on the EEC expenditures, which is consistent with Section 60 (b)(ii) of the Utilities Commission *Act* that states:

> *"Provides to the public utility for which the rates is set a fair and reasonable return on any expenditure made by it to reduce energy demands"*

It is the understanding of the Companies that under the OEB mandated SSM, EEC expenditures are expensed in the year incurred and shareholders only receive an incentive in the event that program results exceed certain criteria. This means that shareholders do not necessarily earn a return on the expenditures made for energy efficiency and conservation programs. This result would be contrary to the Utilities Commission Act. Accordingly, the Companies are of the view that the SSM is not an acceptable incentive mechanism to align shareholder and ratepayer interests for utilities in British Columbia.

29.2 Would the SSM be better than capitalizing to rate base, in terms of aligning the shareholder incentive to maximize TRC results for the ultimate goal of energy conservation? Please discuss.

Response:

Please see response to BCUC IR 2.29.1.

29.3 If the Commission determined that an incentive mechanism would be a superior method of rewarding the utilities for promoting and undertaking cost-effective DSM, what form of incentive mechanism would the Companies propose? Please provide a detailed description of the type of mechanism.

Response:

The Companies are receptive to a mechanism that provides a fair return to shareholders and provides optimal benefit for its customers. The Companies are of the view that the financial treatment proposed in its Application is superior to an incentive mechanism, for the purposes of rewarding utilities in British Columbia for promoting and undertaking cost-effective EEC programs. For a further discussion, please refer to the response to BCUC IR 2.29.1.

As previously discussed, successful DSM will contribute to reduced demand and future expansion requirements and therefore restrict the Companies' ability to expand its business in the future. Incentive mechanisms are unlikely to provide the utility the same opportunity to generate additional future earnings consistent with system expansion. The Companies believe that the proposed capitalization of EEC expenditures helps to alleviate the dis-incentive that successful DSM programs could create.

However, in an attempt to be responsive to the hypothetical scenario set out in the question, the Companies are of the view that there may be some merit in an incentive mechanism similar to that approved for FortisBC (please refer to the response to BCUC IR 2.29.4 below), which allows for incentives over and above a return on its EEC expenditures.

29.4 FortisBC's current DSM incentive mechanism is described in Exhibit B-1, Appendix 4, at pages 8 and9. Please provide the results in terms of target and actual savings, target and actual costs, and incentive received, for the most recent five years available. Please comment on whether Terasen would consider such a mechanism to be acceptable in its case? If not, why not?

Response:

The results[17] in terms of target and actual savings, target and actual costs, and incentive received for the years 2002-2007 are listed below:

---

[17] Source: Email correspondence, Keith Veerman, PowerSense Department, FortisBC, August 2008.

To December 31, 2007; Energy Savings by Year (GW.h)

Year	Plan	Actual	% of Plan Achieved
2002	14.1	16.3	116%
2003	15.6	18.5	119%
2004	14.7	21.3	145%
2005	19	23.9	126%
2006	20.4	23.1	113%
2007	21.8	27.9	128%

Cumulative Fortis Costs

To December 31, 2007; Cost by Year ($000)

Year	Plan	Actual	% of Plan	$/MWh
2002	$ 1,661	$ 1,555	94%	95
2003	$ 1,840	$ 1,706	93%	92
2004	$ 1,814	$ 1,989	110%	93
2005	$ 1,835	$ 2,350	128%	98
2006	$ 2,234	$ 2,241	100%	97
2007	$ 2,474	$ 2,549	103%	91

DSM Incentive Earned

To December 31, 2007; Incentive by Year ($)

Year	Actual
2002	$ 61,810
2003	$ 69,000
2004	$ 58,000
2005	$ 99,000
2006	$ 76,400
2007	$ 119,500

As stated in the response to BCUC IR 2.29.3, the Companies are receptive to a mechanism that provides a fair return and provides optimal benefit for its customers. The Companies are of the view that the above noted mechanism contains components that may assist in meeting that goal. In the PowerSense model, EEC expenditures are treated as deferred expenditures. These deferred expenditures are factored into the rate base and FortisBC earns an approved rate of return over the approved amortization period. These earnings are in addition to any earnings that FortisBC might receive as an incentive as a result of the Shared Savings Mechanism ('SSM") that FortisBC currently uses.

As illustrated in the chart above, FortisBC has been successful in maximizing the resource savings acquisition per dollar spent and has received an incentive for each of the last 5 years.

29.5 The Performance Incentive Mechanism (PIM) and the Global Energy Efficiency plan Performance Incentive (GEEP) is described for Gaz Metro in Exhibit B-1, Appendix 4, at pages 20-22. Please comment on whether Terasen would consider such a mechanism to be acceptable in its case? If not, why not?

Response:

Under Gaz Metro's PIM, the utility receives an incentive based on the projected cost of service using a formula which includes consideration for the impact on volumes of energy efficiency measures. This incentive is based on a Reference Formula which allows Gaz Metro to retain a portion of the difference between the cost of service and the result obtained by applying the Reference Formula. If the costs of service exceed the result obtained by applying the Reference Formula, Gaz Metro has to either offset the difference or return a portion to the ratepayers.

The Reference Formula is based on the previous year's revenues plus inflation and adjustments for factors that affect volumes. One of these factors is the impact on volumes of energy efficiency measures. Gaz Metro receives compensation for 90 per cent of volume variations attributed to energy efficiency measures. Under the GEEP, Gaz Metro is tied to a targeted annual savings for a five year period. If Gaz Metro does not reach its goal in any one year, they do not receive a full yearly payout but a prorated incentive.

The Gaz Metro PIM and GEEP would not be an appropriate mechanism for the Companies to consider because under this plan, all EEC expenditures are expensed, and the shareholder may not necessarily earn a fair and reasonable return on its EEC expenditures.

29.6 Appendix 4 (page 29) of Exhibit B-1 states that the incentive mechanism in place "…ensures that program savings are real and verified and imposes penalties for sub-standard performance…."

Does Terasen support an approach that ensures that program savings are real and verified and imposes penalties for sub-standard performance? Why or why not?

Response:

The Companies support an approach that ensures that program savings are real and verified. To this end, the Companies have proposed a portfolio approach for the evaluation of its EEC programs. The Companies are seeking Commission approval for the overall incremental expenditures as outlined in Table 1.4.1 of the Application and have asked for the flexibility to redirect funds from one program area to another program area that the Companies believe will more readily meet the goals based on the assessment criteria outlined in the Application.

If the Companies receive Commission approval for the EEC spending levels as requested in the Application, cumulative annual savings in nominal (as opposed to present value) GJs is projected to result in savings reaching 6.4 million GJs by 2016. While this is a substantial savings, the Companies have not proposed an incentive based mechanism in its Application. The Companies believe that the optimum benefit for the ratepayer would be the approval of the Companies' proposed financial treatment. The Companies are of the view that imposition of penalties to shareholders will not result in greater alignment between shareholder and customer interest with respect to EEC expenditures. Additionally, any regime that included penalties for the Terasen Utilities would create a major difference between the programs of the Companies and the large electric utilities in the Province. This would not be appropriate in the opinion of the Companies.

Executive Summary

Background and Objectives

This Conservation Potential Review (CPR) provides FortisBC Energy Utilities ("FortisBC") with a comprehensive planning document that the company can use on an ongoing basis to:

- Develop a long-range energy-efficiency strategy
- Design and implement energy-efficiency programs
- Assess the impact of energy-efficiency programs on both peak and annual loads
- Set annual energy-efficiency targets and budgets.

Summary of Findings

This report covers the results for the Residential sector; results for the Commercial and Industrial sectors are provided in separate reports.

The study findings confirm the existence of potential cost-effective natural gas efficiency improvements in British Columbia's Residential sector, but highlight the increasing challenges in finding opportunities. In the *most likely* and *aggressive* Achievable scenarios energy-efficiency improvements would provide between 3,329,000 and 5,836,000 GJ/yr. of savings in 2030 as well as peak day load reductions of approximately 34,000 to 59,000 GJ.

These potential savings are smaller than those found in previous studies, both because of the success of previous program initiatives on the part of FortisBC and other utilities, and because of new standards for furnaces, water heaters, and new home construction. Consequently, there is a need to look beyond the "easy" and the "conventional" to more innovative approaches to seeking continued energy-efficiency and GHG reduction opportunities.

As an example of one possible approach, this study explored the potential offered by early retirement of gas furnaces. This measure was included in the Achievable Potential at the request of FortisBC. This is because, although the measure is not considered cost effective when viewed through conventional DSM screens (it does not pass the total resource cost [TRC] test as applied in this study), fully 76% of FortisBC's customers (or 91% of those who heat with gas furnaces) have standard- and mid-efficiency furnaces. It is the desire of FortisBC to offer its customers a program to encourage these customers to replace their standard- and mid-efficiency furnaces before the end of equipment life with high-efficiency furnaces.

Partly because of the inclusion of the furnace early retirement measure, space heating accounts for nearly 80% of the total energy savings in the two Achievable Potential scenarios. The largest contributor to these savings is the early retirement of gas furnaces, which accounts for approximately half of the total Achievable Potential savings. Improvements in gas fireplace efficiency offer 12%-13% of the total energy savings in the two Achievable Potential scenarios, swimming pool heater efficiency offers 6%, and water heating efficiency offers 3% of the savings.

Scope

Sector Coverage: The study addresses three sectors: Residential (this report), Commercial/Institutional[1] and Industrial. In contrast to the 2006 CPR, which excluded FortisBC's (then Terasen Gas's) 300 largest manufacturing accounts, this CPR includes all of FortisBC's customers.

Geographical Coverage: The study results are presented for the total FortisBC service region and for the five service areas of: Lower Mainland, Vancouver Island, Whistler, Northern Inland and Southern Inland.

Study Period: The Base Year for this study is calendar year 2010. The time period covered by this study is to 2030, with milestones at the intervening years of 2015, 2020 and 2025.

Technologies: The study addresses energy-efficiency, customer behaviour and alternative energy options such as renewables and combined heat and power technologies.

Relation to Previous B.C. CPRs: This study builds on the substantial body of information and modelling work prepared in previous CPR studies conducted for FortisBC (then Terasen Gas) (2006) and BC Hydro (2007). The 2006 FortisBC study was intended to mesh with the BC Hydro study from 2007 and therefore included all customers of either utility, not just FortisBC customers. This study includes only FortisBC natural gas customers because this permitted the study to make better use of the recently completed energy end-use studies.

Approach

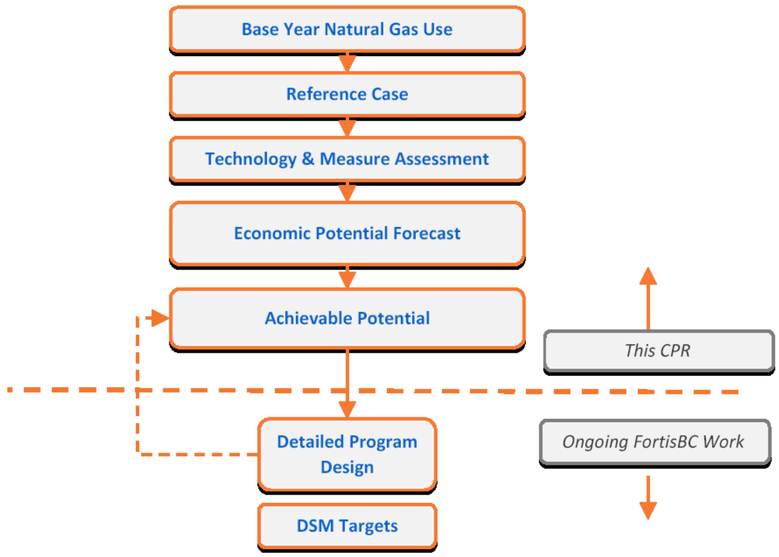
The detailed end-use analysis of energy-efficiency opportunities in the Residential sector employed two linked modelling platforms: HOT2000, commercially supported, residential building energy-use simulation software; RETScreen, a commercially supported, renewable energy systems modelling tool; and RSEEM (Residential Sector Energy End-use Model), a Marbek in-house spreadsheet-based macro model.

The major steps involved in the analysis are shown in Exhibit ES -1 and are discussed in Section 2. As illustrated, the results of this CPR study, and in particular the estimation of Achievable Potential, support on-going DSM planning work. However, it should be emphasized that the estimation of Achievable Potential is not synonymous with either the setting of specific program targets or with program design.

---

[1] Throughout this report, use of the word "commercial" includes both commercial and institutional buildings unless otherwise noted.

Exhibit ES 1 CPR 2010: Main Analytic Steps



Base Year Natural Gas Use[2]

In the Base Year of 2010, FortisBC's residential customers consumed approximately 74,440,000 GJ. Exhibit ES 2 and Exhibit ES 3, respectively, provide additional details on the major end uses and sub sectors where Residential sector natural gas consumption occurs.

Exhibit ES 2 shows that space heating accounts for approximately 62% of the total residential natural gas use. Domestic hot water heating is the next largest residential end use, accounting for approximately 19% of total residential natural gas use, followed by fireplaces (15%). Cooking, swimming pool heaters, clothes dryers, and other gas uses, combined, account for about 4% of residential natural gas use. The "other gas uses" end use includes a variety of residential uses such as gas barbecues, outdoor fireplaces, garage or patio heaters, and outdoor lights.

Exhibit ES 3 shows that single-family dwellings (SFD) and duplexes account for about 92% of residential natural gas consumption followed by attached/row houses at 6%. Mobile/other dwellings account for the remaining 2% of residential natural gas use.

[2] Readers attempting to compare these results with the CPR study completed for FortisBC (then Terasen Gas) in 2006 should be aware of two key difference between this study and the earlier one:

- The 2006 study was intended to complement a CPR completed for BC Hydro and therefore included all residential customers of both utilities. This current study includes only those dwellings that have natural gas accounts with FortisBC.
- The 2006 study included high-rise multi-family buildings in the Residential sector, again for compatibility with the BC Hydro study. This current study includes them in the Commercial sector, to be consistent with FortisBC's customer rate classes.

Exhibit ES 2 Base Year Residential Natural Gas Consumption Distribution of Use by End Use

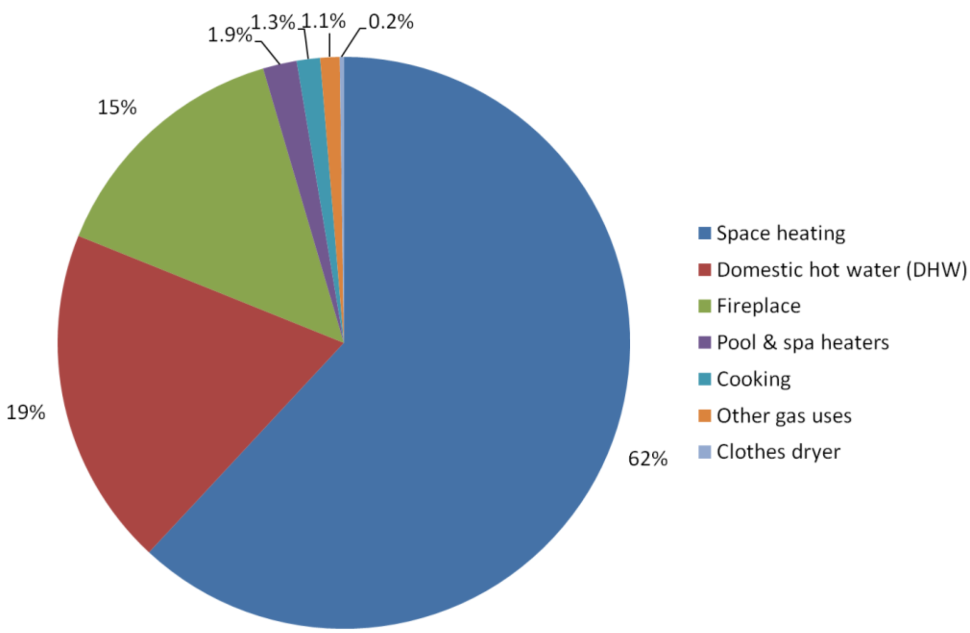


Exhibit ES 3 Base Year Residential Natural Gas Consumption Distribution of Use by Building Segment

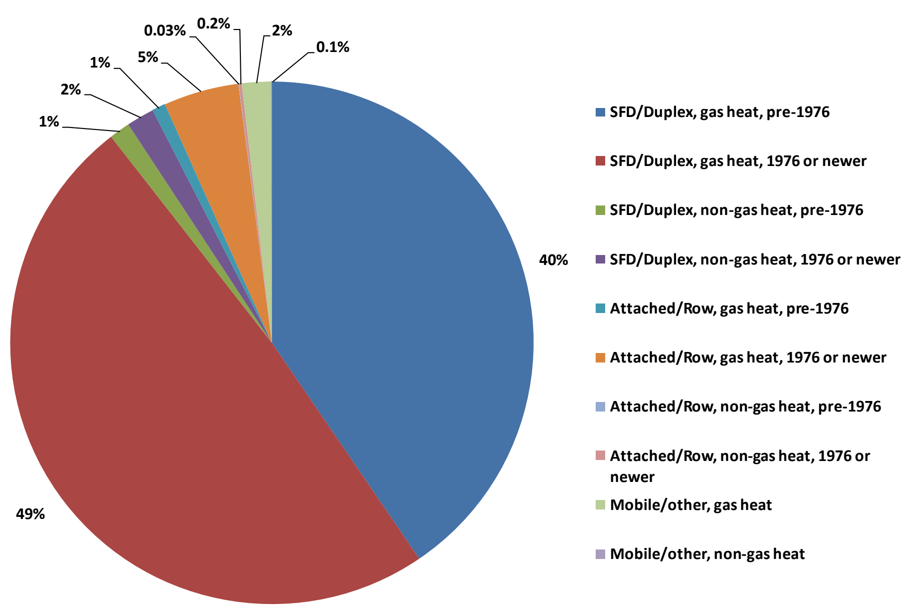
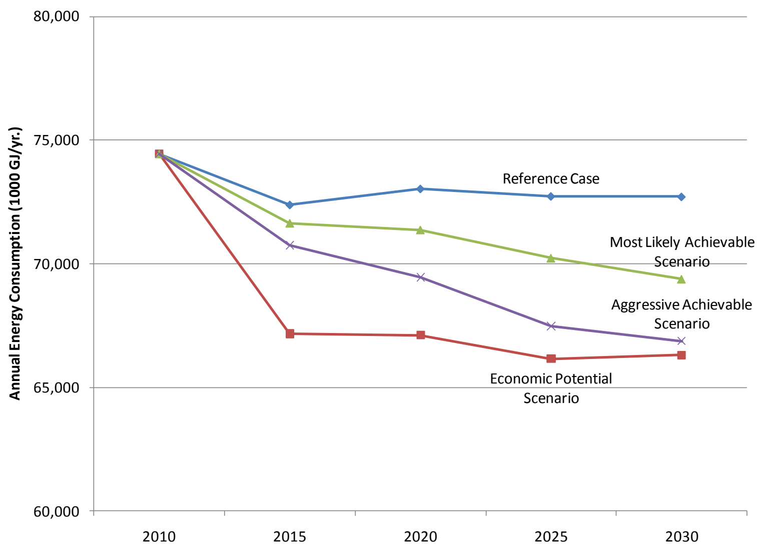


Results and Findings

A summary of the levels of annual natural gas consumption contained in the Reference Case and each of the energy-efficiency forecasts, by milestone year, is presented in Exhibit ES 4 and discussed briefly in the paragraphs below.

Exhibit ES 4 Summary of Forecast Results, Energy Efficiency (thousand GJ/yr.)

Year	Annual Consumption (thousands of GJ/yr.)					Potential Annual Savings		
	Base Year	Reference Case	Economic	Achievable		Economic	Achievable	
				Most Likely	Aggressive		Most Likely	Aggressive
2010	74,440	74,440						
2015		72,382	67,173	71,638	70,742	5,209	744	1,640
2020		73,027	67,110	71,369	69,453	5,917	1,658	3,574
2025		72,726	66,152	70,226	67,474	6,574	2,500	5,252
2030		72,707	66,306	69,378	66,871	6,401	3,329	5,836



Reference Case

In the absence of continued demand side management (DSM) initiatives, the study estimates that natural gas consumption in the Residential sector will decline from the Base Year (2010) consumption of approximately 74,440,000 GJ/yr. to 73,027,000 GJ/yr. by 2020 and 72,707,000 GJ/yr. by 2030. This represents an overall decrease of about 2% in the period. Gas consumption per customer is expected to decline over the study period, partly because of the natural replacement of furnaces and water heaters with more efficient models, as required by new mandatory minimum efficiency standards, and partly because of new minimum performance standards for the construction of new homes. The decline in consumption per customer is expected to more than compensate for the increasing number of customers over the period, so that the overall residential gas consumption will decline.

Economic Potential Forecast

Under the conditions of the Economic Potential Forecast, the study estimated that consumption in the Residential sector would decline to about 66,306,000 GJ/yr. by 2030. Annual savings relative to the Reference Case are about 6,401,000 GJ/yr., or about 9%. The Economic Potential annual savings are about 5,917,000 GJ/yr. in 2020.

Achievable Potential – Energy-efficiency Scenario

A selection of the natural gas savings opportunities identified in the Economic Potential Forecast was discussed in a full-day workshop. The guided participant discussions provided estimated levels of participation under a *most likely* scenario of program activity and an *aggressive* scenario of program activity. These levels were applied to the Economic Potential savings to estimate the Achievable Potential for these two scenarios. For technologies not specifically discussed in the workshops, participation levels were estimated through extrapolation from the technologies that were discussed. The results are presented in Exhibit ES 5 and Exhibit ES 6 by action and by milestone year.

Exhibit ES 5 Most Likely Achievable Natural Gas Savings for the Total FortisBC Service Area by Technology and Milestone Year (1000 GJ/yr.)[3]

End Use	Measure	2015	2020	2025	2030	% Savings 2030 Relative to Total 2030 Savings	Average B/C Ratio
Domestic hot water (DHW)	DHW Pipe Insulation	11	18	20	20	1%	17.08
Domestic hot water (DHW)	Showerheads	35	49	47	38	1%	9.55
Space heating	Prog. Thermostats	198	292	303	256	8%	7.05
Domestic hot water (DHW)	Faucet Aerators	21	29	28	22	1%	5.00
Fireplace	Gas Fireplaces	23	111	336	391	12%	3.45

Space heating	Homeowner Air Sealing	60	116	169	218	7%	1.08
Domestic hot water (DHW)	ESTAR Clothes Washers	11	29	36	26	1%	1.02
Space heating	Early Retire Gas Furnaces	294	780	1,134	1,693	51%	0.34
Grand Total		744	1,658	2,500	3,329	100%	1.68

Exhibit ES 6 Aggressive Achievable Natural Gas Savings for the Total FortisBC Service Area by Technology and Milestone Year (1000 GJ/yr.)

End Use	Measure	2015	2020	2025	2030	% Savings 2030 Relative to Total 2030 Savings	Average B/C Ratio
Domestic hot water (DHW)	DHW Pipe Insulation	22	36	41	41	1%	17.08
Domestic hot water (DHW)	Showerheads	55	78	75	60	1%	9.55
Space heating	Prog. Thermostats	396	580	599	505	9%	7.03
Domestic hot water (DHW)	Faucet Aerators	33	46	44	35	1%	5.00
Fireplace	Gas Fireplaces	46	222	667	753	13%	3.44
Pool & spa heaters	Solar Pool Heaters	22	90	207	377	6%	1.25
Space heating	Wall Insulation	16	48	92	149	3%	1.17
Domestic hot water (DHW)	DHW Tank Insulation	5	8	10	10	0%	1.16
Space heating	Attic Insulation	88	170	247	318	5%	1.15
Space heating	Basement Insulation	49	142	272	434	7%	1.10
Space heating	Homeowner Air Sealing	120	233	338	437	7%	1.08
Domestic hot water (DHW)	ESTAR Clothes Washers	22	58	73	52	1%	1.02
Space heating	Early Retire Gas Furnaces	766	1,864	2,588	2,668	46%	0.33
Grand Total		1,640	3,574	5,252	5,836	100%	1.80

[3] Early retirement of gas furnaces is included in Exhibit ES 5 and Exhibit ES 6 at the request of FortisBC. This is because, although the measure is not considered cost effective when viewed through conventional DSM screens (it does not pass the TRC test as applied in this study), fully 76% of FortisBC's customers (or 91% of those who heat with gas furnaces) have standard- and mid-efficiency furnaces. It is the desire of FortisBC to offer its customers a program to encourage these customers to replace their standard- and mid-efficiency furnaces at or before the end of equipment life with high-efficiency furnaces. Thus, FortisBC wanted to discover through this study the impacts of such a program on the savings available from the Residential sector.

Peak Day Load Impacts – Energy-efficiency Scenarios

The peak day savings associated with each of the Achievable energy-efficiency scenarios were calculated using load factor data provided by FortisBC. The results are summarized in Exhibit ES 7 and Exhibit ES 8. As illustrated, the Achievable peak day savings in 2030 range from a decrease of about 34,000 GJ/day (*most likely* scenario) to a decrease of approximately 59,000 GJ/day (*aggressive* scenario) for the total FortisBC service region.

Exhibit ES 7 Peak Day Capacity Impacts – Most likely Achievable Potential, by Scenario, Service Region and Milestone Year (GJ)

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total
2015	5,294	1,224	747	256	17	7,539
2020	11,830	2,670	1,695	575	29	16,800
2025	17,913	3,840	2,543	995	28	25,319
2030	23,904	5,182	3,398	1,215	25	33,724
Savings 2030 Relative to Total 2030 Savings	71%	15%	10%	4%	0.1%	100%

Exhibit ES 8 Peak Day Capacity Impacts – Aggressive Achievable Potential, by Scenario, Service Region and Milestone Year (GJ)

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total
2015	11,686	2,683	1,676	530	39	16,614
2020	25,557	5,711	3,705	1,181	60	36,214
2025	37,702	8,034	5,410	1,997	54	53,196
2030	41,351	9,632	5,890	2,205	47	59,126
Savings 2030 Relative to Total 2030 Savings	70%	16%	10%	4%	0.1%	100%

Electricity Impacts

The natural gas savings associated with the Economic Potential scenario shown in Exhibit ES 4 would also result in "collateral" electricity savings as some efficiency measures affect both energy sources. The study estimated that in 2030 the natural gas efficiency measures contained in the Economic Potential scenario would result in additional electrical savings of 24 GWh/yr.

Greenhouse Gas Impacts – Energy-efficiency Scenarios

The natural gas savings associated with each of the Achievable energy-efficiency scenarios shown in Exhibit ES 5 and Exhibit ES 6 would result in significant greenhouse gas reductions. The study estimated that in 2030 the natural gas efficiency measures contained in the *aggressive* and *most likely* Achievable Potential scenarios would reduce greenhouse gas emissions by, respectively, 296,000 and 169,000 of CO_2e/yr. The electricity savings associated with the natural gas efficiency measures would result in additional GHG reductions, which have not been included in this calculation.

Exhibit ES 9 Estimated GHG Emission Reductions – Most Likely Achievable Potential, By Scenario and Milestone Year (tonnes CO_2e/yr.)

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total
2015	26,603	6,032	3,681	1,322	85	37,724
2020	59,447	13,156	8,352	2,966	146	84,067
2025	90,014	18,917	12,530	5,139	138	126,737
2030	120,118	25,530	16,741	6,270	126	168,785
Savings 2030 Relative to Total 2030 Savings	71%	15%	10%	4%	0.1%	100%

Exhibit ES 10 Estimated GHG Emission Reductions – Aggressive Achievable Potential, By Scenario and Milestone Year (tonnes CO_2e/yr.)

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total
2015	58,723	13,220	8,255	2,738	192	83,129
2020	128,426	28,136	18,252	6,096	301	181,211
2025	189,455	39,580	26,653	10,307	268	266,263
2030	207,792	47,455	29,016	11,384	236	295,883
Savings 2030 Relative to Total 2030 Savings	70%	16%	10%	4%	0.1%	100%

Achievable Potential - Customer Behaviour

The study also assessed potential from customer behaviours changes. Exhibit ES 11 presents a summary of the results for both the aggressive and most likely achievable potential scenarios.

It should be noted that there is significant potential overlap with the reported savings from energy efficiency technologies. Consequently, the behaviour savings shown in Exhibit ES 11 have not been added to those for the energy efficiency technologies.

Exhibit ES 11 Achievable Potential from Customer Behaviour Changes, Aggressive and Most Likely Achievable Natural Gas Savings, by Milestone Year (1000 GJ/yr.)

Scenario		Energy Impact (1000 GJ/yr.)			
		2015	2020	2025	2030
Residential	Most Likely	383	975	1,727	2,649
	Aggressive	199	518	930	1,439

APPENDICES (Bound Separately)

List of Exhibits

1 Introduction

1.1 Background and Objectives

This Conservation Potential Review (CPR) provides FortisBC with a comprehensive planning document that the company can use on an ongoing basis to:

- Develop a long-range energy-efficiency strategy
- Design and implement energy-efficiency programs
- Assess the impact of energy-efficiency programs on both peak and annual load
- Set annual energy-efficiency targets and budgets.

1.2 Study Scope

Sector Coverage: The study addresses three sectors: Residential, Commercial/Institutional[4] and Industrial. In contrast to the 2006 CPR, which excluded FortisBC's 300 largest manufacturing accounts, this CPR includes all of FortisBC's customers.

Geographical Coverage: The study results are presented for the total FortisBC service region and for the five service areas of: Lower Mainland, Vancouver Island, Whistler, Northern Inland and Southern Inland.

Study Period: The Base Year for this study is calendar year 2010. The time period covered by this study is to 2030, with milestones at the intervening years of 2015, 2020 and 2025.

Technologies: The study addresses energy-efficiency, customer behaviour and alternative energy options such as renewables and combined heat and power technologies.

Relation to Previous B.C. CPRs: This study builds on the substantial body of information and modelling work prepared in previous CPR studies conducted for FortisBC (then Terasen Gas) (2006) and BC Hydro (2007). The 2006 FortisBC study was intended to mesh with the BC Hydro study from 2007 and therefore included all customers of either utility, not just FortisBC customers. This study includes only FortisBC natural gas customers because this permitted the study to make better use of the recently completed energy end use studies.

1.2.1 *Data Caveat*

As in any study of this type, the results presented in this report are based on a large number of important assumptions. Assumptions such as those related to the current penetration of energy-efficient technologies, the rate of future growth in the stock of residential buildings and customer willingness to implement new energy-efficiency measures are particularly influential. Wherever possible, the assumptions used in this study are consistent with those used by FortisBC and are based on best available information, which in many cases includes the professional judgement of the consultant team, FortisBC personnel and local experts. The reader should, therefore, use the results presented in this report as best available estimates; major assumptions, information sources and caveats are noted throughout the report.

[4] Throughout this report, use of the word "commercial" includes both commercial and institutional buildings unless otherwise noted.

1.3 Study Organization

The study has been organized into four[5] areas:

- **Three individual sector reports** (Residential, Commercial and Industrial) that provide an assessment of the technical opportunities for more efficient use of natural gas within each sector. A summary report will bring together the findings of all three sectors.
- **A commercial end-use survey (CEUS)** that provides insight into current natural gas equipment efficiency levels, fuel share and annual consumption levels within key commercial sub sectors. The CEUS results were used to refine the Commercial sector building archetypes employed in the assessment of technical opportunities.
- **A summary and employment impact report** that brings together the findings of the Residential, Commercial and Industrial sectors, together with an estimate of the net job creation and other economic effects attributable to the Achievable efficiency results within the three sectors.
- **An options paper** that outlines alternative approaches to the assessment of cost-effective levels of DSM activity outside of the California Standard Practice tests.

1.4 This Report

This report presents the Residential sector results and is organized as follows:

- **Section 2** presents an overview of the study methodology, including a definition of key terms and an outline of the major analytic steps involved.
- **Section 3** presents a profile of Residential sector Base Year natural gas use in the total FortisBC service area as well as in the five individual service regions.
- **Section 4** presents the Residential sector Reference Case, which provides a detailed estimate of natural gas use within the total FortisBC service area and each of the five service regions over the study period 2010 to 2030, in the absence of new DSM program initiatives.
- **Section 5** identifies and assesses the economic attractiveness of energy-efficiency, customer behaviour and alternative energy technology options within the Residential sector.
- **Section 6** presents the Residential sector Economic Potential Forecast for the study period 2010 to 2030.
- **Section 7** estimates the proportion of energy savings identified in the Economic Potential Forecast that can realistically be achieved within the study period. Impacts on peak day loads and greenhouse gas emissions are also presented.
- **Section 8** summarizes the key study findings and identifies areas that warrant further consideration.
- **Section 9** lists sources and references.

---

[5] A separate Customer Preferences study was prepared in parallel with this CPR. The two studies were, however, implemented in a co-ordinated manner and the results of the Customer Preferences study contributed to the results of this CPR.

- **Section 10** provides a glossary of terms.

1.5 Results Presentation

The preparation of Conservation Potential Reviews involves the compilation and analysis of an enormous amount of market and technology data and a nearly infinite number of ways of organizing and presenting the results. It is recognized that readers will have differing levels of needs with respect to the level of detail that is provided. Consequently, the results of this CPR study are presented at three levels of detail.

- **Main report body**. The main body of the report provides a relatively high level reporting of the main steps involved in undertaking each stage of the study together with a concise summary of results, including comments and interpretation of key findings. It is assumed that the content and level of detail in the main report body is suitable for the majority of readers who wish to gain an understanding of the potential contribution of DSM options to FortisBC's long-term natural gas requirements.

- **Appendices.** A separate appendix accompanies each major chapter of the main report. Each appendix provides more detailed information on the methodology employed, including major assumptions or sample calculations as applicable, together with additional levels of results. It is assumed that this presentation is better suited to DSM analysts and managers wishing a more thorough understanding of the study results.

- **Software.** All of the data generated by the study is provided in two custom-designed Excel models: Data Manager and the Measure TRC model.

    - Data Manager is a custom designed Excel workbook with query protocols that enable the user to search and report the study results in a virtually infinite number of combinations. Data Manager is intended to support the most detailed level of DSM activity such as program design, preparation of regulatory submissions, etc.

    - The Measure TRC model is a custom designed model that provides comprehensive profiles of the DSM measures assessed within the study. Because the information is provided in software form, any changes to economic, financial or performance data inputs can be easily accommodated and revised results generated automatically.

2 Study Methodology

This section provides an overview of the methodology employed for this study. More specifically, it addresses:

- Definition of terms
- Major analytic steps
- Key economic inputs
- Analytic models.

2.1 Definition of Terms

This study employs numerous terms that are unique to analyses such as this one and consequently it is important to ensure that all readers have a clear understanding of what each term means when applied to this study. Below is a brief description of some of the most important terms.

Base Year The Base Year is the starting point for the analysis. It provides a detailed description of "where" and "how" energy is currently used in the existing Residential sector building stock. Creation of the Base Year required the development of profiles of natural gas use within each dwelling type and service region.

Reference Case (includes Natural Conservation) The Reference Case estimates the expected level of natural gas consumption that would occur over the study period in the absence of new DSM program initiatives. It provides the point of comparison for the subsequent calculation of "economic" and "achievable" savings potentials. Creation of the Reference Case required the development of detailed profiles for new buildings in each of the building segments, estimation of the expected growth in building stock, estimation of the likely impacts of new building and appliance standards, and, finally, an estimation of "natural" changes affecting energy consumption over the study period.

Technology Assessment Energy-efficiency, customer behaviour and alternative energy options were identified that met the criteria, as outlined in Section 1.2. Technology cost and performance data were compiled relative to the baseline technology and the measure total resource cost (TRC) was calculated for each option.

The measure TRC calculates the net present value of energy savings that result from an investment in an efficiency, behaviour or alternative energy technology or measure. The measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and operating and maintenance (O&M) costs. This calculation includes, among others, the following inputs: the avoided natural gas and electricity supply costs, the life of the technology, and the selected discount rate, which for this analysis has been set at 7.38% for most of the regions and 6.87% for Vancouver Island.

Economic Potential Forecasts

The Economic Potential Forecast is the level of energy consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost effective, from FortisBC's perspective, when using lifecycle costing with the long-run avoided cost of new natural gas supply. All the energy-efficiency, behaviour and alternative energy options included in the technology assessment that had a positive measure TRC were incorporated into the Economic Potential Forecast.

Two Economic Potential Forecasts were prepared: 1) energy efficiency and alternative energy and 2) behaviour.

Achievable Potential

The Achievable Potential is the proportion of the savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. Achievable Potential recognizes that it is difficult to induce customers to purchase and install all the energy-efficiency/alternative energy or behaviour options that meet the criteria defined by the Economic Potential Forecast. The results are presented as a range, defined as *most likely* and *aggressive*.

Estimates provided were developed in a workshop involving FortisBC energy-efficiency program personnel, trade allies, selected external experts and the consulting team.

Peak Day Load Impacts

Load factors provided by FortisBC were used to derive peak day load impacts from the energy consumption values contained in each of the potential estimates noted above.

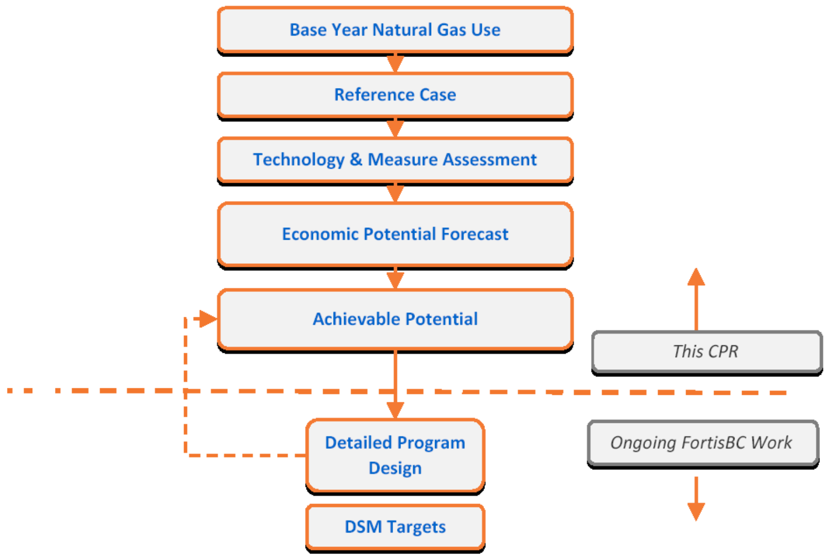
Residential Customers

For the purpose of this study, residential customers are those categorized under Rate 1 in most of the FortisBC service area, RGS in the Vancouver Island region, and Res SGS1/SGS2 in the Whistler Region. Multi-storey apartment and strata buildings are addressed in the Commercial sector report.

2.2 Overview of Approach

To meet the objectives outlined above, the study was conducted within an iterative process that involved a number of well-defined steps, as outlined in Exhibit 1. At the completion of each step, the client reviewed the results and, as applicable, revisions were identified and incorporated into the interim results. The study then progressed to the next step.

Exhibit 1 CPR 2010: Main Analytic Steps



A summary of the steps is presented below.

Step 1: Develop Base Year Calibration Using Actual FortisBC Billing Data

- Compile and analyze available data on British Columbia's existing building stock.
- Develop detailed technical descriptions of the existing building stock.
- Undertake computer simulations of energy use in each building type and compare these with actual building billing and audit data.
- Compile actual FortisBC billing data.
- Create sector model inputs and generate results.
- Calibrate sector model results using actual billing data.

Step 2: Develop Reference Case

- Compile and analyze building design, equipment and operations data and develop detailed technical descriptions of the new building stock.
- Develop computer simulations of energy use in each new building type.
- Compile data on forecast levels of building stock growth and "natural" changes in equipment efficiency levels and/or practices.
- Define sector model inputs and create forecasts of energy use for each of the milestone years.
- Calibrate with FortisBC load forecast.

Step 3: Develop and Assess Energy-efficiency, Alternative Energy, and Behaviour Options

- Develop list of energy-efficiency, alternative energy, and behaviour measures.
- Compile detailed cost and performance data for each measure.
- Identify the baseline technologies employed in the Reference Case.
- Develop energy-efficiency, alternative energy, and behaviour options for each end use.
- Compile FortisBC and BC Hydro economic data on current and forecast costs for new supply of natural gas and electricity generation.

- Determine the measure TRC for each energy-efficiency, alternative energy, or behaviour option.

Step 4: Estimate Economic Energy-efficiency and Alternative Energy Potential

- Screen the identified energy-efficiency and alternative energy measures from Step 3 against the economic data.
- Identify the combinations of energy-efficiency measures and building types where the measure TRC is positive.
- Apply the economically attractive energy-efficiency measures from Step 3 within the energy use simulation model developed previously for each building type.
- Determine annual natural gas consumption in each building type when the economic efficiency measures are employed.
- Compare the consumption levels when all economic efficiency measures are used with the Reference Case consumption levels and calculate the natural gas consumption impacts.

Step 5: Estimate Economic Customer Behaviour Potential

- Apply the customer behaviour measures from Step 3 within the energy use simulation model developed previously for each building type.
- Compare the consumption levels when all economic behaviour measures are used with the Reference Case consumption levels and calculate the natural gas consumption impacts.

Step 6: Estimate Achievable Savings Potential

- "Bundle" the energy-efficiency, alternative energy and customer behaviour options identified in the Economic Potential Forecast into a set of Actions.
- Create "Action Profiles" for each of the identified Actions that provide a high level rationale and direction, including target technologies and sub markets as well as key barriers and a broad intervention strategy.
- Review historical Achievable program results and prepare preliminary Action Assessment Worksheets.
- Consult with FortisBC personnel, review preliminary estimates and reach general agreement on *most likely* and *aggressive* range of Achievable Potential.

Step 7: Estimate Peak Day Load Impacts of Economic and Achievable Savings Potential

- Annual energy decreases/increases contained in each of the energy-efficiency/alternative energy scenarios were converted to average daily values based on annual load profile data provided by FortisBC.
- Load factors that correlate "average" to "peak" consumption were provided by FortisBC for each rate class and service region.
- Peak day load impacts were calculated for each of the energy-efficiency/alternative energy scenario results by applying the above load factors.

2.3 Analytical Models

The analysis of the Residential sector employs three modelling platforms. They are:

- HOT2000**,** a commercially supported, residential building simulation software.
- RSEEM (***R***esidential ***S***ector ***E***nergy ***E***nd-use ***M***odel), a Marbek in-house spreadsheet-based macro model.
- RETScreen, a commercially supported, renewable energy systems modelling tool.

HOT2000 is used to define household heating, cooling and domestic hot water (DHW) energy use for each of the residential building archetypes. HOT2000 uses state-of-the-art heat loss/gain and system modelling algorithms to calculate household energy use. It addresses:

- Electric, natural gas, oil, propane and wood space heating systems and DHW systems.
- Space heating and DHW systems from conventional to high-efficiency condensing systems.
- Air, ground and water source heat pumps.
- Central air conditioning systems with conventional or economizer controls.
- Primary and secondary DHW systems, including solar DHW.
- Inputs of steady state or seasonal efficiencies for heating and cooling equipment.

The outputs from HOT2000 provide the space heating/cooling energy-use intensity (EUI) inputs to the thermal archetype module of RSEEM (see below).

RSEEM is a spreadsheet-based macro model that has been used in many studies similar to this current one. RSEEM consists of three modules:

- A general parameters module that contains general sector data (e.g., number of dwellings, growth rates, etc.).
- A thermal archetype module, as noted above, that contains data on the heating and cooling loads in each archetype.
- An appliance module that contains data on appliance saturation levels, fuel shares, unit energy use, etc.

RSEEM combines the data from each of the modules and provides total natural gas use by dwelling type and end use for each of the target years.

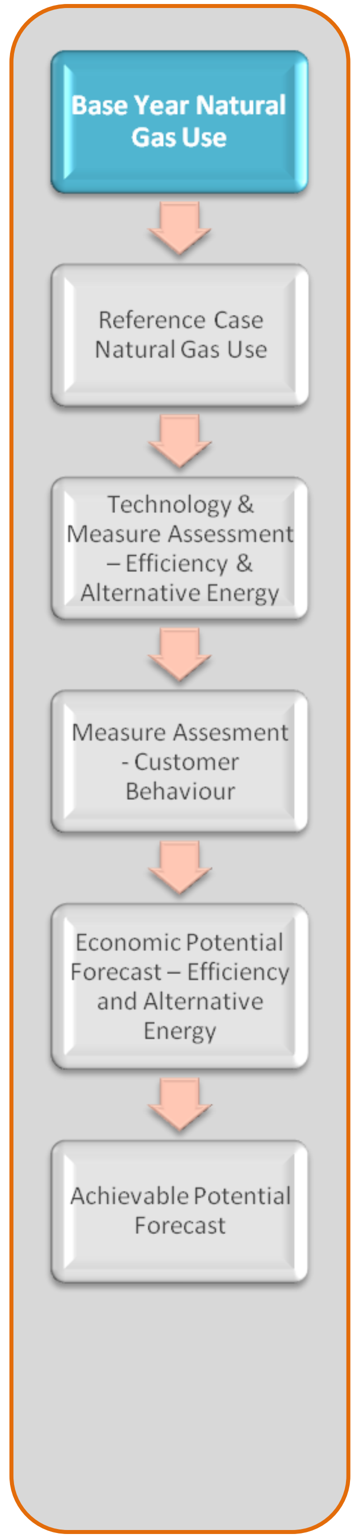
RETScreen is a modelling tool developed and maintained by Natural Resources Canada specifically for analyzing renewable and alternative energy systems such as those addressed by this study. Renewable and alternative energy analysis modules supported by the software are summarised in Exhibit 2.

Exhibit 2 RETScreen Renewable/Alternative Energy Modules

Power	Heating	Cooling
Fuel cell	Biomass system	Absorption
Gas turbine - combined cycle	Heat pump	Desiccant
Geothermal power	Passive solar heating	Free cooling
Hydro turbine	Solar air heater	Heat pump
Ocean current power	Solar water heater	Other
Photovoltaic		
Reciprocating engine CHP		
Solar thermal power		
Steam turbine		
Tidal/wave power		
Wind turbine		

RETScreen also contains energy-efficiency modules.

3 Base Year (2010) Natural Gas Use



This section provides a profile of Base Year (2010) natural gas use in B.C.'s Residential sector. The discussion is organized into the following sub sections:

- Base Year housing stock
- Natural gas end uses
- Net space heating loads
- Annual appliance unit energy use (UEC)
- Average natural gas use per dwelling unit
- Summary of model results.

Each of the above is discussed below. Additional information is provided in Appendix A.

3.1 Base Year Housing Stock

The first step in developing the profile of Base Year natural gas consumption involved the segmentation of the residential building stock on the basis of four factors:

- Dwelling type
- Vintage
- Heating category (natural gas, electric)
- Service region.

Based on discussions with FortisBC personnel, it was agreed that B.C.'s existing residential stock would be segmented into the following dwelling types:

- Single detached/duplex Gas- pre 1976[6]
- Single detached/duplex Gas - post 1976
- Single detached/duplex Non-Gas - pre 1976
- Single detached/duplex Non-Gas - post 1976
- Attached/row housing Gas – pre 1976
- Attached/row housing Gas – post 1976
- Attached/row housing Non-Gas – pre 1976
- Attached/row housing Non-Gas – post 1976
- Mobile/other with gas heat
- Mobile/other without gas heat.

