January 10, 2019

British Columbia Utilities Commission  
Suite 410, 900 Howe Street  
Vancouver, B.C.  
V6Z 2N3

Attention: Mr. Patrick Wruck, Commission Secretary and Manager, Regulatory Support

Dear Mr. Wruck:

**Re: FortisBC Energy Inc. (FEI)**

**Project No. 1598977**

**Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (the Application)**

**Response to the British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1**

---

On September 21, 2018, FEI filed the Application referenced above. In accordance with BCUC Order G-234-18 setting out the Regulatory Timetable for the review of the Application, FEI respectfully submits the attached response to BCUC IR No. 1.

If further information is required, please contact Sarah Smith, Director NGT, RNG, and Regional LNG at (604) 582-7528.

Sincerely,

**FORTISBC ENERGY INC.**

***Original signed:***

Doug Slater

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 1

1   **1.0   Reference:   Project Overview**  
 2                                   **Exhibit B-1, Section 3, p. 6; Section 4.5, pp. 12–13**  
 3                                   **Biomethane upgrading facilities**

4           On page 6 of the FEI Biogas Purchase Agreement between FEI and CoV application  
 5           (Application), FEI states:

6           Using approved depreciation rates, the biomethane Upgrader, Structure and  
 7           Improvements, Compressor Equipment, Distribution Mains and Meters will all depreciate  
 8           over a longer period than 20 years... [This] is aligned with the term of the CoV BPA  
 9           [Biogas Purchase Agreement] of 20 years.

10           1.1   Please provide the location, technology type and number of years that FEI’s  
 11           existing biomethane Upgrader systems have been operational.

12  
 13   **Response:**

14   The following table provides a summary of the requested information.

Supplier	Location	Upgrader Type	FEI Owns Upgrader	Online Date	Years Operational
Salmon Arm Landfill	Salmon Arm, BC	PSA	Y	Feb 2013	6
Glenmore Landfill	Kelowna, BC	PSA	Y	Sep 2016	2
Fraser Valley Biogas	Abbotsford, BC	Water Wash	N	Oct 2010	8
Seabreeze Farm	Delta, BC	Water Wash	N	Feb 2015	4
Surrey Biofuel	Surrey, BC	Water Wash	N	Jun 2018	<1

15  
 16  
 17  
 18           1.2   What evaluation did FEI conduct to conclude a 20-year asset life is suitable?  
 19           Please explain.

20  
 21   **Response:**

22   FEI has not concluded that a 20-year asset life is suitable. For the purpose of this Application,  
 23   FEI used approved depreciation rates but also performed a secondary evaluation using a 20-  
 24   year asset life to ensure the acquisition price per GJ remained below the prescribed maximum  
 25   of \$30/GJ for the term of the CoV BPA, which is 20 years.

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 2

1 FEI's depreciation rates are approved by the BCUC in FEI's revenue requirements applications  
2 based on depreciation studies conducted from time to time. FEI has modeled this Project using  
3 BCUC approved depreciation rates and will depreciate the Project assets at the depreciation  
4 rates that are in effect at the time the Project enters rate base (which are currently longer than  
5 20 years) unless otherwise directed. If FEI's depreciation rates are updated in a depreciation  
6 study and approved by the BCUC, then the depreciation rates for the Project assets would also  
7 be updated as part of that process.

8  
9

10

11 On page 12 of the Application, FEI states:

12 It was determined that a low limit of 48 percent methane and a high limit of 12  
13 percent nitrogen would maximize the expected future operational time for the  
14 upgrading plant. FEI confirmed with LFG [landfill gas] technology suppliers that  
15 these limits are reasonable.

16 On page 13 of the Application, FEI states:

17 To establish a short list of the most suitable or appropriate technology, FEI  
18 conducted a review of the LFG upgrading technologies currently in commercial  
19 operation and injecting RNG [renewable natural gas] into pipelines in North  
20 America. Based on this review and FEI's experience, three technologies were  
21 identified as the best candidates for upgrading LFG to biomethane. These three  
22 technologies are pressure swing adsorption (PSA), water wash and membrane-  
23 based processes. FEI has direct experience owning PSA upgrading equipment  
24 and indirect experience interfacing with water wash technology owned by other  
25 suppliers.

26 Of the three technologies, a preliminary assessment concluded that a combined  
27 membrane separation and PSA technology is recommended based on the LFG  
28 composition.

29 1.3 Please provide a summary of FEI's conducted review and the criteria used to  
30 establish suitable technologies.