FortisBC customer billing data, combined with data from the 2008 Residential End Use Study (REUS) prepared for FortisBC were used to develop a composite breakdown of the Residential sector.

A summary of the distribution of B.C.'s residential dwellings is provided in Exhibit 3, by dwelling type, primary heating source and service region.

[6] 1976 was chosen as a dividing year largely to be consistent with previous studies and to draw on earlier research. In the earlier studies, 1976 was chosen because there was a change in the building standards at the time that affected space heating consumption in new homes built after that date.

Exhibit 3 Existing Residential Units, by Dwelling Type, Primary Heating Source and Service Region

Dwelling Units	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total	% of Total
SFD/Duplex, gas heat, pre-1976	195,502	24,278	42,485	24,070	99	286,436	34%
SFD/Duplex, gas heat, 1976 or newer	241,378	33,784	81,743	46,311	911	404,127	47%
SFD/Duplex, non-gas heat, pre-1976	12,700	10,159	3,198	1,812	48	27,916	3%
SFD/Duplex, non-gas heat, 1976 or newer	15,681	14,136	6,153	3,486	437	39,892	5%
Attached/Row, gas heat, pre-1976	7,115	597	760	431	16	8,919	1%
Attached/Row, gas heat, 1976 or newer	42,401	4,017	6,210	3,518	503	56,649	7%
Attached/Row, non-gas heat, pre-1976	462	250	57	32	8	809	0%
Attached/Row, non-gas heat, 1976 or newer	2,754	1,681	467	265	241	5,409	1%
Mobile/other, gas heat	9,508	1,427	6,574	3,724	15	21,248	2%
Mobile/other, non-gas heat	618	597	495	280	7	1,997	0%
Grand Total	528,119	90,926	148,143	83,930	2,285	853,403	100%
% of Total	62%	11%	17%	10%	0%	100%	

As illustrated in Exhibit 3:

- Nearly 62% of FortisBC residential customers are located in the Lower Mainland region. The second largest region is Inland Southern, with 17% of FortisBC customers.
- Nearly 89% of FortisBC residential customers are in the single detached or duplex category.
- Nearly 91% of FortisBC customers use natural gas as their primary space heating fuel. Natural space heating shares on Vancouver Island (~70%) are lower than in other regions served by FortisBC.

3.2 Natural Gas End Uses

Natural gas use within each of the dwelling types noted above is defined on the basis of specific end uses. In this study, an end use is defined as, "the final application or final use to which energy is applied. End uses are the services of economic value to the users of energy."

A summary of the major Residential sector end uses used in this study is provided in Exhibit 4, together with a brief description of each. As noted in Exhibit 3, several of the end uses included in this study use electricity. They are included in this study because their consumption levels can be affected by some of the natural gas efficiency measures. For example, added insulation reduces winter space heating consumption (natural gas) but it also reduces summer air conditioning loads (electricity). This analysis captures these changes, known as interactive effects.

Exhibit 4 Residential End Uses

End Use	Description
Space heating	All space heating, including both central heating and supplementary heating
Domestic hot water (DHW)	Heating of water for domestic hot water (DHW) use. Does not include hydronic space heating
Fireplaces	
Cooking appliances	Includes ranges, separate ovens and cook tops and microwave ovens
Clothes dryers	
Swimming pool and spa heaters	
Other	Barbeques, outdoor fire places and lighting
Related Electric End Uses	
Ventilation & circulation	Primarily the furnace fan, but also includes the fan in heat recovery ventilators as well as kitchen and bathroom fans
Space cooling	All space cooling, including both central air conditioning (AC) and room or portable AC
Clothes washer	
Dishwasher	
Other electric internal loads	Lighting, electronics, appliances, etc.

Further discussion of natural gas use within each of the above end uses is provided below.

3.2.1 *Annual Space Heating Loads, by Dwelling Type and Service Region*

The next step involved estimating the net space heating loads[7] for each of the dwelling types and service regions noted above. Estimation of the net space heating loads involved the consideration of numerous factors such as envelope area and exposure, floor area, regional climate, insulation and air tightness levels, basement style, etc.

Exhibit 5 provides a summary of the net space heating load by dwelling type, vintage and service region. A detailed description of the data sources and approach used to estimate the levels shown in Exhibit 5 is provided in Appendix A.

Exhibit 5 Existing Residential Dwellings—Net Space Heating Loads by Building Type, Vintage and Service Region, (MJ/yr.)

Dwelling Types	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Weighted Average
SFD/Duplex, gas heat, pre-1976	68,946	46,066	48,002	89,990	88,031	65,675
SFD/Duplex, gas heat, 1976 or newer	55,557	37,620	40,602	76,117	74,460	53,431
SFD/Duplex, non-gas heat, pre-1976	65,056	45,344	47,410	88,881	86,946	57,445
SFD/Duplex, non-gas heat, 1976 or newer	52,422	37,031	40,101	75,179	73,543	47,287
Attached/Row, gas heat, pre-1976	38,660	25,071	28,693	53,791	52,620	37,657
Attached/Row, gas heat, 1976 or newer	31,392	20,488	25,415	47,646	46,608	31,108
Attached/Row, non-gas heat, pre-1976	28,847	19,325	23,486	44,030	43,071	26,275
Attached/Row, non-gas heat, 1976 or newer	23,424	15,792	20,803	39,000	38,151	22,245
Mobile/other, gas heat	35,642	24,267	31,784	59,587	58,290	37,897
Mobile/other, non-gas heat	35,645	24,269	31,787	59,592	58,295	34,728
Weighted Average	57,908	39,056	41,663	78,106	64,753	55,084

Key observations from Exhibit 5 are as follows:

[7] Net space heating load is the space heating load of a building that must be met by the space heating system. This is equal to the total heat loss through the building envelope minus solar and internal gains. The heating load is assumed to be met by a natural gas heating system with an efficiency similar to the average efficiency in the FortisBC service area.

- The regional variation is considerable. Since space heating dominates natural gas consumption, the assumed net heating load for a set of dwellings is strongly influenced by the average sales of gas to those homes. Although the climates of the Vancouver Island and Lower Mainland regions are similar, the sales of gas per dwelling on Vancouver Island are much lower, and the assumed net space heating load for that region has been adjusted to reflect this. It is assumed that a combination of dwelling size, building envelope quality, and behaviour explains the difference. Dwellings in the Southern Interior also have much lower net space heating loads than dwellings in the Lower Mainland, even though the climate is somewhat colder. Again, this is assumed to occur because of differences in dwelling size, building envelope quality, and behaviour. Dwellings in the Northern Interior and Whistler regions have higher net space heating loads, mainly due to colder climate.
- Newer dwellings are assumed to have lower net space heating loads than older dwellings, mainly because of better building envelopes.
- Attached dwellings are assumed to have lower net space heating loads than detached dwellings, primarily because they are somewhat smaller and share common walls. Mobile homes also are assumed to have lower net space heating loads, mainly due to smaller size.
- The net space heating loads for dwellings not heated by gas are assumed to be somewhat lower than those for gas-heated homes. This is due to a combination of smaller size, better building envelope, and occupant behaviour.[8]

3.2.2 *Annual Appliance Unit Energy Use (UEC)*

The next step involved estimating the average annual unit energy consumption (UEC) for major natural gas end-use appliances other than space heating equipment. UEC is the average consumption for a given end use for dwellings of a given type in a given region that *have the end use and use natural gas for it*. The number may be reduced by a saturation less than 100% or a natural gas fuel share less than 100% (or both).

Exhibit 6 provides the estimated UEC values for the Lower Mainland region. The values shown in Exhibit 6 apply to the current stock mix in the Lower Mainland. UECs vary slightly by service region, in some cases because of climate, in other cases because of differences in occupancy rates, and in some cases because of some combination of influences. For some end uses, consumption was assumed to vary between detached and attached houses, mainly because of differences in occupancy. Where no information on variation was available, identical UECs were used for different groups of houses.

Further discussion of the estimated UEC values is provided in Appendix A, together with the UECs for the other service regions.

[8] Habart & Associates, *Energy Use Discrepancy Analysis*, prepared for FortisBC, April 2010.

Exhibit 6 Annual Appliance Natural Gas Use (UEC) for the Lower Mainland in Base Year (MJ/yr.)

Dwelling Types	Domestic hot water (DHW)	Fireplace	Cooking	Clothes dryer	Pool & spa heaters	Other gas uses
SFD/Duplex, gas heat, pre-1976	21,061	25,833	5,694	4,607	27,693	1,093
SFD/Duplex, gas heat, 1976 or newer	21,061	25,833	5,694	4,607	27,693	1,093
SFD/Duplex, non-gas heat, pre-1976	21,061	25,833	5,694	4,607	27,693	1,093
SFD/Duplex, non-gas heat, 1976 or newer	21,061	25,833	5,694	4,607	27,693	1,093
Attached/Row, gas heat, pre-1976	18,750	15,709	5,079	4,102	27,693	973
Attached/Row, gas heat, 1976 or newer	18,750	15,709	5,079	4,102	27,693	973
Attached/Row, non-gas heat, pre-1976	18,750	15,709	5,079	4,102	27,693	973
Attached/Row, non-gas heat, 1976 or newer	18,750	15,709	5,079	4,102	27,693	973
Mobile/other, gas heat	18,369	15,389	4,962	4,007	27,693	953
Mobile/other, non-gas heat	18,369	15,389	4,962	4,007	27,693	953

3.3 Average Natural Gas Consumption Per Dwelling Unit

Exhibit 7 provides a profile of average natural gas use within each of the dwelling types and end uses described above for dwellings in the Lower Mainland. The values shown in Exhibit 7 combine three factors:

- **Unit Energy Consumption (UEC).** This is the average amount of natural gas that one appliance (e.g., a hot water tank) consumes annually in a given dwelling type.
- **Saturation.** This is the percentage of households within each dwelling type that have the given appliance. For example, in the case of a hot water tank, every household has one and, therefore, the saturation is 100%. However, some appliances such as dryers or fireplaces have a saturation of less than 100% as some households do not have these appliances.
- **Natural Gas Fuel Share.** Several appliances, such as hot water tanks, clothes dryers, cooking ranges, etc., can operate on natural gas or electricity as well as other fuels. Natural gas fuel share, therefore, refers to the percentage of each appliance that operates with natural gas.

A sample calculation is provided below for DHW use in pre-1976 single detached homes. The exhibits cited below are contained in Appendix A. Appendix A also presents the results for the remaining service regions, together with a detailed discussion of the estimation of UEC, saturation and natural gas fuel data.

Sample Calculation of Annual DHW Natural Gas Consumption for a SFD/Duplex, Gas-heated – pre-1976 home In Lower Mainland Region

UEC, see Exhibit 6	21,061 MJ/yr.
Saturation, see Exhibit A 13	100%
Natural Gas Fuel Share, see Exhibit A 18	92.3%

Annual DHW Natural Gas Consumption = 21,061 x 100% x 92.3% = 19,439 MJ/yr.

Exhibit 7 Average Natural Gas Use per Dwelling Unit for the Lower Mainland, Base Year (MJ/yr.)

Dwelling Types	Space heating	Domestic hot water (DHW)	Fireplace	Cooking	Clothes dryer	Pool & spa heaters	Other gas uses	Grand Total
SFD/Duplex, gas heat, pre-1976	76,679	19,439	14,654	1,344	238	2,056	1,093	115,504
SFD/Duplex, gas heat, 1976 or newer	61,787	19,439	14,654	1,344	238	2,056	1,093	100,612
SFD/Duplex, non-gas heat, pre-1976	3,699	14,598	14,654	1,344	238	2,056	1,093	37,683
SFD/Duplex, non-gas heat, 1976 or newer	2,980	14,598	14,654	1,344	238	2,056	1,093	36,965
Attached/Row, gas heat, pre-1976	42,996	17,189	10,478	890	132	592	973	73,250
Attached/Row, gas heat, 1976 or newer	34,913	17,189	10,478	890	132	592	973	65,167
Attached/Row, non-gas heat, pre-1976	2,788	12,909	10,478	890	132	592	973	28,762
Attached/Row, non-gas heat, 1976 or newer	2,264	12,909	10,478	890	132	592	973	28,238
Mobile/other, gas heat	39,639	16,954	7,999	1,140	197	592	953	67,475
Mobile/other, non-gas heat	2,027	12,732	7,999	1,140	197	592	953	25,640
Weighted Average	60,916	18,876	14,110	1,295	227	1,882	1,078	98,383

3.4 Summary of Residential Base Year Natural Gas Use

This section combines the data on average annual natural gas use by dwelling type shown in the preceding exhibit with data on the number of each dwelling type to produce a summary of the total natural gas use in B.C.'s Residential sector in the Base Year (2010). The model results shown in Exhibit 8 are within 1% of FortisBC's actual reported sales volume.

The results are presented for the Total FortisBC Service Area and for the Lower Mainland. Results for the remaining service regions are provided in Appendix A.

- Exhibit 8 presents the natural gas consumption by dwelling type and end use for the total FortisBC service area, with a pie chart that shows the end use breakdown
- Exhibit 9 presents the same information for the Lower Mainland region
- Exhibit 10 shows the relationship of % of dwelling units to % of Base Year consumption. The dwellings that account for less than 2% of units and consumption are not labelled on the chart.

Additional highlights are provided below.

By Dwelling Type

- Approximately 92% of the natural gas FortisBC supplies to residential customers (not including multi-family high rises[9]) is consumed in single detached or duplex dwellings.
- Approximately 6% is consumed in attached dwellings, while the remaining 2% is consumed in mobile homes.
- The main reason why consumption by dwelling type is dominated by detached dwellings is that they make up 89% of the residential dwellings in the FortisBC service area. Their consumption is more than 89% of the total because their saturations of end uses such as pools is higher than in attached or mobile dwellings. They are also less likely to have electric heat or DHW than attached or mobile dwellings.

[9] For the purposes of this study, residential customers are those categorized under Rate 1 in most of the FortisBC service area, RGS in the Vancouver Island region, and Res SGS1/SGS2 in the Whistler Region. Multi-storey apartment and strata buildings are addressed in the Commercial sector report.

By End Use

- Approximately 63% of the natural gas FortisBC supplies to residential customers is used for space heating.
- Approximately 19% is used for heating water.
- Approximately 13% is used in natural gas fireplaces.
- Pools and spas, cooking, clothes dryers, and all other uses together account for approximately 5% of residential natural gas consumption.

By Service Region

- Customers in the Lower Mainland region consume approximately 70% of the natural gas FortisBC supplies to residential customers.
- Customers in the Inland Southern and Inland Northern regions consume 12% and 11% of the residential natural gas, respectively.
- Customers in the Vancouver Island region consume 7% of the residential natural gas, and customers in Whistler consume less than 1%.

Data Manager – Final Edition

As part of the final report, a final version of Data Manager is also provided. This Excel workbook includes all the exhibits that were produced using Excel for Chapters 3, 4, 7, 8, and the Appendices of the document. It also has the ability to produce charts and tables looking at the data filtered and segmented in other ways. For example:

- The user can produce a pie chart of natural gas consumption by end use for an individual dwelling type of interest, such as the SFD/Duplex pre-1976.

- The user can produce a column chart showing the natural gas consumption for dryers and fireplaces in each of several dwelling types, with each dwelling type as a separate column and the different appliance consumption values shown stacked on top of each other.

- The user can produce a table of the savings for a specific measure such as basement insulation, showing which dwelling types and regions offer the most savings in a given scenario.

- The user can produced a line chart showing consumption in a given region by year for each scenario.

This version of the Data Manager includes all the data from previous versions, with any revisions and corrections as applicable.

Data Manager has a user interface designed for someone with basic knowledge of Excel. Contact Marbek if you need any help to get started with it.

Exhibit 8 Natural Gas Consumption for the Total FortisBC Service Area, Modelled by End Use and Dwelling Type, Base Year (1000 GJ/yr.)

Dwelling Types	Space heating	Domestic hot water (DHW)	Fireplace	Pool & spa heaters	Cooking	Other gas uses	Clothes dryer	Grand Total	% of Total
SFD/Duplex, gas heat, pre-1976	20,316	5,059	3,560	478	347	286	76	30,122	40%
SFD/Duplex, gas heat, 1976 or newer	23,172	6,940	4,740	641	472	392	108	36,465	49%

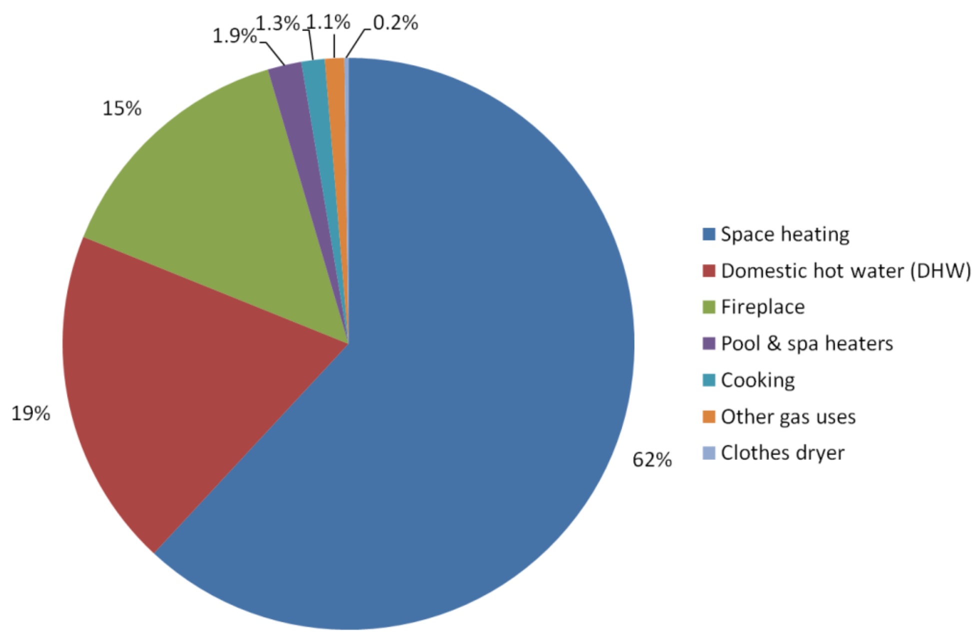

Exhibit 10 Relationship of % of Dwelling Units to % of Consumption

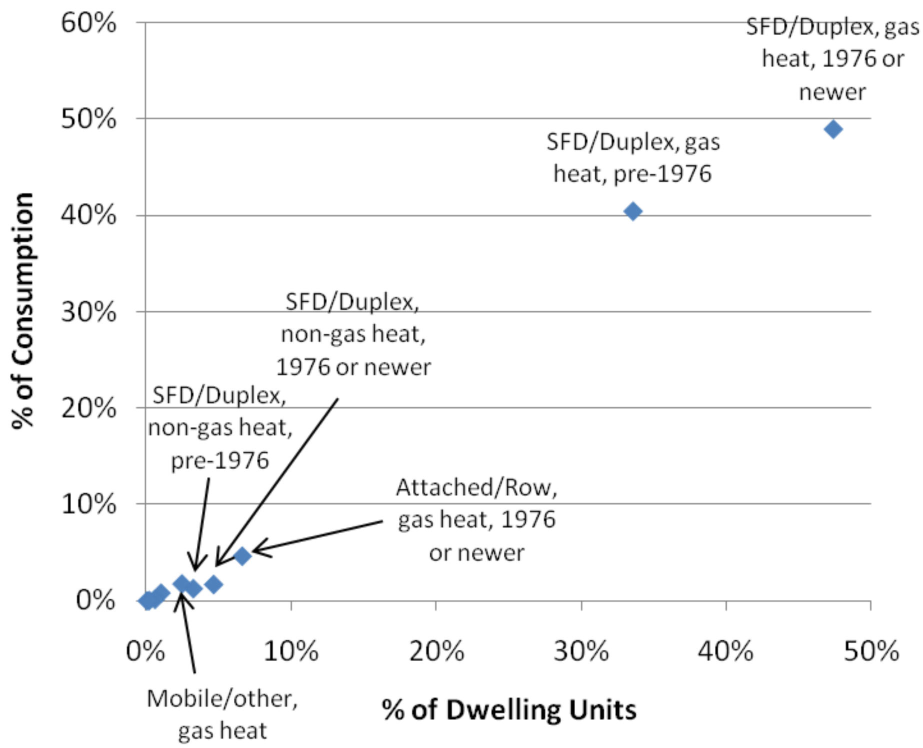
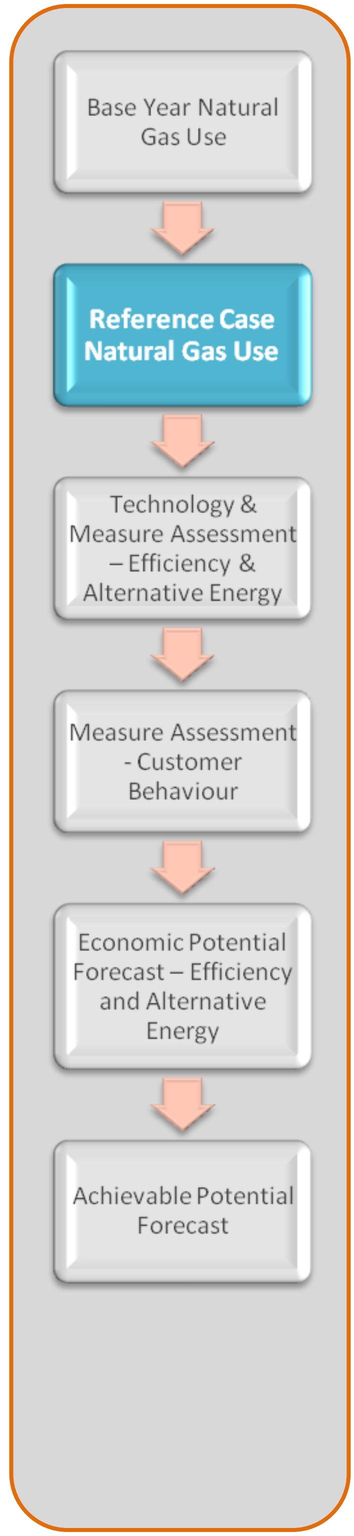


4 Reference Case Natural Gas Forecast

4.1 Introduction



This section presents the Residential sector Reference Case for the study period (2010 to 2030). The Reference Case estimates the expected level of natural gas consumption that would occur over the study period in the absence of new utility-based DSM initiatives conducted by FortisBC.

The Reference Case includes the ongoing effects of DSM activity initiated before the study period, and also includes the effects of DSM activity by other actors in the market, such as BC Hydro. The Reference Case also presents a scenario in which policy, legislation, and regulation continue to exist as they are today. Legislation that is not yet passed or clearly mapped out is subject to influence by FortisBC and is therefore considered within the realm of potential savings.

The Reference Case, therefore, provides the point of comparison for the calculation of energy saving opportunities associated with each of the scenarios that are assessed within this study.

The Reference Case discussion is presented within the following sub sections:

- Methodology
- Summary of model results.

4.2 Methodology

Development of the Reference Case involved the following steps:

- **Step 1**: The growth in the number of residential dwellings was estimated for each dwelling type within each service region, based on FortisBC load forecast data.

- **Step 2:** The net space heating loads for each new dwelling type were estimated within each service region.

- **Step 3:** Naturally-occurring changes in net space heating loads were estimated for existing dwelling types.

- **Step 4**: Naturally-occurring changes in annual natural gas use were estimated for the evolving stock of residential appliances, including the influence of new appliance efficiency standards to be introduced over the study period.

- **Step 5**: Future appliance saturation trends were estimated for each dwelling type and service region.

- **Step 6**: Changes in natural gas share for space heating and each appliance were estimated for each dwelling type and service region.

Further information related to the growth in residential dwellings over the study period and their net space heating loads is provided below.

A detailed discussion of the methodology employed in each of the remaining steps is provided in Appendix B.

4.2.1 *New Residential Dwellings in Study Period*

Exhibit 11 shows the estimated number of residential units in 2010 and 2030, by dwelling type and service region. Tables or charts showing the number of residential units for milestones 2015, 2020, and 2025 can be obtained using Data Manager.

Exhibit 11 shows that attached housing is assumed to grow at a rate 2.95 times as fast as the growth in detached housing. This ratio was derived using the reported ages of dwellings of different types in the FortisBC 2008 REUS. Consequently, by the end of the study period, attached housing is expected to be a larger percentage of the total dwellings, rising from 8% of the total to more than 10% of the total. Total numbers of houses in the exhibit, by the region, are the same as the numbers assumed in the FortisBC load forecast.[10]

[10] The dwelling numbers in this study include only FortisBC customers. Thus, the number of customers who do not heat with natural gas includes only dwellings that have a connection to the FortisBC system and use natural gas for other purposes. The dwelling totals will therefore not match the totals included in conservation potential studies for BC Hydro. The conservation potential study conducted for FortisBC (then Terasen Gas), in 2006 did include the British Columbia dwellings that were not customers of FortisBC, to coordinate with a BC Hydro study at the time. For this study, the decision was made to include only FortisBC customers, because the study could more easily benefit from the data provided in the 2008 Residential End Use Study.

Exhibit 11 Residential Customers, 2010 and 2030, by Region and Dwelling Type, (Number of Units)

Dwelling Types	Number of Dwellings												% of Total
	Lower Mainland		Vancouver Island		Southern Interior		Northern Interior		Whistler		Grand Total

4.2.2 *Net Space Heating Loads in New Dwellings*

Exhibit 12 provides a summary of the net space heating load by dwelling type and service region. A detailed description of the data sources and approach used to estimate the levels shown in Exhibit 12 is provided in Appendix B. The space heating loads shown below are for any dwellings built after the Base Year. The study does not assume significant improvement in space heating loads or significant change in floor area for new homes built during the study period.

Exhibit 12 New Residential Dwellings—Net Space Heating Loads by Building Type and Service Region, (MJ/yr.)

Dwelling Types	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Weighted Average
SFD/Duplex, gas heat	55,557	37,620	40,602	76,117	74,460	50,290

4.2.3 *Naturally-Occurring Changes in Space Heating and Appliance Efficiency Levels*

Exhibit 13 provides the estimated UEC values for the Lower Mainland region in 2030. The values shown in Exhibit 13 apply to the appliances present in new dwellings constructed in the Lower Mainland. UECs vary slightly by service region, in some cases because of differences in occupancy rates.

The UECs in dwellings constructed both at the beginning and the end of the study period are shown in the exhibit, to illustrate the way they are expected to evolve. The UECs for several of the end uses (such as DHW or cooking) are expected to decrease over the study period because of improvements in efficiency. Where these improvements resulted in total consumption for 2030 that was substantially less than the FortisBC forecast, the “other” end use was increased to compensate.

Further discussion of the estimated UECs values is provided in Appendix B, together with the UECs for the other service regions.

4.2.4 *Appliance Saturation and Fuel Share Trends*

Appliance saturations and fuel shares are currently held constant throughout the study period. There is anecdotal evidence that some saturations and fuel shares are changing, specifically the natural gas fuel share for DHW. For example, as condensing gas furnaces are installed in new houses, natural gas DHW can only be installed if the builder chooses either a power-vented gas water heater or expensive venting dedicated to an atmospheric unit. Consequently, more builders are installing electric water heaters instead. Data on this phenomenon were not available at the time of the study, so no adjustment was made to DHW fuel shares over the study period.

4.3 Summary of Results

This section presents the results of the model runs for the entire study period. The results are presented for the total FortisBC service area and for the Lower Mainland. Results for the remaining service regions are provided in Appendix B.

- Exhibit 14 presents the model results in tabular form, by dwelling type, end use and milestone year
- Exhibit 15 presents the model results for 2030 by region
- Exhibit 16 presents the model results for 2030 by dwelling type
- Exhibit 17 presents the model results for 2030 by end use
- Exhibit 18 shows the evolving relative contribution of different end uses towards the total consumption in different dwelling types.

Selected highlights of are provided below.

By Dwelling Type

- The percentage of natural gas supplied to single detached or duplex dwellings is expected to fall from 92% to 91% by 2030.
- The percentage supplied to attached dwellings is expected to rise from 6% to 7%, while the mobile homes are expected to consume approximately 2% throughout the study period.
- This modest shift towards a greater share of consumption in attached dwellings is driven by higher growth rates for those types of houses.

By End Use

- Approximately 61% of the natural gas FortisBC supplies to residential customers is expected to be used for space heating in 2030.
- Approximately 15% will be used for heating water.
- Approximately 16% will be used in natural gas fireplaces.
- Pools and spas, cooking, and clothes dryers are expected to continue to use less than 4% of residential natural gas consumption, but the other category is projected to increase to 6% of consumption. This reflects the potential emergence of new uses for natural gas in addition to the barbecues, patio heaters, patio lights and other growing uses.

By Service Region

- Customers in the Lower Mainland region will consume approximately 69% of the natural gas FortisBC supplies to residential customers.
- Customers in the Inland Southern and Inland Northern regions each consume 12% of the residential natural gas.
- Customers in the Vancouver Island region consume 7% of the residential natural gas and customers in Whistler consume less than 1%.

By Dwelling Type and End Use

The last exhibit in this chapter shows the trends in consumption by major end-use groupings. The following key observations can be made:

- Heating is expected to decrease moderately as a share of residential natural gas consumption between now and 2030. Although the heating consumption per house is expected to decline, it will fall only slightly faster than other uses.

- DHW is expected to consume a declining share of residential natural gas consumption between now and 2030. This is because a mandated improvement in the equipment efficiency will be combined with reductions in DHW use due to improved clothes washers and dishwashers and increases in low-flow fixtures.

- Fireplaces are expected to consume a rising share of residential natural gas consumption between now and 2030, because their number is expected to increase and improvements in their efficiency are uncertain.

- Most remaining end uses are expected to consume approximately the same share of residential natural gas throughout the study period, but the other category is projected to increase.

- The increase in the “other gas uses” is, in part, used to ensure that the total Reference Case consumption in this study matches the FortisBC forecast. It is also consistent with past experience, which suggests that consumers find new uses for energy that largely offset conservation in the existing end uses.

Exhibit 14 Reference Case Forecast, Total FortisBC Service area (1000 GJ/yr.)

5 Technology & Measure Assessment

5.1 Introduction

This section identifies and assesses the financial and economic attractiveness of the selected energy-efficiency and alternative energy measures for the Residential sector. The discussion is organized and presented as follows:

- Methodology
- Energy-efficiency and alternative energy technologies
- Summary of results.

5.2 Methodology

The following steps were employed to assess the energy-efficiency and alternative energy measures:

- Select candidate energy-efficiency measures
- Establish technical performance for each option within a range of applicable load sizes and/or service region conditions (e.g., degree days)
- Establish the capital, installation and operating costs for each option
- Calculate the simple payback from the customer's perspective
- Calculate the measure TRC
- Calculate the benefit-cost ratio.

A brief discussion of each step is outlined below.

Step 1 Select Candidate Measures

The candidate measures were selected in close collaboration with FortisBC personnel based on a combination of a literature review and the previous experience of both the consultants and FortisBC personnel. The selected measures are all considered to be technically proven and commercially available, even if only at an early stage of market entry. Technology costs, which will be addressed in this section, were not a factor in this initial selection of candidate technologies.

Step 2 Establish Technical Performance

Information on the performance improvements provided by each measure was compiled from available secondary sources, including the experience and on-going research work of study team members. As applicable, the energy impacts of the measures are reported for both natural gas and electricity.

Step 3 Establish Capital, Installation and Operating Costs for Each Measure

Information on the cost of implementing each measure was also compiled from secondary sources, including the experience and on-going research work of study team members. As applicable, both the incremental and full cost of each measure were estimated.

The incremental cost is applicable when a measure is installed in a new facility, or at the end of its useful life in an existing facility; in this case, incremental cost is defined as the difference between the energy-efficiency or alternative energy option relative to the baseline technology. The full cost is applicable when an operating piece of equipment is replaced with a more efficient model or an alternative energy option prior to the end of its useful life.

In both cases, the costs and savings are annualized, based on the number of years of equipment life and the discount rate, and the costs incorporate applicable changes in annual O&M costs. All costs are expressed in constant (2010) dollars.

Step 4 Calculate Simple Payback

The simple payback is generated to show the customer's financial perspective. Simple payback is "*a measure of the length of time required for the cumulative savings from a project to recover its initial investment cost and other accrued costs, without taking into account the time value of money. The simple payback period is usually measured from the service date of the project*."[11] The cost of the measure (incremental or full, as appropriate) is divided by the expected annual savings. The answer is given in years.

The following equation illustrates how this calculation is applied to a situation where an upgrade has a higher upfront cost than the baseline technology, but lower ongoing operating costs:

$$\text{Payback}_{(\text{years})} = (\text{CostUpgr} - \text{CostBase})/(\text{AnnBase} - \text{AnnUpgr})$$

where:

CostUpgr	= initial capital cost of the upgrade measure ($)
CostBase	= initial capital cost of the baseline measure ($)
AnnUpgr	= ongoing operating cost of the upgrade ($/year)
AnnBase	= ongoing operating costs of the baseline technology ($/year)

Step 5 Calculate the Measure Total Resource Cost (TRC)

The measure TRC calculates the net present value of energy savings that result from an investment in an efficiency or alternative energy technology or measure. The measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and O&M costs. This calculation includes, among others, the following inputs: the avoided natural gas and electricity supply costs, the life of the technology, and the selected discount rate, which in this analysis has been set at 7.38% for most of the regions and 6.87% for Vancouver Island.

A technology or measure with a positive TRC value is included in subsequent phases of the analysis, which consists of the Economic and Achievable Potential scenarios. A measure with a

[11] Sieglinde K. Fuller and Stephen R. Petersen. (1996). "*Life Cycle Costing Manual for the Federal Energy Management Program".* National Institute of Standards and Technology Handbook 135, 1995 Edition, Washington, DC.

negative TRC value is not economically attractive and is therefore not included in subsequent stages of the analysis.

It should be noted that the measure TRC provides an initial screen of the technical options. Considerations such as program delivery costs, incentives, etc., are incorporated in later detailed program design stages, which are beyond the scope of this study.

Step 6 Calculate Benefit-Cost Ratio

The measure benefit-cost ratio indicates the relative attractiveness of the measures. A measure that has a benefit-cost ratio in excess of "1" means that the measure's benefits outweigh its costs; it is, therefore, included in subsequent stages of the analysis. Similarly, a measure with a benefit-cost ratio that is well in excess of one (e.g., 3) means that it is very attractive. A measure with a benefit-cost ratio of less than one means that its costs outweigh its benefits and, hence, is not included in subsequent stages of the analysis.

5.2.1 *Energy Costs*

The financial and economic results presented in this section are based on the following:

- Avoided supply cost of natural gas
- Avoided supply cost of electricity
- Customer energy prices.

A brief discussion of each is provided below.

Avoided Supply Cost of Natural Gas

Natural gas avoided supply costs were provided by FortisBC[12] and are summarized in Exhibit 19. As illustrated, the avoided cost of gas on a per unit basis includes three components: an estimate of the commodity cost, an estimate of the distribution cost and the carbon tax.

- The commodity cost is based on the 10-year AECO price forecast according to GLJ Petroleum Consultants (an independent energy consultant) based on their latest available forecast (updated by GLJ each quarter).

- The distribution costs are estimated by calculating an approximation of the pipeline transportation charges required by FortisBC to move the commodity supply to core markets as well as the storage costs associated with meeting winter load requirements.

- The carbon tax values shown are based on current estimates of $20/ton, $25/ton for 2011 and then remaining constant at $30/ton from 2011 and beyond.

The resulting avoided costs represent the expected marginal cost of to serve FortisBC's customers on a per unit basis. In this study, no distinction has been made between high load factor (flat) and low load factor (peaky) load shapes, or between different service areas within the province.

[12] FortisBC, Supply Group. Values are updated quarterly.

Exhibit 19 Natural Gas – Avoided Supply Costs ($/GJ)

Year	Commodity Cost	Distribution	Carbon Tax	Total
2010	$ 5.59	0.15	0.75	$ 6.49
2011	$ 5.88	0.15	1.00	$ 7.03
2012	$ 6.61	0.15	1.25	$ 8.01
2013	$ 7.32	0.15	1.50	$ 8.97
2014	$ 7.92	0.15	1.50	$ 9.57
2015	$ 8.41	0.15	1.50	$ 10.06
2016	$ 8.82	0.15	1.50	$ 10.46
2017	$ 9.14	0.15	1.50	$ 10.78
2018	$ 9.35	0.15	1.50	$ 11.00
2019	$ 9.57	0.15	1.50	$ 11.22
2020	$ 9.78	0.15	1.50	$ 11.43
2021	$ 9.99	0.15	1.50	$ 11.64
2022	$ 10.21	0.15	1.50	$ 11.86
2023	$ 10.43	0.15	1.50	$ 12.08
2024	$ 10.66	0.15	1.50	$ 12.31
2025	$ 10.89	0.15	1.50	$ 12.54
2026	$ 11.13	0.15	1.50	$ 12.78
2027	$ 11.37	0.15	1.50	$ 13.02
2028	$ 11.62	0.15	1.50	$ 13.27
2029	$ 11.87	0.15	1.50	$ 13.52
2030	$ 11.87	0.15	1.50	$ 13.52

Avoided Supply Cost of Electricity

The avoided supply cost of electricity used in this analysis is $0.12/kWh.[13] This value is higher than the current average cost for BC Hydro to deliver electricity to a Lower Mainland busbar. The added cost reflects a number of recent bids for new electricity supply options. The value was adjusted to add 7% for area transmission and distribution losses between the busbar and the customer.

BC Hydro is confronted with higher supply costs for end uses such as space heating that have peaky requirements. However, detailed electricity supply costs were not available for this study for each of the defined load types. BC Hydro also did not generate distinct avoided cost values to be used for different regions in the last BC Hydro CPR. Furthermore, the current study uses the same natural gas avoided costs for all load types and regions. Consequently, it was decided to use the same avoided cost for electricity throughout the study.

Customer Energy Prices

The Residential sector customer energy prices used in this analysis are $0.083/kWh[14] for electricity and $0.01/MJ for natural gas. Both prices are from a proprietary FortisBC Energy Inc. (FEI) planning tool provided to the consultant team by FortisBC.

---

[13] $33.33/GJe.
[14] $23.06/GJe. Value provided by FortisBC, November 2010.

5.3 Technology and Measure Assessment

Exhibit 20 lists the energy-efficiency technologies and measures that are included in this study. A description and detailed financial and economic assessment of each measure is provided in the measure TRC model that accompanies this report. An example of the TRC model worksheet for one measure is provided in Appendix C.

Exhibit 20 Efficiency and Alternative Energy Technologies Included in this Study

- **Heating: Shell Measures**
  - Insulation – attic, wall, slab, basement, crawlspace
  - Air sealing/weather stripping/caulking – average and old homes
  - High-performance (ENERGY STAR™) windows
  - Super high-performance windows
- **Heating: Shell (New Homes)**
  - High-performance new homes (EGH 80 /R2000/ENERGY STAR™)
  - Near-zero/Net-zero energy homes
- **Heating: Equipment**
  - Furnaces above standard efficiency (>90%)
  - Condensing boilers
  - Programmable thermostats
  - Solar pre-heated make-up air systems (e.g., SolarWall™)
  - High-efficiency heat recovery ventilators (HRVs)
  - Integrated heating and DHW/hydronic combination systems
  - Gas-fired air heat pumps
  - Gas-fired GS heat pumps
- **Water Heating**
  - Condensing water heaters
  - Tankless water heaters
  - Solar water heating
  - DHW tank insulation
  - DHW pipe insulation
  - DHW heat trap
  - Ultra low-flow showerheads
  - Low-flow aerators
  - Wastewater heat recovery
  - DHW recirculation (e.g. Metlund D'MAND™)
- **Appliances**
  - DHW savings from efficient dishwashers
  - DHW and dryer savings from efficiency clothes washers
  - Moisture sensors in dryers
- **Other**
  - High-efficiency/EnerChoice gas fireplaces
  - Insulating pool covers
  - Heat pump pool heaters
  - High-efficiency pool heaters
  - Solar pool heaters
  - Micro-CHP

Descriptions of each of these measures are provided in Appendix C.

5.3.1 *Technology Screening Results*

A summary of the results is provided in Exhibit 21. For each of the measures reviewed, the Exhibit shows:

- The name of the measure
- The cost basis[15] for the cost of conserved energy (CCE) that is shown, e.g., "full" versus "incremental"
- The measure's average CCE when applied to existing dwellings and to new dwellings.

Measures that pass on the basis of full cost are qualitatively different from the measures that pass only on an incremental basis. A measure that passes on a full-cost basis can be applied immediately, even if the piece of equipment that it replaces or improves is currently working properly. That means the rate at which the measure can be implemented as a utility DSM measure is limited by market and program constraints. A measure that passes only on an

[15] See Step 3 in Section 5.2 for a fuller description.

incremental basis, on the other hand, is limited by the rate of natural replacement (due to failure or obsolescence) or purchase of the piece of equipment it replaces.

In Exhibit 21 the TRC $ column is the total present value of all the benefits included in the TRC test minus the total present value of all the costs included in the TRC test, for the life of the measure. These benefits and costs are calculated per measure implemented, and do not include program costs. The benefit-cost ratio is the present value of the benefits in the TRC test divided by the present value of the costs in the TRC test. A measure whose TRC $ value is slightly more than $0 will have a benefit-cost ratio slightly over 1, and will pass the TRC test.

Exhibit 21 Residential Sector Energy-efficiency Technology Measures, Screening Results, Lower Mainland

Measure Name	Basis (Full/ Incremental)	Weighted Average	
		B/C Ratio	Measure TRC ($)
DHW Pipe Insulation	Full	18.33	$12
Ultra Low-Flow Showerheads	Full	10.35	$122
Programmable Thermostats (Central Heating and Cooling)	Full	6.35	$267
Faucet Aerators	Full	5.42	$66
Solar Pool Heaters	Full	1.25	$851
DHW Tank Insulation	Full	0.98	-$1
Attic Insulation	Full	0.88	-$78
Insulating Pool Covers	Full	0.86	-$169
Homeowner Air Sealing/Weather Stripping/Caulking	Full	0.85	-$51
DHW Recirculation Systems (e.g. Metlund D'MAND®)	Full	0.63	-$206
Air Leakage Sealing and Insulation (Old Homes)	Full	0.57	-$1,375
Wastewater Heat Recovery Systems	Full	0.49	-$399
Professional Air Sealing/Weather Stripping/Caulking	Full	0.46	-$1,086
Crawlspace Insulation	Full	0.33	-$538
Net-Zero Ready Energy Homes	Full	0.28	-$9,260
Active Solar Water Heating Systems	Full	0.24	-$5,326
Solar Pre-Heated Make-Up Air Systems (e.g., SolarWall®)	Full	0.17	-$1,073
High-Efficiency Gas Fireplaces	Incr.	3.67	$400
High-Efficiency (ENERGY STAR®) Clothes Washers	Incr.	1.00	-$1
Basement (Foundation) Insulation	Incr.	0.92	-$95
Wall Insulation	Incr.	0.88	-$228
Super High-Performance Windows	Incr.	0.56	-$1,266
Point-of-Use (Tankless) Water Heaters (Gas)	Incr.	0.42	-$1,154
Micro-Combined Heat and Power (CHP)	Incr.	0.35	-$5,163
High-Efficiency (ENERGY STAR®) Dishwashers	Incr.	0.34	-$69
Integrated Heating and DHW (Hydronic Heating)	Incr.	0.33	-$4,034
Early Retirement of Existing Gas Furnaces	Incr.	0.32	-$1,260
High-Efficiency Heat Recovery Ventilators (HRVs)	Incr.	0.31	-$412
Condensing Gas Water Heaters	Incr.	0.30	-$936
High-Efficiency Condensing Gas Furnaces	Incr.	0.28	-$1,062
Condensing Gas Boilers	Incr.	0.24	-$2,432
Zoned-Up Windows: (ENERGY STAR®) Rating for a Colder Zone	Incr.	0.23	-$1,377
Integrated Heating and DHW (Forced Air Heating)	Incr.	0.17	-$5,142
Slab Insulation (Unfinished Basements)	Incr.	0.10	-$1,069
High-Efficiency Gas-Fired Pool Heaters	Incr.	0.07	-$2,696

Highlights are summarized below:

- The most attractive measures pass the economic screen on a full-cost basis. This implies that they can be implemented immediately. In contrast, measures that pass the economic screen on an incremental cost basis are assumed to be implemented when equipment or material is being replaced.

- When the weighted average results are considered, only six of the 35 measures analyzed currently pass the economic screen. However, there are several other measures that only marginally fail the economic screen.

  - The most attractive measures include DHW pipe insulation, ultra low-flow showerheads, programmable thermostats, faucet aerators, solar pool heaters, and high-efficiency gas fireplaces.
  - Measures that marginally fail the economic screen include DHW tank insulation, basement (foundation insulation), and high-efficiency (ENERGY STAR®) clothes washers. Although these measures fail the economic screen on average, a more detailed analysis of the results shows that, in some cases, they pass the economic screen in certain housing types. This is due to the varying consumption levels in the different types of homes.

- DHW measures that fail the economic screen include the condensing water heater, the instantaneous water heater, wastewater heat recovery, and solar water heating. All these measures have upfront costs that are too high relative to the value of their energy savings.

- Innovative new technologies, such as the micro-combined heat and power (CHP) units do not currently pass the economic screen.

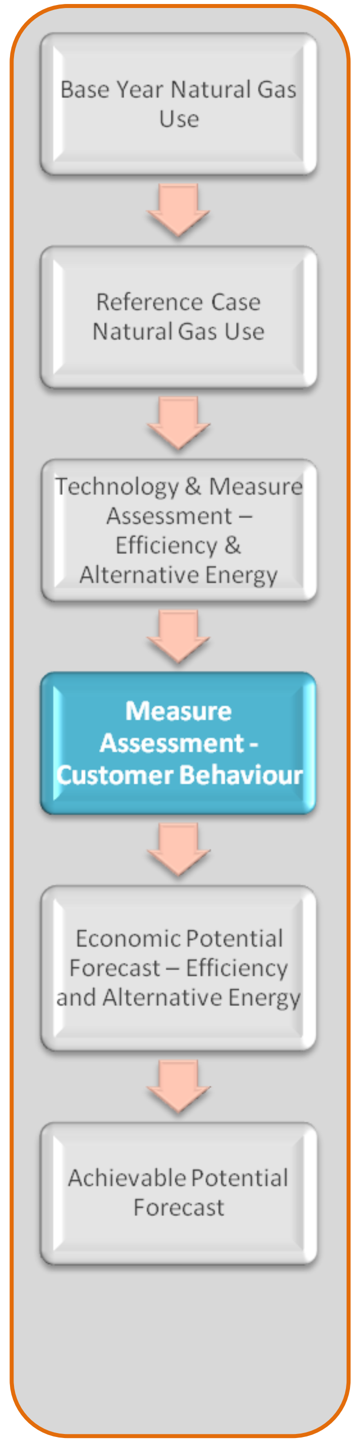
- Several measures that were included in the original list of measures were excluded from the final analysis or modified:

  - **Gas-fired heat pumps -** Research indicated that residential-sized units are not yet available.
  - **DHW heat traps -** This option no longer applies because most new hot water heaters include an integrated heat trap.
  - **High-efficiency gas clothes dryers -** This option is no longer valid because almost all new gas dryers have moisture sensors. Cutting-edge technologies, such as microwave clothes dryers, heat pump clothes dryers, and clothes dryers with heat recovery, are currently under development and they should be monitored for inclusion in future studies.
  - **Heat pump pool heaters -** This represents a fuel switching measure (i.e., from gas to electricity). Thus, it has been removed from the list of measures analyzed.
  - **High-performance (EGH 80/R2000/ENERGY STAR®) homes -** This measure has been superseded by changes to the building code, the ENERGY STAR® standard, and standard building practice that will soon require all new homes meet an energy rating of EGH 80.
  - **Net-zero homes -** Since this measure would displace a large amount of electricity rather than natural gas, it was modified to reflect the building of a net-zero ready home. This implies a home with extremely low space heating loads (~EGH 86), where the remaining electrical load could be displaced by the addition of renewable energy generation.

The benefit-cost ratio presented in Exhibit 21 for each measure is an average for all the housing types in the Lower Mainland region. Measures pass or fail for each housing type and region based on the benefit-cost ratio for that housing type, in that region. Therefore, a number of measures whose benefit-cost ratio in the exhibit is marginally below 1 will pass in certain niches. Other measures whose benefit-cost ratios are slightly over 1 may fail in some regions or housing types. This pattern is shown more clearly in Section 7.

6 Measure Assessment – Customer Behaviour

6.1 Introduction



This section identifies and assesses the potential natural gas savings that could be provided by the actions of customers who habitually save energy within their daily routines. The discussion is organized and presented as follows:

- Methodology
- Description of Residential sector behaviour measures
- Summary of "unbundled" results.

6.1.1 *Methodology*

The following steps were employed to assess the behaviour measures:

- Step 1: Select candidate behaviour measures
- Step 2: Develop baseline of participants for selected behaviours
- Step 3: Develop estimates for unused energy services
- Step 4: Develop unbundled/Economic Potential for energy.

A brief discussion of each step is outlined below.

Step 1 Select Candidate Behaviour Measures

There are a wide number of behaviours that homeowners and building occupants can undertake that affect natural gas consumption.

For this study, the number of behaviours was narrowed by looking at the potential size of the impact, the availability of information, and by consulting with FortisBC personnel.

Step 2 Develop Baseline for Selected Behaviours

Once the behaviours of interest were defined, it was then necessary to determine what share of the customer base already performed those behaviours on a routine basis.

The FortisBC 2008 REUS included a series of questions regarding current behaviour practices. These were developed in anticipation of the CPR and provide a good overlap with the selected behaviours.

Data from the survey were analyzed to determine the share of the current population that states that they are currently undertaking the specified behaviours and how frequently. These data were collected on a four-point scale (always, usually, occasionally, never).

Step 3 Develop Estimates of Potential for Unused Energy Services

The next step was to determine the share of the Base Year consumption that goes to the production of unused energy services. These are the energy services that are produced unnecessarily and therefore provide the potential to reduce the energy requirement. Unused energy services may also be thought of as waste.

The approach was to develop simple engineering estimates to approximate the amount of unused energy services that are embedded in each end use from the Base Year consumption estimates. For example, if 30% of the households are not setting back the temperature at night, and that temperature setback would reduce heating consumption by 5%, then the share of the space heating consumption that is available by increasing this behaviour can be estimated by combining the two values. These are referred to as unused energy services.

Step 4 Develop Unbundled Economic Potential for Energy

The next step in the assessment was to prepare an approximate estimate of the potential unbundled energy savings that could theoretically be provided by each measure. The term "unbundled" means that the savings for each measure are calculated in isolation of each other as well as other factors that ultimately determine the potential for real life savings.

The strength of this approach is that it provides insight into the relative size of the potential energy savings associated with individual measures; this perspective is often of particular value to program design personnel who may need to consider combinations of measures that differ from those selected for the CPR analysis.

The unbundled potential is calculated as the difference between the baseline level of activity for each behaviour and 100% of the people undertaking that behaviour. For example, if 10% of the population does the behaviour 25% of the time, inducing these 10% to do the behaviour 100% of the time is part of the unbundled potential, as well as inducing the remaining 90% of the population to do the behaviour 100% of the time.

As there is no cost for individuals to undertake a specific behaviour, all of the behaviour measures pass the economic screen.

6.2 Residential Sector Behaviour Measures

The residential behaviours included in this CPR are summarized in Exhibit 22 and are briefly described in the following text.

Exhibit 22 Residential Behaviours

Space Heating *(incl. temp)*

- Temperature setback - night
- Temperature setback - day
- Heat only occupied parts of house
- Maintain draft proofing
- Install storm windows
- Use window coverings to reduce space heat loss
- Reduce opening windows in winter
- Turn off fireplace pilot lights in summer[16]

Domestic Hot Water

- Turn off water heater when on vacation
- Reduce water heater temperature
- Share cold water wash
- Potential for cold water wash
- 5-minute showers

6.2.1 *Space Heating*

Space heating is the major residential end use, accounting for about 63% of the residential natural gas consumption in the Base Year. This section includes data only for houses with natural gas space heating. A number of behaviours were identified where the waste of space heat could be reduced through behaviour change. They are:

- Setting back temperature overnight
- Setting back temperature during the day when no one is at home
- Heating only occupied parts of the home
- Maintaining weather stripping and draft proofing
- Installing storm windows if the dwelling has single-glazed windows
- Using window coverings to reduce heat loss in the winter

Temperature Setback - Night

This behaviour consists of turning down the heat at night and then turning it up again in the morning. The practice can be accomplished either by turning down the heat manually, or by the correct use of a programmable thermostat. The 2008 REUS results show that 83% of FortisBC customers "always" or "usually" currently practice this behaviour.

Based on the REUS results, the average temperature setback was estimated to be 3^{o}C and the typical setback period was from 11 pm to 7 am (eight hours). The associated energy reduction from this behaviour was based on measurements from the Canadian Center for Housing Technology (CCHT).[17]

[16] This behavior was identified during the initial workshop but upon further research it was found that this behavior had not addressed by the REUS. Consequently, it was not included in the analysis due to the absence of base line data.

[17] Manning et al., *The Effects of Thermostat Setback and Setup on Seasonal Energy Consumption: Surface Temperatures and Recovery Time at the CCHT Twin House Research Facility* (Ottawa, 2007).

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural space heat
Applicable end use	Space heating
Estimated unused energy services	0.8%
Eligible population	17%

Temperature Setback - Day

This behaviour consists of turning down the heat when leaving the house and then turning it up again when returning. The practice can be accomplished either by turning down the heat manually, or by the correct use of a programmable thermostat. The 2008 REUS results show that 70% of FortisBC customers “always” or “usually” currently practice this behaviour

For the analysis, an average setback of 3^{o}C was used, based on the REUS 2008 results. It is recognized that there will be a mix of circumstances for people who undertake this practice. In a number of cases where both adults work, the setback will be approximately eight hours per day. However, some of these families have children who return from school in the afternoon, and will, therefore, have a shorter turndown period (perhaps five hours); another group will have only one working adult with the other likely leaving the house for a shorter period of time. An average daytime setback of five hours was assumed.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas space heat
Applicable end use	Space heating
Estimated unused energy services	0.9%
Eligible population	30%

Heat Only Occupied Parts of the House

This behaviour consists of keeping unoccupied parts of the house cooler than the remainder of the house. The REUS 2008 determined that 80% of FortisBC customers have the ability to heat only a part of their dwelling and that 65% of those customers “always” or "usually” keep those unoccupied areas of their house cooler than the occupied areas. Consequently, the REUS 2008 estimated that the eligible population for this behaviour is about 15% of FortisBC customers. A 3^{o}C temperature difference was assumed between the heated and cooler areas of the dwelling.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas space heat
Applicable end use	Space heating
Estimated unused energy services	0.6%
Eligible population	15%

Maintain Draft Proofing

This behaviour consists of routinely checking and repairing the draft proofing in the house, where draft proofing was considered to include weather stripping and sill plates around the doors and caulking around the windows.

The REUS 2008 reported that 28% of FortisBC customers check and maintain weather stripping once a year, or more, 36% reported it on an "as needed" basis, and 16% said they never undertake draft proofing. Note: the eligible population shown below is based on 50% of the "as needed" respondents and 100% of the "never" respondents.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas space heat
Applicable end use	Space heating
Estimated unused energy services	1.7%
Eligible population	34%

Install Storm Windows

This behaviour applies only to those in the 28% of homes with one, or more, single-glazed windows. The REUS 2008 reports that 10% of dwellings with single-glazed windows install storm windows or plastic film. Adjusting for the 90% of people who do not install storm windows to the base of natural gas-heated dwellings gives an eligible population of 25%.

The energy savings is based on modeling the impact of replacing single-glazed windows with double-glazing for those natural gas-heated houses that have at least 10% single-glazed windows.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas space heat, single-glazed windows
Applicable end use	Space heating
Estimated unused energy services	1.2%
Eligible population	25%

Use Window Coverings to Reduce Space Heat Losses

This behaviour consists of drawing the window coverings, such as drapes, blinds or shutters to reduce heat loss in winter. The REUS 2008 determined that 69% of survey respondents do this, while 31% do not.

The savings associated with the behaviour were estimated to be approximately 5% of the space heating load.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments
Applicable end use	Space heating
Estimated unused energy services	1.6%
Eligible population	31%

Reduce Opening Windows in Winter

This behaviour consists of reducing the practice of opening windows during the winter to improve ventilation. The REUS 2008 determined that, on average, 25% of FortisBC customers “always” or “usually” open windows during the winter.

The savings associated with the behaviour were estimated to be approximately 5% of the space heating load.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments
Applicable end use	Space heating
Estimated unused energy services	1.3%
Eligible population	25%

6.2.2 *Domestic Hot Water*

DHW heating accounts for about 19% of residential natural gas consumption in the Base Year. The following behaviours were identified where the waste of hot water could be reduced through behaviour change:

- Turning off the water heater when on vacation
- Reducing the temperature of the hot water in the tank
- Increasing the share of laundry done with cold water
- Reducing shower length to five minutes.

Turn Off Water Heater When on Vacation

This behaviour applies to all dwellings with natural gas water heating. Seven percent of the natural gas used by a hot water tank is for standby losses or the heat loss through the tank walls while the water is being stored. This latter loss can be addressed by using a water heater blanket. However, it can be further reduced during absences from the house by turning off the water tank. The REUS 2008 reported that 30% of FortisBC customers currently practice this behaviour.

For the purpose of this analysis, we have assumed that the tank can be turned off for three weeks per year, reducing standby losses for the period.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas water heating
Applicable end use	Natural gas DHW
Estimated unused energy shares	0.3%
Eligible population	70%

Reduce the Temperature of the Hot Water Tank

This behaviour applies to all residents with a natural gas hot water tank. The behaviour consists of checking the temperature of the hot water tank and reducing it by 4°C, thereby reducing standby losses.

The REUS 2008 reported that 50% of FortisBC customers have checked the temperature setting of their water tank and, of those customers, 46% subsequently lowered the temperature, 9% increased the temperature, and 46% left it unchanged. Natural gas water tank temperatures are typically set by plumbers at the time of installation; consequently, it is not known for certain why the 46% of customers left their temperature unchanged (i.e., what the actual temperature was). Hence, in the absence of more detailed data, this analysis assumes that the eligible population is the 50% of FortisBC customers who have not checked their hot water tank temperature. It further assumes that 50% of those customers will be able to reduce the temperature of the hot water tank by 4°C.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas water heating
Applicable end use	Natural gas DHW
Estimated unused energy shares	0.4 %
Eligible population	25%

Increase Share of Laundry Done with Cold Water

This behaviour consists of encouraging FortisBC customers to increase the share of laundry done with cold water, thereby eliminating DHW usage for hot and warm water washes. The 2009 REUS estimated that FortisBC customers currently use cold water for 58% of their laundry. As technically it is possible with modern detergents to use cold water for 100% of laundry, the eligible population is the 42% customers who do not currently follow this practice.

The savings estimate is based on having all clothes washing done in cold water. As clothes washing accounts for 27% of the DHW usage, the potential savings are 27%.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas water heaters
Applicable end use	DHW
Estimated unused energy services	27%
Eligible population	42%

Five-Minute Shower

This behaviour consists of reducing the average per-person shower length, as reported in the 2008 REUS, from the average time for all FortisBC customers of 8.2 minutes to five minutes. The REUS further estimated that the eligible population for this measure was 22% of FortisBC customers.

The savings estimate assumes that showers account for approximately 24% of DHW usage and that the five-minute shower time represents a 39% reduction in DHW shower usage.

A summary of the applicable data assumptions for this behaviour is provided below.

Assumptions Used for Analysis	
Applicable dwelling type	All detachments – natural gas water heaters
Applicable end use	DHW
Estimated unused energy services	10%
Eligible population	22%

6.3 Potential Savings

Exhibit 23 and Exhibit 24 show the unbundled savings potential for, respectively, space heating and DHW behaviours.

Exhibit 23 Unbundled Savings Potential, Total FortisBC Service Area – Space Heating

End Use & Dwelling Type	Base Year Consumption (1000 GJ/yr.)	Behaviour Measure	Unused Energy Services (% of Base Year)	Eligible Population	Unbundled Potential (1000 GJ/yr.)	Share of End Use

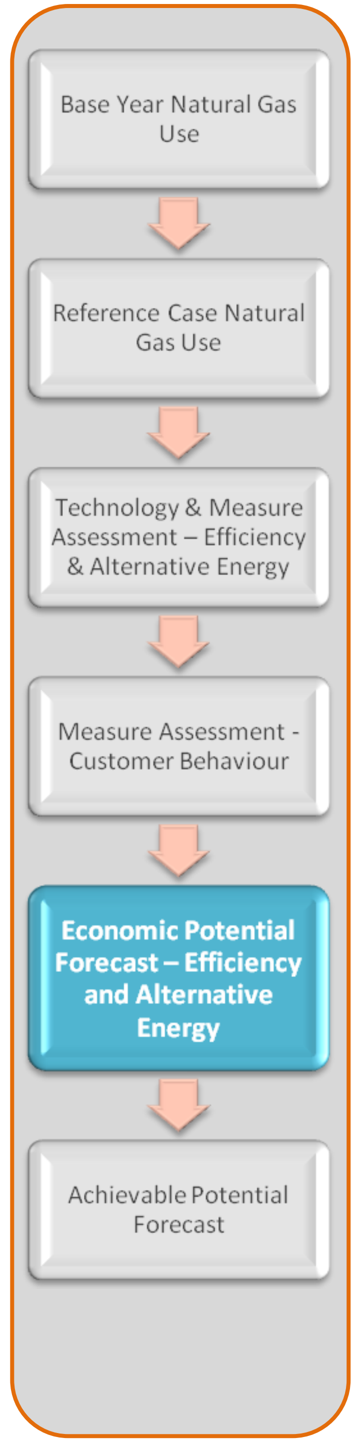
7 Economic Potential Forecast

7.1 Introduction



This section presents the Residential sector Economic Potential Forecast for the study period (2010 to 2030). The Economic Potential Forecast estimates the level of natural gas consumption that would occur if all building systems and equipment were upgraded to the level that is cost effective. In this study, "cost effective" means that the technology upgrade passes the measure TRC test, as discussed in Section 5.

The discussion in this section is organized into the following subsections:

- Major modelling tasks
- Technologies included in Economic Potential Forecast
- Presentation of results.

7.2 Major Modelling Tasks

By comparing the results of the Residential sector Economic Potential Forecast with the Reference Case, it is possible to determine the aggregate level of potential natural gas savings within the Residential sector, as well as to identify which specific building segments, end uses and technologies can provide the most significant opportunities for savings.

To develop the Residential sector Economic Potential Forecast, the following tasks were completed:

- The measure TRC results for each of the energy-efficiency upgrades presented previously in Exhibit 20 and Exhibit 21 were reviewed.

- Technology upgrades that had positive measure TRC results were selected for inclusion either on a "full-cost" or "incremental" basis. Technical upgrades passing the measure TRC test on a full-cost basis were implemented in the first forecast year. Those upgrades that only passed the measure TRC test on an incremental basis were introduced as the existing stock reached the end of its useful life. If more than one cost-effective measure existed for the same end-use application, the study selected the most energy-efficient one.

- Energy use within each of the dwelling types was modelled with the same energy models that were used to generate the Reference Case. However, for this forecast, the remaining standard efficiency technologies included in the Reference Case were replaced with the most efficient technology upgrade option that passed the measure TRC test.

- When more than one upgrade option was applied to a given end use, the first measure selected was the one that reduced the energy load. For example, measures to reduce the overall DHW load (e.g., ultra low-flow showerheads and more efficient dishwashers) would be applied before a high-efficiency water heater.

7.3 Technologies Included in Economic Potential Forecast

Exhibit 25 provides a listing of the technologies selected for inclusion in the Economic Potential Forecast. In each case, the exhibit shows the following:

- End use affected
- Upgrade option(s) selected
- Dwelling types to which the upgrade options were applied
- Rate at which the upgrade options were introduced into the stock.

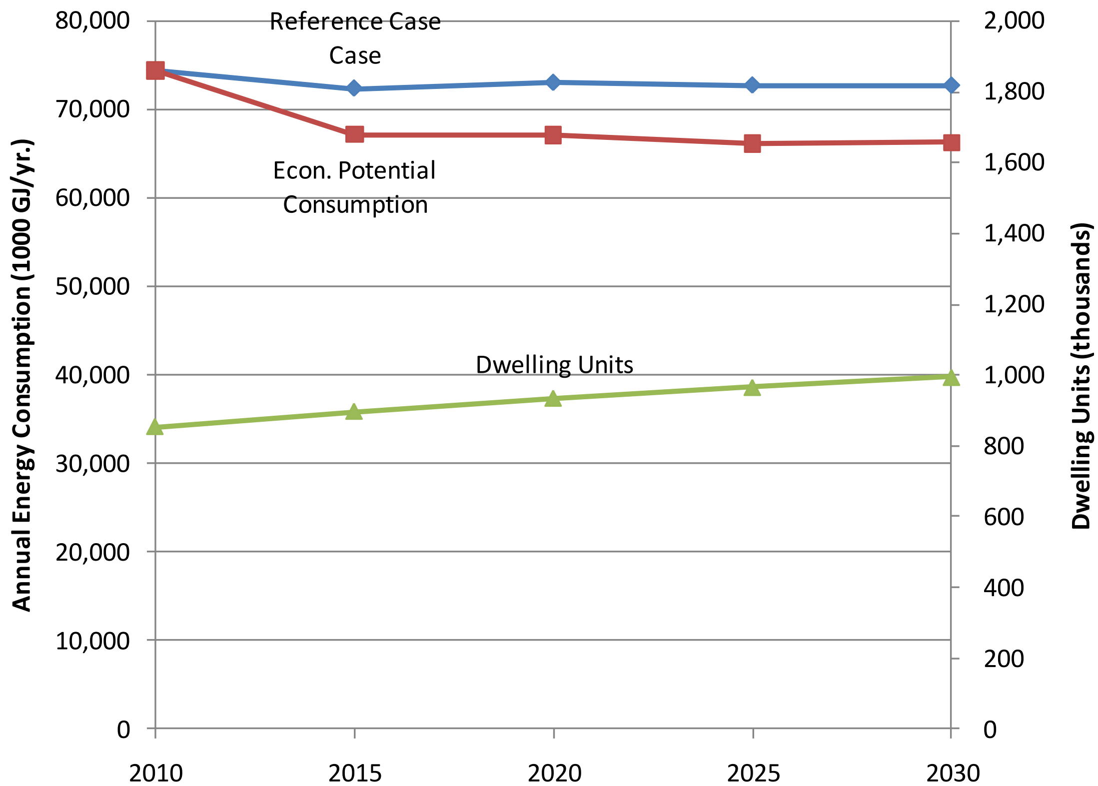
Exhibit 25 Technologies Included in Economic Potential

End Use	Upgrade Option	Applicability of Upgrade Options by Dwelling Type	Rate of Stock Introduction
Space Heating	High-performance glazing	▪ New and existing, all dwelling types	▪ New construction, immediate ▪ Existing, at rate of window replacement
	Attic, wall, and basement insulation	▪ Existing detached and attached	▪ At rate of renovation for other reasons
	Homeowner air sealing	▪ Existing, all dwelling types	▪ Immediate
	Programmable thermostats	▪ All	▪ Immediate
DHW	Savings from new clothes washers	▪ All	▪ See below for appliances
	Ultra low-flow showerheads and faucet aerators	▪ All	▪ Immediate
	DHW pipe insulation	▪ All existing	▪ Immediate
	DHW tank insulation	▪ All	▪ Immediate
Appliances	ENERGY STAR® clothes washers	▪ All	▪ Existing stock, at turnover ▪ New stock, immediate
Pools	Solar pool heaters	▪ All homes with pools	▪ At rate of heater replacement
Fireplace	High-efficiency fireplaces	▪ All existing or new homes with fireplaces	▪ As replaced or installed in new construction

7.4 Presentation of Results

Exhibit 26 compares the Reference Case and Economic Potential Forecast levels of residential energy consumption. As illustrated, under the Reference Case, residential natural gas consumption would decline slightly from the Base Year level of approximately 74 million GJ/yr. to 73 million GJ/yr. by 2030. This contrasts with the Economic Potential Forecast in which natural gas consumption would decrease to approximately 66 million GJ/yr. This is a difference of approximately 6.4 million GJ/yr., or about 9%.

Exhibit 26 Reference Case versus Economic Potential - Natural Gas Consumption for the Total FortisBC Service Area (1000 GJ/yr.)[18]



7.4.1 *Natural Gas Savings*

Further detail on the total potential natural gas savings provided by the Economic Potential Forecast is provided in the following exhibits:

- Exhibit 27 presents the results for the total FortisBC service area by service region and milestone year.
- Exhibit 28 presents the results for the total FortisBC service area by dwelling type and milestone year.
- Exhibit 29 presents the results for the total FortisBC service area by end use and milestone year.
- Exhibit 30 presents the results for the total FortisBC service area by technology and milestone year.

[18] The graph shows a large fraction of the Economic Potential savings occurring in the first milestone period. This is because a significant number of measures are cost effective at full cost and could theoretically be implemented immediately.

Exhibit 27 Natural Gas Savings for the Total FortisBC Service Area by Service Region and Milestone Year (1000 GJ/yr.)

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total	% Savings Relative to Ref Case
2015	3,792	734	439	231	13	5,209	7%
2020	4,263	851	485	301	17	5,917	8%
2025	4,686	957	532	378	20	6,574	9%
2030	4,479	1,039	494	368	21	6,401	9%
Savings 2030 Relative to Ref Case	9%	13%	6%	7%	10%	9%	
Percentage of 2030 Savings by Region	70%	16%	8%	6%	0.3%	100%	

Exhibit 28 Natural Gas Savings for the Total FortisBC Service Area by Dwelling Type and Milestone Year (1000 GJ/yr.)

Dwelling Type	2015	2020	2025	2030	% Savings 2030 Relative to Ref Case	% Savings 2030 Relative to Total 2030 Savings
SFD/Duplex, gas heat, pre-1976	2,622	2,926	3,200	3,197	12%	50%
SFD/Duplex, gas heat, 1976 or newer	2,091	2,401	2,687	2,551	7%	40%

Space heating	Wall Insulation	89	173	253	329	5%	1.17
Domestic hot water (DHW)	DHW Tank Insulation	15	14	14	13	0%	1.16
Space heating	Attic Insulation	468	453	438	424	7%	1.15
Space heating	Basement Insulation	264	512	744	960	15%	1.10
Space heating	Homeowner Air Sealing	640	621	602	583	9%	1.08
Domestic hot water (DHW)	ESTAR Clothes Washers	68	131	153	70	1%	1.02
Grand Total		5,209	5,917	6,574	6,401	100%	3.23

Note: Any difference in totals is due to rounding.

The average benefit-cost ratios in Exhibit 30 differ from those presented in Exhibit 21 because these ratios are based on the tallied ratios for all combinations of dwelling types and regions *where the measure passes*. The ratios presented in Exhibit 21 were based on the Lower Mainland region only and averaged all the applicable dwelling types, whether or not the measure passed.

7.4.2 *Interpretation of Results*

Highlights of the potential natural gas savings presented in the preceding exhibits are summarized below.

Savings by Service Region

The Lower Mainland service region represents 70% of the identified savings. This is consistent with the fact that the Lower Mainland is expected to account for 69% of FortisBC customers in 2030. The Northern Interior region represents 16% of the identified savings, which is disproportionately large compared to its expected 10% share of FortisBC customers in 2030. The Southern Interior represents 8% of savings, much lower than its expected 17% of FortisBC customers by 2030, and Vancouver Island represents 6% of savings, also much lower than its expected 14% share of customers.

In the Northern Interior region, potential savings are 13% of the Reference Case consumption in 2030, the highest percentage of any of the regions. In the Whistler region, potential savings are 10% of the Reference Case consumption in 2030 and in the Lower Mainland savings are 9% of Reference Case consumption in 2030. In the Southern Interior and Vancouver Island regions, potential savings are only 6% and 7% of Reference Case consumption in 2030, respectively.

The Southern Interior and Vancouver Island regions have lower potential savings primarily because they use less gas per customer in the Reference Case. End uses such as space heating account for less gas consumption in these regions, so many measures are less attractive financially.

Savings by Milestone Year

Eighty-one percent of the total identified Economic Potential savings are economically feasible by 2015. This is because a number of measures are cost effective at full cost (i.e., it is economically attractive to implement them immediately). Therefore, they are implemented right away under the Economic Potential scenario.

The expected impact of natural conservation in the Residential sector is also an important factor that causes 2015 savings to be relatively large in proportion to the total 2030 savings. Savings are calculated based on the expected difference between the Reference Case (which includes savings from natural conservation) and the Economic Potential Forecast. As naturally-occurring savings gradually increase over the study period they erode some of the Economic Potential.

Savings by Dwelling Type

Single-family dwellings account for approximately 94% of the potential savings; this reflects their larger market share and their generally higher level of energy intensity per dwelling.

Savings by End Use

Space heating accounts for approximately 46% of the total energy savings in the Economic Potential Forecast. The largest contributor to these savings is basement insulation, followed by programmable thermostats, homeowner air sealing, wall insulation, and attic insulation.

Fireplaces account for approximately 33% of total energy savings in the Economic Potential Forecast. These savings are all from upgrading to more efficient fireplaces at the natural rate of replacement or new purchase.

DHW accounts for approximately 11% of the total energy savings in the Economic Potential Forecast. There are several significant DHW energy-saving measures that are economically attractive, including ultra low-flow showerheads, faucet aerators, efficient clothes washers, hot water pipe insulation, and hot water tank insulation.

Swimming pool and spa heaters account for approximately 10% of the total savings in the Economic Potential Forecast. These savings are from solar pool heaters.

Clothes dryers account for less than 1% of the total savings in the Economic Potential Forecast. These savings result from the faster spin cycles of efficient clothes washers.[19]

7.4.3 *Electricity Savings*

Implementation of the natural gas efficiency measures contained in the Economic Potential Forecast would also result in electricity savings. For example, measures that improve the building envelope (such as efficient windows) also reduce furnace runtime, thereby saving ventilation fan energy. Similarly, ENERGY STAR® clothes washers use less electricity and less hot water.

Further detail on the potential electricity savings provided by the Economic Potential Forecast is provided in the following exhibits:

---

[19] The faster spin cycle in an efficient washer removes more water from the clothing, so that the time required to dry the clothes is reduced by approximately 35%.

7.4.4 *Caveats on Interpretation of Results*

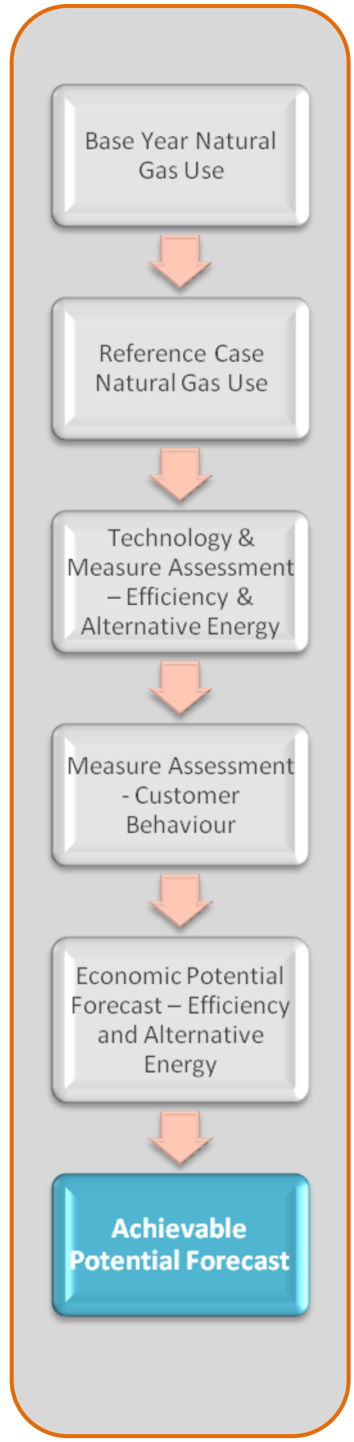
A systems approach was used to model the energy impacts of the efficiency upgrades presented in the preceding section. In the absence of a systems approach, there would be double counting of savings and an accurate assessment of the total contribution of the energy-efficient upgrades would not be possible.

For example, programmable thermostats reduce space heating natural gas use, as does the installation of new energy-efficient windows. On its own, each measure will reduce overall space heating energy use. However, the two savings are not cumulative. The order in which some upgrades are introduced is also important. In this study, the approach has been to select and model the impact of measures that reduce the load for a given end use (e.g., wall insulation or window upgrades that reduce the space heating load) and then to introduce measures that meet the remaining load more efficiently (e.g., a high-efficiency space heating system).

The above approach means that where there is interaction between measures that affect the same end use, the savings for the individual measures shown in Exhibit 30 are reduced. For example, if the programmable thermostat measure were implemented in the absence of any other space heating measures, its savings would be greater than those shown in Exhibit 30. As appropriate, this issue is addressed in Section 8 of this report.

8 Achievable Potential Forecast

8.1 Introduction



This section presents the Residential sector Achievable Potential for the study period (2010 to 2030). The Achievable Potential is defined as the proportion of the energy-efficiency opportunities identified in the Economic Potential Forecast that could realistically be achieved within the study period.

The remainder of this discussion is organized into the following subsections:

- Description of Achievable Potential
- Approach to the estimation of Achievable Potential
- Results – energy-efficient technologies.

8.2 Description of Achievable Potential

Achievable Potential recognizes that, in many instances, it is difficult to induce all customers to purchase and install all the energy-efficiency technologies that meet the criteria defined by the Economic Potential Forecast. For example, customer decisions to implement energy-efficient measures can be constrained by important factors such as:

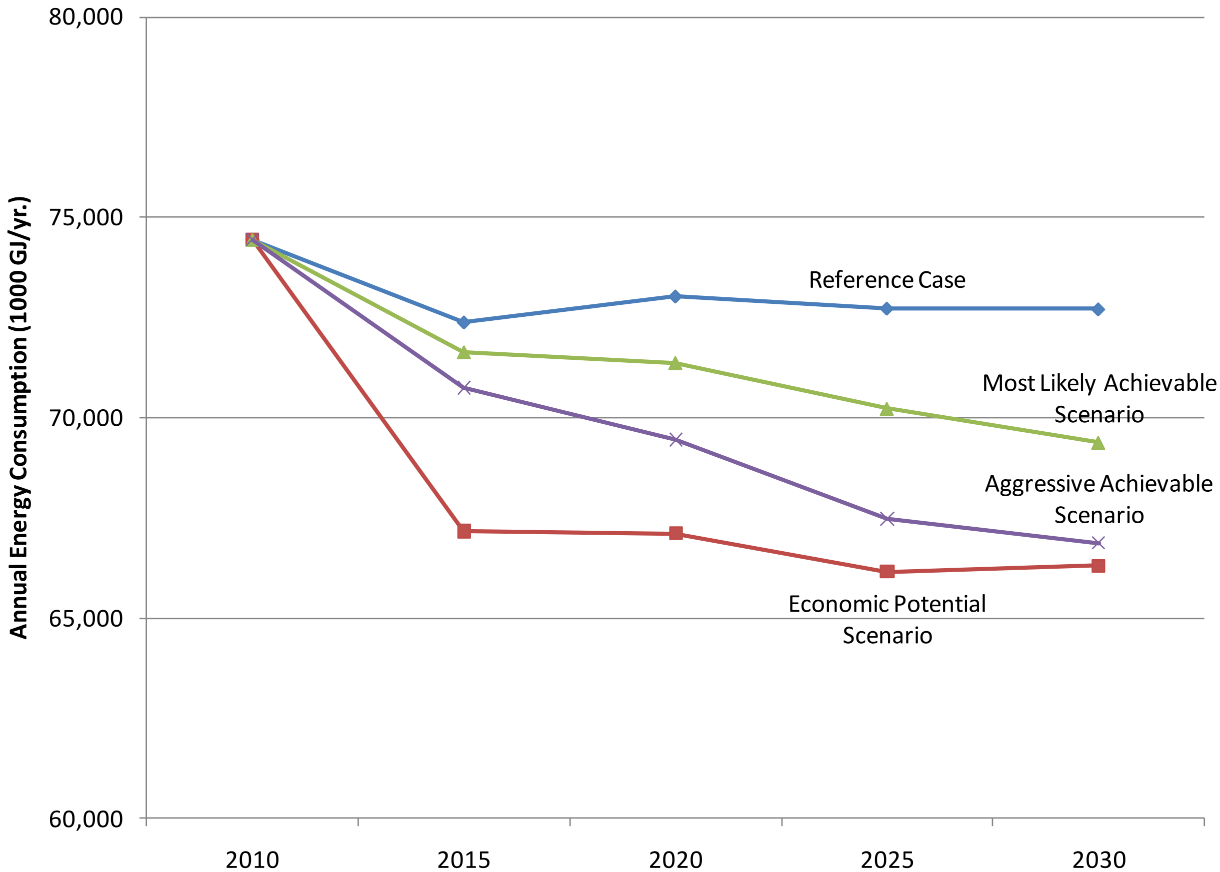
- Higher first cost of efficient product(s)
- Need to recover investment costs in a short period (payback)
- Lack of product performance information
- Lack of product availability.

The rate at which customers accept and purchase energy-efficient products will be influenced by the level of financial incentives, information and other measures put in place by FortisBC, BC Hydro, governments and the private sector to remove barriers such as those noted above.

Exhibit 35 presents the levels of natural gas consumption that are estimated in the Achievable Potential scenario. As illustrated, the Achievable Potential scenarios are *banded* by the two forecasts presented in previous sections, namely the Economic Potential Forecast and the Reference Case.

As illustrated in Exhibit 35 energy savings under the Achievable Potential scenario are less than in the Economic Potential Forecast. In this CPR, the primary factor that contributes to the outcome shown in Exhibit 35 is the rate of market penetration. In the Economic Potential Forecast, efficient new technologies are assumed to fully penetrate the market as soon as it is economically attractive to do so. However, the Achievable Potential recognizes that under real world conditions, the rate at which customers are likely to implement new technologies will be influenced by additional practical considerations and will, therefore, occur more slowly than under the assumptions employed in the Economic Potential Forecast.

Exhibit 35 Annual Natural Gas Consumption—Energy-efficiency Achievable Potential Relative to Reference Case and Economic Potential Forecast for the Residential Sector (1000 GJ/yr.)



As also illustrated in Exhibit 35, the Achievable results are presented as a band of possibilities, rather than a single line. This is because any estimate of Achievable Potential over a 20-year period is necessarily subject to uncertainty. Consequently, two Achievable Potential scenarios are presented: *most likely* and *aggressive*.

The *most likely* Achievable Potential assumes British Columbia market conditions that are similar to those contained in the Reference Case. That is, customers' awareness of energy-efficiency options and their motivation levels remain similar to those in the recent past, technology improvements continue at historical levels, and new energy performance standards continue as per current known schedules. It also assumes that FortisBC's ability to influence customers' decisions towards increased investments in energy-efficiency options remains roughly in line with previous company DSM experience.

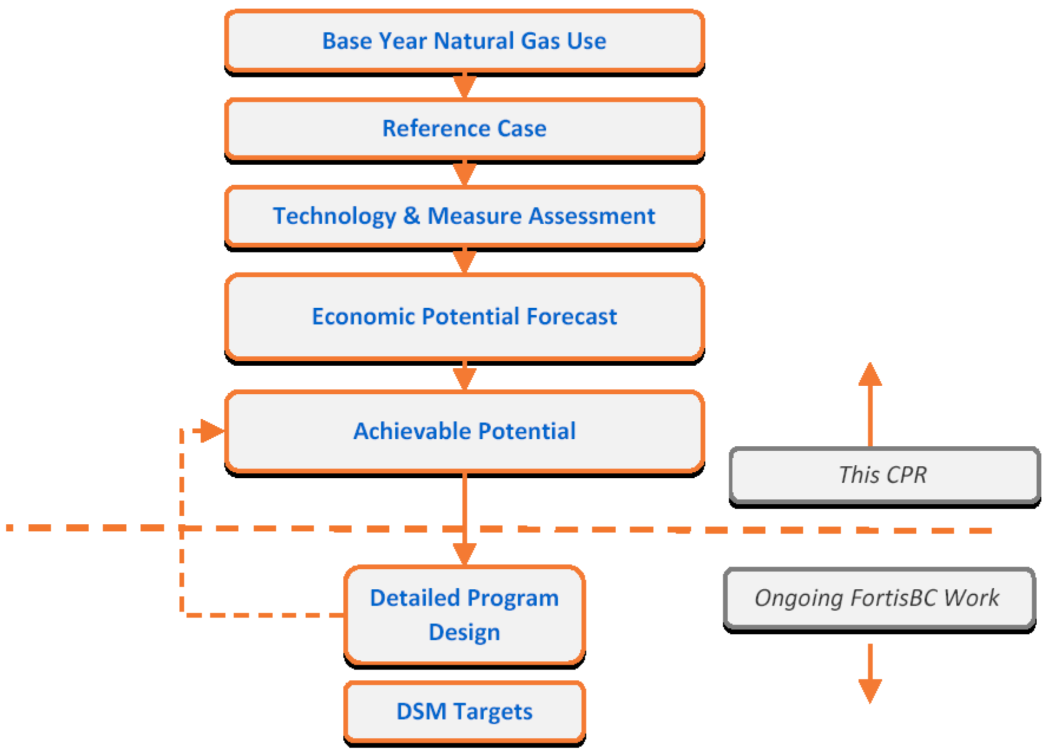
The *aggressive* Achievable Potential assumes British Columbia market conditions that aggressively support investment in energy efficiency. For example, this scenario assumes that real energy prices increase over the study period and that federal and provincial government actions to mitigate climate change result in increased levels of complementary energy-efficiency initiatives. *Aggressive* Achievable Potential typically does not reach Economic Potential levels; this recognizes that some portion of the market is typically constrained by barriers that cannot realistically be affected by DSM programs within the study period.

8.2.1 *Achievable Potential Versus Detailed Program Design*

It should also be emphasized that the estimation of Achievable Potential is not synonymous with either the setting of specific program targets or with program design. While both are closely linked to the discussion of Achievable Potential, they involve more detailed analysis that is beyond the scope of this study.

Exhibit 36 illustrates the relationship between Achievable Potential and the more detailed program design.

Exhibit 36 Achievable Potential versus Detailed Program Design



8.3 Approach to the Estimation of Achievable Potential

Achievable Potential was estimated in a five-step approach.

- Priority opportunities were selected
- Opportunity profiles were created
- Opportunity worksheets were prepared
- A full-day workshop was held
- Workshop results were aggregated and applied to the remaining opportunities.

Further discussion is provided below.

8.3.1 *Step 1: Select Priority Opportunities*

The first step in developing the Achievable Potential estimates required selecting the energy saving opportunities identified in the Economic Potential Forecast to be discussed during the Achievable workshop. Several criteria determined selection, including:

- The priority measures should represent a substantial fraction of the overall Economic Potential
- The priority measures should represent several different energy end uses
- The priority measures should have a variety of different likely patterns of market adoption so the discussions will be widely varied.

A summary of the selected energy-efficiency actions, along with the approximate percentage that it represents in the Economic Potential, is provided in Exhibit 37.

Exhibit 37 Residential Sector Actions – Energy Efficiency

Action Profile #	Measure	End Use	% Savings 2030 Relative to Total 2030 Savings
R1	Gas Fireplaces	Fireplace	33%
R2	Basement Insulation	Space heating	15%
R3	Solar Pool Heaters	Pool & spa heaters	10%
R4	Showerheads	Domestic hot water (DHW)	5%
R6	Attic Insulation	Space heating	7%
Grand Total			70%

In addition to these measures, early retirement of gas furnaces (R5) was included in the Achievable Potential at the request of FortisBC. This is because, although the measure is not considered cost effective when viewed through conventional DSM screens (it does not pass the TRC test as applied in this study), fully 76% of FortisBC's customers (or 91% of those who heat with gas furnaces) have standard- and mid-efficiency furnaces. It is the desire of FortisBC to offer its customers a program to encourage these customers to replace their standard- and mid-efficiency furnaces at or before the end of equipment life with high-efficiency furnaces. Thus, FortisBC wanted to discover through this study the impacts of such a program on the savings available from the Residential sector.[20]

8.3.2 *Step 2: Create Opportunity Profiles*

The next step involved the development of brief profiles for each of the opportunities noted above in Exhibit 37, in the form of four or five PowerPoint slides. The slides are presented in Appendix D.

The purpose of the opportunity profiles was to provide a high-level logic framework that would serve as a guide for participant discussions in the Achievable workshop (see Section 8.3.3 below). The intent was to define a broad rationale and direction without getting into the much greater detail required of program design, which, as noted previously, is beyond the scope of

[20] In principle, the same approach can also be applied to residential DHW tanks. New regulations have increased the minimum efficiency of new tanks but many customers have old, inefficient tanks that are not due for replacement for several years.

this project. As illustrated in Appendix D, each opportunity profile addresses the following areas:

Technology Description – provides a summary statement of the broad goal and rationale for the Action.

Target Dwelling Type and Typical Application – highlights the dwelling types and applications that offer the most significant opportunities and which provide a good starting point for a discussion of the technology.

Financial and Economic Indicators – provides estimates of average simple payback, benefit-cost ratio (TRC analysis), and basis of assessment (full cost versus incremental).

Eligible Participants – provides an estimate of the number of dwellings or appliances that could be affected during the study period if the entire Economic Potential were to be captured.

Economic Potential versus Time – shows the pattern of the changing size of the opportunity over the study period, for existing and new dwellings. Some opportunities grow steadily through the study period, as more and more appliances reach the age when they would be replaced. Other opportunities are economic to capture immediately, and after that the growth over time is limited to opportunities in new dwellings being built. Still other opportunities decline with time as they are eroded by natural conservation activities.

Economic Potential versus Dwelling Type and Region – shows how the opportunity is distributed through FortisBC's service area.

8.3.3 *Step 3: Prepare Opportunity Worksheets*

A draft assessment worksheet was prepared for each opportunity profile in advance of the achievable workshop. The assessment worksheets complemented the information contained in the opportunity profiles by providing quantitative data on the potential energy savings for each opportunity as well as providing information on the size and composition of the eligible population of potential participants. Energy impacts and population data were taken from the detailed modelling results contained in the Economic Potential Forecast.

The worksheets, including the results recorded during the workshop discussions, are provided in Appendix E. As illustrated in Appendix E, each opportunity assessment worksheet addresses the following areas:

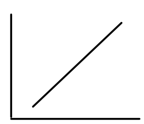
Approximate Benefit-Cost Ratio – shows the approximate ratio of economic benefits to costs. The benefit-cost ratio provides an indication of the relative economic attractiveness of the energy-efficiency measures from FortisBC's perspective. For the purposes of the workshop, this information provided participants with an indication of the scope for using financial incentives to influence customer participation rates.

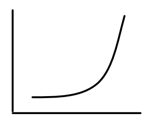
Customer Payback – shows the simple payback from the customer's perspective for the package of energy-efficiency measures included in the opportunity. This information provided an indication of the level of attractiveness that the opportunity would present to customers. This provided an important reference point for the workshop participants when considering potential participation rates. When combined with the preceding benefit-cost information, participants were able to "roughly" estimate the level of financial incentives that could be employed to increase the opportunity's attractiveness to customers without making it economically unattractive to FortisBC**.**

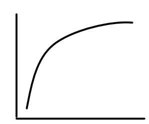
Economic Potential in Terms of Applicable Participants (e.g., number of dwellings) – shows the total number of potential participants in terms of either dwellings or appliances (as appropriate) that could theoretically take part in the opportunity. Numbers shown are from the eligible populations used in the Economic Potential Forecast.

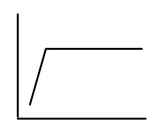
Participation Rates (%) – these fields were filled in during the workshops (described below in Step 4), based on input from the participants. They show the percentage of economic savings that workshop participants concluded could be achievable in the last milestone period (usually 2030, but may be earlier for measures that peak earlier). As noted in the introduction to this section, two achievable levels are shown: *most likely* and *aggressive*. For example, Exhibit 38 shows a participation rate of 29% (*most likely*) for high-efficiency fireplaces in existing detached homes by the year 2025. This means that an estimated 29% of the fireplaces being replaced in that year could be upgraded under a likely level of program activity. Under the comments column, participants indicated a likely shape for a curve to describe how quickly activity would rise to that level, so that participation rates for the intervening milestone years could be estimated. The different curves are shown in Exhibit 38.

Exhibit 38 Sample Participation Curves for Achievable Workshop

Curve A	Curve B	Curve C	Curve D
			








Achievable Potential in Terms of Applicable Participants (e.g., number of dwellings) – these fields were calculated by the spreadsheet based on the participation rates provided by the participants.

Participation Rates Relative to the Discussion Scenario – these fields were filled in during the workshops to provide guidance to the consulting team on how participation might differ in other regions or dwelling types.

Other Parameters – these fields were filled in during the workshop to capture other aspects of the discussion. In addition, the consulting team took notes on the discussion and summarized them in Appendix F.

8.3.4 *Step 4: Achievable Workshop*

The most critical step in developing the estimates of Achievable Potential was a one-day Achievable Potential workshop that was held on January 25, 2011. Workshop participants consisted of core members of the consultant team, DSM program and technical personnel from FortisBC, and industry representatives. Together, the participating personnel brought many years of experience to the workshop related to the technologies and markets as well as the design and delivery of energy-efficiency programs in British Columbia.

The purpose of this workshop was to:

- Promote discussion regarding the technical and market constraints confronting the identified energy-efficiency opportunities
- Identify potential strategies for addressing the identified constraints, including potential partners and delivery channels

- Compile participant views related to how much of the identified economic savings could realistically be achieved over the study period.