31

32 **Response:**

33 FEI's review to establish suitable technologies identified five different technologies in use at a  
34 combined total of 43 LFG upgrading facilities that were in commercial operation. The following  
35 table shows the breakdown of utilization by technology type:

Core Technology for Upgrader	Projects in Operation	Percent of Projects
Pressure Swing Adsorption (PSA)	7	16%
Selexol™ absorption	8	19%
Water wash	2	5%
Membrane separation	24	56%
Cryogenic separation	2	5%

1

2 Both the Selexol™ absorption technology and the cryogenic separation technology involve  
 3 storage, handling and processing of flammable and/or toxic liquids that are controlled under  
 4 Canadian WHMIS regulation. They were, therefore, excluded from further consideration.

5 The remaining three core upgrading technologies (PSA, water wash, and membrane  
 6 separation), were short-listed for further evaluation. The review concluded that all three short-  
 7 listed technologies would be technically capable of producing pipeline quality biomethane.

8 To evaluate the short list of technologies, FEI applied a weighted scale to each of five key  
 9 criteria in order to come up with a total score for each technology option. Each technology  
 10 option was ranked in order from best to worst based on its expected ability to satisfy each  
 11 criterion.

12 The key criteria are described in the following table:

Criterion	Summary Explanation
Methane Recovery	The Project must be able to recover 80% of the methane emitted
Process Performance	The LFG upgrading process must: a) have at least 94% availability (operational uptime); and b) meet pipeline specifications at maximum input nitrogen and oxygen levels
Biomethane Quality	The LFG upgrading process must produce biomethane that meets or exceeds the FEI pipeline gas quality specifications.
Minimize Costs	The preferred option will be the lowest cost (capital + operational) while meeting technical criteria noted above.
Expansion Potential	Some preference will be given to a plant that can be more readily expanded in the future

13  
 14 FEI gave the most weight to methane recovery, process performance and biomethane quality  
 15 (the ability for the process to produce high quality gas in a reliable manner). FEI considered  
 16 cost next and gave expansion potential the least weight.

17 FEI also considered other evaluation constraints, including:

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 4

Criterion	Summary Explanation
Environment	Emissions from the plant must be appropriately accounted for and processed according to legislation and regulation
Site	Smaller footprint is desirable due to space availability
Installed Base	The degree to which the technology has been proven is generally reflected in the number of sites where it is being used (installed base)

1  
 2 The results of the evaluation indicated that the membrane-based process is the preferred  
 3 technology. The final design recommendation also incorporates a one-stage, nitrogen-removal  
 4 PSA to complement the membrane process to maximize the methane production.

5 During the evaluation, FEI concluded that the next best alternative was a pure, two-stage PSA-  
 6 based system. Despite its lower installed base at the time, there are potential advantages to  
 7 using a single technology.

8  
 9

10  
 11           1.4     Please provide detail of the indirect experience FEI has with water wash  
 12                    technology.

13  
 14 **Response:**

15 FEI has three suppliers that are operating water-wash LFG upgraders. Two of these are  
 16 agricultural anaerobic digester facilities with a mix of on-farm and off-farm wastes as feedstock,  
 17 while the third is a municipal waste transfer station processing source-separated organics.  
 18 These three suppliers are identified in the response to BCUC IR 1.1.1.

19 In all three cases, the nature of the partnership interface is similar. FEI receives a stream of  
 20 upgraded biomethane from the water wash system. The stream is analyzed using real time  
 21 monitoring equipment to ensure that gas quality specifications are met. Gas that meets  
 22 specifications is then regulated to the correct pressure, odorized for leak detection, and then  
 23 injected into the FEI distribution system. Any gas that does not meet specifications does not  
 24 enter the system, but is instead diverted and sent back to the supplier.

25 The calibration, operation, and troubleshooting of FEI's interconnect stations at these projects  
 26 has provided indirect experience interfacing with the water wash upgrading plants by evaluating  
 27 all parameters of the biomethane, such as pressure, flow, and gas composition. Through  
 28 collaboration with the partner organizations, FEI has gained insight into the various challenges  
 29 and process upsets that the water wash systems encountered.

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 5

1 As a result of its experience, FEI can conclude that water-wash technology has proven to be  
2 effective for gas upgrading as these suppliers have all been able to successfully meet pipeline  
3 quality specifications.

4  
5

6  
7 1.5 Please provide an overview of the preliminary assessment that was conducted  
8 and the criteria used to determine that a combined membrane separation and  
9 PSA technology is recommended.

10

11 **Response:**

12 Please refer to the response to BCUC IR 1.1.3.

13  
14

15  
16 1.5.1 Would a single type of technology be suitable for the upgrade facility  
17 given the gas composition? Please explain.

18

19 **Response:**

20 The preliminary assessment shows that a single technology type – a PSA only - could be  
21 suitable for the facility; however, this would result in impacts to other selection criteria such as  
22 capital and operating costs. For a PSA system, there would be a limitation on the ability to  
23 easily expand and the expected operating costs would be higher.