The discussion of each opportunity profile began with a brief consultant presentation. The floor was then opened to participant discussion of the key factors affecting each of the market segments and technical opportunities contained in the opportunity profile and accompanying worksheet.

Following discussion of the broad market and intervention conditions affecting the opportunity, workshop participant views were recorded on the *most likely* and *aggressive* customer participation rates. General agreement was sought on rates to be carried forward into the analysis.

As noted earlier, it was not possible to fully address all opportunities in the one-day workshop. Consequently, the workshop focused on opportunities selected based on the criteria described in Step 1. The consultants extrapolated to estimate participation for the remaining opportunities, consulting with FortisBC program personnel as needed. The values shown in the attached appendices and in the following summary tables incorporate the results of all these inputs.

8.3.5 *Step 5: Aggregate Opportunity Results*

The final step involved aggregating the results of the individual opportunities to provide a view of the Achievable Potential savings for the total Residential sector.

8.4 Results – Energy-efficient Technologies

A summary of the *most likely* and *aggressive* Achievable Potential results for the energy-efficiency opportunities is presented in this section. These results include the following:

- Natural gas consumption savings
- Peak day load impacts
- Greenhouse gas emission reductions.

8.4.1 *Natural Gas Consumption Savings – Aggressive Achievable Scenario*

The following exhibits present the potential natural gas savings under the *aggressive* Achievable Potential scenario. The results shown are relative to the Reference Case. The results are broken down as follows:

- Exhibit 39 presents the results for the total FortisBC service area by service region and milestone year.
- Exhibit 40 presents the results for the total FortisBC service area by dwelling type and milestone year.
- Exhibit 41 presents the results for the total FortisBC service area by end use and milestone year.
- Exhibit 42 presents the results for the total FortisBC service area by technology and milestone year.

Exhibit 39 Aggressive Achievable Natural Gas Savings for the Total FortisBC Service Area by Service Region and Milestone Year (1000 GJ/yr.)[21]

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total	% Savings Relative to Ref Case
2015	1,158	261	163	54	4	1,640	2%

8.4.2 *Natural Gas Consumption Savings – Most likely Achievable Scenario*

The following exhibits present the potential natural gas savings under the *most likely* Achievable Potential scenario. The results shown are relative to the Reference Case. The results are broken down as follows:

- Exhibit 43 presents the results for the total FortisBC service area by service region and milestone year.
- Exhibit 44 presents the results for the total FortisBC service area by dwelling type and milestone year.
- Exhibit 45 presents the results for the total FortisBC service area by end use and milestone year.
- Exhibit 46 presents the results for the total FortisBC service area by technology and milestone year.

Exhibit 43 Most Likely Achievable Natural Gas Savings for the Total FortisBC Service Area by Service Region and Milestone Year (1000 GJ/yr.)[22]

Note: Any difference in totals is due to rounding.

8.4.3 *Peak Day Load Impacts – Energy-efficiency Scenarios*

This sub section estimates the peak day load impact that would occur as a result of the Achievable Potential scenarios presented in the preceding exhibits. Peak day load impact measures the relationship between a typical or average daily consumption rate and the consumption that occurs on a peak day when the demand for natural gas is at a maximum. The relationship is illustrated in the formula below.

$$\textit{Peak Day Consumption} = \frac{\textit{Average Daily Consumption}}{\textit{Load Factor}}$$

The following steps were employed to derive the estimated peak day load impacts:

- Annual natural gas decreases associated with each of the preceding Achievable Potential scenarios were identified (GJ/yr.).

FortisBC provided load factors that correlate the relationship between average and peak day consumption levels for each rate class and service region. The Residential sector defined in this CPR includes only customers from Rate class 1. Large multi-unit residential buildings from classes 2, 3, and 23 are reported in the Commercial sector report.

- Exhibit 47 shows a Lower Mainland Residential sector load factor rate of 0.272.

- Finally, peak day load impacts were calculated by dividing the average daily consumption by the appropriate sector and service region load factors.

Exhibit 47 Peak Day Load Factors, by Sector and Service Region

CPR Sector	Sales Weighted Average/Peak Load Factor, by Sector & Service Region*				
	Lower Mainland	Southern Interior	Northern Interior	Vancouver Island	Whistler
Residential	0.272	0.266	0.266	0.279	0.269
Commercial	0.358	0.298	0.288	0.380	
Manufacturing	0.589	0.812	0.862	0.384	

*Above sector load factors are sales weighted values based on the rate class load factors shown below.

Rate Class (FEI, FEVI, FEW)	Average/Peak Load Factor, by Rate Class & Service Region#			
	Lower Mainland (FEI)	Inland (FEI)	Vancouver Island (FEVI)	Whistler (FEW)
Rate 1, RGS, SGS1/2 RES	0.272	0.266	0.279	0.269
Rate 2, SCS1, SGS1/2 COMM	0.279	0.256	0.308	0.402
Rate 3, SCS2, LGS1	0.357	0.329	0.386	0.346

#Source: FortisBC

Exhibit 48 and Exhibit 49 summarizes the estimated peak day load impacts for each of the Achievable Potential scenarios. The results for the *aggressive* Achievable Potential are presented in Exhibit 48 and the results for the *most likely* Achievable Potential are presented in Exhibit 49. The values in these exhibits are estimates of the natural gas reduction on the system peak day.

Exhibit 48 Peak Day Capacity Impacts – Aggressive Achievable Potential, by Scenario, Service Region and Milestone Year (GJ)

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total
2015	11,686	2,683	1,676	530	39	16,614

Savings 2030 Relative to Total 2030 Savings	71%	15%	10%	4%	0.1%	100%

8.4.4 *Greenhouse Gas Emission Impact – Energy-efficiency Scenarios*

The natural gas savings associated with each of the Achievable Potential scenarios would also result in a reduction of greenhouse gas (GHG) emissions.[23] Exhibit 50 and Exhibit 51 provide the estimated GHG reduction impact of each of the two Achievable Potential scenarios.

Exhibit 50 Estimated GHG Emission Reductions – Aggressive Achievable Potential, By Scenario and Milestone Year (tonnes CO_2e/yr.)

Year	Lower Mainland	Northern Interior	Southern Interior	Vancouver Island	Whistler	Grand Total
2015	58,723	13,220	8,255	2,738	192	83,129
2020	128,426	28,136	18,252	6,096	301	181,211
2025	189,455	39,580	26,653	10,307	268	266,263

2030	120,118	25,530	16,741	6,270	126	168,785
Savings 2030 Relative to Total 2030 Savings	71%	15%	10%	4%	0.1%	100%

8.4.5 *Interpretation of Results*

Highlights of the potential natural gas savings presented in the preceding exhibits are summarized below.

[23] GHG impacts are estimated based on an emissions factor of 50.7 kg of CO_2e per GJ of natural gas. This is the value currently employed by Natural Resources Canada.

Savings by Service Region

The Lower Mainland service region represents approximately 70% of the identified savings in either of the two Achievable Potential scenarios. This is consistent with the large number of customers in this service region. The Northern Interior service region represents approximately 15% of the identified savings, followed by Southern Interior at 10% and then Vancouver Island at 4%.

In the Northern Interior, potential savings are 6%-11% of the Reference Case consumption in 2030, depending on whether the *most likely* or *aggressive* levels of potential are achieved. This is the highest percentage of any of the regions. In the Lower Mainland, potential savings are 5%-8% of the Reference Case consumption in 2030. In the Southern Interior, potential savings are 4%-7% of Reference Case consumption in 2030. In the Vancouver Island service region, they are 2%-4%, and in the Whistler service region, they are 1%-2% of Reference Case consumption in 2030. The variation from region to region relates closely to the age and efficiency of existing gas furnaces in the building stock.

Savings by Milestone Year

In contrast to the Economic Potential scenario, savings in both Achievable Potential scenarios are achieved more steadily throughout the study period. Based on the adoption patterns estimated by the workshop participants, under the *most likely* scenario 22% of the 2030 savings would be achieved by 2015, 50% by 2020, and 75% by 2025. In the *aggressive* scenario, 28% would be achieved by 2015, 61% by 2020, and 90% by 2025. Overall, the *most likely* scenario represents an even rate of adoption throughout the 20 years, whereas the *aggressive* scenario results in more of the full-cost measures being adopted early.

Savings by Dwelling Type

Single-family dwellings account for approximately 94% of the potential savings, which reflects their larger market share and their generally higher level of energy intensity per dwelling.

Savings by End Use

Space heating accounts for nearly 80% of the total energy savings in the two Achievable Potential scenarios. The largest contributor to these savings by far is the early retirement of gas furnaces, which accounts for approximately half of the total Achievable Potential savings. The remaining space heating savings are from programmable thermostats, homeowner air sealing, and improved insulation in basements, attics and walls.

Fireplaces account for approximately 12%-13% of total energy savings in the two Achievable Potential scenarios. These savings are all from upgrading to more efficient fireplaces at the natural rate of replacement or new purchase.

Swimming pool and spa heaters account for approximately 6% of the total savings in the two Achievable Potential scenarios. These savings are from solar pool heaters.

DHW accounts for approximately 3% of the total energy savings in the two Achievable Potential scenarios. These savings come from several measures, including ultra low-flow showerheads, efficiency clothes washers, faucet aerators, hot water pipe insulation, and hot water tank insulation.

Clothes dryers account for less than 1% of the total savings in the two Achievable Potential scenarios. These savings result from the faster spin cycles of efficient clothes washers.

Peak Day Capacity Impacts

The natural gas savings contained in the two Achievable Potential scenarios would result in a total peak day load reduction of approximately 34,000 GJ to 59,000 GJ by 2030, depending on the scenario.

Greenhouse Gas Emission Impacts

By 2030 the GHG reductions are estimated to be in the range of 169,000 to 296,000 tonnes/year, depending on scenario.

8.5 Results – Customer Behaviour

A selection of the unbundled savings potential from customer behaviours changes were also addressed as part of the one day residential sector workshop that was held on 25 January, 2011. The approach to the assessment of the achievable potential savings from customer behaviours was the same as for the energy efficiency technologies previously discussed.

Exhibit 52 presents a summary of the results for both the aggressive and most likely achievable potential scenarios.

It should be noted that there is significant potential overlap with the reported savings from energy efficiency technologies. Consequently, the behaviour savings shown in Exhibit 52 have not been added to those for the energy efficiency technologies, nor has any further analysis been undertaken at this time.

Exhibit 52 Achievable Potential from Customer Behaviour Changes, Aggressive and Most Likely Achievable Natural Gas Savings, by End Use and Milestone Year (1000 GJ/yr.)

10 Glossary

achievable potential
The Achievable Potential is the proportion of the natural gas savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. Achievable Potential recognizes that it is difficult to induce customers to purchase and install all of the efficiency technologies that meet the criteria defined by the Economic Potential Forecast.

avoided cost
The unit cost of acquiring the next resource to meet demand, which is used as a measure for evaluating individual demand-side and supply-side options. In the context of this study "avoided cost" is the capital expenditure offset by FortisBC's DSM activities (i.e., the cost of having to buy natural gas on the open market, contract for long-term supply, and the cost of associated transmission and storage.

base year
The Base Year is the year to which all potentials will be compared. It provides a detailed description of "where" and "how" natural gas is currently used in each sector. For this study, it is the calendar year 2010. The modelled base year energy use is calibrated against FortisBC's actual sales for 2009.

benefit/cost ratio
The measure benefit/cost ratio indicates the relative attractiveness of the measures. A measure that has a benefit/cost ratio in excess of 1.0 has benefits which outweigh its costs. Similarly, a measure with a benefit/cost ratio that is well in excess of one (e.g., 3.0) means that it is very attractive. A measure with a benefit/cost ratio of less than 1.0 has costs which outweigh its benefits.

building envelope
The material separation between the interior and the exterior environments of a building. The building envelope serves as the outer shell to protect the indoor environment as well as to facilitate its climate control.

british thermal unit or BTU
The standard measure of heat energy. It takes one Btu to raise the temperature of one pound of water by one degree Fahrenheit at sea level

co-generation
The simultaneous production of electric or mechanical energy and useful heat energy from a single fuel source.

combustion efficiency
The ratio of energy released during combustion to the potential chemical energy available in the fuel.

demand-side management (DSM)
Actions taken by a utility or other agency which are expected to influence the amount or timing of a customers energy consumption.

discount rate
The interest rate used in calculating the present value of expected yearly benefits and costs.

economic efficiency
Allocation of human and natural resources in a way that results in the greatest net economic benefit, regardless of how benefits and costs are distributed within society.

economic potential forecast
The economic potential forecast is an estimate of the level of natural gas consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost effective from society's perspective. All of the energy-efficiency technologies and measures that have a positive measure TRC are incorporated into the economic potential forecast. These technologies and measures are applied at either natural stock turnover rates or at designated years for immediate application.

energy audit
An on-site inspection and cataloguing of energy using equipment/buildings, energy consumption and the related end-uses. The purpose is to provide information to the customer and the utility. Audits are useful for load research, for DSM program design and for identification of specific energy savings measures.

energy conservation
Activities by energy users that result in a reduction of the energy used to provide services. Energy conservation can include a wide variety of behavioural or operational changes that result in energy savings..

energy efficiency
Using less energy to perform the same function.

energy intensity
The ratio of energy consumed per application or end use. For example, cubic metres per square metre of heated office space per day, or cubic metres per tonne of aluminum produced. All else being equal, energy intensity increases as energy efficiency decreases.

emerging technologies
New energy-conserving technologies that are not yet market-ready, but may be market-ready over next 5 to 10 years. This category includes technologies that could be accelerated into the market during that period through targeted financial or technical support.

end use
The final application or final use to which energy is applied. End use is often used interchangeably with energy service.

energy savings
The reduction in use of energy from the pre retrofit baseline to the post retrofit energy use that result from efficient technologies or activities. In this document, the term "energy" refers specifically to energy derived from natural gas unless otherwise noted.

energy service
An amenity or service supplied jointly by energy and other components/equipment such as buildings and heating equipment. Examples of energy services include residential space heating, commercial cooking, aluminum smelting and public transit. The same energy service can frequently be supplied with different mixes of equipment and energy.

energy use index (EUI)
End use energy consumption divided by a specific parameter of production (e.g., m^3/unit)
environmental credit/environmental penalty
An increment or decrement to the cost of a resource or set of resources, to reflect the overall level of its/their environmental impact, relative to another resource or set of resources.

financial incentive
Certain financial features in the utility's DSM programs designed to motivate customer participation. They may include features designed to reduce a customer's net cash outlay, pay-back period or cost of finance to participate.

fuel share
The proportion of requirements for a specific service that is met using a certain fuel. In the Commercial sector, fuel shares are normalized on a floor area basis. For example, a natural gas fuel share of 90% for space heating in the Large Office sub sector implies that 90% of the sub sector floor space is heated using natural gas.

free rider
A program participant who would have implemented the program measure or practice in the absence of the program.

interactive effects
In the context of natural gas use, interactive effects refer to the increase in gas consumed by heating equipment required to offset a decrease in "waste" heat generated by more efficient electrical fixtures or appliances after retrofit or replacement.

kilowatt (kW)
One thousand watts; the most common unit of measurement of electric power. (The amount of energy transferred at a rate of one kilowatt for one hour is equal to one kilowatt hour.)

kilowatt hour (kWh)
The most common unit of measurement of electric energy. One kilowatt hour represents the power of one thousand watts for a period of one hour.

load forecast
An estimate of expected natural gas requirements that have to be met by the utility in future years.

load research
Research to disaggregate and analyze patterns of natural gas consumption by various subsectors and end-uses. Load Research supports the development of the load forecast and the design of demand-side management programs.

market transformation
A reduction in market barriers resulting from a market intervention, as evident by a set of market effects that lasts after the intervention has been withdrawn, reduced or changed.

measure total resource cost (TRC)
The Measure TRC is the net present value of energy savings that result from an investment in a energy efficiency measure. The Measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and operating & maintenance costs. This calculation includes among others, the following inputs: the avoided natural gas, electricity and water; the life of the measure; and the selected discount rate.

natural conservation
The future change in energy intensity or base usage that is expected to occur in the absence of utility DSM programs. Natural change represents the effects of energy related decisions that would have been made in the absence of the utility programs by both program participants and non-participants

rate
Generically refers to a utility's rate structure.

rate structure
The formulae used by a regulated gas utility to calculate charges for the use of natural gas..

rebates
A type of incentive provided to encourage the adoption of energy efficeing practices, typically paid after the measure has been installed. There are typically two types of rebates: a Prescriptive Rebate, which is a prescribed financial incentive/unit for a prescribed list of products and a customized rebate in which the financial incentive is determined using an analysis of the customer equipment and an agreement on the specific products to be installed.

reference case forecast
An estimate of the expected level of natural gas consumption that would occur over the study period in the absence of any new utility DSM market interventions after 2010. It is the baseline against which the scenarios of energy savings are calculated. The Reference Case forecast incorporates an estimation of "natural conservation," namely, changes in end-use efficiency over the study period that are projected to occur in the absence of new market interventions by the utility.

retrofit
Energy efficiency activities undertaken in existing residential or non residential buildings where existing inefficient equipment is replaced by efficient equipment.

saturation
The portion of floor area that receives a specific energy service. For example, a saturation of 86% for space cooling in the Large Office sub sector means that 86% of the sub sector floor space is cooled (regardless of fuel used to provide that cooling).

seasonal efficiency
The ratio of delivered useful energy relative to the input potential fuel energy determined over a full heating season (or year).

sector
A group of customers having a common type of economic activity.

service area
The portion of the Province of British Columbia that receives service from FortisBC Gas.

service region
For the purposes of this study, the total FortisBC Gas service area is divided into two service regions. They are the Southern Region and the Eastern Region.

simple payback
The simple payback is generated to show the customer's financial perspective. Simple payback is a measure of the length of time required for the cumulative savings from a project to recover its initial investment cost, without taking into account the time value of money

sub sectors
A classification of customers within a sector by common features. Residential subsectors are by type of home (SFD, duplex, apartment, etc.). Commercial subsectors are generally by type of commercial service (office, retail, warehouse, etc.). Industrial subsectors are by product type (pulp and paper, solid wood products, chemicals, etc.).

supply curves
A curve illustrating the amount of energy (e.g., m^3) or societal benefit available at an appropriate screened price in ascending order of cost.

Total Resource Cost (TRC) Test
A test that compares the total costs of energy efficiency investments, including natural gas conservation programs, to the social cost of natural gas. Un-priced environmental and social costs may be accounted for by changing the cost of either the investment under consideration or the total cost of natural gas in such a way that relative un-priced impacts are reflected. It is used in designing and evaluating programs that are developed from the Energy Efficiency Potential study's results.

utility cost
The total financial cost incurred by the utility to acquire energy resources. For DSM, the costs include all utility program costs, including incentive costs.

watt
The basic unit of measurement of power, at a point in time as capacity or demand.

Appendix A Background - Section 3: Base Year Natural Gas Use

Introduction

This appendix provides background supporting information for the Base Year calibration presented in Section 3. The discussion is organized into the following subsections:

- Estimation of space heating loads
- Estimation of appliance energy consumption
- Estimation of appliance saturation
- Estimation of fuel share by end use
- Calibration of most recent sales data (for 2009) and adjustment to the study Base Year of 2010
- Model results – Base Year energy use.

Estimation of Net Space Heating Loads

The net space heating loads[24] as shown in Exhibit 5 were developed based on two data sources:

- FortisBC sales data that shows average consumption per residential customer.
- HOT2000 simulations of archetypal buildings that were originally developed for the 2007 BC Hydro study. These building archetypes have been updated using data from the EnerGuide for Houses and ecoENERGY databases, as analyzed in *Residential Existing House Statistics*.[25]

A brief discussion of some of the most important variables affecting the net space heating loads in British Columbia's residential stock is presented below.[26]

Envelope Area and Exposure

Attachment type is the main influence on building envelope area and exposure of buildings. Moving from greatest exposure to least, dwelling types include mobile homes, single-family, duplex, townhouse or row, and low- and high-rise apartments. Duplexes are built in a similar fashion to single-family homes but, from an exposure perspective, are more similar to row houses. Townhouses, which also share one or two walls, are, on average, smaller than single-family detached dwellings. Apartments are analyzed in the Commercial sector report.

Climate

British Columbia has a far greater diversity of climatic types than any other region in Canada, which creates a unique situation when it comes to defining building types. The simplest division on a climatic basis is between the coastal areas and the interior. Approximately 75% of the residential stock in British Columbia is located in the coastal areas, including Vancouver Island and the Lower Mainland. The remainder is spread out over the interior where the climate is similar to that of northern Canada and the Prairies. In general, this climatic divide results in major variations in the size, structure and thermal performance of buildings. For data analysis purposes, however, it was necessary to work with the regions that BC Hydro and FortisBC had already established for customer accounts. In general, the coastal climate corresponds to British Columbia's Lower Mainland and Vancouver Island regions. The Southern Interior region,

---

[24] Net space heating load is the space heating load of a building that must be met by the space heating system. This is equal to the total heat loss through the building envelope minus solar and internal gains.
[25] Ken Cooper, *Residential Existing House Statistics*, prepared for FortisBC, 2010.
[26] For reader convenience, the following sub sections are repeated from the earlier BC Hydro study, with minor modifications as applicable.

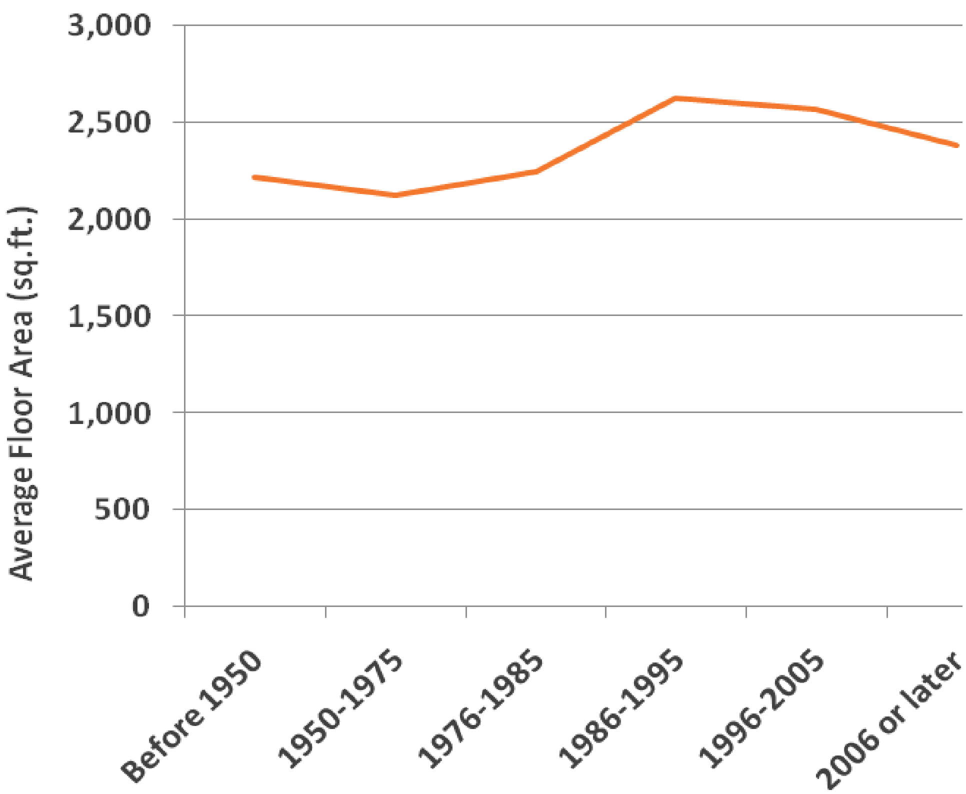
including the southern part of FortisBC's Inland Region as well as Columbia, has a colder interior climate. The Northern Interior region, including the northern part of FortisBC's Inland Region and Fort Nelson, is considerably colder yet. Whistler has a climate intermediate between the two interior climates. For modelling purposes, weather data from Vancouver, Victoria and Whistler were used to create thermal simulations of the Lower Mainland, Vancouver Island and Whistler regions, respectively. Summerland was used for the Southern Interior and Prince George was used for the Northern Interior.

Floor Area and Shape

Exhibit A 1 presents the average floor area by construction date for single detached houses, based on data from the 2008 REUS. As can be seen, there has been a general increase in floor area over time. The biggest changes in housing size occurred between 1975 and 1995 when changing demographics and growing affluence resulted in larger floor areas for new houses. Since that time, average house size has gradually decreased. Exhibit A 2 presents the variation in average floor area for both single detached houses and multi-family (attached) houses by region. As the exhibit shows, houses in the Lower Mainland are generally larger than those in the Vancouver Island and two Interior regions. Houses in Whistler are larger still.

The shapes of houses have also changed over the years, as they have in other Canadian provinces. Pre-1970 houses typically have half-storeys and simple floor plans. Post-1970 houses are most likely to include split-levels, ranches and two-storey houses, with more complex floor plans. As a result, newer houses generally have more wall area relative to their floor area. In other words, average wall area in new homes has grown faster than floor area. Finally, due to the improved performance of newer windows, the area of glazing has increased by about 15%.

Exhibit A 1 Average Floor Areas for Detached Dwellings by Construction Date (sq. ft.)



Source: 2008 Residential End Use Survey.

Exhibit A 2 Average Floor Areas for Detached and Attached Dwellings by Region (sq. ft.)

Dwelling Type	Lower Mainland	Interior	Vancouver Island	Whistler	Fort Nelson
Single Detached House	2,338	2,169	2,084	2,520	1,839
Multi-family (attached) Dwelling	1,699	1,596	1,553	1,583	**

Source: 2008 Residential End Use Survey
** Sample size too small to report estimate.

Basement Style

Basement style also affects space heating consumption. For example, full basements (e.g., ceiling height of 7 to 8 ft.) result in greater exterior wall area and room volume that require more heating than, say, a crawlspace, where ceiling heights are typically four feet or less.

Data on basement detachment styles was collected in the 2008 REUS and the results are shown in Exhibit A 3.

Exhibit A 3 Basement Style by Region

Dwelling Type	Lower Mainland	Interior	Vancouver Island	Whistler	Fort Nelson
No basement	24.9%	11.0%	22.2%	31.3%	31.1%
Partial	11.5%	13.3%	13.5%	19.7%	8.1%
Full	48.2%	65.8%	37.9%	14.6%	54.1%
Crawlspace	15.4%	9.8%	26.4%	34.4%	6.7%
Total	100.0%	99.9%	100.0%	100.0%	100.0%
Basement or crawlspace	75.1%	88.9%	77.8%	68.7%	68.9%

Source: 2008 Residential End Use Survey

Space Heating Efficiency

Natural gas furnaces are generally categorized into high-, mid- and standard efficiency levels. Data collected in the 2008 REUS were analyzed and presented in Table 4.1 of the 2010 Long Term Resource Plan. Exhibit A 4 reproduces the data in that table and also shows an estimate of the average efficiency of furnaces in each region, based on the following assumptions:

- Standard efficiency furnaces average 70% efficiency
- Mid-efficiency furnaces average 81.5% efficiency
- High-efficiency furnaces average 92% efficiency.

The estimated average furnace efficiency is lowest in the Lower Mainland and highest in Whistler.

Exhibit A 4 Existing Natural Gas Furnace Distribution, by Efficiency Level

Gas Furnace Efficiency	Lower Mainland	Interior	Vancouver Island	Whistler	Fort Nelson
Standard Efficiency (less than 78% AFUE; assumed mean 70%)	52.1%	38.0%	19.0%	20.7%	29.2%
Mid-efficiency (78% to 85% AFUE; assumed mean 81.5%)	34.0%	44.2%	56.5%	42.8%	49.5%
High-efficiency (80% AFUE or higher; assumed mean 92%)	13.9%	17.7%	24.5%	36.5%	21.2%
Total	100.0%	99.9%	100.0%	100.0%	99.9%
Estimated overall mean AFUE	77.0%	78.9%	81.9%	83.0%	80.3%

Source: 2008 Residential End Use Survey and 2010 Long Term Resource Plan

Supplemental Heating

The use of supplemental heating in residential dwellings is a dynamic process shaped by a number of factors. During the 1970s and 1980s, a small percentage of houses in British Columbia were converted to electric heating from other fuels. This occurred primarily on Vancouver Island, either as part of the Electric Plus program, or as a result of the federal government's Canadian Oil Substitution Program (COSP). These conversions had the effect of increasing the numbers of older housing stock with electric heat. A fraction of 1940s and 1950s housing with uninsulated walls and foundations was converted to electric heating.

During the mid-1980s, low-temperature radiant electric heating once again became popular. In a number of fast-growing subdivisions in the Lower Mainland area, electric heating was combined with forced-air gas furnaces. This hybrid system was popular because of easy installation and low capital cost. A gas-fueled forced-air system was installed in the crawlspace and main floor portions of the house, and electric baseboards were installed upstairs. This avoided the requirement for ducting up to the second storey, and the trades promoted it on the basis that "heat rises," and therefore the electric heating was simply a backup for the coldest weather.

More recently, increases in the cost of natural gas and propane fuels have resulted in significant increases in the use of portable electric resistance heaters during periods of higher priced fossil fuels.[27]

In addition to fuel conversions and substitutions, there are a large number of home renovations and additions that have involved the installation of electric space heating in previously non-electrically heated houses. Electric baseboards are a convenient, low first-cost installation for a new room in an existing house. Presumably this phenomenon has been occurring since the mid-1960s and growing in proportion to the rapidly increasing rates of renovation and addition building in the 1970s and 1980s.

---

[27] Personal communications with major British Columbia home improvement retail outlets.

The results of the 2008 REUS show the incidence of supplemental heating equipment for each region, as well as the fuels used, as illustrated in Exhibit A 5. Unfortunately, these data only show the incidence of each type of heating equipment; they do not tell how much space heat is actually provided by the equipment. This makes the calculation of actual electric heat contribution difficult. (The amount of space heat provided by supplemental heating systems is addressed below under *Natural Gas Fuel Shares*.)

Exhibit A 5 Incidence of Supplementary Space Heating and Fuels Used, by Region, (%)

Dwelling Type	Lower Mainland	Interior	Vancouver Island	Whistler	Fort Nelson
Use of Supplementary Heating	54.3%	55.3%	64.8%	80.8%	43.5%
Fuels Used *	**Lower Mainland**	**Interior**	**Vancouver Island**	**Whistler**	**Fort Nelson**
Electricity	75.2%	68.0%	54.4%	59.1%	68.2%
Natural gas	8.9%	9.2%	34.8%	6.8%	4.5%
Piped propane	0.0%	0.0%	0.1%	20.5%	0.0%
Bottled propane	0.6%	0.0%	0.0%	0.0%	0.0%
Oil	0.6%	0.8%	0.4%	0.0%	0.0%
Wood	14.0%	28.8%	14.8%	31.8%	22.7%
Other	0.6%	1.2%	0.8%	0.0%	0.0%

Estimation of Net Space Heating Loads

Exhibit 6 in Section 3.2.2 provides the estimated UEC values for the Lower Mainland region. The values shown in Exhibit 6 apply to the current stock mix in the Lower Mainland. UECs for the other service regions are shown in Exhibit A 6, Exhibit A 7, Exhibit A 8, and Exhibit A 9 below.

Exhibit A 6 Annual Appliance Natural Gas Use (UEC) for the Vancouver Island Region in Base Year (MJ/yr.)

Dwelling Types	Domestic hot water (DHW)	Fireplace	Cooking	Clothes dryer	Pool & spa heaters	Other gas uses
SFD/Duplex, gas heat, pre-1976	15,214	16,836	4,510	3,636	27,693	951

A brief discussion of some of the most important variables affecting the UEC values in British Columbia's residential stock is presented below.

Occupancy

Average occupancy rates by region were obtained from the data presented in the 2008 REUS, and are shown in Exhibit A 10. Average occupancy rates for single detached homes and multi-family (attached) dwellings are shown in Exhibit A 11. In this study, they are used, as applicable, to estimate energy use for occupant-sensitive end uses, such as domestic hot water (DHW), cooking and laundry.

Exhibit A 10 Occupancy Rates by Region

	Lower Mainland	Interior	Vancouver Island	Whistler	Fort Nelson
Mean Household Occupancy	3.01	2.43	2.39	3.04	2.70

Source: 2008 Residential End Use Survey

Exhibit A 11 Occupancy Rates by Dwelling Type

	Single Detached Houses	Multi-Family (Attached) Dwellings
Mean Household Occupancy	2.82	2.38

Source: 2008 Residential End Use Survey

Domestic Hot Water

UEC estimates for DHW are based primarily on the findings of the FortisBC 2008 REUS and natural gas sales data provided by FortisBC, adjusted for variations in occupancy rates as shown above. Exhibit A 12 shows the estimated distribution of DHW load by sub end use.

Exhibit A 12 Distribution of DHW Energy Use by End Use in Existing Stock

DHW Sub End Uses	Gas Consumption per Sub End Use (MJ)	Gas Consumption per Sub End Use (%)
Showers	5,001	24%
Clothes washer	4,601	22%
Faucets	3,572	17%
Dishwasher	3,242	15%
Pipe losses	1,429	7%
Tank (standby) losses	1,429	7%
Leaks	1,072	5%
Baths	714	3%
Total	21,061	100%

Note: Any differences in totals are due to rounding.

The DHW values shown in Exhibit A 12 are based on a combination of sources including available data from other jurisdictions, Natural Resources Canada studies (NRCan, 2005) and the results of conditional demand analysis and customer survey work presented in the 2008 REUS.

Cooking

UEC estimates for the existing stock of this group of food preparation appliances were initially developed using the conditional demand analysis from the 2008 REUS, and these values were compared against values for electric cooking appliances obtained from *Energy Consumption of Major Household Appliances Shipped in Canada* (NRCan, 2008). Comparing the two sets of values showed that gas consumption values were consistent with range efficiencies below 40%. The gas consumption values were adjusted downward to be consistent with range efficiencies of approximately 50%, which is consistent with previous Marbek studies for FortisBC and other Canadian gas utilities. Energy consumption was adjusted for occupancy rates.

Dryer

UEC estimates for the existing stock of clothes dryers were initially developed using the conditional demand analysis from the 2008 REUS, and these values were compared against values for electric dryers obtained from *Energy Consumption of Major Household Appliances Shipped in Canada* (NRCan, 2008). Comparing the two sets of values showed gas consumption values were consistent with range efficiencies over 100%. The gas consumption values were adjusted downward to be consistent with dryer efficiencies of approximately 85%, which is consistent with previous Marbek studies for FortisBC and other Canadian gas utilities. Energy consumption was adjusted for occupancy rates.

Pool or Spa Heater

UEC estimates for the existing stock of pool and spa heaters were developed using the conditional demand analysis from the 2008 REUS. Previous Marbek work concluded that gas-fired pool heaters use approximately the same amount of energy as a typical primary gas space heating appliance in a home. The figures in the FortisBC conditional demand analysis show that in British Columbia, the consumption of average pool heaters is somewhat less in relation to furnace consumption, as compared with other jurisdictions. This additional information was used to adjust the pool heater average consumption for the FortisBC service area. The average figure has not been adjusted for climate differences between regions. In colder regions, heating requirements per day may be higher, but the swimming season is also shorter.

Fireplaces

UEC estimates for the existing stock of gas fireplaces were developed using the conditional demand analysis from the 2008 REUS. The average gas fireplace in other jurisdictions uses approximately 20% as much energy as a primary gas heating appliance.[28] Gas fireplace consumption in the FortisBC service area would be expected to be higher relative to the consumption of the furnace because furnace consumption is more closely tied to climate than fireplace consumption. The FortisBC REUS contains more detailed consumption data on two types of gas fireplace: heater-type fireplaces and decorative fireplaces. The UEC used in the model is a weighted average of the two.

Other

A variety of other gas end uses are found in the homes of FortisBC residential customers, including gas barbecues, spa/hot tub heaters, outdoor fireplaces or campfires, garage or patio heaters, and outdoor gas lights. These end uses each account for a small portion of FortisBC's residential load and are therefore not modeled separately. The model does not specifically track other end uses consuming fuels other than natural gas or electricity. For example, propane barbecues, which represent a fuel switching option, would require special attention because their propane fuel use is not included in the Reference Case.

---

[28] Personal communication, Skip Hayden, Group Leader - Integrated Energy Systems, NRCan.

Electric End Uses

Marbek's energy model tracks energy consumption for both electricity and natural gas. Several electrical end uses, such as furnace fans and air conditioning systems, are directly affected by some of the efficiency measures applicable to natural gas space heating. The electrical savings attributable to these measures are factored into the measure TRC results found in Section 4.

Appliance Saturation

Exhibit A 13, Exhibit A 14, Exhibit A 15, Exhibit A 16, and Exhibit A 17 summarize the saturation levels assumed in the present analysis for the five regions. Saturation percentages combine the percentage of homes that contain a given appliance with the average number of such appliances found. Gas end uses that are assumed to be present in all homes include space heating, DHW, cooking, and other. The saturations for those end uses are not presented in the exhibits.

The assumed saturation levels are developed from the 2008 FortisBC REUS.

Natural Gas Fuel Share

Exhibit A 18, Exhibit A 19, Exhibit A 20, Exhibit A 21, and Exhibit A 22 summarize the natural gas fuel shares assumed in the present analysis for the five regions. The assumed natural gas fuel shares were developed from the 2008 FortisBC REUS.

For this CPR, only FortisBC customers are included in the analysis. All houses in the housing segments that do not use natural gas for space heating are, therefore, FortisBC customers who use gas for some other end uses. The REUS provided sufficiently detailed data to use different gas fuel shares for the DHW in houses with and without gas as the primary space heating fuel. For other end uses, the same fuel shares were used in houses with and without gas as the primary space heating fuel. Other gas uses, by definition, always have 100% natural gas fuel share, so it has been omitted from these exhibits.

The space heating fuel shares are handled primarily through the segmentation of the housing stock into gas-heated and non-gas-heated homes. However, the data also confirm that supplemental heating is widespread in both electric and natural gas heated dwellings.

The more difficult issue is determining the amount of heating load that is met by:[29]

- Electricity in non-electrically heated dwellings (primarily natural gas)
- Non-electric sources in electrically heated dwellings.

The space heating fuel shares presented in these exhibits have been selected on the basis that they provide a reasonable fit with:

- The information on supplementary heating in the REUS
- Customer billing data
- General market description (i.e., known distribution of heating appliances by fuel).

[29] Due to the prevalence of more than one heating system, actual space heating fuel shares can vary from year to year based on prevailing natural gas and electricity rates in the period.

Calibration of 2009 Sales Data and Adjustment to Study Base Year

FortisBC provided natural gas consumption per account for the year 2009, which was the latest year for which a complete year of data was available at the time of the study. Consumption per dwelling was multiplied by total number of residential accounts, and the resulting totals were divided among the dwelling types and vintages according to the best information available from the 2008 REUS and from Marbek's energy end-use modelling. The RSEEM model was populated with data for UEC, saturation, and gas fuel share, and calibrated for a close match to the 2009 data.

The Base Year of 2010 was chosen for the study, because no programs based on study results can begin early enough to have an effect on natural gas consumption in 2010. The 2009 model therefore had to be adjusted to provide a realistic estimate of natural gas end-use consumption in 2010 for all the dwelling types and end uses, calibrated to total consumption estimated in the FortisBC load forecast. Growth rates provided by FortisBC forecasting were applied to the 2009 numbers of dwellings. Adjustments were then made to UEC values to achieve calibration with the FortisBC consumption forecast.

Model results – Base Year energy use

Base year energy consumption is presented both on a per dwelling basis and as totals by region, end use, and dwelling type. The Lower Mainland values were presented in Section 3. Exhibit A 23, Exhibit A 24, Exhibit A 25, and Exhibit A 26 present the per dwelling values for the other four regions. Exhibit A 27, Exhibit A 28, Exhibit A 29, and Exhibit A 30 provide the regional totals for the other four regions.

Appendix B Background - Section 4: Reference Case Natural Gas Forecast

Introduction

This appendix provides background supporting information for the natural gas forecast presented in Section 4. The discussion is organized into the following sub sections:

- Estimation of net space heating loads in new dwellings
- Growth of building stock
- “Natural” changes to space heating loads in existing dwellings
- “Natural” changes to appliance and heating energy use
- Appliance saturation trends
- Fuel share trends
- Model results.

Estimation of Net Space Heating Loads—New Dwellings

The first task in building the Reference Case involves the development of thermal archetypes for the new stock. As was the case with existing stock, the archetypes were based to a large extent on the HOT2000 simulations of archetypal buildings originally developed for the 2006 BC Hydro study. Two major data sources were referenced:

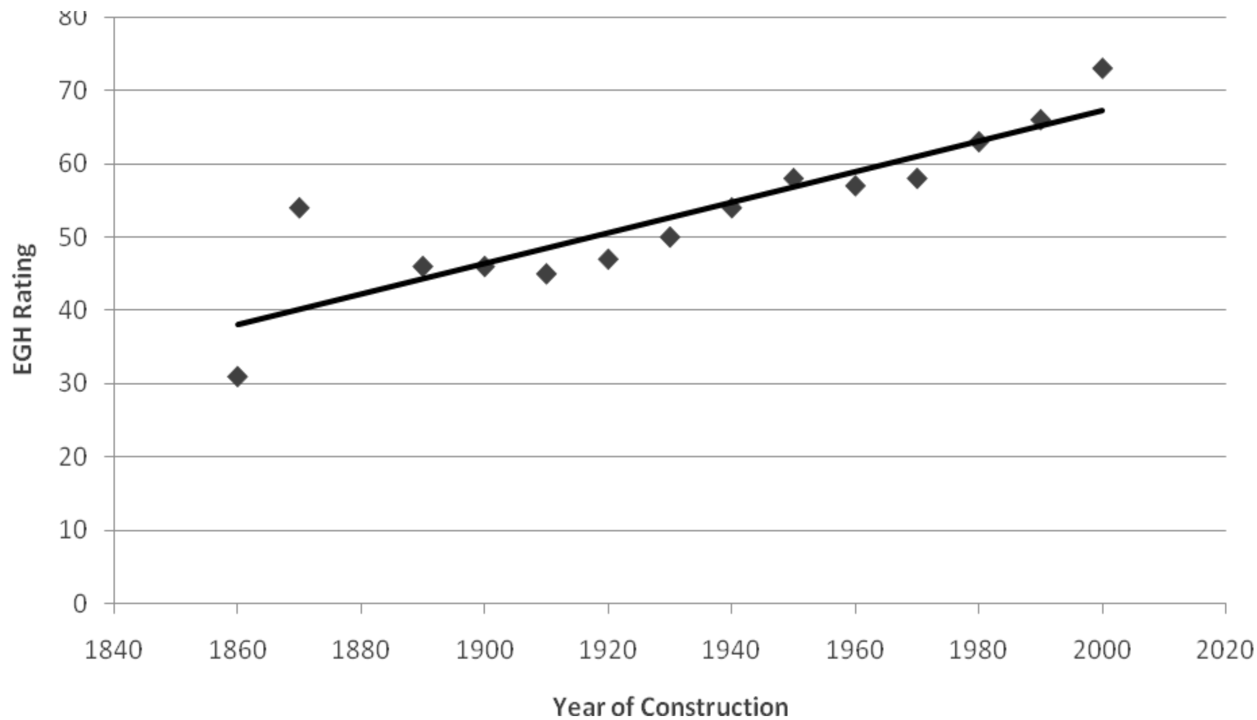
- The EnerGuide for Houses database
- The BC Building Code.

The current BC Building Code establishes a target energy performance of EnerGuide 80 for newly constructed houses beginning late in 2011. Current construction practices are designed to produce houses with performance of approximately EnerGuide 77.

Trends in British Columbia Residential Space Heating Loads

Exhibit B 1 provides a summary of trends in the thermal performance of British Columbia dwellings based on the results of 1,300 EnerGuide for Houses audits.

Exhibit B 1 Trends in B.C. Housing Efficiency Rating



As illustrated in Exhibit B 1, the thermal performance of British Columbia housing stock has been improving steadily with each new generation of construction. The thermal performance of new construction is therefore already considerably above the average existing dwelling, even in the newer (1976-present) vintage category. The new target of EnerGuide 80 increases this improvement further.

Overall space heating loads for the Lower Mainland will continue to be larger than for the other two regions, primarily because houses are expected to continue to be larger, on average, than in the other regions.

The amount of window area in new houses, as a percentage of the total exterior wall area, has increased by up to 30% relative to homes constructed in earlier periods.

In the Lower Mainland and Interior regions, the new stock tends to have floor areas that are 10% larger, on average; these same buildings also feature a 20% increase in exterior wall surface area as the result of the more complex wall geometry used in many of the new designs. The trend towards increased floor area appears to have levelled off, as shown in Exhibit A 1.

Window thermal efficiency has increased and air leakage rates have been reduced. U-value (heat loss factor) in windows has been reduced by approximately a factor of two over the course of a gradual evolution from old double-glazed wood-frame windows with no thermal break to current thermally-broken vinyl-framed windows with double-paned low-E glass. Overall air leakage in B.C. homes has decreased by approximately a factor of two in the last 80 years. Tighter windows account for a significant portion of this improvement.

The net effect of the above trends is that while thermal efficiencies are improving, they are being partially offset by changing construction practices.

Net Space Heating Loads Used in This Study

A summary of the net space heating loads used in this Reference Case for new residential dwellings are presented in Exhibit 12 in Section 4.

Growth of Building Stock

The next step in developing the Reference Case involved the development and application of estimated levels of growth in each building segment and service region over the study period. The stock growth rates are based primarily on the FortisBC 2010 Long Term Resource Plan. In addition, the data on age of construction for different kinds of housing in the 2008 REUS were used to establish the relative growth rates of multi-family (attached) housing versus single detached houses. Since 1950, attached homes have grown at approximately 2.95 times the rate of detached homes in the FortisBC service area.

In most service regions, dwellings with natural gas as the primary heating fuel and dwellings with other fuels as the primary heating fuel are assumed to grow at approximately the same rate. In the Vancouver Island service region, however, the predominant type of new residential customer is expected to use natural gas mainly for a gas fireplace, and not for DHW or space heating. Consequently, the model has been adjusted so that the majority of growth in dwelling units in Vancouver Island is in the dwellings that do not use natural gas as their main space heating fuel.

Exhibit B 2 presents a summary of the growth rates employed in this Reference Case, by region, dwelling type and primary space heating fuel.

Exhibit B 2 Annual Growth Rates in Period by Building Segment and FortisBC Service Region, (%)

Regions	Dwelling Types	Annualized Stock Growth Rates by Period

	Mobile/other, non-gas heat	6.2%	4.6%	2.9%	2.3%

Demolition Rates

Rates of demolition of older residential dwellings have been neglected in this analysis.

"Natural" Changes to Space Heating Loads—Existing Dwellings

In addition to new dwellings, space heating loads in existing dwellings are also expected to change over the study period. However, no specific data are available and, as outlined in the preceding discussion of new dwellings, contrary trends[30] are occurring.

Examples of trends that tend to decrease the net space heating loads include:

- Insulation and other improvements that occur when renovation projects are undertaken
- Replacement of old windows with new models that provide comfort and aesthetic benefits as well as improved energy efficiency

[30] Replacement of the heating equipment itself is not one of these factors because it does not actually change the net heating load.

- Installation of more efficient thermostatic controls.

Examples of trends that tend to increase net space heating loads include:

- Enlargement of houses with additions
- Reductions in internal gains due to more efficient appliances and lights.

Dwellings that undergo a major energy retrofit to the building shell are moved from the existing dwelling category into renovated dwellings. On average, these projects are assumed to include two envelope retrofits (though they may not all happen in the same month), such as replacement of half of the windows and the addition of insulation to the attic. In past projects, window replacement has been used as an indicator of the percentage of dwellings being renovated. Window sales are typically divided roughly evenly between installation in new homes and replacement in existing homes. A typical window replacement project involves approximately half the windows in the dwelling. Therefore, the rate of renovation is approximately double the rate of new construction.

Trial energy simulation runs were undertaken in HOT2000, assuming a variety of combinations of retrofit measures. The results varied widely, from a 2% to 15% reduction in space heat and cooling loads, depending on assumptions related to the number of windows replaced, or the part of the house being insulated. These increases will be partly or wholly offset in those renovation jobs that also increase the floor area of the dwelling.

In the absence of more comprehensive data, this study assumes that a renovation to a home built after 1980 would experience a net reduction in space heating load of 3%. An older home (in which it was assumed to be more likely that there would be an addition to the floor area) would experience a net reduction in space heating load of 2%.

"Natural" Changes to Appliance and Heating Energy Use

Overview

Changes in the annual energy consumption of residential appliances and heating equipment result from improvements in the energy efficiency of new models and the gradual penetration of those new, more efficient models into the stock of new and existing residences.

New energy-efficiency regulations affect replacement of natural gas furnaces and tank water heaters in British Columbia homes. This Reference Case assumes the performance of this equipment will improve accordingly, as the existing stock is replaced at its normal rate throughout the study period.

Data available from NRCan[31] show that significant improvements occurred in the energy efficiency of new appliances and heating equipment during the late 1980s and mid 1990s, but in the period post-1997 the efficiency of new natural gas appliances (clothes dryers and cooking ranges) has remained relatively unchanged. This Reference Case assumes that, in the absence of new initiatives, further improvements in the gas consumption of new gas dryers and ranges will track the improvement in the electricity consumption of the corresponding electric appliances, as the existing stock is replaced over the study period.

---

[31] Natural Resource Canada, *Energy Use Data Handbook, 2005.* p. 38-39.

Further discussion of assumptions applied to the major natural gas appliance appliances and heating equipment is provided below. The discussion is organized as follows:

- Furnaces
- Domestic Hot Water
- Cooking Ranges
- Clothes Dryers
- Fireplaces
- Pool Heaters
- Other.

Furnaces

Replacement furnaces must have a minimum efficiency of 90% as of December 31, 2009. This analysis assumes that furnaces last an average of 18 years, so that on average 1/18th of the furnaces in the existing dwellings will be replaced. All the furnaces in the FortisBC service area are therefore expected to be at least 90% efficient well before the end of the study period.

Domestic Hot Water

Exhibit B 3 summarizes the DHW percentage consumption by end use for dwellings in 2030. A comparison with the values presented previously for existing dwellings (see Section 2) shows the greatest reductions for hot water use in dishwashing and clothes washing. Slightly more modest changes have been assumed for personal consumption.

Superimposed on the reductions in DHW consumption are improvements in the equipment itself. DHW energy consumption for new tank heaters will improve over the study period because of new regulations in B.C. that took effect September 1, 2010. As an example, for a 151 litre (40-gal) tank, the energy factor must be at least 0.62. The minimum efficiency factor has previously risen from 0.52 for a 200-litre tank as of 1995, to 0.57 for a 200-litre tank as of 2003.[32] The new regulations therefore represent a significant improvement.

---

[32] Office of Energy Efficiency, Regulations Bulletin, Sept. 2004.

Exhibit B 3 Distribution of DHW Use by End Use in 2030, (%)

DHW Sub End Uses	Natural Gas per Sub End Use (MJ)	Natural Gas per Sub End Use (%)
Clothes washer	3,369	23%
Dishwasher	3,086	21%
Faucets	2,619	18%
Showers	1,937	13%
Tank (standby) losses	1,360	9%
Leaks	1,020	7%
Pipe losses	735	5%
Baths	680	5%
Total	14,805	100%

Cooking Ranges

As outlined in the overview above, the primary contribution to reduced natural gas consumption in cooking ranges will come from the gradual penetration of new, more efficient models into the stock of new and existing residences. Marbek has developed an appliance model that tracks and forecasts the replacement of appliances and the resulting stock averages over time. This Reference Case assumes that the current gas cooking UEC declines (in a straight line) by 32% by the final milestone year. The variation of UECs by dwelling type and region (primarily based on occupancy) remains the same.

Clothes Dryers

As outlined in the overview above, the primary contribution to reduced natural gas consumption in clothes dryers will come from the gradual penetration of new, more efficient models into the stock of new and existing residences. Marbek has developed an appliance model that tracks and forecasts the replacement of appliances and the resulting stock averages over time. This Reference Case assumes that the current gas dryer UEC declines (in a straight line) by 5% by the final milestone year. The variation of UECs by dwelling type and region (primarily based on occupancy) remains the same.

Fireplaces

Fireplaces currently have a very wide range of efficiencies, and the average efficiency of units currently sold has not been extensively studied. An unpublished presentation by NRCan shows an average efficiency of approximately 60% in sales across Canada. In the absence of any new initiatives, the average UEC was not assumed to change during the study period.

Pool Heaters

The UEC for pool heaters is not expected to change during the study period in the absence of any new initiatives.

Other

In the absence of any new initiatives, other gas uses (spas, barbecues, etc.) were not assumed to change during the study period.

Appliance Saturation Trends

There are noticeable trends in the saturation of a number of electrical appliances, such as dishwashers, computers, and set-top boxes. These changes do not directly impact natural gas consumption, however, and therefore are not considered further in this analysis.

Fuel Share Trends

Fuel share data are taken directly from the 2008 REUS. No changes to them are considered in this analysis.

Model Results

Exhibit B 4, Exhibit B 5, Exhibit B 6, Exhibit B 7, and Exhibit B 8 present the model results in tabular form, by dwelling type, end use and milestone year for each of the five regions.

Appendix C

Background - Section 5: Efficiency and Alternative Energy Technologies

Introduction

Exhibit C 1 provides a sample TRC analysis table for the high-efficiency gas fireplaces measure. Further details on this measure are provided in the TRC Analysis Workbook, an Excel file that accompanies this report. Similar worksheets are provided for all the measures analyzed.

After the exhibit, descriptions of all the measures considered are provided.

Exhibit C 1 Sample TRC Calculation Worksheet

High-Efficiency Gas Fireplaces

Description:	All vented gas fireplaces sold in Canada must now be tested for their energy efficiency using the Canadian Standards Association CSA-P.4.1-02 standard if they are shipped across provincial lines. The energy-efficiency rating of the fireplace is printed on the EnerGuide label. EnerGuide does not set a minimum efficiency level, so savings are possible by using the EnerGuide label to choose the more efficient unit.
Baseline:	An average efficiency natural gas fireplace (60% assumed)
Upgrade:	A high-efficiency natural gas fireplace (80% assumed)

Baseline Reference:	1. Annual consumption, end use		= User Input
Heating Fuel Type:	All Fuels (Average Fuel Mix)		= Calculation

Heating: Shell Measures

Attic Insulation

Insulation levels can be increased in attics by blowing insulation into the attic spaces to fill and cover the space within the roof frame. One technique is to make sure loose-fill or batt insulation fills the attic floor joists fully and then add an additional layer of unfaced fibreglass batt insulation across the joists. To reduce cost, it is also possible to blow in cellulose insulation on top of the existing insulation instead.

Wall Insulation

It can be challenging to retrofit wall insulation in existing homes since the inside surfaces of the exterior walls are already finished. It is sometimes possible to add insulation to a wall by blowing insulating materials into the wall cavity, if sufficient space exists. Alternatively, if the siding is old and due for replacement, rigid foam insulation can be added before the new siding is installed. In this situation, it would also be quite cost effective to install a more effective vapour and air barrier (e.g., Dupont Tyvek®) to reduce the amount of air leakage through the walls.

Slab Insulation (Unfinished Basements)

Insulation can be added both under and on top of basement slab floors. However, in existing homes, only the latter is practical. It is assumed that additional insulation is added to the slab floor while the basement is being finished. This can be done by purchasing insulated sub floor panels or laying down extruded polystyrene rigid foam insulation.

Basement (Foundation) Insulation

In many homes, the basement is often under-insulated or even left uninsulated. Increasing the insulation level in basements can be achieved in a number of ways, including constructing a new insulated frame wall, moving the existing frame wall to increase the insulation level, adding extra insulation to the existing frame wall, adding rigid board insulation to the exterior of the foundation, or using a combination of interior and exterior rigid board insulation. As a lower cost alternative, it is also possible to use polyurethane foam.

Crawlspace Insulation

Insulation levels remain below code in many homes that include crawlspaces as part of the basement design. If the floor is exposed, it would first be necessary to install a vapour barrier (e.g., 6 mil (600 gauge/0.15 mm) polyurethane barrier). Polyurethane foam could then be applied to the ceiling of the crawlspace (or the outer walls if there are pipes running below the floor). In addition to increasing the insulation of the crawlspace, this would help to eliminate any air leaks. Co-benefits of improved crawlspace insulation include improved thermal comfort, fewer drafts, and less condensation.

Professional Air Sealing/Weather Stripping/Caulking

Air leakage sealing of building envelopes includes completion of a blower door test to quantify leakage levels and to identify the location of air leaks. Generally, major leakage occurs at window-to-wall interfaces, around doors (especially patio doors), through electrical and plumbing penetrations and at the top of foundation walls. Installation of sealant and gaskets are generally accepted methods for reducing air leakage in buildings. Other sources of air leaks include pot lights, wall-to-floor interfaces (i.e., top and bottom of baseboards) and bathroom and kitchen exhaust piping.

Homeowner Air Sealing/Weather Stripping/Caulking

Homeowner air leakage sealing does not include a blower door test to quantify leakage levels and to identify the location of air leaks. Homeowners are likely to identify leakage primarily in more visible areas of the envelope, for example, the major leakage at window-to-wall interfaces, around doors (especially patio doors), through electrical and plumbing penetrations and perhaps at the top of foundation walls. Installation of weather stripping, sealant and gaskets are the most likely methods to be used. Less visible sources of air leaks such as pot lights, wall-to-floor interfaces (i.e., top and bottom of baseboards), bathroom and kitchen exhaust piping, and leaks from the top of walls into the attic are less likely to be addressed by the homeowner.

Air Leakage Sealing and Insulation (Old Homes)

This measure is targeted at homes that are at least 30 years old, since many of these homes haven't had any work done to improve insulation and air-sealing deficiencies and it is generally most cost effective to upgrade the insulation and the air sealing at the same time. This includes wall, attic, foundation, and crawlspace retrofits of older homes but, for the purposes of this analysis, it is assumed that a retrofit is being conducted on the attic.

The air-sealing portion of the work could be accomplished by segmenting the attic. In each segment, the existing insulation could be moved to one side and polyurethane foam could be sprayed in (serves as an air sealant in addition to its insulating properties). It may also be necessary to install or refurbish top plates to prevent airflow into the attic through exterior wall cavities. Other considerations that would increase the cost of the air-sealing portion of the work and may be present in some homes include sealing pot lights and kitchen or bathroom exhaust piping. When completed, these measures would dramatically improve the air tightness of an older home. The attic insulation could subsequently be cost effectively improved with cellulose insulation.

Zoned-Up Windows: (ENERGY STAR®) Rating for a Colder Zone

High-performance windows incorporate a number of additional energy-saving features, including low-E (soft coating), insulating spacers, argon fill and low conductivity frames (which can be sliders, hinged or picture). These windows are certified based on their energy rating (ER), which is based on their tested energy performance rather than on their specific combination of features. In this case, however, the ENERGY STAR® windows for a colder zone are specified instead of the ENERGY STAR® windows for the zone where the house is located, e.g., Zone C ENERGY STAR® windows would be chosen for a house in Zone A. High-performance windows also provide occupant co-benefits, such as reduced interior noise, reduced air leakage, greater thermal comfort, and fewer condensation problems.

Super High-Performance Windows

In addition to low-E coating, argon fill and insulating spacers, super high-performance windows incorporate features such as triple glazing, transparent insulating films, and fibreglass frames.

Heating: Shell Measures (New Homes)

High-Performance Homes (EGH 80/R2000/ENERGY STAR®)

There are several certification schemes for energy-efficient new homes that incorporate integrated design and multiple envelope measures. An EnerGuide for Houses (EGH) rating is a standard measure of a home's energy performance, calculated by a professional EGH advisor. The rating is based on information on the construction of the home and the results of a blower door test performed once the house has been built.

The R-2000 standard is one method of achieving an EGH 80 rating. However, R-2000 homes are required to achieve an air tightness level of 1.5 ACH@50Pa, install a heat recovery ventilator (HRV), and meet other environmental requirements. This substantially increases the cost of the measure. The ENERGY STAR® for New Homes program has similar requirements and also requires that homes be rated EGH 80. Since these three high-performance home standards all result in essentially the same energy performance, the costs assumed for the measure are those of the least expensive of the three. EGH 80 is the lowest cost, since it allows the builder the most flexibility for achieving the energy performance.

Net-Zero Ready Energy Homes

Net-zero energy homes (NZEH) produce at least as much energy as they consume. This is accomplished by incorporating on-site power generation, such as solar PV panels or small wind turbines, to offset electrical loads. However, the energy consumption of a NZEH is significantly lower, due to the addition of a wide array of energy-efficiency features. Measures that are typically considered include increased insulation, super high-performance windows, ENERGY STAR® appliances, solar thermal space and/or water heating, heat pumps, and passive solar designs. This measure is designed to produce a highly efficient house that is ready to be turned into a NZEH with the addition of on-site renewable energy generation.

Heating: Equipment

High-efficiency Condensing Gas Furnaces

Federal legislation now requires that all residential furnaces meet the minimum performance standard of 90% AFUE. However, higher efficiency condensing furnaces are available. These furnaces include more advanced heat exchanger designs that extract more heat from the flue gases before they are exhausted.

Early Retirement of Existing Gas Furnaces

Federal legislation now requires that all residential furnaces meet the minimum performance standard of 90% AFUE. However, consumers with less efficient furnaces that still work may wait years before replacing them. Early retirement of existing furnaces that are still functional is an option. Energy savings only last until the old furnace would have been replaced; after that, the energy consumption of the base case and upgrade is the same. The consumer has the added peace of mind of having a new furnace that is less likely to break down in winter.

Condensing Gas Boilers

High-efficiency condensing boilers feature advanced heat exchanger designs that extract more heat from the flue gases before they are exhausted. So much heat is extracted that the flue gases condense and must be discharged as a condensate rather than a gas. In retrofit applications where condensing boilers are replacing non-condensing units, it may be necessary to modify the radiating system. Otherwise, the units may not actually condense the flue gas and realize their full efficiency potential.

High-efficiency Gas Fireplaces

All vented gas fireplaces sold in Canada must now be tested for their energy efficiency using the Canadian Standards Association CSA-P.4.1-02 standard if they are shipped across provincial lines. The energy-efficiency rating of the fireplace is printed on the EnerGuide label. EnerGuide does not set a minimum efficiency level, so savings are possible by using the EnerGuide label to choose the most efficient unit.

Programmable Thermostats (Central Heating and Cooling)

Digital programmable thermostats provide improved temperature setting accuracy and allow occupants to preset temperatures for various time periods. A 4°C temperature setback is often assumed during night and unoccupied periods. However, utility studies have indicated that a lower average setback value should be used to reflect the fact that the thermostat's setback capabilities do not completely reflect how they are used. For example, some home occupants reliably set back manual thermostats while others do not use the setback features on their electronic thermostats.

Solar Pre-Heated Make-Up Air Systems (e.g., SolarWall®)

Solar pre-heated ventilation systems pre-heat incoming ventilation air and reduce heat loss through the portion of the building shell covered by them. They consist of perforated steel or aluminum absorber sheets that are mounted vertically on a building's exterior surface and are ideally mounted on southerly facing walls, plus or minus 20 degrees. The dark coloured metal sheets that make up the system are mounted a small distance away from the building's surface, creating an air cavity. A negative pressure is created within the cavity by ventilation fans and air is drawn through small holes in the metal panels.

On sunny winter days, these systems can raise incoming air temperatures by 25°C to 35°C. In summer months, ventilation air can be drawn directly from the outside through a bypass damper, while heated air is rejected through vents at the top of the air cavity. These systems are generally used in commercial and industrial applications but they have seen some limited residential use.

High-efficiency Heat Recovery Ventilators (HRVs)

Heat recovery ventilators (HRVs) are heat exchangers that are integrated into the centralized ventilation and exhaust systems of many newer homes. In the winter, they allow for incoming fresh air to be heated by outgoing stale air. Conversely, in homes with central air conditioning systems, they allow incoming fresh air to be cooled by outgoing stale air in the summer. High-efficiency HRVs incorporate more effective heat exchangers. Some models also include desiccant wheels so that latent heat (i.e., humidity) can be transferred between the two air streams.

Gas-Fired Air-Source Heat Pumps

Early gas-fired heat pumps, such as the York Triathlon, were unsuccessful due to their bulky size and poor quality design. A new generation of gas absorption heat pumps (GAHPs) is currently available through Robur, an Italian manufacturer. These systems can either be ground-source or air-source (i.e., the heat sink may be either an underground fluid loop or an above ground heat exchanger coil). Air-source systems are substantially less expensive since they don't require drilling to install underground fluid loops. However, they can also be much less efficient than ground-source versions since their efficiency is a function of outside air temperature.

Commercial-sized GAHP systems have been available in Canada since mid-2007 but residential-sized systems are rare in North America. It is hoped that residential-sized units will become more available in Canada within the study period, but the current manufacturers do not have specific plans at this time. It is estimated that air-source systems can operate at temperatures as low as -29°C and have annual efficiencies of 105% in cold winter locations. In more moderate winter climates, an efficiency of up to 129% is advertised.

Unlike electric heat pump systems, GAHPs do not require any auxiliary heating equipment. In addition, the lack of a mechanical compressor extends their lifetime and allows air-source systems to withstand more extreme temperatures.

Gas-Fired Ground-Source Heat Pumps

Early gas-fired heat pumps, such as the York Triathlon, were unsuccessful due to their bulky size and poor quality design. A new generation of gas absorption heat pumps (GAHPs) is currently available through Robur, an Italian manufacturer. These systems can either be ground-source or air-source (i.e., the heat sink may be either an underground fluid loop or an above ground heat exchanger coil). Air-source systems are substantially less expensive since they don't require drilling to install underground fluid loops. However, they can also be much less efficient than ground-source versions since their efficiency is a function of outside air temperature.

Commercial-sized GAHP systems have been available in Canada since mid-2007 but residential-sized systems are not currently available outside of Europe. It is hoped that residential-sized units will become more available in Canada within the study period, but the current manufacturers do not have specific plans at this time. Ground-source GAHPs have efficiencies (COPs) ranging from 120% to 130%.

Unlike electric heat pump systems, GAHPs do not require any auxiliary heating equipment. In addition, the lack of a mechanical compressor extends their lifetime.

Integrated Heating and DHW (Forced Air Heating)

Integrated mechanical systems combine the most efficient technologies for residential space heating and domestic water heating into one package. For example, the Matrix system by NTI NY Thermal incorporates a condensing furnace, condensing boiler, condensing water heater and HRV all in one unit. Primary benefits of the integrated units include compact construction, lower cost of installation (only one set of gas, water and circulation connections are required), and lower installation and maintenance costs (once the technology is mature).

Since the minimum performance standards for furnaces was brought up to 90% efficiency at the end of 2009, the base case system is a 90% efficient forced-air furnace and a standard efficiency natural gas tank-style water heater. With this baseline, the integrated system would offer little in the way of space heating savings, but it does still offer DHW savings because the integrated system would heat domestic water with its high-efficiency, condensing combustion.

Integrated Heating and DHW (Hydronic Heating)

Integrated mechanical systems combine the most efficient technologies for residential space heating and domestic water heating into one package. For example, the Matrix system by NTI NY Thermal incorporates a condensing furnace, condensing boiler, condensing water heater and HRV all in one unit. Primary benefits of the integrated units include compact construction, lower cost of installation (only one set of gas, water and circulation connections are required), and lower installation and maintenance costs (once the technology is mature).

Water heating in the base case is assumed to be provided by a standard efficiency natural gas tank-style water heater (EF of 0.62 or 0.64), while space heating is provided by a non-condensing boiler, assumed to have an AFUE of 82%. The HRV in the base case is assumed to be of similar efficiency to the HRV in the integrated unit.

Water Heating

Condensing Gas Water Heaters

Condensing water heaters feature advanced heat exchanger designs that extract more heat from the flue gases before they are exhausted. So much heat is extracted that the flue gases condense and must be discharged as a condensate rather than a gas. As a result, the efficiency of these types of water heaters is significantly higher than standard water heaters.

Point-of-Use (Tankless) Water Heaters (Gas)

Tankless water heaters heat water on demand, eliminating hot water storage. The absence of hot water storage reduces standby heat losses. The efficiency of tankless water heaters is generally improved by the addition of features such as modulating controls, electric spark ignitions and direct venting. The applicability of tankless gas-fired DHW systems is somewhat limited by venting constraints; the burner is significantly larger than for a standard water heater, so a larger vent is required. Some houses cannot accommodate the larger flue because of requirements for clearance from other structures, windows, etc.

Active Solar Water Heating Systems

Solar DHW systems use the energy of the sun to heat water. The primary components of a solar water heating system are a solar collector, a heat transfer fluid and a well-insulated storage tank. Due to Canada's colder climate and the higher likelihood of freezing, active closed-loop systems are generally used. These systems use a pump to circulate a non-freezing heat transfer fluid through the collectors and then through a heat exchanger so that the thermal energy can be transferred to the water.

Solar DHW are not generally sized to supply all of the annual requirement for water heating in the home, because if the system is sized for cloudy winter periods it will have enormous excess capacity during sunny summer periods, and will cost far too much to install. The system analyzed here meets approximately two-thirds of the annual requirements.

DHW Tank Insulation

Pre-cut tank jackets/blankets (DHW tank insulation) are readily available and can be installed on hot water storage tanks to reduce standby heat losses. Caution is required to install blankets on gas water heaters, to avoid blocking the flue, the air intake to the burner, or the drain at the bottom. The thermostat should also remain uncovered.

DHW Pipe Insulation

Hot water pipe insulation reduces the distribution losses for DHW. In general, only the first one or two metres of pipe nearest the DHW tank are accessible enough to insulate. However, since the dominant loss is from the pipe transferring heat out of the tank and then losing it to the basement, the first meter of pipe is the most important and only worthwhile section of pipe to insulate. Insulating this section of piping affects both the delivery of hot water and the losses from the tank. Delivery temperature is slightly increased during a hot water draw, and the water in the piping does not lose its stored heat as quickly between draws.

DHW Heat Traps

This measure involves the installation of external "S-type" pre-bent copper pipe heat traps on both of the outlets of water heaters. This measure is only being considered during the installation of new tanks since it can be prohibitively expensive to bring in a plumber otherwise.

Ultra Low-Flow Showerheads

Ultra low-flow showerheads have aerators and flow restrictors to reduce water use. At 4.75 LPM (1.25 GPM), their flow rates are substantially lower than traditional low-flow fixtures, whose flow rates range between 7.6 LPM and 9.5 LPM (2.0-2.5 GPM).

Faucet Aerators

Aerators can easily be attached to most faucets to restrict the flow rate of water flowing from them. This can result in savings to both water consumption and DHW energy.

Wastewater Heat Recovery Systems

Residential wastewater heat recovery systems transfer the waste heat from drains to pre-heat make-up water. These systems work well only for DHW uses in which the hot water use and the draining of wastewater are simultaneous. Thus, in homes, application to anything other than showers is difficult. Heat recovery systems incorporate shell-and-tube heat exchangers that typically have efficiencies in the range of 40% to 55%, depending on factors such as design, material, overall length, and fluid flow rate.

DHW Recirculation Systems (e.g. Metlund D'MAND®)

When turning on the hot water tap, it often takes a long time before hot water begins to flow. DHW recirculation systems can be used to pump hot water to a faucet at the demand of a user, getting hot water to the fixture four to five times quicker than traditional systems. Water that is in the hot water lines is pumped back to the water heater either through the cold water lines or through a dedicated line. This pumping continues until the temperature of the hot water at the point of use reaches a specified value. In retrofit situations, this pumping system is generally installed at the faucet that is furthest away from the water heater and the system is enabled by remote activation from the other points of use.

Along with improved convenience and water savings (since water isn't flushed down the drain), energy savings are achieved since the water that is pumped back to the water heater is generally warmer than city water. In addition, since the pump gets water to the fixture more quickly, there is an overall reduction of hot water use.

Appliances

High-Efficiency (ENERGY STAR®) Dishwashers

ENERGY STAR® dishwashers save energy by using improved technology for the primary wash cycle and by using less hot water to clean. Features include more effective washing action, energy-efficient motors, and sensors that determine the length of the wash cycle and the temperature of the water necessary to clean the dishes. In addition, some advanced dishwashers can sense and adjust for the amount of soil on dishes, using only as much water as necessary. These savings affect both the energy used for heating the water and the mechanical energy of the dishwasher.

High-Efficiency (ENERGY STAR®) Clothes Washers

In January 2011, the ENERGY STAR® standard for clothes washers will be increased once again. As a result, very few top loading washers will meet ENERGY STAR® requirements. Instead, the overwhelming majority of ENERGY STAR® models will be front loading (horizontal axis) models. Compared to standard models, front-loading washing machines use less hot water, less mechanical energy, and result in dryer energy savings due to faster spin cycle speeds.

High-Efficiency Gas Clothes Dryers

The major distinction with energy-efficient gas clothes dryer models is that they incorporate termination controls to sense dryness and turn off automatically. The most efficient models have moisture sensors in the drum for sensing dryness, while other lower cost and slightly less efficient models infer dryness by sensing the temperature of the exhaust air. The majority of the retail models currently available employ some type of dryness sensing technology but it is unclear how often homeowners use these controls.

Other

Insulating Pool Covers

Between 30% and 50% of the heat loss from a swimming pool is due to evaporation. In an outdoor pool, this heat loss either adds to the cost of heating the pool or shortens the swimming season. Evaporation also increases the quantity of chemicals that must be added to the pool. A pool cover can reduce evaporation and other heat losses but can also reduce heat gains depending on the design. An insulating vinyl pool cover is assumed for this analysis. Although substantially more expensive than the bubble type covers, insulating vinyl pool covers are much more robust and, thus, have much longer lifetimes. They are also more effective at trapping heat.

Heat Pump Pool Heaters

Air-source heat pumps can be used to replace electric or gas-fired pool heaters. The principal of operation for these types of heat pumps is very similar to refrigerators and air conditioning units in that they are used to transfer heat from one place to another. This allows them to be significantly more efficient than electric or gas-fired pool heaters since these types of heaters generate heat rather than transferring it.

High-Efficiency Gas-Fired Pool Heaters

High-efficiency pool heaters incorporate advanced heat exchangers, forced draft combustion systems, pilot-less ignitions and innovations in hydraulics, which result in performance efficiencies that range between 90% and 95%, compared to efficiencies of 80% to 85% for standard models.

Solar Pool Heaters

Unlike other types of solar hot water systems, solar pool heaters do not include storage tanks or heat exchangers and, since they are only used in warmer weather, they generally employ unglazed solar collectors that are composed of a polymer. These collectors are mounted on the roofs of homes or in an unshaded part of the yard. The heat transfer fluid is usually pool water that is pumped directly into the array of collectors and flows within the polymer in a serpentine array in order to pick up heat. Although solar DHW systems do require a pump, its consumption is similar to that used in electric and gas-fired pool heaters.

Solar pool heaters can completely offset the energy requirements of conventional pool heaters and, since they are much simpler than solar DHW systems, they are also much more affordable.

Micro-Combined Heat and Power (CHP)

Several types of micro-combustion heat and power (micro-CHP) systems are either available or under development. These units all generate electrical power and capture the resulting “waste” heat for space and/or water heating. Reciprocating engine units such as the Honda Freewatt use a well-developed technology and can be scaled to a residential size. Power generating efficiencies range from 20%-40% and up to 90% of the waste heat can be captured. Various sizing and control strategies can be used, e.g., the amount of heat can be maximized or the amount of electricity can be maximized. This example assumes a unit such as the Honda Freewatt hydronic system, which has a 1.2 kW maximum electrical output and a 3.5 kW thermal output. Heat load following control is assumed to avoid fuel switching, however power load following control is usually more economically attractive for applications involving seasonally varying loads. A back-up boiler is included in the Honda Freewatt package. Net metering is assumed.

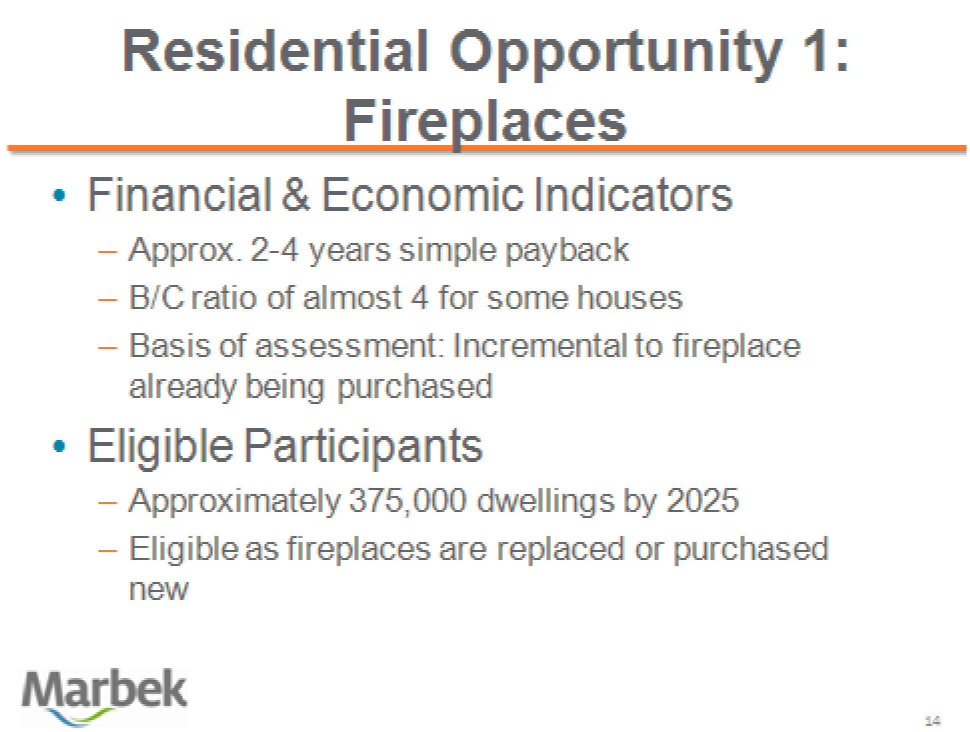
Appendix D

Background - Section 8: Achievable Workshop Action Profile Slides

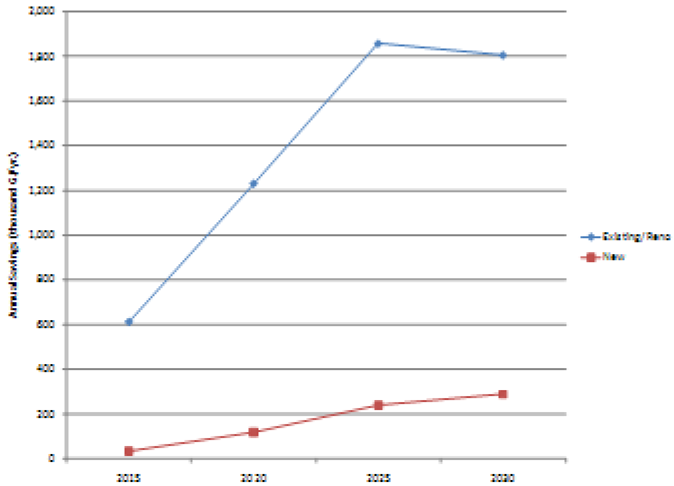
Introduction

Exhibit D1 through Exhibit D6 show the slides that were prepared before the Achievable Potential workshop to provide participants with background information on each of the measures discussed.

Exhibit D 1 Residential Action Profile Slides, Opportunity 1



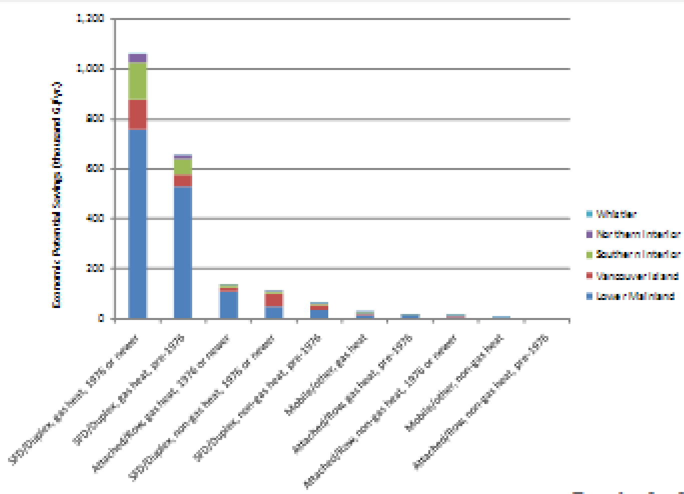
Residential Opportunity 1: Fireplaces



Marbek

15

Residential Opportunity 1: Fireplaces



Results for 2030

Marbek

16

Exhibit D 2 Residential Action Profile Slides, Opportunity 2

Residential Opportunity 2: Basement Insulation

- Technology Description
  - Measure involves adding basement insulation to an already-planned basement renovation project
- Discussion Dwelling Type: Pre-1976 single detached
- Typical Application
  - Cost: estimated at $1,400 installed
  - Useful life: 30 years
  - Savings: approx 12% of space heating energy

Marbek

17

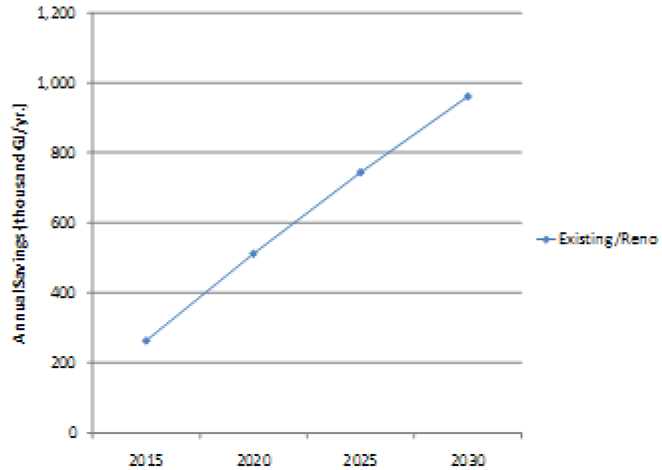
Residential Opportunity 2: Basement Insulation

- Financial & Economic Indicators
  - Approx. 14 years simple payback
  - B/C ratio = just over 1 for some house types and regions
  - Basis of assessment: Incremental to renovation project
- Eligible Participants
  - Approximately 110,000 dwellings by 2030
  - Eligible as basement renovations are planned

Marbek

18

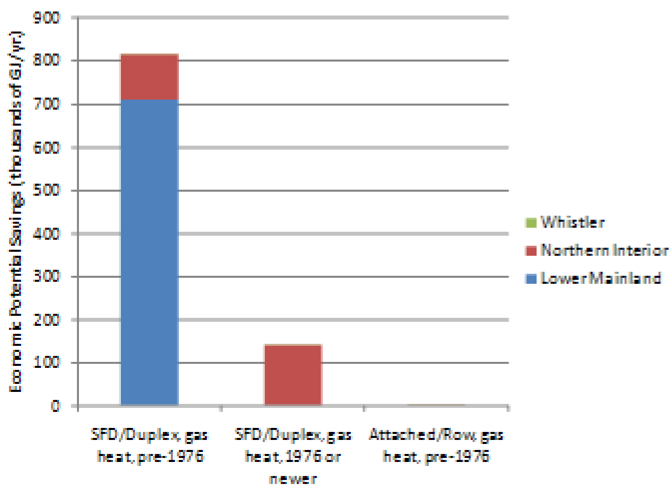
Residential Opportunity 2: Basement Insulation



Marbek

19

Residential Opportunity 2: Basement Insulation



Results for 2030

20

Exhibit D 3 Residential Action Profile Slides, Opportunity 3

Residential Opportunity 3: Solar Pool Heaters

- Technology Description
  - Measure involves installing solar pool heaters, ideally instead of gas heaters (but could be as well)
- Discussion Dwelling Type: Existing single detached
- Typical Application
  - Cost: estimated at $3,450 full cost installed
  - Useful life: 20 years
  - Savings: can be 100% of pool heater energy

Marbek

21

Residential Opportunity 3: Solar Pool Heaters

- Financial & Economic Indicators
  - Approx. 9 years simple payback
  - B/C ratio of about 1.25
  - Basis of assessment: full cost
- Eligible Participants
  - Approximately 30,000 pools by 2030
  - Eligible immediately, with new pools done as they are installed

Marbek

Residential Opportunity 3: Solar Pool Heaters

Results for 2030

24

Exhibit D 4 Residential Action Profile Slides, Opportunity 4

Residential Opportunity 4: Ultra Low-flow Showerheads

- Technology Description
  - Measure involves installing ultra low-flow showerheads: 1.25 gpm (4.75 lpm)
- Discussion Dwelling Type: Existing single detached
- Typical Application
  - Cost: estimated at $13 full cost, installed by owner
  - Useful life: 10 years
  - Savings: 37.5% of shower, or nearly 10% of DHW

Marbek

25

Residential Opportunity 4: Ultra Low-flow Showerheads

- Financial & Economic Indicators
  - Less than 1 year simple payback
  - B/C ratio of about 10
  - Basis of assessment: full cost
- Eligible Participants
  - Over 400,000 households in 2015 (declining due to naturally-occurring installations)
  - Eligible immediately

Marbek

Residential Opportunity 5: Furnace Early Retirement

- Technology Description
  - Measure involves replacing existing furnaces before end of life with new (90%) furnaces
  - Numbers are based on replacement at 9 years, halfway through life
  - Higher efficiency (96%) furnaces are a separate measure
- Discussion Dwelling Type: Existing single detached

Marbek

29

Residential Opportunity 5: Furnace Early Retirement

- Typical Application
  - Cost: estimated at $1,860 net of same cost discounted by 9 years
  - Useful life: 9 years (until normal replacement)
  - Savings: approx. 14% of space heating energy
- Financial & Economic Indicators
  - Payback is longer than the 9-year useful life
  - B/C ratio of about 0.3
  - Basis of assessment: incremental

Marbek

30

Residential Opportunity 5: Furnace Early Retirement

- Eligible Participants
  - Over 480,000 households in 2020 (declining due to naturally-occurring installations)
  - Eligible as furnaces exceed 9 years of age – do oldest ones first

Marbek

Appendix F **Background – Section 8: Achievable Workshop Discussion Summaries**

Introduction

Appendix F provides a summary of the discussions on each of the actions discussed during the Achievable Potential workshop.

Action R1 – Gas Fireplaces

- Non-energy/design factors drive consumer demand more than energy efficiency. Style requirements are usually paramount.
- Bulk of sales are "zero clearance" models, where geometry is very similar, restricting upgrade options.
- Most pre-1990 fireplaces are more difficult to replace, as there may be restrictions on venting, etc.
- Is there a portion that may switch their fireplaces to electric? Probably, mostly in apartment buildings.
- Many fireplaces are essentially decorative. Efficiency can be between 0%-40%.
- Note that fireplaces are "localized," zoned heat, which is an inherently more efficient way to use heat (analogous to task lighting).
- Only a few manufacturers are making an 80% efficient fireplace. Typically there are no retrofit challenges, but would require replacement of venting.
- Baseline of 60% efficiency is probably too high (80% for the upgrade is probably too high as well). Overall savings are likely realistic (maybe 50%-70%, 55%-75%). Installed base is likely around 40% on average.
- Challenges to selling energy-efficient fireplaces: People say efficiency is important, but it may not be as high in reality.
- Most decisions made at dealership level. Dealer can influence decision. FortisBC has incentivized dealers/salespeople in the past. Joint incentive (dealer/customer) may be an appropriate approach.
- This may be attractive when included in a complete renovation.
- Research shows that ENERGY STAR® is driving purchase decisions for many products. There is an EnerChoice rating for fireplaces (64%, 62% for inserts). Barrier: Lack of customer recognition of EnerChoice.
- May be attractive to roll into LiveSmart program.
- Gas permit generally required for fireplace retrofit.
- Federal tax credit did move the market in the recent past.
- Other energy-efficiency features: pilot on/off, programmed pilot system (i.e., if fireplace has not been used in five days, the pilot light shuts itself off automatically).

- Permitting authority may be a contact point for delivery of educational materials, etc.

Action R2 – Basement Insulation

- Generally requires an energy audit: difficult to get uptake on audit at outset. No strong relationship with trade allies.
- LiveSmart has been incentivizing these sorts of retrofits. Incentives are currently quite modest, especially without NRCan incentive (making it a tough sell for the installers).
- Long payback a barrier for those not planning on remaining in the same house over the long term. Does not increase resale value of the home commensurately with the expense.
- Opportunity to sell non-energy benefits. Those looking only at payback are tougher sell. About 80% of customers in the "what's in it for me" group.
- Lower Mainland market - a driver is the installation of basement apartments.
- Adding EnerGuide rating to MLS listing could be a driver.
- Barrier: big ticket items viewed as capital investment.
- Simplifying/educating is important.
- Potential partners: BC Hydro, installers, realtors. Recent research indicates rated homes sell faster.
- Some pushback from MLS (fear that low-end homes will be more difficult to sell).
- Important for trades to "cross sell": insulation/windows/etc.
- Possible delivery channels: building supply stores, contractors, possibly realtors.

Action R3 – Solar Pool Heaters

- FortisBC has no prior program experience in this area.
- Barrier: lack of information, lack of actual savings data, technical approval etc. (also educating consumers about the high gas consumption of pool heaters is important).
- Role for FortisBC to pilot/test performance. Could talk to existing customers who use solar pool heaters.
- Fairly well established technology. Natural growth quite high. (REUS only showed about 1%). Delivery system should be well established.
- Could include indoor pools.
- Pool contractors are likely main installers (also Solar BC, possibly plumbers dealing with boilers).
- Panels on the roof are a cosmetic "turn off" for some people.

Action R4 – Ultra Low-Flow Showerheads

- Barriers: perception of low quality. Reduction of perceived service is an issue for some people.
- Take out rate probably fairly high (20%-25% is the approximate level in other jurisdictions)
- May be limited market (such as people who are energy price conscious, environmentally-conscious, landlords or other people who are not direct users of the shower being retrofitted).

Action R5 – Furnace Early Retirement

- Could be offered in conjunction with renovations so that furnace size could be reduced. Logic in grouping these is to avoid over sizing of equipment. Some incentive in terms of reduced equipment cost for furnace down sizing (approximately $200 for reducing from 80 to 60 MBH).
- Majority of furnaces are replaced at failure.
- REUS: 140,000 or more furnaces are older than 15 years in the Lower Mainland alone.
- EnerGuide credits are a driver during renovations.
- Potential partners: renovation contractors, energy advisors, service contractors.
- Potential to pay furnace service contractor incentive for replaced furnaces? (SPIFs can lead to unnecessary replacements).
- Interest-free loans/financing? (Dealers often offer financing.)
- Could incentivize replacement of furnaces older than a specific age (below mid-efficiency).
- Incentive could be distributed to customer or retailers/installers.
- Currently, incentives are $750/$1,000 through LiveSmart BC (for 95% furnace). FortisBC would have to incentivize beyond this.
- Little capacity within contracting community. Off-season program may be way to go.
- Close to 100% of LiveSmart participants replaced the furnace as part of their project.

Action R6 – Attic Insulation

- Not discussed during workshop.

Executive Summary

Background and Objectives

This Conservation Potential Review (CPR) provides FortisBC Energy Utilities ("FortisBC") with a comprehensive planning document that the company can use on an ongoing basis to:

- Develop a long-range energy-efficiency strategy
- Design and implement energy-efficiency programs
- Assess the impact of energy-efficiency programs on both peak and annual loads
- Set annual energy-efficiency targets and budgets.

Summary of Findings

This report covers the results for the Commercial sector; results for the Residential and Industrial sectors are provided in separate reports.

The study findings confirm the existence of significant potential cost-effective natural gas efficiency improvements in British Columbia's Commercial sector. In the *most likely* and *aggressive* Achievable scenarios those energy-efficiency improvements would provide between 4,915,000 and 6,633,000 GJ/yr. of savings in 2030 as well as peak day load reductions of approximately 38,000 to 51,000 GJ. Savings are primarily associated with the space heating and water heating end uses, with approximately two-thirds of the savings in both Achievable scenarios associated with space heating measures.

Four measures each account for more than 10% of the savings in both the *most likely* and *aggressive* Achievable scenarios. These are, in order of their contribution; operations & maintenance measures, advanced building automation systems/recommissioning, high efficiency boilers, and low flow plumbing fixtures. These four measures represent 69% of the *most likely* Achievable scenario savings and 65% of the *aggressive* Achievable scenario savings.

Scope

Sector Coverage: The study addresses three sectors: Residential, Commercial/Institutional (this report) [1] and Industrial. In contrast to the 2006 CPR, which excluded FortisBC's (then, Terasen Gas) 300 largest manufacturing accounts, this CPR includes all of FortisBC's customers.

Geographical Coverage: The study results are presented for the total FortisBC service region and for the five service areas of: Lower Mainland, Vancouver Island, Whistler, Northern Inland and Southern Inland.

Study Period: The Base Year for this study is calendar year 2010. The time period covered by this study is to 2030, with milestones at the intervening years of 2015, 2020 and 2025.

Technologies: The study addresses energy-efficiency, customer behaviour and alternative energy options such as renewables and combined heat and power technologies.

[1] Throughout this report, use of the word "commercial" includes both commercial and institutional buildings unless otherwise noted.