24 A water-wash system would require a PSA as well to meet the RNG production specifications  
25 similar to the membrane system, and it would not have the expansion potential. Therefore, a  
26 water wash system could not be used alone.

27 It is FEI's intent to proceed with a procurement process that indicates a preferred technology  
28 type to potential bidders, while being open to considering a single or alternate technology  
29 provided that equal or better performance can be guaranteed.

30  
31

32  
33 1.6 Please provide examples of LFG-to-biomethane upgrading facilities that use  
34 combined membrane separation and PSA technology.

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 6

1  
2 **Response:**

3 FEI was able to find the following examples of combined Membrane-PSA technology projects  
4 from the survey conducted as part of the evaluation.

Initial Developer	Project Location (State)	In-service date	Equipment Supplier	End User
Bio Energy Washington	Cedar Hills Regional Landfill (Washington)	2010-10-01	Air Liquide	Puget Sound Energy
Keystone Renewable Energy	Seneca Landfill (Pennsylvania)	2011-02-01	Air Liquide	Peoples Natural gas
River Birch LLC	River Birch Landfill, Avondale (Louisiana)	2013-05-01	Air Liquide	Atmos Energy
EDF Renewable Energy	Greentree Landfill, Kersey, Pennsylvania	2007-07-01	Air Liquide	Conectiv Energy Supply
Manufactured Methane Corp (Tengasco)	Carter Valley Landfill, Surgoinsville, Tennessee	2009-04-01	Air Liquide	Eastman Chemical

5  
6  
7  
8 1.7 Please outline the benefits and risks of using the combined technologies.

9  
10 **Response:**

11 FEI's preliminary assessment is that a combined technology system has benefits that outweigh  
12 any risks.

13 The benefits for using a combined technology include scalability, potential lower maintenance  
14 costs and future operational flexibility. More specifically, membrane technology is the best  
15 technology on the market for scalability and operating cost. Additional membranes can be  
16 added in series without any other major changes being required and cost less to maintain  
17 because they have fewer moving parts. The PSA is well-suited specifically to removing nitrogen  
18 and complements the membrane system which is very effective at removing carbon dioxide.

19 The risks of combined systems include higher up-front costs for integration and increased  
20 operating costs. Combined systems require additional engineering and time to connect the  
21 process steps in series. This can add up-front engineering cost and make troubleshooting more  
22 complex during operations. A wider range of spare parts may also be required.

23 The risks associated with a combined system are lower today than in the past as suppliers are  
24 now providing these combined systems for landfills in order to fully meet pipeline specifications.

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 7

1 For example, membrane suppliers such as DMT sell combined membrane-PSA systems for  
2 high nitrogen content applications (such as landfills). This means that equipment suppliers to  
3 the biogas industry are taking on the integration risk and can provide a complete package if  
4 required, which lowers any risk for FEI.

5  
6

7

8 1.7.1 Please explain how the identified risks would be mitigated.

9

10 **Response:**

11 In order to mitigate the identified risks, FEI has included additional time and associated costs in  
12 the capital cost estimate for the Project to account for the increased up-front work on integration  
13 of technologies. FEI will also place performance guarantees on any potential suppliers of  
14 upgrading equipment and seek to work with contractors and upgrading equipment suppliers that  
15 have experience with integration of technologies.

16  
17

18

19 1.8 Please discuss the risks FEI has identified with using a membrane separation  
20 technology.

21

22 **Response:**

23 Please refer to the response to BCUC IR 1.7.1.

24  
25

26

27 1.8.1 Please explain how the identified risks would be mitigated.

28

29 **Response:**

30 Please refer to the response to BCUC IR 1.7.1.

31  
32

33

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 8

1           1.9     Please explain what effects a change in gas composition from those described in  
2                   the preamble would have on each technology, including the effect on recovery  
3                   rates and expected operational life.

4  
5     **Response:**

6     The main risk related to gas composition with any of the technologies, is that there will be an  
7     increase in nitrogen composition, as nitrogen and methane are difficult gases to separate.

8     For pressure swing adsorption, an increase in the composition of nitrogen beyond the design  
9     point would have a deleterious impact on the recovery rate, but would not have an impact on the  
10    operational life of the equipment. In the event of high nitrogen, gas would need to be  
11    periodically sent to flare to reduce the buildup of nitrogen in the system.

12    Membrane and water wash technologies are not able to separate nitrogen. As a result, nitrogen  
13    concentrations >2 percent cannot be upgraded effectively to RNG with these technologies  
14    alone.