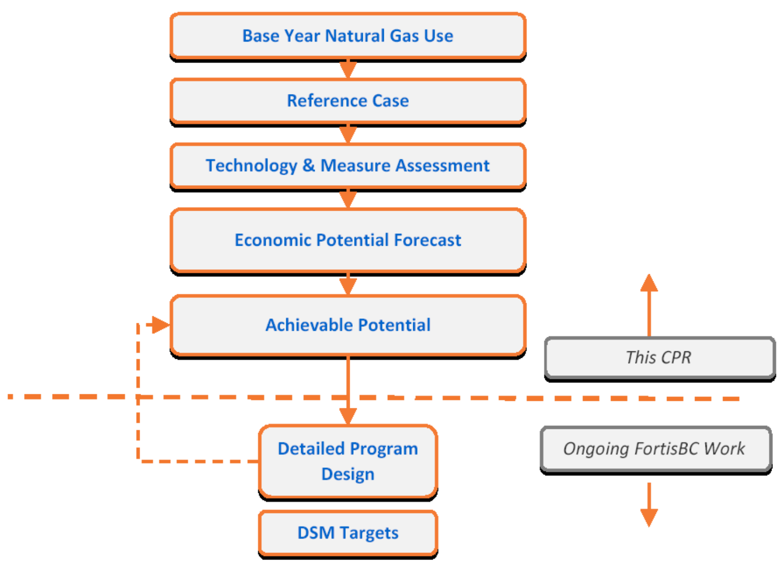
Relation to Previous B.C. CPRs: This study builds on the substantial body of information and modelling work prepared in previous CPR studies conducted for FortisBC (then Terasen Gas) (2006) and BC Hydro (2007). The data set for this study, however, includes FortisBC customers only, an important difference in relation to the above-mentioned studies.

Approach

The detailed end-use analysis of energy-efficiency opportunities in the Commercial sector employed two linked modelling platforms: CEEAM (Commercial Energy and Emissions Analysis Model), an in-house commercial building energy-use simulation modeling platform, and CSEEM (Commercial Sector Energy End-use Model), a spreadsheet-based macro model, also developed by Marbek in-house.

The major steps involved in the analysis are shown in Exhibit ES 1 and are discussed in Section 2. As illustrated, the results of this CPR study, and in particular the estimation of Achievable Potential, support on-going demand side management (DSM) planning work. However, it should be emphasized that the estimation of Achievable Potential is not synonymous with either the setting of specific program targets or with program design.

Exhibit ES 1 CPR 2010: Main Analytical Steps



Base Year Natural Gas Use

In the Base Year of 2010, FortisBC's Commercial sector customers consumed approximately 57,000,000 GJ. Exhibits E2 and E3, respectively, provide additional details on the major end uses and sub sectors where Commercial sector natural gas consumption occurs.

Exhibit ES 2 shows that space heating accounts for approximately 59% of the total Commercial sector natural gas use. Domestic hot water heating is the next largest end use, accounting for approximately 25% of total commercial natural gas use, followed by commercial cooking (9%). Other end uses such as dehumidification, steam system distribution losses, laundry equipment, and pool heating account for about 7% of commercial natural gas use.

Exhibit ES 3 shows that Small Commercial buildings account for about 30% of natural gas consumption followed by Large and Medium Apartments, (approximately 25% combined). No other sub sector accounts for more than 10% of Commercial sector natural gas use.

Exhibit ES 2 Base Year Commercial Natural Gas Consumption by End Use[2]

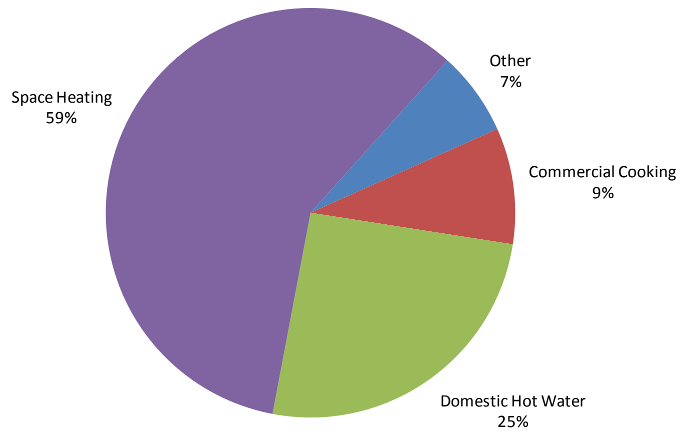


Exhibit ES 3 Base Year Commercial Natural Gas Consumption by Sub Sector

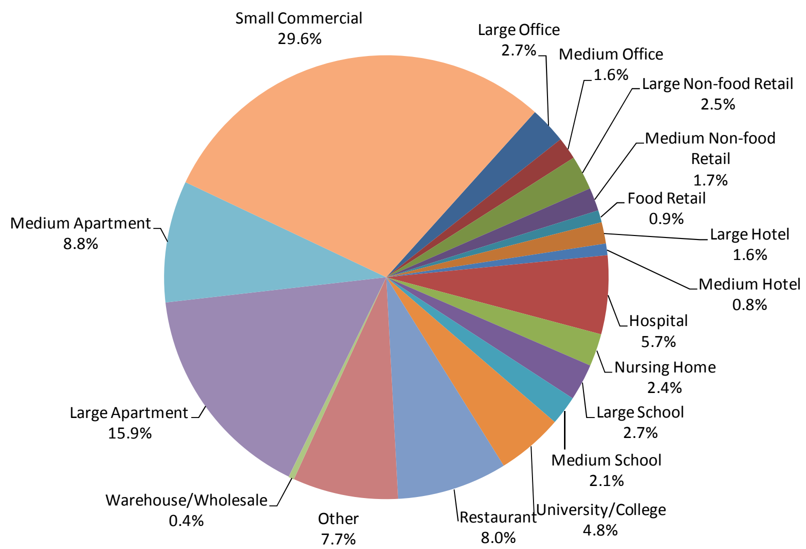


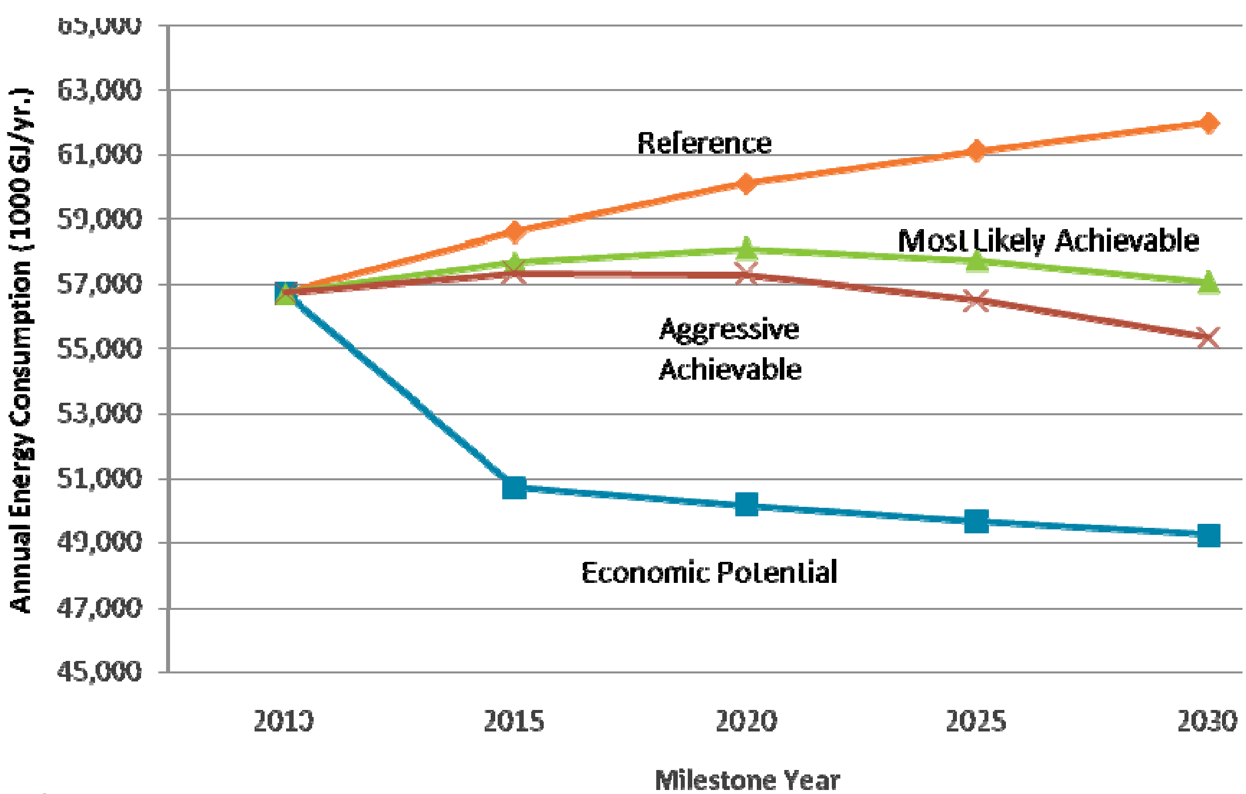
[2] End-use distributions shown are based on the results of modelled sub sectors.

Results and Findings

A summary of the levels of annual natural gas consumption contained in the Reference Case and each of three energy-efficiency forecasts, by milestone year, is presented in Exhibit ES 4 and discussed briefly in the paragraphs below.

Exhibit ES 4 Summary of Forecast Results, Energy Efficiency (1000 GJ/yr.)

	Annual Consumption (1000 GJ/year)					Potential Annual Savings		
				Achievable			Achievable	
Year	Base Year	Ref. Case	Economic	Most Likely	Aggressive	Economic	Most Likely	Aggressive
2010	56,730	56,730						
2015		58,607	50,714	57,676	57,332	7,893	930	1,275
2020		60,095	50,137	58,104	57,286	9,958	1,991	2,809
2025		61,118	49,622	57,739	56,498	11,496	3,379	4,619
2030		61,977	49,225	57,062	55,344	12,752	4,915	6,633



Reference Case

In the absence of continued DSM initiatives, the study estimates that natural gas consumption in the Commercial sector will increase from the Base Year (2010) consumption of approximately 56,730,000 GJ/yr. to 60,095,000 GJ/yr. by 2020 and 61,977,000 GJ/yr. by 2030. This represents an overall increase of about 9% in the period.

Economic Potential Forecast

Under the conditions of the Economic Potential Forecast, the study estimated that consumption in the Commercial sector would decline to about 49,225,000 GJ/yr. by 2030. Annual savings relative to the Reference Case are about 12,752,000 GJ/yr. or about 22%. The Economic Potential annual savings are about 9,958,000 GJ/yr. in 2020.

Achievable Potential – Energy-efficiency Scenario

A selection of the natural gas savings opportunities identified in the Economic Potential Forecast was discussed in a full-day workshop. The guided participant discussions provided estimated levels of participation under a *most likely* scenario of program activity and an *aggressive* scenario of program activity. These levels were applied to the Economic Potential savings to estimate the Achievable Potential for these two scenarios. For technologies not specifically discussed in the workshops, participation levels were estimated through extrapolation from the technologies that were discussed. Results by sub sector, end use and individual measure for both Achievable scenarios are presented in Exhibit ES 5 through ES 12.

Exhibit ES 5 Natural Gas Savings for the Total FortisBC Service Area by Sub Sector and Milestone Year (GJ/yr.) - Most Likely Achievable Scenario

Multiple	O&M Measures	241,403	474,158	698,360	914,103	13.8%	1.38
Space Heating	Roof Insulation	3,442	25,847	84,415	195,136	2.9%	1.26
Space Heating	Condensing Unit Htr.	82	313	665	1,109	0.0%	1.21
Domestic Hot Water	Drainwater Heat Recovery	630	2,292	4,797	7,910	0.1%	1.19
Space Heating	HVLS Fans	939	1,793	2,554	3,207	0.0%	1.19
Space Heating	Demand Ctrl Vent.	1,298	2,464	3,469	4,295	0.1%	1.17
Space Heating	Infrared Heaters	0	1,838	3,474	4,884	0.1%	1.16
Multiple	Small Commercial	334,939	753,649	1,263,001	1,846,194	27.8%	-
Multiple	Other	84,288	191,639	322,624	473,670	7.1%	-
Grand Total		1,274,993	2,808,920	4,619,354	6,633,079	100%	3.32

Note that individual measures were not applied in the "Small Commercial" and "Other" sub sectors. Potential savings in these subsectors are estimated based on results of detailed modelling and analysis in other subsectors. See section 3.1 for a description of the treatment of these two sub sectors.

Peak Day Load Impacts – Energy-efficiency Scenarios

The peak day savings associated with each of the Achievable energy-efficiency scenarios were calculated using load factor data provided by FortisBC. The results are summarized in Exhibit ES 11 and Exhibit ES 12. As illustrated, the Achievable peak day savings in 2030 range from a decrease of about 38,000 GJ (*most likely* scenario) to a decrease of approximately 51,000 GJ (*aggressive* scenario) for the total FortisBC service region.

Exhibit ES 11 Peak Day Capacity Impacts, By Scenario, Service Region and Milestone Year (GJ) - Most Likely Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	4,714	744	802	849	31	7,141
2020	9,904	1,675	1,753	1,883	66	15,281
2025	16,637	2,977	3,012	3,197	113	25,936
2030	23,786	4,537	4,502	4,740	164	37,729
Savings 2030 Relative to Total 2030 Savings	**63%**	**12%**	**12%**	**13%**	**0.4%**	**100%**

Exhibit ES 12 Peak Day Capacity Impacts, By Scenario, Service Region and Milestone Year (GJ) – Aggressive Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	6,424	1,058	1,061	1,202	42	9,787
2020	13,983	2,461	2,401	2,623	94	21,562
2025	22,688	4,212	4,092	4,314	154	35,459
2030	32,115	6,298	6,100	6,182	221	50,917
Savings 2030 Relative to Total 2030 Savings	**63%**	**12%**	**12%**	**12%**	**0.4%**	**100%**

Greenhouse Gas Impacts – Energy-efficiency Scenarios

The natural gas savings associated with each of the Achievable energy-efficiency scenarios shown in Exhibit ES 13 and Exhibit ES 14 would result in significant greenhouse gas (GHG) reductions. The study estimated that in 2030 the natural gas efficiency measures contained in the *aggressive* and *most likely* Achievable Potential scenarios would reduce GHG emissions by, respectively, 338,000 and 250,000 of CO_2e/yr.

Exhibit ES 13 Estimated GHG Emission Reductions, By Scenario and Milestone Year (tonnes CO_2e/yr.) – Most Likely Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	31,274	4,933	5,321	5,635	206	47,369
2020	65,701	11,108	11,626	12,493	440	101,368
2025	110,366	19,747	19,978	21,209	747	172,047
2030	157,787	30,100	29,865	31,444	1,087	250,283
Savings 2030 Relative to Total 2030 Savings	**63%**	**12%**	**12%**	**13%**	**0.4%**	**100%**

Exhibit ES 14 Estimated GHG Emission Reductions, By Scenario and Milestone Year (tonnes CO_2e/yr) – Aggressive Achievable Scenario

1 Introduction

1.1 Background and Objectives

This Conservation Potential Review (CPR) provides FortisBC (formerly Terasen Gas) with a comprehensive planning document that the company can use on an ongoing basis to:

- Develop a long-range energy-efficiency strategy
- Design and implement energy-efficiency programs
- Assess the impact of energy-efficiency programs on both peak and annual load
- Set annual energy-efficiency targets and budgets.

1.2 Study Scope

Sector Coverage: The study addresses three sectors: Residential, Commercial/Institutional[3] and Industrial. In contrast to the 2006 CPR, which excluded FortisBC's 300 largest manufacturing accounts, this CPR includes all of FortisBC's customers.

Geographical Coverage: The study results are presented for the total FortisBC service region and for the five service areas of: Lower Mainland, Vancouver Island, Whistler,[4] Northern Interior, and Southern Interior.

Study Period: The Base Year for this study is calendar year 2010. The time period covered by this study is to 2030, with milestones at the intervening years of 2015, 2020, and 2025.

Technologies: The study addresses energy-efficiency, customer behaviour and alternative energy options such as renewables and combined heat and power technologies.

Relation to Previous B.C. CPRs: This study builds on the substantial body of information and modelling work prepared in previous CPR studies conducted for FortisBC (then Terasen Gas) (2006) and BC Hydro (2007). The data set for this study, however, includes FortisBC customers only, an important difference in relation to the above-mentioned studies.

1.2.1 *Data Caveat*

As in any study of this type, the results presented in this report are based on a large number of important assumptions. Assumptions such as those related to the current penetration of energy-efficient technologies, the rate of future growth in the stock of commercial buildings and customer willingness to implement new energy-efficiency measures are particularly influential. Wherever possible, the assumptions used in this study are consistent with those used by FortisBC and are based on best available information, which in many cases includes the professional judgement of the consultant team, FortisBC personnel and local experts. The reader should, therefore, use the results presented in this report as best available estimates; major assumptions, information sources and caveats are noted throughout the report.

[3] Throughout this report, use of the word "commercial" includes both commercial and institutional buildings unless otherwise noted.
[4] Due to data limitations, sales data for the Whistler service region are not disaggregated by sub sector and include all non-residential sales.

1.3 Study Organization

The study has been organized into four areas:

- **Three individual sector reports** (Residential, Commercial and Industrial) that provide an assessment of the technical opportunities for more efficient use of natural gas within each sector. A summary report will bring together the findings of all three sectors.
- **A commercial end-use survey (CEUS)** that provides insight into current natural gas equipment efficiency levels, fuel share and annual consumption levels within key commercial sub sectors. The CEUS results were used to refine the Commercial sector building archetypes employed in the assessment of technical opportunities.
- **A summary and employment impact report** that brings together the findings of the Residential, Commercial and Industrial sectors, together with an estimate of the net job creation and other economic effects attributable to the achievable efficiency results within the three sectors.
- **An options paper** that outlines alternative approaches to the assessment of cost-effective levels of DSM activity outside of the California Standard Practice tests.

1.4 This Report

This report presents the Commercial sector results and is organized as follows:

- **Section 2** presents an overview of the study methodology, including a definition of key terms and an outline of the major analytic steps involved.
- **Section 3** presents a profile of Commercial sector Base Year natural gas use in the total FortisBC service area as well as in the five individual service regions.
- **Section 4** presents the Commercial sector Reference Case, which provides a detailed estimate of natural gas use within the total FortisBC service area and each of the five service regions over the study period 2010 to 2030, in the absence of new DSM program initiatives.
- **Section 5** identifies and assesses the economic attractiveness of energy-efficiency behaviour and alternative energy technology options within the Commercial sector.
- **Section 6** presents the Commercial sector Economic Potential Forecast for the study period 2010 to 2030.
- **Section 7** estimates the proportion of energy savings identified in the Economic Potential Forecast that can realistically be achieved within the study period. Impacts on peak day loads and greenhouse gas emissions are also presented.
- **Section 8** lists sources and references.
- **Section 9** is a glossary of terms.

1.5 Results Presentation

The preparation of Conservation Potential Reviews involves the compilation and analysis of an enormous amount of market and technology data and a nearly infinite number of ways of organizing and presenting the results. It is recognized that readers will have differing needs with respect to the level of detail that they require. Consequently, the results of this CPR are presented at three levels of detail.

- **Main report body:** The main body of the report provides a relatively high level reporting of the main steps involved in undertaking each stage of the study together with a concise summary of results, including comments and interpretation of key findings. It is assumed that the content and level of detail in the main report body is suitable for the majority of readers who wish to gain an understanding of the potential contribution of energy-efficiency and alternative energy options to FortisBC's long-term natural gas requirements.

- **Appendices:** A separate appendix accompanies each major chapter of the main report. Each appendix provides more detailed information on the methodology employed, including major assumptions or sample calculations as applicable, together with additional detailed results. It is assumed that this presentation is better suited to DSM analysts and managers wishing a more thorough understanding of the study results.

- **Software:** All of the data generated by the study is provided in two custom-designed Excel models: Data Manager and the Measure TRC model.

  - Data Manager is a custom-designed query protocol that enables the user to search and report the study results in a virtually infinite number of combinations. Data Manager is intended to support the most detailed level of DSM activity, DSM program design, preparation of regulatory submissions etc.

  - The Measure TRC model is a custom-designed model that provides comprehensive profiles of all of the DSM measures assessed within the study. Because the information is provided is software form, any changes to economic, financial or performance data inputs can be easily accommodated and revised results generated automatically.

2 Study Methodology

This section provides an overview of the methodology employed for this study. More specifically, it addresses:

- Definition of terms
- Major analytical steps
- Key economic inputs
- Analytic models.

2.1 Definition of Terms

This study employs numerous terms that are unique to analyses such as this one and consequently it is important to ensure that all readers have a clear understanding of what each term means when applied to this study. Below is a brief description of some of the most important terms.

Base Year — The Base Year is the starting point for the analysis. It provides a detailed description of "where" and "how" energy is currently used in the existing Commercial sector building stock. Building energy-use simulations were undertaken for each building type to support the construction of the Base Year.

Reference Case (includes Natural Conservation) — The Reference Case estimates the expected level of natural gas consumption that would occur over the study period in the absence of new DSM program initiatives. It provides the point of comparison for the subsequent calculation of "economic" and "achievable" savings potentials. Creation of the Reference Case required the development of detailed profiles for new buildings in each of the building segments, estimation of the expected growth in building stock, estimation of the likely impacts of new building and equipment standards and, finally an estimation of "natural" changes affecting energy consumption over the study period.

Technology Assessment — Energy-efficiency and alternative energy options were identified that met the criteria, as outlined above in the study's scope. Technology cost and performance data were compiled relative to the baseline technology and the measure total resource cost (TRC) was calculated for each option.

The measure TRC calculates the net present value of energy savings that result from an investment in an efficiency, behaviour or alternative energy technology or measure. The measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and O&M costs. This calculation includes, among others, the following inputs: the avoided natural gas and electricity supply costs, the life of the technology, and the selected discount rate, which in this analysis has been set at 7.38% for most of the regions and 6.87% for Vancouver Island.

Economic Potential Forecast — The Economic Potential Forecast is the level of energy consumption that would occur if all buildings were upgraded to the level that is cost effective, from FortisBC's perspective, when using lifecycle costing with the long-run avoided cost of new natural gas supply. All the energy-efficiency, behaviour and alternative energy options included in the technology assessment that had a positive measure TRC were incorporated into the Economic Potential Forecast.

Achievable Potential

The Achievable Potential is the proportion of the savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. Achievable Potential recognizes that it is difficult to induce customers to purchase and install all the energy-efficiency/alternative energy or behaviour options that meet the criteria defined by the Economic Potential Forecast. The results are presented as a range, defined as *most likely* and *aggressive*.

Estimates provided were developed in a workshop involving FortisBC energy-efficiency program personnel, trade allies, selected external experts and the consulting team.

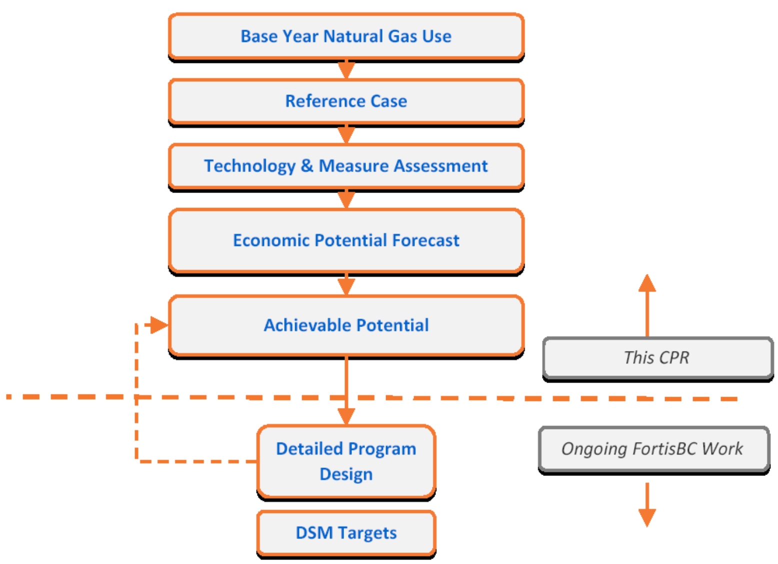
Peak Day Load Impacts

Load factors provided by FortisBC were used to derive peak day load impacts from the energy consumption values contained in each of the potential estimates noted above.

2.2 Overview of Approach

To meet the objectives outlined above, the study was conducted within an iterative process that involved a number of well-defined steps, as outlined in Exhibit 1. At the completion of each step, the client reviewed the results and, as applicable, revisions were identified and incorporated into the interim results. The study then progressed to the next step.

Exhibit 1 CPR 2010: Main Analytical Steps



A summary of the steps is presented below.

Step 1: Develop Base Year Calibration Using Actual FortisBC Billing Data

- Compile and analyze available data on British Columbia's existing building stock.
- Develop detailed technical descriptions of the existing building stock.
- Undertake computer simulations of energy use in each building type and compare these with actual building billing and audit data.
- Compile actual FortisBC billing data.
- Create sector model inputs and generate results.
- Calibrate sector model results using actual billing data.

Step 2: Develop Reference Case

- Compile and analyze building design, equipment and operations data and develop detailed technical descriptions of the new building stock.
- Develop computer simulations of energy use in each new building type.
- Compile data on forecast levels of building stock growth and "natural" changes in equipment efficiency levels and/or practices.
- Define sector model inputs and create forecasts of energy use for each of the milestone years.
- Calibrate with FortisBC Forecast.

Step 3: Develop and Assess Energy-efficiency and Alternative Energy Options

- Develop list of energy-efficiency and alternative energy measures.
- Compile detailed cost and performance data for each measure.
- Identify the baseline technologies employed in the Reference Case.
- Develop energy-efficiency and/or alternative options for each end use.
- Compile economic data, including current and forecast costs for new supply of natural gas and electricity generation.
- Determine the measure TRC for each energy-efficiency and alternative energy option.

Step 4: Estimate Economic Energy-efficiency and Alternative Energy Potential

- Screen the identified energy-efficiency and alternative energy measures from Step 3 against the economic data.
- Identify the combinations of energy-efficiency measures and building types where the measure TRC is positive.
- Apply the economically attractive energy-efficiency measures from Step 3 within the energy-use simulation model developed previously for each building type.
- Determine annual natural gas consumption in each building type when the economic efficiency measures are employed.
- Compare the consumption levels when all economic efficiency measures are used with the Reference Case consumption levels and calculate the natural gas consumption impacts.

Step 5: Estimate Achievable Savings Potential

- "Bundle" the energy-efficiency, alternative energy and customer behaviour options identified in the Economic Potential Forecast into a set of Actions.
- Create "Action Profiles" for each of the identified Actions that provide a high level rationale and direction, including target technologies and sub markets as well as key barriers and a broad intervention strategy.
- Review historical Achievable program results and prepare preliminary Action Assessment Worksheets.

- Consult with FortisBC personnel, review preliminary estimates and reach general agreement on *most likely* and *aggressive* range of Achievable Potential.

Step 6: Estimate Peak Day Load Impacts of Economic and Achievable Savings Potential

- Annual energy decreases/increases contained in each of the energy-efficiency/alternative energy forecasts were converted to average daily values based on annual load profile data provided by FortisBC.
- Load factors that correlate "average" to "peak" consumption were provided by FortisBC for each rate class and service region.
- Peak day load impacts were calculated for each of the energy-efficiency and fuel choice scenario results by applying the above load factors.

2.3 Analytical Models

The analysis of the Commercial sector employs two linked modelling platforms. They are:

- CEEAM (Commercial Energy and Emissions Analysis Model), an in-house, simulation model developed in conjunction with Natural Resources Canada (NRCan) for modelling energy use in commercial/institutional building stock.
- CSEEM *(*Commercial Sector Energy End-use Model), an in-house spreadsheet-based macro model.

CEEAM was used to develop commercial energy end-use intensities (EUIs) for each of the commercial and institutional building archetypes. CEEAM has been successfully employed in numerous domestic and international CDM projects. Domestically, this includes assignments for BC Hydro, FortisBC, Manitoba Hydro, the Ontario Power Authority, Enbridge Gas, Union Gas, NB Power, Newfoundland Power, Newfoundland Labrador Hydro and NRCan. CEEAM is a robust modelling platform and its results have been verified against actual end-use metered data for commercial buildings in the cities of Ottawa and Toronto and against commercially supported software.[5]

CEEAM was developed specifically for applications such as this study. One of its particular strengths is the capability to simulate energy performance not only in a given building but also in an entire stock of similar buildings (e.g., all Large Offices). In particular, it is capable of tracking the penetration of multiple technologies in combinations that are not possible in most commercially available simulation software.

CEEAM simulates the energy consumption and peak load for all energy end uses present in a given commercial building segment. CEEAM calculates energy use and emissions by end use and reports them in kWh/ft^2/yr. and kg eCO_2/ft^2. Because CEEAM is a full modelling program, it calculates both building heating and cooling loads (internal and transmission). It therefore accounts for interactive effects such as the increase in heating energy use and decrease in cooling energy use resulting from lighting retrofits. CEEAM also uses equipment part load performance curves to accurately model the seasonal efficiency of heating and cooling plants.

The commercial EUIs derived by CEEAM provide inputs into CSEEM. CSEEM consists of two modules:

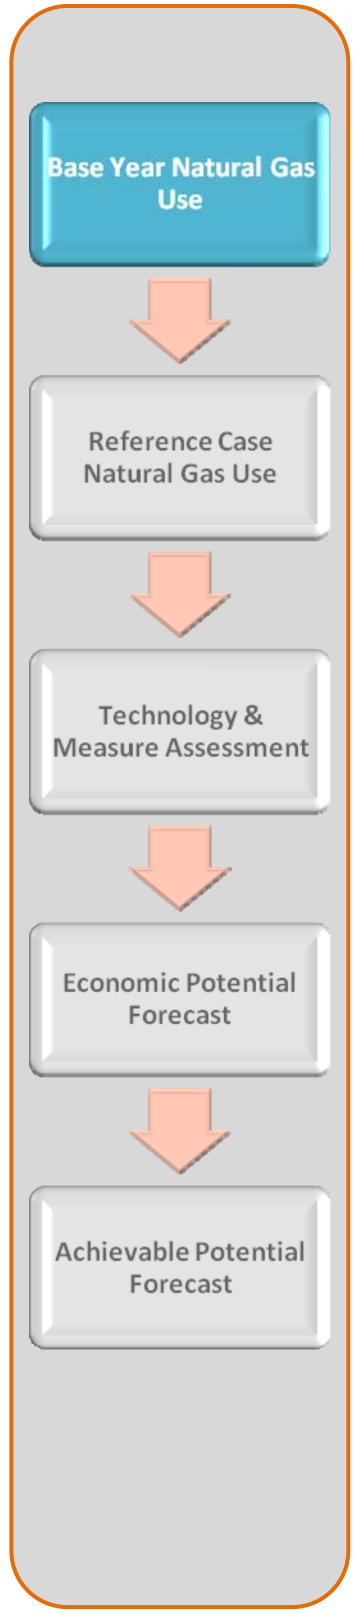
---

[5] CEEAM results have been verified against results generated by DOE-2.1E, a commercially supported building energy simulation software developed and maintained by the U.S. Department of Energy.

- A general parameters module that contains general sector data (e.g., floor space, growth rates, etc.)
- A building profile module that contains the EUI data for each of the selected building sub sectors.

CSEEM combines data from each of these modules and provides total energy use by service region, building sub sector and end use. CSEEM also enables the analyst to estimate the demand impacts of the energy-efficiency measures introduced in the Economic Potential Forecast.

3 Base Year (2010) Natural Gas Use



This section provides a profile of Base Year (2010) natural gas use by FortisBC's Commercial sector customers. It outlines the steps involved in preparing the profile of Base Year natural gas use and presents a summary of the results.

Completion of this section of the study involved the following steps:

- FortisBC's Commercial sector customers were segmented into sub sectors containing buildings with similar energy-use patterns.
- The major energy end uses within the commercial buildings were selected.
- Detailed commercial building archetypes[6] developed in previous CPR studies for FortisBC and BC Hydro were updated using the results of recent Commercial End Use Surveys (CEUS) completed by FortisBC (as part of this study) and BC Hydro as well as other current information describing the commercial building stock. These archetypes were used to create building energy-use models for each sub sector.
- Utility sales data were compiled for each sub sector.
- Utility sales data were combined with the model results showing typical sub sector natural gas use to generate an estimate of floor area for each sub sector.
- The above data was combined using CSEEM to produce the detailed Base Year profile.

A brief description of each of the above steps is provided below, together with a summary of the results. Additional information is provided in Appendix A.

3.1 Commercial Sector Segmentation

The first task in developing the Base Year calibration involved the segmentation of the building stock into specific sub sectors. The choice of building sub sectors is driven by both data availability and the need to facilitate the subsequent analysis and modelling of potential energy-efficiency improvements.

For modelling and analysis of energy-efficiency opportunities, the selected building sub sectors must be reasonably similar in terms of major design and operating considerations, such as building size, typical mechanical systems, annual operating hours, etc.

A summary of the Commercial sub sectors that are used in this study is provided in Exhibit 2.

[6] Each building archetype contains detailed specifications of building envelope, equipment and operating practices for a "typical" building within a specific sub sector.

Exhibit 2 Commercial Sub Sectors

- Large Office
- Medium Office
- Large Non-Food Retail
- Medium Non-Food Retail
- Food Retail / Grocery
- Large Hotel
- Medium Hotel / Motel
- Hospital
- Nursing Home
- Large School
- Medium School
- University/College
- Restaurant
- Warehouse/Wholesale
- Large Apartment
- Medium Apartment
- Small Commercial*
- Recreation and Other*

*Note: Separate building archetypes were not developed for these sub sectors due to the wide variety of building types and equipment included within each.

Further details regarding the building types included in most of the sub sectors shown in Exhibit 2 are provided in Appendix A. Sub sector size cut-offs were chosen to align with both the 2006 CPR and the 2007 BC Hydro CPR. Additional detail is provided below:

- **Large Office, Large Hotel, Large Non-food Retail, Large Apartment**. For the purposes of this study, Large Offices, Large Hotels, Large Non-food Retail buildings and Large Apartments have been defined as buildings with a floor area greater than 100,000 ft^2. As actual floor area data are not available, annual consumption data were used to partition these sub sectors. These cut off points were chosen to align with the 2006 CPR as well as the most recent BC Hydro CPR. Office buildings with annual consumption greater than 3,500 GJ/yr.[7] (~35 MJ/ft^2/yr. * 100,000 ft^2), Hotels with annual consumption greater than 6,000 MJ/yr. (~60 MJ/ ft^2/yr. * 100,000 ft^2), Non-food Retail buildings with annual consumption greater than 3,000 MJ/yr. (~30 MJ/ ft^2/yr. * 100,000 ft^2) and Apartment buildings with annual consumption greater than 6,500 GJ/yr. (~65 MJ/ft^2/yr. * 100,000 ft^2) are included in the Large Office, Large Hotel, Large Non-food Retail and Large Apartment sub sectors, respectively.

- **Medium Office, Medium Hotel/Motel, Medium Non-food Retail, Medium Apartment.** For the purposes of this study, Medium Offices, Medium Hotels/Motels and Medium Apartments have been defined as buildings with a floor area less than 100,000 ft^2 and greater than 50,000 ft^2. Medium Non-food Retail buildings have been defined as buildings with a floor area less than 100,000 ft^2 and greater than 25,000 ft^2. Following the methodology outlined above, Office buildings with annual consumption greater than 1,750 GJ/yr. (~35 MJ/ft^2/yr. * 50,000 ft^2), Hotels with annual consumption greater than 3,000 MJ/yr. (~60 MJ/ ft^2/yr. * 50,000 ft^2), Non-food Retail buildings with annual consumption greater than 850 MJ/yr. (~35 MJ/ ft^2/yr. * 25,000 ft^2) and Apartment buildings with annual consumption greater than 3,000 GJ/yr. (~60 MJ/ft^2/yr. * 50,000 ft^2) but below the respective thresholds for "Large" buildings are included in the Medium Office, Medium Hotel/Motel, Medium Non-food Retail and Medium Apartment sub sectors.

- **Large and Medium School**. For the purposes of this study, Large Schools have been defined as having a floor area greater than 50,000 ft^2, while schools with a floor area of 25,000 ft^2 to 50,000 ft^2 are defined as Medium Schools. Following the methodology outlined above, the

[7] Consumption levels for sub sector size classifications vary only moderately between the Lower Mainland, Vancouver Island and Southern Interior regions. Proportionally higher cut-offs were used for the Northern Interior region to reflect higher space heating loads.

relevant annual consumption threshold levels are 1,700 GJ/yr. (~35 MJ/ft^2/yr. * 50,000 ft^2) and 875 GJ/yr. (~35 MJ/ft^2/yr. * 25,000 ft^2).

- The **Small Commercial** sub sector is a mirror image of the sub sectors listed in Exhibit 2, except that the buildings in this grouping have, on average, less than 25,000 ft^2 of floor space. This sub sector includes buildings which fall below the “Medium” consumption thresholds described above, and any other buildings with consumption of less than 750 GJ/yr. (~30 MJ/ft^2/yr. * 25,000 ft^2). This approach is consistent with the 2006 CPR as well as the 2007 BC Hydro CPR. The rationale is that the annual energy expenditures of medium and large buildings are large enough to support targeted DSM efforts. On the other hand, it was expected that DSM approaches to the smaller buildings (with smaller annual energy expenditures) would rely more heavily on mass market approaches. This rationale also applies to the current study.

- The **Restaurant** sub sector is the one exception to the above methodology. Because restaurants tend to be small buildings with very intensive energy use, all customers identified as restaurants are included in the Restaurant sub sector, regardless of annual consumption.

- The **Recreation and Other** sub sector consists of commercial and institutional buildings that do not fall into one of the primary building types. Examples include: recreational facilities, police and fire stations, airports and bus stations, and provincial and municipal transportation garages. While energy use can be significant in individual buildings within these types, they present one of the following conditions that preclude their inclusion as a sub sector to be modelled individually:

  - The total floor area represented by the individual building type was too small relative to the other primary sub sectors,[8] and/or
  - The energy-use patterns within the building type were too varied to allow a realistic depiction of “typical” energy-use patterns.

Building archetype models were not constructed for the Small Commercial or the Recreational Facilities and Other Buildings sub sectors. Instead, energy consumption apportioned to these sub sectors was carried as an aggregate, and potential savings for these sub sectors was estimated based on the results for the sub sectors for which detailed building archetypes have been produced. This approach is consistent with previous studies.

[8] For example, energy use within a recreational building can be significant; however in the 2007 BC Hydro CPR, when the total electricity use within all recreational facilities was combined, it represented less than 1% of total Commercial sector electricity use.

3.2 Segmentation of FortisBC Sales Data

Once agreement was reached on the selection and definition of the Commercial[9] sub sectors shown in Exhibit 2, FortisBC provided monthly sales data, by account, for the 2009 calendar year. Marbek, in consultation with FortisBC personnel, then grouped this data into sub sectors, using North American Industry Classification System (NAICS) codes and account names in the sorting process.[10] Finally, the 2009 sales data allocated to each sub sector were grossed up to align with the estimated 2010 sales levels contained in FortisBC's most recent load forecast.

Exhibit 3 provides a summary of the allocation of rate-based customer sales data into the sub sectors employed in this CPR. The sales data by sub sector provides the reference point for the calibration of the modelled results that are developed in subsequent steps of the analysis. This data was further disaggregated into its base and weather-sensitive components to assist in the calibration. Base load factors for each sub sector were derived from FortisBC sales data, the previously cited CEUS studies, and Marbek's in-house database of end-use intensities for similar building types and service regions.

[9] Note that this study classifies "Commercial" and "Industrial" facilities based on building/plant attributes, as represented by NAICS codes. This approach, which is consistent with CPR best practices throughout North America, is in contrast with the rate class approach employed by FortisBC. The rate-based approach tends to classify customers based on annual sales volumes. For example, light manufacturing facilities are typically included within FortisBC's small commercial rate class; however, in this study these customers are included in the Industrial sector.

[10] Due to data limitations, sales data for the Whistler service region are not disaggregated by sub sector and include all non-residential sales.

Exhibit 3 Allocation of FortisBC Rate Based Sales Data, by Sector (GJ, 2009)

Vancouver Island	Total (GJ)	Residential	Commercial	Industrial	Residential	Commercial	Industrial
1	4,728,089	4,728,089			100 %	-	-
2	3,482,532		3,310,782	171,750	-	95 %	5 %

****Outside study scope.**

3.3 Natural Gas End Uses

Natural gas use within each of the sub sectors noted above is defined on the basis of specific end uses. In this study, an end use is defined as, "the final application or final use to which energy is applied. End uses are the services of economic value to the users of energy."

A summary of the major Commercial sector end uses used in this study is provided in Exhibit 4, together with a brief description of each.

Exhibit 4 Commercial Sector Natural Gas End Uses

End Use	Description/Comments
Space Heating	Boilers, rooftop units, furnaces,
Water Heating (DHW)	DHW boilers, tank heaters
Cooking Equipment	Food preparation equipment including ranges, broilers, ovens
Other	Pool heating, fireplaces, absorption cooling, sterilizing, etc.

3.4 Fuel Share Data

Space heating and water heating fuel shares developed for the 2006 CPR were used as a starting point for this study. Fuel shares were adjusted based on, among other sources, the results of the 2007 BC Hydro CPR, and results from FortisBC's CEUS (a deliverable of the current project).

A summary of the fuel share data for each end use and modelled sub sector is provided for the Lower Mainland region in Exhibit 5. Data for the remaining service regions is provided in Appendix A.

Exhibit 5 Natural Gas Fuel Share Distribution by Sub Sector and Major End Use for the Lower Mainland Service Region – Existing Buildings (% of total floor space)

Sub Sector	Space Heating	DHW
Large Office	95%	60%
Medium Office	90%	60%
Large Non-food Retail	90%	50%
Medium Non-food Retail	89%	45%
Food Retail	90%	65%
Large Hotel	85%	90%

Medium School	94%	70%
University/College	95%	85%
Restaurant	87%	60%
Warehouse/Wholesale	88%	50%
Large Apartment	85%	75%
Medium Apartment	80%	70%

3.5 Detailed Technical Profiles for Existing Buildings

The next step involved developing building profiles for each of the major existing Commercial sub sectors described above.[11] Each profile contains detailed technical data on building construction and operation, and specifications for gas-fired space heating, DHW, and cooking equipment. These building profiles also include data on relevant electrical equipment such as ventilation equipment, lighting fixtures, and plug and miscellaneous loads. The detailed technical profiles summarize the major data inputs that are used to populate CEEAM models in order to generate a bottom-up profile of energy use in the targeted segments.

The starting point for each profile was the corresponding building profile developed for the previous CPRs. These profiles were developed based on an exhaustive review of B.C. commercial building audit data, consultations with the B.C. engineering and energy retrofit community, as well as with B.C. building design practitioners. The profiles constructed for the current study incorporate recent information describing the B.C. commercial building stock. These include early results from both the CEUS and Commercial sector conditional demand analysis undertaken as part of the current CPR, as well as results of BC Hydro’s most recent Commercial End Use Study. Compared to the profiles used in the 2006 CPR, the net impact of the updates made to the building profiles is an increase in “base load” (non-heating) gas consumption, especially for domestic hot water heating.

Separate building profiles were developed for each combination of sub sector and region. The service regions[12] and the weather data used in this study are noted below:

- The Lower Mainland region (using Vancouver weather data)
- The Vancouver Island region (using Victoria weather data)
- The Northern Interior region (using Prince George weather data)
- The Southern Interior service region (using Summerland weather data).

A sample building profile summary for existing Large Offices in the Lower Mainland is presented in Exhibit 6. Detailed assumptions included in the building profiles are addressed in the following sections.

Detailed profiles for each existing building sub sector are provided in Appendix A.

---

[11] Detailed profiles were not constructed for the Small Commercial or Recreation and Other sub sectors. As described above, these sub sectors are carried throughout the study in aggregate. In subsequent stages of analysis, potential savings for the facilities included in these sub sectors are estimated based on the results from the modelled sub sectors

[12] Although the Commercial sector analysis segments Whistler as a separate service region, the available data for the Commercial sector facilities in Whistler are insufficient to support a more detailed analysis at this time. Consequently, Whistler’s Commercial sector is reported at an aggregate level only.

Exhibit 6 Sample Building Profile Summary – Existing Large Office: Lower Mainland

Building Type: Large Office **Location:** Lower Mainland

Description:
This is an archetype of a Large Office building. The inputs used to develop this model include Marbek's Building Energy Performance Database, Terasen's Commercial End Use Study, consultation with engineering practitioners and information gathered as part of market share surveys in various jurisdictions

The Average Building:
The average building characteristics used to define this building profile are as follows:
- Average gross floor area of 21,365 m² (approx 230,000 ft²)
- Average footprint of 1,526 m² (approx 16,500 ft²)
- Average height of 14 stories

Building Envelope:

Roof U Value	0.61 W/m².°C
Wall U Value	0.91 W/m².°C
Window U Value	4.29 W/m².°C
Shading Coefficient (SC)	0.58
Window to Wall Ratio (WWR)	0.41

Space Heating Load 228 MJ/m².yr. P. Design 33.9 W/m²

System Types

Natural Gas						Electric

3.5.1 *Space Heating Equipment*

Model assumptions related to the distribution of natural gas space heating equipment by type[13] are summarized in Exhibit 7 for the Lower Mainland. Data for the remaining service regions is presented in Appendix A.

Exhibit 7 Natural Gas Space Heating Equipment Distribution for the Lower Mainland Region – Existing Buildings (% of Natural Gas Heated Floor Area)

	Lower Mainland		
Sub Sector	Boiler	Rooftop Unit	Other
Large Office	89%	11%	0%

3.5.2 *Domestic Hot Water*

Exhibit 8 lists the Base Year distribution of DHW equipment between boilers and tank heaters that has been assumed in this study for all service regions. The distributions are shown by sub sector; data was not available to further differentiate by service region.

Exhibit 8 Natural Gas DHW Equipment Distribution in Total FortisBC Service Area – Existing Buildings (% of Natural Gas DHW- Serviced Floor Area)

Sub Sector	Boiler	Tank
Large Office	33%	67%
Medium Office	17%	83%
Large Non-food Retail	30%	70%
Medium Non-food Retail	22%	78%
Food Retail	8%	92%
Large Hotel	78%	22%
Medium Hotel	43%	57%

[13] "Other" gas space heating equipment includes residential-style forced air furnaces, forced air unit heaters and radiant gas space heating equipment.

Sub Sector	Boiler	Tank
Hospital	89%	11%
Nursing Home	86%	14%
Large School	36%	64%
Medium School	36%	64%
University/College	88%	12%
Restaurant	50%	50%
Warehouse/Wholesale	6%	94%
Large Apartment	67%	33%
Medium Apartment	29%	71%

3.5.3 *Natural Gas Cooking*

Detailed data are not available on the distribution of electric versus natural gas cooking equipment. Instead, the natural gas cooking energy-use intensities (EUIs) used in this study are presented in Exhibit 9. The distributions are shown by sub sector; data were not available to further differentiate by service region. These EUIs represent stock averages that take into account the incidence of gas cooking equipment in each sub sector. These EUIs were developed using Marbek's internal database, which includes the results of CPR studies in several Canadian jurisdictions, as well as the results of recent building audits in all Commercial sub sectors.

Exhibit 9 Natural Gas Cooking EUIs – Existing Buildings (MJ/m^2/yr.)

Sub Sector	EUI (MJ/m^2/yr)
Large Office	10
Medium Office	10
Large Non-food Retail	10
Medium Non-food Retail	20
Food Retail	80
Large Hotel	100
Medium Hotel	60

Nursing Home	60
Large School	20
Medium School	10
University/College	40
Restaurant	900
Warehouse/Wholesale	5
Large Apartment	10
Medium Apartment	5

3.5.4 Other Gas Use

Natural gas use is used primarily for space heating, hot water heating, and cooking. Other natural gas uses commonly found in commercial buildings include:

- Dehumidification
- Air reheat
- Steam distribution losses
- Sterilizers and other process loads
- Laboratory equipment
- Laundry equipment
- Fireplaces and patio heaters
- Pool heating
- Absorption chillers for space cooling.

Exhibit 10 presents the estimated EUIs for "other" gas uses, and their approximate percentages of the total natural gas use in each sub sector and service region. These EUIs were derived based on Marbek's in-house database, including several building end-use surveys. The values shown in Exhibit 10 are assumed to be applicable in all service regions.

Exhibit 10 Natural Gas EUIs and Percent of Sub Sector Natural Gas Used by "Other" End Uses – Existing Buildings

Sub Sector	EUI (MJ/m^2/yr)	% of Sub Sector Natural Gas Use
Large Office	20	6%
Medium Office	20	5%
Large Non-food Retail	5	1%
Medium Non-food Retail	10	3%
Food Retail	20	4%
Large Hotel	60	8%
Medium Hotel	60	9%
Hospital	250	17%
Nursing Home	70	10%
Large School	5	1%
Medium School	5	1%
University/College	70	13%
Restaurant	20	1%
Warehouse/Wholesale	20	7%
Large Apartment	40	6%
Medium Apartment	30	5%

3.6 Floor Area Calculations

The estimated floor area for each building sub sector was estimated by dividing the FortisBC sales data by the whole building natural gas EUI that was generated by the CEEAM model using the input assumptions, as summarized in the preceding discussions. The general equation is shown below.

$$Floor\,area = \frac{Consumption}{(EUI_{heat})(FS_{heat}) + (EUI_{water\ htg})(FS_{water\,htg}) + (EUI_{cook}) + (EUI_{other})}$$

Where;

EUI is energy-use intensity in MJ/m²/yr.
FS is percent natural gas fuel share for the end use

Exhibit 11 shows the resulting estimates of floor area within each of the modelled sub sectors for FortisBC customers[14] in the Lower Mainland region as well as in the total FortisBC service area. Data for the remaining regions is presented in Appendix A.

Exhibit 11 Base Year Floor Area for Lower Mainland and Total FortisBC Service Area (m^2)

Sub Sector	Lower Mainland	Total FortisBC Service Area
Large Office	2,853,587	4,158,868
Medium Office	1,482,179	2,210,047
Large Non-food Retail	3,380,852	4,055,816
Medium Non-food Retail	1,997,727	2,520,528
Food Retail	476,237	923,369
Large Hotel	724,240	1,153,115
Medium Hotel	387,211	710,255
Hospital	1,302,501	2,042,883
Nursing Home	1,262,027	1,909,287
Large School	2,857,352	4,117,587
Medium School	1,602,266	2,685,613
University/College	3,869,828	4,868,608
Restaurant	1,740,290	2,324,101
Warehouse/Wholesale	598,670	816,519
Large Apartment	15,421,251	16,633,453
Medium Apartment	9,147,687	10,142,849
Total	49,103,905	61,272,899
%	80%	100%

[14] This approach differs slightly from the 2006 CPR, which estimated the floor space for all B.C. commercial facilities, regardless of whether they were FortisBC (then Terasen Gas) customers. The approach employed in the 2006 CPR was intended to facilitate the analysis of fuel switching options. Fuel switching is not part of the scope of this study; consequently, it was decided to narrow the focus to only FortisBC customers.

3.7 Base Year Commercial Natural Gas Use

This section presents the Base Year Commercial sector results.

Exhibit 12 provides a summary of Base Year (2010) Commercial sector natural gas consumption by sub sector and end use for the total FortisBC service area.[15]

[15] The pie charts in Exhibit 12 and Exhibit 13 show distribution of gas consumption by end use, based on the modelled sub sectors. As is the case throughout this report, the sub sectors Small Commercial, Recreation Facilities and Other have not been modelled at the same level of end-use detail due to data constraints. In the absence of better data, the % distributions from the modelled sub sectors have been assumed for the non-modelled sub sectors.

Exhibit 12 Base Year (2010) Natural Gas Consumption by Sub Sector and End Use for the Total FortisBC Service Area 2010 (GJ/yr.)

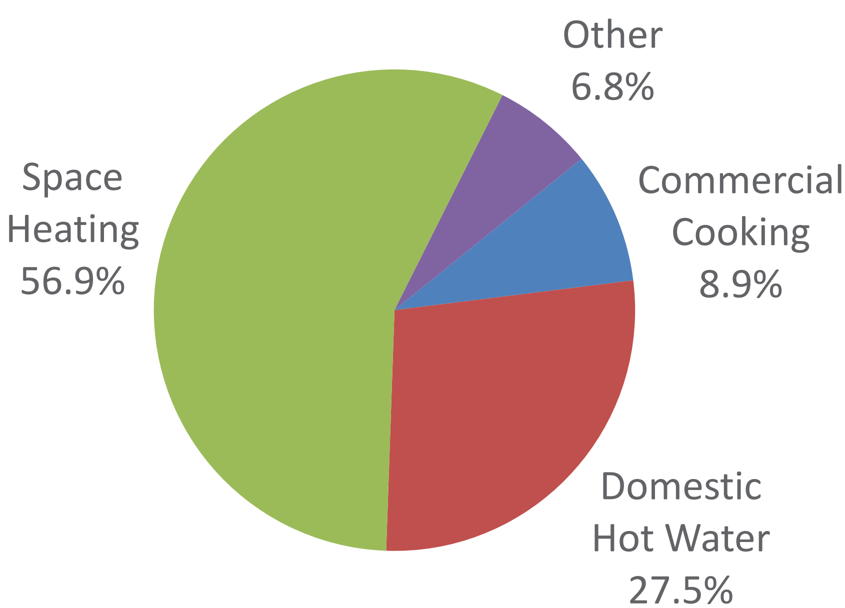
Grand Total	2,414,941	7,506,812	15,505,094	1,845,022	40,129,999



Additional results for the remaining service regions are provided in Appendix A.

Selected highlights are provided below.

By Sub Sector

- Within the Commercial sector, Small Commercial buildings account for 30% of gas consumption across the FortisBC service area. Although each individual customer included within this sub sector is a small natural gas user, the sub sector includes a very large number of customers, resulting in this large portion of overall consumption.
- Apartment buildings account for a further 25% of consumption within the entire service area. Approximately two-thirds of this consumption occurs in Large Apartment buildings.
- Other high-consuming sub sectors include Restaurant (8%), Hospital (6%), University/College (5%), Office (5%), and Non-food Retail (4%). The un-modelled sub sector Recreation Facilities and Other accounts for approximately 8% of total gas consumption.

By End Use

- Space heating (59%) accounts for the largest share of natural gas consumption in all service regions and sub sectors. The space heating share of total Commercial sector consumption varies by climate, accounting for 61% of total gas use in the Vancouver Island Region, 63% in the Southern Interior Region and 74% in the Northern Interior Region.
- DHW (25%) is the second largest end use within the Commercial sector across all service regions. This is significantly higher than the 2006 CPR, primarily as a result of the inclusion of apartment buildings in the Commercial sector in the current study, but also in part as a result of the findings of the CEUS. The DHW share of total Commercial sector consumption is 21% in the Vancouver Island Region, 20% in the Southern Interior Region and 13% in the Northern Interior Region.
- Commercial cooking (9%) and Other (7%) account for the remaining Commercial sector natural gas use within the total FortisBC service area.

Exhibit 13 presents the Base Year (2010) Commercial sector natural gas consumption by sub sector and end use for the Lower Mainland region.

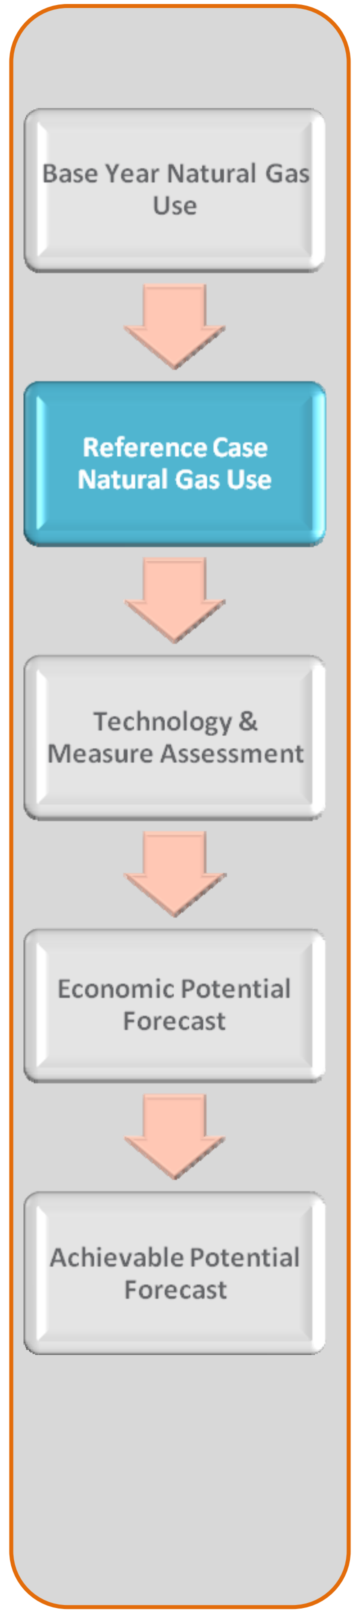
4 Reference Case Natural Gas Forecast



4.1 Introduction

This section presents the Commercial sector Reference Case for the study period (2010 to 2030). The Reference Case estimates the expected level of natural gas consumption that would occur over the study period in the absence of new utility-based DSM initiatives.

The Reference Case includes the ongoing effects of DSM activity initiated before the study period, and also includes the effects of DSM activity by other actors in the market, such as BC Hydro. The Reference Case also presents a scenario in which policy, legislation, and regulation continue to exist as they are today. Legislation that is not yet passed or clearly mapped out is subject to influence by FortisBC and is therefore considered within the realm of potential savings.

The Reference Case, therefore, provides the point of comparison for the calculation of energy saving opportunities associated with each of the scenarios that are assessed within this study.

The discussion is presented within the following sub sections:

- Methodology
- Summary of Model Results.

4.2 Methodology

Development of the Reference Case involved the following steps:

- **Step 1**: The detailed profiles of new commercial buildings (those buildings expected to be constructed during the study period) were updated for each sub sector in each service region. Changes in building envelope and equipment affecting energy consumption were noted.

- **Step 2:** The growth in commercial building floor space was estimated for each sub sector within each service region.

- **Step 3**: Naturally-occurring[16] efficiency changes affecting annual natural gas use in existing buildings were estimated. Special consideration was given to three factors:

  - Naturally-occurring improvements in equipment efficiency
  - Expected penetration of more efficient equipment into the building stock
  - Known, upcoming changes in building and equipment energy performance codes and standards.[17]

[16] Naturally-occurring changes are meant to include any changes that are not the result of FortisBC DSM initiatives.

- **Step 4**: Changes in natural gas share for each end use were estimated.
- **Step 5:** The inputs from the preceding steps were entered into the Commercial sector model and estimates of natural gas use throughout the study period were generated.

A brief description of the tasks involved in the completion of the above steps is provided below. Additional discussion of the methodology employed is provided in Appendix B.

4.2.1 Development of Detailed Profiles—New Buildings

The first task in building the Reference Case involved the development of detailed technical profiles that define building specifications, mechanical equipment, cooking, and miscellaneous equipment for the "new" buildings in each of the Commercial sub sectors. In each case, the new building profiles were developed using Marbek's building energy simulation model, CEEAM, and the same approach as described previously in the Base Year discussion.

A sample building profile summary for new Large Offices in the Lower Mainland is presented in Exhibit 14. It summarizes the major technical assumptions that have been used for new offices in the development of the Reference Case.

A complete set of detailed profiles for new buildings is presented in Appendix B.

[17] The anticipated effects of any code/standard changes, which have been passed into law, are included in the Reference Case. Effects of changes due to codes/standards currently in development (for example, the 2011 National Energy Code for Buildings) are not included.

Exhibit 14 Sample New Building Profile Summary – New Large Office in Lower Mainland

Building Type:	Large Office	**Location:**	Lower Mainland

Description:
This is an archetype of a Large Office building. The inputs used to develop this model include Marbek's Building Energy Performance Database, Terasen's Commercial End Use Study, consultation with engineering practitioners and information gathered as part of market share surveys in various jurisdictions.

The Average Building:
The average building characteristics used to define this building profile are as follows:
- Average gross floor area of 21,365 m² (approx 230,000 ft²)
- Average footprint of 1,526 m² (approx 16,500 ft²)
- Average height of 14 stories

Building Envelope:

Roof U Value	0.34 W/m².°C
Wall U Value	0.88 W/m².°C
Window U Value	3.50 W/m².°C
Shading Coefficient (SC)	0.40
Window to Wall Ratio (WWR)	0.60

Space Heating — Load 228 MJ/m².yr. — P. Design 33.9 W/m²

System Types	Natural Gas						Electric	
	Boilers			Forced Air				
	Stan.	High	Cond.	RTU	Furnace	Unit Heater		
	35%	35%	15%	10%	0%	0%	5%	100%

Other	16	
Subtotal	653	
Total	997	

Exhibit 15 highlights the resulting whole building natural gas EUIs for new buildings in each Commercial sub sector for the Lower Mainland. With a few noted exceptions, whole building EUIs are lower for new[18] buildings compared to existing buildings. General factors that lead to lower gas energy intensity for new buildings include the following:

- Improved thermal characteristics of building envelope systems including walls, roofs and windows
- Higher efficiency heating systems
- Higher efficiency water heating systems.

There are also several factors that contribute to higher gas energy intensities in new buildings, including:

- Higher ventilation rates, which lead to an increase in space heating energy. This is especially relevant in new institutional buildings such as Hospitals and Nursing Homes where a large portion of the heating energy reductions achieved through improved building envelopes and high-efficiency heating systems are offset by increased ventilation rates
- Higher gas shares for space heating and water heating in new buildings belonging to FortisBC customers
- Lower internal heat gains due to improved lighting efficiencies.

[18] New buildings include FortisBC Customers only. Buildings added to the Commercial sector stock, that do not become FortisBC customers, are not included in this analysis.

Exhibit 15 Comparison of Existing and New Whole Building Gas EUIs – Lower Mainland (MJ/m²/yr.)

Sub Sector	Existing Buildings	New Buildings	Comments
Large Office	348	328	
Medium Office	387	404	Although building shells are improved in new Medium Office buildings, higher ventilation rates and lower internal heat gains (primarily as a result of a decrease in connected lighting load) result in higher overall heating loads.
Large Non-food Retail	334	173	New Large Non-food Retail buildings tend to be "big box" style buildings with high internal heat gains, low window: wall ratios and low surface area: volume ratios resulting in much lower space heating EUIs
Medium Non-food Retail	362	319	
Food Retail	530	483	
Large Hotel	746	669	
Medium Hotel	632	531	
Hospital	1464	1323	
Nursing Home	675	669	
Large School	345	376	Although building shells are improved in new Schools, higher ventilation rates result in higher overall heating loads.
Medium School	419	360	
University/College	536	518	
Restaurant	1929	2037	Slightly higher overall EUI driven by a higher gas fuel share for DHW
Warehouse/Wholesale	267	272	New Warehouses have a higher gas fuel share for space heating DHW, partially offset by a better performing thermal envelope.
Large Apartment	540	491	
Medium Apartment	490	485	

A comparison of whole building natural gas EUIs for new and existing buildings in the remaining Commercial sub sectors is provided in Appendix B. Refer to building archetype summaries in Appendices B and C for further detail.

4.2.2 *Expected Growth in Commercial Sector Floor Space*

The next step in developing the Reference Case involved the development and application of estimated levels of floor space growth in each sub sector and service region over the study period.

The sub sector floor space growth rates used in this study were developed from the rate-based growth provided by FortisBC's Load Forecasting Group. In each sub sector and service region, total sales growth for each rate class contained in the FortisBC load forecast was allocated to the Commercial sector using the mapping shown previously in Exhibit 3. The resulting total Commercial sector sales growth in each study period and service region was then allocated among individual sub sectors using the same proportions as developed in the 2007 BC Hydro CPR.

Exhibit 16 presents the resulting estimated growth rates for FortisBC customers in the Lower Mainland service region, by sub sector and study milestone period.

Exhibit 16 FortisBC Customer Commercial Floor Space Growth Rates for Lower Mainland by Sub Sector and Study Milestone Period (%/yr.)

Sub Sector	Period 2010-2015 %	2015-2020 %	2020-2025 %	2025-2030 %
Large Office	3.22%	2.76%	2.30%	2.07%
Medium Office	3.22%	2.76%	2.30%	2.07%
Large Non-food Retail	3.83%	3.29%	2.74%	2.46%
Medium Non-food Retail	3.83%	3.29%	2.74%	2.46%
Food Retail	3.53%	3.02%	2.52%	2.27%
Large Hotel	3.68%	3.15%	2.63%	2.37%
Medium Hotel	3.68%	3.15%	2.63%	2.37%
Hospital	2.60%	2.23%	1.86%	1.67%
Nursing Home	3.53%	3.02%	2.52%	2.27%
Large School	3.22%	2.76%	2.30%	2.07%
Medium School	3.22%	2.76%	2.30%	2.07%
University/College	3.22%	2.76%	2.30%	2.07%
Restaurant	3.22%	2.76%	2.30%	2.07%
Warehouse/Wholesale	3.37%	2.89%	2.41%	2.17%
Large Apartment	3.40%	2.90%	2.43%	2.21%
Medium Apartment	3.40%	2.90%	2.43%	2.21%
Small Commercial	4.15%	3.55%	2.96%	2.67%
Recreation Facilities and Other	3.40%	2.90%	2.43%	2.21%

4.2.3 *Natural Changes Affecting Natural Gas Consumption*

The next task involved an estimation of expected “natural” changes in natural gas consumption patterns over the study period with consideration of three major factors:

- Naturally-occurring improvements in equipment efficiency
- Expected penetration of more efficient equipment into the commercial building stock that would occur in the absence of DSM activities
- Impacts of new building and equipment performance standards.

A discussion of the expected natural changes follows. In each case, the discussion identifies the technical change, the major driver(s) and the assumed natural gas impact.

Space Heating

Gas boilers being installed in new buildings are assumed to be a mix of standard, near condensing and condensing boilers. An estimated weighted seasonal efficiency, shown in Exhibit 17, was used in the building profile models. Estimated seasonal efficiency of boilers in the existing building stock is shown for comparison purposes.

The type of space heating equipment installed in new buildings was assumed to be constant through the study period, while modest improvements in the equipment efficiency are assumed in later milestone years.

Exhibit 17 Estimated Stock Weighted, Seasonal Natural Gas Boiler Efficiency in Existing and New Buildings

Sub sector	Existing Boiler Efficiency (%)	New Boiler Efficiency (%)
Large Office	77%	80%
Medium Office	78%	82%
Large Non-food Retail	79%	80%
Medium Non-food Retail	79%	80%
Food Retail	79%	80%
Large Hotel	78%	81%
Medium Hotel	79%	82%
Hospital	79%	80%
Nursing Home	78%	81%
Large School	78%	81%
Medium School	78%	81%
University/College	79%	82%
Restaurant	80%	81%
Warehouse/Wholesale	79%	80%
Large Apartment	78%	82%
Medium Apartment	78%	82%

Domestic Hot Water

The type of DHW equipment installed in new buildings was assumed to be constant through the study period, with modest improvements in equipment efficiency assumed in later milestone years.

Commercial Cooking

Commercial cooking EUIs for new buildings were assumed to be equivalent to those in existing buildings. Very little research has been done on commercial cooking EUIs; the great uncertainty in these numbers precludes predicting either increases or decreases.

Other

The EUI for the Other end use was assumed to be independent of building vintage and was assumed to be constant throughout the study period.

4.2.4 *Electrical End Uses*

Natural changes also occur in the electrical end uses and are incorporated in the CEEAM sub sector models. The two most relevant electrical end uses for this study are:

- Lighting
- Plug loads.

Lighting

The continued replacement of T12 fluorescent lighting and electromagnetic ballasts with T8 fluorescent lamps and electronic ballasts in existing buildings is being driven by decreasing prices, increasing public recognition of the savings, and changing energy performance codes and standards. The Federal government has also announced their commitment to phase out incandescent lighting from the marketplace, beginning in 2012. Both of these lighting changes will result in reduced lighting loads and, hence, reduced internal heat gains. As lighting loads decrease, winter heating loads will tend to increase.

Plug Loads

The density and variety of office and other plug load equipment is increasing. However, the electricity use of many types of office equipment has been decreasing due to programs such as ENERGY STAR®. Previous studies performed on behalf of BC Hydro, Newfoundland Power/Newfoundland and Labrador Hydro and SaskPower have assumed a low to intermediate growth scenario in terms of overall plug load. An increase in plug loads will tend to decrease heating loads via increased internal heat gains.

The net impacts of these electrical trends are included in the results provided in the following sections.

4.2.5 *Additional Considerations*

The B.C. government's aggressive GHG emissions reduction goals have led to the proposal and implementation of a variety of building codes and standards, as well as equipment efficiency regulations that will impact energy consumption in the near and long term. The Reference Case attempts to incorporate the effects of energy performance codes and standards which are currently in effect, but does not include proposed codes, standards or other legislation.

4.3 Summary of Results

This section presents the estimated Commercial sector natural gas consumption for the Reference Case period of 2010 to 2030. The results are summarized in the following exhibits:

- Exhibit 18 presents total Commercial sector Reference Case natural gas consumption by service region and milestone year for the period 2010 to 2030

- Exhibit 19 presents total Commercial sector Reference Case natural gas consumption by sub sector and milestone year for the Total FortisBC Service Area

- Exhibit 20 presents Commercial sector Reference Case natural gas consumption by sub sector and milestone year for the Lower Mainland service region.

Exhibit 18 Commercial Sector Reference Case Forecast by Milestone Year and Service Region for the Total FortisBC Service Area, 2010-2030 (GJ/yr.)

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Total
2010	40,129,999	6,269,053	5,666,967	4,664,130	247,757	56,977,907

Large Apartment	8,327,204	8,437,357	8,513,706	8,557,305	8,585,163
Medium Apartment	4,478,593	4,547,766	4,597,030	4,627,018	4,647,706
Small Commercial	10,381,028	10,732,397	11,042,636	11,309,761	11,556,958
Recreation Facilities and Other	2,477,102	2,560,945	2,634,974	2,698,715	2,757,700
Grand Total	40,129,999	40,948,617	41,607,601	42,102,254	42,518,263

Additional results for the remaining service regions are provided in Appendix B.

Selected highlights are provided below.

By Sub Sector

- The sub sectors that account for a larger portion of gas consumption in 2030 compared to 2010 include: Food Retail, Large Hotel, Medium Hotel, Nursing Home, Restaurant, Small Commercial and Recreation/Other.
- The sub sectors that account for a smaller portion of gas consumption in 2030 than in 2010 include: Large Office, Small Office, Large Non-food Retail, Small Non-food Retail, Hospital, Large School, Medium School, University/College, Warehouse/Wholesale, Large Apartment and Medium Apartment.

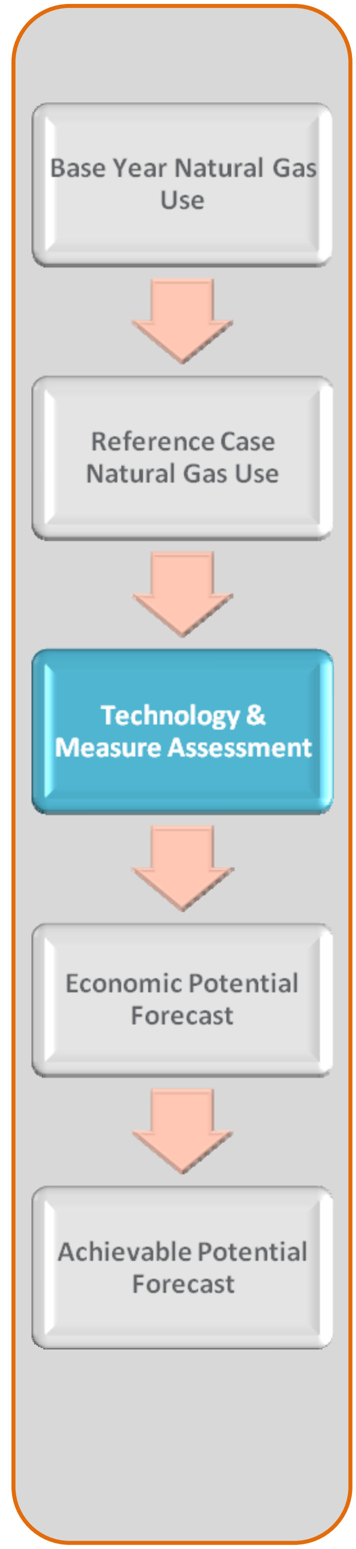
By End Use

- By 2030 space heating is projected to account for a slightly smaller share of gas consumption than in 2010, due to natural improvements in building envelopes and space heating equipment, which are expected to outpace natural improvements in other end uses.[20] In 2030, space heating is projected to account for 58% of total Commercial sector gas consumption across the FortisBC service area (compared to 59% in 2010).

[20] Natural gas space heating shares are assumed to remain constant for existing commercial buildings.

- DHW is expected to continue to be the second largest end use within the FortisBC service area in 2030, holding at 26% of all gas use. Other end uses account for a slightly larger proportion of 2030 gas use than 2010 gas use (17% vs. 16%).

5 Technology & Measure Assessment



5.1 Introduction

This section identifies and assesses the financial and economic attractiveness of the selected energy-efficiency and alternative energy measures for the Commercial sector. The discussion is organized and presented as follows:

- Methodology
- Energy-efficiency and alternative energy technologies
- Summary of results.

5.2 Methodology

The following steps were employed to assess the energy-efficiency and fuel choice measures:

- Select candidate energy-efficiency measures
- Establish technical performance for each option within a range of applicable load sizes and/or service region conditions (e.g., degree days)
- Establish the capital, installation and operating costs for each option
- Calculate the simple payback from the customer’s perspective
- Calculate the measure total resource cost (measure TRC)
- Calculate the benefit-cost ratio.

A brief discussion of each step is outlined below.

Step 1 Select Candidate Measures

The candidate measures were selected in close collaboration with FortisBC based on a combination of a literature review and the previous experience of both the consultants and FortisBC personnel. The selected measures are all considered to be technically proven and commercially available, even if only at an early stage of market entry. Technology costs, which will be addressed in this section, were not a factor in this initial selection of candidate technologies.

Step 2 Establish Technical Performance

Information on the performance improvements provided by each measure was compiled from available secondary sources, including the experience and on-going research work of study team members. As applicable, the energy impacts of the measures are reported for both natural gas and electricity.

Step 3 Establish Capital, Installation and Operating Costs for Each Measure

Information on the cost of implementing each measure was also compiled from secondary sources, including the experience and on-going research work of study team members. As applicable, both the incremental and full cost of each measure were estimated.

The incremental cost is applicable when a measure is installed in a new facility or at the end of its useful life in an existing facility; in this case, incremental cost is defined as the difference between the energy-efficiency or alternative energy option relative to the “baseline” technology. The full cost is applicable when an operating piece of equipment is replaced with a more efficient model or a fuel choice option prior to the end of its useful life.

In both cases, the costs and savings are annualized, based on the number of years of equipment life and the discount rate, and the costs incorporate applicable changes in annual O&M costs. All cost are expressed in constant (2010) dollars.

Step 4 Calculate Simple Payback

The simple payback is generated to show the attractiveness of a measure from the customer’s financial perspective. Simple payback is *“a measure of the length of time required for the cumulative savings from a project to recover its initial investment cost and other accrued costs, without taking into account the time value of money. The simple payback period is usually measured from the service date of the project.”*[21] The cost of the measure (incremental or full, as appropriate) is divided by the expected annual savings. The answer is given in years**.**

The following equation illustrates how this calculation is applied to a situation where an upgrade has a higher upfront cost than the baseline technology, but lower ongoing operating costs:

$$\text{Payback}_{(\text{years})} = (\text{CostUpgr} - \text{CostBase})/(\text{AnnBase} - \text{AnnUpgr})$$

where:

CostUpgr	= initial capital cost of the upgrade measure ($)
CostBase	= initial capital cost of the baseline measure ($)
AnnUpgr	= ongoing operating cost of the upgrade ($/year)
AnnBase	= ongoing operating costs of the baseline technology ($/year)

Step 5 Calculate the Measure Total Resource Cost (TRC)

The measure TRC calculates the net present value of energy savings that result from an investment in an efficiency or fuel choice technology or measure. The measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and O&M costs. This calculation includes, among others, the following inputs: the avoided natural gas and electricity supply costs, the life of the technology, and the selected discount rate, which in this analysis has been set at 7.38% for most of the regions and 6.87% for Vancouver Island.

A technology or measure with a positive TRC value is included in subsequent phases of the analysis, which consists of the Economic and Achievable Potential scenarios. A measure with a

[21] Sieglinde K. Fuller and Stephen R. Petersen. (1996). “*Life Cycle Costing Manual for the Federal Energy Management Program”.* National Institute of Standards and Technology Handbook 135, 1995 Edition, Washington, DC.

negative TRC value is not economically attractive and is therefore not included in subsequent stages of the analysis.

It should be noted that the measure TRC provides an initial screen of the technical options. Considerations such as program delivery costs, incentives, etc., are incorporated in later detailed program design stages, which are beyond the scope of this study.

Step 6 Calculate Benefit-Cost Ratio

The measure benefit-cost ratio indicates the relative attractiveness of the measures. A measure that has a benefit-cost ratio in excess of "1" means that the measure's benefits outweigh its costs; it is, therefore, included in subsequent stages of the analysis. Similarly, a measure with a benefit-cost ratio that is well in excess of one (e.g., 3) means that it is very attractive. A measure with a benefit-cost ratio of less than one means that its costs outweigh its benefits and, hence, is not included in subsequent stages of the analysis.

5.2.1 *Energy Costs*

The financial and economic results that are presented in this section are based on the following

- Avoided supply cost of natural gas
- Avoided supply cost of electricity
- Customer energy prices.

A brief discussion of each is provided below.

Avoided Supply Cost of Natural Gas

Natural gas avoided supply costs were provided by FortisBC[22] and are summarized in Exhibit 21. As illustrated, the avoided cost of gas on a per unit basis includes three components: an estimate of the commodity cost, an estimate of the distribution cost and the carbon tax.

- The commodity cost is based on the 10-year AECO price forecast according to GLJ Petroleum Consultants (an independent energy consultant) based on their latest available forecast (updated by GLJ each quarter).

- The distribution costs are estimated by calculating an approximation of the pipeline transportation charges required by FortisBC to move the commodity supply to core markets as well as the storage costs associated with meeting winter load requirements.

- The carbon tax values shown are based on current estimates of $20/ton, $25/ton for 2011 and then remaining constant at $30/ton from 2011 and beyond.

The resulting avoided costs represent the expected marginal cost of to serve FortisBC's customers on a per unit basis. In this study, no distinction has been made between high load factor (flat) and low load factor (peaky) load shapes, or between different service areas within the province.

[22] FortisBC, Supply Group. Values are updated quarterly.

Exhibit 21 Natural Gas – Avoided Supply Costs

Year	Commodity Cost	Distribution	Carbon Tax	Total
2010	$ 5.59	0.15	0.75	$ 6.49
2011	$ 5.88	0.15	1.00	$ 7.03
2012	$ 6.61	0.15	1.25	$ 8.01
2013	$ 7.32	0.15	1.50	$ 8.97
2014	$ 7.92	0.15	1.50	$ 9.57
2015	$ 8.41	0.15	1.50	$ 10.06
2016	$ 8.82	0.15	1.50	$ 10.46
2017	$ 9.14	0.15	1.50	$ 10.78
2018	$ 9.35	0.15	1.50	$ 11.00
2019	$ 9.57	0.15	1.50	$ 11.22
2020	$ 9.78	0.15	1.50	$ 11.43
2021	$ 9.99	0.15	1.50	$ 11.64
2022	$ 10.21	0.15	1.50	$ 11.86
2023	$ 10.43	0.15	1.50	$ 12.08
2024	$ 10.66	0.15	1.50	$ 12.31
2025	$ 10.89	0.15	1.50	$ 12.54
2026	$ 11.13	0.15	1.50	$ 12.78
2027	$ 11.37	0.15	1.50	$ 13.02
2028	$ 11.62	0.15	1.50	$ 13.27
2029	$ 11.87	0.15	1.50	$ 13.52
2030	$ 11.87	0.15	1.50	$ 13.52

Avoided Supply Cost of Electricity

The avoided supply cost of electricity used in this analysis is $0.12/kWh.[23] This value is higher than the current average cost for BC Hydro to deliver electricity to a Lower Mainland busbar. The added cost reflects a number of recent bids for new electricity supply options. The value has adjusted to add 7% for area transmission and distribution losses between the busbar and the customer.

BC Hydro is confronted with higher supply costs for end uses such as space heating that have peaky requirements. However, detailed electricity supply costs were not available for this study for each of the defined load types. BC Hydro also did not generate distinct avoided cost values to be used for different regions in the last BC Hydro CPR. Furthermore, the current study is using the same natural gas avoided costs for all load types and regions. Consequently, it was decided to use the same avoided cost for electricity throughout the study.

Customer Energy Prices

The Commercial sector customer energy prices used in this analysis are $0.077/kWh for electricity and $0.0092/MJ for natural gas for most of the regions and $0.0159/MJ for Vancouver Island. Prices were obtained from a planning tool provided to the consultant team by FortisBC.

[23] $33.33/GJe.

5.3 Technologies and Measures

Exhibit 22 lists the energy-efficiency technologies and measures that are included in this study. A brief description of each measure is provided in Appendix C, while a detailed financial and economic assessment of each measure is provided in the measure TRC model that accompanies this report.

Exhibit 22 Efficiency and Alternative Energy Technologies Included in this Study

Space Heating
- Near-condensing boilers
- Condensing boilers
- Condensing unit heaters
- High-efficiency rooftop units
- Condensing rooftop units
- Infrared heaters
- High-efficiency forced air furnaces
- Absorption heat pumps
- Micro-combined heat & power
- Solar pre-heated make-up air
- Air-to-air heat recovery
- Demand controlled ventilation
- Demand controlled kitchen ventilation
- HVLS fans
- Programmable thermostats

Building Envelope
- High-performance glazings
- Super high-performance glazings
- Wall insulation upgrade
- Roof insulation upgrade
- Air sealing

Water Heating
- Condensing DHW boilers
- Condensing tank-type water heaters
- Tankless water heaters
- Drainwater heat recovery
- Low-flow faucet aerators & showerheads
- Low-flow pre-rinse spray valves
- Solar hot water heating

Cooking
- High-efficiency cooking equipment

Whole Building
- New construction – 25% more efficient
- New construction – 40% more efficient
- Recommissioning & advanced building automation (BAS)
- Operations & maintenance (O&M)

5.3.1 *Technology Screening Results*

A summary of the results is provided in Exhibit 23. For each of the measures reviewed, the exhibit shows:

- The name of the measure
- The cost basis[24] for the measure that is shown, e.g., “full” versus “incremental”
- The measure TRC
- The measure’s benefit-cost ratio

Measures analyzed on the basis of full cost have been placed towards the top of Exhibit 23, because they are qualitatively different from the measures that pass only on an incremental basis. A measure that passes on a full cost basis can be applied immediately, even if the piece of equipment that it replaces or improves is currently working properly. That means the rate at which the measure can be implemented as a utility DSM measure is limited by market and program constraints. Conversely, a measure that passes only on an incremental basis is limited

[24] See Step 3 in Section 5.2 for a detailed description.

by the rate of natural replacement (due to failure or obsolescence) or purchase of the piece of equipment it replaces.

Exhibit 23 Commercial Sector Energy-efficiency Technology Measures, Screening Results Lower Mainland

Measure Name	Basis (Full/Incremental)	Measure TRC	B-C Ratio
Pre-rinse spray valves	Full	$673	11.36
Low-flow faucet aerators	Full	$69	7.89
Demand-controlled kitchen ventilation	Full	$27,441	4.38
Building automation/recommissioning	Full	$4	3.70
Tankless hot water heater	Full	$4,813	3.19
Programmable thermostats	Full	$2	2.48
O&M improvements	Full	$0.10	1.94
Low-flow showerheads	Full	$17	1.70
Infrared heaters	Full	$0.27	1.06
High-volume low-speed fans	Full	-$0.46	0.92
Drainwater heat recovery	Full	-$98	0.89
Demand-controlled ventilation	Full	-$292	0.88
Air sealing	Full	-$0.25	0.76
Air-to-air heat recovery	Full	-$1	0.76
Solar pre-heated make-up air	Full	$0.00	0.31
Solar water pre-heat	Full	-$5,576	0.25
Micro-combined heat & power	Full	$0.00	N/A
Efficient new construction - 25% better	Incr.	$76	5.71
Near-condensing boilers	Incr.	$12,817	4.93
Efficient new construction - 40% better	Incr.	$99	3.05
Condensing boiler-based hot water heater	Incr.	$3,359	2.40
Condensing tank-type hot water heater	Incr.	$1,783	1.74
High-efficiency cooking equipment	Incr.	$1,929	1.48
Condensing boilers	Incr.	$7,711	1.42
Condensing unit heaters	Incr.	$139	1.08
Roof insulation	Incr.	-$0.08	0.99
Condensing rooftop HVAC units	Incr.	-$1,142	0.75
High-performance glazings	Incr.	-$17	0.69
Super high-performance glazings	Incr.	-$65	0.51
Wall insulation	Incr.	-$17	0.37
High-efficiency condensing gas furnaces	Incr.	-$1,017	0.31
Gas absorption heat pump	Incr.	-$9,197	0.26
High-efficiency rooftop HVAC units	Incr.	-$2,568	0.11

Highlights are summarized below.

- The most attractive measures pass the economic screen on a full-cost basis. This implies that they can be implemented immediately. In contrast, measures that pass the economic screen on an incremental cost basis are assumed to be implemented when equipment or material is being replaced.

- When the weighted average results are considered, 17 of the 33 measures analyzed pass the economic screen. However, there are several other measures that only marginally fail the economic screen on average. Some of these measures pass the economic screen in specific sub sectors and/or regions.

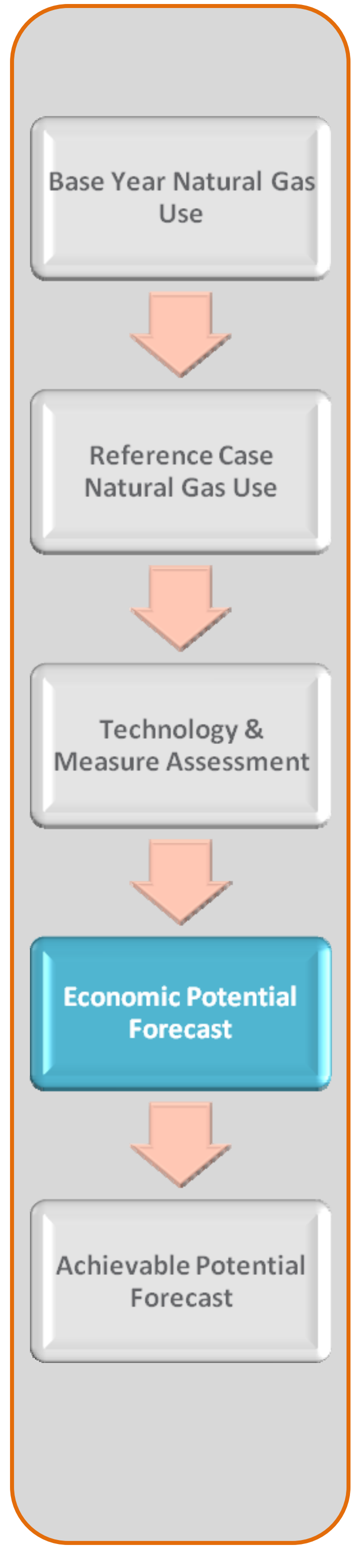
  - The most attractive measures include low-flow pre-rinse spray valves, faucet aerators, ultra low-flow showerheads, demand-controlled kitchen ventilation, programmable thermostats, tankless water heaters, DHW boilers and O&M measures

  - Measures that marginally fail the economic screen include air sealing, high-volume low-speed fans, drain water heat recovery, and high-performance glazings.

- Innovative new technologies, such as gas absorption heat pumps and micro-combined heat & power (CHP) units do not currently pass the economic screen. Although these measures are not currently economically attractive in a typical case, they may be suitable to pursue as part of a demonstration or pilot project.

6 Economic Potential Forecast

6.1 Introduction



This section presents the Commercial sector Economic Potential Forecast for the study period (2010 to 2030). The Economic Potential Forecast estimates the level of natural gas consumption that would occur if all building systems and equipment were upgraded to the level that is cost effective. In this study, "cost effective" means that the technology upgrade passes the measure TRC test, as discussed previously in Section 5.

The discussion in this section is organized into the following subsections:

- Major modelling tasks
- Technologies included in Economic Potential Forecast
- Presentation of results.

6.2 Major Modelling Tasks

By comparing the results of the Commercial sector Economic Potential Forecast with the Reference Case, it is possible to determine the aggregate level of potential natural gas savings within the Commercial sector, as well as identify which specific building segments, end uses and technologies can provide the most significant opportunities for savings.

To develop the Commercial sector Economic Potential Forecast, the following tasks were completed:

- The measure TRC results for each of the energy-efficiency upgrades presented previously in Exhibit 23 were reviewed.
- Technology upgrades that had positive measure TRC results were selected for inclusion either on a "full-cost" or "incremental" basis. Technical upgrades passing the measure TRC test on a full-cost basis were implemented in the first forecast year. Those upgrades that only passed the measure TRC test on an incremental basis were introduced as the existing stock reached the end of its useful life. If more than one cost-effective measure existed for the same end-use application, the study selected the most energy-efficient one.
- Energy use within each of the sub sectors was modelled with the same energy models that were used to generate the Reference Case. However, for this forecast, the remaining standard efficiency technologies included in the Reference Case were replaced with the most efficient technology upgrade option that passed the measure TRC test.
- When more than one upgrade option was applied to a given end use, the first measure selected was the one that reduced the energy load. For example, measures to reduce the overall DHW load (e.g., ultra low-flow showerheads) would be applied before a high-efficiency water heater.

6.3 Technologies Included in Economic Potential Forecast

Exhibit 24 provides a listing of the technologies selected for inclusion in the Economic Potential Forecast. In each case, the exhibit shows the following:

- End use affected
- Upgrade option(s) selected
- Rate at which the upgrade options were introduced into the stock.

Note that not all technologies are applied to all sub sectors and regions. In some cases, specific technologies are not applicable to some sub sectors (i.e., high-volume low-speed fans are not applicable in Office buildings), while other technologies pass the economic screen in a subset of regions and/or sub sectors in which they are technically appropriate, usually because of differences in climate conditions. Tables showing measure applicability by both sub sector and region are provided in Appendix D.

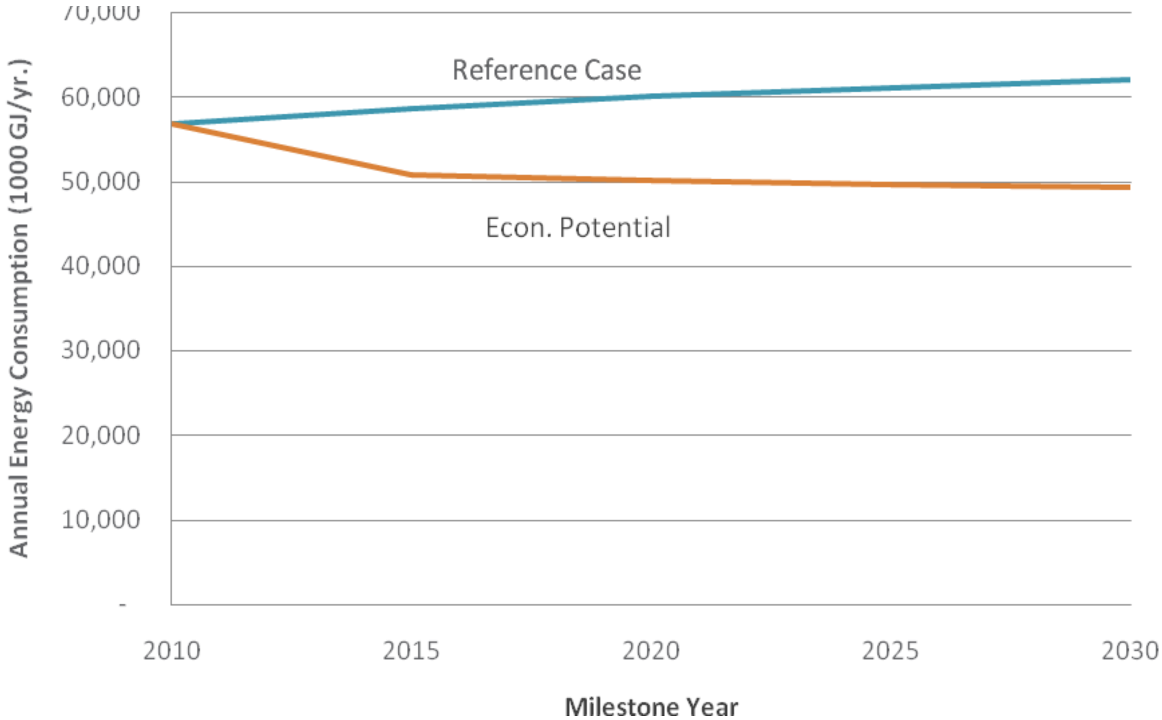
Exhibit 24 Technologies Included in the Economic Potential Scenario

End Use / Application	Upgrade Option	Rate of Stock Introduction
Cooking	High-efficiency cooking equipment	At rate of equipment replacement
Building Envelope	High-performance windows	At rate of replacement/ major building refit
	Roof insulation	At time of roof replacement
	Air sealing	Immediate
Space Heating	Programmable thermostat	Immediate
	Air-to-air heat recovery	Immediate
	Demand-controlled ventilation	Immediate
	Demand-controlled kitchen ventilation	Immediate
	Infrared radiant heating	At time of heating system replacement
	High-volume low-speed destratification fans	Immediate
	Condensing boilers	At time of heating system replacement
	Condensing unit heaters	At time of heating system replacement
	Condensing rooftop units	At time of heating system replacement
Water Heating	Low-flow fixtures	Immediate
	Low-flow pre-rinse spray valves	Immediate
	Condensing DHW boilers	At rate of equipment replacement
	Condensing tank-type water heaters	At rate of equipment replacement
	Drainwater heat recovery	Immediate
Whole Building	O&M measures	Immediate
	Advanced building automation systems/recommissioning	Immediate
Whole Building -New Building Design	New buildings - 40% better	Immediate

6.4 Presentation of Results

Exhibit 25 provides a comparison of the Reference Case and Economic Potential Forecast levels of commercial energy consumption. As illustrated, under the Reference Case, commercial natural gas consumption would rise slightly from the Base Year level of approximately 57 million GJ/yr. to almost 62 million GJ/yr. by 2030. This contrasts with the Economic Potential Forecast in which natural gas consumption would decrease to approximately 49.2 million GJ/yr. This is a difference of approximately 12.8 million GJ/yr., or about 20%.