15    A spike or long term change in carbon dioxide concentration coming from the landfill is unlikely  
16    because it is generated from a stable biological process in the landfill. Similarly, a spike in  
17    oxygen concentration is unlikely because available oxygen would be used up in microbial  
18    decomposition.

19    An increase in methane content from the landfill over time could also occur. This change would  
20    improve the operability of any upgrading technology and would likely be a result of reducing  
21    nitrogen concentration.

22    Trace compounds do not tend to vary significantly in LFG. An increase in these compounds  
23    would decrease the lifespan of the scrubbing medium, requiring more frequent change-outs.

24  
25

26  
27           1.10    For each technology, please explain, using vendor data and industry experience  
28                   where possible, how the upgrading efficiency of each technology is forecast to  
29                   change over the expected life of the asset.

30  
31     **Response:**

32     Vendors continue to indicate that, provided their technology is maintained, the performance of  
33     the technology will not degrade. Xebec, a PSA supplier, believes that the media in their PSA  
34     would only need to be replaced once every 20 years and DMT, a membrane supplier, estimates  
35     a service life of 15 to 20 years for membranes.

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 9

- 1 From operational experience, FEI has not seen a decrease in the recovery rate over time from
- 2 any of the PSAs that it operates. Routine maintenance of process equipment has been
- 3 effective at maintaining recovery rates.
- 4

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 10

1   **2.0   Reference:   Risks and Mitigation**

2                                   **Exhibit B-1, Section 5, p. 17; Section 1, p. 2**

3                                   **Facilities**

4                   On page 17 of the Application, FEI states:

5                                   The above ground facilities used may be removed and used for other projects.  
6                                   The biogas upgrading facilities owned by FEI will be designed to maximize the  
7                                   ability of FEI to relocate them.

8                   2.1   Please discuss if FEI currently has other projects that the facilities could be used  
9                                   for.

10

11   **Response:**

12   The above ground facilities for the project include the interconnection station and the upgrading  
13   facilities. FEI is currently working to develop a number of projects within British Columbia  
14   including five potential landfills. As such, in the unlikely circumstance that it became necessary,  
15   FEI believes there are projects where these facilities could be used.

16   The interconnection station will be designed and built substantially the same as a typical  
17   pressure regulation station for conventional natural gas. As a result, the interconnection station  
18   would be deployable to either a new biomethane project or, in a less likely scenario, for use as a  
19   typical pressure regulating station for conventional natural gas.

20   The biomethane upgrading facility will be more specifically designed for biogas upgrading. The  
21   process for biogas upgrading (to biomethane) is substantially the same for different types of  
22   projects including non-landfill based projects. Therefore, the facilities would be deployable at  
23   another project.

24

25

26

27                   2.2   Under the scenario that the CoV BPA is terminated prior to the initial term of the  
28                                   BPA and the facilities cannot be used for other projects, would FEI consider the  
29                                   facilities to be “stranded assets.” Please explain why or why not.

30

31   **Response:**

32   In the unlikely event that no further use for these assets is established and CoV BPA  
33   termination occurs prior to the end of the initial term, FEI would evaluate all relevant variables at  
34   that time to determine the best alternative to account for the remaining asset value, including

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 11

1 but not limited to considering them as stranded. Regardless of whether the assets are  
2 considered stranded, they would have been constructed prudently, in compliance with section  
3 2(3.8)(a) of the GRR, and with regard to the BC Government's commitment to growing  
4 renewable natural gas as outlined in FEI's response to BCUC IR 1.5.7. At the time that the  
5 assets became unused, FEI would propose a mechanism to recover their costs aligned with  
6 mechanisms FEI has used for prudently incurred costs in the past.

7  
8

9  
10 2.2.1 If yes, please discuss if the facilities would remain in rate base and  
11 continue to be recovered in the delivery rates of all non-bypass  
12 customers. Would the approach be different if the Project was not a  
13 prescribed undertaking under section 18 of the Clean Energy Act? Why  
14 or why not?

15  
16 **Response:**

17 Please refer to the response to BCUC IR 1.2.2. The approach for the recovery of these assets  
18 would be the same regardless of whether the biomethane project was constructed as a  
19 prescribed undertaking or not.

20

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 12

1   **3.0   Reference:   Biogas Purchase Agreement**  
2                                   **Exhibit B-1, Table 5, p. 16, Appendix A, Sections 5.2 & 6.1**  
3                                   **Non-compliant biogas**

4                   Further to Section 5.2 of the BPA, FEI has the option to accept “Non-Compliant Biogas”  
5                   into its facilities. Section 6.1 of the BPA provides the reduced base price that FEI shall  
6                   pay the CoV for “Non-Compliant Biogas” accepted by FEI into FEI’s facilities.

7                   3.1     Please discuss the implications to FEI, financial or otherwise, to upgrade “Non-  
8                   Compliant Biogas” to RNG in FEI’s facilities. Please quantify the implications,  
9                   where possible.

10  
11   **Response:**

12   The most likely cause of non-compliant biogas would be an increase in nitrogen composition.  
13   This occurs when more air is able to infiltrate deeper into the landfill. The amount of air  
14   infiltration is controllable by landfill operators by controlling the suction pressure from each  
15   landfill gas well. In FEI’s experience, the operators of the City of Kelowna’s landfill have been  
16   effective in controlling and limiting the amount of nitrogen in the LFG produced at that landfill  
17   through this technique.

18   The possibility for FEI to upgrade “non-compliant biogas” will form a part of the equipment  
19   design and specifications, especially to accommodate higher nitrogen levels. This will ensure  
20   that the equipment is capable of processing full design rates of both compliant and non-  
21   compliant gas.

22   The main implication of processing non-compliant gas is a decrease in production efficiency.

23   If nitrogen levels exceeded the design point, the pressure swing adsorption (PSA) equipment  
24   would need a way to dissipate the build-up of nitrogen. If the high nitrogen level exists for a  
25   short period of time, the built-in recycle system will handle the excess until the nitrogen level of  
26   the inlet gas falls back under specification. If the nitrogen level continues to be high for a longer  
27   period of time, the recycle gas will need to be intermittently flared off to reduce the accumulation  
28   of nitrogen.

29   The exact amount that a PSA could tolerate depends on the media and the design of the  
30   recycle system (especially, the size of a recycle buffer tank). As the amount of nitrogen  
31   increases, flaring would happen more frequently, decreasing the recovery rate. At a certain  
32   amount of nitrogen it would become uneconomic to continue to process the LFG and the  
33   process would stop. FEI estimates that the uneconomic point would be at a level of  
34   approximately 50 percent more nitrogen than designed tolerance.

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 13

1

2

3

4           3.2     Please discuss whether the RNG production efficiency would be reduced (i.e. a  
5                   lower recovery rate) if FEI’s facilities were to upgrade “Non-Compliant Biogas.” If  
6                   so, please quantify where possible.

7

8     **Response:**

9     Please refer to the response to BCUC IR 1.3.1.

10

1    **4.0    Reference:    Biogas Purchase Agreement**  
 2                                    **Exhibit B-1, Table 2, p. 10; Appendix A, Section 5.3(a), Section 5.8(a),**  
 3                                    **pp. 9–11**  
 4                                    **Supply based and anniversary reviews**

5    The following information is extracted from Table 2 of the Application:

Item	Amount	Contract Clause	Comment
Anniversary Reviews	10 Years and 18 years		10 Year review will re-base expectations with respect to volume and LFG composition. 18 Year review will evaluate Project with
Minimum Volume	██████ GJ/6 month period	Clause 5.3 (ii)	The City must meet this amount or a supply-based review is triggered which may result in termination.

6  
 7    Section 5.3(a) of the BPA states:

5.3    **Supply Based Reviews.**

(a)    Subject to subsection 5.3(d), the parties will undertake a joint review of the Project, to be completed within ninety (90) days of the triggering event, to enable the parties to determine ongoing Project viability, if:

(i)    at the 4<sup>th</sup> anniversary of the Acceptance Date, the First Delivery Date has not occurred despite the Owner having the Supply Minimum available and meeting the Specifications in Schedule A; or

(ii)    after the First Delivery Date, the Owner does not deliver at least the aggregate of ██████ GJ of Biogas meeting the Specifications over any period of six (6) consecutive months (collectively the "Supply Minimum") and FEI requests a review be conducted.

8  
 9    Section 5.8 (a) of the BPA states:

5.8    **Anniversary Reviews.**

(a)    In addition to any reviews conducted pursuant to section 5.3 (*Supply Based Reviews*), at the tenth(10<sup>th</sup>) and eighteen (18<sup>th</sup>) anniversaries of the First Delivery Date, the parties will undertake a review of the Project, which review will not exceed 90 days, including quantity, flow and quality of the Biogas made available to FEI throughout the Term, and the future projections of quantity, flow and quality (the "10<sup>th</sup> Anniversary Review" and the "18<sup>th</sup> Anniversary Review" respectively). The purpose of the 10<sup>th</sup> Anniversary Review is to determine Project financial viability for the balance of the Term based on historic and projected supply of Biogas at the then current pricing. The purpose of the 18<sup>th</sup> Anniversary Review is to determine Project financial viability for the balance of the Term and whether to extend this Agreement beyond the Term.