Exhibit 25 Reference Case versus Economic Potential - Natural Gas Consumption for the Total FortisBC Service Area (1000 GJ/yr.)



6.4.1 Natural Gas Savings

Further detail on the total potential natural gas savings provided by the Economic Potential Forecast is provided in the following exhibits:

- Exhibit 26 presents the results for the total FortisBC service area by service region and milestone year.
- Exhibit 27 presents the results for the total FortisBC service area by sub sector and milestone year.
- Exhibit 28 presents the results for the total FortisBC service area by end use and milestone year.
- Exhibit 29 presents the results for the total FortisBC service area by technology and milestone year.

Ultra low-flow fixtures	653,458	643,507	633,556	623,605	4.9%	8.61
New construction 40% better	137,065	258,593	358,921	453,200	3.6%	3.07
O&M	1,072,901	1,053,684	1,034,607	1,015,669	8.0%	1.38
Pre-rinse spray valves	198,990	195,960	192,929	189,899	1.5%	16.70
Programmable thermostats	271,495	262,831	254,274	245,823	1.9%	2.77
Roof insulation	194,496	385,660	573,502	758,030	5.9%	1.26
Aggregate savings[25]	2,631,903	3,428,142	4,054,561	4,604,036	36.1%	-

Note: Several measures, such as BAS/Recommissioning and O&M, have associated savings across more than one end use.

[25] The aggregate savings (36%) are from the "Small Commercial" and "Recreational and Other" sub sectors, which were not modelled by end use; however, it can be assumed that relative savings by end use would be similar to those in the modelled sub sectors.

Note that the average benefit-cost ratios in Exhibit 29 differ from those presented in Exhibit 23 because these ratios are based on all combinations of sub sectors and regions only *where the measure passes the economic screen*.

6.4.2 *Interpretation of Results*

Highlights of the potential natural gas savings presented in the preceding exhibits are summarized below.

Savings by Service Region

The Lower Mainland service region represents 62% of the identified savings, which is consistent with the large number of customers in this service region. Vancouver Island accounts for 14% of all identified savings. The Southern and Northern Interior regions each represent 12% of the identified savings.

In the Northern Interior region, potential savings are 28% of the Reference Case consumption in 2030, the highest percentage of any of the regions. In the Lower Mainland region, potential savings are 19% of the Reference Case consumption in 2030, the lowest of any of the regions. Differences in relative savings between regions are primarily due to variation in space heating loads, which lead to some variance by region in the measures that pass the economic screen.

Savings by Milestone Year

Sixty-two percent of the total identified Economic Potential savings are economically feasible by 2015. This is because the majority of measures that are cost effective pass the economic screen at full cost (i.e., it is economically attractive to implement them immediately),[26] and are therefore implemented immediately under the Economic Potential scenario.

The expected impact of natural conservation in the Commercial sector is also an important factor that causes 2015 savings to be relatively large in proportion to the total 2030 savings. Savings are calculated based on the expected difference between the Reference Case, which includes savings from natural conservation, and the Economic Potential Forecast. As naturally-occurring savings gradually increase over the study period, they erode some of the Economic Potential.

Savings by Sub sector

Small Commercial buildings represent approximately 29% of the total Economic Potential savings, followed by Large Apartment buildings at 16%, Restaurants at just over 8% and Other Commercial at almost 8%.

There are two primary drivers of relative savings by sub sector:

- Base case consumption by sub sector is highly correlated with Economic Potential savings by sub sector.

[26] See Exhibit 23 for a summary of the basis (full/incremental) by which measures pass the economic screen for the Lower Mainland region.

- Sub sectors with high DHW EUIs tend to contribute more potential savings to the Economic Potential scenario total, as there are slightly more economically attractive savings available for the DHW end use than in other end uses.

Savings by End Use

- Within the modelled sub sectors:
  - Space heating savings account for approximately 60% of total energy savings in the Economic Potential Forecast. Advanced BAS/recommissioning, air-to-air heat recovery, and O&M measures make significant contributions to this total.
  - DHW savings account for approximately 32% of the total energy savings in the Economic Potential Forecast. The largest contributors are condensing DHW boilers, ultra low-flow fixtures and condensing DHW tanks.
  - Cooking savings account for approximately 8% of the total energy savings in the Economic Potential Forecast.
- The sub sectors Small Commercial and Recreation Facilities and Other were not modelled at the same level of end-use detail due to data constraints. In the absence of detailed data it is assumed that the distribution of end-use savings within the non-modelled sub sectors would be similar to those in the modelled sub sectors.

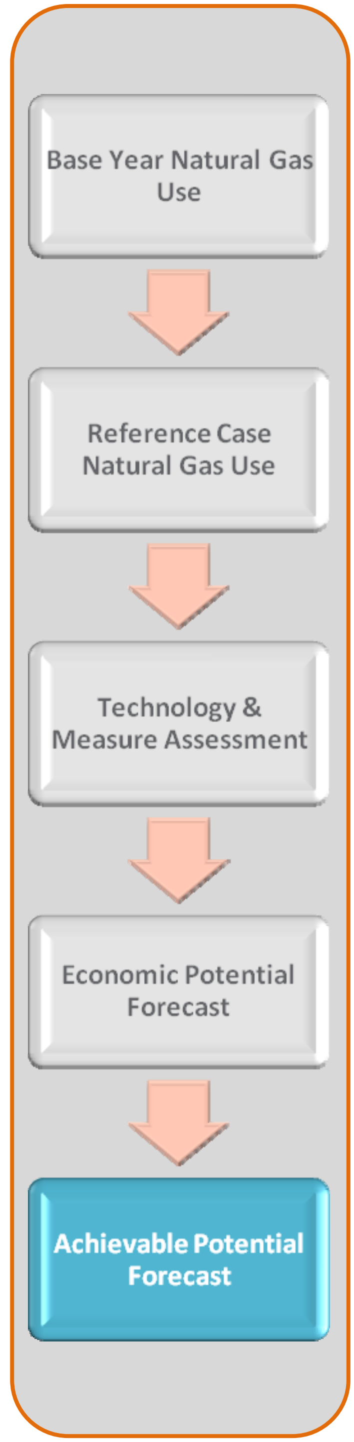
6.4.3 *Caveats on Interpretation of Results*

A systems approach was used to model the energy impacts of the efficiency upgrades presented in the preceding section. In the absence of a systems approach, there would be double counting of savings and an accurate assessment of the total contribution of the energy-efficient upgrades would not be possible.

For example, programmable thermostats reduce space heating natural gas use, as does the installation of new energy-efficient windows. On its own, each measure will reduce overall space heating energy use. However, the two savings are not cumulative. The order in which some upgrades are introduced is also important. In this study, the approach has been to select and model the impact of measures that reduce the load for a given end use (e.g., wall insulation or window upgrades that reduce the space heating load) and then to introduce measures that meet the remaining load more efficiently (e.g., a high-efficiency space heating system).

The above approach means that where there is interaction between measures that affect the same end use, the savings for the individual measures shown in Exhibit 29 are reduced. For example, if the programmable thermostat measure were implemented in the absence of any other space heating measures, its savings would be greater than those shown in Exhibit 29. As appropriate, this issue is addressed in Section 7 of this report.

7 Achievable Potential



7.1 Introduction

This section presents the Commercial sector Achievable Potential for the study period (2010 to 2030). The Achievable Potential is defined as the proportion of the energy-efficiency opportunities identified in the Economic Potential Forecast that could realistically be achieved within the study period.

The remainder of this discussion is organized into the following subsections:

- Description of Achievable Potential
- Approach to the estimation of Achievable Potential
- Results – energy-efficient technologies.

7.2 Description of Achievable Potential

Achievable Potential recognizes that, in many instances, it is difficult to induce all customers to purchase and install all the energy-efficiency technologies that meet the criteria defined by the Economic Potential Forecast. For example, customer decisions to implement energy-efficient measures can be constrained by important factors such as:

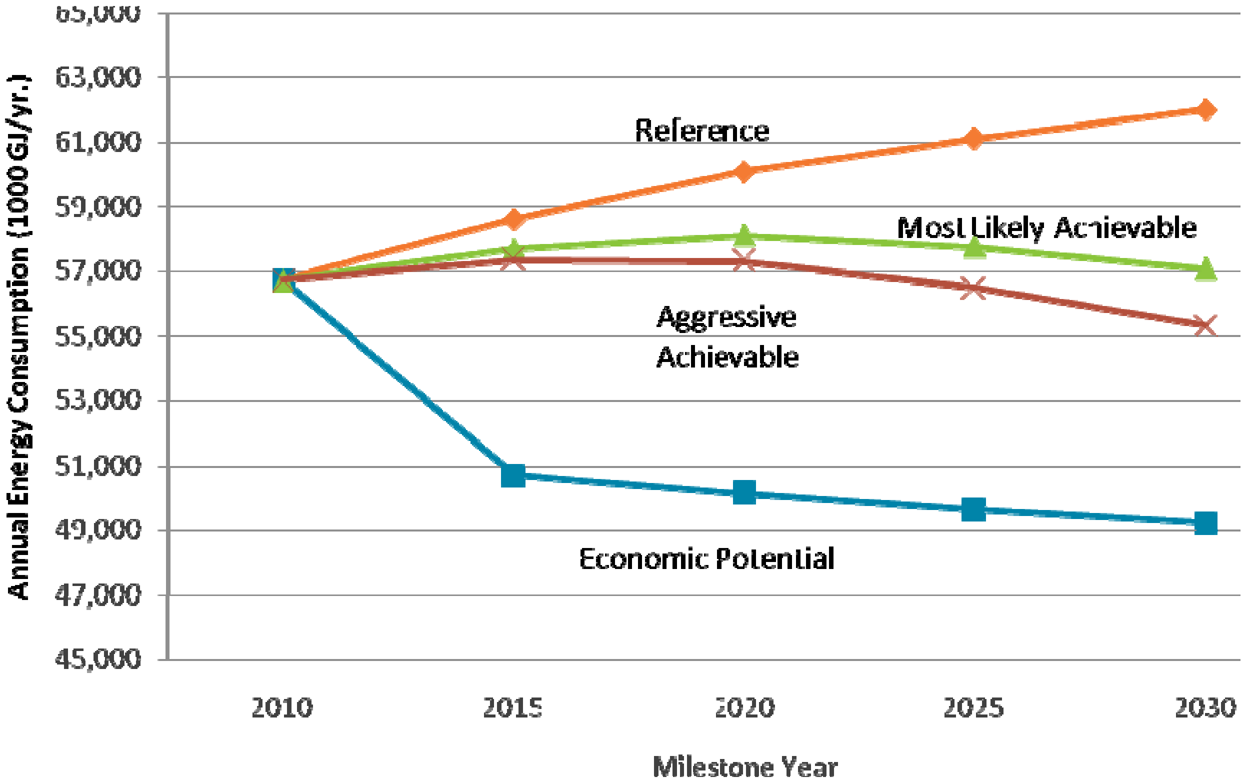
- Higher first cost of efficient product(s)
- Need to recover investment costs in a short period (payback)
- Lack of product performance information or unsubstantiated performance claims
- Lack of product availability.

The rate at which customers accept and purchase energy-efficiency products will be influenced by the level of financial incentives, information and other measures put in place by FortisBC, BC Hydro, governments and the private sector to remove barriers such as those noted above.

Exhibit 30 presents the levels of natural gas consumption that are estimated in the Achievable Potential scenario. As illustrated, the Achievable Potential scenarios are *banded* by the two forecasts presented in previous sections, namely the Economic Potential Forecast and the Reference Case.

As illustrated in Exhibit 30 energy savings under the Achievable Potential scenario are less than in the Economic Potential Forecast. In this CPR, the primary factor that contributes to the outcome shown in Exhibit 30 is the rate of market penetration. In the Economic Potential Forecast, efficient new technologies are assumed to fully penetrate the market as soon as it is economically attractive to do so. However, the Achievable Potential recognizes that under real world conditions, the rate at which customers are likely to implement new technologies will be influenced by additional practical considerations and will, therefore, occur more slowly than under the assumptions employed in the Economic Potential Forecast.

Exhibit 30 Annual Natural Gas Consumption—Achievable Potential Scenarios Relative to Reference Case and Economic Potential Forecast (1000 GJ/yr.)



As also illustrated in Exhibit 30, the Achievable results are presented as a band of possibilities, rather than a single line. This is because any estimate of Achievable Potential over a 20-year period is necessarily subject to uncertainty. Consequently, two Achievable Potential scenarios are presented: *most likely* and *aggressive*.

The *most likely* Achievable Potential assumes British Columbia market conditions that are similar to those contained in the Reference Case. That is, customers' awareness of energy-efficiency options and their motivation levels remain similar to those in the recent past, technology improvements continue at historical levels and new energy performance standards continue as per current known schedules. It also assumes that FortisBC's ability to influence customers' decisions towards increased investments in energy-efficiency options remains roughly in line with previous company DSM experience.

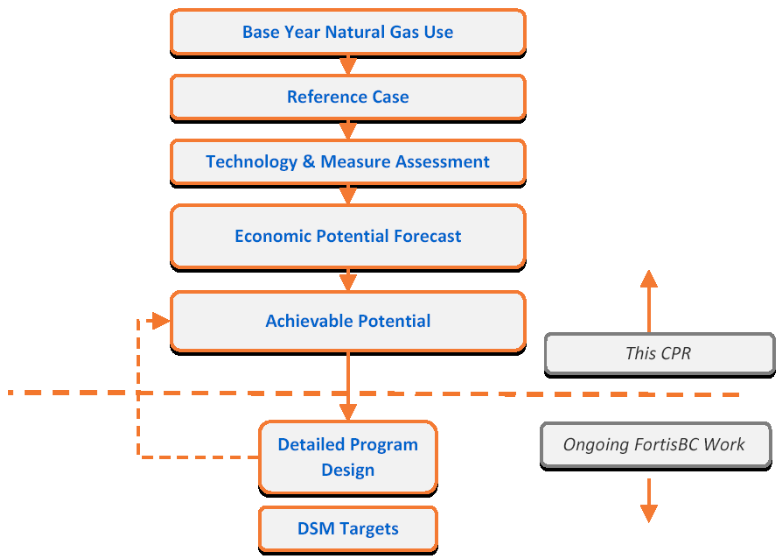
The *aggressive* Achievable Potential assumes British Columbia market conditions that aggressively support investment in energy efficiency. For example, this scenario assumes that real energy prices increase over the study period and that federal and provincial government actions to mitigate climate change result in increased levels of complementary energy-efficiency initiatives. *Aggressive* Achievable Potential typically does not reach Economic Potential levels; this recognizes that some portion of the market is typically constrained by barriers that cannot realistically be affected by DSM programs within the study period.

7.2.1 Achievable Potential Versus Detailed Program Design

It should also be emphasized that the estimation of Achievable Potential is not synonymous with either the setting of specific program targets or with program design. While both are closely linked to the discussion of Achievable Potential, they involve more detailed analysis that is beyond the scope of this study.

Exhibit 31 illustrates the relationship between Achievable Potential and the more detailed program design.

Exhibit 31 Achievable Potential versus Detailed Program Design



7.3 Approach to the Estimation of Achievable Potential

Achievable Potential was estimated in a five-step approach.

- Priority opportunities were selected
- Opportunity profiles were created
- Opportunity worksheets were prepared
- A full-day workshop was held
- Workshop results were aggregated and applied to the remaining opportunities.

Further discussion is provided below.

7.3.1 Step 1: Select Priority Opportunities

The first step in developing the Achievable Potential estimates required selection of the energy saving opportunities identified in the Economic Potential Forecasts to be discussed during the Achievable workshop. Several criteria determined selection, including:

- The priority measures should represent a substantial fraction of the overall Economic Potential
- The priority measures should represent several different energy end uses

- The priority measures should have a variety of different likely patterns of market adoption so the discussions will be widely varied.

A summary of the selected energy-efficiency actions discussed, along with the approximate percentage of 2030 Economic Potential savings that each represents, is provided in Exhibit 32.

Exhibit 32 Commercial Sector Priority Opportunities – Energy Efficiency

Action Profile #	Measure	End Use	% Savings 2030 Relative to Total 2030 Savings
C1	Ultra low-flow fixtures	Water Heating	8%
C2	Roof insulation	Space Heating	9%
C3	Condensing DHW tank	Water Heating	6%
C4	High-efficiency cooking equipment	Cooking	8%
C5	High-efficiency boilers	Space Heating	19%
C6	Recommissioning	All	8%
C7	O&M measures	All	12%
C8	New construction measures	All	6%
Grand Total			77%

7.3.2 Step 2: Create Opportunity Profiles

The next step involved the development of brief profiles for each of the opportunities noted above in Exhibit 32, in the form of four or five PowerPoint slides. The slides are presented in Appendix D.

The purpose of the opportunity profiles was to provide a high-level logic framework that would serve as a guide for participant discussions in the Achievable workshop (see Section 7.3.3 below). The intent was to define a broad rationale and direction without getting into the much greater detail required of program design, which, as noted previously, is beyond the scope of this project. As illustrated in Appendix D, each opportunity profile addresses the following areas:

Technology Description – provides a summary statement of the broad goal and rationale for the Action.

Target Sub Sector and Typical Application – highlights the sub sectors and applications offering the most significant opportunities and which provide a good starting point for discussion of the technology.

Financial and Economic Indicators – provides estimates of average simple payback, benefit-cost ratio (TRC analysis), and basis of assessment (full cost versus incremental).

Eligible Participants – provides an estimate of the number of buildings within the target sub sector that could be affected during the study period if the entire Economic Potential were to be captured.

Economic Potential versus Time – shows the pattern of the changing size of the opportunity over the study period, for existing and new buildings. Some opportunities grow steadily through the study period, as more and more appliances reach the age when they would be replaced. Other opportunities are economic to capture immediately, and after that the growth over time is limited to opportunities in new buildings being built. Still other opportunities decline with time as they are eroded by natural conservation activities.

Economic Potential versus Sub Sector and Region – shows how the opportunity is distributed through FortisBC's service area.

7.3.3 Step 3: Prepare Opportunity Worksheets

A draft assessment worksheet was prepared for each opportunity profile in advance of the Achievable workshop. The assessment worksheets complemented the information contained in the opportunity profiles by providing quantitative data on the potential energy savings for each opportunity as well as providing information on the size and composition of the eligible population of potential participants. Energy impacts and population data were taken from the detailed modelling results contained in the Economic Potential Forecast.

The worksheets, including the results recorded during the workshop discussions, are provided in Appendix E. As illustrated in Appendix E, each opportunity assessment worksheet addresses the following areas:

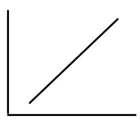
Approximate Benefit-Cost Ratio – shows the approximate ratio of economic benefits to costs. The benefit-cost ratio provides an indication of the relative economic attractiveness of the energy-efficiency measures from FortisBC's perspective. For the purposes of the workshop, this information provided participants with an indication of the scope for using financial incentives to influence customer participation rates.

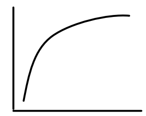
Customer Payback – shows the simple payback from the customer's perspective for the package of energy-efficiency measures included in the opportunity. This information provided an indication of the level of attractiveness that the opportunity would present to customers. This provided an important reference point for the workshop participants when considering potential participation rates. When combined with the preceding benefit-cost information, participants were able to "roughly" estimate the level of financial incentive that could be employed to increase the opportunity's attractiveness to customers without making it economically unattractive to FortisBC***.***

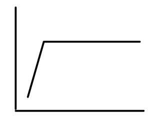
Economic Potential in Terms of Applicable Participants (e.g., square footage, number of buildings) – shows the total number of potential participants in terms of both square footage and estimated number of buildings that could theoretically take part in the opportunity. Numbers shown are from the eligible populations used in the Economic Potential Forecasts.

Participation Rates (%) – these fields were filled in during the workshops (described below in Step 4), based on input from the participants. They show the percentage of economic savings that workshop participants concluded could be achievable in the last milestone period (usually 2030, but may be earlier for measures that peak earlier). As noted in the introduction to this section, two Achievable levels are shown: *most likely* and *aggressive*. Under the comments column, participants indicated a likely shape for a curve to describe how quickly activity would rise to that level, so that participation rates for the intervening milestone years could be estimated. The various curves used in the discussion are shown in Exhibit 33.

Exhibit 33 Sample Participation Curves for Achievable Workshops

Curve A	Curve B	Curve C	Curve D
			






Achievable Potential in Terms of Applicable Participants (e.g., square footage, number of buildings) – these fields were calculated based on the participation rates provided by the participants.

Participation Rates Relative to the Discussion Scenario – these fields were filled in during the workshops to provide guidance to the consulting team on how participation might differ in other regions or sub sectors.

Other Parameters – these fields were filled in during the workshop to capture other aspects of the discussion. In addition, the consulting team members took notes on the discussion, a summary of which is included in Appendix E-1.

7.3.4 Step 4: Achievable Workshop

The most critical step in developing the estimates of Achievable Potential was a one-day Achievable Potential workshop that was held on January 26, 2011. Workshop participants consisted of core members of the consultant team, DSM program and technical personnel from FortisBC, and industry representatives. Together, the participating personnel brought many years of experience to the workshop related to the technologies and markets as well as the design and delivery of energy-efficiency programs in British Columbia.

The purpose of this workshop was to:

- Promote discussion regarding the technical and market constraints confronting the identified energy-efficiency opportunities
- Identify potential strategies for addressing the identified constraints, including potential partners and delivery channels
- Compile participant views related to how much of the identified economic savings could realistically be achieved over the study period.

The discussion of each opportunity profile began with a brief consultant presentation. The floor was then opened to participant discussion of the key factors affecting each of the market segments and technical opportunities contained in the opportunity profile and accompanying worksheet.

Following discussion of the broad market and intervention conditions affecting the opportunity, workshop participant views were recorded on the *most likely* and *aggressive* customer participation rates. General agreement was sought on rates to be carried forward into the analysis.

As noted earlier, it was not possible to fully address all opportunities in the one-day workshop. Consequently, the workshop focused on opportunities selected based on the criteria described in Step 1. The consultants extrapolated to estimate participation for the remaining opportunities, consulting with FortisBC program personnel as needed. The values shown in the attached appendices and in the following summary tables incorporate the results of all these inputs.

7.3.5 Step 5: Aggregate Opportunity Results

The final step involved aggregating the results of the individual opportunities to provide a view of the Achievable Potential savings for the total Commercial sector.

7.4 Results – Efficient Technologies

A summary of the *most likely* and *aggressive* Achievable Potential results for the energy-efficiency opportunities is presented in this section. These results include the following:

- Natural gas consumption savings
- Peak day load impacts
- Greenhouse gas emission reductions.

7.4.1 Natural Gas Consumption Savings – Aggressive Achievable Scenario

The following exhibits present the potential natural gas savings under the *aggressive* Achievable Potential scenario. The results shown are relative to the Reference Case. The results are broken down as follows:

- Exhibit 34 presents the results for the total FortisBC service area by service region and milestone year.

- Exhibit 35 presents the results for the total FortisBC service area by sub sector and milestone year.

- Exhibit 36 presents the results for the total FortisBC service area by end use and milestone year.

Exhibit 34 Natural Gas Savings for the Total FortisBC Service Area by Service Region and Milestone Year (GJ/yr.) - Aggressive Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total	% Savings Relative To Ref
2015	840,486	138,461	138,763	157,282	5,558	1,280,551	2.2%

Small Commercial	241,293	527,453	911,955	1,357,598	7.1%	27.6%
Other	60,181	132,367	230,676	345,306	6.9%	7.0%
Grand Total	**930,246**	**1,990,692**	**3,378,709**	**4,915,107**	**7.9%**	**100%**

Note: Any difference in totals is due to rounding.

Exhibit 39 Natural Gas Savings for the Total FortisBC Service Area by End Use and Milestone Year (GJ/yr.) - Most Likely Achievable Scenario

End Use	2015	2020	2025	2030	% Savings 2030 Relative to Ref Case	% Savings 2030 Relative to Total 2030 Savings
Commercial Cooking	4,717	36,212	83,000	151,441	2.7%	3%
DHW	400,468	683,643	1,067,311	1,367,484	9.2%	28%
Space Heating	525,061	1,270,837	2,228,397	3,396,181	10.2%	69%
Grand Total	**930,246**	**1,990,692**	**3,378,709**	**4,915,107**	**7.9%**	**100%**

Note: Any difference in totals is due to rounding.

7.4.3 Savings Comparison – Aggressive and Most likely Achievable Scenarios

As a point of comparison, Exhibit 40 below expresses the *most likely* Achievable scenario savings as a percentage of the *aggressive* Achievable scenario savings by region and milestone year.

Exhibit 40 Natural Gas Savings for the Total FortisBC Service Area by Region and Milestone Year (GJ/yr.) - Achievable Scenario Savings Comparison

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	73%	70%	76%	71%	73%	73%
2020	71%	68%	73%	72%	71%	71%
2025	73%	71%	74%	74%	73%	73%
2030	74%	72%	74%	77%	74%	74%

7.4.4 Peak Day Load Impacts – Energy-efficiency Scenarios

This sub section estimates the peak day load impact that would occur as a result of the Achievable Potential scenarios presented in the preceding exhibits. Peak day load impact measures the relationship between a typical or average daily consumption rate and the consumption that occurs on a peak day when the demand for natural gas is at a maximum. The relationship is illustrated in the formula below.

$$\textit{Peak Day Consumption} = \frac{\textit{Average Daily Consumption}}{\textit{Load Factor}}$$

The following steps were employed to derive the estimated peak day load impacts:

- Annual natural gas decreases associated with each of the preceding Achievable Potential scenarios were identified (GJ/yr.).

FortisBC provided load factors that correlate the relationship between average and peak day consumption levels for each rate class and service region. Commercial sector customers, as defined in this CPR, include accounts in all rate classes except rate 1. The overall commercial peak day load factors therefore represent a consumption-weighted average of the various rate class peak day load factors. Exhibit 41 shows a Commercial sector load factors ranging from 0.288 in the Northern Interior Region to 0.380 in the Vancouver Island Region.

Exhibit 41 Peak Day Load Factors, by Sector and Service Region

CPR Sector	Lower Mainland	Vancouver Island	Northern Interior	Southern Interior
Residential	0.272	0.279	0.266	0.266
Commercial	0.358	0.380	0.288	0.298
Industrial	0.589	0.384	0.862	0.812

- Finally, peak day load impacts were calculated by dividing the average daily consumption by the appropriate sector and service region load factors.

Exhibit 42 and Exhibit 43 summarize the estimated peak day load impacts for each of the Achievable Potential scenarios. The results for the *aggressive* Achievable Potential are presented in Exhibit 42 and the results for the *most likely* Achievable Potential are presented in Exhibit 43.

Exhibit 42 Peak Day Capacity Impacts, By Scenario, Service Region and Milestone Year (GJ) – Aggressive Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	6,424	1,058	1,061	1,202	42	9,787
2020	13,983	2,461	2,401	2,623	94	21,562
2025	22,688	4,212	4,092	4,314	154	35,459
2030	32,115	6,298	6,100	6,182	221	50,917
Savings 2030 Relative to Total 2030 Savings	63%	12%	12%	12%	0.4%	100%

Exhibit 43 Peak Day Capacity Impacts, By Scenario, Service Region and Milestone Year (GJ) - Most Likely Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	4,714	744	802	849	31	7,141
2020	9,904	1,675	1,753	1,883	66	15,281
2025	16,637	2,977	3,012	3,197	113	25,936
2030	23,786	4,537	4,502	4,740	164	37,729
Savings 2030 Relative to Total 2030 Savings	63%	12%	12%	13%	0.4%	100%

7.4.5 Greenhouse Gas Emission Impact – Energy-efficiency Scenarios

The natural gas savings associated with each of the Achievable Potential scenarios would also result in a reduction of greenhouse gas (GHG) emissions.[27] Exhibit 44 and Exhibit 45 provide the estimated GHG reduction impact of each of the two Achievable Potential scenarios.

[27] GHG impacts are estimated based on an emissions factor of 50.7 kg of CO_2e per GJ of natural gas. This is the value currently employed by Natural Resources Canada.

Exhibit 44 Estimated GHG Emission Reductions, By Scenario and Milestone Year (tonnes CO_2e/yr) – Aggressive Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	42,613	7,020	7,035	7,974	282	64,924
2020	92,758	16,325	15,927	17,402	620	143,033
2025	150,501	27,939	27,145	28,617	1,021	235,222
2030	213,041	41,776	40,468	41,012	1,468	337,765
Savings 2030 Relative to Total 2030 Savings	63%	12%	12%	12%	0.4%	100%

Exhibit 45 Estimated GHG Emission Reductions, By Scenario and Milestone Year (tonnes CO_2e/yr) – Most Likely Achievable Scenario

Year	Lower Mainland	Vancouver Island	Southern Interior	Northern Interior	Whistler	Grand Total
2015	31,274	4,933	5,321	5,635	206	47,369
2020	65,701	11,108	11,626	12,493	440	101,368
2025	110,366	19,747	19,978	21,209	747	172,047
2030	157,787	30,100	29,865	31,444	1,087	250,283
Savings 2030 Relative to Total 2030 Savings	63%	12%	12%	13%	0.4%	100%

7.4.6 Interpretation of Results

Highlights of the potential natural gas savings presented in the preceding exhibits are summarized below:[28]

Savings by Service Region

The Lower Mainland service region represents approximately 63% of the identified savings in both the *aggressive* and *most likely* Achievable Potential scenarios. Although this magnitude is consistent with the large number of customers in this service region (who constitute approximately 70% of the 2030 Reference Case gas consumption), Achievable savings are slightly lower in the Lower Mainland relative to the 2030 reference than in other regions. This is due to smaller savings for space heating measures in the relatively warm Lower Mainland region.

Savings in the Northern Interior, Southern Interior and Vancouver Island regions each represent between 12% and 13% of the identified savings in both the *most likely* Achievable scenarios. Again, savings relative to the 2030 Reference Case are linked closely to the space heating loads

[28] It should be noted that the approach to Commercial sector segmentation employed in this study differs from that employed in the 2006 CPR. These changes were introduced to better accommodate the scope and objectives of the current study. Of particular importance to any comparison of results, this study includes Medium and Large Apartments in the Commercial sector; the 2006 study included them in the Residential sector. Additionally, this study addresses only those commercial facilities that are FortisBC customers. The 2006 CPR included all commercial facilities within the province, including those that were not FortisBC, then Terasen Gas, customers.

in each region, with the colder Northern Interior region having the largest savings relative to the Reference Case, and the warmer Vancouver Island Region having the smallest relative savings in both Achievable scenarios.

Savings by Milestone Year

In contrast to the Economic Potential scenario, where a large portion of the savings are realized immediately, savings in both Achievable scenarios show a significant increase through time. Based on the adoption patterns estimated by the workshop participants, under the *most likely* scenario, 19% of the 2030 savings would be achieved by 2015, 41% by 2020, and 69% by 2025. In the *aggressive* scenario, 19% would be achieved by 2015, 42% by 2020, and 70% by 2025. While the absolute level of savings differ in the two Achievable scenarios, the rate at which these savings are realized is similar, with the savings being realized in the *aggressive* scenario only slightly more quickly than in the *most likely* scenario.

Savings by Sub Sector

Similar to the results of the Economic Potential scenario, Small Commercial buildings represent approximately 28% of the *most likely* Achievable Potential savings, followed by Apartment buildings at 24%, Hospitals at 8%, Restaurants at just under 7%, and Other Commercial at 7%.

The results of the *aggressive* Achievable Potential scenario are very similar, as Small Commercial buildings represent approximately 28% of the potential savings, followed by Apartment buildings at 24%, Hospitals at almost 8%, and Restaurants & Other Commercial at just over 7%.

Savings by End Use

Similar to the results of the Economic Potential scenario, in the *most likely* Achievable Potential scenario:

- Space heating savings account for approximately 45% of total energy savings.
- DHW savings account for approximately 18% of the total energy savings.
- Cooking savings account for approximately 2% of the total energy savings.
- The remaining savings (35%) are aggregate savings from the two unmodelled sub sectors, Small Commercial and Other Commercial.
- Savings in unmodelled sub sectors are extrapolated based on the results of the modelled sub sectors. Assuming that the savings in the unmodelled sub sectors follow the same end-use pattern as those in the modelled sub sectors, space heating would represent 69% of all savings, with DHW representing 28%.

In the *aggressive* Achievable Potential scenario:

- Space heating savings account for approximately 43% of total energy savings.
- DHW savings account for approximately 20% of the total energy savings.
- Cooking savings account for approximately 2% of the total energy savings.

- The remaining savings (35%) are aggregate savings from the two unmodelled sub sectors, Small Commercial and Other Commercial.
- Savings in unmodelled sub sectors are extrapolated based on the results of the modelled sub sectors. Assuming that the savings in the unmodelled sub sectors follow the same end-use pattern as those in the modelled sub sectors, space heating would represent 65% of all savings, with DHW representing 31%.

In both scenarios, space heating and DHW represent a larger portion of the Achievable savings than they do of Reference Case energy. This illustrates the relative difficulty in realizing savings in more niche end uses, such as commercial cooking.

9 Glossary

Achievable potential
The Achievable Potential is the proportion of the natural gas savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. Achievable Potential recognizes that it is difficult to induce customers to purchase and install all of the efficiency technologies that meet the criteria defined by the Economic Potential Forecast.

Avoided cost
The unit cost of acquiring the next resource to meet demand, which is used as a measure for evaluating individual demand-side and supply-side options. In the context of this study "avoided cost" is the capital expenditure offset by FortisBC's DSM activities (i.e., the cost of having to buy natural gas on the open market, contract for long-term supply, and the cost of associated transmission and storage.

Base year
The Base Year is the year to which all potentials will be compared. It provides a detailed description of "where" and "how" natural gas is currently used in each sector. For this study, it is the calendar year 2010. The modelled base year energy use is calibrated against FortisBC's actual sales for 2009.

Benefit/cost ratio
The measure benefit/cost ratio indicates the relative attractiveness of the measures. A measure that has a benefit/cost ratio in excess of 1.0 has benefits which outweigh its costs. Similarly, a measure with a benefit/cost ratio that is well in excess of one (e.g., 3.0) means that it is very attractive. A measure with a benefit/cost ratio of less than 1.0 has costs which outweigh its benefits.

Building envelope
The material separation between the interior and the exterior environments of a building. The building envelope serves as the outer shell to protect the indoor environment as well as to facilitate its climate control.

British thermal unit or BTU
The standard measure of heat energy. It takes one Btu to raise the temperature of one pound of water by one degree Fahrenheit at sea level

Co-generation
The simultaneous production of electric or mechanical energy and useful heat energy from a single fuel source.

Combustion efficiency
The ratio of energy released during combustion to the potential chemical energy available in the fuel.

Demand-side management (DSM)
Actions taken by a utility or other agency which are expected to influence the amount or timing of a customers energy consumption.

Discount rate
The interest rate used in calculating the present value of expected yearly benefits and costs.

Economic efficiency
Allocation of human and natural resources in a way that results in the greatest net economic benefit, regardless of how benefits and costs are distributed within society.

Economic potential forecast
The economic potential forecast is an estimate of the level of natural gas consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost effective from society's perspective. All of the energy-efficiency technologies and measures that have a positive measure TRC are incorporated into the economic potential forecast. These technologies and measures are applied at either natural stock turnover rates or at designated years for immediate application.

Energy audit
An on-site inspection and cataloguing of energy using equipment/buildings, energy consumption and the related end-uses. The purpose is to provide information to the customer and the utility. Audits are useful for load research, for DSM program design and for identification of specific energy savings measures.

Energy conservation
Activities by energy users that result in a reduction of the energy used to provide services. Energy conservation can include a wide variety of behavioural or operational changes that result in energy savings..

Energy efficiency
Using less energy to perform the same function.

Energy intensity
The ratio of energy consumed per application or end use. For example, cubic metres per square metre of heated office space per day, or cubic metres per tonne of aluminum produced. All else being equal, energy intensity increases as energy efficiency decreases.

Emerging technologies
New energy-conserving technologies that are not yet market-ready, but may be market-ready over next 5 to 10 years. This category includes technologies that could be accelerated into the market during that period through targeted financial or technical support.

End use
The final application or final use to which energy is applied. End use is often used interchangeably with energy service.

Energy savings
The reduction in use of energy from the pre retrofit baseline to the post retrofit energy use that result from efficient technologies or activities. In this document, the term "energy" refers specifically to energy derived from natural gas unless otherwise noted.

Energy service
An amenity or service supplied jointly by energy and other components/equipment such as buildings and heating equipment. Examples of energy services include residential space heating, commercial cooking, aluminum smelting and public transit. The same energy service can frequently be supplied with different mixes of equipment and energy.

Energy use index (EUI)
End use energy consumption divided by a specific parameter of production (e.g., m^3/unit)
environmental credit/environmental penalty
An increment or decrement to the cost of a resource or set of resources, to reflect the overall level of its/their environmental impact, relative to another resource or set of resources.

Financial incentive
Certain financial features in the utility's DSM programs designed to motivate customer participation. They may include features designed to reduce a customer's net cash outlay, pay-back period or cost of finance to participate.

Fuel share
The proportion of requirements for a specific service that is met using a certain fuel. In the Commercial sector, fuel shares are normalized on a floor area basis. For example, a natural gas fuel share of 90% for space heating in the Large Office sub sector implies that 90% of the sub sector floor space is heated using natural gas.

Free rider
A program participant who would have implemented the program measure or practice in the absence of the program.

Interactive effects
In the context of natural gas use, interactive effects refer to the increase in gas consumed by heating equipment required to offset a decrease in "waste" heat generated by more efficient electrical fixtures or appliances after retrofit or replacement.

Kilowatt (kW)
One thousand watts; the most common unit of measurement of electric power. (The amount of energy transferred at a rate of one kilowatt for one hour is equal to one kilowatt hour.)

Kilowatt hour (kWh)
The most common unit of measurement of electric energy. One kilowatt hour represents the power of one thousand watts for a period of one hour.

Load forecast
An estimate of expected natural gas requirements that have to be met by the utility in future years.

Load research
Research to disaggregate and analyze patterns of natural gas consumption by various subsectors and end-uses. Load Research supports the development of the load forecast and the design of demand-side management programs.

Market transformation
A reduction in market barriers resulting from a market intervention, as evident by a set of market effects that lasts after the intervention has been withdrawn, reduced or changed.

Measure total resource cost (TRC)
The Measure TRC is the net present value of energy savings that result from an investment in a energy efficiency measure. The Measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and operating & maintenance costs. This calculation includes among others, the following inputs: the avoided natural gas, electricity and water; the life of the measure; and the selected discount rate.

Natural conservation
The future change in energy intensity or base usage that is expected to occur in the absence of utility DSM programs. Natural change represents the effects of energy related decisions that would have been made in the absence of the utility programs by both program participants and non-participants

Rate
Generically refers to a utility's rate structure.

Rate structure
The formulae used by a regulated gas utility to calculate charges for the use of natural gas..

Rebates
A type of incentive provided to encourage the adoption of energy efficeing practices, typically paid after the measure has been installed. There are typically two types of rebates: a Prescriptive Rebate, which is a prescribed financial incentive/unit for a prescribed list of products and a customized rebate in which the financial incentive is determined using an analysis of the customer equipment and an agreement on the specific products to be installed.

Reference case forecast
An estimate of the expected level of natural gas consumption that would occur over the study period in the absence of any new utility DSM market interventions after 2010. It is the baseline against which the scenarios of energy savings are calculated. The Reference Case forecast incorporates an estimation of "natural conservation," namely, changes in end-use efficiency over the study period that are projected to occur in the absence of new market interventions by the utility.

Retrofit
Energy efficiency activities undertaken in existing residential or non residential buildings where existing inefficient equipment is replaced by efficient equipment.

Saturation
The portion of floor area that receives a specific energy service. For example, a saturation of 86% for space cooling in the Large Office sub sector means that 86% of the sub sector floor space is cooled (regardless of fuel used to provide that cooling).

Seasonal efficiency
The ratio of delivered useful energy relative to the input potential fuel energy determined over a full heating season (or year).

Sector
A group of customers having a common type of economic activity.

Service area
The portion of the Province of British Columbia that receives service from FortisBC Gas.

Service region
For the purposes of this study, the total FortisBC Gas service area is divided into two service regions. They are the Southern Region and the Eastern Region.

Simple payback
The simple payback is generated to show the customer's financial perspective. Simple payback is a measure of the length of time required for the cumulative savings from a project to recover its initial investment cost, without taking into account the time value of money

Sub sectors
A classification of customers within a sector by common features. Residential subsectors are by type of home (SFD, duplex, apartment, etc.). Commercial subsectors are generally by type of commercial service (office, retail, warehouse, etc.). Industrial subsectors are by product type (pulp and paper, solid wood products, chemicals, etc.).

Supply curves
A curve illustrating the amount of energy (e.g., m^3) or societal benefit available at an appropriate screened price in ascending order of cost.

Total Resource Cost (TRC) Test
A test that compares the total costs of energy efficiency investments, including natural gas conservation programs, to the social cost of natural gas. Un-priced environmental and social costs may be accounted for by changing the cost of either the investment under consideration or the total cost of natural gas in such a way that relative un-priced impacts are reflected. It is used in designing and evaluating programs that are developed from the Energy Efficiency Potential study's results.

Utility cost
The total financial cost incurred by the utility to acquire energy resources. For DSM, the costs include all utility program costs, including incentive costs.

Watt
The basic unit of measurement of power, at a point in time as capacity or demand.

Appendix A Background – Section 3: Base Year Natural Gas Use

Introduction

Appendix A provides additional detailed information related to the generation of the Commercial sector Base Year profile. The appendix discusses the following:

- Sub sector descriptions
- Base Year details – Vancouver Island, Southern Interior and Northern Interior regions
- CEEAM Archetype summaries – Existing Buildings.

A1 Sub Sector Descriptions

Exhibit 46 presents brief descriptions of the Commercial sub sectors. Detailed building archetype profiles for each sub sector are provided in Appendix A3 (Existing buildings) and Appendix B2 (New Buildings).

Exhibit 46 Sub sector Descriptions

	Building Category	Definition	Examples of Building Types
1	Office	Buildings used for office or public administration.	Municipal office, government office building, private office buildings
2	Non-Food Retail	Retail store that primarily sells non-food items	"Big box" store, strip mall, enclosed mall unit
3	Food Retail	Retail store that primarily sells food items and has a significant refrigeration load.	Supermarket
4	Hotel	Hotel or motel building.	
5	Hospital	Hospital or other large, intensive healthcare building.	
6	Nursing Home	Buildings used for providing multiple accommodations for long-term care residents.	Long-term care facility, retirement home, nursing home
7	School	Elementary or Secondary school, typically with seasonal occupancy.	
8	University/College	Post-secondary institution, typically including laboratories, dormitories and less seasonal variation in occupancy than primary/secondary schools.	
9	Restaurant	Full service or quick service restaurant	
10	Warehouse / Wholesale	Typically metal-clad building with high ceilings and predominantly high-bay lighting.	
11	Apartment	Residential building with 5 or more units	
12	Recreation and Other	Commercial or institutional buildings which do not fit into one of the above categories	Service garages, religious buildings, theatres, prisons.

A2 Base Year Details – Vancouver Island, Southern Interior and Northern Interior Regions

Exhibit 47 Natural Gas Shares by Area and Sub Sector (%)

	Vancouver Island		Southern Interior		Northern Interior	
Sub Sector	**Space Heating**	**DHW**	**Space Heating**	**DHW**	**Space Heating**	**DHW**
Large Office	95%	60%	95%	60%	95%	60%
Medium Office	90%	60%	90%	60%	90%	60%
Large Non-food Retail	90%	50%	90%	50%	90%	50%
Medium Non-food Retail	89%	45%	89%	45%	89%	45%
Food Retail	90%	65%	90%	65%	90%	65%
Large Hotel	85%	90%	85%	90%	85%	90%
Medium Hotel	60%	70%	60%	70%	60%	70%

A3 CEEAM Archetype Summaries – Existing Buildings

This section includes summary profiles of the 64 existing building archetypes constructed for this study. Exhibit 53 provides definitions for and explanations of various terms used within the CEEAM profiles, while Exhibit 54 presents a table of contents for the CEEAM building profiles that follow.

Exhibit 53 Terminology used in CEEAM Building Profiles

Profile Term	Explanation
Building Envelope	Defines the thermal characteristics of a building's exterior components
U-value	The rate of heat loss, in Btu per hour per square foot per degree Fahrenheit (BTU/hr. f^2.°F) through walls, roofs and windows. The U-value is the reciprocal of the R-value
Shading coefficient (SC)	Is a measure of the total amount of heat passing through the glazing compared with that through a single clear glass
Window-to-wall ratio	Defines the ratio of window to insulated exterior wall area
General Lighting	Defines the lighting types that are used within the main areas of a building, e.g., for a school, the area is classrooms and the lighting type is fluorescent; for a Food Retail store, the main area is the retail floor.
LPD	Lighting power density expressed in terms of W/ft^2
Lux	The amount of visible light per square meter incident on a surface (lumen/m^2)
Inc	Incandescent lamps
CFL	Compact fluorescent lamps
T12	T12 fluorescent lamps with magnetic ballasts
T8	T8 fluorescent lamps with electronic ballasts
MH	Metal halide lamps
HPS	High-pressure sodium lamps
HID	High-intensity discharge lighting includes both MH and HPS
Secondary Lighting	Defines the lighting types that are used within the secondary areas of a building, e.g., for a school, the secondary areas are corridors, lobbies, foyers, etc.,
Tertiary Lighting	Defines the lighting types that are used within special purpose areas of a building, e.g., for a school, the tertiary area is a gymnasium.
Outdoor Lighting	Defines the outdoor lighting including parking lot and façade
Overall LPD	The total floor weighted LPD that includes general, secondary, tertiary, and outdoor.
Fans	Defines mix of air handling systems
CAV	Constant air volume
VAV	Variable air volume
Space Heating	Defines the mix of heating equipment types found within the stock of buildings
ASHP	Air source heat pump
WSHP	Water source heat pump
Resistance	Electric resistance heating equipment including boilers and baseboard heaters
Natural Gas	Natural gas heating equipment including packaged rooftop units and boilers
Space Cooling	Defines the mix of cooling equipment types found within the stock of buildings
Centrifugal	Standard centrifugal chillers with a full load performance of 0.75 kW/ton
Centri HE	High-efficiency centrifugal chillers assumed to have a performance of <0.65 kW/ton
Recip Open	Semi-hermetic reciprocating chillers
DX	Direct expansion cooling equipment that use small tonnage hermetic R-22 compressors