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 16

1 **Response:**

2 Please refer to the response to BCUC IR 1.4.1.

3

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 17

1   **5.0   Reference:   Legislative and Regulatory Context**  
2                           **Greenhouse Gas Reduction (Clean Energy) Regulation (GGRR),**  
3                           **section 2(3.8)(a); Exhibit B-1, Section 2, pp. 2–6; Section 4, p. 8**  
4                           **Acquisition price**

5           On page 3 of the Application, FEI states:

6                           Section 18 of the CEA establishes the concept of a ‘prescribed undertaking’ for  
7                           the purposes of the CEA as follows:

8   18 (1) In this section, ‘prescribed undertaking’ means a project, program,  
9   contract or expenditure that is in a class of projects, programs, contracts  
10    or expenditures prescribed for the purpose of reducing greenhouse gas  
11    emissions in British Columbia.

12           On pages 4–5 of the Application, FEI states:

13                           OIC 161/2017 approved an amendment to the GGRR which, among other things,  
14                           classified renewable natural gas as a prescribed undertaking. Sections 2(3.7)  
15                           and 2(3.8) of the GGRR, as amended by OIC 161/2017, state that:

16   (3.7) A public utility’s undertaking that is in the class defined in subsection (3.8) is  
17    a prescribed undertaking for the purposes of section 18 of the Act.

18   (3.8) The public utility acquires renewable natural gas

19   (a) for which the public utility pays no more than \$30 per GJ, and

20   (b) that, subject to subsection in a calendar year, does not exceed 5% of  
21   the total volume of natural gas provided by the public utility to its non-  
22   bypass customers in 2015.

23           FEI states on page 6:

24                           The CoV BPA meets the two criteria for RNG projects as prescribed  
25                           undertakings as set out in section 2(3.8)(a) and 2(3.8)(b) of the GGRR in terms  
26                           of total cost to acquire RNG and total volume threshold.

27           5.1   Please provide FEI’s interpretation of “pays no more than \$30 per GJ,” clearly  
28                   explaining what costs FEI believes can be included in the \$30 per GJ calculation  
29                   and why.  
30

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 18

1    **Response:**

2    FEI interprets “pays no more than \$30 per GJ” to mean the total levelized cost of biomethane  
3    delivered to the FEI system, including all costs associated with upgrading and interconnection of  
4    the Project to the FEI system. Therefore:

- 5           • In the case of a contract to acquire raw biogas, the maximum price of \$30 per GJ would  
6           include the purchase price of raw biogas plus the upgrading and interconnection costs.
- 7           • In the case of a contract to acquire pipeline quality biomethane, the maximum price of  
8           \$30 per GJ would include the purchase price of biomethane plus the interconnection  
9           costs for the project.

10    The costs of upgrading and interconnection are included because these costs are ultimately  
11    necessary to acquire the biomethane. The levelized cost is a reasonable means of determining  
12    a portion of the acquisition cost because it averages the effects that the change in annual cost  
13    of service has on the cost per GJ of produced biomethane in any one year.

14    The inclusion of the levelized cost, including upgrading and interconnection, was also the  
15    method that FEI used to determine the delivery price of biomethane for the purposes of  
16    complying with the BCUC’s maximum price for biomethane, before the maximum price in the  
17    GRR was in place. The maximum price in the GRR replaced the BCUC’s maximum price for  
18    delivered biomethane, and should be interpreted in this context.

19  
20  
21

22  
23           5.2    Please confirm, or explain otherwise, that if the Project is deemed a prescribed  
24           undertaking, all raw LFG, capital and O&M costs related to the Project would be  
25           included in FEI’s calculation of rate base.

26  
27    **Response:**

28    FEI confirms that all the items identified in the question are included in calculating FEI’s revenue  
29    requirement for the Project. Only the capital items are included in the calculation of rate base.  
30    The raw LFG and O&M are included as an addition to FEI’s Biomethane Variance Account  
31    (BVA).

32  
33  
34

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 19

1                   5.2.1    If not confirmed, please explain.

2

3    **Response:**

4    Please refer to the response to BCUC IR 1.5.2.

5

6

7

8                   5.3    If the Project is deemed a prescribed undertaking, does the Project remain a  
9                   prescribed undertaking indefinitely? If not, please discuss scenarios where the  
10                  Project would no longer be a prescribed undertaking and what should happen  
11                  with cost recovery in such an event.

12

13   **Response:**

14    Yes, FEI believes that if the Project is a prescribed undertaking it remains a prescribed  
15    undertaking indefinitely, subject to any conditions or constraints for the prescribed undertaking  
16    set out in the GGRR. Since the prescribed undertaking for RNG in the GGRR has no expiry  
17    date or set period of time during which the undertaking must be carried out, FEI concludes that  
18    RNG projects qualifying as prescribed undertakings retain that status indefinitely.

19

20

21

22                   5.4    If the Project is deemed a prescribed undertaking, please explain how FEI would  
23                  recover costs in the event that:

24                               (a) increases in actual construction costs resulted in the cost to acquire RNG  
25                               exceeding \$30/GJ;

26                               (b) initial operating costs resulted in the cost to acquire RNG exceeding  
27                               \$30/GJ after completion of the Project ; and

28                               (c) the cost to acquire RNG exceeded \$30/GJ as a result of increased annual  
29                               operating costs due to upgrade system efficiency and/or LFG quality  
30                               deviating from assumptions used by FEI.

31

32   **Response:**

33    Based on the estimated construction costs, initial operating costs, and ongoing operating costs  
34    filed in the Application, the resulting total acquisition cost is \$22.24/GJ. If the BCUC approves  
35    the Project as a prescribed undertaking based on those cost estimates, then the Project

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 20

1 remains a prescribed undertaking. The required engineering accuracy level for the capital  
2 costs has been included in the Application which provides confidence that the estimates are  
3 reasonable. FEI also believes the initial and ongoing operating cost estimates are reasonable,  
4 particularly given the conservative assumptions used. However, in the very unlikely event that  
5 increases in actual construction costs, initial operating costs, or annual operating costs result in  
6 the cost to acquire RNG exceed \$30/GJ, all prudently incurred project costs, even costs in  
7 excess of \$30/GJ, would be recovered through the BVA in the same manner as existing  
8 biomethane projects, first from voluntary RNG or Biomethane program customers.

9 As noted above, the construction cost estimates provided in the Application have been  
10 developed with the required accuracy level to provide confidence that the costs are reasonable.  
11 As a result, FEI believes it is unlikely that the actual construction costs will result in a cost to  
12 acquire RNG exceeding \$30/GJ. Even at the high-end of the cost estimate range, the cost of  
13 acquisition remains below \$30/GJ.

14 The initial operating costs were developed based on a combination of industry estimates and  
15 FEI's experience. There may be fluctuations in costs at any time during the life of the Project,  
16 but FEI is confident that these costs, when examined as part of the levelized cost of service, are  
17 reasonable.

18 FEI based its ongoing cost of service on conservative assumptions regarding upgrader  
19 efficiency and existing data provided by the CoV. As such, FEI believes the annual operating  
20 cost estimates are also reasonable.

21  
22

23  
24

25 5.5 Please confirm, or explain otherwise, whether in FEI's view, section 2(3.8)(a) of  
26 the GRR is satisfied if the levelized cost of the Project is below \$30 per GJ.  
27 Please explain why or why not.

28  
29

**Response:**

30 Confirmed. It is FEI's view that, based on the language in the GRR, if the Project cost  
31 estimates show a levelized cost below the prescribed undertaking maximum of \$30/GJ, then  
32 section 2(3.8)(a) of the GRR is satisfied. This means that section 2(3.8)(a) of the GRR is  
33 satisfied even if the non-levelized cost per GJ is greater than \$30/GJ at any time during the term  
34 of the CoV BPA.

35 As discussed in FEI's response to BCUC IR 1.5.1, the levelized cost is a reasonable means of  
36 determining the acquisition cost because it averages the effects that the change in annual cost

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 21

1 of service has on the cost per GJ of produced biomethane in any one year. Annual variations in  
2 the cost of service and resultant cost per GJ could be due to the impact of taxes, such as capital  
3 cost allowance, or the initial ramping up of volumes during the start-up period of a project. Due  
4 to temporary or variable factors such as these, it would not be reasonable to use a non-levelized  
5 acquisition price for the purpose of the GGRR. For reasons such as these, a levelized cost  
6 approach has been used and accepted by the BCUC when evaluating FEI's prior biomethane  
7 upgrading projects as well as for setting FEI's CNG and LNG station rates. It is therefore a well-  
8 established approach.

9 As FEI explained in its December 11, 2018 submission (Exhibit B-2), the words of any Act are to  
10 be read in their entire context and, in the case of section 2(3.8) of the GGRR, the relevant  
11 context is FEI's well-established RNG supply side model for its Biomethane Program. The  
12 maximum price in the GGRR replaced the BCUC's maximum price for delivered biomethane,  
13 and should be interpreted in this context. The levelized cost approach was the method that FEI  
14 used to determine the delivered price of biomethane for the purposes of complying with the  
15 BCUC's maximum price for biomethane, before the maximum price in the GGRR was in place.  
16 It is reasonable to apply the same approach for compliance with the GGRR.

17 As FEI also explained in its December 11, 2018 submission (Exhibit B-2), the words of any Act  
18 are to be interpreted harmoniously with its object and intention. Further, as required by section  
19 8 of the Interpretation Act: "Every enactment must be construed as being remedial, and must be  
20 given such fair, large and liberal construction and interpretation as best ensures the attainment  
21 of its objects." It is, therefore, significant that the object and intention of section 2(3.8) of the  
22 GGRR is to increase FEI's ability to obtain RNG supply for its Biomethane Program.

23 Interpreting section 2(3.8)(a) of the GGRR to apply to the non-levelized cost per GJ over the life  
24 of the CoV BPA would be contrary to the object and purpose of the GGRR, as it would decrease  
25 FEI's ability to obtain RNG supply for its Biomethane Program:

- 26 • The non-levelized cost will vary from year to year of the CoV BPA, with some years  
27 being higher and some years being lower than the levelized costs. It would be  
28 impractical to evaluate a project's non-levelized variable annual costs. The non-  
29 levelized cost approach is, therefore, a stricter test than previously applied by the BCUC  
30 and would decrease FEI's ability to obtain RNG.
- 31 • A non-levelized cost approach is more uncertain than a levelized cost approach. It is a  
32 relatively straightforward exercise to derive the levelized cost of a project. Consistent  
33 with how FEI considers all projects, FEI considers the overall cost to the customer and  
34 spreads those over the life of the project. Determining the fluctuations in the acquisition  
35 cost year over year is a more difficult and uncertain exercise. Introducing this  
36 uncertainty would decrease FEI's ability to receive approval to obtain RNG supply.
- 37 • A non-levelized cost approach would create differences between how purchases of  
38 biomethane and biogas are judged, which would be inappropriate. When purchasing

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 22

1 biomethane, the contract price is levelized over the length of the contract, and does not  
2 vary from year to year based on the third party's upgrading costs. Purchases of biogas  
3 should be considered on the same basis as this supply model is necessary or preferable  
4 for the development some sources of supply, including with the CoV. Hampering FEI's  
5 ability to proceed with the purchase of biogas would, therefore, reduce FEI's ability to  
6 obtain RNG supply.

7  
8  
9 It is, therefore, consistent with the context, purpose and object of the GGRR to interpret the  
10 price in section 2(3.8) of the GGRR as applying to the levelized acquisition cost over the life of  
11 the BPA. This approach is a reasonable means of determining the acquisition cost and well-  
12 established in the context of biomethane and CNG and LNG station projects.

13  
14

15

16 5.6 In FEI's view, would section 2(3.8)(a) of the GGRR be satisfied if the non-  
17 levelized cost per GJ is greater than \$30/GJ at any time during the term of the  
18 CoV BPA? Please explain why or why not.

19

20 **Response:**

21 In FEI's view, section 2(3.8)(a) of the GGRR applies to the estimated levelized cost of a project  
22 and, therefore, is satisfied even if the non-levelized cost per GJ is greater than \$30/GJ at any  
23 time during the term of the CoV BPA. Please refer to the responses to BCUC IRs 1.5.1 and  
24 1.5.5.

25

26

27

28 5.7 In the event that the Project is not deemed to be a prescribed undertaking,  
29 please discuss how FEI would proceed with the Project and the Application.

30

31 **Response:**

32 For the reasons outlined in FEI's Application, December 11, 2018 submission (Exhibit B-2) and  
33 various IR responses, FEI believes that the Project clearly qualifies as a prescribed undertaking.

34 Further, subsequent to FEI's filing of this Application, the BC Government has issued its  
35 CleanBC climate action and energy plan in early December 2018 in which its policy commitment  
36 to growing renewable natural gas as a carbon-reducing resource has been strengthened. In the  
37 CleanBC plan the BC Government indicates its intention to establish a requirement that at least

FortisBC Energy Inc. (FEI or the Company) Application for Acceptance of the Biogas Purchase Agreement Between FEI and the City of Vancouver (City or CoV) (the Application)	Submission Date: January 10, 2019
Response to British Columbia Utilities Commission (BCUC) Information Request (IR) No. 1	Page 23

1 15 percent of the fuel supply for residential, commercial and industrial gas consumption comes  
2 from renewable gas<sup>1</sup>. Since the CleanBC planned target of 15 percent renewable gas is much  
3 higher than the RNG supply cap currently allowed by the GGRR, FEI believes that the  
4 Province's policy intentions add further weight to the notion that the Project qualifies as a  
5 prescribed undertaking.

6 Notwithstanding the foregoing comments, in the event that the BCUC found on some basis that  
7 the Project does not qualify as a prescribed undertaking under the GGRR, FEI would analyze  
8 the reasons of the BCUC and either seek to adjust the current application or CoV BPA as  
9 needed to address the BCUC's concerns, or potentially prepare and file an application for a  
10 Certificate of Public Convenience and Necessity (CPCN) for the Project.
